**CATAWBA**, an Indian tribe formerly occupying large parts of North and South Carolina. The Catawbas were generally friendly to the settlers, and served with them in the Revolution and against the hostile tribes of Indians. Pontiac and Peter Harris, the latter a Revolutionary soldier, were of Catawba descent. When in their greatest strength, the tribe numbered 1,500 warriors. It is now reduced to a small number and most of these Indians are mixed with whites.

**CATBIRD** (kăt'bērd), an American bird belonging to the same group as the mocking bird, and commonly found in thickets and shrubberies. Its name was derived from the peculiar mewlike cry which it makes when disturbed. The nest is built of twigs, leaves, weeds, and grass, and its greenish-blue eggs usually number from four to six. Its food consists chiefly of worms, insects, berries, and fruit. The color is dark-gray or blackish, with bluish-gray beneath, and the head and tail brownish-black. It is more slender than the robin and measures about nine inches in length. In the autumn it passes to the extreme south of the United States, Mexico, and Central America, and in the spring moves northward, where it builds its nest and rears its young.

**CATECHISM** (kăt'ĕ-kiz'm), an elementary book in which the principles of any art or science are explained by means of questions and answers, but the term is applied especially

to texts treating of the principles of religion. The first Christian catechisms were those written by Kero of Saint Gall and Otfried of Weisenburg, and others issued in the 8th or 9th centuries. In 1520 Martin Luther published a short catechism for Protestant students, and larger and smaller ones were issued by him in 1529. These still continue to be used in the Lutheran churches. In 1536 the Geneva Catechism was issued, and in 1549 the catechism of the Church of England appeared. The latter originally contained only the baptismal vow, the ten commandments, the creed, and the Lord's Prayer with explanations. Later larger editions were published, the complete form appearing in 1612. The catechism of the orthodox Greek Church was published in 1542, and that of the Roman Catholic was issued in 1566 under the direction of the Council of Trent. The general assembly of divines at Westminster agreed upon the catechism of the Church of Scotland in 1648. Catechisms have since been published by other sects, some of which are of great literary merit. They constitute the principal text-books in teaching religious principles in parochial schools and academies.

**CATEGORY** (kăt'ĕ-gō-rŷ), in logic, a predicament understood to be an attempt at a comprehensive classification of all that exists, for the purpose of logical affirmation, proof, or disproof. The entire universe may be classified in various ways—as into things celestial and terrestrial; as matter and spirit, as minerals, plants, animals, etc. The original classification made by Aristotle proceeds on the very general properties or attributes that most extensively pervade all existing things, although in unequal degrees. He made ten categories, viz., *substance, quantity, quality, relation, action, passion, time, place, situation, and habit*. These have not been admitted by many logicians. Plato admits only five, the Stoics four, and Descartes suggests seven, while J. S. Mill says, "It is like a division of animals into man, quadrupeds, horses, asses, and ponies." He gives as the result of his own analysis the following enumeration: 1. Feelings, or states of consciousness. 2. Minds, which experience those feelings. 3. Bodies, or external objects. 4. Successions and coexistences, the likenesses and unlikenesses between feelings and states of consciousness.

**CATENARY CURVE** (kăt'ĕ-nā-rŷ), a curve formed by a chain or rope of uniform density hanging freely from any two points. The forms are of two kinds, the *common* and the *uncommon*. The former is constituted by a chain equally thick in all its points; the latter,

by a thread unequally thick. The catenary curve was first observed by Galileo, who proposed it as the proper figure for an arch of equilibrium. It is now adopted in suspension bridges, and is of interest as bearing on the theory of arches and domes.

**CATERPILLAR** (kăt'ēr-pīl-lēr), the larva or larval state of lepidopterous insects, from which they finally turn into butterflies, moths,

CATERPILLAR—1 SMOOTH, 2 HAIRY, 3 SPANNER.

or hawk moths. They are hatched by the warmth of the sun from the eggs laid by the butterfly. The points of difference in caterpillars are as great as those found in the perfect insects into which they change. The body, usually soft and formed like a cylinder, is generally divided by rings into thirteen segments, with nine small openings for respiration on each side of the head. Most caterpillars have a rounded head composed of a horny substance. It is much harder than the rest of the body and contains about six shining points at each side, which are regarded as eyes, and two very short antennae. In size they vary from very small to quite large, the usual size being about an inch in length. The body of some is covered with hairs, and others have a smooth skin. Many live in large societies in nets spun in the small branches of trees, while others roll leaves for houses or burrow in the ground. The food consists of seeds, roots, fruits, flowers, or leaves, this depending upon the class to which they belong. Most caterpillars that grow into butterflies have sixteen legs, and those that develop into moths have from ten to sixteen. In many caterpillars the legs are distributed along the entire body, while in loopers, spanners, or measuring worms they are on the ends of the body. The latter class move from place to place by drawing themselves into arches or loops.

When hatched from the egg, the caterpillar grows very fast, owing largely to its remarkable ability to devour food, which sometimes equals more than twice the weight of the body

in a day. For this reason the insect becomes very harmful to tender plants, shrubs, and trees. It turns into the pupa or chrysalis state before becoming a butterfly or moth. In this state it is pointed and has little warts over its surface, but some species have a smooth and oval surface. When about ready to turn into the chrysalis state, it ceases to eat and hangs from the under side of a twig or leaf by means of its legs or threads of silk spun by itself. While in this state it is at perfect rest and takes no food. After eight or ten days it passes into the butterfly or moth state, but during damp and cool weather it requires from two to three weeks to make this change. Shortly after passing from the chrysalis state it is seen with its wings hanging downward, but they soon grow to their proper proportion, the body becomes hardened, and the butterfly is seen flitting about gathering food from various articles of subsistence.

The habits of caterpillars are quite various, some moving about during the daytime, while others work at night taking in their food. It is estimated that the food consumed by a caterpillar before passing into the developed state weighs many thousand times as much as the first weight of the larva. Among the enemies of the caterpillars are birds and poultry. In some localities birds are valuable in destroying caterpillars and protecting orchards from their ravages. Butterflies and moths are not as great a pest as caterpillars for the reason that they move from place to place, while caterpillars remain fixed to one place, thus entirely consuming the foliage and vegetation as they move onward. From 200 to 800 eggs are laid by a single butterfly or moth, and when these come into the caterpillar state they fully cover large branches of trees, sap them of their juices, and often cause them to wither and die. Some forms of caterpillars are carnivorous, and live on the carrion of insects and small quadrupeds.

**CATFISH** (kăt'fīsh), a fish found in the lakes and streams of all the continents. The

CATFISH.

family includes a large number of species. In the catfish of North America the skin is wholly naked, most species have barbels about the mouth, and the color is dark or dark-blue. All have a large head and are armed with barbs

or spines, with which they are able to inflict a painful wound. Among the familiar species are the *channel cat*, the *bullhead*, and the *stone cat*. Those found in the smaller streams are usually from six to ten inches long, while a number of species common to lakes grow to a length of several feet. The catfish of the Mississippi attains a weight of over one hundred pounds. It prefers to frequent muddy bottoms rather than clear streams. The flesh is prized for its flavor and nutritious qualities.

**CATGUT** (kăt'güt), a cord used as the strings in musical instruments, such as the violin, harp and guitar. It is employed as whipcord, in the bows of archers, and in the cords used by clockmakers. Catgut is made chiefly from the intestines of the sheep, and sometimes from those of the mule and horse, but not from the intestines of a cat. It is prepared by a tedious process, which consist chiefly of cleansing the intestines from fatty matters, after which they are steeped in water and carefully scraped with a blunt knife, then treated with a solution of alkali, and assorted into their respective sizes by drawing them through a perforated brass thimble. At this stage the catgut is subjected to the fumes of burning sulphur in order to prevent offensive odors or putrefaction. The so-called Roman strings, manufactured in Italy, are considered the strongest and best on the market. Surgeons use a superior grade of catgut for tying wounds, and whipcord is made by twisting catgut similar to a one-corded rope.

**CATHEDRAL** (kâ-thē'dral), the principal church of a province or diocese. It is distinguished from others by its *cathedra* or throne, and by having a more elaborate and larger style of architecture. The largest and most noted cathedral is Saint Peter's at Rome, founded in 1450. Others of much renown include the fine Italian-Gothic style at Florence, begun in 1294; the one at Milan, 1386; at Cologne, 1248; those at Amiens and Rheims; and the Notre Dame Cathedral, Paris; the last mentioned was begun in 1163. Many of the noted cathedrals of Europe are in the Gothic style, and in connection with them are side chapels, chapter houses, crypts, and cloisters. The Byzantine, Romanesque, and Renaissance styles of architecture are well represented in the cathedrals of continental Europe. Among the leading cathedrals of North America are the Notre Dame, in Montreal; the Roman Catholic Cathedral of Saint Patrick's, in New York City, and the Protestant Episcopal Cathedral of Saint John the Divine, in New York City.

**CATHETOMETER** (kâth-ê-tôm'ê-tēr), an

instrument employed to measure accurately small differences of height, especially two columns of fluid. It consists of a perpendicular metallic standard, to which is attached a telescopic leveling apparatus so it may be moved up or down. In order to sight the objects or surfaces, the telescope is raised or lowered, and the differences in height are thus seen on the graduated standard.

**CATHODE RAY** (kâth'ōd), a kind of ray generated at the cathode in a vacuum tube by the electrical discharge. The poles of the battery are called *electrodes*. The one which receives the electric current, or the negative pole, is called *cathode*, and the other, which overflows with electricity, or the positive pole, is known as the *anode*. When a cylindrical tube from which the air has been exhausted is attached to the poles of an electrical machine, the cathode rays fill the vacuum with a green light. An apparatus of this kind is employed in producing Röntgen rays.

**CATHOLIC CHURCH** (kâth'ō-lik), a term signifying universal church. It cannot be applied to any particular sect or party, as Greek, Anglican, Roman, Lutheran, or Presbyterian, since any one of these forms merely a portion of the universal church. The term is employed to distinguish the Christian from the Jewish; the former applies to the world and the latter is confined to a particular nation. About the year 160 A. D. the term *Catholic Church* began to be applied in this universal sense to distinguish the followers of Christ from Gnostics and all others not holding to Christianity. The term is now applied in the catechisms, the books of faith, of the Christian churches generally, but the Roman Catholic and Greek Catholic are the only ones that have retained the name and made it apply to their organizations. See **Greek Catholic**, **Roman Catholic**.

**CATHOLIC EMANCIPATION**, in England, the term used in reference to the repeal of certain laws affecting the civil rights of Roman Catholics. The law prohibited Catholics from purchasing land and performing the rites of their church until 1780, when many of these laws were repealed. The Duke of Wellington, in 1829, moved the repeal of all anti-Catholic laws, and after much discussion they were generally discontinued. However, there are still some restrictions upon Catholics, chief among which is that a seat in the House of Commons cannot be held by a Catholic priest.

**CATHOLIC UNIVERSITY OF AMERICA**, an institution of higher learning established at Washington, D. C., under authority of Leo XIII., who granted its apostolic constitution

in 1887. It was opened for instruction in 1889. The chief officers, who consist of the chancellor, the rector, and the treasurer, are chosen by the board of trustees, which is made up from the laity, clergy, and episcopate. Cardinal Gibbons, the first chancellor, continues to hold that office. The primary purpose is to facilitate original research by graduates of Catholic seminaries and colleges. It maintains faculties of law, philosophy, theology, and technology, and instruction is given by about 35 professors. The library has 40,000 volumes and the value of property is \$1,350,000. The attendance is reported at 250.

**CATHOLIC YOUNG MEN'S NATIONAL UNION**, an organization of young men belonging to the Roman Catholic Church. It is a federation of the diocesan unions and was organized in 1875. A council approved it at a session held in Baltimore, and since then it has grown in favor and membership in the United States and Canada. The purpose is to bring young men into the church, establish and maintain reading rooms, and promote the organization of libraries. It has a membership of about 65,000.

**CAT ISLAND**, one of the Bahama Islands, about 200 miles northeast of Nuevitas in Cuba. It is about 45 miles long, from two to eight miles wide, and is largely of coral formation. It is supposed that Columbus visited this island in 1492.

**CATLETTSBURG** (kăt'lets-bûrg), a city in Kentucky, county seat of Boyd County, at the confluence of the Big Sandy and Ohio rivers, on the Chesapeake and Ohio Railroad. It has electric lights, waterworks, and a brisk trade in lumber and merchandise. The manufactures include flour, machinery, and lumber products. Among the chief buildings are a county courthouse and several fine churches and schools. Population, 1900, 3,061.

**CATNIP** (kăt'nîp), or **Catmint**, a perennial plant of the mint family, common in the fields of Europe and North America. It was so named for the fondness with which cats eat the leaves. The plant has an erect stem from two to three feet in height and heart-shaped leaves, and bears a dense whorl of whitish flowers. The leaves are soft and downy beneath. They are aromatic and somewhat bitter to the taste and have a slightly disagreeable odor. The leaves are used in medicine as a tonic.

**CAT'S-EYE**, a mineral classed with the precious stones, found in Brazil and Ceylon. It is so named from its peculiar internal radiation called *chatoyant*, which somewhat resembles a cat's eye. It is commonly of a greenish-gray col-

or, though sometimes red, brown, or yellow. A variety known as *tiger-eye* is obtained in the vicinity of the Orange River in South Africa. It is an altered crocidolite and is not of much value.

**CATSKILL** (kăts'kîl), county seat of Greene County, New York, on the Hudson River, thirty-five miles below Albany. It occupies a fine site at the mouth of Catskill Creek, on the West Shore Railroad, and is the starting point of the Catskill Mountain Railroad. The chief buildings are a courthouse, an academy, a public library, and an opera house. Among the manufactures are paper, woolen goods, and stone products. It is an important station for pleasure parties visiting the Catskill Mountains and is connected by ferry with the New York Central Railway on the east side of the river. The vicinity was settled by the Dutch in 1680. Population, 1900, 5,484; in 1910, 5,296.

**CATSKILL MOUNTAINS**, a group of mountains in New York, belonging to the Appalachian system, situated west of the Hudson River and south of the Mohawk. Washington Irving made the Dunderberg, one of the Catskills, the scene of his famous "Rip Van Winkle." The area covered by the group is about 5,000 square miles. The highest peaks are Roundtop, 3,810 feet; Slide Mountain, 4,250; and Hunter Mountain, 4,025. The scenery is very fine and attracts many visitors in the summer season. Forests of oak ash, beech, pine, and maple cover a large part of the region.

**CATTEGAT** (kăt'tê-găt), or **Kattegat**, a gulf extending between Sweden and Denmark. It is an extension of the Skager-Rak from the North Sea. Its length is 150 miles and the greatest breadth is 90 miles. The shores of Sweden are rocky and steep, but the Danish shores are low. There are sand banks more or less dangerous to navigation. Among its principal islands are Samsö, Läsö, and Anholt.

**CATTLE** (kăt't'l), the name formerly applied to all large domestic animals, such as oxen, cows, horses, swine, and sheep, but now limited to cows, oxen, and steers. The name applied to this class of animals in British countries is neat cattle. Cattle were unknown in America prior to the discovery of the continent by Columbus. They are mentioned in the ancient records of Hindu and Hebrew peoples, and are shown extensively on Egyptian monuments constructed more than 2,000 years before the Christian era. Remains of cattle have been found in the Swiss lake dwellings along with stone implements. The wealth of primitive man consisted largely of cattle, since they furnished the necessary meat and milk for subsistence, answered as beasts of burden, and were suitable

HERD OF HEREFORD CATTLE.

for plowing the soil and threshing the grain. The Hindus still hold several species sacred. The Romans punished the mistreatment of this animal by inflicting severe penalties, while the Germanic and Latin tribes of early Europe used them as a chief support.

Cattle were first brought to America by the Spaniards in 1525, about six years after the

HOLSTEIN COW.

discovery of Mexico by Cortez. From Mexico they spread into California, Central America, and later over the whole of South America. Most Spanish grades of cattle are marked by rough characteristics and a tendency to merge into a wild state. The wild cattle of South America are descendants of those brought from Spain. The Dutch brought the first cattle to the northern colonies in 1625. Others introduced them into Virginia from the West Indian Islands, while the Swedes brought a number to Delaware in 1627; the Danes, to New Hampshire; and the English, to Maryland. Most of the teaming, plowing, and prairie breaking in early times was done by oxen, horses being introduced later on account of their greater speed.

The grades of cattle now generally reared in Canada and the United States are greatly diversified, owing to the fact that importations have been made from various parts of Europe, but also because different sections of the country demand a diversity. The chief uses of cattle are to supply milk and yield beef, although in many localities there is still a demand for oxen as beasts of burden. It may be said that the *Galloways* constitute a grade distinctly fitted for beef production, while the *Jersey*, *Guernsey*, and *Ayrshire* breeds are reared principally for their abundant yield of rich milk. The *Durham*, *Holstein*, and *Hereford* grades are reared most extensively through the central portion of the United States and in the corn belt region, for the reason that they yield a choice quantity of milk and at the same time are among the finest for beef. In general Texas cattle are coarser and rougher, owing to their descent from Span-

ish ancestors, but they are being rapidly improved by skillful breeding and care. Other well-known breeds of cattle are the *Polled Aberdeen*, *Devon*, *Angus*, *Suffolk*, *Red Polls*, *Norfolk*, and the highly valuable Dutch breeds, among them the *Dutch Belted*.

Beef is obtained from the adult animal including both the male and female, and veal is secured from the calves. The hides of cattle are of value in making leather, while the bones are used for fertilizing; the blood, for buttons and fertilizing; and horns, for cutlery and other purposes. The production of milk, cheese, butter, and beef constitutes one of the most important industries in America, engaging much labor and capital. Several grades, among them the *Galloways*, are *hornless*, but feeders of cattle have for many years practiced *dehorning*, a process whereby the horns are removed by means of a saw, or the germs of the horns are clipped out of the head of the calf when it is a few days old. Dehorning has proven valuable in that it makes the cattle more docile, and consequently more productive in milk and beef. The State of Iowa has led in the production of milk and butter, while Texas ranks first in the number of beef cattle produced annually in the United States. About half the cattle reared in Canada are in the Province of Ontario. In

HEREFORD BULL.

the western grazing districts cattle are largely grass-fed, while in the corn belt region the richest corn beef is produced.

**CAUCA** (kou'kà), a river of Colombia, South America, the largest tributary of the Magdalena. It rises in the Andes and flows northward through Cauca, Antioquia, and Bolivar, and has a length of about seven hundred miles. The lower course is navigable, but numerous waterfalls obstruct navigation in the province of Cauca.

**CAUCASIAN** (ka-kā'shan), the name first applied by the German writer Johann F. Blumenbach (1752-1840) to the fair race, because of its greater intelligence and physical perfec-

tion, and because he regarded it the original race. It is classed into three branches: the Hamitic, the Semitic, and the Japhetic. The Hamitic races formerly inhabited the Arabian Peninsula, Palestine, and the valley of the Nile. The Semitic races include the inhabitants of Arabia, Abyssinia, the northern part of Africa, and the Jews. This race included the great peoples of antiquity—the Assyrians, Babylonians, Moabites, Edomites, Phoenicians, Ammonites, and Ishmaelites. The Japhetic races include the Aryan. They are classed as follows: The Germanic, including Germans, Dutch, English, Flemish, Danes, Swedes, and Norwegians; the Celts, comprising the Welsh, Irish, Scots, and Bretons of France; the ancient Greeks; the Romanic, including the French, Italian, Spaniards, and Portuguese; the Slavonic, comprising the Russians, Croats, Poles, and Czechs; the Iranians, including the Afghans, Persians, and Baluchis; the Hindus.

**CAUCASUS** (kə'kə-sūs), a mountain range in the region between the Caspian and Black seas, stretching northwest and southeast, and forming part of the boundary between Asia and Europe. The width is about 150 miles and the length is 750 miles. A number of the peaks are highly elevated, including Kasbek, altitude 16,546 feet; Koshtantau, 17,120 feet; Dikhtau, 16,925 feet; and Elbruz, 18,570 feet. The region contains a number of mud volcanoes, mineral and thermal springs, and a few glaciers. At its eastern extremity, near the Caspian Sea, are the productive oil fields of Baku. The inhabitants include Russians, Tartars, Armenians, Turks, Persians, and Georgians. The Russian government has established a number of forts, built railroads, and constructed several military passages across the mountains. Among the leading products are cattle, cereals, minerals, and timber. Tiflis is the central railway city.

**CAUCUS** (kə'kūs), a term derived before the American Revolution from meetings held by calkers of ships in so-called calkhouses of Boston, for the purpose of resisting the British and eventually controlling the city. The term *calk-hus* was applied in ridicule by British sympathizers. John Adams first used the word *caucus* in his diary in 1763. It is now applied to meetings held by political parties or legislative assemblies in which plans for future action are discussed. In some states caucuses are regulated by law to prevent designing persons from obtaining undue advantages, in which case the voting is by ballot and the meetings are called *primaries*. The caucus has recently been introduced into Great Britain.

**CAULIFLOWER** (kə'li-flou-ēr), a species

of cabbage cultivated extensively by the Greeks and Romans. The flowers constitute a flattened head and are the edible part. It requires a richer soil and is not so hardy as cabbage, but is cultivated in a similar manner. It is pickled or is eaten boiled with sauce.

CAULIFLOWER.

Among the species cultivated are *broccoli*, which matures late, and *snowball* and *dwarf erfurt*. See **Cabbage**.

**CAUSTIC** (kə'st'ik), a substance that destroys the tissues of the animal parts to which it is applied. It is used to remove morbid growths, as warts, cancerous deposits, and excessive granulations, and to improve the character of ulcerated surfaces. Caustics serve a good purpose in opening abscesses and in destroying poisonous bites of rabid animals and serpents.

**CAVALIER** (käv-à-lēr'), a term used to designate a horseman. The courtiers, in the struggle between Charles I. and his Parliament in 1641, were nicknamed *Cavaliers*, and the friends of the Parliament were called *Roundheads*. Later the Cavaliers came to be called Tories and the Roundheads were known as Whigs.

**CAVALRY** (käv'al-rÿ), the division of a military force which serves on horseback. In time of peace cavalrymen serve as a mounted police and form a nucleus for organization in case of war. Their drilling is thorough, fitting them to maneuver both on horseback and as foot soldiers. This part of the army is serviceable for speedy and decisive movements to protect the center or the wings of a department, and is utilized as closely to the infantry as possible. During the time of war, the cavalry is employed chiefly to cover a retreat, for intercepting an enemy, for procuring intelligence, and as an aid in foraging. Formerly the cavalry was armed with lances and sabers, but now the arms consist principally of rifles and revolvers. See **Army**.

**CAVE DWELLERS**, a prehistoric race that lived in caves and caverns. Very little is known of this peculiar race of people, and the only information obtainable is from the remains left in the places of their habitation. New Mexico,

Arizona, Mexico, and Utah have supplied the best evidences of cave dwellers. Their remains indicate that they knew nothing of agriculture, metals, and pottery, and that they kept none of the domestic animals. Their manufactures and modes of life were very simple and primitive. See **Cliff Dwellers**.

**CAVES**, the general designation for subterranean caverns under the crust of the earth. They occur most frequently in limestone regions and were produced by the upheaval of strata, by the erosion of water, or by both causes combined. Some have been greatly enlarged by the action of the water, which carried away sand and gravel, thus eroding the bottoms and sides. Great caves occur in many regions where limestone rocks abound, notably in America, Australia, and Eurasia. Among the most remarkable in America is the Mammoth Cave in Kentucky, which is celebrated for its great size and subterranean streams. It includes more than fifty miles of subterranean passages and is rich in the remains of various extinct animals. The waters are inhabited by fish and other forms of life devoid of eyes. A cave about fifty miles from Los Angeles, Cal., in the Santa Susanna Mountains, is studded with stalactites and stalagmites and has several large halls covering an acre or more. Wyandotte Cave, in Crawford County, Indiana, bears evidence of having been an underground river in prehistoric times. The length, including its various passages, is about twenty-five miles, and in it are some remarkable chambers and gulches.

The Fingal's Cave, on the Island of Staffa, has a roof and many walls formed of basaltic columns. The cave in Franconia, Germany, is another remarkable formation. Many of the caves contain animal remains. Those of South Africa have relics of animals now found only in Asia, and those in Southern Europe contain bones of the hyena, which animal is now common only to Africa. Thus, the different caves bear evidence that many animals formerly numerous are now extinct, and that the existing animals are distributed differently than at former times. Geologists have been able to add valuable information to the study of geological and historical biology by the study of animal fossils found in caves.

**CAVITE** (kā-vē'tā), a city in the Philippines, on the island of Luzón, about ten miles southwest of Manila. It is the capital of the province of Cavite and is strongly fortified. It has several fine churches and schools, good dockyards, and a well equipped arsenal. The manufactures include soap, cigars, sugar, oil, and alcoholic beverages. It was the scene of a

battle in the war with Spain. Population, 1907, 4,680.

**CAVY** (kā'vŷ), a small rodent mammal native to South America, allied to the capybara and the agouti. Several species have been described. The cavies are hunted for their flesh and are now nearly extinct in the plains of Argentina. They are active, feed chiefly at night, and spend the day in deep burrows. Some students consider a species of the cavy the ancestor of the guinea-pig.

**CAWNPORE** (kān-pōr'), a city of the Northwest Provinces of India, on the Ganges River, forty miles southwest of Lucknow. It passed under British influence in 1801, and has since ranked as one of the strongly fortified cities. A mutiny broke out in 1857, under the leadership of Nana Sahib, during which nearly all of the Europeans, numbering about 1,000, were massacred. The city is now the seat of government of a province of the same name. It has an important railroad and river commerce. The railroads penetrate from it into the mining and agricultural districts, while telephone and telegraph lines connect it with many important points. The river is 500 yards wide in the dry season, and attains a width of over a mile in the rainy times. Among the manufactures are cotton, woolen, and silk products, tobacco, furniture, machinery, and leather. The city has several large government, religious, and educational buildings. It is improved by parks, electric lights, rapid transit, and waterworks. Population, 1906, 198,690.

**CAYENNE** (kā-ĕn'), capital of French Guiana, located on an island of the same name, at the mouth of the Cayenne River. It has a shallow harbor, which has been improved by dredging. The chief buildings include a college, several hospitals, a number of churches, and the structures erected by the government. Direct steamer communication is maintained with France. The city was founded in 1604 and has been a possession of France since 1675. Population, 1906, 13,500.

**CAYUGA LAKE** (kā-yōō'gā), a beautiful lake located between Seneca and Cayuga counties, in the central part of New York. It is from one to three miles wide and thirty-eight miles long, the greatest depth being 500 feet. The surface is 387 feet above the level of the sea. Its outlet is the Seneca River, which flows into Lake Ontario. The lake is rich in fish. On its shores are numerous cities and pleasure resorts, including Aurora, Cayuga, and Ithaca.

**CAYUGA INDIANS** (kā-yū'gā), a tribe of North American Indians, formerly located near Cayuga Lake, New York. The tribe formed

an alliance with the Five Nations, known as the Iroquois, in the 16th century, and which, in 1712, became known as the Six Nations. After the Revolutionary War, it greatly decreased in numbers. At the present time there are about 1,500 members of this tribe, who reside in Ontario, Canada, near the Grand River, but a few are located in Oklahoma and Wisconsin.

**CEBÚ** (thâ-vōō'), an island of the Philippines, located between Mindanao and Luzón, containing an area of 4,210 square miles. The productions include sugar and tobacco, while the manufactures consist of abaca, cigars, oil, and sisal goods. It is the seat of the oldest Spanish settlement of the Philippines. Cebú is the capital and principal city. It has a fine cathedral, a seminary, and a well-organized school system. There is a considerable foreign trade. In 1906 the island had a population of 575,630, and the city of Cebú, 15,475.

**CEDAR** (sē'dēr), the name applied to various cone-bearing trees of the evergreen kind. They are distributed widely and thrive in swamps, valleys, and arid mountain elevations. Among the most famous species is the *cedar of Lebanon*, of which the Bible speaks in these words: "His boughs were multiplied, and his branches became long." Solomon's temple was constructed largely of a species of the cedar of Lebanon. Cedar timber has been useful in all historic times for manufacturing and other purposes. The wood yields an oil useful in preserving books against moths and for embalming. Some species grow to a height of eighty feet and the largest specimens measure sixty-five feet in circumference. The age cannot be estimated by concentric rings as in many trees, since the older owe their vitality to portions of the bark. Botanists think they frequently attain an age of 800 years, while some are estimated at 2,000 years. They thrive at a height of 6,500 feet above the sea.

The *deoder cedar*, a native of India, is classed by botanists as a species of the cedar of Lebanon. It grows abundantly in the Himalayas, and attains a circumference of thirty-five feet and a height of more than 150 feet. Its leaves and cones are larger than those borne by the cedar of Lebanon, and it yields fine material for building and resinous oils. The *atlas cedar* is widely distributed in North Africa. In America and the West Indies the *red cedar* is a common tree. This species is found in the swamps of many sections, as well as on the arid, rocky cliffs of the continental highlands. It is cultivated extensively for ornamental purposes in parks and gardens, and serves as a valuable protection on the Great Plains for barn and

house yards against winds and storms. The wood is used extensively for lead pencils, furniture, and boxes in which clothes are protected against moths. In swamps it is of a slender growth, on arid hills it is low and branchy, while in valleys, particularly in California, it attains an immense size. The *arbor vitae*, or *white cedar*, is a common tree in many parts of Canada and the United States. Cigar boxes are made of *Spanish cedar*. However, this species and the American red cedar are not true cedars, though they are coniferous trees.

**CEDAR CREEK**, a stream in northern Virginia, rises in the North Mountains, and flows into the Shenandoah River. It was the scene of a battle fought on Oct. 19, 1862, between the Union army under General Sheridan and the Confederates under General Early. Sheridan had been called to Washington and left General Wright in command, and while he was away the Confederates made an attack, utterly routing the eighth corps. Wright immediately reformed his lines, making a change of front and a retrograde movement, thus losing heavily during the formation. Just at that time Sheridan, who had heard of the battle at Winchester, appeared upon the scene with his horse covered with foam and inspired his men with such confidence that the enemy was driven back and put to flight with great slaughter. The Union losses were estimated at 5,600, while the Confederates lost about 3,150. The famous ride of Sheridan from Winchester to Cedar Creek was made the basis of Thomas Buchanan Read's famous poem, "Sheridan's Ride."

**CEDAR FALLS**, a city of Iowa, in Black Hawk County, one hundred miles west of Dubuque, on the Illinois Central, the Great Western, the Rock Island, and other railroads. It is nicely situated on the Cedar River and has connection by an electric railway with Waterloo, which is six miles east. The surrounding country is fertile. It has a brisk trade in produce and merchandise. Among the manufactures are clothing, flour, machinery, and canned goods. It has a public library and is the seat of a State normal school, one of the largest in the United States. The first settlement was made on its site in 1845 and it was incorporated in 1853. Its importance as a city is due to its location on the Cedar River and its excellent public institutions. Population, 1905, 5,329.

**CEDAR LAKE**, a lake of Canada, in the district of Keewatin, about twenty-five miles north of the province of Manitoba. It receives the drainage from the Saskatchewan River and the discharge is carried by the same river into Lake Winnipeg. It is about thirty miles long,

from ten to twenty-five miles wide, and has an area of 315 square miles. Forests of poplar, pine, balsam, and tamarack abound in the vicinity.

**CEDAR MOUNTAIN**, an elevation situated near the Rappahannock River, in Culpepper County, Virginia. It was the scene of a battle on Aug. 9, 1862, between the Federal forces under General Banks and the Confederates under General Jackson. The Union army was greatly outnumbered and was defeated with a loss of 400 prisoners and 1,400 killed and wounded, besides a loss of stores and a large quantity of ammunition. The confederate loss was 1,314.

**CEDAR RAPIDS**, a city of Iowa, in Linn County, seventy-eight miles southwest of Dubuque. It occupies a fine site on both sides of the Cedar River, on the Chicago and Northwestern, the Illinois Central, the Chicago, Milwaukee and Saint Paul, and other railroads. Intercommunication is by a system of electric railways, which have lines to Marion and other cities. The chief buildings include Coe College (a Presbyterian institution), the high school, the post office, the public library, and the Masonic Temple. The city has extensive railroad shops, pork-packing establishments, and flouring mills, and manufactures of oatmeal, carriages, machinery, and agricultural implements. It has a large jobbing trade. The streets are substantially paved and improved by waterworks, sewerage, and electric and gas lights. The first settlement was made in 1845 and it was incorporated in 1856. Population, 1910, 32,811.

**CEDAR RAPIDS**, or **The Cedars**, a village on the north bank of the Saint Lawrence River, in Soulanges County, Quebec. It is located at the Cedar Rapids of that river, which is avoided in navigation by the Soulanges Canal. This point was the scene of a military contest in 1776, when the British and a number of Indians under Captain Foster captured four hundred Americans in their retreat from Quebec. Arnold went out from Montreal with a force to attack the captors, but consented to a compromise for an exchange, fearing that the Indians under Brant would massacre the prisoners.

**CEDAR RIVER**, a river of Iowa, rises in southeastern Minnesota. It has a southeastern course of about four hundred miles, and joins the Iowa River about twenty-five miles above its junction with the Mississippi. Its course is through a fertile region and along its banks are belts of hard wood timber.

**CEILING** (sē'ling), the upper surface of a room, opposite the floor, usually finished with plaster work; but sometimes with ceiling lumber.

In large structures, such as churches and government buildings, the ceiling is often decorated with fine frescoes and other paintings.

**CELEBES** (sē'l'e-bēz), one of the largest islands of the Indian archipelago, located east of Borneo, having an area of 71,470 square miles. The equator crosses the northern part. On the southern shore is the Bay of Boni and on the eastern, the two great bays of Tomini and Tolo. It was visited by the Portuguese in 1512 and claimed by them. The Dutch took possession of the southern peninsula as early as 1660 and later expelled the Portuguese, and in 1683 acquired possession of the entire island. It is now one of the important Dutch possessions, and is governed by them under a general system for the administration of the colonies. The soil is exceedingly productive, though there are several active volcanoes and earthquakes are not uncommon. The highest peak is Bonthain, height 9,690 feet.

The leading products are coffee, bananas, tobacco, sago, sugar cane, maize, indigo, and tropical fruits. Cattle, buffaloes, horses, goats, and sheep are reared profitably. It has rich deposits of coal, iron, salt, and gold. The manufactures include principally weaving and spinning. The island is noted for its large variety of beautiful birds, including the cuckoo, parrot, and bird of paradise, besides many species of bees, butterflies, and other insects. Among the principal towns are Port Rotterdam, Menado, and Macassar. The last mentioned is the capital and has a population of 21,300. Most of the natives belong to the Malay race. Mohammedanism is the chief religion. Population, 1906, 2,120,640.

**CELERY** (sē'ēr-y), the name of a plant of the parsley family. In the native state it is acrid and poisonous, being rank and coarse, but under cultivation it has become a wholesome vegetable. It is cultivated extensively for salads and raw consumption. The principal species grown for the market are those that have red or white stalks, which include a number of sub-varieties. They include those known as the *Paris Golden*, *Giant Pascal*, *Boston Market*, and *White Plume*. The stalks are bleached by placing soil about the plants after they are developed. It is useful in the preparation of medicine for nervous disorders and yields an agreeable flavoring. *Celeriac* is a root form of celery and does not require bleaching. Celery thrives best in a well-drained, but deep, rich soil. See illustration on following page.

**CELESTIAL SPHERE** (sē-lēs'chal), a term generally applied to the heavens. The word *celestial* has reference to objects surpass-

ing in excellence anything earthly, and which partake of a divine or angelic nature. China is often called the Celestial Empire, because its rulers claim authority from heaven and assume

CELERY.

the title of "Son of Heaven." John Bunyan speaks of heaven in his "Pilgrim's Progress" as the celestial city. Heavenly bodies are often spoken of as celestial bodies.

**CELESTINE** (sĕl'ĕs-tĭn), the name of five Roman popes who ruled in the period included between 422 and 1294. See **Pope**.

**CELIBACY** (sĕ-lib'ă-sÿ), the state of being unmarried, but having especial reference to voluntary abstinence from marriage. Celibacy is followed by several orders of religious denominations, particularly among the Christians by the clergy of the Roman Catholic Church. The custom is of great antiquity and was observed anciently by the priests of Egypt and the priestesses of Greece and Rome. It is now held essential by the Buddhist priests, who are universally pledged to it. There has been more or less contention on the importance of celibacy since the early centuries of Christianity and successive movements were made to abolish it entirely, even some of the leading adherents of Roman Catholicism holding it unnecessary. In the early part of the 19th century several European countries favored abolishing it by compulsory legislation, but with little effect.

**CELLS**, the minute microscopic cavities in animals which are composed of cell-walls and contain cell contents. A single cell is usually a closed sac, the membrane of which it is constructed being generally nitrogenous formation. Within the sac is a fluid or semifluid *protoplasm* in which *globules*, *molecules*, *gran-*

*ules*, or other very minute cells are suspended. The larger cells inclose still other *nucleus cells* containing *nucleolus*. Within and surrounding the nucleus is an albuminous substance vital in principle and which is thought to contain the seat of life. In plants, cells are composed of solid, soft, and fluid layers. They are largely grouped and united, and, in this relation, form a cell tissue. In size they are very small, ranging from 0.004 to 0.002 of an inch in diameter. The cells of the yeast plant are about 0.00032 of an inch in diameter, but the bacteria are still smaller. Most cells are made up of three parts: a firm outer skin, a soft albuminous matter, and an inner cavity filled with a watery fluid called *cell sap*.

The term *cells* is applied to the compartments of a honeycomb and to the inclosed walls of an ancient temple. In physics, the term has reference to a single jar, bath, or division of a compound usually containing a couple of zinc or copper plates united to each other, or to their opposites, by a wire.

**CELLULAR TISSUE** (sĕl'ŭ-lĕr), in physiology, the fibro-cellular connectives or areolar tissues which fill interstices between the organs in man and the vertebrate animals. In botany, the term is applied to a tissue composed of a number of separate cells or minute bags holding together. When first formed they are egg-shaped or globular, but afterward become flattened by pressure. See **Connective Tissue**.

**CELLULOID** (sĕl'ŭ-loid), a compound resembling ivory in appearance, which can be turned, molded, and manufactured into various products, such as were formerly made of bone and ivory. Its manufacture was first introduced at Birmingham, England, in 1856, but it is now manufactured extensively in America. The process consists of immersing paper in nitric and sulphuric acids, by which it is converted into *nitrocellulose*. After being washed and bleached, a quantity of camphor is added and the mass is passed through a roller mill. At 176° Fahr. it readily softens and can be made into the most delicate forms, and it again hardens after becoming cold. The chief use of celluloid is for the manufacture of napkin rings, piano keys, billiard balls, handles for knives, forks, and umbrellas, backs of brushes, collars, cuffs, buttons, shirt fronts, dolls, and a large variety of other useful products. It can be colored easily, but is inflammable, unless blended with some chemical having an opposite property.

**CELLULOSE** (sĕl'ŭ-lōs), a substance which constitutes the basis of vegetable tissues. It is allied to sugar and starch, and is changed into

starch by the action of caustic potash, sulphuric acid, or heat. The cell walls of plants consist almost entirely of cellulose during the early stages of development, but it is replaced in part by coloring matter, resins, and other substances as the plant grows. The pith of the Chinese rice-paper plant consists almost wholly of cellulose. Animal tissues do not contain this substance, with the possible exception of the integument of insects, but it is important as a food for animals. It is manufactured and used in making vegetable parchment, collodion, and gun cotton.

**CELTS** (sěłts), an ancient Indo-European or Aryan race which formerly inhabited a large part of Italy, Spain, Gaul, and Britain. The descendants of this race still occupy Wales, Ireland, the Highlands of Scotland, and part of northern France. After spreading over large portions of Europe, they appear to have been driven westward by the Teutons, Slavs, and succeeding waves of migratory peoples. They were mentioned by Herodotus as occupying the valley of the Ebro River, with the Iberians, in Spain. They were called Galli by the Romans, and appear to have reached their greatest power in the 2d and 3d centuries B. C. In Asia Minor they settled a region known as Galatia. They eventually divided into two branches and spoke dialects widely different from each other, known as the Gaelic and the Cymric. The Highlanders of Scotland, the Manx, and the Celtic Irish represent the Gaelic; while the inhabitants of Cornwall and Brittany and the Welsh represent the Cymric, or the other dialect. The sun was the object of worship among the Celtic people in former times. They supported a literary order known as the Bards.

**CEMENT** (sě-měnt'), the name applied to any matter having elements capable of holding two bodies in close cohesion. In building the name is applied to the mortars consisting of white lead, glue, plaster of Paris, putty, and hydraulic limes containing silica. The cements used in building are known chiefly as *Portland* and *Roman*. Portland cement was patented in 1824 and is so called from its resemblance to Portland stone. It was first manufactured by calcining a proper portion of chalk with clayed mud, and this mass was reduced to a fine powder after being dried. Roman cement is the name applied to hydraulic mortars made by calcining limestone and mixing it with sand in various proportions. It can be prepared from any limestone containing from fifteen to twenty per cent. of clay. The calcining is effected by burning the stone to ashes. *Hydraulic cement* is a mortar used in building piers and walls

under or exposed to water. One of the best grades is made of ground Portland stone in the proportion of six to twelve parts mixed with thirty-five parts of sand and three parts of litharge. The cement of ordinary use is made by burning together clay or shale and limestone, but it is not as good as the manufactured product for the reason that limestone contains unequal proportions of iron, silica, and alumina, which in the process of manufacture can be made uniform. Age increases the strength of good cement. See **Concrete**.

**CEMETERY** (sěm'ě-těř-ỹ), a word derived from the Greek, meaning a sleeping place, and applied to burial grounds and other places for the deposit of the dead. The modern cemeteries have taken the place of the burial grounds that were formerly maintained around churches, and came into use in Western Europe as a consequence of the fine burial grounds established by the Turks in the vicinity of Constantinople and other cities. The Turkish burial grounds are famous for their dense forests of cypresses, which are planted by the Mohammedans after burial on the grave of the dead and the grave is never reopened.

In Italy the cemetery is known as the *Campo Santo* (holy field) and is generally an inclosed place. The most famous burying ground is at Pistoia, near the cathedral and leaning tower, and was founded by Archbishop Ubaldo in the 12th century. Other noted cemeteries of Europe are the Père Lachaise, in Paris; the Kensal Green, near London; and Capuchin Cemetery, near Palermo. Most of the cemeteries in Canada and the United States are located at convenient distances from the center of cities, or, in country districts, in the center of communities. The lots are usually deeded in fee simple, but are sometimes leased for a term of years. The laws govern the care and protection of cemeteries. They are usually cared for by a board of directors appointed by the department of health in cities, or by societies, and quite often are under the ownership of municipal corporations.

The government of the United States owns eighty-three national cemeteries, which are cared for by the United States. In them are buried officers and soldiers who died during the war or while in active service, and those who died after being mustered out and left without ample means to provide a suitable burial. The eighty-three national cemeteries are located in different portions of the Union, but are mostly near the battlefields of the Civil War, or at army posts of the United States. They are under the charge of the quartermaster's department. The num-

ber of soldiers interred aggregates 335,453. Among the most celebrated are those at Nashville, Tenn., containing 16,558 graves; Vicksburg, Miss., 16,656; Fredericksburg, Va., 15,285; and Andersonville, Ga., 13,705. The national cemeteries and those located near cities are beautified by monuments, avenues of trees, and splendid walks. The most beautiful cemeteries in the United States are Laurel Hill, Philadelphia; Greenwood, Brooklyn; Spring Grove, Cincinnati; and Mount Auburn, Boston.

**CENIS** (sē-ně'), **Mount**, a mountain of the Alps, located between Piedmont and Savoy, altitude 11,456 feet. It is celebrated for the road constructed, for military purposes, over the pass from the Isère valley in France to Susa in Italy in 1803-10. It is penetrated by an immense railway tunnel, which was completed in 1872 at a cost of \$15,000,000. It was constructed by the French and Italian governments and the Northern Railway Company of Italy.

**CENOZOIC** (sē-nō-zō'ik), or **Tertiary**, a division of geologic time, extending from the Mesozoic to the Quaternary Period. It embraces the rock systems of the Pliocene, Miocene, Oligocene, Eocene, and Cretaceous periods. See **Geology**.

**CENSER** (sēn'sēr), a vase or other sacred vessel used by the Hebrews for burning perfume and wafting incense. The censer used by the Roman Catholic Church in mass, vespers, etc., is called *thurible*. It is swung in the air by means of chains for the purpose of diffusing the incense in all directions.

**CENSOR** (sēn'sōr), the title of two Roman magistrates, established by Servius Tullius, but not held by special appointives until 443 B. C. Patricians filled the office until 351 B. C., when a change of the law provided for the election of one plebeian, and in 131 B. C. both censors were plebeians. The term of office originally was five years, but it was soon limited to eighteen months. Among the duties of the office were included taking the census and the assessments, caring for public buildings, supervising the morals of the nation, administering the finances, inflicting disgrace upon those who were negligent or unworthy, and regulating the private life of citizens. The censors ranked in honor second only to that of dictator. The term is now applied to an examiner of books before publication, and to any person who holds the position of a critic.

**CENSUS** (sēn'sūs), an official numbering of the people, together with the collection of other statistics regarding the population, industries, and productions of any district or country. The Israelites were counted by Moses in 1490 B. C.

and by David in 1017 B. C. A general census system was established by Servius at Rome, under which an enumeration was taken every five years. Greece and other ancient countries maintained census systems. In the Roman government severe penalties were inflicted in cases where citizens gave in false returns, or refused to make statements, this being necessary because taxation depended upon the census. The first modern European nation to establish a census system was Sweden, where a reliable enumeration was made in 1749. France, Venice, and Florence established census systems before Sweden, but they were not counted reliable. The census of the United States, Switzerland, England, Sweden, Norway, Belgium, Holland, Portugal, and other nations is taken every ten years. In Germany a census is taken every five years; it may be said that the German system dates from Frederick William I. of Prussia. The first census in the United States was authorized by an act of Congress in 1787 and was taken in 1790. Congress also authorized a decennial census; thus one was taken in 1800, 1810, 1820, and every tenth year; the last taken was in 1900. On record they are known consecutively, the last being the twelfth. The census of Canada is taken every tenth year, in the years ending in 1, as 1901, 1911, 1921, etc.

Congress has general control of the census, and may fix the rules and regulations from time to time. Previously it was under the supervision of the Department of the Interior, which was organized in 1849. Congress placed the eleventh census and succeeding censuses under the immediate direction of the superintendent of the census, who was made the head of the census office. Each State is under a supervisor, under whose direction the enumerators canvass their respective subdistricts in the month of June. The enumerators must visit personally all families and dwelling houses within their respective districts, and ask such questions of the family regarding the age and intelligence as are required by act of Congress. The matters regarding which inquiry is made include age, sex, color, and ability to read and write, as well as facts relating to commerce, agriculture, manufactures, resources of the country, productions, and many other matters of interest regarding the population and products. It is made incumbent upon persons to answer the questions asked them, and a penalty of \$30 is placed upon those refusing to answer, with imprisonment until the penalty is paid. The penalty applies to each refusal to answer. The office of the superintendent of the census is

virtually perpetual, since it requires ten years to publish all the information regarding the population, productions, general conditions, and other matters of general interest regarding which information is taken by the enumerators.

**CENT**, from the Latin *centum*, a copper coin of the United States, which has the value of ten mills, or the hundredth part of a dollar. The same value is represented by the cent used in Canada, and approximately the same by the *centime* in France, the *centesimo* in Peru and Italy, and the *centavo* in Chile and other countries.

**CENTAUR** (sĕn'tar), a name first applied to a savage race of people inhabiting the forests and mountains of Thessaly, but later incorporated in the myths of Greece. They are mentioned by Homer as gigantic savages covered with hair, while the poet Pindar refers to them as half man and half horse. It is thought that the myth arose from the appearance of men on horseback in battle against people unacquainted with the uses of the horse, as was the case when the Spaniards invaded Mexico, the Mexicans thinking that the horse and man constituted one animal, as the Grecian centaur. The name is also given to a constellation in the Southern Hemisphere located below the Southern Cross. It contains two stars of the first magnitude and five of the second.

**CENTENNIAL EXPOSITION** (sĕn-tĕn'-nĭ-al), an international exposition of arts, commerce, manufactures, and products of the soil and mines held in 1876 at Philadelphia, Pa. It was designed to celebrate the 100th anniversary of the Declaration of Independence of the United States, and was open to visitors from May 10 to Nov. 10. The grounds on which this first international exposition of America was held included 236 acres, which was a part of Fairmount Park, and about two hundred buildings were erected. The largest attendance on a single day was on Sept. 28, which was Pennsylvania Day, when 274,919 persons entered the grounds. A total of 9,910,996 admissions were recorded during the season, of which 8,004,274 were paid. The leading nations of the world made exhibits of their products and the several states of the United States were represented, hence the exposition furnished facilities for studying the growth and development of industries as well as the quality of products in almost every art and enterprise. In this respect the exposition was profitable, furnishing means to compare and criticise, and as a result much benefit has come to trade and in manufacturing. See **Exposition**.

**CENTER OF GRAVITY** (grāv'ĭ-tĭ), that

point of a body about which all its parts can be balanced. The attraction of gravity on any body tends to draw its particles toward one point, though the direction of these forces are not parallel. However, since the radius of the earth is very large in comparison with the size of any object which is weighed, the diversions of the directions of these forces from parallel lines is practically not measurable. The point at which all the parallel forces that make up the weight of a body meet is the center of gravity, and is sometimes called its *center of mass* or its *center of inertia*. A ring and other circular bodies have their center of gravity on the outside. The center of gravity of bodies that are of homogeneous or uniform specific gravity may be found by geometrical rules.

**CENTERVILLE**, a city in Iowa, county seat of Appanoose County, seventy-three miles southeast of Des Moines, on the Iowa Central, the Chicago, Rock Island and Pacific, and the Keokuk and Western railroads. It is surrounded by a rich farming and coal producing region, and has a large trade in farm produce. The chief buildings include the county courthouse, the public library, and the high school. It has manufactures of flour, brick, and machinery. The municipal improvements include electric lighting and waterworks. The first settlement was made in 1847 and it was incorporated in 1848. Population, 1905, 5,967.

**CENTIGRADE** (sĕn'tĭ-grād), a thermometer graded by Anders Celsius (1701-44), a Swedish astronomer. The scale is divided into one hundred parts, named *grades* or *degrees*, of which the *zero* is fixed at the freezing-point of water and the 100 point at the temperature at which water boils. In the Fahrenheit scale the freezing point is 32° and the boiling point is 212°, hence the proportion of one degree of Fahrenheit to one of the centigrade is as 5 is to 9. That is, the range of the centigrade between freezing and boiling is 100°, while in the Fahrenheit is 180°; hence, to reduce degrees expressed in the centigrade scale to the Fahrenheit, it is necessary to multiply by 5 and divide the product by 9.

**CENTIPEDE** (sĕn'tĭ-pĕd), an articulated animal having many feet and a body made up of numerous similar segments or rings. It is popularly believed that centipedes have a hundred feet, but this is not accurate. These worms are commonly placed in opposition to the millipede, an animal reputed to have a thousand feet, but the number of its feet is likewise very various. The most prominent distinction between the two is that the centipede has only one pair of legs from every ring of the body, while the

millipede has two pairs, except the anterior five or six rings, where there are none. The joints of the centipede are not less than fourteen and the feet consist of from fifteen to thirty pairs, and sometimes even more. They are found largely under stones and decaying wood by day, but come out at night to gather food, their eyes being better adapted to twilight than to the brightness of the day. They are distributed more or less over the entire earth, but are most numerous in the warm countries. Some species in the tropical regions have a length of twenty

plains to a height of 12,875 feet above sea level, thus explaining the possibility of cultivating a large variety of products with much success. The slow development of the past two centuries is explained by the unstable government, which is frequently disturbed by political insurrections. Within recent years railroads have developed with some degree of certainty, and the different political divisions have made advances along the line of internal improvement. The productions include lumber, tobacco, corn, sugar, cacao, dye woods, mahogany, coffee, minerals, and fruits.

Coffee culture is especially profitable, and the production of tropical fruits takes a high rank. The minerals include gold, silver, copper, lead, iron, and quicksilver. Cattle raising is developing, especially in Honduras, while horses and sheep can be grown with much profit. Commerce is in a healthful state of growth with the great trade centers of the world, and is developing locally, especially in the districts where canals are building and in the regions traversed by railway lines.

CENTRAL AMERICA.

inches. Many species common to warm countries have a poisonous bite.

**CENTRAL AFRICA.** See *British Central Africa*.

**CENTRAL AMERICA**, a portion of North America, occupying the region between Mexico and South America, comprising an area of 210,900 square miles. It is yet sparsely populated, but contains a soil so rich, mineral wealth so extensive, and a climate so agreeable and healthful that a population of 25,000,000 could be supported easily. The surface rises from low coast

The governments of Central America are exclusively republics, except the small country of British Honduras, and include Guatemala, Honduras, Salvador, Panama, Nicaragua, and Costa Rica. The principal rivers are Molagua, Belize, Bluefields, San Juan, and Usumacinta. Among the chief lakes are Dulce, Managua, Petén, and Nicaragua. North of Central America is the Bay of Honduras, east of it the Caribbean Sea and Mosquito Gulf; and its western and southern shores are washed by the Pacific Ocean. In 1525 Dom Pedro de Alvarado, one

C.S. HAMMOND & CO., N.Y.

of the companions of Cortez, conquered the country for Spain. It was maintained as a single state under Spanish dominion until 1821, when its independence was secured by revolution. In 1839 a general revolution broke out, and terminated with a treaty under which five countries absolutely independent of each other were formed. In 1895 it was proposed to unite all the countries into the Greater Republic of Central America, which terminated in the adoption of a constitution in 1898 modeled after the Constitution of the United States. The president was to be inaugurated March 15, 1899, but a revolution broke out, and the very excellent plan was frustrated. Panama was a part of the republic of Colombia until 1903, when its people became angered by the government obstructing the project to build the Panama Canal, hence it seceded and assumed independence. The total population of the entire Central America is estimated at 3,585,000. For further information see articles treating of the several countries of Central America.

**CENTRAL FALLS**, a city of Providence County, Rhode Island, on the Blackstone River, six miles above Providence. It is on the New York, New Haven and Hartford Railroad. Among the chief buildings are the public library and the high school. The manufactures include cotton and woolen goods, machinery, leather, haircloth, thread, and copper ware. It has stone and asphalt pavements, waterworks, gas and electric lighting and electric street railways. Formerly it was a part of the town of Lincoln, but was incorporated separately in 1895. Population, 1905, 19,446; in 1910, 22,754.

**CENTRALIA** (sĕn-trā'li-à), a city in Marion County, Illinois, sixty miles east of Saint Louis, on the Southern, the Illinois Central, and other railroads. It is surrounded by productive coal regions and an agricultural country. Among the chief buildings are the Carnegie library, the city hall, the high school, and a number of churches. The manufactures include flour, implements, cigars, machinery, and earthenware. Electric lights, waterworks and a sewerage system are among the municipal improvements. It was settled in 1853 and incorporated in 1859. It is the center of a growing jobbing trade. Population, 1900, 6,721.

**CENTRALIZATION** (sĕn-tral-ĭ-zā'shŭn), the act of bringing to the center, or centralizing. The term has come to be applied largely in economics to the tendency of wealth to centralize in the hands of millionaires, and in civics to the administration of government from the central power, instead of through local management. *Localization* and *centralization* stand opposed to

each other. One represents the theory that large powers can be safely trusted to the people, while the other, centralization, represents the opposite, that large powers should be vested in those governing through the functions of high office.

**CENTRAL PARK**, a great central park of New York City, one of the most beautiful in the world, platted in 1858. Its site was once a marshy and rocky locality, which prevented the platting of city lots and the construction of buildings. It consists of 843 acres, with an additional 24 acres on the northwest. The plan of converting this tract of land into a great park was an excellent one. It resulted in transforming the rocky slopes into grassy plats and the marshes into crystal lakes, around which grow the most beautiful trees of the temperate climates. In the very heart of the city, one-half mile wide, this beautiful improvement stretches a distance of two and one-half miles. Among its attractive features are its lakes, monuments, obelisk, cave, menagerie, and labyrinth. In it are located two great reservoirs of the Croton water system, the American Museum of Natural History, and the Metropolitan Museum of Art. Central Park as a whole, considered in the light of the surrounding edifices, internal wealth, and vast improvements, affords visitors and the public a most excellent resort for pleasure and recuperation.

**CENTRIFUGAL** (sĕn-trĭf'ŭ-gal) and **CENTRIPETAL** (sĕn-trĭp'ĕ-tal), terms used in botany to designate inflorescence of two different kinds. The former term is applied when the development of flowers proceeds from the apex toward the base of the axis, and the latter, when it extends from the base to the apex. The elder and valerian are examples of the former and the daisy and hemlock of the latter. For application in physics see **Force**.

**CENTURY** (sĕn'tŭ-rĭ), the term applied in modern usage to a period of one hundred years. It was derived from the practice of the Roman tribes, who voted in companies of one hundred men each at elections.

**CENTURY PLANT**, a popular name of the agave or American aloe. It is native to Central America and Mexico. The name arose from the wrong impression that a century of leaf formation and food storage elapsed before the appearance of a flower stalk. It is a plant of beautiful appearance, and develops a cluster of very thick and spiny leaves, from the midst of which, after a number of years, a flowering stalk rapidly rises to a height of from twenty to thirty feet, and bears a large cluster of greenish flowers. After flowering, it dies down to the

ground and new plants grow up from the roots. See **Agave**.

**CEPHALONIA** (sěf-à-lō'ně-à), or **Kephallenia**, an island of the Ionian group, belonging to Greece, of which country it forms a nomarchy. The area is 302 square miles. It has a very irregular coast line and possesses a number of elevated peaks. The surface is largely mountainous. Its rainfall is somewhat deficient, and it is subject to frequent but slight earthquakes. The principal cities include Lixuri, population 6,500, and Argostoli, 9,500. Among the chief exports are textiles, cheese, oil, cereals, wine, and fruits. In former times the island belonged successively to the Athenians, Romans, Byzantines, and Venetians, and was long held by the Turks. In 1797 it came into possession of the French, who were expelled by the Russians, and they in turn by the British. In 1864 it was ceded to Greece. Population, 1906, 84,148.

**CEPHALOPODA** (sěf-à-lōp'ō-dā), a class of mollusks which have their organs of locomotion arranged in groups about the head. These organs are called feet and arms, either of which name may be properly given, since they serve both as means of locomotion and for securing a hold upon objects. The mouth, situated in the center of the circle of feelers, is furnished with a pair of horny jaws, the tongue is rough and prickly, and the eyes and organs of hearing are well developed. They breathe through gills and most species have something resembling shells, though only the nautilus and argonaut are entirely covered with them. Their arms are supplied with suckers, by which they fasten themselves to and overcome animals much larger and better protected than themselves. The cephalopoda include the cuttlefish, nautilus, octopus, argonaut, and squid. The cuttlefish is entirely unprotected by a shell, but defends itself by throwing out from a bag a dark colored fluid, which is gathered by seamen and forms the valuable pigment known as *sepia*. Many extinct species of cephalopoda are found in fossiliferous rocks.

**CERAM** (sě-rām'), or **Zeram**, an island lying west of New Guinea and belonging to the Moluccas. The area is 6,910 square miles. Much of the surface is hilly, but vegetation is luxuriant. It has extensive productions of cabinet wood, sugar, palms, tobacco, rice, and tropical fruits. The inhabitants consist largely of Malays, and the government is administered by Holland. Population, 1907, 208,460.

**CERAMIC ART** (sě-rām'ik), the department of decorative and plastic art which comprises objects made of baked clay, as cups, urns, vases, statuettes, and all others included in the

variety of porcelain and earthenwares. The Centennial Exposition (q. v.) in 1876 and the tariff law of 1883 operated to increase the American product. Besides the production of pottery proper, the art has been extended to include the manufacture of inlaid floor tiles, panels in relief, and facings. These products are usually decorated by mosaic, arabesque, or damask-finished effects. The enameling and glazing of the best products are held as trade secrets by manufacturers and are known to only a few.

**CEREBELLUM** (sěr-ě-běl'lŭm), the rounded part of the brain, situated above the medulla oblongata and under the cerebrum. It assists the brain to direct precise motion, as movements on which the body is balanced. It is composed of white matter in the interior and gray matter on the surface. The white matter is arranged in a branching manner, hence is sometimes called *Arbor Vitae*, or *tree of life*. In shape the cerebellum is oblong and flattened. It is largest from side to side and is divided into two hemispheres. Three pairs of rounded cords connect it with the rest of the brain.

**CEREBRATION, Unconscious** (sěr-ě-brā'-shŭn), an activity of the brain unaccompanied by mental activity. Many writers on psychology have advanced the theory that all the conscious mental processes are accompanied by molecular changes in the cerebrum, and that similar changes may take place without consciousness on the part of the individual, until the complete mental result is presented. According to this theory the brain works automatically, but unconsciously, which results in suddenly remembering or understanding a previously unknown matter, as a name or incident. Another example of it is an involuntary kick when the foot is tickled. It is best defined as an involuntary response of the motor nerve to an excitement of the sensory nerve.

**CEREBRUM** (sěr'ě-brŭm), the higher and front portion of the brain. It is the seat of thought and consciousness, receives all sensations, and sends all voluntary impulses and those that produce motion. Like the cerebellum, it is divided into two hemispheres, and these are again divided into an anterior, middle, and posterior lobe. See **Brain**.

**CEREUS** (sěr'rě-ŭs), the name of many species of cactus, about 100, which include several noted for their beautiful flowers. The *night-blooming cereus*, native to South America and the West Indies, is remarkable for its sweet-scented flowers, which open in the evening and fade before morning. During the time it blooms the flower perfumes the air a considerable distance with a sweet scent. The *giant cactus*,

native to the arid regions of Arizona and Mexico, is treelike and grows to a height of fifty feet, and at the top of each branch is a cluster of flowers. The natives gather its fruit for food. Another species, the *old man cereus*, is so called from the hairlike growth which appears at the top about the time the flowers open.

**CERIUM** (sē'rī-ŭm), a metallic element discovered in 1803 by Berzelius, and so named from the planetoid Ceres. It is a chocolate-brown, ductile, and malleable metal, has a specific gravity of about 6.2, and forms the two series of salts known as *ceric* and *cerous*. Cerium is not found native, but occurs with other minerals in Sweden, North Carolina, and other places, usually as the silicate of cerite and samarskite.

**CERRO GORDO** (sēr'rô gôr'dô), a pass in the mountains of Mexico, on the road from Vera Cruz to the City of Mexico. It was the scene of a battle on April 18, 1847, between Gen. Scott, with 8,500 men, and Santa Anna, with 13,000. The Mexican general had retreated from Vera Cruz and took a strong position in the pass, which was assaulted by Gen. Scott, who lost only 431 killed and wounded, while the Mexican army lost 3,000 prisoners, more than 1,000 slain and wounded, about 4,300 stand of arms, and 43 pieces of artillery. Gen. Scott moved to Jalapa the next day and occupied it.

**CERTIFICATE** (sēr-tif'ĩ-kât), a written document certifying to the qualification, conduct, or other advantageous facts more official than a recommendation. In the United States it is commonly understood to be a formal statement made by a public servant in the execution of his duty, as the certificates issued to school teachers and those written by courts, postmasters, and collectors of taxes.

**CERUSE** (sē'rŭs), a name given to white lead, or the carbonate of protoxide of lead. It is prepared by subjecting lead to a treatment of carbonic acid, and by the action of the vapor of vinegar on the slabs of lead, by which the metal is converted into a carbonate. It is used as a cosmetic and is mixed with oil for use in painting.

**CETACEA** (sê-tă'shê-à), an order of marine animals, having no hind feet and including species that surpass in size all others now living. Their form is like that of fishes, with the exception that the tail is horizontal, thus enabling them to rise rapidly to the surface of the water for respiration in the air, which is necessary, as they breathe with lungs. They are true mammals, since they suckle their young, and are warm-blooded. They are commonly divided into cetacea herbivora and cetacea ordinaria; the former division includes the dugongs, lamantins,

and stellerida, and the latter, the dolphins, whales, narwhals, porpoises, and cachalots. Remains of these animals are found in the deposits of the Eocene period and extend from that epoch to the present time.

**CETTE** (sět), a city of France, in the department of Hérault, twenty miles southwest of Montpellier. It is situated on the Mediterranean Sea, is well fortified, and has an important domestic and foreign trade. A deep canal connects the harbor with the lagoon of Thau, which is near the city, and through it transportation facilities are furnished by the Rhone and other streams. It is a railroad center and has electric railway facilities. Among the chief manufactures are chemicals, perfume, machinery, sailing vessels, and canned fish and oysters. The city has a number of fine buildings, including numerous schools and churches, and is supplied with modern utilities, such as paving and electric lights. It was founded in 1666. Population, 1906, 33,243.

**CEUTA** (sŭ'tà), a Spanish town on the northern coast of Africa, located on a small promontory in Morocco, eighteen miles south of Gibraltar. It is well built and strongly fortified. The chief buildings include those of the government and a cathedral, and it belongs officially to the province of Cadiz. Ceuta was founded by the Romans and was annexed to Spain in 1580, since which time it has served mainly as a penal settlement. Population, 1906, 14,350.

**CÉVENNES** (să vĕn'), a range of mountains in the southern part of France. It extends a distance of about 400 miles, from the Vosges in the northeast to the Pyrenees in the southwest, and separates the basins of the Loire and the Garonne from those of the Rhone and the Saône. With it is included the Côte d'Or, which is sometimes classed with the Vosges system. Mont Mézenc, the highest peak, has an elevation of 5,754 feet, and the average elevation is about 3,500 feet. The rocks consist chiefly of limestone, sandstone, and granite. The Albigenes, the Camisards, and the Waldenses were sheltered from persecution in these mountains during the religious warfares of France.

**CEYLON** (sê-lŏn'), a large island in the Indian Ocean, lying southeast of the peninsula of Hindustan, to which it is almost joined by a chain of reefs known as Adam's Bridge. It is separated from continental Asia by the Gulf of Manar and Palks Strait. The length north and south is 265 miles; greatest breadth, 140 miles; area, 25,332 square miles. The soil is exceedingly fertile. Large tracts consist of marshy flats and jungles, but where these have been

drained they constitute the richest and most productive land. The animals common to Asia abound on the island and consist of crocodiles, pangolin, armadillos, wild hogs, monkeys, jackals, buffaloes, leopards, hyenas, elephants, bears, flying foxes, numerous snakes, and a large variety of beautiful birds of song and plumage. The most important stream is the Mahavelliganga. Other rivers include the Kalawa, Oga, Moondini Aar, and Gindura Ga. The forest productions are exceedingly valuable, and the fisheries and minerals are a considerable source of wealth. The productions and exports consist largely of live stock, coffee, tea, plumbago, cinchona, cinnamon, tobacco, cereals, cocoanuts, and many varieties of excellent fruits. Among the minerals are iron, zinc, salt, and plumbago.

The history of Ceylon extends back to remote antiquity, but authentic accounts date only to the year 543 B. C., when it was governed by a series of kings, who had their seat of government at the ancient capital of Anuradhapura. In the year 307 B. C. Buddhism was introduced by the invaders of India. Indian civilization was a potent factor in the building of cities and the development of agriculture, commerce, and the arts. The capital city was a place of much wealth and magnificence, a fact attested by the ruins still found at its former location. Ceylon became known to the Europeans at the time of Alexander the Great, when he made his noted expedition from Greece to India. The Malabars invaded it in the Middle Ages and later it became tributary to China. When visited by Marco Polo, near the end of the 13th century, it had declined materially in prosperity. In 1505 it was visited by the Portuguese and later was made subject to them. At that time the seaports in the northern part of the island were held by the Arabs, or Moors, who carried on an extensive trade, and those in the southern part were in possession of the Malabars.

In 1658 the Dutch expelled the Portuguese, and they in turn were conquered by the British in 1796, but it was not annexed by the latter until 1817. The island still remains under British influence. It is governed by a local magistrate and an executive council of five members, and the legislative power is vested in a council of seventeen members. Buddhism is the prevailing religion, though there are a considerable number of Christians and Mohammedans. Several railroads, highways, and telephone and telegraph lines are maintained. A plan has been projected to connect the island with the continent by railway. Colombo is the capital. Among the other important cities are Jaffna, Point de Galle,

Kandy, and Trincomali. Population, 1906, 3,680,195.

**CHAGOS** (chä'gös), the name of a small island archipelago in the Indian Ocean, a colonial possession of Great Britain and a dependency of Mauritius. These islands are of coral formation. Diego Garcia, the largest island of the group, is about six miles wide and twelve miles long, and has a population of 526. Fruit and cocoanut oil are the chief products. Population, 1906, 1,028.

**CHAGRES** (chä'grës), a seaport of Panama, on the Caribbean Sea, at the mouth of the Chagres River. This stream is about 100 miles long and flows nearly across the isthmus of Panama, entering the sea a short distance west of Colon, and its waters are used in connection with the Panama Canal. The town has a considerable trade and will be benefited as an outlet when the canal is completed. Population, 1,175.

**CHAIN**, in surveying, a line made of a hundred iron links, each 7.92 inches long. Its total length is four rods, or sixty-six feet, and ten square chains equal one acre. It is often called *Gunter's chain* from its inventor.

**CHAIN**, a line formed of a series of metal links, connected with or fitted into each other. In the manufacture of chains the best quality of soft iron is used, as they require strong material possessing capability of being easily welded. Chains are used for support, connection, restraint, transmission of mechanical power, and many other purposes in construction and machinery. The chain pump has an endless chain and is used mainly for pumping water from deep wells.

**CHAISE** (shāz), a vehicle with two wheels, usually drawn by one horse, and furnished with a calash top. The body is hung on leather straps, or through braces, and is intended for two persons. Oliver Wendell Holmes in his poem, "The Wonderful One-Hoss Shay," immortalized this kind of a vehicle. More recently the name has come to be applied to a light carriage with four wheels.

**CHALCEDON** (käl-sē'dün), a city of ancient Bithynia, in Asia Minor, near the Bosphorus, opposite Byzantium. It was about one mile distant from the site of the present city of Constantinople and its site is now occupied by the modern town of Kadiköi. It was founded about 685 B. C. and was long important as a military and commercial center. The Romans captured it in 74 B. C. and made it a free city. In 451 A. D. it was the seat of a general council of the Christian Church, which was attended by 600 bishops and other representatives. It was convoked by Emperor Marcianus to settle the

doctrinal disputes of the Nestorians and Monophysites, and after long deliberations it adopted the orthodox confession of faith, adjusted differences between the sees of Antioch and Jerusalem, and defined the duties and obligations of bishops.

**CHALCEDONY** (käl-sěd'ō-nŷ), a beautiful mineral quartz mixed with opal. It is named from Chalcedon in Bithynia, where it is found in considerable quantities. It also exists in basaltic rock formations, such as abound in Iceland and Scotland. The varieties are different in color and hardness. When arranged in stripes or layers, chalcedony is called *agate*; if the stripes or layers are horizontal, it is termed *onyx*; besides these are greenish, flesh-red, and grayish-red varieties. Many species of chalcedony are either transparent or translucent with a luster nearly the same as that of wax. The principal uses are for ornaments, necklaces, and brooches. Chalcedony is a favorite article for cups, ornamental boxes, and souvenirs. Various articles and figures made of chalcedony by the ancients may be seen in the museums of America and Europe. Some varieties are rich in vegetable fossils, which were likely incased while the mineral was forming.

**CHALCIS** (käl'kīs), a town of Greece, capital of the nomarchy of Euboea, 18 miles north-east of Thebes. It is on the island of Euboea, which is separated from the mainland by the strait of Euripos, and the strait is crossed by a stone bridge about 120 feet long. Through the narrow channel passes a strong current, and this has been improved by deepening so the larger vessels can pass safely through it. It is thought that the vicinity of Chalcis was colonized from Athens at a very remote date, and it is known that Aristotle died here in 322 B. C. The Venetians captured it in 1205 A. D., but it passed to the Turks in 1470 and to the Greeks in 1821. The streets are narrow and few ancient ruins are in the vicinity. Most of the inhabitants are Greeks and Italians, but a few Mohammedans and Jews reside here. Population, 1907, 10,150.

**CHALDAEA** (käl-dē'ā), in ancient geography, the southern part of Babylonia, but the name is applied by some writers to the entire Babylonian Empire. The Chaldaeans were devoted to the pursuit of natural astronomy and magical science. Their language consisted of the Aramaean, one of the principal dialects of the ancient Semites. The portion of the Bible including Daniel from Chap. ii, 4, to Chap. vii, 28; Ezra, Chap. iv, 8, to Chap. vi, 18; Chap. vii, 12-16; and Jeremiah, Chap. x, 11, were written in the Chaldee language, but it included several shades of dialects. A number of the Jewish

writings were in the Chaldee language. See **Babylon**.

**CHALDEE LANGUAGE** (käl'dē), the eastern dialect of the Aramaean language, of which the Syriac is the western branch. It was written in cuneiform characters, probably borrowed from the Assyrians, and its literature is known to us only through the writings of Jews. Many inscriptions have been discovered in modern Armenia that are assigned to this language, though they show some differences in the dialects, and they are generally classed with the Hittite and other early languages of Asia. The older writings in the Chaldee language are represented in certain chapters of the books of Ezra, Daniel, and Jeremiah, and the more recent are found in the later writings of Jews, such as those in the *Targums*. It is thought that Abraham used the Chaldee language before migrating to Palestine.

**CHALEURS BAY** (shā-lērs'), an inlet on the eastern shore of the Gulf of Saint Lawrence, which forms part of the boundary between Quebec and New Brunswick. Its length from east to west is about ninety miles, the breadth is from twelve to twenty miles, and the depth is about 250 feet. It received the discharge from a number of small streams, including the Patapedia River from the west and the Nepisiguit River from the south. The fisheries are important, and it has deep water in many places along the shore, affording safe anchorage for large vessels. It was so named by Jacques Cartier, who discovered and explored it in 1535.

**CHALICE** (chāl'is), an ordinary drinking cup used by the ancients, but the term is now applied to the cup in which the wine of the holy sacrament is administered. It consists of the foot, the stem, the knop, and the bowl. In most cases the foot or base is wide so as to prevent the vessel from upsetting. Anciently the chalices were made of wood, horn, or gold, but now they are chiefly of gold, silver, or glass, and are adorned with elaborate designs. Some are enriched with inscriptions and even settings of precious stones.

**CHALK** (chāk), an earthy limestone belonging to the cretaceous system. It is white, yellowish, or grayish in color and readily imparts its color to surfaces over which it is rubbed. Chalk is composed mainly of the mineral remains of animals, such as the teeth of fish and reptiles and the shells of turtles and mollusks. On the coasts of France and Great Britain, and in other localities, it occurs in quantities sufficiently large to form cliffs many feet high. Texas has a belt of chalk deposits that is about

250 miles long and 600 feet thick. In laying the Atlantic cable great oozes were discovered, proving that the process of formation is still going on in the sea at a depth of from 5,000 to 15,000 feet. The principal uses of chalk are for writing on blackboards, for cleaning purposes, for manure when burnt with lime, and for medicine. Several varieties furnish a fine mortar and whitewash. Red chalk consists of a clay-iron ore and black chalk contains a carbon, while French chalk is a kind of soapstone. These well-known varieties are used extensively in making colored crayons and in drawing.

**CHALLENGER EXPEDITION** (chäl'lĕn-jĕr), an exploration made by the British government in 1872-76. The *Challenger*, a vessel of 2,306 tons, was sent out in 1872 to make soundings and study the surface as well as the bottom of the sea. Captain Nares had charge of the expedition, and during the three and a half years traveled 68,900 nautical miles. The depth and the character of the surface and bottom, including the temperatures, currents, atmospheric conditions and fauna, were studied at 362 stations. The deepest soundings were made between Japan and the Admiralty Islands, where the depths were found to be 4,575 fathoms.

**CHÂLONS-SUR-MARNE** (shä-lôn'sür-märn'), a city of France, capital of the department of Marne, ninety-five miles east of Paris. It is nicely located on the Marne River, which is crossed by a fine stone bridge, and has extensive railroad conveniences. It has a seminary, an industrial school, a museum, and a public library. The manufactures include leather, machinery, and cotton and woolen fabrics. It has a brisk trade in grain, merchandise, and champagne. Châlons was captured by Aurelian in 274 A. D., and near it were defeated Attila and his Huns, who had made an attack on the Romans and Visigoths. It was captured by the Germans in 1814 and again in 1870. Napoleon III. established a military training camp near Châlons in 1856. Population, 1906, 21,860.

**CHÂLONS-SUR-SAÔNE** (sür-sôn'), a city of France, capital of a district in the department of Saône-et-Loire, thirty-two miles north of Mâcon. It is on the Saône River, at a point where the Canal du Centre joins that river with the Loire. The surrounding country has fine vineyards and cultivated fields. Many of the streets are irregular, but some of the newer buildings are modern and commodious, and the streets are well improved with paving and drainage. It has a college, several fine churches, and a public library of 25,000 volumes. The manufactures consist chiefly of pottery, clothing, jew-

elry, and hats. It has a growing trade in live stock and agricultural products. Population, 1906, 26,850.

**CHAMBER** (chäm'bĕr), the term used in many countries to denote the legislative branch of the government, as the chamber of deputies in France, and the imperial chambers of the German Empire in the time of Maximilian I. Chambers of commerce are organizations which are maintained by business men in cities to further commercial interests. See **Board of Trade**.

**CHAMBERSBURG**, a borough in Pennsylvania, county seat of Franklin County, fifty-two miles southwest of Harrisburg, on the Western Maryland, the Philadelphia and Reading, and other railroads. It is surrounded by a mineral and agricultural district, and has a large trade in produce and merchandise. Its industries include flouring mills, iron foundries, and factories for the production of furniture, shoes, farm machinery, and wood products. It is the seat of Wilson College and a fine school system. The municipal improvements include electric lights, waterworks, a public library, and street pavements. It was settled by Benjamin Chambers in 1730 and was incorporated in 1803. Population, 1900, 8,864.

**CHAMBLY** (shän-blĕ'), a town of Quebec, in Chambly County, about twenty-five miles southeast of Montreal. It is situated on the Richelieu or Sorel River, at the rapids of the river, the outlet of Lake Champlain, and is connected by canal with Saint Johns. The British had a post at Chambly in 1775, and General Montgomery, who was besieging Saint Johns, aided by some Canadian scouts, surprised and captured the post after a short fight. The Americans secured a large quantity of provisions and military stores and captured the colors of the seventh regiment of British regulars, which was sent to the Continental Congress as the first trophy of war received by that body. This disaster hastened the downfall of Saint Johns.

**CHAMBORD** (shän-bôr'), a village of France, in the department of Loir-et-Cher, ten miles east of Blois. It is noted for a castle of its own name, which is surrounded by a beautiful park twenty-one miles in circumference. This castle was begun in 1526 under the direction of Francis I., and was given by Louis XV. to Marshal Saxe, who lived here from 1745 until his death in 1750. Napoleon I. bestowed it on Marshal Berthier, and in 1821 it was purchased and presented to the Duke of Bordeaux, who afterward became the Count of Chambord. This building has 440 rooms, is in the Renaissance style, and is surmounted by six towers, each of which is sixty feet in diameter.

**CHAMELEON** (kâ-mē'lê-ŭn), a genus of reptiles belonging to the order of lizards, and native to Eurasia and Africa. They are sluggish and move silently and slowly, but possess remarkable quickness of eye and tongue. The tongue is wormlike and is thrust out with much precision in catching insects, upon which they feed. In size they range from six to eight inches long, with a tail about five inches, and the feet are suitable for fastening themselves to branches. They have but five cervical vertebrae, five toes, and very large lungs, and are reproduced by means of eggs. Their capacity to inflate themselves with air has given rise to the fable that air is their food, but this is erroneous, as they live on insects caught by thrusting the long, viscid tongue outward and grasping flies, beetles, and other insects. The peculiarity of chameleons consists mainly in their ability to assume colors agreeable to their surroundings, thus rendering themselves in appearance like the leaves or branches of the trees for protection. Some writers assert that they change colors, at least in some cases, to display displeasure when they are disturbed. These changes are brought about by cells at various depths in the skin, by which expansion and contraction are effected, the contractile cells being under the influence of the nervous system.

**CHAMOIS** (shăm'mÿ), the only wild antelope found in Europe, known to the Germans

CHAMOIS.

as the *gemse*. It is found in the Alps, Carpathians, Pyrenees; in Greece, and in Western Asia, particularly in the Taurus and Caucasus mountains. In size it is about three feet long

and two feet high, and is similar to the roebuck in structure and general characteristics. Its horns are from six to eight inches long. They are smooth, round, and straight, with a short curve at the ends. The hairs are longest in the winter and of a chestnut-brown color, but in the summer season assume a much lighter hue, approaching gray in the spring. It inhabits the precipitous and rocky mountain peaks, moving to higher altitudes in the summer season and to the lower slopes in the winter. Herds of from ten to twenty feed in the mornings and evenings, while in the day they are inclined to seek places of safety, usually isolating themselves for that purpose. The habits are quick and watchful, and the power of smell is remarkable, thus rendering capture difficult. The flesh is a favorite article of food, while the celebrated chamois skin is made from the hide.

**CHAMOMILE** (kăm'ō-mīl), or **Camomile**, a plant native to Southern Europe, but now cultivated extensively in gardens. It has branched stems, is perennial, and bears a white flower with a yellow center. It yields an essential oil useful in medicine. The leaves and flowers are used for an infusion, as a stimulant, and for poultices.

**CHAMOUNI** (shâ-mōō-nē'), or **Chamonix**, a famous valley and village located among the Alps in France. The village is the gathering place of about 20,000 tourists annually, on account of the beautiful location and grandeur of the scenery found in the valley and adjacent mountains. The valley is located 3,400 feet above sea level, is two miles wide and thirteen miles long, and south of it is the celebrated group of Mont Blanc. Vast glaciers slide from the mountains. The large lake of ice called Mer de Glace merges into the Glacier de Bois, which reaches to the lower portion of the valley even during the summer season. Mont Blanc, as seen from the village, affords a view that is remarkable for its simple and massive sublimity, and has caused an inspiration for beautiful writings by Shelley, Byron, Wordsworth, Coleridge, Lamartine, and Ruskin.

**CHAMPAGNE** (shăm-pān'), a celebrated brisk and sparkling wine now made chiefly in the department of Marne, but formerly in the province of Champagne, France. The finest quality is made of black grapes, but similar grades are made in Germany. The effervescent wines made in California are pronounced equal to the best French product.

**CHAMPAIGN**, a city of Champaign County, Illinois, 127 miles southwest of Chicago, on the Illinois Central, the Wabash, and other railroads. It is surrounded by a fine agricultural country.

The streets are improved by avenues of trees, pavements, waterworks, and sewerage. It has a public library, a fine high school, and a fine public park. The manufactures include machinery, cigars, earthenware, and implements. The University of Illinois is located near the city. It is connected with Urbana, the county seat, by an electric railway. Champaign was settled in 1855 and incorporated in 1860. Population, 1900, 9,098.

**CHAMP DE MARS** (shān'de-märs), meaning Field of Mars, a celebrated square in Paris, France, where the feast of the revolution was held on July 14, 1790, and Louis XVI. swore to defend the new constitution. Besides being a seat of many noted feasts and demonstrations, it was the site of the great expositions of 1867, 1878, 1889, and 1900.

**CHAMPLAIN** (shām-plān'), a beautiful lake located between New York and Vermont and extending into Canada. Its greatest breadth is about fifteen miles; length, 110 miles; and area, 600 square miles. It is connected with the Hudson River by a canal. The discharge is carried by the Richelieu River, which flows into the Saint Lawrence. A large number of small islands are located in the lake, some of which are highly productive, and its beautiful scenery attracts many visitors. The name was given to it from its discoverer, Samuel de Champlain. It was the scene of an important battle between the Americans and British in 1814, when the latter were defeated.

**CHAMPS ELYSÉES** (shān-zā lē-zā'), a fashionable promenade established at Paris, France, in 1616, when it was planned by Marie de Medicis. It extends from the Arc de l'Etoile to the Place de la Concorde, a distance of one and one-third miles. At the lower end are many cafés and restaurants. Those who visit Paris find the promenade one of the finest sights, especially in the afternoon, when many carriages and pedestrians are on the Champs Elysées.

**CHANCELLOR** (chān'sēl-lēr), an officer who presides over a court of chancery, similar to the judges of a court of law. He is usually selected from among judges by other judges, to sit as a chancellor. In a university the chancellor is the chief officer of the institution, but generally an honorary officer. In Great Britain the lord high chancellor is a state officer of large functions. His office is one of the highest civil positions in the land and when raised to the peerage he takes precedence immediately after the Archbishop of Canterbury. He is an important official of state, acts for both England and Scotland, and in some respects

for the United Kingdom. The chancellor is the chairman or speaker of the House of Lords.

**CHANCELLORSVILLE**, a village in Spottsylvania County, Virginia, about sixty-five miles northwest of Richmond. It was the scene of a number of battles fought on May 2-4, 1863, between the Union and Confederate armies. General Hooker commanded the army of the Potomac and the Confederates were commanded by General Lee. The Union army numbered 100,000, while the Confederates consisted of 90,000 men. In the terrible conflict of three days the Union army was defeated with a loss of 18,000 men, while the Confederates lost 13,000, including their able and brave general, Stonewall Jackson, who fell mortally wounded and died about a week later. This loss was irreparable.

**CHANG-CHOU** (chāng'chou), a city in the province of Fu-Kien, China. It is located in the valley of the Chang River. The city is surrounded by a wall about five miles in circumference and is ancient and uncouth. In it are several Buddhist temples, among them a magnificent structure erected in the 8th century. The industries include manufactures of utensils, sugar, porcelain, opium, and paper and silk goods, and a large export and import trade. Its location on a navigable river only twenty-five miles from the sea renders it an important commercial center. Population, 900,190.

**CHANNEL ISLANDS**, a small group of islands in the English Channel, off the coast of France. The area is 108 square miles. The most important islands of the group include Sark, Alderney, Guernsey, and Jersey, the last three giving the names to the celebrated milch cows exported from them. Much of the surface is productive and well cultivated. The principal industries are agriculture and dairying. The language spoken is Norman-French, the official language is French, and the government is under the British. These islands became a possession of Britain at the time William the Conqueror made his famous invasion. A number of strong fortifications still indicate the English possession of Norman provinces, of which they are the only remains. Population, 1907, 95,974.

**CHANTILLY** (shān-tē-yē'), a town of France, in the department of Oise, twenty-four miles northeast of Paris. It is a picturesque place and is noted for its manufacture of fine lace and porcelain. Several parks are maintained, one of which belonged to the Condé family from 1632 until 1830. The remains of Coligny were interred in the parish church of Chantilly, after his head had been cut off and

sent to Catherine de' Medici. In one of the châteaux is a splendid art collection, which was presented by the Duc d'Aumale to the Institute of France in 1887. Population, 1906, 4,750.

**CHANTILLY** (shān-tī'li), a village of Virginia, in Fairfax County, twenty miles west of Washington, D. C. It was the scene of an indecisive battle of the Civil War on Sept. 1, 1862, when the Federals under Generals Hooker and Kearny made an attack upon the Confederates under General Jackson. Both sides lost heavily and Generals Philip Kearny and Isaac J. Stevens were among the Federal dead.

**CHANUTE** (chā-nōōt'), a city of Kansas, in Neosho County, 125 miles southwest of Kansas City, Mo., on the Missouri, Kansas and Texas and the Atchison, Topeka and Santa Fé railroads. It is surrounded by a country that produces gas and oil. Among the public utilities are waterworks, street pavements, a public library, and several fine schools. It has manufactures of machinery, clothing, and ironware. The first settlement was made in 1872 and it was incorporated the following year. Its rapid growth and prosperity is due to its convenient location on important railways and within a productive field of oil and natural gas. Population, 1904, 10,116.

**CHAOS** (kā'ōs), the void existing before the creation, or the mass of matter existing in confusion before the elements were arranged according to class, kind, and form by creation. The term is also used to express any condition of being in which the elements or parts are in utter disorder or confusion.

**CHAPALA** (chā-pā'la), a beautiful lake located in Mexico, in the states of Jalisco and Michoacán, and forming part of their boundary. The lake has excellent fisheries. Near it is the railroad city of Ocotlan. The area of the lake is 1,390 square miles. It receives the inflow from the Rio Lerma and the discharge is carried by the Rio Santiago, which issues from the north side.

**CHAPERON** (shāp'ēr-ōn), a cap or hood worn by knights. The name is also applied to a device placed on the foreheads of horses drawing a hearse, especially at stately and pompous funerals.

**CHAPLAIN** (chāp'lin), a name originally applied to a spiritual adviser of a regiment of soldiers, but now used to signify the spiritual adviser of any organization or collection of persons. Such an officer is employed by legislative bodies, naval organizations, and military institutions, while many noblemen and sovereigns also engage them. In the prisons the chaplain ministers to the comfort and need of

the inmates. The chaplain of the United States army usually holds the rank of captain. He ranks from lieutenant up to captain in the navy, this depending upon the time of service.

**CHAPULTEPEC** (chā-pōōl-tā-pēk'), a fortress two miles southwest of the city of Mexico, located on a rock formation 150 feet high, and crowned by a castle erected in 1785 by the Spaniards. It was the scene of the decisive battle in the Mexican War. General Scott first stormed Molino del Rey on Sept. 8, 1847, and engaged the attention of the Mexicans by heavy fire from the batteries at the south end of the city. On Sept. 13, under the cover of guns, picked men forming two columns assaulted and captured the fortress. The Americans lost less than 900 killed and wounded. The fall of Chapultepec opened the causeway to the capital of the republic and compelled the Mexicans to terminate the war. Since then the castle has been transformed into a beautiful summer residence for the President of Mexico, while adjoining it is the Mexican military school, often called the West Point of Mexico.

**CHARADE** (shā-rād'), a kind of enigma, which consists in dividing a word into syllables, each of which must be a complete word and vaguely define without naming each of the parts and the whole word. For a charade to have literary worth its members must have some relation to each other, and unite in an epigrammatic point. It was invented in the latter part of the 18th century and had been used most extensively in Germany and France. In some countries the charade forms a kind of parlor drama, in which each syllable is introduced prominently in the successive scenes, and the whole word is brought out in the last act.

**CHARCOAL** (chār'kōl), a pure variety of carbon prepared from bones or vegetable substances. Other sources of charcoal are coke, ivory, and various semiorganic substances. Charcoal made of bones is used in refining sugar and as a medium to filter and disinfect. It is prepared by calcining bones in closed vessels, which are in the form of earthen pots, and are filled with bones and highly heated, or are made of retorts and treated much like those used in distilling coal for the production of illuminating gas. It requires about sixteen hours of firing to complete the charring of fifty pounds of bones to a pot. After calcining, the bones are ground between rollers to form granulated material serving to charge the filters of the sugar refiner. *Bone charcoal* is particularly valuable for removing color and impurities from sugar. *Wood charcoal* is made

by burning wood with but little access of air. Before burning, the wood is piled in a heap and covered with sand or earth. The fire is applied at an opening near the bottom of the pile, and small openings are constructed above for the escape of the gases. Since wood consists of carbon, hydrogen, and oxygen, the carbon remains to form the charcoal, while the hydrogen and oxygen gases escape. In making a fine grade of charcoal, useful in the manufacture of gunpowder, such woods as the willow are used, and the burning is done in iron cylinders or retorts, in which the hydro-carbons and acids are removed by a process of distillation. In this way the process can be accurately regulated, and the products are increased correspondingly in value. The many useful purposes to which wood charcoal is put include its employment as an essential element in the manufacture of gunpowder, fireworks, galvanic batteries, and electric lamps. It is valuable as a fuel, a polishing powder, a means to remove color and unwholesome smells from solutions and water, an absorbent of gases and vapors, and a nonconductor in safes, refrigerators, and ice houses. The best grades of charcoal contain from sixty-five to ninety-six per cent. of carbon. Charcoal consisting of lamp-black, ivory black, and kindred substances is used as the basis of black paint, and is of value as a constituent of printing ink when mixed with resinous matter and oils. Other uses of the several varieties are for medicine and in the toilet for tooth powder.

**CHARENTE** (shä-ränt'), a river in the western part of France, rises about fourteen miles northwest of Châlus, and after a course of 220 miles discharges into the Bay of Biscay, opposite the Aix and Oléron islands. It is navigable to Angoulême, a distance of 104 miles, but steamboats do not ascend farther than Saintes, which is at the head of tidewater.

**CHARIOT** (chär'ï-öt), a vehicle used for pleasure and war by the early Assyrians, Egyptians, Greeks, Romans, and other ancient peoples, but now used principally in exhibitions. It has two wheels and is closed in front and open behind, and those used by ancient warriors had quivers to contain the arrows attached to the side. Three men—the *warrior*, the *shield-bearer*, and the *charioteer*—were necessary to fully equip the vehicle of war. In the ancient chariot races two or four horses were commonly used, while in war two horses generally served the purpose of drawing this vehicle. The chariots employed by the Romans in the campaigns in Germanic countries and Gaul were provided with a scythelike implement, hooks,

and other offensive weapons. They were attached to each extremity of the axle, on the outside of the wheels. The sculptures of ancient Assyria give definite ideas of the construction of the vehicles that were peculiar to their time.

**CHARITY, Sisters of**, a sisterhood of the Roman Catholic Church, founded by Saint Vincent de Paul at Paris in 1629. The primary object of this organization at the time it was instituted was to nurse patients in hospitals, but the care of poor children, free schools, almshouses, and hospitals were soon placed under their management. Branch organizations are now maintained in all countries where the Catholic Church is represented, the total being about 40,000. Besides these are the Sisters of Charity organized at Dublin, Ireland, in 1815, and the Sisters of Charity of Saint Paul, instituted by a French curé in 1704. The vows of the members in the last two are perpetual, while in the former they renew their vows annually. The work of these helpful organizations consists largely of giving instruction to the children of the poor and in parochial schools.

**CHARITY ORGANIZATIONS**, the name applied to associations having for their object the improvement of morals and the conditions of human life. In some countries they are known as *United Charities* or *Bureau of Charities*. The first society of this kind had its beginning in London in 1869, and its plan was copied in 1873, when a similar society was formed at Germantown, Pa. The Buffalo Charity Organization Society was founded in 1877, and since then many similar societies have been formed. In 1908 there were 142 cities in the United States that had societies of this kind. In the same year ten cities of Canada had organizations of this kind, and similar societies were maintained in Australia and most countries of Europe.

The general object of charity organizations may be said to be the cure of social evils as well as the alleviation of distress suffered by the poor and unfortunate. Where those in poverty are absolutely in need of alms it is customary to give relief, but as a general rule the practice is to train people to help themselves. In many cases trained workers of the local association visit the homes of improvident families with the object of helping them to help themselves, or rather to put them on a footing where they will be able to live under improved conditions and become competent to sustain themselves by following some useful occupation.

Much good has been done by studying san-

itation with the view of inducing cleanliness and supplying the needy with pure water and good ventilation. In this connection the tenement houses have been improved, especially in the congested districts of large cities. The Charity Organization Societies of New York City, after taking steps to improve housing by advocating restrictive legislation and sanitary inspection, effectually turned attention to the project of stimulating a higher conception of life by means of general education. Recently the Chicago Bureau of Charity carefully investigated the treatment of youthful offenders and worked out a plan to rescue children under arrest for crime. This movement caused the establishment of the Chicago Juvenile Court, which was organized under a law that went into effect in 1901, and it has jurisdiction of cases in which children under ten years of age are arrested for begging, singing, selling articles, or playing musical instruments on the streets. Under this plan of treating youthful vagrants, or semicriminals, it has been possible to not only reduce the number of misdemeanors committed by neglected children, but also to rescue juveniles and bring about permanent reform. Similar provisions are now enforced in Baltimore, Minneapolis, New York, Philadelphia, and other American cities. In order to prevent a tendency to crime, or reform those who have erred, it is the general rule to deal with the head of the family. Mothers' meetings, home libraries, penny saving banks, and local organizations have proven wholesome means to carry on charity work.

**CHARIVARI** (shà-rē-và-rē'), a serenade given by a company who make discordant music at marriages as a token of good feeling or for merriment. In some countries the practice is perpetrated as a mark of disregard. In France the name has been applied to several comic journals, as the Paris *Charivari*.

**CHARLEROI** (shär-le-roi'), a borough of Pennsylvania, in Washington County, 40 miles south of Pittsburg. It is located on the Monongahela River and on the Pittsburg, Virginia and Charleston Railroad, and is a manufacturing and commercial center. Among the manufactures are glass, utensils, and machinery. The principal buildings include several fine schools and churches. The first settlement on its site was made in 1890, and its prosperity is due to its extensive manufacturing enterprises. Population, 1900, 5,930; in 1910, 9,615.

**CHARLES CITY**, a city of Iowa, county seat of Floyd County, on the Cedar River, 140 miles northwest of Dubuque. It is on the Illinois Central and the Chicago, Milwaukee

and Saint Paul railroads, and the surrounding country is fertile, producing cereals and live stock. The Cedar River furnishes good water power. Among the manufactures are wagons, clothing, furniture, and farming machinery. It is the seat of Charles City College, a Methodist Episcopal institution founded in 1891. The chief buildings include a courthouse, a library, an opera house, and several fine churches. All the public utilities have been provided, such as waterworks, sewerage, and electric lighting. The first settlement was made on its site in 1856 and it was incorporated in 1869. Population, 1905, 4,546.

**CHARLES RIVER**, a river in the eastern part of Massachusetts, rises in Norfolk County and flows into Boston Harbor. It separates Charlestown from Boston, and on its banks are Cambridge, Watertown, Waltham, and Newtons. Tidewater extends to Watertown, and between Cambridge and Boston is an estuary.

**CHARLESTON** (chärلز'tün), a city of Illinois, county seat of Coles County, forty-seven miles west of Terre Haute, Ind., on the Big Four and the Toledo, Saint Louis and Western railroads. The surrounding country is devoted to farming and stock raising. It has an important trade in merchandise and manufactures of tile, flour, woolen goods, and hardware. The chief buildings include a courthouse, a free library, and a number of fine schools. It is the seat of the Eastern Illinois Normal School. The first settlement was made in 1830, and its incorporation dates from 1855. Population, 1900, 5,488.

**CHARLESTON**, a city and port of entry in South Carolina, county seat of Charleston County, on a peninsula between Cooper and Ashley rivers, eighty-two miles northeast of Savannah, Ga. It is on the Southern, Atlantic Coast Line, and other railroads, and has regular steamboat connections with Boston, New York, and the leading ports of Europe. The harbor is landlocked and safe, and has been improved by jetties so as to admit the large sea-going vessels. A lighthouse with a flashing light, elevated 133 feet, stands west of the channel. The harbor is defended by Fort Moultrie, on Sullivan's Island, which has been improved by the Federal government.

Charleston has a water front of nine miles and the larger part has regularly platted and well-improved streets, but some of the thoroughfares in the older parts are narrow. The architecture is generally substantial, constructed mostly of stone and brick, and the newer buildings are tall structures with steel frames. The

county courthouse is at the corner of Broad and Meeting streets, and near it are the city hall and the post office. Other fine buildings include the customhouse, the Thomson Memorial Normal School, the Saint Michael's Church (Protestant Episcopal), and the Roman Catholic Cathedral. It has a public library of 25,000 volumes. Among the educational institutions are the College of Charleston, the South Carolina Military Academy, the South Carolina Medical College, and the Avery Normal School for colored students. The Euston Home, the Charleston Orphan House, the city hospital, and the Confederate Home are among the charitable institutions. White Point Garden, a finely wooded park, contains the Jasper monument. Other objects of interests are the bust of Henry Timrod and the monuments of William Pitt and John C. Calhoun. The Battery, near the harbor, is a popular promenade.

Charleston is preëminently a manufacturing and commercial city. In the early years of the last century it was the chief cotton port of North America, but it still has a large coastwise and foreign trade. The manufactures include clothing, phosphates, furniture, cigars, machinery, refined oil, flour, boilers, and spirituous liquors. Large quantities of fruit and early vegetables are grown in the vicinity and shipped to the markets in the North. It has an important wholesale and jobbing trade with cities of the interior. The exports consist chiefly of rice, cotton, fertilizers, lumber, cereals, and live stock.

Charleston was settled by the English in 1670, when a colony under William Sayle was planted on the west bank of the Ashley River, about three miles from the present city. The public offices were shortly after removed to the present site of Charleston, which soon became one of the chief seaports in America. It was held by the Americans during the early part of the Revolution, but was captured by the British in 1780, with a force of 16,000 under Sir Henry Clinton. The first bale of cotton exported from America to Europe was shipped from this port in 1784. The ordinance of secession was passed in Charleston, and Fort Sumter, in the harbor, was the scene of the first hostility of the Civil War. Half of the city was burned in 1864 by the Union forces, and the last two years of the war it was held by the Federals in a state of siege. A great earthquake destroyed much property in August, 1886. In 1901 it was the seat of the South Carolina Interstate and West Indian Exposition. Population, 1900, 55,807; in 1910, 58,833.

**CHARLESTON**, the capital of West Vir-

ginia, county seat of Kanawha County, on the Kanawha and Elk rivers. It is on the Ohio Central, the Chesapeake and Ohio, and other railroads, and has regular steamboat connection with many river ports. The chief buildings include the capital, the county courthouse, the customhouse, and an opera house. It has extensive dry docks and shipbuilding yards. The manufactures include furniture, wagons, ice, iron fences, and machinery. It is lighted by gas and electricity, and surrounded by extensive coal fields, and has a large trade in coal and produce. A fort was built here in 1786 and the city was incorporated in 1794. Charleston was made the capital of the State in 1869, but it was removed to Wheeling in 1875. It became the permanent capital in 1885. Population, 1900, 11,099; in 1910, 22,996.

**CHARLOTTE** (shär'löt), a city in North Carolina, county seat of Mecklenburg County, 110 miles north of Columbia, on the Southern, the Seaboard Air Line, and other railroads. It occupies a fine site on Sugar Creek and is surrounded by an agricultural country, which has deposits of gold and commercial clays. The chief buildings include a Carnegie public library, the county courthouse, the Young Men's Christian Association building, a military institute, and a United States mint. Among the industries are cotton mills, machine shops, tobacco factories, and carriage works. The general manufactures include cigars, earthenware, cotton goods, clothing, and machinery. It is the seat of a Lutheran and a Presbyterian college and of the Biddle University, a Presbyterian institution for colored students. Gas and electric lighting, pavements, sewerage, waterworks, and electric street railways are among the public utilities. It was settled in 1750 and incorporated in 1768. The Mecklenburg Declaration of Independence was adopted here in 1775 and the signers of this document are commemorated by a monument. Population, 1900, 18,091; in 1910, 34,014.

**CHARLOTTENBURG** (chär-löt'ten-böörg), a city of Germany, on the Spree River, three miles southwest of Berlin. It is connected with the capital city by an elevated railway and electric lines through the famous Thiergarten, which is a favorite promenade and zoölogical garden. The chief buildings include a royal palace, the Technical Academy, a military school, a fine public library, and numerous gymnasiums. It is the seat of the Royal Porcelain Factory, founded in 1761. Among the manufactures are glass, pottery, electrical apparatus, hosiery, clothing, cotton goods, toys, chemicals, and machinery. Charlottenburg was founded in

1705 by Frederick I., but its rapid growth is recent. The park has a Doric mausoleum which contains the remains of Frederick William III. and his wife, Queen Louisa, and their statues executed by Rauch. It is one of the most flourishing and beautiful cities in Europe. Population, 1905, 239,559.

**CHARLOTTESVILLE** (shär'löts-vil), a city of Virginia, county seat of Albemarle County, 100 miles northwest of Richmond. It occupies an elevated site on the Rivanna River and has transportation facilities by the Southern and the Chesapeake and Ohio railroads. The chief buildings include the county courthouse, the Albemarle College, the Rawlings Female Institute, and the University of Virginia. Monticello, the home of Jefferson, is a short distance southeast of the city. Charlottesville has manufactures of flour, cigars, machinery, and earthenware. Waterworks, electric lighting, and sewerage are among the public utilities. It was settled in 1744 and incorporated as a city in 1888. Population, 1900, 6,449.

**CHARLOTTETOWN**, a city of Canada, capital of the province of Prince Edward Island, in Queen's County, on the Prince Edward Island Railway. It is located on Hillsborough Bay, on the southern coast, and has an excellent harbor. Steamers carry trade regularly with the principal ports of Canada, and the railroad furnishes transportation facilities to all points of the island. It has manufactures of cotton and woolen goods, machinery, hardware, and clothing. The fisheries are important in that they supply catches for the trade and for canning. Among the public utilities are electric and gas lights, waterworks, sewerage, and paving. The Dominion buildings, the city hall, the courthouse, and a number of fine schools and churches are among the chief buildings. It is the seat of the Prince of Wales College and of a normal school. The French founded Charlottetown in 1750 and named it Port la Joie. Population, 1901, 12,080.

**CHARNEL HOUSE** (chär'něl), a depository under or near churches for the bones of the dead. In many ancient churches the crypt under the chapel was used for the purpose of reverently storing the bones, which are still preserved with much care.

**CHART**, a representation of the whole or a portion of the earth's surface projected on a plane, by which the contour of the continents, the islands, and the ocean may be studied. Charts intended for navigators' use are made to represent the seas and oceans, and merely include the outlines of the coast and islands.

The best known chart is the projection of the earth's surface by Mercator, called *Mercator's chart*. A *plane chart* is the representation of some part of the superficies of the earth, in which the spherical form is disregarded, the meridians are drawn parallel, the parallels of latitude are represented at equal distances, and the degrees of latitude and longitude are supposed to be of equal length. A chart representing the surface of the moon is called *selenographical*, while one representing the small parts of the earth is known as a *topographical*. See **Map**.

**CHARTERHOUSE** (chär'ter-hous), a school and hospital in England, founded by Thomas Sutton in 1611. It occupies the site of the celebrated Carthusian monastery established in 1371. After the monasteries were dissolved by Henry VIII., the land passed through several hands, until it was purchased by Thomas Sutton, who endowed the institution located here at present. The school is one of the largest in England and among its graduates are Grote, Steele, Blackstone, Addison, Thackeray, and John Wesley. In recent years the average attendance has been over 500 students. The hospital is maintained for the benefit of poor men, and those admitted must be bachelors, not less than fifty years of age, and members in good standing of the Church of England.

**CHARTER OAK**, an oak tree that formerly stood in Hartford, Conn., and became associated with early history. In 1687 Sir Edmund Andros marched to Hartford as the representative of King James II. to demand the charter of the colony with the intention of revoking it. Capt. James Wadsworth, hearing of the intention, hid the charter in the hollow of this oak. The tree was destroyed by a gale on Aug. 21, 1856, but fortunately a drawing had been made of it a few years previous.

**CHARTRES** (shär'tr'), a city of France, capital of the department of Eure-et-Loire, forty-eight miles southwest of Paris. It is located on the Eure River, has ample railway facilities, and carries a brisk trade in merchandise and produce. Some of the streets are narrow and crooked, but the newer parts are well built. It has a fine Gothic cathedral of the 11th century, surmounted by a tower 382 feet high, and the public library has 35,000 volumes. Among the manufactures are clothing, leather, hosiery, and machinery. Chartres was founded by the Carnutes, was the seat of the College of Druids, and Francis I. made it a duchy. Henry IV. captured it in 1519. It was occupied by the Germans in 1870. Population, 1906, 19,850.

**CHARYBDIS.** See *Scylla and Charybdis*.

**CHAT**, a small bird of the warbler family, found in North America, chiefly along the eastern coast.\* The tail is somewhat longer than the wing, the color is greenish above and yellowish beneath, and the song uttered by the male in the mating season is a curious mixture of caws and whistles. It feeds on insects and inhabits thickets and copses. The nest is built in bushes near the ground. The *whinchat* of England belongs to this class of birds.

**CHATHAM** (chăt'am), a town of Kent County, Ontario, on the Thames River, forty-five miles northeast of Detroit, Mich. It is on the Erie and Huron and the Grand Trunk railroads and has regular steamboat communication. The chief buildings are the town hall and several schools and churches. The manufactures include woolen goods, machinery, and furniture. It has public waterworks, sewerage, electric lighting, and a large trade in farm produce, soap, tobacco, and lumber. Population, 1901, 9,068.

**CHATHAM**, a town of New Brunswick, in Northumberland County, on the Miramichi River. It is pleasantly situated near Miramichi Bay, six miles northeast of Newcastle, and has transportation facilities by an important railway. It has a fine harbor and is a port of entry. The chief industries include foundries, gas works, shipyards, and flouring and lumber mills. It has a college, a hospital, several fine churches, and a Roman Catholic cathedral. The export trade is chiefly in fish, lumber, and merchandise. Population, 5,500.

**CHATHAM**, a fortified city of England, in the county of Kent, thirty miles southeast of London. It is located on the estuary of the Medway, near Rochester, with which it is closely united socially and commercially. Some of the streets are narrow and irregular, but the newer thoroughfares have been improved by paving and modern architecture. It is important as a military post, has a military hospital and school of engineering, and its fortifications are the scenes of many drills and reviews. About 500 acres are included in the royal dockyard, which was established by Queen Elizabeth, and its shipyards are ample for the construction of the largest vessels. Chatham is not important as a manufacturing center aside from its shipyards and metal mills, in which about 5,000 men are employed. It has considerable trade in merchandise and produce and has modern utilities, such as gas and electric lights and urban and interurban rapid transit. Population, 1907, 40,840.

**CHATHAM ISLANDS**, an island group

located in the Pacific Ocean, about 450 miles east of New Zealand, under which the government is administered. The area is 375 square miles. The soil is fertile and produces cereals, vegetables, and fruit. Sheep and cattle raising and whaling are the leading industries. The islands were discovered by Lieutenant Broughton in 1791 and were so named from his ship. A majority of the inhabitants are Maoris and Morioris. Population, 1906, 399.

**CHATTAHOOCHEE** (chăt-tà-hōō'chê), a river in Georgia, having a length of about 510 miles. It is navigable for boats 325 miles. It rises in the Blue Ridge Mountains, in Georgia, flows south, forming part of the boundary between Alabama and Georgia, and unites with the Flint River to form the Appalachicola.

**CHATTANOOGA** (chăt-tà-nōō'gà), a city of Tennessee, county seat of Hamilton County, on the Tennessee River, about 155 miles southeast of Nashville. It is finely situated in a fertile valley, on the Queen and Crescent, the Southern, the Central of Georgia, and other railroads. Several electric lines furnish transportation to suburban and interurban points. The surrounding country is rich in agricultural and mineral products. The manufactures include clothing, ironware, nails, machinery, cigars, furniture, cotton and leather goods, railroad cars, and flour. It has about 325 manufacturing establishments, gas and electric lighting, waterworks, and numerous jobbing houses. The obstructions formerly in the Tennessee River were removed by the United States government, and it is navigable about eight months of the year.

Chattanooga has a fine county courthouse, a public library, a customhouse, a Federal building, and an opera house. Among the public institutions are the Grant University, the Chattanooga Medical College, a Dominican convent, and a number of commercial colleges and private schools. A short distance south is Lookout Mountain, near the line between Georgia and Alabama, which furnishes a fine view of the surrounding country. In the Civil War it was the scene of severe contests. It was with-in hearing of the famous battles of Missionary Ridge, Chickamauga, and Lookout Mountain. A national military park has been platted by the government on the site of the Battle of Chickamauga, a short distance southeast of the city. The first settlement was made on the site of the city in 1836 and it was known as Ross's Landing, but was incorporated as Chattanooga in 1851. Population, 1910, 44,604.

**CHATTEL** (chăt't'l), in law, a term used to describe, with certain exceptions, all property

of a personal or movable nature. It embraces the portion of *personal property* that can be possessed and delivered, and in a general sense includes all property which is less than a life estate in land. Real chattels pertain to *real estate*, such as a lease of land or a mortgage taken as security. *Personal chattels* are things movable, which may be carried about by the owner, such as money, animals, household goods, promissory notes, etc., though in the common parlance of some countries the term does not include money or evidences of indebtedness.

**CHAUDIÈRE** (shō-dyâr'), a river of Canada, in the province of Quebec. It is the outlet of Lake Megantic, near the northwest boundary of Maine, and flows in a general course toward the northwest to the Saint Lawrence, into which it discharges about seven miles above Quebec. Chaudière Falls, about 115 feet high, are three miles above its mouth. The river is 120 miles long and the scenery on its banks is very diversified and picturesque.

**CHAUDIÈRE LAKE**, an extension of the Ottawa River, in Canada, immediately above the city of Ottawa. Below the lake are the Chaudière Falls, which are spanned by a railway bridge and a road bridge, connecting Ottawa with Hull. Chaudière Lake extends properly from these cities to the mouth of the Mississippi River, a distance of about thirty miles.

**CHAUTAUQUA** (shà-tà'kwà), a celebrated summer resort on Chautauqua Lake, in Chautauqua County, New York. Chautauqua Lake is about two miles wide and eighteen miles long, 1,300 feet above the sea, with an outlet into the Allegheny River. The grounds were purchased in 1874, by the Chautauqua Sunday School Assembly. Subsequently many edifices for religious service and instruction have been erected, besides a large number of villas and hotels to accommodate visiting delegations. The lectures are devoted to religious instruction, art, languages, temperance, sciences, and industrial and fine arts. They attract large throngs of people annually. The town is the seat of the New York State Summer Institute. Population, 1905, 3,972.

**CHAUTAUQUA Literary and Scientific Circle**, an institution incorporated for study and instruction. It was first promoted largely under the influence of Louis Miller of Akron, Ohio. In 1878 it was organized at Chautauqua, N. Y., with Louis Miller as president and John H. Vincent as chancellor. The object is to promote habits of reading and study in the sciences, arts, nature, and secular and sacred

literature, and to enable the members to make a review of the college courses. Enrollment is effected by the payment of a fee of fifty cents, no examination being necessary. The enrollment may be for one year, but the course consists of four years, after the completion of which a diploma is granted. The annual meeting usually occurs in July and August. The official organ, *The Chautauquan*, is published at Meadville, Pa.

At present there are a large number of Chautauqua assemblies in the United States, Canada, Japan, India, England, South America, Australasia, and Africa; the membership exceeding over half a million persons. About 10,000 circles were established during the first twenty years of the movement, and about 40,000 of the total enrollment completed the course. The Catholic Summer School, organized at Plattsburg, N. Y., is a similar organization. The courses of Chautauqua assemblies consist of work in literature, languages, mathematics, science, pedagogy, music, fine arts, expression, physical education, practical arts, and sacred literature. As a general rule the study work is done largely in the homes, while the summer meetings are inspirational and bring the members in contact with prominent thinkers and speakers of the world, as well as to aid in the way of sociability.

**CHEBOYGAN** (shê-boi'gan), county seat of Cheboygan County, Michigan, at the extreme northern portion of the southern peninsula, on the Michigan Central Railroad. It is finely located at the mouth of the Cheboygan River, on Lake Huron, and has a large lake and railway trade. The chief buildings include the courthouse, a public library, and the high school. It has manufactures of flour, lumber, machinery, and wood products. Several iron foundries, planing mills, and sawmills produce large quantities in their lines. The country toward the south is productive in agriculture and fruit. Cheboygan was settled in 1849 and incorporated in 1877. Population, 1910, 6,859.

**CHECK**, a bill of exchange made payable to the bearer, or to the order of the payee, on demand. A check made payable to the bearer may be transferred without endorsement, while one made payable to order must be *indorsed* to be transferred or paid, that is, the name of the person in whose favor it is drawn must be written on the back of it. Checks are used to transact the largest volume of business. They are a commercial convenience, both in local trade and in making payments to parties at a distance.

**CHECKERED BEETLE**, an insect more

or less widely distributed in North America, so named from its peculiar markings, usually dark brown with checks of white and yellow. Many species are included, some of which have a form much like an ant. They subsist largely on the sweet sap of plants, but some frequent the hives of bees and others feed on the carrion of animals. A number of species are harmful to bee keeping, since they enter the cells and feed on the honey and the young bees.

**CHECKERS**, a game played by two persons with *men* or *checkers* on a board divided into sixty-four equal squares, colored white and black. Each player has twelve men or checkers, colored differently, usually made flat and circular. The squares are numbered alternately from one to thirty-two, and the players place the board so the corners four and twenty-nine are at the left hand. It is immaterial whether the men are placed on the black or white squares, or whether any of the squares are numbered, but the contestants cover the squares from one to twelve and from twenty-one to thirty-two, respectively, and the moves are confined to one step diagonally at a time. When a player leaps over one or more men belonging to the opponent under the rules of the game, these men are said to be *taken*, and the game is won by the player who succeeds in taking all of the checkers of the opponent. Moves are made only in the direction of the side occupied by the opposing player until a man is moved into the last line of the opposite side, when he is crowned as *king*, and after that may be moved diagonally in any direction.

**CHEDUBA** (chê-dōō'bâ), an island in the Bay of Bengal, about ten miles from Arakan, to which province it belongs. The area is 245 square miles. The soil is fertile and produces rice, sugar cane, tobacco, cotton, hemp, and indigo. Petroleum is the chief mineral product. Several extinct volcanoes are located near the coast, and some of the volcanic cones emit gas and mud. Cheduba, or Manaung, is the chief town and has a population of 2,150. The island has been a British possession since 1824. Population, 1906, 24,500.

**CHEESE** (chēz), an important dairy product made of the curd or casein of milk, with variable quantities of butter and salt, formed into molds and cured or ripened by keeping for a time. In America it is made almost entirely of milk of the cow, but in parts of Europe the milk of goats and ewes is used, while in Arabian countries it is produced largely from the milk of mares and camels. The cheese generally sold in the American markets is known as *Cheddar* and *Swiss*. Other varieties of cheese in-

clude *Brick*, *Limberger*, *Neuchâtel*, *Edam*, and *Roquefort*. The Cheddar is the favorite in the markets of the United States and Canada. This kind of cheese includes several classes, such as the whole milk, skim milk, and cream cheese. The whole milk cheese is made from unskimmed milk and contains from twenty to forty per cent. of fat or cream, and thirty to forty per cent. of casein. Skim milk cheese is poor in fat, containing only from one to four per cent. Cream cheese is the richest, containing from sixty to seventy per cent. of fat, and is more digestible than any other kind, owing to its containing less casein. The production of cheese is one of the important industries in many agricultural districts. Farmers usually sell their milk or cream to private individuals, or operate a factory on the coöperative plan, owned by the farmers themselves.

In making Cheddar cheese, the milk is curdled or coagulated by adding an acid, sour milk, or rennet, and the watery portion or *whey* is separated from the insoluble *curd*. The curd is then worked into a uniform mass, after which salt is added, and the whole is pressed into a vat or mold to form cheese, after which it is placed in a curing room and allowed to ripen or cure. It is best to have the temperature of the curing room range at from 70° to 80°, but the temperature should be kept uniform at all times. The cheese is turned each day, and the upper surface is rubbed with the hand. After from three to six weeks it is sold on the market as mild, soft cheese, but the Cheddar does not reach its best condition until from three to six months of curing.

**CHEESE FLY**, a two-winged fly, mostly of a shining black color, which lays its eggs on cheese and cured meat. It is a pest in stores and dairies. The eggs are white and hatch in about thirty hours, and the larva or maggot feeds voraciously and matures in about ten days. The maggot is known as *cheese hopper* from its habit of forming a circle by bringing the two ends of the body together and then jerking abruptly, causing itself to be thrown a considerable distance. An insect known as cheese mite, a small, whitish mite, feeds upon cheese, flour, sugar, etc.

**CHELSEA** (chěl'sê), a suburb of London, England, on the Thames River, distinguished principally for containing the Chelsea Hospital, an asylum for old and disabled soldiers of the British army. The foundation of this institution was laid by Charles II. in 1682, and the structure was completed in ten years at a cost of \$750,000. It is supported by Parliamentary grants, and is designed for the accommodation

of sick, maimed, and superannuated soldiers. Chelsea is famous as the home of many celebrated persons, among them Princess Elizabeth, Sir Thomas Moore, Carlyle, Swift, Walpole, and George Eliot. It has a number of charities, several fine schools and churches, and a considerable trade. Population, 1907, 78,524.

**CHELSEA**, a city in Suffolk County, Massachusetts, three miles north of Boston, on the Boston and Maine Railroad. It is connected with Boston by a system of electric railways. On the opposite of the Mystic River is Charlestown, with which it is connected by a bridge. The chief buildings include the city hall, the courthouse, the Fitz public library, and several hospitals. It has manufactures of chemicals, rubber, sewing machines, linseed oil, brassware, safes, woolen goods, tools, and brushes. The first settlement was made in 1626 and it was incorporated under its present name in 1638. Many Boston business men reside in Chelsea. Population, 1905, 37,277; in 1910, 32,452.

**CHELTENHAM** (chělt'năm), a famous water place in Gloucestershire, England, among the Cotswold Hills. George III. made a visit to its mineral springs in 1788, and since then it has grown largely in popularity. It has a number of colleges, public and private edifices, parks, and promenades, and a large trade in merchandise. Among the chief buildings are the public library, an art school, and the Gothic Church of Saint Mary. Being chiefly a resort and educational center, it has no manufactures. Population, 1907, 53,394.

**CHEMISTRY** (kěm'is-trý), the branch of physical science which investigates the elements of which bodies, whether organic or inorganic, are composed, and treats of the relations of one kind of matter to another. The word was derived from Khem, the name of the Egyptian god of generation, productiveness, and vegetation.

**HISTORY.** In its infancy chemistry was the art of distilling the juices of vegetable substances for healing purposes, and the first marked stages of its development were effected by the Greeks, who devoted much thought to investigation of the medical properties and uses of plants. Alchemy was the forerunner of chemistry, and bore a relation to it quite like astrology did to astronomy. The science was brought from Egypt to Asia by the Arabs, and by the Moors to Spain, from whence it was made known throughout Western Europe. However, its early history is quite closely associated with that of alchemy, and it did not take on the form of a distinct science until after the Middle Ages.

Robert Boyle (1627-1691) may be regarded

the first modern chemist. He published his "Skeptical Chemist" in 1669 and was the first to introduce chemical tests or reagents. That respiration and combustion produce the same effect on atmospheric air was discovered by Mayhow, of Oxford, in 1674. Priestley discovered oxygen in 1774, and Cavendish in the same year announced the exact constituents of water, while Scheele made known the existence and nature of chlorine. These and other discoveries enabled Lavoisier to revolutionize and systematize the science. Vanquelin discovered chromium in 1797, Dalton introduced the atomic theory in 1803, Sir Humphrey Davy announced the existence of potassium and sodium in 1807, and Klaproth analyzed about 200 minerals prior to 1870. Others contributing to the advancement of chemistry include Wöhler, Wurtz, Rutherford, Liebig, Faraday, Bunsen, Berzelius, Crookes, Hoffmann, and Berthelot.

**BRANCHES OF CHEMISTRY.** Modern chemistry is divided into *organic* and *inorganic*, the former treating of the hydro-carbons and the compounds derived from them, and the latter of metallic and nonmetallic elements. Another classification is *pure* or *theoretical* chemistry, and *applied* or *practical*. Theoretical chemistry treats of the laws governing chemical action, while practical chemistry deals with the application and economic relation of chemistry to the arts. The latter is usually designated according to the arts or occupations to which it relates, as agricultural, medical, sanitary, physiological, metallurgical, etc. Some writers group the subject under *analytical* and *descriptive* chemistry. Analytical chemistry is concerned with the art of determining the composition of substances, while descriptive chemistry deals more particularly with the chemical and physical characteristics of substances.

**ELEMENTS AND COMPOUNDS.** Matter may be defined as anything that occupies space. It is capable of being measured and weighed. The various kinds of matter constitute different substances, which differ from each other by such general properties as relative weight, color, hardness, etc. Some substances are capable of existing in the form of solid, liquid, and gas. This is easily recognized in water, which may exist as mist, fog, rain, frost, snow, and ice. In any of these forms it represents the same substance, the nature of which is not changed in the process of being converted from one into another. These and similar changes are called physical changes, and differ from chemical changes in that new substances are produced in the latter. The rusting of iron and the burning of wood are examples of chemical changes.

In a physical change the composition of the molecule is not affected, while in a chemical change the atoms are rearranged so as to form new molecules and the specific properties of a substance are destroyed. There are two general classes of matter, known as *compounds* and *elements*.

Compounds embrace all those substances which are composed of more than one kind of matter, as, for instance, water, which consists in the proportion of two volumes of hydrogen to one of oxygen. Chemists are acquainted with only about seventy substances which they have been unable to change into more simple forms and these are designated *elements*. In elements the atoms, which form small indivisible particles, are all of the same kind. On the other hand, in compounds there is a notable difference in the atoms—a fact easily ascertained by the use of a microscope. There is also a notable difference between compounds and mixtures. For instance, gunpowder is a mixture of charcoal, saltpeter, and sulphur. That it is not a chemical compound can be proven by microscopic examination, and also by the circumstance that the three constituents may be again separated by a process of decomposition. However, if a sufficient degree of heat to explode the powder is applied, a chemical change takes place which produces gases and solids of an entirely different kind than the matter contained in the powder. The atoms common to the different kinds of matter are held together by a force called *chemical affinity*. It depends not only upon the kinds of atoms between which it is exerted, but also upon temperature, its intensity varying in different substances at different temperatures.

The elements are classed as metals and non-metals, and, like the compounds, are designated by a system of symbols, thus Cu=copper; Ba S=baric sulphide. Ductility, malleability, metallic luster, and marked ability to conduct heat and electricity are the essential points in which metals differ from the nonmetallic elements. The following are the nonmetals: hydrogen, helium, chlorine, bromine, iodine, fluorine, oxygen, sulphur, selenium, tellurium, nitrogen, phosphorus, arsenic, antimony, boron, carbon, silicon, and argon. Below is a list of the elements, together with their symbols and the approximate weight of their atoms compared to the weight of an atom of hydrogen:

NAMES OF THE ELEMENTS. (Continued.)	SYMBOLS.	ATOMIC WEIGHTS.
Arsenic.....	As	75
Barium.....	Ba	137
Bismuth.....	Bi	208
Boron.....	B	11
Bromine.....	Br	80

Aluminium.....	Al	27
Antimony.....	Sb	120
Argon.....	A	40

**CHEMNITZ** (kēm'nīts), a city of Germany, at the base of the Erzgebirge, on the Chemnitz River, in the kingdom of Saxony. The older part has narrow streets, but the newer portion and the suburbs are regularly platted and well

built. Schillerplatz is a beautiful square and contains the Church of Saint Peter and the Royal Technical School. Other noted buildings are the railway depot, the post office, the Imperial Bank, and the city hall. It is particularly noted for its manufacture of cotton prints, woolen and silk textiles, handkerchiefs, chemicals, machinery, and books. It has a brisk trade in produce and is a large exporter of merchandise. The streets are generally paved with stone and macadam. An extensive system of electric railways furnishes communication to all parts of the city and many interurban points. The waterworks, sewerage, and public library are owned by the municipality. Population, 1905, 244,927.

**CHENAB** (chê-nâb'), a river of British India, in the Punjab. It rises in the Himalaya Mountains, joins the Ghara near Uchh, where it assumes the name of the Panjnad, and near Mithankot flows into the Indus. The length is about 775 miles and it is navigable a considerable of this distance. In the lower course it is about one mile wide.

**CHER** (shâr), a river of France, rises in the department of Creuse, and after a course of 200 miles toward the northwest joins the Loire near Tours. It is navigable to Vierzon, 45 miles from its mouth, and the Berry Canal runs parallel to it in the upper course. The Arnon, Evre, and Tardès are its chief tributaries.

**CHERBOURG** (shêr'bûrg), a strongly fortified naval station and seaport of France, at the mouth of the Divette River, on the English Channel. It has railroad facilities and a mild climate, and is protected by a substantial breakwater, which incloses a space of nearly 2,000 acres. This breakwater is one of the most famous in the world. It is built so as to be protected on three sides by the land, and at the apex of the angle formed by the meeting of the two branches is a central fort or battery. The city is defended by regular forts and redoubts and has two harbors, one for naval and the other for commercial enterprises. Among the chief industries are machine shops, sugar refineries, cotton and woolen mills, tanneries, and shipyards. The chief buildings include the church of Saint Trinité, the Hôtel de Ville, a museum, and a marine library with 30,000 volumes. Cherbourg owes its prosperity to Napoleon I., who planned and constructed the great defenses as a means of protecting France against an invasion from the north, and his plans were enlarged by Napoleon III. and others. Population, 1906, 43,837.

**CHEROKEES** (chêr-ô-kêz'), a tribe of North American Indians who occupied the

upper valley of the Tennessee River prior to 1830. They were friendly to the English in the wars against the French, and ceded lands to Governor Glen for the construction of forts within their territory in 1755. Hostilities soon after arose between them and the English, which terminated in their defeat in 1761. They joined the English at the commencement of the Revolution, served at Augusta in 1780, but were reduced by General Pickens and acknowledged the sovereignty of the United States in 1785. They ceded portions of their territory to the United States, and in 1790 a part of the tribe migrated to Louisiana. In 1812 they rendered valuable service in General Jackson's army against the British. Their lands were ceded to the United States as early as 1817 in exchange for lands on the Arkansas and White rivers, a portion of which is now occupied by Oklahoma. They were removed thither by the government in 1838. In the Civil War they sided with the Confederates, taking part in the Battle of Pea Ridge, but afterward were divided into two factions. The Cherokees are noted as the most progressive of the Indian tribes. They have an alphabet and convenient vocabulary, and publish newspapers and books in their own language. The government of the United States provided schools and colleges for their education. Their architects have learned to construct beautiful houses. Many Cherokees have grown exceedingly wealthy. At present they number about 20,000.

**CHERRY** (chêr'ry), an ornamental fruit tree of the plum or prune variety, extensively culti-

CHERRY: LEAF AND FRUIT.

vated in the Temperate zones. It is of Asiatic origin, and, according to Pliny, was brought to Italy by Lucullus about 68 B. C. It thrives best in temperate climates and bears abundantly.

The fruit is eaten fresh, dried, and canned. *Kirschwasser* and *maraschino* are brandies made of the fruit. Wild species thrive in many countries and yield excellent woods for cabinet work and furniture. Among the wild cherries are the chokecherry and the black cherry. The fruit furnishes astringent medicines. The native trees in North America attain a height of a hundred feet, and a diameter of from three to four. The species cultivated extensively in gardens and parks for ornament and fruit belong mainly to two kinds, the *gean cherry* and the *bird cherry*. However, many species have been improved by cultivation, such as the black cherry, red heart and white heart. Cherries are grown extensively in Kansas, Pennsylvania, Indiana, British Columbia, and other sections of the continent.

**CHERRY LAUREL**, the name of several evergreen shrubs and trees native to Asia Minor. The common cherry laurel has lanceolate leaves and racemose flowers, and is cultivated extensively in the gardens of Europe and America. The leaves are poisonous from the abundant hydrocyanic acid which they contain. They yield the laurel water, known in German as *kirschwasser*, which is used in medicine as a substitute for hydrocyanic acid. An oil somewhat similar to that derived from the bitter almonds is obtained from the leaves, but must be used with caution in flavoring sauces, pudding, etc.

**CHERRY VALLEY**, a village of New York, in Otsego County, sixty-eight miles west of Albany. It was the scene of the Cherry Valley Massacre at the time of the American Revolution, on Nov. 11, 1778, when an attack was made by 600 Indians under Joseph Brant and 200 English under Walter N. Butler. Nearly all of the buildings were burned, sixteen soldiers of the small garrison and thirty of the inhabitants were killed. The prisoners, seventy-one in number, were led away half naked and were treated with great cruelty. Soon after General Sullivan conducted an expedition through the State of New York to punish the Indians and protect the settlers.

**CHERSONESUS** (kēr-sō-nē'sūs), the Greek name of several peninsulas and promontories. The ancient Greeks applied this term to the Tauric Chersonese, the modern Crimea; to the Cimbrian Chersonese, now Jutland; and to the Tracian Chersonese, a region northwest of the Hellespont.

**CHERUSCI** (kê-rūs'si), an early German tribe which dwelt between the Weser and Elbe rivers. The Cherusci are noted for the great victory of their leader, Arminius, who formed

an alliance with other German tribes and conducted a warfare against the Romans under Varus, whose forces he defeated and annihilated in the forest of Teutoburg, in the year 9 A. D. The tribe was overcome by the Chatti, after the death of Arminius, and later became subject to the Franks.

**CHESAPEAKE** (chēs'ā-pēk), a large bay in Maryland and Virginia, dividing Maryland into two parts. It enters the United States from the Atlantic Ocean between Cape Charles and Cape Henry, where it is sixteen miles wide. The width is from four to forty miles. It contains many harbors, is valuable for its excellent oyster fisheries, and is safe and easy to navigate. The general depth is from thirty to sixty feet. It receives the waters of the James, Potomac, Rappahannock, Susquehanna, and other streams. The chief cities on its shore include Baltimore and Annapolis.

**CHESAPEAKE, The**, an American vessel built in the early part of the 19th century, famous in the history of the American navy. She was repaired in the Washington navy yard in 1807 and put under command of Commodore James Barron, and with an untrained crew started on a cruise across the Atlantic. While en route, she was halted by the British frigate *Leopard*, whose commander demanded the return of British deserters who were supposed to form a part of the crew of the *Chesapeake*. Commodore Barron refused to permit his vessel to be searched, when the *Leopard* opened fire and killed three and wounded eighteen, after which the *Chesapeake* surrendered, and four of her crew were taken prisoners. England refused to make reparation when requested to do so by the American government, and the "Chesapeake Affair," as it became known, was one of the chief causes that led up to the War of 1812.

The *Chesapeake*, commanded by Captain James Lawrence, fought a battle in Massachusetts Bay with the British vessel *Shannon* on June 1, 1813. The latter was commanded by Captain Broke and had a trained crew. A terrific fire was kept up for fifteen minutes, when the *Chesapeake* was set on fire and surrendered. Lawrence was mortally wounded and exhorted his men with the words, "Don't give up the ship," which were adopted as the motto of the American navy. The *Chesapeake* had a crew of 379 and the *Shannon* had 330, while the former lost 61 killed and 85 wounded and the latter lost 33 killed and 50 wounded. The British took the *Chesapeake* to Halifax as a prize and fitted her up as a war vessel, but sold her for old timber in 1820.

**CHESAPEAKE AND OHIO CANAL**, a waterway completed in 1850, extending from Georgetown, D. C., to Cumberland, Md. It follows the Potomac River the entire distance, 184.5 miles, and serves as a means of transportation to Washington, D. C., where the Potomac becomes a tidal stream and is navigable for large ships. This canal is six feet deep and sixty feet wide, and has a lift of 609 feet by means of 74 locks. Much of its distance is paralleled by railways, but it is still used for the transportation of coal and other freight.

**CHESSE**, a game played by two persons on a chessboard, which consists of eight rows of alternate light and dark squares, eight in each row, a total of 64. It is played with two differently colored sets of men, 16 in each set.

CHESSEBOARD.

Position of men at beginning of game.

Each player has eight *pawns*, two *castles* or *rooks*, two *knight*s, two *bishop*s, a *queen*, and a *king*. The game is one of the oldest and most scientific amusements and is thought to have originated in India, whence it was brought by way of Persia and Arabia to Europe. It was made popular in America through Benjamin Franklin, who both played it and wrote in its favor. The first national congress of chess clubs was held in 1857, at which Paul Morphy of New Orleans was awarded the championship. The rules differ materially and are set out most completely in a work entitled "Chess Praxis," published in London, England, in 1860.

**CHEST**, or **Thorax**, in anatomy, the part of the human body which lies below the neck and above the abdomen. It consists of the upper portion of the trunk, to which are at-

tached the breasts, the arms, and the shoulders. Within the cavity are the heart and lungs. The walls are composed chiefly of the ribs and the muscles attached to the ribs. The dorsal portion of the spinal column forms the back part of the chest, and the front is comprised of the sternum, or breast plate. In form it is conical, with the apex upward, and the neck connects it with the head. Inspiration takes place by air being drawn through the trachea, or windpipe, and the bronchial tubes, causing an extension, and during expiration the muscles contract and the diaphragm descends. Many of the most dreaded diseases affect the chest and the organs located within, including cancer, pleurisy, bronchitis, pneumonia, and consumption.

**CHESTER** (chēs'tēr), a city of Pennsylvania, in Delaware County, on the Delaware River, twelve miles southwest of Philadelphia. It is on the Baltimore and Ohio, the Pennsylvania, and the Philadelphia and Reading railroads. The chief buildings include the Pennsylvania Military College, the Crozer Theological Seminary, and the public library. The house of William Penn is an object of interest. It has extensive systems of waterworks, sewerage, and electric railways. The principal industry is shipbuilding, in which several thousand men are employed. Other manufactures are implements, machinery, clothing, cotton and woolen goods, and building material. It was settled by the Swedes in 1643, who named it Upland, and is the oldest city in the State. The name was changed to Chester under a charter of William Penn in 1699. Population, 1900, 33,988; in 1910, 38,537.

**CHESTER**, a city in England, capital of Cheshire County, on the Dee River, fifteen miles southeast of Liverpool. It is located on an elevated site made up largely of sandstone and is the focus of several important railways. Ancient walls about two miles in length and seven feet thick surround the city, which is entered by four gates. Chester was founded by the Romans, who cut the streets in solid rock from two to eight feet below the buildings, many of which are reached by flights of steps. A covered way for foot passengers called the "rows" is located in front of the second stories of the houses, which are used for shops. The chief buildings include a cathedral in the Norman-Gothic style and a castle founded by William the Conqueror. A fine stone bridge crosses the Dee. Several schools, a museum, a public library, and a theater are maintained. The manufactures consist chiefly of ironware, shoes, clothing, machinery, and

sailing vessels. It has a large trade in cheese, produce, and merchandise. Among the public utilities are sewerage, gas and electric lights, and a system of rapid transit. Near the city is Eaton Hall, the splendid country seat of the Duke of Westminster. Population, 1907, 39,303.

**CHESTER**, a city of South Carolina, county seat of Chester County, sixty miles north by west of Columbia, on the Southern, the Seaboard Air Line, and other railroads. It is surrounded by a fertile agricultural country. The manufactures include flour, cottonseed oil, machinery, and cotton goods. It is an important shipping point of cotton and farm produce. The chief buildings include several public schools and churches. Population, 1900, 4,075.

**CHESTER**, a port of entry of Nova Scotia, in Lunenburg County, forty-five miles southwest of Halifax. It is located on Mahone Bay, and is popular as a summer resort. The fishing industries supply a large revenue. It has manufactures of clothing and machinery. It was founded by people from New England in 1760. Population, 1901, 985.

**CHESTERFIELD** (chēs'tēr-fēld), a town of England, in Derbyshire, at the confluence of the Hipper and Rother rivers. It is twelve miles south of Sheffield, with which it is connected by railway and electric lines. The manufactures include lace, leather, earthenware, and machinery. Iron, coal, lead, and clay are mined in the vicinity. The public utilities include gas and electric lighting, waterworks, public baths, and two parks. It is the seat of several schools and has a number of fine churches, including the parish church of All Saints. King John reigned at the time the first charter was granted. Population, 1907, 27,860.

**CHESTNUT**, a genus of plants allied to the beech. A large number of species are found

CHESTNUT: FRUIT AND BUR.

in the different continents, and three of the species are valuable for their nuts and wood. These include the *American*, the *European*, and

the *Japanese* chestnuts. They grow to a height of 100 feet and bear ample and graceful foliage. The tree is widespreading and attains a great age, often many centuries. The leaves are smooth and green on both sides, and are pointed at the end. From two to five nuts are borne in a prickly sack. Chestnuts are prized as food among the peasants of Italy and Spain. The wood somewhat resembles oak, but is less valuable, and is used for house building and furniture. The nuts may be eaten raw, boiled, or roasted, and in some countries are ground into flour, which is used in making bread. In Southern Africa, the cape chestnut abounds, which belongs to the rue family, while in Australia a similar tree is known as the Moreton Bay chestnut, and resembles the American species. The horse-chestnut is a much different tree from the common chestnut, and the water chestnut is known as the water caltrop.

**CHEVIOT HILLS** (chē'vē-ūt), a range of mountains in the counties of Roxburgh and Northumberland, stretching a distance of thirty-five miles on the boundary between England and Scotland. Cheviot Hill, altitude 2,660 feet, is the highest point. They are noted for the Cheviots, a superior grade of sheep. On these mountains many fierce battles were fought between the Scotch and English, the fame of which is commemorated in the Chevy Chase ballads.

**CHEVY CHASE** (chēv'ī chās), the name given to an edition of early English ballads written in the reign of Henry VI., or between 1420 and 1461, which purport to describe the Battle of Otterburn, fought in August, 1388. They contain an account of the chase of the Earl of Douglas among the Cheviot Hills for the Earl Percy of Northumberland. Portions of the old manuscript are preserved in the Bodleian library at Oxford. See **Ballads**.

**CHEYENNE** (shī-ēn'), the capital of Wyoming, county seat of Laramie County, on Crow Creek and on the Union Pacific, the Colorado and Northern, and the Chicago, Burlington and Quincy railroads. It is pleasantly located on the eastern slope of the Laramie Mountains, its altitude being 6,041 feet above sea level. The chief buildings include the State capitol, the Carnegie library, the post office, and the high school. It is the seat of the Soldiers' and Sailors' home and three miles south is Fort Russell, a United States military post. The industries include brickyards and railroad machine shops. It has gas and electric lighting, waterworks, sewerage, and a public park. The surrounding country produces coal, iron, and live stock, in which it has a large trade. It was

first settled in 1867, when the Union Pacific was completed to this point, and became the capital of Wyoming in 1869. Population, 1905, 13,656.

**CHEYENNE INDIANS** (shê-ên'), an Indian tribe belonging to the Algonquin family, who settled near the Black Hills before the beginning of the last century. They were first met with by Lewis and Clarke in 1803, and in 1825 a treaty of peace was made with them by General Atkinson. A portion of the tribe settled in Arkansas and here joined the Arapahoes, while the remainder carried on a war against the government in 1861. A battle was fought with them by Colonel Chevington on Nov. 29, 1864, at Sand Creek village, in which a hundred were slain. In 1867 their village was burned by General Hancock, and later General Custer engaged them in battle at Washita. The Indians remaining in the north were generally peaceful. At present they number 3,200, of which about 1,200 are in Arizona and 2,000 in Oklahoma.

**CHIAROSCURO** (kyä-rô-skôô'rô), the arrangement of light and dark colors in a work of art, such as a drawing or painting. It is important to distribute the lights and shadows of a picture in such a manner that the objects may be naturally and effectually relieved from one another, otherwise the product has the appearance of being unreal. Painters study this feature of art very carefully with the view of applying the force of colors so as to produce in art certain effects found in nature, especially in blending the lights and shadows. The term *chiaroscuro prints* is applied to the woodcuts or plates used in printing pictures of two or more colors, each cut or block being used with different-colored ink. The colored illustrations of books and magazines are printed generally with three sets of plates, the product being known as *tricolor work*.

**CHICA** (chê'kà), a dyestuff obtained in South America, used chiefly to give an orange-red color to cotton prints. It is obtained from the leaves of a species of begonia, native to the basin of the Orinoco and other sections. The dyestuff is obtained by boiling the leaves and was first used by the Indians for painting their bodies. The plant is a climber and has heart-shaped leaves and drooping clusters of flowers.

**CHICAGO** (shî-kä'gô), the largest interior city of North America, second in size on the Western Hemisphere, being surpassed in population only by New York City. It is located at the head of Lake Michigan, in Illinois, and is the county seat of Cook County. Through it flow the Chicago and Calumet Rivers, both of which originally discharged into Lake Michigan,

but the former is now a part of the Chicago Drainage Canal and carries a constant current out of the lake. The distance from Chicago to New Orleans is 914 miles; to Washington, 810 miles; to New York, 910 miles; and to the Pacific Coast, 2,415 miles.

**DESCRIPTION.** The city is located along the western shore of Lake Michigan, occupying territory from five to twelve miles wide and about twenty-five miles long. The area is about 190 square miles, all of which is remarkably level, elevated about 25 feet above the lake and 580 feet above the sea. It is separated by the Chicago River, which is formed within the city by the north and south branches, into three districts, known as the North Side, the West Side, and the South Side. The North Side is located north and east of the river, extending along the lake almost to Evanston; the South Side lies south and east of the river; and the West Side embraces all of the section west of the two principal branches of the river. Between Twelfth Street and the river, which embraces the northern part of the South Side, are the larger business establishments and within this area is located the chief business section. It has all of the great depots, except two, the Union and the Northwestern, the former of which is on the West Side and the latter on the North Side, and within it is the loop of the elevated railroad. Many factories and warehouses are in the southern part of the North Side, which also contains Lincoln Park and a large residence section. In the eastern part of the West Side are many warehouses and freight offices, and west of these are retail stores and shops, beyond which is an extensive section occupied by residences. Many bridges cross the rivers, including ample facilities for vehicles, street cars, and pedestrians.

The city is regularly platted and nearly all of the streets cross each other at right angles. Most of the streets are wide and some of the boulevards are exceptionally fine, having a width of 120 feet. Western Avenue and Halsted Street run north and south almost the entire length of the city. The streets aggregate about 2,450 miles, of which 1,500 miles are improved by paving, chiefly macadam and asphalt in the residence districts and brick and cobblestone in the business section. Rapid transit is almost entirely by electric lines, both surface and elevated, the former of which aggregate 1,500 miles of single track and the latter about 125 miles of double track. The elevated lines carry passengers north to Evanston, south to Sixty-third Street, and west to Oak Park, and the main lines have several branches, all of

which center in the loop, which encircles the chief business district. The surface lines pass to all parts of the city and connect with many interurban railways, furnishing direct electric

transportation to points in western Illinois, northern Indiana, and southern Wisconsin. Chicago is the focus of many railroads. In 1850 the Galena and Chicago Union Railroad Company, now the Chicago and Northwestern, constructed about thirty miles of railway westward, while, in 1852, the Lake Shore and Michigan Southern was the first railway to enter the city from the east. Since then about thirty different railway lines have entered the city, penetrating in all directions and representing more than 150,000 miles of railroads. These are all connected by a belt line, which enables freight to be passed through the city without local transfer by drayage. Within the city are more than 1,500 miles of trackage. These railroad systems connect the great West and North with the South and East, and make Chicago the greatest railroad and grain center in the world, while its merchant marine service is constantly increasing. Fully 10,000 vessels arrive and depart from the Chicago docks annually. These include liners that communicate directly with the chief ports on the Great Lakes and indirectly with European and other foreign commercial centers.

**SEWAGE AND WATER.** The site of the city is perfectly level, hence its drainage was long a question of much concern to the city authorities. The grade of the streets was raised from ten to fifteen feet, and the buildings were constructed in conformity with these grades in the principal portions of the city. In 1890 the Legislature of the State formed a drainage district in Chicago, which provided for the construction of the Chicago Drainage Canal, extending from Lake Michigan to a point near Lockport, a distance of twenty-eight miles, where it connects with the Illinois River and by it reaches the Mississippi. By means of this canal the fresh water flows from the lake through the city and carries the sewage entirely out of the municipality.

The city supply of water is obtained through tunnels from Lake Michigan. These tunnels extend from two to four miles from the shore, where the cribs, or intakes, secure uncontaminated water. The water is pumped through the tunnels, which are located at different points in the city, whence it is

forced through the mains that carry it direct to the consumers. Both the waterworks and the electric-light plant are operated by the municipality.

**PARKS.** The parks cover an area of about 2,250 acres and are connected by wide boulevards. Seven of the parks, which number about

transportation to points in western Illinois, northern Indiana, and southern Wisconsin.

Chicago is the focus of many railroads. In 1850 the Galena and Chicago Union Railroad Company, now the Chicago and Northwestern, constructed about thirty miles of railway westward, while, in 1852, the Lake Shore and Mich-

forty, are of considerable size, and in addition there are many playgrounds to accommodate the children who are not near the parks. Sheridan Road is one of the many boulevards and extends north beyond Evanston. Among other noted boulevards are Michigan Avenue, Jackson Boulevard, Diversey Avenue, and Lake Shore Drive. The entire system of boulevards includes 70 miles of thoroughfares, most of which are lined on both sides by splendid residences. Drexel and Garfield boulevards are beautified by flowers and ornamental shade trees. Washington Boulevard extends west and is one of the main thoroughfares of the West Side.

Lincoln Park includes 320 acres and is one of the attractions of the city. It has fine gardens, conservatories, fountains, and a zoölogical collection. The statues in this park include those of Lincoln, Grant, Schiller, Linnaeus, La Salle, Shakespeare, Franklin, and Hans Christian Andersen. Among the noted busts are those of Goethe, Beethoven, and Garibaldi. It has an equestrian statue of Grant. Near the western part of the park is located the Academy of Sciences. At Oakwoods Cemetery is a Confederate monument, in Humboldt Park is the Humboldt Monument, in Union Park is the Police Monument, and in Monument Square is the Douglas Monument. The site of Fort Dearborn is marked by a tablet at the end of Michigan Avenue.

Jackson Park, the site of the World's Columbian Exposition, is the chief park on the South Side. It has an area of 524 acres and extends along the lake front. It is beautified by many lagoons and driveways, and within it is the Field Columbian Museum. The Midway Plaisance, a tract of eighty acres, extends from Jackson Park westward past the grounds of the University of Chicago to Washington Park. The latter is noted for its many species of trees and flowers. Douglas Park, Humboldt Park, Grant Park, Marquette Park, and Garfield Park belong to the south park system. The system of parks is under the control of a board of commissioners appointed by the Governor of the State.

**BUILDINGS.** In the heart of the city, bounded by Clark, Adams, and Dearborn streets and Jackson Boulevard, is the Federal Building, which is sixteen stories high and was completed in 1903 at a cost of about \$5,000,000. Besides the post office, it contains the customhouse, the United States court, and a branch of the National treasury. The city hall and courthouse building covers an entire block and is used jointly for city and county purposes. The

Chamber of Commerce, a structure thirteen stories high, is in the French-Gothic style, and the Masonic Temple, twenty-one stories high, is one of the finest buildings of the kind in America. Among the many fine office buildings may be mentioned the Manhattan, the Monadnock, the First National Bank, the Old Colony Building, the Tribune Building, the Rand-McNally Building, the Rookery, the Fisher Building, and the Borland Building. Many of the retail stores are structures of much convenience and beauty, such as those of Marshall Field and Company, Mandel Brothers, and the Fair Store. The Auditorium, on Michigan Avenue and Congress Street, was erected at a cost of \$3,750,000. It has a tower 225 feet high, contains a theater with a seating capacity of 4,050, and within it is a large hotel, which, with two annexes south of Congress Street, furnishes the finest accommodations in the city.

Chicago is noted as a musical center and has many prominent places of amusement. Among the theaters are the Auditorium, the Garrick, the Studebaker, the Illinois, the Powers, the Great Northern, McVicker's and the Grand Opera House. The Majestic Theater Building, one of the highest in the city, contains the Majestic Vaudeville. Others of this class include the Olympic and the Haymarket. The Coliseum is used for political conventions and exhibitions, and the Orchestra Building is the seat of a noted musical society. Among the clubs are the Illinois, Chicago, Argo, Calumet, Athletic, Iroquois, La Salle, Standard, and Union League. The chief hotels include the Auditorium, Palmer House, Great Northern, Metropole, Wellington, Grand Pacific, Victoria, Stratford, Virginia, Lexington, Kaiserhof, Brevoort, and Sherman House. The Virginia, on the North Side, and the Chicago Beach, on the South Side, are family hotels.

Few cities are better supplied with fine churches than Chicago. The Cathedral of Saint Peter and Saint Paul is a fine Protestant Episcopal place of worship, and the Roman Catholics have the Cathedral of the Holy Name, which is their finest ecclesiastical edifice in the city. Other churches of note include the Plymouth (Congregational), Church of Christ (Christian Science), First Unitarian, Second Presbyterian, and Saint James (Methodist).

**EDUCATION.** The public schools furnish ample facilities for the instruction of youth and courses are maintained from the kindergarten to the high school, with which is affiliated the Chicago Normal School. Manual training is given to boys of the 7th and 8th grammar grades, and girls of the same classes receive

instruction in household arts, such as cooking and sewing. The city has eighteen high schools and about 250 graded schools, and in addition there are many private and parochial schools. Besides English, the courses offer instruction in Latin and German. Higher instruction is given in the University of Chicago, located near Jackson Park; the Northwestern University (Methodist), at Evanston, whose dental, law, and medical schools are within the city; Saint Ignatius's College (Roman Catholic); Lewis Institute; Armour Institute; Chicago Lutheran Seminary; Western Seminary; and McCormick Seminary. The Chicago Music College and the Art Institute are representative institutions. About 1,500 students are enrolled in the latter each year for the study of painting, sculpturing, and modeling.

The charitable institutions are very numerous. They include the Cook County Hospital, the largest in the city; the United States Marine Hospital, one of the largest of its kind in America; the Presbyterian Hospital; the Hospital of the Alexian Brothers; the Women's Hospital; and the Saint Luke's and Saint Joseph's hospitals. The Armour Institute of Technology, maintained as a memorial to Joseph Armour, affords excellent instruction in religious and industrial training. Hull House, modeled after Toyndee Hall, London, is a social settlement located in the Ghetto district on the West Side. Other settlements of this kind include the West Side, the Chicago Commons, the Northwestern University settlement, and the Chicago University settlement. The Bureau of Hebrew Charities, the Chicago Bureau of Justice, and other similar organizations do worthy work among the poor and for the protection of wage-workers. Many nurseries, asylums, reformatories; and relief societies are maintained by the city and by societies.

**LIBRARIES.** Three great libraries are maintained, including the public library, the John Crerar Library, and the Newberry Library. The public library was founded in 1872 and has about 310,000 volumes. It is located in the public building erected on Michigan Avenue, which is finished in Sienna and Carrara marble and is ornamented with glass mosaics and fine sculptures. The John Crerar Library, named from its founder, was endowed with a bequest of \$2,500,000 and has 150,000 volumes. It is located in temporary quarters and will eventually be housed in the south part of the city. The Newberry Library was endowed by Walter L. Newberry, who bequeathed about \$2,000,000 to establish it. It contains about 280,000 volumes, mostly works of general ref-

erence. Other libraries of note are those maintained by the University of Chicago, which has about 400,000 volumes; that of the Chicago Law Institute; that of the Chicago Historical Society; that of the Field Columbian Museum; and that of the Chicago Academy of Sciences.

**COMMERCE AND INDUSTRY.** Various causes contributed to the phenomenal development of Chicago, and promoted its speedy rise to the position of the greatest interior city and market of America. Its location on Lake Michigan and the construction of the Michigan and Illinois Canal caused the first material growth. This canal, constructed in 1836-48, is no longer an important link in transportation, having served its purpose until the great railways were built and the navigation of the Great Lakes was fully organized. Chicago ranks next to London, New York, and Antwerp as a commercial port, measured by the tonnage of vessels that carry trade. Lumber is the largest lake import, and corn represents about half of the value of the exports, while wheat is the next item. In live stock and grain Chicago takes precedence over all other markets. It is noted for its trade in coal, being a distributing center for the coal fields of Illinois, and it receives a large tonnage of iron ore, which is smelted within the city or in suburbs near by. Butter, cheese, machinery, merchandise, fruit, and hardware are handled in large quantities. Chicago is a center of wholesaling and jobbing, and supplies the retailers of many cities with wares and merchandise of different kinds.

In manufacturing enterprises Chicago takes high rank. The establishments of this kind employ about 300,000 workmen. Meat packing and slaughtering, confined largely to the South Side, represents an industry of vast proportions and gives employment to about 26,500 workmen. Associated with this enterprise are the manufacture of by-products, such as leather, candles, and soap. It has extensive machine shops and foundries, which turn out hardware and agricultural implements of various kinds. Among the large factories are the Deering Harvester Works and the McCormick Harvester Works, now controlled by the International Harvester Company. Other manufactures include textiles, furniture, brick, clothing, liquors, and tobacco. It has an enormous output of books and printed matter, including many daily, weekly, and monthly periodicals. The jobbing and wholesale trade is centered on Franklin and Market streets and Fifth Avenue.

**HISTORY.** Chicago is thought to have been named from an Indian word meaning wild

onion, a plant found abundantly in the locality. Marquette and Joliet stopped in the vicinity in 1673, and the region was afterward visited by La Salle and Hennepin. Jean Baptiste Point de Salle, a refugee from Haiti, is supposed to have built the first log hut on its site, in 1779. John H. Kinzie came across the lake from Saint Joseph in 1803 and was the first permanent settler. In 1804 the government erected a stockade fort near the mouth of the Chicago River and named it Fort Dearborn. At the beginning of the war with Great Britain, in 1812, the government ordered the fort abandoned. It was destroyed soon after by the Indians, but was rebuilt in 1816. In 1832 it contained a dozen families, and on August 10 of the next year twenty-eight voters organized the town. It was incorporated in 1837 with a population of 3,497.

In October, 1871, Chicago was visited by a great fire, which burned 17,500 buildings, covering 2,500 acres, and 100,000 persons were made homeless. The property destroyed represented a value of nearly \$200,000,000. The work of rebuilding began immediately after the fire, the new structures comprising some of the finest and most substantial buildings in the world. The frontage was made uniform and the streets were widened and improved in various localities. Many substantial fireproof buildings, from 10 to 20 stories high, the frames being of steel, were erected in place of those consumed by the flames. Railroad riots occurred in 1877, when United States troops were called to quash the disturbances, and in 1886 occurred the Haymarket riots in consequence of labor troubles. The World's Columbian Exposition was held in Chicago in 1893, and the Chicago Drainage Canal, begun in 1892, was completed in 1900.

The inhabitants of Chicago are largely of foreign birth. The Germans number more than 400,000 and exceed any other class. Next in numerical order are the Irish, Swedes, Norwegians, Bohemians, Poles, and Italians. Other nationalities more or less strongly represented include the Jews, Russians, Arabs, Turks, Armenians, and Negroes. The following census reports give an idea of the rapid growth of the city:

YEAR.	POPULATION.	YEAR.	POPULATION.
1840.....	4,470	1865.....	187,446
1845.....	12,080	1870.....	298,977
1848.....	20,035	1875.....	410,000
1850.....	28,260	1880.....	503,304
1852.....	38,733	1890.....	1,099,850
1853.....	60,652	1900.....	1,698,575
1855.....	83,509	1910.....	2,185,283
1860.....	150,000		

**CHICAGO DRAINAGE CANAL**, a canal in the State of Illinois, constructed primarily to furnish a means of disposing of the sewage of Chicago. It connects the south branch of the Chicago River with the Des Plaines River, a tributary of the Illinois River, at Lockport, Ill. The sewage was formerly discharged into Lake Michigan, but by the construction of this canal the flow of water was reversed, and a strong current now passes by means of the Chicago River and the canal to the Des Plaines, whence the water passes to the Illinois River and through it to the Mississippi.

Work was begun on the canal on Sept. 3, 1892, and it was formally opened on Jan. 28, 1900. It begins at the west fork of the south branch of the Chicago River, at Robey Street, and extends to Lockport, a distance of 28.05 miles. The controlling works are at Lockport, where a basin sufficiently wide permits vessels to turn, and below Lockport is a tailrace 6,500 feet long by which the water is carried to the Des Plaines River. A bear-trap dam and sluice gate control the flow of water, which has sufficient fall to be used profitably for power to propel electrical machinery. The canal is 160 feet wide at the bottom and from 175 to 300 feet at the top, and the minimum depth is 22 feet. Its capacity is 300,000 cubic feet per minute. The total cost to Jan. 1, 1908, was \$42,500,000. The canal is sufficient to carry large steamboats to the Des Plaines River, and it is designed to improve this stream and the Illinois River sufficiently to permit large boats to pass from Lake Michigan to the Gulf of Mexico, a project supported enthusiastically by all the states of the Mississippi valley. See illustration on following page.

**CHICAGO, University of**, an institution of higher learning in Chicago, Ill., located between Jackson and Washington parks. It was opened as a Baptist institution in 1857, but through lack of funds closed its doors in 1886, and its success is due to systematic efforts made by the American Baptist Educational Society, through whose influence several large endowments were obtained. The largest of these was given by John D. Rockefeller, who made a gift of \$600,000, and later added to this sum, the total of his bequests amounting to about \$10,000,000. Other benefactors include Marshall Field, Silas B. Cobb, S. A. Kent, Charles T. Yerkes, Helen Culver, Martin A. Ryerson, and Anne Hitchcock. Nearly all the buildings, about 25, were erected almost entirely from private donation and have a value of \$7,500,000, including the grounds and equipments. The investments aggregate \$9,250,000. At Geneva Lake, Wis.,

about 75 miles from Chicago, is the Yerkes Observatory, which is one of the buildings of the university. The library is the best in Chicago and has about 400,000 volumes.

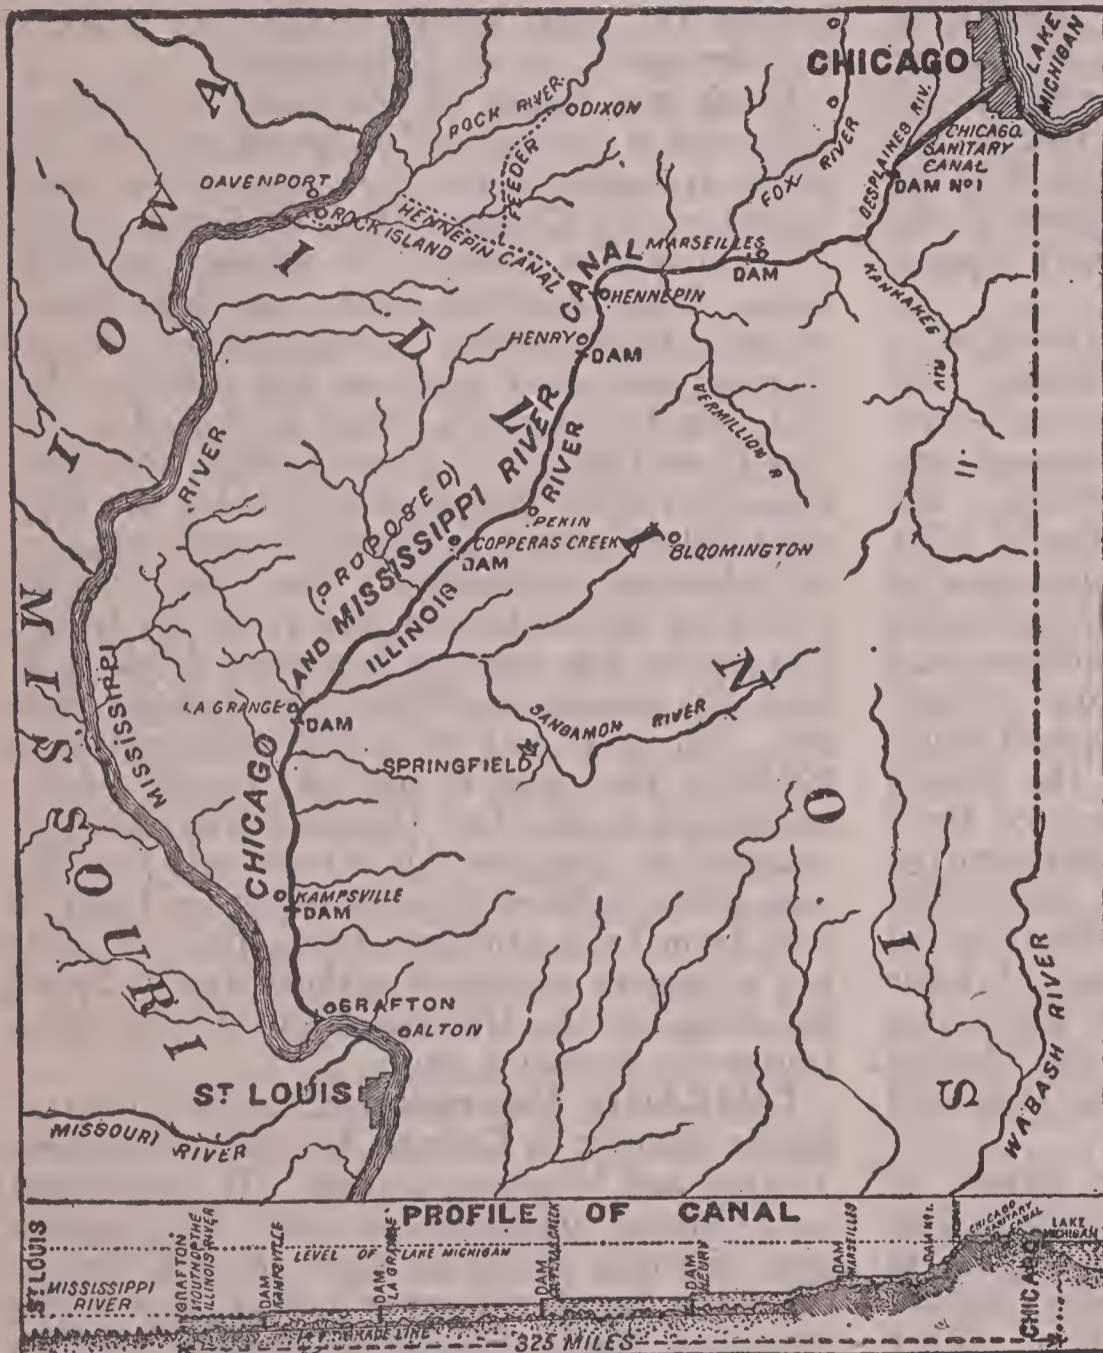

Five departments are embraced in the university, those of the university press; schools and colleges; libraries, laboratories, and museum; university extension; and the university affiliated schools. A term of 12 weeks is the unit, instead of the scholastic year as is the case in many institutions, and the year is divided

junior colleges receive the degree or title of *associates* in the arts, science, or philosophy. Lecture and study courses are given outside of Chicago, and a systematic line of work is done in correspondence courses, which are arranged according to the regular university schedule, and those who do the work receive credits toward degrees. Many publications and periodicals are issued by the university press, including the *Manual Training Magazine*, *Journal of Geology*, *Journal of Political Economy*, *American Journal of Theology*, *The Astrophysical Journal*, *The University Record*, *The Biblical World*, *American Journal of Semitic Language and Literature*, etc. About 250 professors and teachers give instruction to the students, who, including men and women, number about 4,000.

**CHICKAHOMINY** (chik-ä-höm'ĩ-nĩ), a river in Virginia, rises about twenty miles northeast of Richmond, and after a course of seventy-five miles flows into the James River. The marshy portions of its valley are often overflowed during extensive rainfalls. The river banks were the scene of severe conflicts during McClellan's campaigns in June, 1862, against Richmond. Among the battles of that year were those of Seven Pines, Fair Oaks, Mechanicsville, Savage's Station, Cold Harbor, and White Oak Swamp. In 1864 the second Battle of Cold Harbor occurred in its proximity.

**CHICKAMAUGA** (chik-ä-ma'gä), a small stream that rises in Georgia and flows into the Tennessee River, about six miles above Chattanooga, Tenn.

**CHICKAMAUGA, Battle of**, an important battle of the Civil War, fought on Sept. 19 and 20, 1863, on Chickamauga Creek, in Tennessee. The Union Army consisted of 55,000 men under command of Gen. Rosecrans and the Confederates, of 70,000 under Gen. Bragg. Chattanooga was the objective point, of which both armies were endeavoring to hold possession, owing to its location as the outlet to the fertile countries to the south and its railroad lines, which were valuable to both the contending parties. The Confederates made an effort to

Map and Profile of Proposed Chicago-Mississippi River Canal.

into four quarters of 12 weeks each. Students may take up or drop work at the beginning of any term, and a degree is given at the completion of the requisite number of courses, computed by units. University work is organized into the two departments known as *junior* and *senior*, the former corresponding to that done in most institutions by freshmen and sophomores, and the latter to that of the juniors and seniors. Degrees are granted to students who complete courses in the senior colleges of the university, and those who graduate from the

secure the road to Chattanooga and fell back to the Chickamauga, where they received reinforcements and were d eployed for battle. The left wing of the Union army was commanded by Thomas, the second by Crittenden, and the last by McCook.

The Confederates crossed the Chickamauga on Sept. 19 and struck Thomas's line. The latter speedily returned the assault, thereby confusing Bragg's plans. A second attack was made on Thomas the following day, but he held his position and was frequently reinforced. Owing to a misunderstanding of an order by Gen. Wood, the Confederates attacked a weak point in the Federal lines and the day was lost. The Union army retreated to Chattanooga and held that point, thus making the victory at Chickamauga of no particular value to the Confederates. The Union loss was 16,000, while the Confederates lost 18,000. Gen. Thomas distinguished himself by making a brave defense and covered the retreat, owing to which he was called the "Rock of Chickamauga."

**CHICKASAW BLUFFS** (chik' -sa), **Battle of**, a battle that occurred near Vicksburg, Miss., Dec. 29, 1862. While conducting the siege of Vicksburg, Gen. Sherman sent a strong force up the Yazoo River with the design of attacking the city on the rear, from the south. At Chickasaw Bluffs, located opposite the Chickasaw Bayou, the force was confronted by Confederate batteries and rifle pits. The Union force charged and reached the works, but was driven back by heavy fire, and the project was abandoned. The Confederate losses were slight, but the Union forces lost 1,800 men.

**CHICKASAW INDIANS**, an Indian tribe of America which inhabited a region between the Mississippi River and the Appalachian Mountains. They were friendly to the English in several wars against the French, and in 1739 made a treaty with Gen. Oglethorpe. By a treaty in 1786 their territory was fixed with a boundary including the Ohio River on the north and extending into the State of Mississippi. In the Indian wars of 1793 they aided the United States against the Creeks. Early in the last century a number located in Arkansas. In 1818 they ceded the lands east of the Mississippi and located in Indian Territory, now Oklahoma, while the last of the tribe ceded their lands in 1834. In the Civil War they sided with the Confederacy and lost several leaders and their slaves. They long lived under the same government with the Choctaws, who speak a common language, but separated from them in 1855. They are now governed locally by a senate, a house of representatives, and a governor.

Education has been beneficial to them, many showing much advancement in scholarship and the arts. Their lands are held in common. The number of Chickasaws in 1908 was about 6,000, but many are mixed with the blood of whites and Negroes.

**CHICKASHA** (chik' -sha), a city of Oklahoma, in the Chickasaw nation, 40 miles southwest of Oklahoma City, on the Saint Louis and San Francisco and the Chicago, Rock Island and Pacific railroads. It is surrounded by a fertile farming country. The manufactures include brick, cotton-seed oil, flour, furniture, machinery and artificial ice. It has a brisk retail and wholesale trade in merchandise and produce. The chief buildings include a number of fine schools and churches. It has modern utilities, such as electric lights and waterworks. Population, 1900, 3,209; in 1910, 10,320.

**CHICO** (ch -k ), a city in Butte County, California, about ninety-five miles north of Sacramento, on the Southern Pacific Railroad. It is surrounded by an agricultural and mining country and is an important shipping point. The chief buildings include the public library and a State normal school. Among the industries are lumber mills, iron works, and flouring mills. Gas, oil, and coal are produced in its vicinity. Population, 1900, 2,640.

**CHICOPEE** (chik' -p ), a city of Massachusetts, in Hampden County, four miles north of Springfield, on the Boston and Maine Railroad. It is centrally located in a fertile region, on the Connecticut River, and has extensive electric railway connections. Among the notable buildings are a public library of 25,000 volumes and a number of educational institutions. Among the manufactures are rifles, bicycles, cotton and woolen goods, carpets, and machinery. The streets are paved and improved by waterworks, sewerage, and parking. The early growth of Chicopee is due to an abundance of water power derived from the river. It was settled in 1675 and incorporated in 1848. Population, 1905, 20,187; in 1910, 25,401.

**CHICORY** (chik' -ry), or **Succory**, a plant cultivated in various parts of Eurasia and America. It thrives best in soil mixed with gravel and chalk. The roots are roasted and used as a substitute for coffee, and are often mixed with genuine coffee. The roasting is done in iron cylinders that are kept revolving as in the roasting of coffee. Butter or lard is added during the roasting process, from which it receives a luster and color similar to coffee. Its presence in coffee can be detected by a magnifying glass and by placing the mixture in cold water, the coffee floating on the surface

and the chickory becoming discolored and sinking.

**CHIHUAHUA** (chĕ-wă'wà), a city of Mexico, capital of a state of the same name, 225 miles south of El Paso, Tex., on the Mexican Central Railway. It is located on the Chihuahua River, at an elevation of about 4,650 feet, and is surrounded by mountains. The streets are regularly platted and many are paved with stone and macadam. Within the public park is a fine monument erected to Hidalgo and the revolutionists of 1810. The manufactures include carpets, brick, cotton goods, and machinery. It has fine gardens of roses and fruit trees and fruits thrive in the vicinity. The surrounding country has rich gold and silver mines. Population, 1907, 30,905.

**CHILBLAIN** (chĭ'blān), an inflammation of the skin and cellular tissue, caused by sudden alterations of temperature. The affection appears as a small patch of reddened skin, sometimes swelled and painful on pressure, and in extreme cases is accompanied by ulceration and superficial gangrene. It most frequently attacks the foot and sometimes the face, due chiefly to frostbites. Persons liable to chilblain should avoid the fire when their feet are cold and damp, and relief may be obtained by bathing the cold parts with alcoholic or other stimulating liquids.

**CHILDREN, Societies for the Prevention of Cruelty to**, an organization instituted by Henry Bergh in 1874. He established the first society of the kind in the world in the City of New York. It was incorporated in 1875, with John D. Wright as president. The enterprise was encouraged financially by Elbridge T. Gerry and G. Fellows Jenkins. From this organization originated 160 American and forty foreign societies, located in the principal cities of the world. The number of complaints received in a single year aggregates 8,500, of which a number are prosecuted and convicted, while more than 5,500 children are rescued and relieved from destitution annually. The work is a most beneficent one and is filling a valuable mission in the large cities, where children are often subjected to vicious treatment and surroundings. The most important foreign society is one organized by Benjamin Vaughan in London, Aug. 26, 1889.

**CHILD STUDY**, the study of children, a branch of educational work considered of importance to all who have charge of the training of infants and youth. It is a subject which, especially in recent years, has very greatly engaged the attention of practical educators, and those who have either written or spoken on

questions concerning the present condition and future prospects of society. Courses of study and rules of treatment are not prepared with the view of being fitted to serve the needs of the individual child, but rather to meet the general requirements of the average person. Hence, it is incumbent upon the instructor to so apply them that growth, both mental and physical, will be the most rational and best fitted to the individual to be trained. Child study embraces, not only an investigation of the physical capability and powers, but comprehends child psychology, one of the branches of general psychology. Attention to this department of learning was first given in Germany, where the teachers and psychologists studied it as a necessary department for those engaged in the training of children.

The educational movement to promote child study in America had its beginning in 1880, and it is now generally incorporated in the educational systems of the various states of the United States and the provinces of Canada. Much has been done by the educational associations and teachers' institutes along this line, since the topic has been made one for discussion and addresses on the program of these organizations. It is in the courses of many normal training schools, where young teachers are instructed in the care and treatment of children. In many of these institutions classes of children of different ages are organized, and those who study for the teachers' profession are thus furnished a practical opportunity to learn of the habits of children and the proper manner of disciplining them.

Child study is concerned with every phase of training youth. It embraces a study of all the elements of character,—physical, mental, and moral. There are propensities to restrain and subdue as well as powers to bring out and direct. The teacher must know what there is in character to repress or extinguish, and what tendencies toward good are to be cultivated and encouraged. It is necessary to know the dispositions, the likes and dislikes, both in play and work. During the period of adolescence, which begins at about 14 and continues in females until 22 and in males until 24, the youth passes through a critical period of life and requires more than ordinary sympathy and encouragement. At all times it is necessary to direct youth to self-control, patience, kindness, industry, and the many other virtues that make up a well-rounded character, and this is done by stimulation and direction rather than by the infliction of punishment or by severe reprimands. Above all, it must be observed that all

children can never properly be subjected to precisely the same processes of education, because their natures are very different, hence the need of pursuing the subject of child study in all of its phases.

**CHILE** (chē'lâ), a republic extending along the Pacific coast of South America, from south latitude 17° 57' to Cape Horn. It is from 68 to 250 miles wide, with an average width of 87 miles, and is about 2,700 miles long, including all the territory in the southern extremity of South America except the eastern half of Tierra del Fuego, which belongs to Argentina. The northern boundary is formed by Peru, the eastern by Bolivia and Argentina, and the southern and western by the Pacific Ocean. The area is given at 290,895 square miles.

**DESCRIPTION.** Chile has a very narrow coast plain, which is confined to certain localities, and the land rises in most places quite abruptly from the sea. Near the sea is an elevated region known as the Coast Cordillera and along the eastern boundary trend elevated chains of the Andes, pierced at many places by deep fiords that extend to the plains of Argentina. The Andes are highest in the northern section, where they reach altitudes of about 15,000 feet, and in the southern part the ranges vary from 3,500 to 6,000 feet in height. Aconcagua, located northeast of Valparaiso, chiefly in Argentina, has a summit of 23,080 feet. The loftiest summits wholly in Chile include Cerro del Mercedario, 22,000 feet, and Tupungato, 23,000 feet. Many of the summits are extinct volcanoes, whose peaks are covered with snow the entire year.

The Andes forming the continental divide, Chile has few rivers suitable for navigation. The Maule, which flows into the Pacific near south latitude 35°, is navigable for small craft. Other rivers located farther south include the Biblio, Imperial, and Bueno, all of which are navigable for small boats. In the northern part are a number of deserts where rainfall is very scant, sometimes at intervals of six months or a year. These include the deserts of Atacama and Tarapacá, both located north of south latitude 32°. A number of lakes are situated in the vicinity of south latitude 40°, of which Lake Llanquihue is the largest, and in the region south of these lakes are many islands. The coast in the northern section is very regular, but in the southern part are numerous inlets, including Gulf del Corcovado, Gulf de las Peñas, and Gulf de Trinidad.

The climate ranges from the tropical in the north to the cold region in the southern part. Much of the coast has a climate similar to

California, with average temperatures in low altitudes at 65° in the north and 40° in the extreme south. The warmest section is along the coast, whence the temperature falls toward the elevated inland. Rainfall is most abundant in the vicinity of the Strait of Magellan, where it reaches about 130 inches, and decreases toward the north, where the coast has less than eight inches and parts of the interior are practically destitute of precipitation.

**FLORA AND FAUNA.** Vegetation is most abundant in the vicinity of 40° south latitude, where the flora is always green and plants grow luxuriantly. Here thrive the cypress, beach, and palm, but plant life decreases toward the south on account of cold and toward the north as rainfall diminishes. The plateaus are well grassed and sage brush and cacti abound in the arid regions. Among the chief forest trees of Chile, besides those already mentioned, are the poplar, oak, chestnut, willow, and eucalyptus. The mammals include the puma, otter, fox, guanaco, pudu deer, and chinchilla. Birds of song, prey, and plumage are very abundant and are represented by the buzzard, parrot, owl, crane, condor, hawk, humming bird, and many varieties of water fowl. The reptiles include lizards, frogs, and snakes. The coastal waters are rich in marine life, such as fish, seal, whale, and dolphin.

**MINING.** Many useful minerals abound in Chile, which ranks as one of the chief mining countries of South America. Tacna, one of the provinces acquired from Peru, has an inexhaustible supply of nitrate deposits. They are worked chiefly by Europeans, employ about 25,000 men, and yield 1,500,000 tons annually. Copper is mined in the provinces of Atacama and Coquimbo, which yield about five per cent. of the world's production. Gold and silver ores are found in paying quantities, and bituminous coal is mined quite extensively in the southern part. Other minerals worked more or less include tin, borax, lead, and borate of lime. Iron, cobalt, mercury, zinc, and alabaster are found in small quantities.

**AGRICULTURE.** Farming is confined chiefly to the central valley, where the land is held in large estates by the wealthy classes. About half of the people are engaged in agricultural pursuits, but much of the work on the extensive estates is done by the natives. Modern farming machinery is imported and utilized in cultivating the soil and harvesting the crops, and the land not occupied is located in the section of country where the climate is unfavorable, or the rainfall is insufficient. Wheat, maize, and barley are the most important crops.

The vine is cultivated extensively for the manufacture of wine, and hemp and flax are grown for their seed and fibers. Apples and pears are exported. Other crops include potatoes, tobacco, alfalfa, and garden vegetables. All the domestic animals common to North America are grown in Chile, though special attention is given to cattle raising. Goats are reared in the mountains and sheep in the central valley. Oxen are used extensively for farm work.

**COMMERCE AND MANUFACTURE.** Commerce with foreign countries is chiefly with Great Britain, Germany, and the United States in the order named. The exports somewhat exceed the imports. The former include cereals, fruit, nitrate of soda, and live stock, and the imports consist chiefly of clothing and iron and steel manufactures. Comparatively unimportant as a manufacturing country, Chile is making advancement in building up industrial enterprises under the influence of Europeans, especially the large German settlement at Valdivia. Among the enterprises are sawmills, tanneries, breweries, shipyards, soap works, and shoe factories. The first railroad was built in 1852, when a short line was completed between Copiapó, the capital of Atacama, to the port of Caldera. Another line was built between Santiago and Valparaiso in 1858. The total railway mileage in 1908 was 3,100, of which about half was operated by the state. In that year the country had 12,500 miles of telegraph lines.

**EDUCATION.** Public instruction is provided by the state, but the schools are not in a progressive condition. The immigration of Germans has caused many teachers to be brought over from Germany, and many of the schools have been reorganized on a modern plan. The elementary and graded schools are supported by local districts, under the inspection of supervisors, and a state university is maintained at Santiago. This institution has departments of medicine and pharmacy, fine arts, political science, and physical and mathematical sciences. Other institutions maintained by the states or nation include the schools of agriculture and mining, normal schools, naval and military academies, and an academy of painting and sculpture.

**INHABITANTS.** The native races of Chile are classed with the Araucanian tribes. About one-fourth of the native-born inhabitants are of Spanish origin, and those of foreign birth, in the order named, are Spaniards, French, Germans, Italians, English, and Peruvians. The language is purely Spanish and Roman Catholic is the state religion, but other denom-

inations are respected and tolerated. Santiago, the capital, is the metropolis and chief commercial center. Other cities of importance include Valparaiso, Concepción, Talca, Iquique, Chillán, Serena, Antofogasta, and Quiron. The population is about twelve to the square mile, a ratio much greater than that of Brazil and Argentina. Population, 1908, 3,250,120.

**GOVERNMENT.** The government is a democratic republic, under a constitution adopted in 1833. It guarantees equal political rights to all citizens, freedom of instruction, inviolability of property, and the right of petition. The executive power is vested in a president, who is chosen by popular vote for a term of five years. He is assisted by a council of state of eleven members, of whom five are nominated by himself and six by congress, and by a cabinet of six ministers, who preside over the departments of the government. A national congress, consisting of a senate and a house of representatives, has general legislative authority. The senators are elected for six years and the representatives for three years, the former by the provinces on the basis of one senator for each three representatives, and both are chosen by popular vote. The supreme judicial power is vested in a high court of justice with its seat at Santiago, and the lower courts are distributed among the districts and provinces. It has a standing army of 9,000 men, and all male citizens between the ages of 20 and 40 constitute the national guard.

**HISTORY.** The country was first visited in 1520 by Magellan, the famous Portuguese explorer, after sailing through the strait that bears his name. Formerly the northern portion belonged to the Incas of Peru, from whom it was conquered by Pizarro and Almagro in 1535, while the southern portion was occupied by the Araucanian Indians, and was not conquered until a comparatively recent date. Santiago was founded in 1541 and has since been the most important center of European influence. Chile remained a Spanish colony until 1810, when a revolution was organized under the direction of Gen. San Martín, and after seven years it became independent, but Spain did not recognize the government until in 1844. Chile joined Peru in a war against Spain in 1865, which terminated in the blockade of the coast and the bombardment of Valparaiso, and peace was not concluded until 1871, when a provisional treaty was signed at Washington, D. C.

In 1879 Chile declared war on Bolivia and Peru on account of the mineral district of

Atacama, with the result that Chile was victorious and added to her territory the provinces of Tarapaca and Antofogasta. An insurrection took place in 1891, owing to a quarrel between President Balmaceda and the congressional government, which resulted in the defeat of the former and brought on several wholesome reforms in the government. In this military disturbance the United States took sides with the president, which caused much ill feeling, and when the steamship *Baltimore* landed her crew was attacked by a mob. This caused serious complications between the two governments, but the authorities apologized and paid \$75,000 damages for the benefit of the injured soldiers. Since then the country has had no revolutionary disturbances, but serious labor difficulties took place in the nitrate fields of Tacna in 1908, which were suppressed by the federal government, but not until several hundred of the strikers were shot.

**CHILLÁN** (chêl-yân'), a city of Chile, 120 miles northeast of Concepción. It is situated about 700 feet above sea level, near the Itata river, and has railway connection with the principal cities of Chile. The chief buildings include a normal school and a Franciscan missionary church. Southwest of the city are sulphur baths. The city was founded in 1579 and was destroyed by an earthquake, but was rebuilt in 1835. It has a growing trade and is in a prosperous condition. Population, 1908, 35,500.

**CHILLICOTHE** (chil-lî-kôth'è), county seat of Livingston County, Missouri, eighty miles northeast of Kansas City, on the Wabash, the Chicago, Burlington and Quincy, and the Chicago, Milwaukee and Saint Paul railroads. It occupies a gently undulating site and is surrounded by a fertile farming country. Among the chief buildings are the public library, the State industrial home for girls, the high school, and a normal school. It manufactures flour, clothing, cigars, and machinery. The streets are lighted with electricity and many are paved with brick. It was settled in 1835 and incorporated in 1845. Population, 1900, 6,905; in 1910, 6,265.

**CHILLICOTHE**, a city in Ohio, county seat of Ross County, on the Scioto River and the Ohio Canal. It is on the Norfolk and Western, the Baltimore and Ohio Southwestern, and the Cincinnati, Hamilton and Dayton railroads. The manufactures include carriages, cigars, machinery, implements, furniture, and paper. A public library, the courthouse, numerous churches, and fine schools

are among its many institutions. Gas and electric lighting, street railways, pavements, and waterworks are the chief public utilities. The city was incorporated in 1802. Population, 1900, 12,976.

**CHILLON** (shê-yôn'), a celebrated castle and fortress of Switzerland, in the canton of Vaud. It is situated on Lake Geneva and is remarkable for its scenic beauty. The castle was built by Amadeus of Savoy in 1238. Byron made "The Prisoner of Chillon" the subject of a celebrated poem.

**CHILOÉ** (chê-lô-â'), an island and province of Chile. The island and a number of others are included in the province. The area of the island, including about 100 islets, is 3,995 square miles. It has fertile soil and vast forests, which furnish large quantities of lumber for exportation. San Carlos, or Ancud, is the chief seaport. Chiloé was discovered in 1558. Population, 1906, 98,764.

**CHIMAERA** (kî-mê'râ), in Greek mythology, a three-headed, fire-breathing monster. The fore part of the body was that of a lion, the hind part that of a dragon, and the middle part that of a goat. Each of the three heads resembled that of one of the three animals. This monster was killed by Bellerophon. Sculptures of it have been discovered in Lycia, and it is said that the finest representation is the large bronze in Florence. The term *chimaera* is applied figuratively to unnatural or idle fancy.

**CHIMBORAZO** (chîm-bô-râ'zô), a mountain about ninety miles from Quito, in Ecuador. It has an altitude of 20,703 feet above sea level. Nearly 2,500 feet of the slope from its summit downward is covered with snow perpetually. E. Whymper was the first to ascend to the top, which he did in 1880.

**CHIME** (chîm), a number of bells attached to each other in a diatonic succession, and used to produce chimes by means of hammers, which are moved by a mechanism or by clockwork. They are used in church towers and elsewhere. The number of bells employed is not less than five, usually nine, but often much larger. The first chimes were made in 1487 at Alost, Belgium. Pianoforte music may be played on some of the chimes, but the fist instead of fingers is used to strike the keys. The Trinity Church, New York City, has one of the oldest chimes in America.

**CHIMNEY** (chîm'nÿ), an erection designed for the passage, from buildings and various structures, of the smoke of a furnace or fire to the open air. Chimneys were not built to any extent before the 13th century. The

smoke was emitted from the house or structure through an open hole in the roof, and this was covered with a board or some other protection in the evening. They are now constructed of brick or stone, and in the better classes of buildings extend from the basement through the floors and the roof. An opening in the basement serves for cleaning purposes, while openings in the various apartments permit the admission of pipes from stoves or furnaces. Many of the newer chimneys have a double passage, one for the smoke and the other for ventilation purposes. The tendency of the smoke to pass upward is due to the differences in the weight of the heated air in the chimney and an equal volume of cold air on the outside, the colder pressing the warmer upward. In early times stove-pipes constructed of sheet iron were in general use and similar pipes or smokestacks are now used in the larger factories and machine shops. The chimney in a residence usually passes from five to seven feet above the ridge of the roof. This arrangement serves as a protection against fire and increases the draft, which depends largely upon the height of the structure. The opening for smoke in the average chimney is about twelve inches square, and that for ventilation is about the same, but in general it varies with the number and size of the stoves or furnaces from which the smoke passes through the chimney into the open air.

**CHIMPANZEE** (chīm-păn'zê), a name formerly given to several large man-shaped apes, but more properly to the native ape of the equatorial portion of Western Africa. It is closely associated with the gorilla. The face is almost hairless, the skin is yellowish, the teeth are beautifully white, and the hair is long and black. The arms are longer than the hind limbs, and, when the animal stands erect, they reach below the knee. The height of a full grown chimpanzee is about five feet, and its structure is much like that of a human being. It moves about freely in an erect position, is gentle in habit and amiable in disposition, and easily makes friends. The brain is about half the size of a human brain. It lives in forests, where it feeds on fruits, though it also robs the gardens of the natives. Its habitation is largely in the branches of trees, in which it constructs a sort of nest and rears its young. The habits of the adult in the native state are not well known, but in captivity they have been thoroughly studied. The first accounts given of a chimpanzee were written by Hanno, who left Carthage in 470

B. C. to explore the northwestern part of Africa.

CHIMPANZEE.

**CHINA SEA**, an extension of the Pacific Ocean along the southeastern coast of Asia. It is divided by Formosa into the East China Sea and the South China Sea. The East China Sea is bounded on the north by the Yellow Sea and Korea, east by Japan and the Riu Kiu Islands, south by Formosa, and west by China. The South China Sea is bounded on the north by China and Formosa, east by the Philippine Islands and Borneo, south by Borneo and the Java Sea, and west by Anam and the Malay Peninsula. The China Sea is important in the commerce and the political questions of the East. Upon its waters ply some of the largest war and commercial ships of the world. Among the fortified cities on its coast are Bangkok, Canton, Hong Kong, and Singapore. The Mekong, the Menam, and the Si-Kiang rivers flow into it.

**CHINCH BUG** (chinch), a small pestiferous insect, about three-sixteenths of an inch long. The wing covers are white, with black spots, and the body is dark brown. Its eggs are deposited in the ground in the spring and

hatch about the first of June. The young insects are very destructive to wheat, barley, rye, and other cereals, and move from these grains into fields of growing corn, which they injure by sapping the juices from the stalk and roots. They produce two broods in a year, one in early summer and one in autumn. Their liability to take infectious diseases has led to a means of destroying them in wheat fields, and until this discovery was made their de-

A, Newly hatched larva; B, Larva after first molting; C, Larva after second molting; D, Leg of perfect insect; E, Pupa; F, Adult insect.

struction was almost impossible. The plan of destroying large swarms of them is to infect several insects artificially with a disease and place them among the swarms; thus the disease will spread very quickly and largely destroy them. Cinch bugs occur most commonly in the wheat fields of the Mississippi valley and the great plains of North America, and thrive best in dry seasons.

**CHINCHILLA** (*chīn-chīl'la*), a small squirrel-like animal, native to the higher regions of Chile and Peru and to the great plains of South America. These animals are rodent in habit, have long hind legs, soft gray hair, and a bushy tail, and the body is about a foot or fifteen inches in length. They feed on herbs and the roots of plants. The fur is used for muffs, tippets, and other articles of ornamental apparel.

**CHINESE EMPIRE**, or **China**, an extensive imperial domain of Eastern Asia, comprising China proper and the dependencies of Mongolia, Tibet, East Turkestan, Jungaria, and Manchuria. It comprises nearly one-fourth of Asia and one-twelfth of the land area of the globe, and is the third largest country in the world. The area is estimated at 4,277,170 square miles. It is irregular in outline and lies between latitudes 18° and 54° north and longitudes 74° and 135° east. The boundary on the north is formed by Siberia; on the east by Siberia, Korea, the Yellow Sea, East China Sea, and South China Sea; on the south by Indo-China and India; and on the west by

Russian Turkestan. Its southern shore is indented by the Gulf of Tonkin and its eastern by the Gulf of Pechili. South of it is the island of Hainan, separated from the mainland by the Strait of Hainan. The extent of the empire from east to west is about 3,000 miles and from north to south, 2,400 miles.

**DESCRIPTION.** The Chinese Empire consists mainly of highlands, characterized by plateaus and mountain ranges, except along the coast and in the valleys of its great rivers. It is separated from Siberia by lofty highlands, known as the Altai and Tian Shan mountains, from which ranges extend westward through Mongolia and finally disappear in the desert plateau of the Gobi. The Tibetan Plateau extends along the western part, and much of the southwestern boundary is formed by ranges of the Himalayas, which rise to heights of over 20,000 feet and are crossed by a number of difficult passes. All of the mountains of southeastern China belong to the Tibetan tableland, which is cut up by many great ridges and peaks. The Kuenlum Range occupies most of the western section. Many of the mountain systems are interspersed by extensive and fertile valleys, but the west central portion is largely of desert formation, embracing the Tarim Desert, with the Desert of Gobi stretching toward the northeast.

**DRAINAGE.** Much of the surface slopes from the west toward the east and southeast, and the drainage of the northern part is toward the northeast. A large part of Mongolia is drained by the Amur and its tributaries, and Manchuria is entirely in the Amur basin. The great Yangtse-Kiang River rises in the western part by a number of branches, flows toward the east, and discharges into the Yellow or North China Sea. Other important rivers flowing east include the Hoang-ho and the Si-Kiang. The Selenga River flows north and discharges into Lake Baikal, Siberia, while the extreme northwestern section is drained by a number of rivers that have no outlet to the sea. The southwestern portion is drained by the Salwin and the Mekong, which flow toward the south. Many of the rivers are important as avenues of transportation and the valleys are densely populated. China has few lakes and all are comparatively small. Near the east central part is Lake Tung-ting-hu, which is drained by the Yangtse-Kiang. In the northwestern part are a number of lakes that have no outlet to the sea, including Shara and Loo, both of which receive the discharge from several rivers.

**CLIMATE.** The climate of China is very similar to that of the central part of North Amer-

ica, being largely temperate. In the northern portion, bordering on Siberia, it is cold; throughout the interior it is temperate; and in the southern portion it is warm and tropical. At Peking the mean annual temperature is 51° and at Canton it is 69°, while the summer heat at the former ranges from 85° to 100° in the shade. At Canton the temperature is greatly modified by the monsoon winds, but in the interior the climate is continental and the range of temperature much greater. The rainfall is excessive on the southern coast, where it averages 100 inches annually. At Hongkong the rainfall is 90 inches and at Peking, 24 inches, and in the northwestern part is a vast extent of territory that has little rain. The southwest monsoons bring most of the rains, and local droughts occur in seasons when these winds do not blow to the average extent. Disastrous typhoons sweep across the country periodically and cause much loss of life and property in many sections of the southeastern part.

**FLORA AND FAUNA.** China has a vast variety of plants useful in the arts and trades. Above all, it is the home of the rice, tea, and bamboo plants. The first furnishes its most important article of food; the second, its drink; and the third, material useful in providing implements and constructing habitations. Fine forests abound in the mountains, but the populous regions have been cut over and the land has been improved for cultivation. Among the forest trees are the cypress, pine, cedar, banyan, camphor, palm, and a number of hard woods. The mulberry is cultivated to promote silk culture, and many varieties of fruits abound, including the orange, banana, mango, and pineapple.

Many wild animals are still abundant in vast tracts of country that are sparsely populated. Over 700 species of birds have been described. In the southern part many ferocious animals abound, including the panther, tiger, leopard, wildcat, rhinoceros, and black and brown bears. In the same section are many species of bats and monkeys, and tapirs and elephants are not uncommon. The northwestern part has the musk deer, muskrat, badger, weasel, and otter, and great swarms of locusts often migrate and do much damage. The coastal waters are rich in eels, porpoises, sharks, finwhales, and sturgeons. The reptiles are represented by snakes, frogs, turtles, and alligators.

**MINING.** All of the valuable minerals are found in the empire. Deposits of commercial coal are thought to extend over an area of 400,000 square miles, but it is mined only in a few localities. Bituminous coal is mined in

Pechili and several other eastern provinces, and beds of anthracite occur in eastern Shansi. Gold is obtained in the auriferous quartz veins of Pechili and Shantung, and is washed from the sands of the Amur and other rivers. Rich deposits of copper occur in Hunan and Yünnan and iron ore is mined in Shansi. Salt is obtained from artesian wells at a depth of 1,500 feet, the brine being evaporated over furnaces in which natural gas is used as fuel. Petroleum and natural gas are obtained in several fields. Other deposits worked more or less include tin, quicksilver, silver, kaolin, and building stone. The absence of adequate transportation facilities and Chinese prejudice against using modern implements are the chief causes of a lack of development in mining to the extent of its possibilities.

**MANUFACTURING.** China is noted for its extensive manufactures, but the products include rather fancy and small articles than the larger wares, such as are common to America and Europe. The Chinese train early in life to secure efficiency in labor and the manual arts. Their silk manufacture is the chief industry along the line of manufacturing, and in the production of silk they excel in varieties and quality all other nations in the world. A high degree of mechanical skill and artistic taste is displayed in the embroidering of silk. Cotton and woolen goods are beginning to meet with favor for wearing materials, and are, to some extent, displacing silk, which is the favorite fabric for clothing and is prescribed for officials and people of high rank. The Chinese knew of movable types in printing before the time of Gutenberg and Koster, and were the first to invent clocks, paper, porcelain, gunpowder, the magnetic needle, silk textiles, jade, and the art of printing. They are skilled in carving, engraving on wood, bronze-casting, lacquer work, and weaving. They support many factories for making matches, brick, powder, steel and iron ware, and munitions of war. Modern machinery has been introduced within the last few decades and all the industries are passing through a period of transition.

**AGRICULTURE.** China is distinctly an agricultural country, and has developed much skill in the care and cultivation of the soil. The art of fertilizing and securing the greatest possible productiveness has been a matter of special attention among the agricultural classes, and it is the policy of the government to promote and encourage this necessary department of husbandry. In theory the farmer ranks next to the scholar, and is looked upon as being

superior to the artisan and merchant. The farming season is inaugurated annually at the spring equinox by the emperor, who sows some seed in a newly turned furrow. The land is held in small estates, usually not over ten acres, and when a man ceases to cultivate his land it becomes the property of the emperor. Crops have been rotated since time immemorial, and the cultivation is done with the utmost skill and care, hence, a failure of crops is very rare. Lowlands are drained and protected from floods by embankments, while fertile soil is transported to the barren hills to render them productive. A network of canals and ditches is utilized in irrigating the land, even where rainfall is ordinarily sufficient, thus insuring abundant moisture at the critical time of plant development.

Farming is developed most extensively in the southeastern part of the empire, especially in the fertile valleys of the rivers. Rice is the staple crop and is grown in the southern and middle parts. Tea is cultivated in the southeastern section, where it yields three crops per year, in April, July, and August. Comparatively little rice is cultivated north of the Yangtse-Kiang River, except on the southern slopes of the hills. The cotton belt extends as far north as the Hoang-ho River, where it is grown chiefly in the low valleys, while farther south it receives more attention and produces a larger yield. Sugar cane is confined chiefly to the provinces bordering on the China Sea. Wheat, oats, corn, buckwheat, and rye are grown principally in the northern part. Tobacco is a staple crop in all parts of the empire, and the cultivation of the poppy is a commercial enterprise owing to the prevailing habit of opium smoking. The mulberry tree is cultivated more than any other on account of its value in silk culture, and ginseng, indigo, and vegetables receive careful attention. Stock raising is not an extensive enterprise, for the reason that butter, milk, and cheese are practically unknown. Fish and eggs are preferred to the flesh of domestic animals, and the horse is little used for driving, being considered less desirable than the men who pull the jinrikisha. Camels, elephants, and buffalo are reared to a considerable extent.

COMMERCE. The tendency to exclusion has caused China to be closed against the commerce of the world, hence its commercial relations with foreign countries is of comparatively recent date. A trading port was established by the Portuguese in China in 1522 and some trade was carried by the Dutch, the English, and the Americans, but the government re-

mained hostile to foreigners and trade continued to be of secondary importance. Special ports were opened to foreign commerce in 1842 by the Treaty of Nanking, which was made shortly after the Opium War with England, and up to 1908 forty-two ports were opened, including a number located on the rivers several hundred miles inland. The import trade greatly exceeds the exports. The former includes chiefly flour, ginseng, kerosene, cotton textiles, quicksilver, sago, rubber shoes, and machinery, while the exports consist principally of tea, hemp, essential oils, fans, mats, chinaware, silk products, bamboo ware, and hides. Foreign trade is principally with Great Britain, Japan, the United States, and Germany in the order named.

TRANSPORTATION. The rivers and canals of China still continue to be the chief highways of commerce, and these are peculiarly busy with boats and barges of all kinds. A vast volume of trade is carried inland by these means, whence it is distributed to remote sections by carts and other vehicles drawn by hand or by animals, such as the horse, elephant, and buffalo. The Grand Canal, a waterway 700 miles long, connects Tientsin with Hankau, and has been in use more than 800 years. Many railroads have been projected and surveyed by foreign corporations, but railway construction is slow on account of hostility of the government, and partly because of the impossibility to construct them without going through numerous burial grounds, which is precluded by the ancestor worship of the Chinese. The total railroad mileage in 1908 did not exceed 3,500 miles, including the lines built through Manchuria by the Russians. The projected lines are one from Kiauchau to Peking by a German corporation, one from Canton to Hankau by an American company, and several branches to extend from the lines at Port Arthur and from Peking to Canton.

SPHERES OF INFLUENCE. A number of nations have secured trade concessions in different parts of China. This was brought about from the fact that the Chinese support customs which are opposed to the methods employed in modern business enterprises, hence the establishment of spheres of influence permit intercourse on a commercial basis decidedly advantageous to the commerce of the world. The oldest European possession is that of the Portuguese, who leased the city and island of Macao, at the mouth of the Canton River, in 1586, subject to an annual payment, and it was ceded in sovereignty in 1863. Hongkong, the mountainous island at the mouth of the Canton River,

was ceded to Great Britain in 1842, and subsequently a number of other islands were added so the district has an area of 405 square miles. Germany acquired a district of 200 square miles on the Shangtung coast, known as Kiaochau, in 1898, and built railroads from this point inland to the Poshan coal mines, which are controlled by German capital. France secured a concession of 230 square miles on the east side of the peninsula of Lienchou, including the town of Lienchou-fu, in 1898. Russia had the largest sphere of influence in Manchuria prior to the Russo-Japanese War, after which it was ceded to Japan with certain limitations.

**RELIGION.** Five religions are well established in China. These include the Confucians, Buddhists, Taoists, Mohammedans, and Christians, represented numerically in the order named. Anciently the Chinese divided their worship between God and their ancestors, and this double worship is embodied in the religion of Confucius, who laid stress upon the material side of life rather than upon the spiritual. It has gone through many changes, is the religion of the educated classes, and is the basis of society and government. Buddhism is on a decline, its priests are illiterate, and its monks and nuns are mendicants. However, monasteries and Buddhist temples are common in all parts of China, though those who profess it are of the uneducated class. Taoism is a system of rationalism, which makes an impersonal first principle the parent of all things, and it teaches that man must aspire to realize this principle through an escape from all mental distraction. Its worship is intermixed with incantation and alchemy, and partakes of a kind of spirit worship. The Arabs introduced Mohammedanism and their religion received state recognition. It is estimated that fully 20,000,000 Chinese profess the Moslem faith, and the mosques are numerous and usually in good condition. It is thought that Christianity was introduced in the 6th century by the Nestorians, but little progress has been made by either the Protestant or Roman Catholic missions. Those who profess Christianity are largely pupils of the missionaries or their descendants, and the total body of Christians does not exceed 1,500,000.

**EDUCATION.** The Chinese hold education and literary attainment in high repute, and among them illiteracy is looked upon almost as a vice. While these people differ in their religion and personal likes and dislikes, they make education the element that binds them together as a nation, and with their educational skill they have been able to endure through history longer

than any of the nations of the world. The ability to obtain and hold an office is looked upon as a great personal attainment, and fitness for public positions is determined by competitive literary examinations, a system which has been in force nearly seventeen centuries. All the villages and towns have elementary schools, and the teachers are made up largely of a class who were rejected in the examinations for public positions. Technical education is provided for at the naval and military schools and at Peking is located the Tung-wen College, in which science, literature, and modern languages are taught. Chinese newspapers are published chiefly in the ports within the sphere of foreign influence. The Chinese language contains only words of one syllable, and each word in print is represented by a character, hence there are as many characters as there are words in the language. It is thought that these symbols originated from the hieroglyphic characters of very ancient times. These characters are represented or printed in vertical columns to be read from top to bottom.

**INHABITANTS.** The Chinese have a yellow complexion and belong to the Mongolian race, which embraces more than one-third of the population of the earth. Their eyes and eyebrows turn upward at the outer extremities, the hair is straight and black, and the forehead is wide. In stature they are low and have small feet and hands. Beginning in the 6th century A. D., the feet of the women of the higher classes were bandaged so as to prevent them from developing to the normal size. The men wear a braid or *queue* on the crown of the head, with the rest of the head shaved closely. They are accustomed to hard work, are free from most vices, and live at a small expense. Opium smoking, gambling, and the consumption of intoxicating beverages are national vices. They are strongly attached to their home, support their families by hard toil, and respect old age and their parents. Remarkable simplicity of manners is exhibited by the inhabitants of the interior who have not come in contact with foreigners, but those acquainted with the customs of foreigners are treacherous and untruthful in dealing with strangers.

China has a style of architecture distinctively her own, the best types of which are found in her temples and public buildings. The culture of the silk worm is left almost entirely to the women, while the men pursue agriculture, the arts, the professions, and laundry work. Death is regarded the most important event and marriage has precedence as of second importance. Both sexes marry young under contracts made

by parents or professional matchmakers, and frequently the future bride and groom do not become acquainted until immediately before the wedding ceremony. Women are not accorded the same social or educational advantages given to men, and in the scale of society are considered of less importance. People in destitute circumstances are permitted to put their female children to death, but child murder is practiced very little, though millions of children die each year from a peculiar treatment of the sick, which prescribes that a child that does not respond to remedies is to be regarded as unhuman and for that reason is passed through an ordeal of neglect or starvation. The board of rites is a department of the government at Peking, and interprets the Li-King or Book of Rites, which has been the basis of all rules of etiquette and conduct for more than 3,000 years, and any action that departs from it is looked upon as treason or impiety.

The great mass of Chinese live in houses built one story, and in the construction use brick, thatch, or bamboo, with the roof made of wood or tiling. Chambers are set aside for the worship of ancestors in all of the better class of dwellings, in which religious ceremonies take place regularly. They have many festivals and holidays, but regard New Year's Day as the greatest of all, for which they make preparation by paying their debts and purchasing new clothing, and it is considered the birthday of everybody, no matter on what day of the year birth took place. The dress has many advantages, since it is graded according to the season, and both sexes aim to have garments of the same kind, the only differences being in the footwear. They do not shake hands or kiss each other, but are free in congratulating and saluting. Every Chinaman has an ambition to be buried properly, hence a handsome coffin is looked upon as a very desirable present, and very often caskets are kept in the home for years so as to have them ready when needed. White is the color put on by mourners.

**POPULATION.** Few foreigners make their home in China. The total number of foreign birth, in 1908, was 16,850, and they resided chiefly in the treaty ports. They included principally British, Japanese, Russians, Americans, Germans, French, and Portuguese. However, the Chinese are widely distributed in every civilized and uncivilized country, and emigration would undoubtedly be much larger, if these people were welcome in the countries of America. Though China has many great cities in a general sense, they are not centers of pop-

ulation like those known to Europeans, since they resemble aggregations of people in a locality rather than cities of social and commercial enterprise. Peking, the capital, is located in the east central part. Other cities are Nanking, Canton, Tientsin, Hankau, Shanghai, Hoang-ho, and Fuchau. The population of the empire is not accurately known and the most recent careful estimates place it at 409,775,000.

**GOVERNMENT.** The government is not centralized like those of Europe, but the Chinese are held together by social, religious, and educational systems rather than by political force. It has a constitution which holds the provinces together as a confederation, under which the emperor is the chief executive and has supreme direction of affairs, with the assistance of a cabinet of ministers of state. Six ministers comprise the cabinet, two of whom are Chinese, two are Manchu, and two are chosen from the great college. The cabinet has control of seven government boards or administrative departments, as follows: the board of civil appointment, of revenues, of military, of public work, of admiralty, of rites and ceremonies, and the high tribunal of criminal jurisdiction. Each province has a governor and each district a magistrate, and between the emperor and the provincial governors is the viceroy. A number of the provinces are united to form vice-royalties, of which there are ten or twelve, and communication between the capital and the province is solely through the viceroy and the governor. The laws are an outgrowth of custom through many centuries rather than direct legislation, and are repromulgated with various modifications when the dynasty is changed. In theory the emperor is the son of Heaven, but he may be deposed by the people if his reign is unwise or wicked, and if such a change is brought about by a rebellion it is said to have been willed by Heaven. The present Manchu dynasty belongs to a clan of conquerors numbering about six million people, and in this class there are nine orders of nobility. Patents of nobility and honorary titles are conferred by the government, and the only permanent noble class is confined to the descendants of Confucius.

Manchu generals have charge of the military forces, which consist of 170,000 men quartered in the larger cities. The war footing is 600,000. Modern rifles and cannons have been imported from Europe and are manufactured in China, but the army still uses the bow and arrow to some extent, and the firearms in use by the cavalry consist of many different kinds of weapons. The navy has little strength com-

pared to those of European nations, but the empire has forty forts and batteries that are armed with high-power guns. The government maintains a system of mail service, though this is inadequate to the needs, and telephone and telegraph lines are used extensively.

**LITERATURE.** The literature of China is the most extensive national literature of the world, its collection of writings extending over an epoch of 2,000 consecutive years. Among the early writings are those of Confucius, the most eminent of early moralists, but there are fragmentary writings that date from about the same time, these being counted among the Chinese classics. The histories are reckoned the most elaborate Chinese works, these being divided into dynasties, each containing an elaborate account of a dynasty. Chinese literature embraces a large collection of biographies of noted statesmen and scholars, a feature quite important in a country where ancestry worship prevails. In connection with each history are elaborate chronologies giving the lineage of important personages, many of which are of little interest and are seldom consulted. However, there are important treatises on law, music, the rights of property, food, and clothing, astronomy, geography, language, and various arts and sciences. One of the most elaborate works is a record entitled "General Examination of Records and Scholars," in which are recorded important details relating to official service and tests of scholarship.

Though the historians and general writers of China are largely men, the poets include numerous women writers. "The Book of Poetry," a classic coming down from Confucius, is a work on poetry held of very high importance, and those desiring official preference are required to be acquainted with its contents. Chinese poetry as a whole is made up of elegies, ballads, and songs, some of them possessing real intrinsic value, though others are of minor importance. The Chinese writings of greatest utility are those relating to the culture of the tea plant and the mulberry tree, those treating of engraving, pottery, medicine, and horticulture, and those bearing on the subject of legislation and the industries. Other writings include essays, elegies, orations, legends, and works relating to Buddhism, alchemy, mechanics, and the drama, and numerous treatises of an encyclopaedic nature. Many libraries were destroyed at different times, particularly by the Tsin dynasty, and at the time of the conflict between the Boxers and the allied armies in 1901. It is to be observed that the Chinese used paper as early as the 1st

century of our era, and that they were the first to employ movable types, which they invented about the 8th century A. D.

**HISTORY.** The early history of China is wrapped in fable, beginning in 2635 B. C., though it is reasonably certain that the country was densely populated even before that time. It is thought that Fu-hi, who lived about that period, founded the social order of the Chinese. Confucius begins his record of Chinese history with the reign of Yao, in 2357 B. C., and praises him as the founder of civilization and prosperity. The Chow dynasty organized the government in 1122 and reigned by a succession of kings until 255 B. C., a period of about 900 years, during which the fine arts and literature flourished. Confucius was born in 551 B. C., at a time when the nation was depressed by misrule and civil war. The Chow dynasty was overthrown by the Tsin or Chin dynasty, in 255 B. C., from which China was named, and its rulers expelled the Tartars, abolished the feudal system, and built the great wall to protect China against invasion. Prince Cheng, one of the Tsin rulers, regarded a national hero of the Chinese, assumed the title of emperor, calling himself Che-Hoang-ti. He beheaded hundreds of scholars who supported feudalism and claimed sovereignty over all the nations of Eastern Asia.

The Han line of rulers reigned from 206 B. C. until 190 A. D. Within this period many Jews settled in China, Buddhism was introduced and competitive examinations as a qualification for office became established. Genghis Khan and the Mongols overran China in the early part of the 13th century. They established a Mongol dynasty in 1259, but this was displaced by the Ming dynasty in 1368, when Hung-wu became the reigning sovereign. The latter dynasty was succeeded by the Manchu-Tartar dynasty in 1618, and through a line of descent still holds the throne. The first accounts published in Europe of the Chinese and their industries were from the pen of Marco Polo, who traveled in that country in the 13th century. Queen Elizabeth attempted to establish trade relations through the East India Company in 1596, but commercial intercourse of noteworthy extent did not take place until 1792. China declared the opium traffic illegal in 1796, but the decree was not enforced until 1837, when the government decided to suppress this traffic and sent commissioners to Canton to confiscate the opium in the possession of merchants. These officials seized the stores of opium and published an edict that vessels engaged in the traffic would be subject to confis-

cation and the persons who engaged in it were declared punishable by death. This brought on the Opium War of 1840, which terminated favorable to the British, and they compelled the opening of the five ports at Amoy, Canton, Ningpo, Fuchau, and Shanghai and the payment of an indemnity of \$21,000,000. Four years later commercial treaties were made with France and the United States.

A formidable insurrection occurred in southern China in 1850, known as the Tai-ping rebellion, which was finally put down by an army raised at the expense of the merchants at Shanghai. This army was first commanded by an American named Ward and later by Charles George Gordon. In the meantime additional trade privileges were obtained by the European nations, and in 1874 the Chinese became complicated with the Mohammedans in Turkestan, which was followed by internal changes and the widening of Chinese influence in East Turkestan. China became involved in a war with Japan in 1894, as an outgrowth of rival interests in Korea. The Japanese army and navy promptly invaded Chinese territory and succeeded in winning every combat, both on land and sea. Through this war China lost the island of Formosa and was required to pay an indemnity of about \$150,000,000. Japan had demanded the cession of the Liaotung peninsula, including Port Arthur, but Russia was unwilling to lose the foothold she had gained, and in conjunction with France and Germany protested until Japan gave up her claim and Russia secured a lease of the harbor of Port Arthur. A large reform party in China sought to bring the country into closer commercial relations with other nations, who demanded an "open door" market, and this led to serious opposition through the organization known as the Boxers.

The Boxers were centered largely in Shantung and through the assistance of several other organizations promoted an agitation against foreign aggression. These revolutionists advocated the extermination of all foreigners, threatened the legations in Peking, and on June 20, 1900, murdered Baron von Ketteler, the German ambassador, on the streets of Peking. This caused the diplomatic corps and those associated with them to fortify themselves in the British legation, which was besieged for nearly two months. To relieve the situation, the allied powers, including the United States, Germany, France, Russia, England, Japan, and Italy, dispatched a large army to China, which was placed under the general command of Count Waldersee. The allied army captured the Taku forts

on June 17, and later took possession of Tientsin and Peking. The royal family of China escaped to the interior and the allied army marched through the forbidden city. Prince Ching and Li Hung Chang were commissioned to conclude a treaty with the powers, and it was submitted and approved by the imperial government in 1901. This treaty required China to pay an indemnity for the damage done to the different foreign interests, granted greater trade privileges, provided protection against members of anti-foreign societies, and gave enlarged advantages to invest foreign capital in constructing public utilities and developing the natural resources.

Little is known of the inner life of Chinese royalty, and the chief executive lives a most retired life under the etiquette of the court. The late ruler, Emperor Kwangsu, was born in 1872 and is thought to have reigned from 1901, but was deprived of all real share in government by the dowager empress. Both he and the dowager died in 1908, when Hsuen Tung, an infant of three years, became emperor under the regency of his father, Prince Chun. Li Hung Chang, often called the Bismarck of China, attained to the highest reputation in modern Chinese statesmanship. He introduced many methods and ideas of western civilization. However, the sentiment "China for the Chinese" has had a permanent growth throughout the empire since the Boxer insurrection.

**CHINESE EXCLUSION**, a term applied to legislation in the United States against the permanent settlement of Chinese in the country. The vast density of the population of China has led to a tendency to emigrate, especially to the Pacific coast in the United States, British Columbia, and Australia. The first treaty between China and the United States regarding residence and travel was effected in 1868. Owing to the cheapness of Chinese labor, many American laborers were injuriously affected, which led to the treaty of 1880, whereby it was sought to absolutely prohibit immigration. The act of Congress passed in 1884 suspended immigration for ten years. Later, in 1892, the Geary law extended the exclusion provision for a further period of ten years, and required Chinese to register and file photographs in order to keep a complete record of those already in the country. This act was reaffirmed in 1902, when Congress further limited immigration and provided certain restrictions upon visiting and traveling. The Chinese population in the United States in 1900 was 119,050.

**CHINESE WALL**, a great artificial structure extending about 1,500 miles between China proper and Mongolia. It was commenced in the year 214 B. C., and was intended to protect the country against the marauding raids of the Tartars. The construction is of brick, rising from granite foundations, and the two outer walls inclose great masses of stone and earth. It is about twenty-five feet wide at the bottom and fifteen at the top, and is from twelve to fifty feet high. It is strengthened by towers at regular distances. The great wall winds through valleys and over hills, the greatest height above the sea at one of the elevations being 5,000 feet. Several million men were engaged in its construction for a period of ten years.

**CHINGTU** (chǐng-tōō'), a city of China, on the Min River, capital of the province of Szechuan. It is inclosed by a wall, has fine streets, several libraries, and a number of beautiful edifices. It is the seat of several public buildings and the residence of the viceroy. Population, 800,000.

**CHINOOK** (chǐ-nōōk'), a family of American Indians, now nearly extinct. They formerly inhabited the region along the Columbia River, and extended from Oregon to the southern part of British Columbia. They were expert fishermen, kept slaves, and manufactured clothing from skins. From them originated the Chinook dialect, a mixture of Indian, French and English. The Chinook wind was named from this Indian tribe. It is a remarkably pleasant wind common to sections of Washington and British Columbia, coming inland from the Pacific as a direct result of the Japan current. In winter it has a warming influence, melting the snow and ice, while in summer it acts as a cooling and tempering agency.

**CHIPMUNK** (chǐp'mũnk), the name of a class of American squirrels. The body is about six inches long and the color is gray or

CHIPMUNK.

reddish-brown, with black and white stripes on the back. These animals are active and cheery and issue a shrill note when alarmed. They burrow habitations underground, subsist on nuts and cereals, and multiply rapidly. In many localities they are a pest in cornfields.

**CHIPPEWA** (chǐp'pě-wä), Battle of, a military engagement between the British and Americans at Chippewa, a village of Ontario, in Welland County. This village is a port of entry on the Niagara River, three miles above Niagara Falls. The British under Gen. Riall were attacked by the Americans under Gen. Brown on July 5, 1814. The first charge was led by Gen. Porter. He pursued the enemy within a few yards of the entire force of British, who made a gallant bayonet charge, and the Americans were routed, but Gen. Scott was ordered forward and saved the day to the Americans. The latter lost 355 men, while the British loss was 604.

**CHIPPEWA FALLS**, a city in Wisconsin, county seat of Chippewa County, on the Chippewa River, ninety-eight miles east of Saint Paul, Minn. It is on the Wisconsin Central, the Chicago and Northwestern, and the Chicago, Milwaukee and Saint Paul railroads. The chief buildings include the county courthouse, a State institution for the feeble-minded, the public library, and the high school. It has gas and electric lights, city waterworks, and other municipal improvements. The manufactures include machinery, cigars, furniture, and implements. It has a considerable trade in farm produce and merchandise. It was settled in 1838 and incorporated in 1870. Population, 1905, 9,009.

**CHIPPEWAS** (chǐp'pě-wāz), a tribe of North American Indians. See **Ojibways**.

**CHISEL** (chǐz'ěl), an edged tool for cutting iron, stone, or wood. It is worked by pressure or by striking the upper end with a mallet or hammer. A carpenter's chisel has a wooden handle attached to the shank of the blade, but those used for cutting metal are entirely of steel.

**CHITON** (kī'tōn), a class of mollusks whose shell is composed of many calcareous pieces, eight in number. The parts are transverse and overlap each other, and are so formed that the animal can roll itself into a ball much like the armadillo. In doing so it exposes only the hard shell, hence defends itself in this way when attacked. Locomotion is by an oval foot, which enables the chiton to cling to rocks like the limpet. About 200 species have been described. They are from eight to ten inches long in the coastal waters of California, but in the North Atlantic rarely exceed in length more than one or two inches. Fossil chitons are abundant in the lower silurian rocks.

**CHIVALRY** (shǐv'al-rĭ), the knightly system of feudal times, especially the system distinguished by the championship of women and

of knightly honor. It had its beginning prior to the time of the Crusades, and during their greatest strength it attained to its advanced stage of development. The principal characteristics of the age of chivalry included the thirst for glory, the love of adventure, a war-like spirit, and a lofty devotion to the female sex. From the 9th to the 12th century a knight was one who held land in fee from a superior and was bound to render him military services. During the height of chivalry, it was customary to place a young knight in the court of a baron or noble knight, under whom he acquired skill in arms and in riding. Later he accompanied his lord in battle, when he was known as a squire or an esquire. A young man attaining the age of responsibility, who inherited estates, was pledged to discharge them honorably in a ceremony of great splendor. The church added solemnity and made the investiture of a youthful knight an imposing religious event, placing before him a high moral and religious ideal to which he was exhorted to aspire. He was implored to have mercy for vanquished foes, purity in youthful relations, and high regard for the Christian Church. Notwithstanding these instructions, knighthood was often accompanied by cruelty and impurity, although the poet celebrated and the church counseled the moral elevation of the true knight. The feudal system was a normal growth from chivalry, when that state of society declined. The most interesting developments of chivalry were the Knights Templar, the Teutonic Knights, and the Knights of Saint John, military orders instituted under its direction. It may be said that the age of chivalry served a useful purpose in making society braver, more pure and compassionate, and that it gave to these virtues high rank, the effects of which are still manifested in modern society.

**CHLORAL** (klō'ral), a colorless, odorous, oily liquid obtained by passing chlorine gas through absolute alcohol to saturation. It is decomposed into chloroform and formate of potassium by the action of caustic potash. It changes into a white solid by keeping, but is reconverted into a liquid by heating. A crystalline compound called *hydrate of chloral* is formed by adding water. This compound is used in medicine in the form of a syrup, as in cases of acute mania, delirium tremens, and severe chorea. If taken in proper quantities, the effects are restful sleep and nerve quietness, in large doses it tends to paralyze the heart and is otherwise harmful, and should never be taken except under medical advice. In medicine it serves both as a hypnotic and an anaesthetic.

**CHLORATE** (klō'rât), a compound formed by replacing the hydrogen of chloric acid by a metallic base. Chlorate of potash is the most important of these salts, which, when mixed with combustibles, such as sulphur and charcoal, forms explosive compounds. It is used in the manufacture of fireworks, matches, and percussion caps. The chlorates of potassium and sodium are used in medicine, especially in cases of inflammation and scarlet fever.

**CHLORINE** (klō'rīn), a yellow-green combustible gas discovered by Scheele in 1774. It has a strong, irritating odor, and affects the bronchial tubes and lungs. In nature it occurs in the form of metallic chlorides, and is artificially obtained by heating sodium chloride (common salt) with black oxide of manganese and sulphuric acid. It is used as a powerful bleaching agent, and is of value for destroying certain forms of animal and vegetable matter. Its property as a disinfectant has given it a wide use, and it is applied for this purpose much the same as chloride of lime.

**CHLOROFORM** (klō'rō-fōrm), a colorless liquid of an agreeable odor, having a sweetish taste and smell. It owes its discovery to Liebig in 1832. The process of preparing chloroform consists of distilling water and alcohol with bleaching powders or chloride of lime. In sunlight it is formed by the direct action of chlorine and methane, or marsh gas. The vapor of chloroform is four times denser than air, boils at 62°, is nearly insoluble in water, and may be dissolved readily in alcohol. It decomposes by exposing to the light, by which means the acid and chlorine are set free. It is used in medicine by dissolving in alcohol. In that state it is known as chloric ether and used as a stimulant. Taken internally, it acts as a sedative narcotic and antispasmodic, and is used in cases of colic, asthma, cholera, and neuralgia. Applied externally, it allays irritation, pain in neuralgia, and itching. It is considered one of the safest anaesthetics, when administered by skillful practitioners, but in the hands of one uneducated in medicine it may produce lasting injury or death. Its use in surgical operations and painful diseases is quite common. Chloroform is also used to dissolve iodine, wax, resins, strychnine, and other alkaloids.

**CHLOROPHYLL** (klō'rō-fīl), the substance which gives the green color to leaves and herbage. It is produced by the protoplasm of plants, and separates into two elements the carbonic acid gas taken in by the leaves—oxygen and carbon. The oxygen is returned to the air and the carbon is converted into starch in the presence of light, hence the green of the

leaves is absent from plants that are deprived of light.

**CHOCOLATE** (chök'ò-lât). See **Cocoa**.

**CHOCTAW INDIANS** (chök'tà), a large tribe formerly occupying lands along the Gulf of Mexico, and extending from the Mississippi to the Atlantic. They were friendly to the French, but later formed an alliance with the English. De Soto engaged them in battle in 1540. In 1784 they acknowledged the sovereignty of the United States. At the beginning of the last century they began to emigrate toward the west. In 1820 they ceded a part of their territory to the government for lands west of the Arkansas, in Indian Territory, now Oklahoma. Their lands in the South came under the control of Georgia, where many Choctaws were granted the right of citizenship. In 1830 they ceded the remainder of their lands and moved with the Chickasaws to Indian Territory. In the Civil War they sided with the Confederates and lost their slaves, about 5,000 in number. Schools are supported among them by the government under a treaty made in 1866, and they are taught in the arts, industries, and sciences, many having made much educational advancement.

**CHOIR** (kwîr), an organized body of singers. The name is applied to the choral singers in churches, cathedrals, and other Christian edifices for worship. In many of the churches, both old and new, the choir occupies a particular place constructed for its use at one side of the altar or chancel, near which is a screen for the organ. See **Church**.

**CHOKÉ DÁMP**, the name given to a fire damp resulting from an explosion of gas in mines. It is also called black damp and after damp, and constitutes an irrespirable gas. See **Carbonic Acid**.

**CHOLERA** (köl'ër-à), the name applied to several diseases more or less similar to each other. *Cholera morbus* is characterized by vomiting and purgative effects with pain in the abdomen and lower intestines, and is accompanied by a loss of strength. It is caused largely by deleterious food or drink taken in the summer season. *Cholera infantum* is a similar disease in children. It is common to hot climates and to the hot seasons in the temperate regions, and in many instances proves fatal. A remedy of much merit consists of equal parts of tincture of rhubarb, tincture of opium, tincture of cayenne, essence of peppermint, and spirits of camphor. This preparation, thoroughly mixed and taken in doses of from fifteen to thirty drops every thirty minutes, is quite certain to give relief.

**CHOLERA**, Malignant, or Asiatic Cholera, a much dreaded disease, the germs of which are conveyed by means of the air or by water, and often proves fatal. It is epidemic in various regions of Asia, and is often spread to different parts of the earth. In 1829 it appeared in Europe and reached Britain two years later, when thousands of people died. It appeared again in 1848, 1854, 1865, 1873, 1875, and 1885. In 1892-93 it appeared in New York, but was prevented from spreading by prompt methods of isolation and sanitation. In 1848 the disease caused the death of 53,293 persons in England and 20,097 in 1854, while in 1855 not less than 55,000 persons died of it in Egypt.

The first stage of the disease is a severe form of diarrhoea with cramps in the abdomen and legs, usually accompanied by marked muscular weakness. In the second stage the patient suffers from intense prostration, feebleness, loss of voice, blueness of skin, and coldness of breath. The third stage is marked by a state of high fevers, with a tendency to suffer a congestion of the brain, kidneys, lungs, or other vital internal organs. In this and the second stage death often results. The best remedies against cholera are preventive medicines. It is favored and spread by conditions of filth and want of sanitation. The disease is primarily caused by a germ of a fungus or minute form of life propagating itself in the food of the alimentary canal. It is thought that the germ is conveyed into the system by unwholesome foods or impure water. Dr. Koch gave the opinion that the disease is due to the common bacillus, and that this organism is multiplied in the small intestines. Some physicians doubt whether these organisms actually produce the disease, but it is known that large numbers of them are found in persons suffering from it.

**CHOLULA** (chò-lōō'là), a city of Mexico, in the state of Puebla, sixty miles southeast of Mexico. It is situated on a plateau 700 feet high, has railroad facilities, and is surrounded by a farming and mining country. At the outskirts of the city is a brick pyramid about 170 feet high which covers over twenty acres, supposed to have been erected by the aborigines in honor of the deity Quetzalcohuatl. Among the manufactures are fireworks, textiles, pottery, and machinery. It has considerable trade, a fine public park, and several schools and churches. Cholula is an ancient city and when visited by Cortez in 1519 it had many temples and 20,000 houses. The Spaniards massacred many of the inhabitants on account of their hostility to Spanish influence. Population, 1908, 10,240.

**CHOPSTICK** (chöp'stĭk), one of two small sticks used by the Chinese in conveying food to the mouth. Chopsticks are made of wood, ivory, or bamboo, and are a substitute for a knife and fork. They are used with much dexterity even in eating food of a liquid character.

**CHORAGUS** (kō-rā'gūs), a music director among the ancient Athenians, appointed by the state to be the leader and trainer of a chorus in dramatic contests. It was an office of high dignity and the choragus who was adjudged to have exhibited the best entertainment received a crown and tripod as a prize. He was permitted to build a monument and on it expose his tripod. A street in Athens was formed almost entirely by these monuments, known as the Street of the Tripods. The monument of Lysicrates, erected in 334 B. C., still stands intact.

**CHORD** (kôrd), in music, a combination of sounds, the frequency of whose vibrations has a simple arithmetical ratio; that is, of sounds whose combination is in accordance with the laws of harmony. The common chord consists of a bass or fundamental tone and is the basis of all harmony.

**CHORUS** (kō'rūs), a term applied to a company of singers and musical recitationists, who perform with appropriate gesticulation. The term originated from the Grecian and ancient tragedy, when choruses were made up of troupes of males and females. They appeared on an elevated stage and engaged in singing and dancing as a means of heightening the pomp and solemnity at festivals. In comedy the number in the chorus was twenty-four consisting of one-half males and one-half females. The chorus in music is that part of a composite vocal performance which is executed by the singers of a body, or company, and in which all take part. It is distinguished from the solo airs in that they are rendered by select voices. In song it is applied to the stanza in which the singer is joined by the company.

**CHOUANS** (shōō'anz), a party of French royalists, who rose in arms against the revolutionary government in 1791. They were largely peasants of Maine and Brittany and carried on a warfare against the republicans during the French Revolution. Napoleon sent an army of 30,000 men to suppress them in 1799, but they continued more or less aggressive until 1815.

**CHRISTCHURCH** (krĭst'chŭrch), a city in New Zealand, capital of the province of Canterbury, on the Avon River, about eight miles from the sea. The surrounding country is fertile. It is connected by a railway with Lyttelton, its port. The chief buildings include

Christ College, the high school, the city hall, and a number of churches. Many of the streets are paved with stone and asphalt. A street railway system, waterworks, electric lights, and sewerage are among the utilities. The manufactures include clothing, furniture, packed meat, and machinery. It has a large interior and foreign trade, especially in grain, minerals, and live stock. The city was founded in 1849. Population, 1906, 49,928.

**CHRISTIAN CATHOLIC CHURCH**, a religious denomination organized by John Alexander Dowie in 1896, and whose principal seat of influence is at Zion City, Ill. The founder of this sect was a minister in Australia and came to the Pacific coast of the United States to preach and practice faith healing, and subsequently settled in Chicago, where many became converted to his teaching. He founded Zion City on a tract of 6,600 acres, which was purchased for the avowed purpose of building a model Christian city. The land was not sold in fee simple, but instead was leased on contracts that expire in the year 3,000, running for the period of about 1,100 years. This arrangement was agreed upon for the purpose of providing a guarantee against any part of the city being used for purposes not sanctioned by the church, such as conducting a drug store or doctor's office, establishing saloons and playhouses, raising swine, or keeping for sale and selling liquors, oysters, and tobacco in any form.

The Christian Catholic Church carries on educational and commercial work as well as religious teaching. At Zion City are a number of primary and grammar schools, and industrial and general educational work is done at Zion College, all of which institutions are maintained in common with church work. The industries are managed by a board of control. They include publishing and printing, the selling of general merchandise, and the manufacture of soap, candy, lace, clothing, harness, and crackers. The denomination numbers about 100,000 souls, distributed more or less in the United States and Canada, and has adherents in Australia, England, China, South Africa, and other regions visited by missionaries. The teaching is confined generally to the principles of the Christian religion and the sacraments are observed. Special prominence is given to divine healing, and the dogma that diseases are cured in answer to prayer is given marked prominence. Trine immersion is practiced in the sacrament of baptism, and at the close of meetings is a united consecration service. Among the official publications are *Leaves*

of *Healing*, "Voices from Zion," "Elijah, the Restorer," and "Zion's Conflict with Methodist Apostasy."

In 1906 the society became involved in financial difficulties and contentions arose among the members. Dowie was deposed by a faction, while he was on a trip to found a colony in Mexico, and Wilbur Glen Voliva was made the official head of the organization. General nervousness and the mental strain caused by financial reverses hastened Dowie's death, on March 9, 1907. The property of Zion City, at the time of his death, was worth about \$10,000,000.

**CHRISTIAN ENDEAVOR, United Society of**, an association founded by Francis E. Clark at Portland, Me., in 1881, for training the young for the duties of Christian membership. It has societies in the United States, Canada, Great Britain, Australia, China, India, Japan, and other countries. In 1908 the number of societies affiliated with the main body numbered 67,342, with a membership of 4,212,500. The membership is distributed among all evangelical denominations. No taxes are levied and the main bodies assume no authority over the societies in the different churches. These are regulated and managed locally. The purpose of each local society is to encourage an earnest and useful Christian life on the part of each member, to increase mutual acquaintance, and to develop in all the practical duties of Christianity. Annual gatherings are held under the auspices of the united societies. *The Christian Endeavor World* is the official organ.

**CHRISTIAN ERA**, the epoch or era introduced by the birth of Christ. The beginning of the epoch was calculated about the year 532 by Dionysius, a Syrian monk. It is certain that he fixed the event too late by four years and that Christ was born, according to his calculations, in the year 4 B. C. Hence the year 1908 should have been written 1912. The Christian era is sometimes called the Dionysian era. Time before the birth of Christ is marked B. C., after Christ, A. D. This did not become general in Christian countries until about the middle of the 15th century.

**CHRISTIANIA** (krīs-tē-ä'nē-ä), or **Kristiania**, the capital of Norway, located in the province of Christiania. It is situated on an inlet from Skager Rack, known as Christiania Fiord, about sixty miles from the Skager Rack. It was named in honor of Christian IV., who laid the foundation of the city in 1624. The architecture is usually plain and without much ornamentation, and the buildings are constructed mostly of brick and stone. Among the

most important structures are the university, an observatory, the palace of the King of Norway, the legislative house, or Storting, and several cathedrals. The Aggershuus is an old castle which stands on a point of land projecting into the fiord. In connection with the university is a museum of antiquities and an excellent library. Several lines of railroads connect it with the interior of Norway and with Sweden. The manufactures include glass, soap, ironware, woolen goods, tobacco, leather, paper, spirits, machinery, liquors, clothing, and textiles. Its exports consist largely of iron, machinery, and lumber. It has a beautiful location, electric street railway connections, gas and electric lights, several parks, and numerous statues and monuments. The city is one of the cleanest and most healthful in Europe. Nearly all the inhabitants are Protestants. Population, 1906, 235,783.

**CHRISTIANITY** (krīs-chăn'ī-tŷ), the doctrines and precepts taught by Christ; the Christian religion. The Christians are separated into many sects, but nearly all agree with respect to certain fundamental doctrines. They embrace the belief in a Supreme Being, the one living and true God. The great majority hold to the tenet that in the Divine Unity there is a Trinity—the Father, the Son, and the Holy Spirit—to all of whom worship of the highest kind is given. The Father is assigned as the first person of the Godhead; Jesus Christ as the second person is held as God and man; and the Holy Spirit is assigned as the third of the Trinity. The Scriptures of the Old and New Testaments are held to be inspired in a sense in which no other book is inspired, and are, therefore, in the highest degree fitted to enlighten the minds of inquirers as to religious duties.

The first followers of Jesus formed a community or society at Jerusalem shortly after the crucifixion of their Master. In the year 65 an organization was founded at Antioch, in Syria, which assumed the name of *Christians*, and the doctrine of Christianity was soon spread through the provinces of the Roman Empire by traveling apostles. Christian societies were organized in the 1st century in Palestine, Asia Minor, Syria, Greece, Italy, Northern Africa, and the islands of the Mediterranean Sea. Fully one-third of the inhabitants of the Roman Empire embraced this belief by the beginning of the 4th century.

Branches existed early in Christendom; the Gnostics date from the time of the apostles, while the Nestorians originated in the 5th century. Among the important events of the Chris-

tian era are the separation of the Greek Catholic and the Roman Catholic churches in the 8th century, the Crusades of the 12th century, and the establishment and rise of Protestantism in the 16th century. At present there are 478,000,000 Christians in the world, of which number 215,000,000 are Roman Catholics, 160,000,000 Protestants, and 130,000,000 Greek Catholics. The most numerous of the Protestant sects are the Lutherans, Calvinists, and Anglicans, in the order named.

**CHRISTIANS**, a religious sect, comprising the Christian Connection and the Christian Church. These Protestant denominations were organized under the leadership of Abner Jones, at Lyndon, Vt., in 1800, and are now largely represented in Canada and the United States. The Bible is accepted as the only rule of faith, and it is interpreted by the individual rather than under the direction of creeds. Members are admitted on a simple profession of belief in Christianity and Christian character is the only test of membership. They support Sunday schools, prayer meetings, and missionary enterprises. The majority are trinitarians and teach baptism of believers by immersion. In 1908 they had 1,350 churches and an estimated membership of about 1,195,000. They support 150 institutions of instruction with more than 5,500 students.

**CHRISTIAN SCIENCE**, a form of Christian religion based upon the Bible, discovered in 1866 by Mary Baker G. Eddy, who founded the denomination and is the author of its text-book, "Science and Health, with Key to the Scriptures." The basic teaching is that God, the infinite Person, is Love; that He is the only Creator, hence that He has made all that really exists, and has pronounced all creation "very good," according to Scripture. From these premises, Christian Science deduces the temporal and unreal nature of sin, disease, evil, all the phenomena of mortal existence, and declares that these abnormal and unspiritual conditions can be overcome by divine power. Christian Science is organized in nearly all countries. It is estimated that over a million persons have been healed by it and are interested in it. There are 957 churches and societies throughout the world. Among the denominational publications issued by the Christian Science Publishing Society are *Christian Science Journal*, a monthly periodical; *Christian Science Sentinel*, a weekly paper; *Der Christian Science Herold*, *Christian Science Quarterly*, and *Christian Science Monitor* (daily).

**CHRISTMAS** (kris'mas), the festival observed by the Christian Church on the 25th day of December in commemoration of the birth of

Jesus Christ. No certain knowledge of the birthday of Jesus Christ existed, and its observance was not established until some time after the organization of the first churches. Augustine regarded Good Friday, Easter Sunday, Ascension Day, and Whitsuntide as the only festivals established by the apostles and sanctioned by the general council. He declared Christmas to be of later origin and of lesser authority. Clement of Alexandria mentioned Christmas in the beginning of the 3d century and Chrysostom speaks of it in the 4th century as having been observed for some time. The early Christians of the Orient thought that both the birth and baptism took place on the 6th of January, while Clement of Alexandria held that the 20th of May or the 20th or 21st of April should be observed.

The 25th day of December was advocated by Julius I., Bishop of Rome from 337 to 352, as the most suitable time to commemorate the birth of Christ. This claim was strengthened by the church of the East, which held to the view that the baptism took place on the 6th of January. The day was finally placed on December 25th, which made it possible for all nations to observe a festival of rejoicing that the shortest day of the year has passed. This selection was approved by many prominent Christians because it placed a festival between Whitsuntide and Good Friday. Christmas festivities with their songs, trees, toys, and religious ceremonies are always favorites. A special religious service for Christmas day is held by the Greek, Lutheran, Roman, and Anglican churches. Catholic priests may celebrate three masses on Christmas day. A large number of churches hold no celebration on the two days immediately following Christmas, but nearly all of them have special services.

**CHRISTMAS ISLAND**, an island in the Indian Ocean, about 250 miles south of the western end of Java. It has valuable beds of phosphate of lime, which are worked quite extensively. The island is a British possession and is a dependency of the Straits Settlements. Another island of the same name is located in the Pacific Ocean, with an area of 234 square miles and a population of 115. It was discovered by Cook in 1777, and is governed from the British administration of the Fiji Colony.

**CHRISTMAS ROSE**. See *Hellebore*.

**CHRISTOPHER'S, Saint**, or **Saint Kitts**, an island in the West Indies, one of the Leeward Islands, about five miles wide and twenty-five miles long. It has an area of 65 square miles. The surface is mountainous, the highest peak being Mount Misery, 4,150 feet. Basseterre is a seaport and the chief city. Local gov-

ernment is administered by a legislature, and is subordinate to the government of the Leeward Islands, under the direction of the British. The island was discovered in 1493 by Columbus and was settled by the English in 1623. Population, 1906, 30,176.

**CHRIST'S HOSPITAL**, a celebrated orphan's school at London, founded in 1553 by Edward IV., as a hospital for poor orphans and foundlings. It is popularly known as the Blue-Coat School, from the picturesque dress of the boys who attend the institution. It has a boys' and girls' preparatory school at Hertford, founded in 1682. Two day schools were opened in 1890 for 600 boys and 400 girls. King Charles II. enlarged the original endowment, and the annual income now amounts to \$300,000 per year. The education is classical, but modern literature and languages are taught. The institution, including the departments at Hertford and Hortham, has accommodations for 2,500 students. A fire destroyed the first building in 1666, but it was rebuilt by Sir Christopher Wren. The present building was erected in 1825 by Shaw. At this institution the following well-known men received their education: Camden, Richardson, Stillingfleet, Coleridge, Charles Lamb, Leigh Hunt, and Sir Henry Maine.

**CHROMATIC** (krō-măt'ík), a term in music. A chromatic chord is one which contains a note or notes foreign to diatonic progression. The eight diatonic tones and five intermediate tones make the *chromatic scale*.—Chromatics is the science of colors.

**CHROMIUM** (krō'mī-ŭm), one of the metallic elements, discovered in 1797 by Vanquelin. It was so named from the number of colored compounds which it forms. It is found in combination with iron and chromite, never in a free state. The latter is a brownish-black ore and is the principal source of chromium. Chrome green, or ultramarine green, is a pigment obtained from chromium. Chromium steel is a kind of steel which contains about one per cent. of this metal, and is valuable for its great hardness and tenacity. Deposits of chromite are found in Asia Minor, Bohemia, Norway, and the Rocky Mountains of Canada and the United States.

**CHRONICLES** (krōn'ī-k'ls), a portion of the Bible. It forms but one book in the Hebrew, but was divided into two books by the Septuagint translators and was placed directly after I and II Kings. The Hebrew name means *words of day*; thus, has the same significance as our diaries or journals. The Chronicles are among the latest compositions of the Old Testament, and show evidences that the writer knew of

many of the earlier books. In the first nine chapters is a line of genealogies which covers a period from the creation to the middle period of the Persians. The work contains valuable contributions to our knowledge of the history of the Israelites.

**CHRONOGRAPH** (krōn'ō-gráf), an instrument used to measure and record minute portions of time. It is intended specially for measurements in astronomy, where a record is desired of the exact instant of the occurrence of an event, such as the transit of a star. The so-called recording chronograph is designed to mark the instant of observation in hours, minutes, seconds, and hundredths of a second, in printed characters, and in a form suitable for preservation and reduction. Another form of the chronograph is used at horse races and other occasions where a seconds watch is not exactly suited. It has an ordinary quick-train lever movement, carrying hands which move over a dial. One of these is a seconds hand, which is usually double, consisting of two distinct hands, one superposed over the other. Chronographs used in astronomical observation are usually moved by electricity.

**CHRONOLOGY** (krō-nōl'ō-gŷ), the science of computing and adjusting dates and epochs of time by divisions and periods to facilitate in assigning events to their proper times. The system of chronology differs among the nations of the world. The motions of the heavenly bodies produce the natural divisions of time into days, months, years, and cycles. Exact computation can be made only from a point or *epoch*, which is taken to mark the beginning of an *era*. The Jews compute from the creation of the world; the Christians, from the birth of Christ; the Greeks, from the Olympiads; the Romans, from the building of Rome; and the Mohammedans, from the *Hegira* or flight of Mohammed. Besides these, there are various other epochs and data on which to base the assignment of historical facts, scientific discoveries, or notable events occurring in the history of the world. In the Christian chronology, the years before Christ are marked B. C. and those after, A. D. (*Anno Domini*, in the year of our Lord).

**CHRONOMETER** (krō-nōm'ē-tēr), an instrument for the exact measurement of time. The term does not especially include clocks, watches, hour glasses, and other similar devices for the measurement of time, but is restricted more particularly to the instruments having compensations and adjustments to render them independent of the fluctuations of temperature. Their chief use is for making astronomical ob-

servations and in measuring longitude at sea. The capacity of these instruments to keep accurate time under great variations of temperature determines their value. Those used at observatories are carefully tested by exposure to heat and cold varying from about  $-60^{\circ}$  to  $+120^{\circ}$ , the extremes within which they are expected to keep exact time. Chronometers used on ships are suspended in gimbals, so the instruments will always maintain the same position.

**CHRYsalis** (kris'á-lis), the last stage through which moths and butterflies pass when going from the larva or caterpillar state to the perfect or winged state. In this stage the insect takes no food, is inactive, and is inclosed in a transparent case composed of fibers spun by the larva. Many species, while in this stage, have a metallic luster. The length of this period depends upon the species and the season. It is attended by changes that take effect in the interior of the insect, its organs securing proper development for the support of the future being.

**CHRYsANTHEMUM** (kris-án'thē-mūm), a flowering plant common to the temperate parts of America and Europe. It belongs to the Compositae order and includes about 150 species. Many are cultivated in gardens and parks for their flowers. The common species include the *golden feather*, *corn marigold*, *marguerites*, and *ox-eye daisy*. Various species have been cultivated in China many years and several were brought to Europe in 1764, where they have been developed by cultivation into many colors and forms. They bloom in gardens late in the fall, in some localities in October, November, and December. In shape they range from the plain to the double and semidouble species, and the flowers are either erect or reflexed. They are propagated by the seeds and by cuttings.

**CHRYsolite** (kris'ō-lit), a mineral composed chiefly of iron, silica, and magnesia. It occurs in transparent crystals and is usually of a greenish color, but sometimes black, and is used as a cheap kind of ornamental stone by jewelers. Chrysolite is found in basalt near Montreal and other parts of Canada, in the Hawaiian Islands, in Arizona, and in New Mexico. The species found in New Mexico closely resemble garnet and are called *Job's tears* from their peculiar appearance.

**CHRYsOPRASE** (kris'ō-prāz), a greenish variety of chalcedony, valued as an ornamental stone. It is found in the mountains of Oregon, especially at Riddles, and in several places of Germany. Jewelers use it to some extent for mountings in rings, and the inferior specimens are employed in making necklaces, brooches, and seals. Some grades lose their color with

age, especially if kept in a light and warm place.

**CHRYSLER'S FIELD**, a locality in Dundas County, Ontario, and the site of a battle in the War of 1812. The American army was commanded by Gen. Wilkinson and the British and Canadian troops were under command of Lieutenants Pearson and Morrison. On Nov. 13, 1813, the Americans made the attack in the open fields of John Chrysler, a British military captain then in service. The battle lasted five hours, victory alternately favoring one and then the other. Night ended the conflict with the British in possession of the field. The American loss was 339 and the British lost 187 men.

**CHUB**, a fish of the carp family, found chiefly in the rivers of Europe. The upper parts are bluish-black, passing into silvery white beneath, and the cheeks are yellow. It weighs about five pounds at maturity and is esteemed for the table. Anglers find it good game, and use worms, cheese, and cured meat for bait. The chub spawns in April and May and bites best in June and July. Several allied species are found in America, including the *chub* of the Columbia River and the *river chub* of the Alleghenies.

AMERICAN CHUB.  
RIVER CHUB.

**CHUQUISACA** (chōō-kē-sā'kà), the name formerly given to the capital of Bolivia. It is now commonly called Sucre, which see.

**CHURCH**, a term first used by the New Testament writers to denote the whole community of Christians, and now applied to the whole body of Christians collectively. It is employed in a more restricted sense to designate a distinct denomination of Christians, as Lutheran, Roman Catholic, Greek Church, Methodist, etc. It is also applied to a building set apart and consecrated for Christian worship. Many public halls or basilicas, courts of adjudication, and heathen temples were consecrated

as Christian churches after the conversion of Constantine. Later special edifices of wood, brick, or stone were built in various styles of architecture. These are designated as chapels, churches, collegiates, conventionals, or cathedrals, this depending upon the style of architecture and the purpose they serve. Many of the ancient churches have the semicircular *apse*, in front of which is the *altar*, and near the latter is the *choir*. This arrangement is maintained in some of the newer edifices, but many modern churches have neither the *apse* nor the *altar*, and in some buildings the *choir* occupies one entire upper end of the church.

**CHURCHILL** (chûrch'il), an important river of Canada, rises between the Athabasca and the north branch of the Saskatchewan. It has a northeasterly course and flows into Hudson Bay. Its entire length is about 850. It receives the Beaver River, which rises in Alberta, and drains a large number of lakes, including Reindeer and South Indian lakes. Missinippi and English are other names of the Churchill River.

**CHURN**, a vessel in which cream or milk is agitated to effect the separation of the butter from the fluid portions. The churn of the pioneers is usually made of a conelike tub, in which the churn dasher is moved by means of a rod or stalk fixed to it. Those of newer manufacture have an inner device by which the churning is effected, or, in other cases, the entire vessel is made to revolve on a shaft. Many of the larger farms have churns that are worked by a gasoline engine or steam or horse power. The churns used in creameries are very large and are propelled by steam power. In some cases the machine is a combined churn and butter worker.

**CHURUBUSCO** (chōo-rōō-bōōs'kō), a village of Mexico, located six miles south of the City of Mexico. It was the scene of a battle between the Americans under Gen. Winfield Scott and the Mexicans under Gen. Santa Anna on Aug. 20, 1847. The Mexican army was guarding the approach to the city and was entirely defeated. Gen. Scott captured 3,000 prisoners and thirty-seven fieldpieces, and gained the battle at Contreras on the same day. The American loss was 1,053 men, while the Mexicans lost in killed and wounded about 4,000.

**CHUSAN ISLANDS** (chōo-sān'), an island group on the east coast of China, the largest of which is called Chusan. This island is from six to twelve miles wide and about twenty-two miles long. Much of the surface is mountainous, with fertile valleys penetrating among the hills. Rice, cotton, tea, tobacco, camphor, and bamboo

are the leading products. The mountain districts contain valuable minerals. These islands were in the possession of the British in 1840, 1841, and 1860. The group contains several monasteries and Buddhist temples. Tinghai, a fortified town, is the chief settlement. For the purpose of administration the islands belong to the province of Chekiang. Population, 1908, 345,540.

**CHYLE** (kīl), a milky fluid found in the lymphatic vessels of the bowels during digestion. It is opaque and under certain circumstances assumes a yellowish or slightly reddish color. After the food is digested in the stomach, it is converted into a yellowish liquid known as *chyme*, which passes into the duodenum, where it is acted upon by the pancreatic secretion and bile. The result is the *chyle*, which, in the thoracic duct, is an oily liquid of considerable turbidity, and is carried into the veins and mingled with the blood. The nutritive portion of the food is contained in the chyle.

**CICADA** (sī-kā'dā), the name applied to a genus of hemipterous insects common to many regions of both hemispheres. They are well known by their peculiar notes, which are made by drumlike appendages attached to the sides of the body, called the *timbal*. The eggs are deposited in the twigs of trees or shrubs by the adult female insects. The larvae fall to the ground and burrow, and during the larval state feed on the juices of roots. Several species occur in North America, among them the *seventeen-year*

SEVENTEEN-YEAR LOCUST.

A, Adult; B, Larva.

*locust*, which lies beneath the ground seventeen years, after which it emerges to become a perfect insect. However, the development is hastened by heat; hence, in the warmer localities, the broods come out in about thirteen years. Some cicadas require much less time in developing, while different areas are frequented by these insects in different stages of development; thus, cicadas develop almost every year. In the United States a record has been kept of about fifteen different broods that appear at definite places and times.

**CIDER** (sī'dēr), a liquor made from the juice of any fruit, but most commonly from apples. In making apple cider the juice is pressed from the crushed apples by a cider

press and allowed to flow into casks. It ferments in the open air and a clear liquor results. The fruit used should be ripe, as the per cent. of sugar in ripe apples is much greater than in partially ripe or green, and therefore yields a larger proportion of alcohol. Fresh cider is a sweet, pleasant beverage. Cider brandy, or *applejack*, is obtained by distilling fermented cider.

**CIENFUEGOS** (sē-ĕn-fwă'gōs), a seaport city of Cuba, capital of the province of Santa Clara, on the Bay of Jagua, an inlet on the southern coast of the island. The city is one of the finest in Cuba. It is connected with other cities by a number of railroad lines. The exports include sugar, wax, tobacco, rum, and molasses. A large number of trading vessels visit it annually and connect it with the leading seaports of the world. It has many fine public buildings and churches. There are regularly established public schools of instruction for free attendance in all parts of the city. Electric lights and street car lines were built shortly after the war with Spain. The city was founded by refugees from Santo Domingo in 1819. Population, 1907, 60,142.

**CIGAR** (sī-gār'), a small roll of tobacco made of tobacco leaves and designed for smoking by lighting one end and drawing smoke through it. The choicest brands are imported from Cuba, or are manufactured from tobacco grown in the vicinity of Havana. *Cigarettes* are small cigars made of a small quantity of fine tobacco and used for smoking. *Cheroots* are thicker at one end than at the other, and are smoked the same as cigars.

**CILIA** (sil'ī-à), the common name of hair-like processes that cover the surface of certain cells, and line the trachea and bronchia. They are in constant motion to sweep out secretions and dust. Their arrangement is in rows. The size ranges from  $1.1000$  to  $12.1000$  of an inch in length. Cilia occur upon the mucous membrane of various organs of the vertebrate animals, especially upon the epithelium, and in certain invertebrates they serve by the rapid vibration as organs of locomotion. In the cells of plants the cilia are exceedingly delicate protoplasmic fibrils.

**CILICIA** (sī-lish'ī-à), an ancient country of Asia Minor, bounded on the north by the Taurus Range, east by the Amanus Mountains, south by the Mediterranean, and west by Pamphylia. It included much of the fertile plain near the sea, the valley of the Cydnus River, and a mountainous region in the western part. Tarsus, the chief city, was long important as a center of education and commerce. The Cili-

cians were distinguished for maritime enterprise. Their country was invaded by the Assyrians, but remained independent until it was conquered by the Persians. A Roman army under Pompeius subdued the Cilician pirates in 67 B. C., who had fortified themselves in the mountains.

**CIMBRI** (sĭm'brī), the name by which a people were known who fought with the Teutons of northern Germany against the Romans in the year 113 B. C. In several great battles they were victorious, but were defeated by Marcus in the Battle of Verona, in the year 101 B. C. Their horsemen were armed with helmets, spears, shields, and coats of mail. In the early battles with the Romans they displayed much courage and bravery, even the women showing many marks of daring. They are mentioned by Greek writers in connection with the Scythian Cimmerii of the Crimea, but modern writers regard them as Celtic, and connect them with the Cymri of Britain. Plutarch and Tacitus regarded them as Germans.

CINCHONA.

A, Flower; B, Fruit.

**CINCHONA** (sĭn-kō'nà), a genus of trees found in the Andes of Peru and adjacent coun-

tries, and subsequently introduced into India, Java, and Ceylon. It produces a medical bark of much value, known as *cinchona bark*, from which alkaloids, cinchonine, quinine, and other valuable drugs are extracted. The bark is taken off in strips and is renewed by natural growth. In the market the product is known as *Peruvian bark*. The trees are evergreen and have opposite leaves, and the flowers resemble lilacs in appearance. The bark is carefully dried when peeled off, and afterward is baled in packages weighing about 150 pounds. Gathering cinchona bark is a growing industry in Peru and Bolivia. See **Quinine**.

**CINCINNATI** (sĭn-sĭn-nă'tĭ), the second largest city in Ohio, county seat of Hamilton County, located on the north side of the Ohio River, opposite the mouth of the Licking River. It is 115 miles southwest of Columbus, 270 miles southeast of Chicago, 765 miles from New York, and the focus of a network of important steam railroads and electric railway lines. The Miami and Erie Canal connects the navigation of the Ohio River with that of the Great Lakes, hence it has transportation facilities that are rarely excelled.

**DESCRIPTION.** The city has an area of thirty-eight square miles, with a river frontage of nearly fourteen miles. It is built upon two picturesque plateaus, the first of which is near the river and is sixty-five feet above low water mark, while toward the north it rises in abrupt steps to a height of 400 feet above the Ohio. The elevated portions are surrounded by a series of semicircular bluffs, affording a fine view of the city and the surrounding country. Improved highways and inclined plane railways make the summits of the hills as well as the plateaus easily accessible, including the beautiful localities known as Mount Auburn, Price's Hill, Mount Adams, Fairview Heights, and College Hill. The city has a number of popular residence districts and suburban places, such as Avondale, Clifton, Winston Place, and East Walnut Hills, these being specially noteworthy for their fine homes and scenic beauty. Across the river, in Kentucky, are Newport, Covington, Bellevue, and a number of other towns and villages. Five bridges cross the river, affording ample facilities for passage by trains, vehicles, and pedestrians. The mean temperature is 55°, while the average in winter is 34° and in summer 75°.

Cincinnati is platted regularly and most of the streets cross each other at right angles. Many large business and office buildings are located in the central business section, which is substantially and compactly built. The Federal

building contains the customhouse, post office, and Federal court, and was erected at a cost of \$5,000,000. It is three stories high, in the Roman-Corinthian style, and is built of a durable quality of freestone. The Masonic Temple, Chamber of Commerce, city hospital, city hall, county courthouse, Odd Fellows' Hall, and several banks and department stores are among the chief buildings, many of which have from ten to twenty stories. Many fine churches are located in different parts of the city. The First Presbyterian Church has a tower 285 feet high. Saint Peter's Cathedral, a Roman Catholic place of worship, is in the Grecian style and has a stone spire 224 feet high. Saint Paul's Protestant Episcopal Cathedral, the First and Second Presbyterian churches, Saint Paul's Methodist Episcopal Church, the Jewish Synagogue, and Saint Francis de Sales Catholic Church are splendid examples of ecclesiastical architecture. All of the Protestant denominations are well represented and have commodious and substantial places of worship. The total number of churches exceeds 200. Cincinnati is the seat of a Protestant Episcopal bishop and of a Roman Catholic archbishop.

**PARKS.** The parks are a feature of the city and cover an area of 575 acres. A collection of wild animals is the chief feature of the Zoölogical Garden, which contains sixty acres, and is beautiful on account of its fine walks and picturesque ravines. Eden Park, or Garden of Eden, located on Mount Adams, incloses 216 acres and is the seat of the Art Museum and Art School. Burnet Wood embraces sixty acres and is located in the northern part of the city. An avenue 100 feet wide has been constructed to Spring Grove Cemetery, the largest and best known, which contains 600 acres. Besides it, there are about twenty-five other burial places. Fountain Square, on Fifth Street, contains the Tyler-Davidson Fountain and is beautified by many rare flowers and vines. This fountain was cast of bronze at Munich, Germany, and cost \$200,000. At Race and Eighth streets is a statue of Garfield, and at Vine and Eighth is an equestrian statue of President William Henry Harrison. Other statues include those of Lincoln and a bronze statue commemorating the soldiers who died in the Civil War, the latter being located in Spring Grove Cemetery.

**INSTITUTIONS.** The public schools range from the kindergarten to the high schools, which fit for entrance into colleges and universities, and have departments of manual training. Among the higher institutions is the University of Cincinnati, with an observatory at Mount Lookout. It is the seat of the Wesleyan Fe-

male College, Lane Theological Seminary, Ohio Mechanics' Institute, Saint Joseph's and Saint Xavier's Jesuit College, and a Hebrew college. The art and professional schools include musical and medical colleges and institutions for instruction in law, commerce, pharmacy, and dentistry. The Museum and Art School, located in Eden Park, has a fine collection of statues and paintings. The public library, with 325,000 volumes, is located in a commodious building on Vine Street. Other libraries include those of the Young Men's Mercantile Association, of the Cuvier Club, of the Ohio Mechanics' Institute, and a number of others. Public charities are numerous.

**INDUSTRIES.** Important as a railroad center and located on the Ohio River, Cincinnati has extensive commercial intercourse with the leading cities of America. The Union Depot on Third Street and Central Avenue is the converging point of most of its railways, but separate stations are maintained by the Pennsylvania and a number of other lines. About 8,000 manufacturing establishments of different kinds are located in the city. These include chiefly slaughterhouses, packing establishments, carriage and wagon works, foundries, breweries, brickyards, machine shops, and boot and shoe factories. In pork packing it takes rank next to Chicago. On Mount Adams is the Rookwood Pottery, which has a wide reputation for the manufacture of artistic and meritorious wares. The city has a large trade in cotton and woolen textiles, furniture, butter and cheese, grains of different kinds, fruits, and merchandise. It is noted as a center of wholesaling.

**HOTELS AND THEATERS.** The chief hotels include the Emery, Grand, Saint Nicholas, Palace, Dennison, Honing, Burnet, and Gibson. Among the chief places of amusement are the Grand Opera House, Columbia Theater, Arbiter Hall, Walnut Street Theater, and the Lyceum. The Music Hall, endowed by Reuben Springer, has a seating capacity for 5,400 persons and contains one of the largest organs in America. Musical societies are very numerous, owing to the large number of German residents. When Charles Dickens visited America for the first time he found more to commend in the social refinement and art advancement of Cincinnati than in any other city of the United States.

**HISTORY.** George Rogers Clark erected two small blockhouses on the site of Cincinnati in 1780, which was probably the first time the locality was visited by white men. The first settlement was made in 1788, when a company from Kentucky and New Jersey settled on a tract of land purchased from the government by

John Cleves Symes. Fort Washington was built in 1789, and the following year the place was named Cincinnati by Gen. Saint Clair, in honor of the Society of the Cincinnati. It was made the county seat of Hamilton County at this time, was incorporated in 1802, and became a city in 1819. Its prosperity dates with the opening of steamboat navigation on the Ohio in 1815. The Miami Canal was completed in 1830 and the first railroad was built in 1843. The citizens of Cincinnati generally opposed antislavery agitation, owing to their close social and commercial relations with the South, but sided with the Federal government during the Civil War. It was threatened by a Confederate force under Gen. Kirby Smith in 1862 and for a time was under martial law. In 1883 a large part of the lower city was submerged by a flood which destroyed many business houses. The famous Cincinnati Riot, incited by the light sentences imposed upon a number of murderers, resulted in burning the courthouse and caused the death of forty-five persons. Population, 1910, 364,463.

**CINCINNATI, Society of,** an organization formed in 1783 by the American and foreign officers in the Revolutionary War. The original purposes included the care for widows and orphans of soldiers who had lost their lives, but later it partook more and more of the nature of perpetuating mutual friendships and remembrances of the noted revolutionary events. It was named from Cincinnatus, the great Roman hero, because he, like many of the members, had been called from the farm in defense of the country. The society now consists of a central organization with branches in the states of Virginia, Maryland, South Carolina, New York, New Jersey, Pennsylvania, Massachusetts, and Rhode Island. Meetings are held triennially, occurring in 1899, 1902, etc.

**CINCINNATI, University of,** a coeducational institution of higher learning at Cincinnati, Ohio. It was founded on bequests made in 1868 by Charles McMicken, and a number of grants were added subsequently by the city. In 1873 the university was opened for instruction; the academic department was added the following year, the medical department was organized in 1896, and the law department was consolidated in the following year with the law school of the Cincinnati College, founded in 1833. The university as now organized includes the academic, law, medical, and graduate departments; the college of engineering; and the summer school. Affiliated with it are the Ohio College of Dental Surgery and the clinical and pathological school of the Cincinnati Hospital. It has a library of 95,000 volumes, a faculty of

175 professors and instructors, and an attendance of about 1,250 students. The endowments and buildings, including equipments, have a value of \$3,500,000.

**CINERARIA** (sĭn-ĕ-rā'rĭ-à), a genus of plants native to South America, including about twenty-five species. They include the garden cineraria, which is an annual with simple leaves and is popular as a greenhouse plant. It is easily cultivated and blooms freely, the flowers being asterlike and include red, white, and purple colors. Most plants of this class have lower leaves with an ashy appearance, hence the name.

**CINNABAR.** (sĭn'nā-bār), the name applied to the sulphide of mercury. It is blood-red in color, crystallizes in the hexagonal system, and is found both massive and crystallized. The *vermilion* of commerce is a valuable pigment and is an artificial mercuric sulphide, while the native cinnabar is mixed with impurities that prevent it from being used directly as a pigment. Cinnabar is found in several localities of the Rocky Mountains, in New South Wales, in Austria, and in South Africa.

**CINNAMON** (sĭn'nā-mŭn), an aromatic bark taken from the under branches of several species of the cinnamon tree, a plant of the

1. CINNAMON. 2. BARK. laurel order. Several species are found in Ceylon, Malabar, and various portions of the East Indies. The trees have yellow flowers, a corn-shaped fruit, and oval leaves, and attain a height of from fifteen to thirty feet. The bark is a staple article of commerce. It is used in the culinary arts and for manufacturing an essential oil. Oil of cinnamon is prescribed in doses of from one to five drops as a stimulant and in the treatment of stomach ailments. See **Spices**.

**CIPHER** (sĭ'fĕr), in mathematics, a character which of itself possesses no value, but when placed after a number increases it tenfold. In decimal fractions a cipher before a number decreases its value tenfold. See **Cryptography**.

**CIRCASSIA** (sĕr-kāsh'ĭ-à), a region in the northwestern part of the Caucasus, in Russia. It is bounded on the north by the Kuban River, on the east by the country of the Lesghians, on the south by Mingrelia, and on the west by the Black Sea. The region is mountainous and is inhabited by the Circassians, a class of warlike

mountaineers. Circassia has been a part of Russia since 1829.

**CIRCASSIANS** (sĕr-kāsh'anz), the name applied to a tribe inhabiting Circassia, a mountainous region in the southeastern part of Russia, in Europe, and including largely the northern slopes of the Caucasus. The inhabitants are divided into a number of tribes with different languages. In religion they are nominally Moslems, but their worship is mixed somewhat with Jewish, Christian, and heathen ceremonies and traditions. They were an independent people in the early part of the 15th century and carried on wars against the Tartars, to whom they afterward became tributary. With the enlargement of Russian territory, they were absorbed after much resistance, and showed further hostilities by leaving Russian possessions and emigrating to the provinces of Turkey. The men are prized as soldiers, while the women are chosen as mistresses by the Turks and are among the handsomest in the harems. The total number of Circassians is estimated at about 150,000.

**CIRCLE** (sĕr'k'l), a plane figure bounded by a curved line called its *circumference*, every part of which is equally distant from a certain point within called the *center*. The *radius* of a circle is a straight line drawn from the center to its circumference, and a straight line drawn through the center and terminated both ways by the circumference is called the *diameter* of a circle. The space inclosed *within* the circumference is called the *area* of a circle. The circumference of a circle is to its diameter about as twenty-two to seven or as 3.1416 to one. In astronomy the circle is divided into 360 equal parts called *degrees*, each degree containing sixty *minutes*, and each minute sixty *seconds*. In geography a circle upon the surface of the earth is called a *great circle* when its plane passes through the center of the sphere, dividing the earth into two equal parts; all others are called *small circles*.

**CIRCLEVILLE**, a city of Ohio, county seat of Pickaway County, thirty miles south of Columbus, on the Norfolk and Western and the Cincinnati and Muskingum Valley railroads. It is nicely situated on the Scioto River and the Ohio and Erie Canal. The manufacturing enterprises include flouring mills, a packing establishment, a canning factory, and machine shops. It has a brisk trade in farm produce and merchandise. Among the chief buildings are several schools, the county and city buildings, and numerous churches. The public utilities include electric lighting, a public library, and a waterworks system. Circleville was settled in 1806

and incorporated in 1814. Population, 1900, 6,991.

**CIRCULATION** (sēr-kū-lā'shūn), in economics, a term used to designate the circulating coin and notes that constitute the currency of a country. In early times articles were exchanged under a system of barter. In the great commercial activity of modern times a monetary system is needed to facilitate convenience in

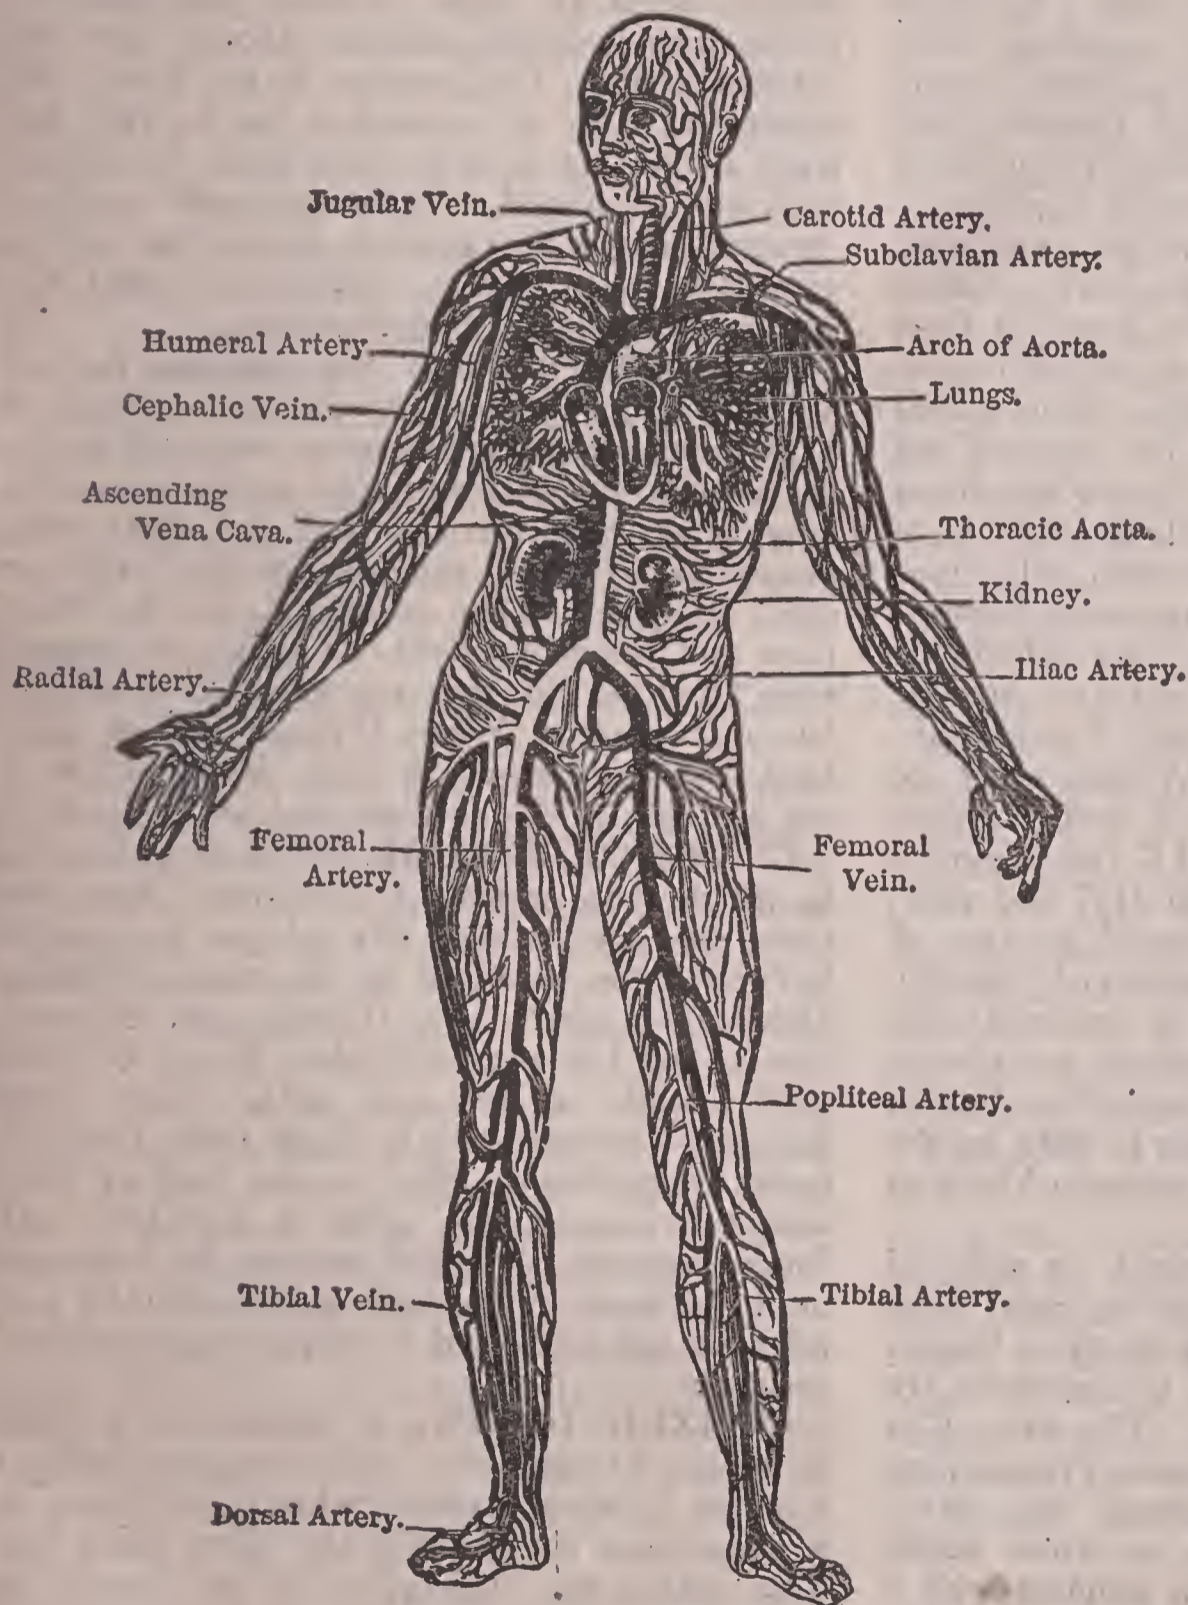

the circulation of the sap in plants. There is no close analogy between the circulation of plants and that in animals. It was thought formerly that sap ascends in the spring and descends in autumn, these two movements constituting the whole circulation. However, it is now known that ascending and descending currents coexist, and that horizontal currents pass between the tissues. The current of sap in ascending enters

the leaves, where it is modified by certain influences which fit it for the nutrition of the plant. It is carried back to the roots by a descending circulation in an elaborated condition. The circulation in plants is not carried on by a central organ as in animals, but rotates within the interior of cells, the fluid of the cell not communicating with the adjacent cells. In the lower forms of animal life, as in the entozoa, there appears to be no circulation, the vital fluid in which they live seeming to be imbibed by their textures.

In *animal physiology* the circulation consists of the blood, which is propelled by the heart, penetrating the arteries, capillaries, and veins of the entire system. Although Galen had observed that the blood flows in opposite directions in the arteries and veins, the circulation was not discovered until 1628 when Harvey demonstrated the connection of the heart with the circulatory system. Malpighi used a microscope, in 1661, to demonstrate the passage of the blood in a frog's foot from the arteries to the veins by the capillaries. The accompanying illustration shows the principal organs of circulation, including the heart

as the center of the system. See **Artery**; **Blood**; **Heart**.

**CIRCUS** (sēr'kūs), an inclosure of space in which sports, games, and various feats of horsemanship are exhibited. The Roman circus was a narrow, long building without a roof in which chariot races, athletic exercises, horse races,

CIRCULATION OF THE BLOOD.

conducting commercial enterprises on a vast scale. The circulation is regulated by the government, restricted to the needs of trade, and guaranteed to remain stable in the exchange for commodities and the payment of public and private obligations.

In *vegetable physiology* the term is applied to

and animal fights were exhibited. It was originated by Romulus, and was made popular by subsequent rulers. The largest of the Roman circuses was the Maximus, capable of holding from 250,000 to 385,000 spectators. Among the few remains of these structures are those of the circus of Caracalla. They were usually oblong and from three to five times longer than wide. The largest in the time of Julius Caesar was 625 feet wide and 1,875 feet long. In these buildings were exhibited games, wrestling, boxing, and sea fights; for the latter purpose canals were dug. The conquerors usually brought large herds of wild animals from foreign countries to exhibit in games for the enthusiastic populace.

When Pompey returned from his expedition he gave a circus occupying five days, during which twenty elephants and five hundred lions were killed. The Roman voters expected candidates for office to give extensive circus games and to contribute otherwise to the comfort and amusement of the partisans. In modern times the circus became largely an exhibition of acrobatic displays, feats of horsemanship, collections of wild animals, and hippodrome performances. Associated with modern circuses are exhibitions of gymnastics, legerdemain, statuary, strange and foreign people, and bold feats of equestrianism. Phineas P. Barnum and William Cody are among the greatest showmen of modern times.

**CISALPINE REPUBLIC** (sĭs-ăl'pĭn), a state organized by Napoleon in 1797 and reorganized by Germany. It contained an area of 16,337 square miles and a population of 3,500,000. However, it received the name of Italian Republic on Jan. 25, 1802, when Napoleon was chosen its president. It was a part of Italy from 1805 to 1814, and was given to Austria in 1815 by the congress of Vienna as the Lombardo-Venetian kingdom.

**CISTERCIANS** (sĭs-tĕr'shanz), an order of monks and nuns founded in 1098 by Saint Robert, abbot of Molesme. It is properly a branch of the Benedictine order and its members are sometimes called Bernardines. The name Cistercians was derived from Citeaux, France, near Dijon, where the first monastery was established. Originally they wore a brown habit, but later adopted a white one supplied with a black scapular. Their monasteries were established chiefly in lonely valleys. They refrained from eating meat, worked hard and slept little, and cultivated an interest in art and literature. This order was well organized in England when Henry VIII. dissolved the monasteries, but at present it is represented by only a few monasteries in Austria and Belgium, and by one in England and two in Ireland.

**CISTERN** (sĭs'tĕrn), a reservoir for water, usually constructed underground, and frequently supplied with a filter to purify the inflow. A cistern receives its water by an artificial channel, which is generally connected with the roof of a house or barn by means of spouting. The construction is chiefly of brick laid in cement and plastered on the inside to prevent the escape of water through the pores of the brick, but cheaper kinds are made by using wood or plastering with hydraulic cement directly upon the earthen walls. The purpose is to obtain soft water and store it as needed, but in arid districts cisterns serve to provide water for household use. Artificial reservoirs or tanks are constructed above the ground where the soil is extremely wet. Large cisterns are used for storage of water in manufacturing.

**CITADEL** (sĭt'ă-del), the strongest part of a fortification, intended as the last defense of a garrison against a besieging army. Citadels are usually supplied with two gates, one communicating with the city and the other with places that furnish supplies for the army in case of siege. They command the fortifications and frequently hold out against an enemy even after the city they are intended to protect has surrendered. When William III. of England besieged Namur in 1695, the citadel held out a month after the town had surrendered.

**CITIES OF REFUGE**, the cities of Canaan in which those guilty of involuntary homicide could flee for safety. Six of the forty-eight Levitical cities belonged to this class, including Shechem, Kedesh, and Hebron, on the west side of the Jordan; and Golan, Bezer, and Ramoth-Gilead, on the east side. They were located so refugees could reach them from all parts of Palestine. Once in the City of Refuge, the accused was given a fair trial. If found innocent of willful murder, he remained until the death of the high priest, when he was released and permitted to return to his former residence.

**CITIZEN** (sĭt'ĭ-z'n), a member of a state or political community. An alien may become a citizen by naturalization, when he is known as a *naturalized* citizen. On the other hand, one born within the jurisdiction of the country is termed a *natural-born* citizen. In most monarchies it is customary to limit the term *citizen* to the residents of a municipality, while the word *subject* expresses the relation of citizenship to the state or country. A citizen of the United States is a citizen of the State in which he resides. A person may be and usually is a citizen both of the nation and of the State, but his rights under the two are legally different.

A resident of a Territory is not a citizen of a State, but is subject to the Federal law. In some states residents are admitted to citizenship in the State, while not eligible to citizenship in the nation. Minors and women are citizens, but the right to vote is withheld from them, though in some states women are granted full privileges, as in Colorado, Wyoming, Utah, and Idaho.

**CITIZENSHIP**, the state of being vested with the rights and privileges of a citizen. In the United States citizenship is extended to all individuals born in the United States, and not subject to any foreign power, except untaxed Indians. Children born elsewhere, but whose fathers were citizens at the time of their birth, are citizens. Women, not citizens, become citizens by marriage to citizens. All persons naturalized are citizens. The Indians who withdraw from tribal relations and enroll as taxpayers become citizens. All classes of foreigners, except Chinese, who prove good behavior and moral character, may be naturalized after five years' residence within the United States. The laws expressly prohibit Chinese from becoming citizens.

**CITRIC ACID** (sīt'rik), an acid obtained from the fruit, roots, and leaves of a number of plants. It is derived largely from the juice of lemons. In preparing it the juice is allowed to ferment, after which it is neutralized with lime, then filtered, and afterward decomposed with sulphuric acid. About five pounds of citric acid are obtained from one hundred pounds of lemons. Among the common plants that yield citric acid are gooseberries, huckleberries, tobacco, grapevines, and sugar beets. The crystalline salts known as nitrates are obtained by combining metals with citric acid. Citric acid is used in treating rheumatism, for effervescent drinks, and in calico printing to prevent the formation of colors not wanted.

**CITRON** (sīt'rūn), a tree common to the warm, temperate, and tropical climates, where it is cultivated for its fruit. It has short and stiff branches, purple flowers, oblong leaves, and large warted fruit. The citron tree was brought from Media by the Romans. It furnishes oil of citron, which is used in confectionery and for culinary purposes. The name *citron* is applied to a variety of watermelon, the rind of which is used for pickles and preserves. It is very hard and inedible, and thrives in most parts of North America.

**CITRUS** (sīt'rūs), a genus of evergreen shrubs and trees native to warm climates, where they are cultivated for their fruit. These plants include the lime, orange, citron, lemon,

and grape fruit, or shaddock. In most species the leaves are pointed and have jointed petioles. A volatile oil is obtained from all the species, used largely in the manufacture of medicine and perfumery. The flowers are peculiarly fragrant and yield a volatile oil, and the fruit is pulpy with smooth seeds and spongy rind.

**CITY**, the name usually applied to a large aggregation of population, the term generally denoting a more populous place than a town. In some states the name is applied to any incorporated town, but in others it is limited to a town having not less than 10,000 inhabitants, and some apply it to a town having at least 2,000 inhabitants. A city in Canada is a municipality of the highest class and is separated from the jurisdiction of the county council. In Great Britain the term is generally applied to all towns that are incorporated and which either are or have been sees of bishops. The larger cities of Greece more nearly resembled a *state* than a *city*, as was the case in Athens and Sparta, and this form of organization is perpetuated in the free cities of Germany.

**CIUDAD REAL** (rā-äl'), a town in Spain, capital of the province of Ciudad Real, about one hundred miles south of Madrid. It is surrounded by a fertile plain, five miles south of the Guadiana, and has railroad conveniences. Among the chief buildings is a hospital founded by Cardinal Lorenzand. It has several monasteries and churches and is the headquarters of the Hermandad, or Holy Brotherhood. The manufactures include leather, woolens, flour, and olive oil. It was founded in the 13th century by Alfonso X., who fortified it as a strategic point. Population, 1906, 15,568.

**CIUDAD VICTORIA** (vĕk-tō'rĕ-ä), a city in Mexico, capital of the state of Tamaulipas, 160 miles southeast of Monterey. It is surrounded by a sugar-growing district, has railroad facilities, and is a market for fruit and sugar. It is the seat of a bishop and the residence of several consular agents. The manufactures include cigars, sugar, clothing, and machinery. It was founded in 1750 and received its present name in 1825. Population, 1906, 16,810.

**CIVET** (siv'ĕt), a carnivorous mammal of Asia and Africa, resembling somewhat the fox and the weasel. The head is long, the ears are short and rounded, and the color is grayish with a tinge of yellow. The body is from three to four feet in length, including the tail, and about twelve inches high. Several species have been described, but the African civet is the best known. It feeds on birds, reptiles, and small quadrupeds, and is regarded a bene-

factor in the valley of the Nile for its ability to devour the eggs of the crocodiles. From it is obtained a fatty substance known as civet. It is a pale-yellow or brownish substance, about the consistency of honey, and is secreted by the

AFRICAN CIVET.

anal glands of this animal. It is removed from the bag about twice a week with a small spoon, and after being cleaned has a value of \$10 or \$12 per ounce. It is used in making perfume. In many sections of Africa civets are kept for this product.

**CIVILIZATION** (siv-ĭ-lĭ-zā'shŭn), a term applied broadly to the culture of a people in contradistinction to those classed as barbaric or savage. A nation is considered civilized when a large proportion of its inhabitants have a high state of intellectual and moral development, and show evidences of increase with the advance of years. Civilization is the outgrowth of material prosperity, between which and the higher state there are frequent actions and reactions. The state of the society of the world exists at the present time with regard to form as barbarous, semicivilized, and civilized. Many scholars and writers believe that the present population of the earth sprung from Noah's family, and that he and all that constituted his household were far advanced in civilization. Others hold a contrary view, thinking that man has shown a systematic growth and development to higher conditions through the ages. This class assert that man originally occupied a barbarous state and that he has advanced from century to century until the present time, although it is admitted that there are some people and nations who have shown no advance, or have fallen back into the state of barbarism, if they ever possessed any degree of civilization.

The first stage of society seems to be a highly barbarous one, in which the food consists of fruits, roots, and fishes. In the second stage man is represented as a hunter, but passes into the state of a shepherd in the third, in which state wild animals are domesticated to avoid the uncertainty of the result in hunting. In the

fourth stage man becomes an agriculturist, and finally, in the last and highest stage, engages in manufacture and commerce. The possibility of civilizing all nations, abolishing wars, and inaugurating peace has long been a question of serious discussion.

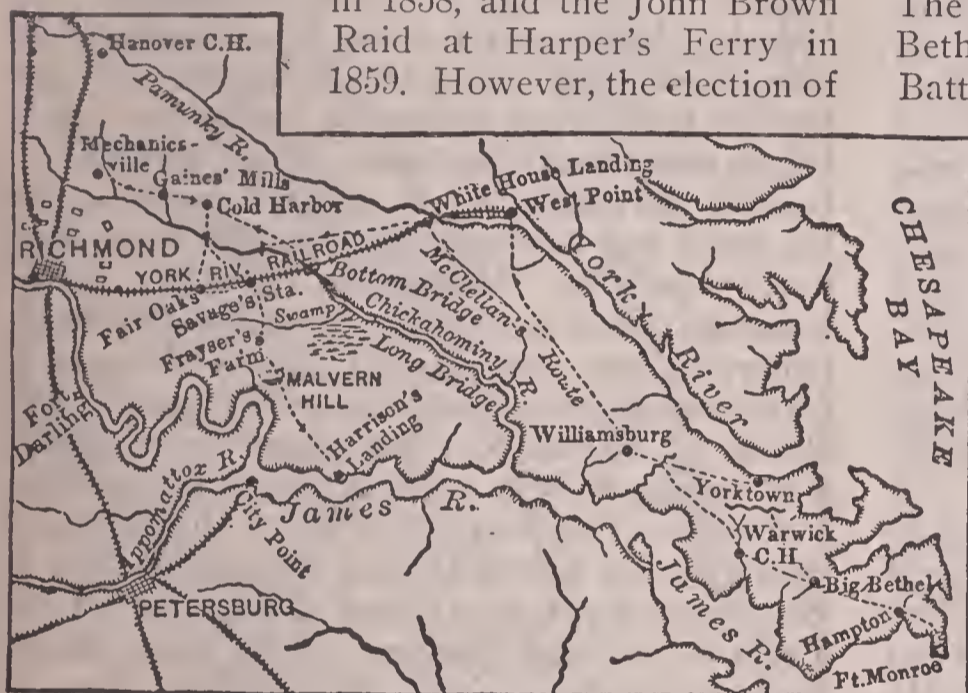

The tendency to higher development seems equal only to the spirit of retrogression, and a nation once civilized may remain in that state only a few decades or centuries. If civilization had been a permanent institution, it would have matured into world-wide achievements from the stages attained in Assyria, Babylonia, Egypt, and the other ancient nations, and by this time have spread to every country. With the rise of civilization in Western Europe there came a period of retrogression in the East, and this, and other examples which might be cited, are evidence conclusive that the work of great physical, mental, and moral effort to make mankind better and wiser must be pursued with ever increasing intensity. However, climate, food, soil, and the aspects of nature are the principal causes of intellectual progress. Viewed from this standpoint, it is assumed that religion, literature, and governments are the products, not the cause, of civilization.

**CIVIL SERVICE**, the service of government which is distinguished from the military and the naval affairs. Government is separated into three branches—*legislative*, *judicial*, and *executive*. The legislative branch is representative of the people, and in it is vested the law-making power. The judicial branch interprets and gives meaning to the law, and establishes and administers justice. The executive branch is the law-enforcing power. Each of the three departments of government is more or less concerned with the civil service. Owing to much responsibility resting upon the different departments, the reform and improvement of this service in many countries has been long a question seriously considered. In the United States partisans often biased appointments to office, which led to inefficiencies and public criticism. Owing to this fact, a system has been established by which competitive examinations are provided for candidates, and the fitness of applicants is tested without regard to politics. Appointments are given to those showing the highest degree of fitness, and these are to remain in office during good behavior. By these means party politics are removed and the efficiency of public service is increased materially. The number of government offices which are now in the civil service list is about 100,000. Within recent years the appointment to office in many cities has been established upon this plan,

which is generally called the *merit* or *competitive* system.

**CIVIL WAR IN AMERICA**, the armed conflict of 1861-65, between the Northern and Southern sections of the United States. Sectional differences had existed from the beginning of the Union, but after the time of the Missouri Compromise of 1820 the differences were based largely upon the economic and social divergence between the North and the South caused by the existence of slavery. Frequent tendencies to disrupt the government prevailed from time to time, but they increased materially after 1850, chiefly on account of the passage of the Fugitive Slave Law and the incidents connected with its enforcement. Other causes of dissatisfaction were the repeal of the Missouri Compromise in 1854, the Dred Scott Decision of the United States Supreme Court in 1858, the Lecompton Constitution for Kansas in 1858, and the John Brown Raid at Harper's Ferry in 1859. However, the election of

SCENE OF THE PENINSULAR CAMPAIGN.

Lincoln in 1860 brought disunion to a head. Seven states seceded between Dec. 20, 1860, and Feb. 1, 1861. These were Alabama, Florida, Georgia, Louisiana, Mississippi, South Carolina, and Texas. The Confederate States of America were organized on Feb. 4, 1861, at Montgomery, Ala., and the four states of Arkansas, North Carolina, Tennessee, and Virginia joined the Confederate States by July of the same year. Kentucky, Maryland, and Missouri were divided and were represented in both armies, while the western counties of Virginia remained loyal to the Union and later were organized as the State of West Virginia.

It was at first expected by many citizens of both sections that there would be a peaceable separation. Buchanan temporized and was succeeded by Lincoln, who at first could not see his

course clearly, but when the Confederates fired upon Fort Sumter, in the harbor of Charleston, S. C., on April 12, 1861, it precipitated the conflict. President Lincoln immediately called for 75,000 volunteers to enforce the authority of the Union and declared a blockade on the coast of the Southern States. The Confederate States likewise called for volunteers and issued letters of marque and reprisal. The North was rich and had a greater variety of industries than the South, where agriculture was the only large industry. However, the people of the South were better united and were pervaded with a more enthusiastic military spirit.

The first blood was shed in Baltimore on April 19th in a street attack on the Sixth Massachusetts Regiment, which was on its way to Washington. It was followed by active operations in the western part of Virginia, which each of the contending parties tried to hold. The Federals were defeated on June 10 at Big Bethel, Va., and on July 21 occurred the first Battle of Bull Run, when the Federals under Gen. McDowell were completely defeated by the Confederates under Generals Johnston and Beauregard. The effect of the Confederate success at Bull Run was to encourage the South and raise a determined spirit in the North, and to unify both sections in support of their respective policies.

Though the experiences of the first year were decidedly against the Federals, their cause was greatly strengthened in 1862. Gen. Thomas succeeded in expelling a large part of the Confederate soldiers from Kentucky, while Pope, Buell, and Grant cleared the upper Mississippi and the lower Cumberland and Tennessee, with battles at Shiloh and Corinth, while Farragut captured New Orleans. Gen. Pope and Commodore Foote captured Island No. 10, in the Mississippi, and Maj. Gilmore bombarded and took possession of Fort Pulaski, near Savannah, Ga. In March of the same year the Confederate ironclad, *Virginia*, formerly the *Merrimac*, was defeated in Hampton Roads by the newly constructed *Monitor*.

Richmond, the Confederate capital, was an objective point in 1862, and Gen. McClellan undertook its capture with the Army of the Potomac. This army was carefully organized and disciplined and took a position on the peninsula formed by the York and James rivers, and in May gained a success at Williamsburgh, Va. It advanced to the Chickahominy and in June won the Battle of Seven Pines, or Fair Oaks, but the Federals were compelled to abandon

the project after a hard-fought campaign of about four months, which included the Seven Days' Battles, known separately as those of Oak Grove, Mechanicsville, Gaines's Mill, Savage's Station, Frazier's Farm, and Malvern Hill. McClellan was superseded by Halleck in July and the contest was shifted to northern Virginia, where occurred the second Battle of Bull Run between the Federals under Pope and the Confederates under Lee, Longstreet, and Jackson, in which the Federals were defeated and driven back upon Washington. Lee now concluded to strike a master blow by crossing the Potomac into Maryland, but he was met at South Mountain by McClellan, who defeated him in the severe Battle of Antietam and compelled him to fall back into Virginia. In September Stonewall Jackson recaptured Harper's Ferry, where the Confederates took about 12,000 prisoners and valuable stores. The latter made an heroic effort to drive the Federals out of Kentucky and Tennessee, and Gen. Bragg with an army of 45,000 men entrenched himself at Perryville, where he was defeated by Rosecrans and Van Dorn was repulsed at Corinth. Buell, who had been commander of the Army of the Cumberland, was succeeded by Rosecrans, who engaged Bragg's army in a battle lasting three days at Murfreesboro, after which the Confederates retreated. Among the severe losses of the Confederates during the year was the death of Gen. Johnston, who fell at Shiloh, or Pittsburg Landing, on the Tennessee, in April.

The proclamation emancipating the slaves in the rebellious states, which had been decreed by President Lincoln in September, took effect Jan. 1, 1863. During the year the campaigns turned the tide in favor of the Federals. Hooker succeeded Burnside as commander of the Army of the Potomac, but was defeated in a great battle at Chancellorsville, where the Confederates lost Stonewall Jackson, and Lee undertook the second invasion of Maryland. Meade succeeded Hooker as commander of the Army of the Potomac and immediately pursued the Confederates. The armies met at Gettysburg in July and fought desperately for three days with the result that the Federals gained a complete victory. Lee crossed the Potomac into Virginia and took a stand at the Rapidan. Meanwhile Gen. Grant undertook the capture of Vicksburg, which the Confederates had fortified, and Pemberton was compelled to surrender his army of 30,000 men almost the same time that the victory of Gettysburg was won. Port Hudson fell in July and gave the Federals complete control of the Mississippi, thus dividing the Confederacy into two sections. How-

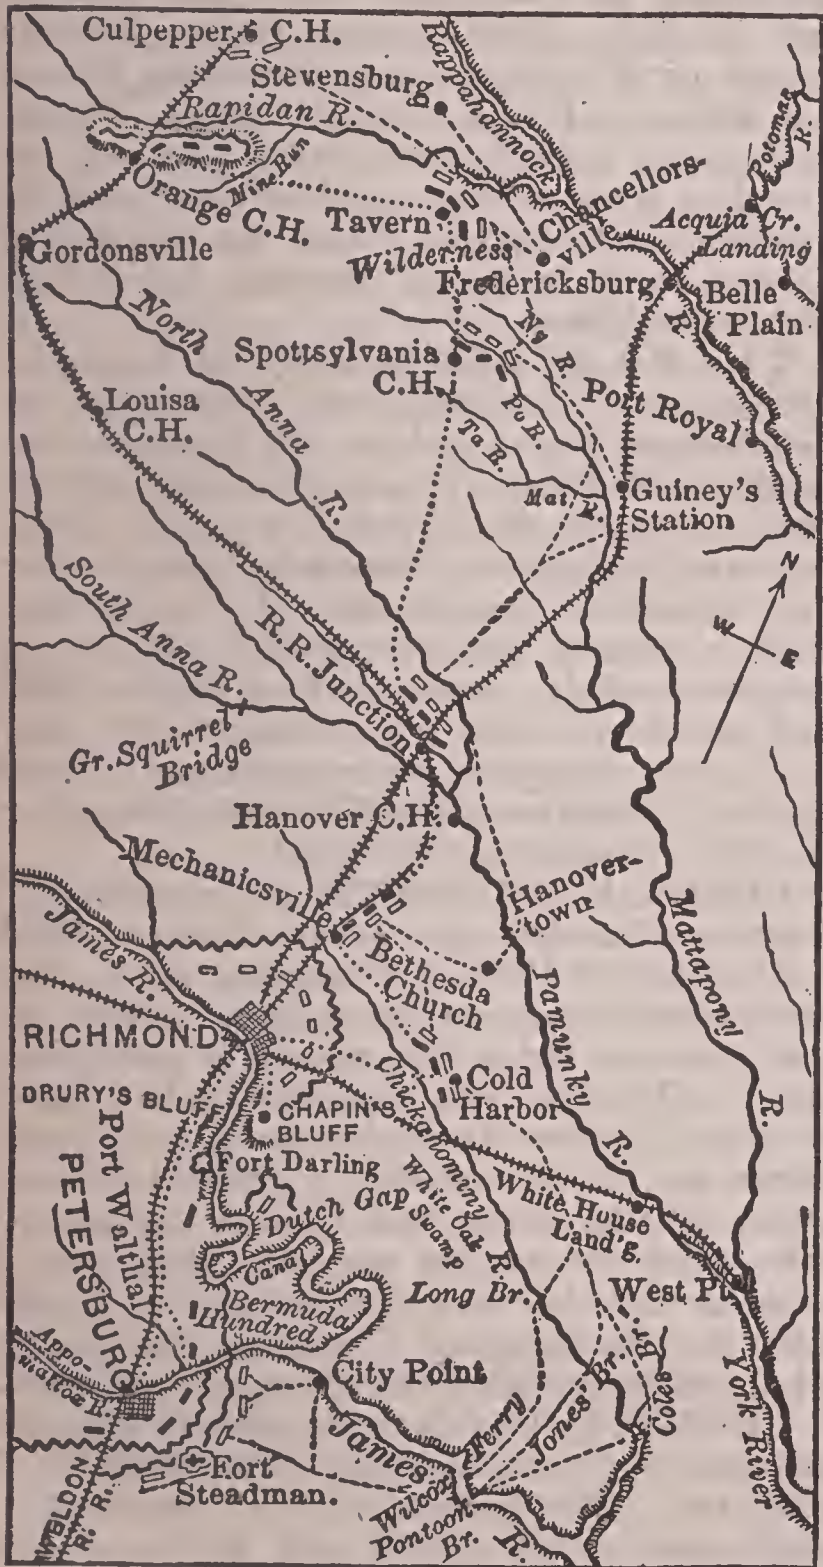

ever, the Army of the Cumberland under Rosecrans was severely defeated by Bragg in the Battle of Chickamauga. Grant was now made commander of the Department of the Mississippi, which included all the armies of the West, and in November defeated Bragg at Chattanooga, in the battles of Lookout Mountain and Missionary Ridge. The year closed with the Federals in control of the Mississippi and in possession of the states of Arkansas, Florida, Kentucky, Louisiana, Mississippi, and Tennessee.

The ability of Grant in his remarkable campaigns in the West brought about his appointment as commander in chief of all the armies. In March, 1864, he took personal command of the armies in the East and placed Sherman in charge of the West and South. Sherman, with an army of 100,000 men, defeated the Confederates at Dalton, Rome, and Resaca, but was himself defeated at Kenesaw Mountain. He occupied Atlanta after it had been evacuated by Hood, who had succeeded Johnston, and two months later began his march to the sea, reaching Savannah on Christmas. Hood had made a counter movement by invading Tennessee, but his army was destroyed by Thomas in the Battle of Nashville. Meanwhile, the Army of the Potomac, under immediate command of Meade, undertook the campaign of the Wilderness to force the ultimate evacuation of Richmond. The Battle of the Wilderness, near the Rapidan, was fought in May without either side gaining a victory. This was followed by the Battle of Spottsylvania Court House, the engagement at the North Anna River, and the repulse of the Federals at Cold Harbor. Grant now crossed the Chickahominy and was met by Lee at Petersburg, where he conducted a protracted siege. Gen. Early moved rapidly across the Potomac and won several successes, including that of the Monocacy, and then withdrew into the Shenandoah Valley, where he was defeated near Winchester by Sheridan and later was routed at Cedar Creek. In June of the same year the Confederate cruiser *Alabama* was sunk off Cherbourg, France, by the *Kearsarge* and Farragut defeated the Confederate squadron in Mobile Bay.

In February, 1865, Sherman left Savannah and marched through South Carolina, where he took possession of Columbia and Charleston, and pushed northward into North Carolina. Johnston undertook to check Sherman at Bentonville, though met with defeat in this design. Lee made an attempt on March 25th to break through the Federal line at the Appomattox River and captured Fort Stedman, but this was

retaken by the Federals. Sheridan defeated the Confederates at Five Forks on March 31, thus exposing the connection of Lee with Richmond, and on April 2 Grant made an attack on the whole line at Petersburg. Richmond was immediately abandoned and Lee retreated to Lynchburg, where he was intercepted by Sheridan and surrendered his army to Grant at Appomattox Court House on April 9, while

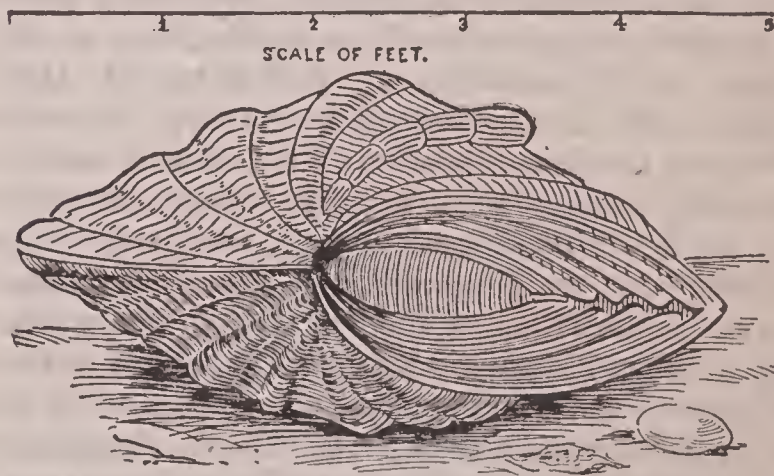

SCENE OF THE CAMPAIGNS AROUND RICHMOND.

Johnston surrendered on the 25th. The last fight took place on the Rio Grande, May 13, 1865, and the last armed forces were surrendered by Kirby Smith on May 26. Jefferson Davis, President of the Confederate States, was captured on May 10 and confined at Fortress Monroe. At the time of the final victory, on April 14, President Lincoln was assassinated.

The Civil War, from April 12, 1861, when Fort Sumter was bombarded, to May 26, 1865, when the Trans-Mississippi army surrendered, covered a period of about four years. The Confederates had about 500,000 men and lost 95,000 in killed and wounded, while the Federals had 2,666,999 men and lost 359,258. It is not certain what number of Confederates were killed by accident or disease, but it is estimated that the total is nearly 200,000. The war cost the Confederate States about two billion dollars and the United States about three and one-half billion, and the latter has paid in pension to Union soldiers about as much as the sum spent by it to maintain the Union. It is estimated that the total cost, counting both sections of the country, aggregates nine billion dollars. See **Confederate States**.

**CLAIRVOYANCE** (klâr-voi'ans), an alleged faculty or power claimed to be possessed by some persons while under the influence of mesmerism. By means of it the clairvoyant claims to be able to see mentally things concealed from sight or at a great distance, to discover things hidden from sight, and to describe clearly events happening at a distance. The claim that clairvoyance is a reality is not admitted by scientists. See **Mesmerism**.

**CLAM**, the name applied to various bivalve mollusks, which are most numerous in the sand and gravel between the high and low water mark. The best known species are the sea, or hen, of the Atlantic; the soft-shelled clam, called the cob in England; the edible giant clam

GIANT CLAM.

of the South Sea; and the fresh-water clam, which is properly a mussel. The clam is a favorite food, while the shells are used in many cities to make ornaments, buttons, snuff boxes, knife handles, and beads. Off the East Indian coast the *giant clam*, weighing 500 pounds, is found.

**CLAN**, meaning offspring or children, the name applied to a tribe or number of families bearing the same surname, claiming descent

from common ancestors, and united under a chieftain who represents that ancestor. The clan system still exists among the Arabs, Tartars, and other tribes of Asia and Africa, and among a number of other peoples, particularly among Indians. A clan system was instituted among the people of Scotland in the reign of Malcolm II., about the year 1008, but it was of much greater antiquity in other countries. The members of a clan were kin by birth and were united by other ties under a chieftain, who was the supreme ruler. Each clan occupied a certain portion of the country, and wars among clans were both frequent and severe. The legal authority of clannish chiefs was abolished by a law passed in 1747, and the government became merged into a system more nearly subject to the central authority. During the period that clans flourished, they were divided into two general classes—those of the Highlands and the clans of the Borders.

**CLAREMONT** (klâr'mönt), a town in Sullivan County, New Hampshire, forty-eight miles northwest of Concord, on the Boston and Maine Railroad. It is surrounded by a productive farming country and is a center of manufactures. The chief buildings include the Fiske Library, the high school, and a number of churches. Among its industries are cotton, woolen, and paper mills, printing, machine works, and marble yards. An abundance of water power is obtained from the Sugar River. Population, 1900, 6,498.

**CLARENDON** (klâr'en-dün), **Constitutions of**, a series of ordinances made by a council of the nobles and prelates in England, at the village of Clarendon, in Wiltshire, in 1164. These laws were favored by Henry II. as a means to check the power of the church and to limit the clergy in exercising secular jurisdiction. They limited and defined the jurisdiction of the Pope in England, and gave the crown power to interfere in the election to fill vacancies in offices and dignitaries. By their terms it became necessary to secure the consent of the king to make appeals to Rome, clergymen were forbidden to leave the realm without royal sanction, and clergymen accused of crime were taken for trial before ecclesiastical courts, after which the law courts were empowered to inflict further punishment.

**CLARINET** (klâr'ĩ-nět), or **Clarionet**, a wind instrument with a reed, first made by John Christopher Denner of Leipzig, Germany, in 1690, but since modified by various improvements. Its principal parts include a mouth-piece, furnished with a single beating reed, and a round tube enlarged at the end in the form of

a bell. The tube is provided with eighteen openings in the sides, half of which are closed by the fingers and half by the keys. It is used extensively in military bands and orchestras. Its compass is much greater than that of the flute and its music is held in higher favor.

**CLARKE'S FORK**, a river of the United States, rises in the Rocky Mountains, in the western part of Montana. It flows toward the northwest in Montana, crosses the northern part of Idaho, flows through the northeastern corner of Washington, and enters the Columbia River in British Columbia, near Waneta. It is about seven hundred miles long and has abundant water power. Its headwaters are the Flathead and Missoula rivers, by which it is formed, and it passes through Lake Pend Oreille, in Idaho.

**CLARKSVILLE**, a city in Tennessee, county seat of Montgomery County, on the Cumberland River, and on the Louisville and Nashville Railroad. The chief buildings include the courthouse, the city hall, and the Southwestern Presbyterian University. Iron mines are worked in the vicinity. It has a large trade in tobacco and merchandise. The manufactures include cigars, clothing, earthenware, and machinery. The city is improved by electric lights, pavements, waterworks, and a sewer system. It was settled in 1780 and incorporated in 1785. Population, 1900, 9,431.

**CLARK UNIVERSITY**, an institution of learning founded by Jonas Gilman Clark (1815-1900) in 1887, at Worcester, Mass. The institution is nonsectarian and has courses for postgraduates and a department for undergraduates. The latter was organized in 1902 under a special bequest of its benefactor. It has a library of 25,000 volumes, a carefully chosen corps of instructors, and modern equipments. The chief publications are the *Mathematical Review*, the *American Journal of Psychology*, and the *Paedagogical Seminary*. G. Stanley Hall was its president for a long term of years.

**CLASSICS** (kläs'siks), the writers and productions of acknowledged excellence and authority. The highest class of Roman citizens were called *classici* and a man of the highest rank was termed a *classicus*. The term *classic* was applied to writers and productions as early as the 2d century after Christ. At present it refers to the best writers and productions of Greece and Rome and to the modern works that conform to the best and most perfect standards. The classical period of Greece extends from Homer to the time of the Roman emperor Antoninus and the Latin, from Plautus to about 200 A. D.

**CLAY**, a term applied to any form of earth which possesses sufficient plasticity to be fashioned like paste by the hand or the potter's lathe, when moistened with water. It is produced by the disintegration of rocks. Streams carry silt, which forms clays when deposited. When currents pass into still waters, the heavier stones drop first, next the pebbles, and then the gravel and sand, and finally the fine silt settles to the bottom and forms clay or mud. The mud, hardened by drying, becomes shale. The purest grade of clay is known as *kaolin*, of which porcelain and white earthenware are made. *Pipe clay* is a plastic and smooth clay and *flint clay* is hard and dense. *Fire clay* is found in coal measures immediately beneath the several veins of coal. It constitutes the soil of the ancient forests, the remains of which have been transformed into coal. It is used to make infusible brick. Other clays are used for making drain and sewer tile, brick, earthenware, tobacco pipes, and many other products. *Loam* is a mixture of sand and clay, *marl* contains clay and shell remains, and *shale* is a rock clay. Calcareous clay lands produce the best wheat and rye, while the rosaceous produce the best fruits. Clay is an important constituent of good soil. The manufactured products of clay produced annually are very extensive.

**CLAYTON-BULWER TREATY** (bul'-wēr), a treaty between the United States and Great Britain, relating to the construction of a ship canal between the Atlantic and Pacific oceans, across the Isthmus of Panama. It received its name from the commissioners, John Middleton Clayton, on behalf of the United States, and Bulwer-Lytton (later Lord Dal-ling), on the part of Great Britain. It was ratified in 1860. The terms include that neither nation is to erect fortifications at or near the canal, and that these nations will not assume dominion over any part of Central America. However, the treaty was abrogated in 1901, when the Hay-Pauncefote Treaty was concluded between the two nations.

**CLEARFIELD**, a borough of Pennsylvania, county seat of Clearfield County, 170 miles northeast of Pittsburg. It is conveniently located on the west branch of the Susquehanna River and on the Pennsylvania and other railroads, and is surrounded by a fertile agricultural country, which contains deposits of coal, fire clay, and limestone. The manufactures include flour, leather, and machinery. It has electric lights, waterworks, and other municipal utilities. The first settlement in its vicinity was made in 1805 and it was incorporated in 1840. Population, 1900, 5,081.

**CLEARING HOUSE**, a banking institution which serves to make mutual payments between bankers on drafts and checks. Clearing houses are organized by an association of banks. The different drafts and checks received by the associated banks are brought to the clearing houses and offset one another, and only the balances are paid in money. Each bank represented has a desk at the clearing house, at which the settling clerk or clerks receive in bundles the checks and drafts payable by the bank they represent, and in return draw a statement of the demand against other banks. All the checks and other evidences of credit are noted carefully by an inspector and the separate items are examined and approved, after which the checks are returned to the respective banks by their clerks, and at a stated time the debtor banks pay to the creditor banks the balances. Clearings are made every business day, usually about 11 A. M., and the transactions are subject to revision or rectification, not at the clearing house, but in the form of verified claims filed on the succeeding day or some time later.

Clearing houses were established in France as early as 1667, the first at Lyons, but the present system did not originate until the latter part of the 18th century. The London Clearing House, established about 1775, is one of the oldest. New York City has the most important clearing house in America, established in 1853, and its average daily clearings aggregate about \$22,500,000 and the average daily payments approximate one million dollars. Chicago has the second largest clearing house in the United States, its annual clearings amounting to twelve billion dollars, while the annual clearings in New York City aggregate ninety billion dollars. Other important clearing centers are located at Boston, Saint Louis, Philadelphia, Cincinnati, San Francisco, and Kansas City. The chief clearing houses of Canada are at Montreal, Toronto, Quebec, and Vancouver.

**CLEAVAGE** (klēv'āj), in geology, the direction or manner in which rocks may be split into parallel layers. The direction of planes or cleavage is frequently in the line of stratification, but differs from it in many instances. It is not difficult to determine the structure of crystallized bodies when they are broken, and on examination it is found that small polyhedrons make up the individual fragments. The phenomenon of rock cleavage is not easily determined. Some writers consider that it is due to the pressure of mechanical forces to the planes of cleavage, while others look upon it as the result of crystalline agency. Nearly all species of rock are subject to cleavage, but those of the finer grains

show it to the best advantage. Slate and schist are names applied to rocks which possess the property of cleavage.

**CLEBURNE** (klē'bûrn), a city in Texas, county seat of Johnson County, forty-eight miles southwest of Dallas, on the Missouri, Kansas and Texas, the Gulf, Colorado and Santa Fé, and other railroads. The chief buildings include the county courthouse, the city hall, and a public library. It is the seat of a college and has a fine high school. The manufactures include ice, farming utensils, and machinery. It has electric lighting, waterworks, and sewerage systems. Population, 1900, 7,493.

**CLEMATIS** (klēm'â-tis), a genus of plants either herbs or shrubs, usually having climbing stems. They are widely distributed throughout the different climates, but are most numerous in the Temperate zones. Many of the species now cultivated have been obtained from plants native to Europe and have large flowers of various colors, often six inches across. The root of a clematis is used by the American Indians as a stimulant to revive horses that are overcome at races. A number of different kinds are cultivated in gardens and greenhouses of Europe and America as ornamental flowering plants.

**CLEOPATRA'S NEEDLES**, the name of two obelisks formerly at Alexandria, but one is now located in New York and the other is in London. They were erected by King Thothmes III., of Egypt, at the entrance of the great temple of Heliopolis, mentioned as On in the Scriptures, and near which Moses was born. After the death of Cleopatra, shortly before the Christian era, they were removed to Alexandria. The obelisk at New York was placed in Central Park in 1881. It was presented to America by the Khedive of Egypt.

**CLEPSYDRA** (klēp-sī-drâ), or **Water Clock**, an instrument devised by the ancient Greeks for measuring time. It consisted of one or more pipes with orifices at the bottom, and a scale of hours at the outside indicated the time in which the water flowed through the orifices. Another form consisted of a uniform flow of water through a pipe into a receptacle, which had a scale of hours to indicate the rise of the water.

**CLERGY RESERVES**, the allotments of land set apart for the support of the Protestant religion in Canada. It was provided by law that every seventh lot in the township of the two divisions known as Upper and Lower Canada be included in the reserves, and the government held that the benefits were to apply to the Church of England, though other Protestant churches received some of the grants. Roman

Catholics regarded the reserves as unfavorable to their religion and the Baptists and Methodists generally opposed the policy of maintaining them. Opposition grew until 1854, when the church and state were formally separated by the laws of Canada, and the lands and moneys obtained from the sales of these reserves were divided equally among the townships according to the number of their inhabitants. Upper Canada had the largest number of reserves, a total of about 2,500,000 acres.

**CLEVELAND** (klēv'land), a city in Ohio, county seat of Cuyahoga County, on the southern shore of Lake Erie, at the mouth of the Cuyahoga River. It is the largest city of Ohio and the second largest port of the Great Lakes, being exceeded only by Chicago. Cleveland is 250 miles northeast of Cincinnati, 356 miles east of Chicago, and 525 miles northwest of Washington. It is the focus of many important trunk and branch railroad and numerous electric railway lines.

**DESCRIPTION.** The city has a lake frontage of ten miles, extends inland five miles, and has an area of thirty-five square miles. The site is more or less undulating, rises gradually from the lake front, and is about 115 feet above the surface of Lake Erie. It is divided into two unequal parts by the Cuyahoga River, known as Eastern and Western, and the portion lying west of the river is known as West Cleveland. Along the river is a low valley, in which are located many factories, coal yards, freight depots, ore docks, and other industrial establishments. Several great viaducts and many bridges cross the river, one of which, completed in 1878, is 3,210 feet long and cost \$2,250,000.

The streets are wide, from 40 to 130 feet, and are beautified by elms and maples, hence Cleveland is known as the *Forest City*. Much of the paving is constructed of brick and asphalt, and in the business center a substantial grade of stone and cement blocks has been used in constructing the pavements. Superior Street, the principal business thoroughfare, is 132 feet wide and on either side has many substantial structures. Monumental Park, which is in fact the public square, is a tract of about ten acres, and from it the streets diverge in all directions. Euclid Avenue, the most beautiful street, begins at Monumental Park and extends east beyond Lake View Cemetery, whence it merges into Euclid Road. This avenue has a number of business houses at the western end, but is mainly a residence street and contains some of the finest homes and most tasteful lawns in the city. Just south of Euclid Avenue is Prospect Street, which is a noted residential thoroughfare. Case,

Wilson, Jennings, Ingleside, and East Madison streets are noted for their fine lawns and beautiful homes.

**PARKS AND CEMETERIES.** Rockefeller Park, a tract of 800 acres, is situated in the eastern part of the city, and near it are Gordon Park and Wade Park. The latter has a zoölogical garden and a statue of Commodore Perry, which was formerly in Monumental Park. Lake View Park extends along the lake shore, and Brookside, Garfield, Riverside, and Shaker-Heights are worthy of mention. The chief drives, besides Euclid Avenue, include Ambler, Parkway, Ridge Road, Gordon Boulevard, and Grand Public Boulevard. Lake View Cemetery is in the eastern part of the city and contains the Garfield Memorial, which is 165 feet high and cost \$130,000, and in the crypt beneath are the remains of President Garfield. Monumental Park contains the statue of Gen. Moses Cleaveland and the monument dedicated to the soldiers and sailors. Woodland and Riverside cemeteries are beautifully improved and contain many fine statues and monuments.

**BUILDINGS.** The county courthouse, the city hall, and the post office and customhouse are the most prominent public buildings. Others of note include the Chamber of Commerce; the Union Depot, the Sheriff Street Market, the Arcade, the New England, the Lennox, the Ross, and the Colonial Arcade. Among the most prominent churches are the First Presbyterian, Plymouth Congregational, Saint Paul's Protestant Episcopal, and the Roman Catholic cathedral. The Euclid Avenue Baptist and the First Methodist churches are fine buildings and are centrally located. Among the principal hotels may be named the Colonial, Forest City, Hollenden, Weddell, Stillman, Kennard, and American. The places of amusement include the opera house, the Lyceum Theater, and the Academy of Music.

**EDUCATION.** The city maintains an adequate number of public schools, including all of the elementary departments, as well as a number of high and manual training schools. Many private and parochial institutions are within the city. Higher and professional education is provided for by the Western Reserve University, Baldwin University Law School, Saint Ignatius College, Case School of Applied Science, Cleveland College of Physicians and Surgeons, and Cleveland School of Pharmacy. The public library has 175,000 volumes, the Case library has 50,000 volumes, and other valuable collections are contained in many of the schools and colleges. All of the charities are well represented and many of the leading educational and

scientific associations have a large membership.

**INDUSTRIES.** Cleveland has a large trade in coal and iron ore, being a distributing point for the coal of Ohio and the product of the iron mines of Michigan and Minnesota. It has a vast trade in grain and lumber and is the largest fresh-water fish market in America. As a manufacturing city it ranks second among the centers on the Great Lakes. The petroleum refineries, shipyards, machine shops, slaughterhouses, planing mills, paint works, and clothing factories are the chief enterprises. Transportation is facilitated by railroads that reach the principal commercial centers of the central parts of the United States and Canada. A breakwater protects the harbor, inclosing about 300 acres, and the Cuyahoga River has been improved by dredging so lake steamers have convenient wharfage on this stream as well as on the lake. The wholesale trade is an important feature of Cleveland, which supplies through its jobbing houses many points on the lake and inland.

**HISTORY.** The city is located in the Western Reserve, a tract of land formerly belonging to the State of Connecticut, and a part of this was purchased in 1795 by the Connecticut Land Company. Gen. Moses Cleaveland, from whom the city received its name, platted a village at the mouth of the Cuyahoga in 1796. It was organized as a town and made the county seat of Cuyahoga County in 1810, and five years later was incorporated. The Ohio Canal was opened between Cleveland and Akron in 1827, and from that time dates its prosperous growth. A number of adjacent villages and towns were united with it at different times, including Ohio City in 1853, East Cleveland in 1872, Newburg in 1873, and Brooklyn and West Cleveland in 1893. It has had a constant and steady growth and since 1900 it has had a larger population than Cincinnati. Population, 1910, 560,663.

**CLICK BEETLE**, the name of a family of beetles which are peculiar for their movements. Some of the species are known as skipjacks, elaters, and springing beetles. About 500 species are distributed more or less widely in North America and the family is well represented in all the continents. The *eyed elater* is a grayish-black beetle characterized by two large black spots on the thorax. The *wireworm* is a larva of the click beetle and lives at the roots of plants and under the bark of trees, frequently in rotten wood. It is so named from the sound it makes when it regains its feet by a spring, after being laid on its back on any hard substance.

**CLIFF** (klĭf), a slope or descent in the surface of the earth. Cliffs are formed by a dislocation of the earth's crust, or by the erosive action of water, or by volcanic disturbances. Waves carve the rocky coast cliffs by beating against the shore line, and their action is enhanced by the weathering of the rock that extends above the reach of the waves. The cliffs of canyons, gorges, and ravines are formed through the erosion of running water. Cliffs due to volcanic action are formed when the crust of the earth is fractured, a portion being elevated so as to form an abrupt cliff. Examples of this class are seen in many parts of the Rocky Mountains, where broken lava cliffs resulted from exposing the abrupt faces of fractures.

**CLIFF-DWELLERS**, a class of people long since extinct, though there are a number of races still dwelling in cliffs. The ancient cliff-dwellers inhabited portions of Mexico, Arizona, New Mexico, California, and Central America. Their dwellings were made in the rocky cliffs of mountains, and divers traces of them still remain. The valley of the San Juan River, in Utah and New Mexico, has many traces of these people, such as rude carvings and habitations in elevated cliffs. In many of them human skeletons, tools, utensils, and ornaments have been found. It is evident that they cultivated maize, cotton, and tobacco, and raised domestic animals. Some writers assume that they suffered by prolonged droughts and that they were finally extinguished by the Apache Indians. See **Pueblos**.

**CLIMATE** (klĭmât), the character of the atmosphere in regard to moisture and heat, together with meteorological conditions so far as they exert an influence on vegetable and animal life. Climate is affected by latitude north and south of the Equator and by elevations above the sea. High latitudes have perpetual snow and ice, as around the North and South poles, while a similar effect is common to the elevations on the summit of mountain chains, as the Andes, Himalayas, and Alps. Isothermal lines indicate the condition of the climate, and, owing to modifying influences, are irregular when compared to the Equator, owing to variations in altitude. Besides these, there are many other modifying influences upon climate, such as the direction and position of the coast lines of continents and islands, the depth and position of the seas, and the source and direction of winds and oceanic currents.

The climate that exists on continents is called *excessive* or *severe* when it is marked by great differences between the temperature of the win-

ter and summer, or by extremes in heat and cold that characterize the day and the night. The interior regions of Asia and North America are the best examples of excessive climates. A good illustration of *modified* climates is that of Great Britain, which is greatly influenced by the winds of the continent and the breezes and currents of the sea. The east wind passing over the frozen steppes of Russia, in the winter, renders its climate cold and dry, while a south wind coming over the continent of Europe, in summer, is hot and dry, and a wind from the southwest brings moisture and heat. Even the effects of spent cyclones from the surface of the Atlantic is manifest in the form of rain, heat, and storm. Similar remarkable effects may be noticed in the northwestern part of North America, where the warm currents of the Pacific Ocean greatly modify the climate of Alaska and the Aleutian Islands, and the warm Chinook winds modify the greater part of British Columbia, Washington, and Oregon. A similar effect is seen in Northern Africa, where the Atlas Mountains of Algeria shut out the rainfall from the northern part of the Siberian Desert. Similar and other effects are noticed in many localities of the earth on account of the prominent modifying conditions of climate.

It is certain that the climate has undergone many distinct and marked changes in the geological ages, evidences of which abound in the fossils of rocks, and in the various formations in the different ages or periods. For instance, during the carboniferous age both animal and vegetable life seems to have been quite uniform from the Equator to the Arctic zone, hence there must have been only a moderate difference in temperature in the various latitudes, and the summer and winter seasons appear to have been very much alike. Some geologists think that the poles were once centers of great heat, which have been modified from time to time until the present state of excessive cold was reached, with conditions more favorable to animal and vegetable growth at the Equator. Others think that the slight alterations in the earth's orbit tend to produce changes in one direction for a long period of time, and then in the other for an equal period. The effects of these changes, which are quite clearly shown in geological formations, are well known.

**CLINTON** (klĭn'tŭn), a city in Iowa, county seat of Clinton County, on the Mississippi River, 136 miles west of Chicago. It is on the Chicago and Northwestern, the Chicago, Milwaukee and Saint Paul, the Chicago, Burlington and Quincy, and other railroads. The chief buildings include

the Wartburg College (Lutheran), the city hall, the county courthouse, and the public library. It is noted as a distributing point of timber rafted down the river, which is prepared for the market in vast saw and planing mills. Other industries include flouring mills, canning works, iron foundries, furniture works, and machine shops. Three immense iron bridges, about four thousand feet long, cross the river. Electric street railway lines connect all parts of the city. It has gas and electric lighting, pavements, waterworks, sewerage, and many fine residences. Lyons, located a short distance north of the main part of the city, was annexed to Clinton in 1895. Population, 1905, 22,756; 1910, 25,577.

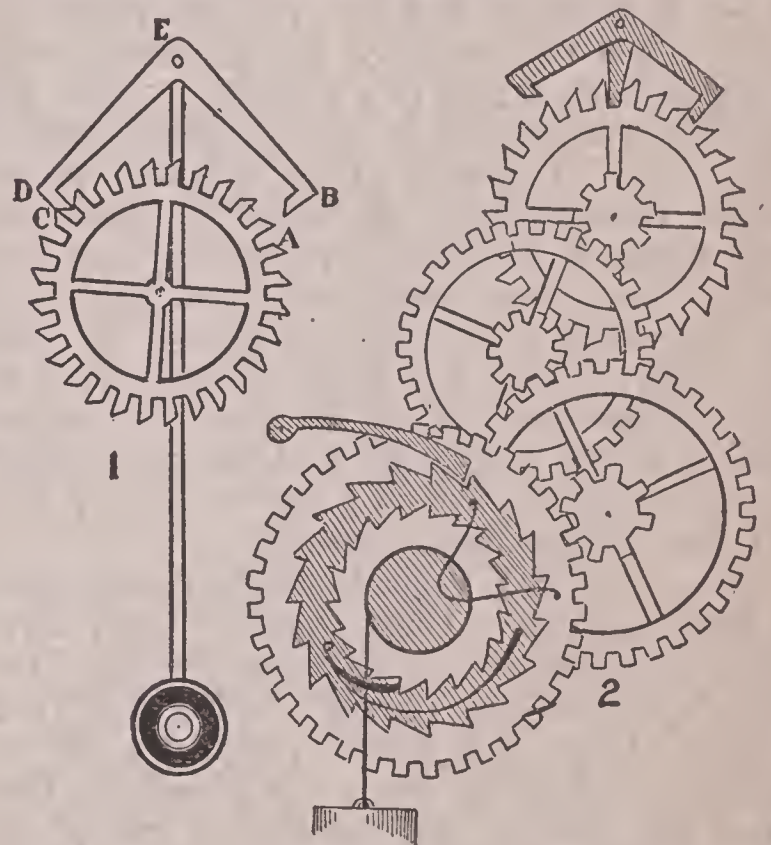

**CLINTON**, a town in Worcester County, Massachusetts, 44 miles west of Boston, on the Boston and Maine and the New York, New Haven and Hartford railroads. It has a public library of 26,500 volumes, a central high school, and a fine public park. Among the manufactures are carpets, ginghams, plaids, clothing, machinery, and utensils. The public utilities include waterworks, gas and electric lighting, and street pavements. A system of electric railways connect it with other trade centers. It has been an incorporated town since 1850. Population, 1905, 13,105.

**CLINTON**, county seat of Henry County, Missouri, 88 miles southeast of Kansas City. It is on the Saint Louis and San Francisco, the Missouri, Kansas and Texas, and other railroads. The chief buildings include the high school and Baird College. It has manufactures of earthenware, flour, pottery, and machinery. Large quantities of grain, coal, and live stock are exported. It was settled in 1835 and incorporated in 1840. Population, 1900, 5,061.

**CLOCK**, an instrument for indicating and measuring time. The name is probably derived from the German word *Glocke*, meaning bell. Time is indicated by means of hands in hours and minutes, and in some instruments by similarly noting seconds, days, and months. In ancient times clocks similar to those now in common use were unknown. Time was measured by means of the shadow cast on an instrument by the sun, called a *sundial*. These could not show the time on a cloudy day. In some countries dials were used to indicate the time at night, called *moon dials*. Later time was indicated by means of water glasses. These instruments consisted of vessels filled with water, with small openings at the bottom through which the water passed drop by drop into a vessel beneath. On the sides of the vessels were spaces indicated by lines, and the time was marked by the height of the water. This form was not

satisfactory, since water does not pass uniformly through an opening, and led to the invention of the *hourglass*, similar to those now used. An hourglass is shaped like a figure eight, the upper side being filled with fine sand, which passes through an opening into the lower part in a definite time. When the sand has all passed to the lower apartment, the instrument is reversed and measures time by the sand passing to the apartment formerly at the top. King Alfred the Great measured time by a gradual burning of candles on which colored rings were placed to indicate the period requisite for the flame to consume the material in the candle.

It is not known when clocks were first invented, but they are of great antiquity. Plato invented an instrument in the year 372 B. C.,

1, Escapement and Pendulum; 2, Train of wheels moved by a weight.

which indicated the hours of night upon organ pipes. Archimedes made a clockwork filled with springs and weights in about the year 200 B. C., and likewise adopted the apparatus to move toys and mechanical engines. The invention of a mechanism for regulating the speed of the going works, on a plan whereby to join wheels to a pointer which traverses the dial, is of newer date. It is not known when these mechanical features of a clock were completed, but they are thought to date from about the beginning of the 11th century A. D.

Clocks are mainly of two kinds. The style in common use is the one in which the wheels are moved by power from the uncoiling of a spring and the other kind is moved by a gradual falling of a weight, both the uncoiling of the spring and the falling of the weight being regulated by

the swinging of a pendulum. The power is applied to a train of cogwheels. In eight-day clocks the train of wheels consists usually of four cogwheels. The power tends to move the wheels quickly and run down the clock with an even motion, but an escapement, fastened to the pendulum, is connected with the train of wheels. Its effect is to change the even motion into little leaps or jerks, thus governing the entire movement. The escapement is adjusted so as to articulate with the escapement wheel, the last of the train, and which usually has thirty teeth or cogs. This is shown in the illustration. As the pendulum, which is attached on the pinion E, swings to and fro, the two pallets B and D strike alternately against the cogs on the opposite sides of the escapement or balance wheel, as shown at A and C, and thus regulate the movement. Each full swing of the pendulum in an ordinary clock marks two seconds of time, and each two revolutions of the escapement wheel, one minute. The cogs of the different wheels are so arranged that the wheel to which the second hand is attached moves around once in a minute; the minute hand, once in an hour; and the hour hand, once in twelve hours. In cases where days, weeks, and longer periods are indicated similar mechanisms are used. At the beginning of the 13th century clocks were placed in church towers, and are now frequently seen in public buildings and churches.

Among the most remarkable clocks are those in great churches. These usually require large pieces of mechanism to overcome friction. The clock in the tower of Trinity Church, New York, is wound by a crank which is turned about 800 times in winding the clock. In Strasburg, Germany, the clock in the cathedral is one of the most noted ever made. It shows the motion of the planets and the sun, and marks the minutes, hours, days, months, years, and the important festivals of the year. It contains many figures moved by machinery. The statues of four old men are located in the upper part and strike the quarter hours. At every quarter hour death comes forward, but Christ meets him with a spear and drives him back. At the last quarter Christ passes inside, while death comes out and strikes the hour with a bone in his hand, which is followed by beautiful chimes.

American inventions have revolutionized the manufacture of clocks. Those produced largely by the Waterbury Clock Company and other similar manufacturers more nearly resemble watches than clocks, and they have been exported to every country in the world. Electrical clocks were manufactured as early as 1840, but they have been greatly modified and improved

in recent years. In these clocks one accurate clock is connected by wires with others, which are controlled and kept in exact time by the first. The principal clock has a pendulum that makes and breaks a circuit at stated intervals; and all the other clocks in the series beat the same time. They are used extensively in offices and public buildings. In another form of electrical clocks a master clock is attached to a number of clock faces by means of electrical currents. At the expiration of each minute an electrical impulse passes from the master clock to the different clocks in the circuit, and the hands of the clocks controlled advance one stroke each minute.

**CLOISTER** (klois'tēr), a covered passage or gallery running through the walls of certain buildings, especially those used for colleges and monasteries before the Reformation. In most of the buildings of this kind one of the walls was formed by the architectural structure to which it was attached, while an open arcade or a series of windows formed the other side. The roof, which was usually vaulted, was supported by pillars and arches. Cloisters were used by the inmates of the monasteries for exercise and recreation, and many of them had an open space which contained a well and gardens. The German word *Kloster* has reference to the whole establishment, including the chapter house and the dormitories as well as the church. Many churches of Italy, Germany, England, and France retain the galleries or arched ways to which the term *cloister* is applied in a strict sense.

**CLOQUET** (klō-kwět'), a city of Minnesota, in Carleton County, 20 miles southwest of Duluth. It is situated on the Saint Louis River and on the Northern Pacific and the Great Northern railroads, and is noted for its extensive sawmills and lumber yards. The manufactures include machinery and lumber products, such as shingles, furniture, and wood pulp. It has a number of excellent schools, waterworks, electric lights, and a growing trade in manufactures and merchandise. Population, 1905, 6,117.

**CLOTH.** See **Weaving.**

**CLOTHES MOTH,** the name applied to several species of moths, the larvae of which are harmful to furs, woolen, cloths, feathers, and stuffed animals. Exposure to light and the application of turpentine are good preventives.

**CLOUD,** a mass of vapor condensed into minute drops, differing from fogs chiefly in that the drops float in higher regions of the atmosphere. Clouds and fogs are derived from vapors that rise from the moist earth, from fresh water, or from the sea. The minute drops of water that constitute clouds and fogs are formed of a

substance about 800 times heavier than air, and are prevented from settling rapidly by the resistance of air. The minute size of drops renders this possible. Whenever they exceed a certain size, they fall as rain or snow. The warmer air usually carries the greater amount of moisture, and, when coming in contact with colder air, the clouds or fogs result. On the contrary, clouds and fogs disappear on the approach of a warm, dry wind.

Clouds are generally higher during the day than during the night, and are higher in the tropics than in the polar regions. The mean height in winter is from 1,300 to 1,500 yards, and in summer from 3,400 to 4,400. They often exist at a distance of 250 yards above the ground, and as high as 7,500 yards, while the *cirri*, light forms of clouds, attain a much greater elevation. Although clouds generally appear stationary, they are really descending slowly, but their lower parts are dissipated by

▼ NIMBUS ▼ STRATUS  
CLOUDS.

air more highly heated and their upper portions become increased by fresh condensations. For this reason their descent is disguised, giving them a stationary appearance. All are more or less charged with electricity, some positively and others negatively, but their tension is greatest during a thunder storm. Clouds carry the moisture needed by plants from the sea, and distribute it over the vast interior of islands and continents, where it falls in the form of rain, snow, or hail.

Clouds are classified in four primary forms: the *cirrus*, the *cumulus*, the *stratus*, and the *nimbus*. *Cirrus* clouds consist of feathery masses of condensed vapor that are suspended in the higher regions of the atmosphere. They were so named from their resemblance to a lock of hair with fiber diverging in all directions. Owing to their elevation, the moisture is thought to consist of ice particles. The halos or circular bands of light around the sun are

caused by light passing through *cirrus* clouds. *Cumulus* clouds are denser than the *cirrus*, and are formed in the lower regions of the air, where the quantity of vapor is greatest. They consist of irregular heaps and rounded masses with moderately broad bases. They originate from ascending currents of air which have their moisture condensed by the cold produced by expansion and elevation. They are seen more frequently during the hotter part of the day at a height seldom exceeding two miles.

The *stratus* clouds consist of long, horizontal sheets or bands. They are seen more generally in the morning and evening, when the ascending currents are weak, and are caused by gradual settling of the *cumulus* and other clouds. The *stratus* clouds are the lowest, often falling to the surface of the earth and becoming a fog. The *nimbus* are the storm clouds from which rain falls. They may be formed by any of the various clouds coming together or collecting. The *nimbus* clouds are usually seen as a dense cloud spreading out into a cloud of *cirrus* with a shower passing beneath. They are the least attractive among the clouds, but are the only ones attended by the splendid phenomenon of the rainbow, seen only when drops of water fall to the earth in the form of rain. Besides these several classes of clouds, there are several secondary forms, known as the *cirro-stratus*, the *cirro-cumulus*, and the *cumulo-stratus*. These are modifications of the other forms.

**CLOUDBERRY**, a plant of the same genus as the dewberry, distributed more or less widely in America and Europe. It grows to a height of eight or ten inches, has few leaves, bears large white flowers, and produces an orange-red fruit with an agreeable flavor and about the size of a dewberry. It is confined chiefly to the moors of Great Britain and the central part of Europe, but is very abundant in Sweden and Norway, where it is highly valued in making preserves.

**CLOUD-BURST**, the name applied to a very heavy local rain, chiefly when the rainfall exceeds the rate of ten inches per hour and not less than six inches fall during the unusually heavy precipitation. Cloud-bursts occur at rare intervals on the eastern slope of the Appalachian Mountains, especially in the region lying between Georgia and New York, where heavy floods follow excessive rains of a local character. They occur more or less frequently on the coast of Washington and British Columbia, in the valley of the Amazon, and on the southwestern coast of Chile. It must be noted that there is a difference between a heavy rain and a cloud-burst, since the former covers a reason-

ably large area while the latter is confined to a small area, usually a few acres, and is thought to be due to thunderstorms or to the fact that rapidly ascending currents hold a mass of water within the cloud for a brief time, after which it falls suddenly to the earth. Cloud-bursts on the eastern slope of the Rocky Mountains are accompanied by heavy thunderstorms and fill the dry channels with large quantities of water, causing destructive mountain torrents to sweep across the valleys below.

**CLOVER** (klō'vēr), or **Trefoil**, the name of various plants of the pea family and of the genus *Trefoilium*. There are no less than 150 species,

some of which are weeds, but many are valuable food of animals and serve a useful purpose in increasing the fertility of soil. The red clover is a biennial, consisting of several kinds. It is sown with oats, barley, or other grain in the fall or spring, and bears a full crop the succeeding year. The Dutch clover bears a white flower, is a perennial, and is sown with various grasses when intended as permanent pasture for sheep. The French clover ripens early, is an annual, and is useful in pasturage. Timothy, rye grass, and other

RED CLOVER.

species of grasses are sown with clover, being then cut for hay. Several species are useful in bee culture, their flowers being rich in food for the production of honey. Many of the poorer and exhausted lands may be redeemed and fertilized by clover sown with grains and plowed under when six to ten inches high. Alsike or Swedish clover has long been cultivated in the southern part of Sweden. It is recommended for cold climates and as suitable for cultivation in moist and heavy soil. It is similar in growth and structure to the red clover, and is cultivated extensively in North America and Europe. The red clover is the best for hay, while the

white clover, when mixed with grasses, serves the best purpose for pasturage. Caterpillars and burrowing quadrupeds are common enemies to clover. They destroy it either by eating the foliage or by damaging its roots.

**CLOVES** (klōvz), the unexpanded dried flowers of the clove tree, used as a pungent aromatic spice. The tree is of the myrtle family and attains a height of from fifteen to thirty-five feet, being an evergreen with leaves from three to five inches long. Its flowers are of a purple color. The value of cloves is due to the oil of cloves, which constitutes about one-sixth of the whole weight. It has an acrid taste and a characteristic odor. It is used as a medicine, especially as a stomachic and to stimulate the appetite, and in cookery is prized for flavoring dessert dishes. The tree was first discovered by the Dutch in the Moluccas, but is now cultivated in India, Zanzibar, Ceylon, and the West Indies.

**CLUB**, an association of persons combined for the promotion of a common object, whether social, political, or otherwise. The name probably comes from knot, meaning a knot or gathering of persons. The earliest club of London was organized in the beginning of the 17th century, at Mermaid Tavern, on Friday Street. It numbered among its distinguished members William Shakespeare, Sir Walter Raleigh, Fletcher, Beaumont, and Sheldon. Ben Jonson was a prominent figure at the club that met near Temple Bar. The Literary Club, established in 1760, numbered among its members Burke, Goldsmith, Boswell, and Johnson. Clubs and kindred associations are maintained at present in all the countries, especially in those of Europe and America, and the larger organizations are centered in the cities.

The club life of America has been greatly enlarged within the past twenty years. Every large city has one or more important buildings erected especially as the quarters of some prominent club, such as the Illinois Club of Chicago, the Metropolitan Club of New York, and the Hunt Club, Cote des Neiges, of Montreal. Clubs of this class usually have reading rooms, apartments for bathing and playing various games, and rooms designed for meetings of a business nature. Many men's clubs admit women as visitors, but a large number of clubs are maintained distinctly for women.

Women's clubs are numerous in all the cities of Canada and the United States, and interest themselves in religious, professional, temperance, suffrage, social, educational, and other lines of study. In some of the larger cities these clubs maintain reading rooms and excellent

libraries. It has been observed that the clubs of both men and women serve a useful purpose in modern civilization. They are aiding materially in philanthropic and educational lines, and thereby tending toward a betterment of humanity.

**CLUNY** (klü-nê), or **Clugny**, a town of France, in the department of Saône-et-Loire, twelve miles northwest of Maçon. It is situated on the Grône River, in a valley between two mountains, and has extensive manufactures of pottery. Cluny is noted chiefly for its history in connection with a number of monasteries. It was a small village until 910, when an order of the Benedictine monks was founded here, and it had fully 2,000 monastic communities prior to the French Revolution. They were known as the Monks of Cluny, or the Congregation of Cluniac Monks, and had establishments in France, Spain, England, Italy, and other countries of Europe. The Abbey church at Cluny, one of the finest monuments of the Middle Ages, was destroyed in 1789.

**CLYDE** (klid), a river of Scotland, flowing westward a distance of 106 miles. A number of important cities are on its banks, including Glasgow, Bothwell, and Lanark. Near Lanark are four famous falls. The river has been deepened and made available for steamboats; the first large steamboat launched in Europe was on the Clyde in 1812. Near the mouth it widens into the Firth of Clyde. The basin drained by it contains rich mineral deposits and fertile soil, and the manufacturing centers upon its banks are among the most important in Scotland.

**COACH**, a four-wheeled closed carriage for private or public conveyance. In ancient Rome they were constructed in the form of both covered and uncovered carriages and constituted the chief means of conveying passengers. At present these vehicles are built largely for four passengers in the inside, and in some countries contain arrangements for ten or twelve on the outside. In the early history of America, especially before the Revolution, regular lines of coaches and stages were maintained to convey passengers and goods between the largest cities. Transportation of this kind is still available in the sparsely settled regions of the western part of the United States and the northern and western sections of Canada. However, coach conveyance has been largely superseded by railways, automobiles, and street cars. See **Carriage**.

**COAL**, a carbonaceous mineral of a black, shiny, or dull color, and used extensively for fuel. It is composed of about seventy-five per cent. of carbon and contains hydrogen, oxygen,

a small per cent. of nitrogen, and small quantities of earthy impurities. It is formed of compressed and chemically changed vegetable matter derived from luxuriant growths during former geological ages. The stems, leaves, and spores of jungle growths accumulated, and hydrogen and oxygen were evolved with some of the carbon. The volume was reduced so as to form about one-ninth to one-eighteenth of its original bulk, the relative proportion of carbon was increased in the mass, and eventually the whole was solidified into a decomposed vegetable pulp very much like peat. The constituents in every hundred parts of dry vegetable matter were about forty-nine per cent. of carbon, six per cent. of hydrogen, and forty-five per cent. of oxygen. In decomposition, which occurred under water, it retained most of the

COAL STRATUM.

carbon, together with parts of the hydrogen and oxygen.

The different kinds of mineral coal are divided by Dana into *anthracite*, *bituminous coal*, *cannel coal*, *lignite coal*, *earthy brown coal*, and *mineral charcoal*. Anthracite, bituminous, lignite, and cannel coal are the kinds marketed most extensively. Anthracite coal contains about ninety per cent. of carbon, burns with little flame, and is much used in kilns, furnaces, and by blacksmiths. Bituminous coal has more or less bituminous matter and is commonly used for fuel in heating and in engines. Cannel coal has an earthy appearance, burns with a bright flame, and is used extensively in gas making. The lignite or brown coal contains only about fifty per cent. of carbon and is not used extensively for manufacturing purposes. However, it is a valuable fuel in sections where other grades of coal are not found, as in North Dakota and some sections of Saskatchewan, and

burns easily when an extra draft of air is admitted to the stove.

In many of the coal fields there are from one to four veins, with a thickness of from two to fifty feet. It is not often that all the veins are workable, nor are all of them of equal value. Many deposits consist of drifts, or pockets, and others are in great veins and underlie large tracts of country. The formations common to the coal fields, including both the coal and the intervening rocks, are known as the *coal measures*. The methods of mining differ with the thickness of the veins, the class of coal, and the character of the roof, or rocky formation covering the deposits. In many localities the vein crops out at the hillsides and the coal

extensively by all civilized people, and is found widely distributed in all the continents. The United States, Great Britain, Germany, Austria-Hungary, and Russia are among the greatest coal-producing countries in the world. Coal deposits are found in thirty-five of the states and territories of the Union, and the products in twenty-nine have reached commercial quantities. Pennsylvania, West Virginia, Illinois, Ohio, Alabama, Indiana, and Colorado, are the leading coal-producing states. The annual production of the United States aggregates about 360,500,000 tons, valued at about \$390,500,000. Besides, the deposits of the colonial possessions, particularly those of the Philippine Islands, are known to be of great extent. Canada has ex-

COAL AREAS OF THE UNITED STATES.

(The black are bituminous and anthracite and the shaded are lignite.)

may be easily secured, while in others shafts are sunk several hundred feet and the coal is hoisted by means of steam or electric power. The output of bituminous coal greatly exceeds all others, but the anthracite is the most valuable and is regarded the best for many purposes.

Coal was not known to the early ancients. It appears to have been used in 852 A. D. in England, but was not known to the Britons before the Roman invasion. For a long time it was thought to be injurious to health, and a common prejudice prevented its entering largely into a fuel material in the avenues of manufacture and household economy. It is now used

tensive deposits of coal and has an annual output of about 15,000,000 tons. The deposits are chiefly in British Columbia, Nova Scotia, New Brunswick, and Alberta.

**COAL TAR**, or **Gas Tar**, a product obtained in the manufacture of illuminating gas from tar. It is a dark-colored, opaque liquid, is somewhat heavier than water, and has a disagreeable odor. Coal tar is made up of many compounds, including anthracene, benzene, creosote, ammonia, xylene, naphtha, and carbolic acid. It is used in making several kinds of dyes and aniline colors and in the manufacture of alizarin and salicylic acid. Coal tar formerly was considered a waste material, but it now

constitutes the source of many substances valuable in science and the industries. It is used as it comes from the factory as a substitute for paint in coating shingled roofs and to protect wood from rotting, especially such as posts and the portions of telegraph poles put in the ground.

**COASTAL PLAIN** (kōst'al), the name generally applied to the lowlands bordering on the sea. The most noted region of this character in North America stretches from New York Bay, along the Atlantic Ocean, to the Gulf of Mexico, in Florida, whence it extends along the northern and western coasts of that body of water to the state of Vera Cruz in Mexico. It varies in width from 20 to 200 miles, but extends inland considerably farther along the streams, especially in the Mississippi Valley, where it penetrates north to the mouth of the Ohio River. A rise known as the Fall Line marks the eastern boundary of the Atlantic coastal plain, due to the upheaval of rocks near the foothills of mountains, and in many places the streams pass over precipices and form cataracts, such as those in the James River at Richmond, Va., and in the Potomac at Washington, D. C., below which cities these streams are navigable. The formations of the coastal plain include those deposited during the Pleistocene, Neocene, Eocene, and Cretaceous periods, and retain their position quite like that acquired during deposition, but are more elevated than originally on account of being uplifted above the ocean.

**COASTING**, an outdoor pastime originated in Russia, and next to skating one of the most popular winter sports in the colder parts of the temperate regions. It consists of sliding by means of a sled down an inclined grade or bank covered with snow or ice. The sleds are made in a variety of forms, frequently of a framework of iron or of solid board. In the former the runner is wholly of iron and extends forward and upward in a curve, while wooden runners are usually shod with steel. Coasters may either sit or kneel in making the trip, or may lie so as to steer with one leg. Coasting may take place on a hillside or on an artificial embankment or grade, though places used for public traffic cannot be used for this purpose. See **Toboggan**.

**COAST RANGE**, a range of mountains in California, extending from the northern to the southern part of the State, and trending parallel to the coast. At the southern extremity are San Bernardino Mountain, 11,580 feet above the sea, and San Jacinto Mountain, 10,987. The range is about forty miles wide, is rich in min-

erals, and contains some beautiful and fertile valleys, among them the Santa Clara, Los Angeles, and Sonoma valleys. An extension of this range penetrates northward through Oregon, Washington, and British Columbia, where it merges into the Cascades on the east and the Island Range on the west. Most of the mountains belonging to the Coast Range are steep and rocky, but the region has fine forests and several passes penetrate the system.

**COAST SURVEY**, a survey of the coast of the United States, first recommended by President Jefferson in 1807. By an act of Congress the President was authorized to cause the coast to be accurately surveyed and a chart of each part to be prepared for future reference. The work was not commenced until 1817, when E. R. Hassler, a German of Switzerland, was secured to begin the surveying and mapping. Owing to a want of suitable appropriations, the work was not prosecuted with much success until 1832, when Professor Hassler was authorized to employ astronomers to carry forward the enterprise with vigor. He remained in the work until his death, in 1843, when he was superseded by A. D. Bache, who continued to superintend operations until his death in 1867.

Since 1867 the coast and geodetic survey has been promoted without intermission under competent superintendence. It is now a bureau under the Department of Commerce and Labor. The coast lines of the United States, exclusive of Alaska, reach a total of 7,050 miles, and, including the numerous indentations of bays and gulfs, aggregate a total length of 29,350 miles. The coast survey has for its object to determine the position of various points along the coast by accurate methods, to secure a definite knowledge of the coast line and features of the land, to survey the channels and shoals near the shore, and to note the effects of currents, tides, and winds upon navigation and the bottom of the sea. The work is one of vast importance to navigation and commerce, and by means of it many advantages have been obtained for the American shipping enterprises. Besides saving many lives, it has been the means of shortening routes, avoiding dangers, and making travel by water much more efficient and profitable.

**COATESVILLE** (kōts'vil), a borough of Pennsylvania, in Chester County, forty miles west of Philadelphia, on the Pennsylvania and the Philadelphia and Reading railroads. It is located on Brandywine Creek, is surrounded by a fertile country, and has a large trade in produce and merchandise. The manufactures include silk and woolen goods, ironware, boilers,

and hardware. The waterworks are owned and operated by the municipality. Coatesville was settled about 1800 and has been incorporated since 1867. Population, 1900, 5,721.

**COATI** (kō-ä'tê), or **Coati-Mondi**, a genus of carnivorous animals native to the tropical regions of South America and Mexico. The *Mexican coati* has a brownish-gray color and is found from Panama to southern Mexico, while the *red coati* is native to the northern part of South America. Both are closely allied to the raccoon and have an elongated snout, which is used in rooting up the earth when in search of worms and insects. The tail is long, covered with hair, and usually held erect. These animals have coarse hair, are about three

MEXICAN COATI.

feet in length, and easily climb the limbs of trees, where they lie quietly most of the day, but come out at night in search of food.

**COBALT** (kō'bölt), a metal used to form compounds of commercial importance. It is brittle and compact, may be easily reduced to powder, and has a greenish-white or a steel-gray color. Cobalt is not found in a pure state, except in meteorites, but occurs with lead, iron, and other minerals. It is found extensively in Saxony and other parts of Germany. The most important American productions come from Mine la Motte, Missouri. Cobalt, when heated with alumina, yields a pigment known as *cobalt blue* or *cobalt ultramarine*. The oxide of cobalt is used by enamelers and to produce a fine blue glaze on porcelain.

**COBLENZ** (kō'blents), or **Koblentz**, a fortified city of Rhenish Prussia, at the junction of the Rhine and Moselle rivers. It is one of the

most securely fortified cities of Germany, the castle of Ehrenbreitstein being one of the strongest points. The fortifications can accommodate an army of 100,000 men. They contain magazines capable of holding provisions sufficient to support 8,000 men for ten years, and have reservoirs sufficient for supplying water for three years. Coblenz was fortified as a bulwark of defense against France. The city has several fine schools, pavements, electric lights, and rapid transit. Among the principal buildings are the Church of Saint Castor, founded in 836, the old Jesuit College, the public market, and the town hall. It has a considerable trade in corn, mineral water, and wine. The manufactures include clothing, furniture, machinery, cigars, and Japan ware. Coblenz was the capital of the department of Rhine-Moselle under the French in 1798 and became a part of Prussia in 1815. Population, 1905, 53,897.

**COBOURG** (kō'bûrg), a city of Ontario, capital of Northumberland County, sixty-eight miles northeast of Toronto. It is located on Lake Ontario, on the Grand Trunk Railway, has a commodious harbor, and is important as a port of entry. The manufactures include woolen goods, clothing, machinery, and spirituous liquors. It is the seat of a college and several fine schools and churches. The public utilities include electric lighting, waterworks, and a number of well-improved streets. Population, 1900, 4,239.

**COBRA DE CAPELLO** (kō'brá dâ kâ-pêl'lô), the Portuguese name of a poisonous snake of India, meaning hooded snake. It is allied to the cobra or asp found in Northern Africa. The color is pale yellow or brownish-yellow with a tinge of bluish-white beneath. The head is broad and at its rear has nine plates, and the neck may be expanded to cover the head like a hood. It is sometimes called the *spectacled snake*, owing to the appearance of a pair of barnacles on the neck that resemble spectacles, when the neck is expanded. It is from four to six feet long, is sluggish in habits, and is easily killed. Its food consists of lizards, eggs, frogs, birds and small reptiles. It is an excellent swimmer and delights to invade the water in search of food. The bite is exceedingly poisonous, recovery from it being rare and death often resulting instantly or within a few hours. It is estimated that several thousand natives of India die from the bite of this snake annually. The poison is secreted in a gland located in the head of the serpent, and flows through a cavity of the tooth into the wound when the animal compresses its mouth upon any object. The government pays a bounty on the cobra head in

order to extinguish it, but it is held sacred by some of the Hindu people, and is protected by them as a being that has power to injure. Indian jugglers charm the snake and have it

COBRA DE CAPELLO.

serve their purpose in giving exhibitions. The animal may be taught to perform by music and keep time by swinging its head and body to the delight of spectators.

**COBURG** (kō'bōōrg), capital of the duchy of Saxe-Coburg-Gotha, Germany, on the Itz River, a tributary of the Main. It is noted for its palace of the Duke of Saxe-Coburg-Gotha and the ancient castle of the dukes of Coburg. In this castle Luther occupied apartments for some time, his bedstead and pulpit still being objects of interest. The public library has 60,000 volumes. It has manufactures of clothing, woolen and linen fabrics, and porcelain. The public utilities include electric street railways, a public park, and waterworks. Coburg was made the capital of Saxe-Coburg in 1735. Population, 1905, 22,488.

**COCA** (kō'kā), a shrub native to Peru. It attains a height of eight feet. In the Andes it is cultivated at an altitude ranging between 2,500 and 5,000 feet. The leaves are dried and mixed with powdered chalk and are chewed as a stimulant much like tobacco. Coca leaves contain an alkaloid *cocaine* and a waxy substance called *coca wax*. The habit of using it is as obnoxious among the Peruvians as the use of opium is among the Chinese.

**COCAINE** (kō'kā-īn), an alkaloid obtained from the leaves of the coca plant. The leaves

of the plant are green, about two inches long, and the alkaloid is extracted by alcohol and a small quantity of sulphuric acid. It is a colorless, transparent drug, has a bitter taste, and is odorless. The drug is soluble in ether, and is used as a local anaesthetic. It is valuable as such in operations on the eye, ear, and other delicate organs of the body. When taken internally, it is a powerful nerve stimulant, and, if used persistently, causes nervousness and later insanity. Cocaine was first made in Peru in 1885, and vast quantities are now exported from that country and Bolivia to the United States and Europe.

**COCCULUS INDICUS** (kōk'kū-lūs īn'dī-kūs), the fruit of a climbing plant native to the East Indies. It is about the size of a pea, has a dry exterior coat, and somewhat resembles the bayberry, but is very poisonous. The bitter principle, known as *picrotoxin*, when taken internally in poisonous doses, acts much like strychnine. It is used to destroy lice and the ringworm and for various purposes in medicine. The seeds are sometimes called *fishberries* from the circumstance that they stupefy fish. They are used to some extent by fishermen, who cast them into the water for the purpose of stupefying the fish so they may be easily caught by hand or in a small net.

**COCCUS** (kōk'kūs), a group of insects which include the bark lice, mealy bugs, scalelike insects, and a number of others. The species are very numerous and differ greatly in appearance, but in most of them the female is wingless and the male has a single pair of wings. They attach themselves to plants by inserting their beak, with which they suck the sap, hence are very injurious to hothouse and garden plants. These insects include those from which cochineal, gum lac, and kermes are obtained.

**COCHABAMBA** (kō-chā-bām'bà), a city of Bolivia, capital of the department of Cochabamba, on the Rio de la Rocha. It is located in a fertile valley, has wide and regular streets, and has considerable trade in produce and merchandise. The manufactures include soap, leather, earthenware, and cotton and woolen goods. Among the chief buildings are a theater, two hospitals, several churches, and the government building. The city was founded in 1563. Population, 1906, 30,175.

**COCHIN** (kō-chēn'), a city of British India, a seaport in the district of Malabar, eighty miles southeast of Calicut. It is important for its large foreign and interior trade, has transportation facilities by railroads and steamship lines, and is the seat of extensive shipyards. Many classes of Asiatics and Europeans make up the

inhabitants, who carry on a large trade in oil, cocoa, teak wood, and merchandise. Cochin was visited by the Portuguese under Vasco da Gama in 1503, but the Dutch captured it in 1662, when it was made a great emporium of trade. It has been a British possession since 1796. Population, 1906, 18,250.

**COCHIN CHINA** (kō'chīn chī'nà), the name applied to the French colony in the southern extremity of the eastern portion of the Indo-Chinese peninsula. The designation is loosely attached to the former empire of Anam, which included three distinct regions: Lower Cochin China, Upper Cochin China, and Tonquin. Lower Cochin China is now the French colony of Cochin China. Upper Cochin China is the French protectorate known as Anam, and the remainder lying to the north is called Tonquin. These and Cambodia constitute the present French possessions in Southeastern Asia.

Cochin China occupies the southeastern extremity of the Indo-Chinese peninsula, and includes a small part of the territory embraced within the former empire of Anam. The area is 23,182 square miles. It is bounded on the northeast by the region included in Anam, northwest by Cambodia, south and east by the China Sea, and west by the Gulf of Siam. It now has a number of railroads and is extensively connected by telephone and telegraph lines, and many of its cities are in a growing condition. The chief products consist of rice, cotton, hides, domestic animals, fish, pepper, and tropical fruits. The French government has established free schools and erected a number of public buildings. There is a French army of about 2,000 soldiers, besides about that number of Anamese troops. The Mekong River furnishes an avenue for interior navigation. A number of the seaport cities have a large foreign and interior commerce.

The region was conquered with Anam by China in 214 B. C., and became independent as a part of Anam in 929 A. D., and in the early part of the 15th century was successful in a war against China. In 1517 it was made a part of the Portuguese possessions. Later it was conquered by the Dutch, and in 1789 became tributary to France. The population is 2,976,521, of which 5,000 are French settlers and traders.

**COCHINEAL** (kōch'ī-nēl), an insect found native on the cactus plants of Mexico and Central America. It has been naturalized in the warmer portions of Eurasia and Africa. The value of the insect consists of its importance in preparing *cochineal*, an article used in producing scarlet colors and in making carmine and lake. However, the commercial product is obtained

only from the females, which outnumber the males in the proportion of about 150 to one male. Each of the females lays about 1,000 eggs, and the crops are picked in the period from December until May. The insects are brushed off the

1, Cochineal insects on cactus; 2, Female; 3, Male.

plants and killed by the heat of the sun or in an oven. A single pound of cochineal contains about 70,000 of the insects. The value of these insects was first discovered by the Spanish in 1518.

**COCKATOO** (kōk-à-tōō'), the name applied to a genus of birds of the parrot family. They have a large head crowned by a tuft of long and pointed feathers. The bill is strong and curved from the base, and the plumage is bright, commonly white in color, but sometimes mixed with red, blue, and yellow. The name was given to these birds on account of their peculiar utterance, screamed out harshly. They are able to acquire a few words, but are not possessed of much imitative power. The chief food consists of fruits, seeds, and small insects. Australia and the Eastern Archipelago are well populated with these birds, where they live in large tribes and may be easily domesticated. See illustration on following page.

**COCKCHAFER** (kōk'chā-fēr), a class of beetles widely distributed in Europe and North America. The larvae live from two to five years in meadows and pastures, where they burrow in the soil and feed on the roots of the grass. In the adult state they are about an inch long and live only a few days, hence they do little damage to the leaves of trees upon which they feed.

This class of insects is known in England as *May bugs* and in America as *June bugs*, since they come out of the ground in May or June. In some seasons they occur in great numbers,

AUSTRALIAN COCKATOO.

though usually they are not regarded as a pest, except in some meadows and strawberry patches.

**COCKLE** (kōk'k'l), a common name for several species of bivalve mollusks. They are found in the sandy shores of the sea, have a heart-shaped form, and are much used as food. The cockle is nearly equivalvular, with a hinge fastening the two parts.

**COCKLEBUR** (kōk'k'l-bûr), or **Clotbur**, the name of several species of troublesome weeds found in most of the continents, especially in the Temperate zones. One species, the *xanthium canadense*, is native to North America, and two other species were introduced from Europe. The species known as *xanthium strumarium* is particularly troublesome in the fields of Southern Canada and most sections of the United States. The plant is branching, has coarse heart-shaped leaves, and grows to a height of from one to four feet. It is an annual plant and produces burs about an inch long covered with stout prickles. The burs have two cells and retain their vitality a number of years, hence it is difficult to rid fields of them, except by seeding the ground in timothy and clover, or some other perennial grasses, thus preventing

the plants from seeding. Cockleburs are injurious to the wool industry as the burs fasten themselves in the wool, hence stringent laws are in force in the south of Africa and other continents to eradicate the obnoxious weed.

**COCK OF THE ROCK**, a bird found in the northern part of South America. It is about the size of a large pigeon, has orange colored plumage, and the head is crowned by a beautiful flattened crest. These birds are so named from their habit of building nests on rocks near rocky watercourses and on bushy hillsides. The males court the females by assembling in cleared places, where they display their plumage until chosen as a mate by some observant female. The skins are valued for millinery purposes and command a high price in the market.

**COCKROACH** (kōk'rōch), a genus of insects belonging to the order having straight wings. The Oriental or proper cockroach is thought to have come originally from India, but is now found widely distributed. In the male the wings are half the length of the body when mature, while in the female they are but rudimentary. The body is oval, elongated, and has a well-marked smoothness on its upper surface. The eggs remain in the abdomen of the female for six or eight days, when they are attached to some solid body by means of a gummy fluid secreted by glands. Several species of cockroaches in America are widely distributed, some of which attain a length of from two to three inches. The *Croton bug*, so named from the Croton Aqueduct of New York, has followed man to all parts of the globe and is confined chiefly to the larger cities. Cockroaches are nocturnal in habit, have a ravenous appetite, and leave an unpleasant scent on food that they are unable to devour.

**COCOA** (kō'kō), or **Cacao**, one of the best known and most prized of the palm trees. It is found on the coasts of islands and continents having a warm climate, and is common to the West Indies, South America, India, and the East Indies. The tree thrives best near the seacoast, but rare ones are found at an elevation of 2,500 feet above the sea. It attains a height of from sixty to ninety feet. The trunk is slender and is marked by scars when the leaves have fallen off, these constituting transverse rings. In most cocoa trees the rings serve as a means of ascending the trees to secure the fruit, and are used for that purpose by the natives. The leaves grow in the form of a bunch or tuft at the top, are from twelve to fifteen in number, and are of gigantic size. About eighty to one hundred nuts are produced on an average tree. They are used for various purposes in the pro-

duction of food and other articles valuable in commerce. The terminal bud is considered a delicate food. The leaves are used for baskets, buckets, and thatched dwellings. In a number of localities fences are made of them, and they also serve as a substitute for writing paper. The

COCOA. TREE AND FRUIT.

midribs of the leaves are used for oars, while their ashes yield potash, and a portion is used in cradles and in the manufacture of clothes. The stem of the leaves serves in making drums and in constructing huts and furniture. The roots yield medicines and serve the natives as a chewing substance. Chocolate is a product from the cocoa and is formed as cakes, after the fatty substances have been removed and sugar, spices, and other ingredients are added.

**COCOANUT**, the fruit of the cocoa palm growing in tropical countries. It is from three to eight inches in length, covered with a fibrous husk, and contains a fleshy kernel. It is an agreeable article of food and is used for various purposes in manufacture. The interior of the nut is of a whitish color and contains a milkish white fluid. In some regions large quantities are dried before the oil is expressed, when the product of the kernel is known as *copra*. The fibrous covering is used in the manufacture of yarn, matting, and cordage, and is known as *coir*. Cups and vessels are made from the hard shell of the nuts, which, when polished, serve a useful purpose. The wood of the tree is used in the construction of houses and for other building purposes. The tree yields a sweetish liquid called *toddy*, which, when distilled, forms a spirit called *arrack*. A sugar is obtained from the juice known as *jaggery*. The nut produces

the *cocoa butter*. This butter is used as a substitute for creamery butter, and is sometimes mixed with butter and colored with a butter coloring. It is usually yellowish white and has a weak chocolate odor and an agreeable taste. It does not become rancid when kept.

**COCOON** (kō-kōon'), the outer covering of silky fibers or hair with which the pupae of many insects are protected. This silky fiber is formed in some insects, as in caterpillars, some varieties of spiders, and silkworms. The cocoon gathered from silkworms is the article from which silk is manufactured.

**COD**, the name of a cape and bay in the eastern part of Massachusetts. They were so named from the large number of codfish that abound in and near the bay. See **Cape Cod**.

**COD**, a valuable food fish abundant in the waters off Newfoundland and throughout the temperate seas of Eurasia and America. There are several well-defined species, all belonging to the soft-finned fishes. They feed mostly in water about twenty-five to sixty fathoms deep, and weigh as much as a hundred pounds. They spawn from January to May, at which season great numbers crowd together. In two years the young fish become marketable and reach maturity at the end of three years, when they weigh about sixty pounds. The best months for cod fishing are October, November, and December. The codfish is a good biter at almost any kind of bait and ordinarily feeds on worms, mollusks, and small fishes. It is a valuable fish for food, while isinglass is made of its bladder and cod-

COMMON COD.  
TOM COD.

liver oil from its liver. Cod-liver oil was recommended as early as 1833 for diseases of the lungs and in cases of chronic rheumatism. Codfish are caught mostly with hooks and lines, one man being able to catch from 300 to 500 in a day. However, most of the fishing is done by

the aid of schooners, from which the fishermen put out long lines called *trawls*, and to these are attached shorter baited lines. The fish are taken off the lines from time to time and are immediately dressed and salted. Some of the best cod fisheries are adjacent to Newfoundland and off the coast of Norway.

**CODE NAPOLÉON**, the laws of France promulgated between 1804 and 1810, which are contained in the so-called Five Codes. The laws of France were greatly diversified at the time of the Revolution and a general or national code was demanded by the people. Napoleon promulgated the first code, generally known as the "Civil Code of France," to which additions were made subsequently, and the title was changed to Code Napoléon in 1807. Few new laws were introduced, but those in existence were codified and edited so as to present simple and clear statements. It may be said that the Code Napoléon harmonized the customary laws of the German provinces in the north with the laws of southern France. The rapid rise of French power caused these laws to be adopted in many countries of Europe before 1814, and many of them are still in force in Belgium, Italy, and Holland. The code of Louisiana and those of a number of republics in Central and South America are based upon the Code Napoléon.

**CODEX** (kō'děks), the name applied to the wooden tablets coated with wax and used for writing by the ancients. Subsequently the name was applied to all large manuscripts, as the works of the poets and historians, and under the emperors of Rome it designated collections of civil and ecclesiastical laws. The oldest and most celebrated collections of civil laws are those known as the "Codex Theodosianus" and "Codex Justinianus." In more recent times the term came to be applied more generally to the ecclesiastical writings, such as the "Codex Alexandrinus," which is written on parchment and contain the entire Greek Bible, except the books of Matthew, John, and II. Corinthians. In this work the Old Testament is in the Septuagint version. The "Codex Rescriptus" is an ancient parchment on which the original writing has been defaced and upon which a different composition has been copied. A parchment of this kind is now called a palimpsest. See **Palimpsest**.

**COD-LIVER OIL**, a fixed oil obtained from the livers of the cod, ling, torsk, and other related species of fish. The adipose tissue of these fish is confined almost entirely to the liver, from which it is obtained by heat or by pressure in a cold state. Formerly the fishermen put the livers in barrels, where they were kept

from one to four months, during which time they underwent putrefaction and the oil would rise to the top and be drawn off into vessels. The oil is now obtained in a much cleaner way by simply heating the fresh livers for two or three hours, after which the oil is pressed out. Cod-liver oil has a pale yellow color and is a better food than any other oil. It is easily digested and is valuable as a food in consumption and other wasting diseases. The taste is very disagreeable, hence it is administered in various ways, frequently in capsules. A preparation known as *emulsion* has a milky appearance and is made by mixing a number of remedies with cod-liver oil, usually such as chloroform, elixir of saccharin, malt extract, alcohol, oil of bitter almonds, sodium bicarbonate, etc. A tablespoonful taken three times a day is a common dose of the pure oil.

**COEDUCATION** (kō-ěd-ŭ-kā'shŭn), the association of males and females for instruction in the same institution, school, or class, each receiving the same training and culture. This system prevails generally in the elementary public schools of the United States, being the most convenient and economical, except in a few large cities, such as New York and Boston. This practice appears to receive, not only the tolerant assent of parents as a necessity, but unqualified approval is given in most cases on the ground that it is the best to be adopted. However, nearly half the private elementary schools have separate instruction and courses of study for boys and girls, and in 1908 about eight per cent. of the pupils receiving elementary instruction attended such schools.

Those who oppose coeducation give a number of reasons in support of their views. Among these is the chief one that mixed schools do not provide instruction and discipline quite as well fitted to the peculiarities of the sexes. They think that the manners of the girls are influenced unfavorably by the coarser conduct of the boys, and that on the other hand the boys receive little or no benefit from the presence of the girls. Some think that there is a liability of influencing unfavorably the moral character of each, which is guarded against by preventing the constant presence and intermixing of the sexes in the classes and on the playground. Those who favor coeducation, on the other hand, think that the presence of the girls tends to improve discipline and stimulate self-respect and politeness. It is held by this class that both instruction and one-sided training is prevented, and that interest will center in such studies as mathematics as well as literature and poetry when both sexes meet in recitation work. So

far as moral tendencies are concerned they think daily association of the sexes is healthful and provides a general uplift and induces a tendency toward the practice of the good rather than toward the more base.

It must be observed that coeducation is gaining ground steadily in America as well as in the more progressive countries of Europe. This is true particularly of England and Germany, though the gymnasiums and *realschulen* of Germany are with few exceptions for boys exclusively. The last few years a struggle of women for admission to the universities of Germany has been going on, and resistance has not only given way to a considerable extent, but many advocate coeducation who formerly opposed it, being satisfied by a practical test that coeducation has many advantages. In England and Scotland women are admitted to nearly all the universities, though exception is made in some to their admission where law and medicine are studied, while in Australia women are not only admitted as students, but are given places as lecturers and professors, and wider privileges have been extended in Austria and Russia. All the universities of Switzerland are open to women on the same terms as to men. In 1908 there were 5,450 coeducational high schools in the United States out of a total of 5,500, while the private secondary schools, which number 1,960, included 325 for boys and 550 for girls, while 1,085 were coeducational. Practically the same proportion of coeducational schools are maintained in Canada.

In speaking of separate schools for the sexes Jean Richter said: "To insure modesty, I would advise the education of the sexes together; for two boys will preserve twelve girls, or two girls twelve boys, innocent, amidst winks, jokes, and improprieties, merely by that instinctive sense which is the forerunner of natural modesty. But I will guarantee nothing in a school where girls are alone together and still less where boys are." Dr. Clark, in his work entitled "Sex and Education," says: "Boys must study in a boy's way, and girls in a girl's way. Appropriate education of the two sexes carried as far as possible is a consummation most devoutly to be desired; identical education of the two sexes is a crime before God and humanity, that physiology protests against, and that experience weeps over." President Fairchild, of Oberlin, said: "During my experience as professor—twenty-seven years in all—I have never observed any difference in the sexes as to performance in recitation." James Burrill Angell, president of the university of Michigan, said: "We have not had the slightest embarrassment

from the reception of women. They have done their work admirably, and, apparently, with no peril to their health." In speaking on this subject, Caroline Wells no doubt expressed the correct view in saying: "Education is to be adapted neither to boys nor to girls, but to individuals. The mother, or the teacher, has learned little who attempts to train any two children alike, whether as regards to the books they are to study, the time it is to take, the attitudes they are to assume, or the amusements they are to be allowed."

**COELENTERATA** (sě-lěn-tě-rā'tà), a branch of the animal kingdom, the next to the lowest of the types of Metazoa, which include the polyps and jellyfishes. The body cavity and circulatory system are not distinctly separate, but the food enters through the mouth into a system of chambers or tubes, which take the place of the body cavity and of the digestive system. These chambers serve as a stomach for digestion and as a circulatory system in conveying food to the different parts of the body. Around the mouth are grouped a number of tentacles, which serve as organs of touch and for taking hold upon food, and some of the species have a form of stinging cells that serve to stun or paralyze the food. Most of the coelenterates live in the sea, only a few inhabiting fresh water. The jellyfish is not regarded as a true member of this class of animal life and is a free-swimming organism, while the corals, hydroids, and sea anemones are fastened to some object during their natural life. The sponges, though classed with these animals, have no tentacles.

**COFFEE** (kǒf'fě), a genus of shrubs cultivated in warm climates, native to Abyssinia and Arabia. The coffee plant is now grown in the West Indies, Bermuda, and the tropical climates of America and other continents. About fifty species are grown for commercial purposes. Those producing the coffee seeds of the market attain a height of from fifteen to twenty feet in the native state, but they are treated usually so as not to exceed more than ten feet. In this way the production is increased largely, since the seeds grow mainly on the smaller and newer twigs. The seeds or beans are destitute of flavor in a raw state, but in roasting a peculiar brown oil, known as *caffeine*, is developed, and this gives to coffee its beautiful aroma. Caffeine is the most valuable constituent of coffee, and is identified closely with the alkaloid *theine* found in tea. It is found in roasted coffee in a proportion of about one per cent. Coffee is ground and made into a drink which constitutes one of the most wholesome beverages

known. It assists digestion, retards waste, and exhilarates the spirits. It is adulterated with chickory in a ground form, and is sometimes mixed with figs, malt, and raisins. The best way to avoid adulteration is to use only the coffee beans and grind them as the coffee is needed for household use.

Among the different kinds of coffee are *Mocha*, secured from the region of the Red Sea; *Java coffee*, *Jamaica coffee*, and the *Rio coffee* of South America. Coffee was entirely unknown to the ancient Greeks and Romans. The Dutch first brought the coffee plant to other lands and cultivated it. Seeds were brought to Java about 1690, and to Brazil and South American countries in 1774. The production is continually increasing. The world's

country which produces fruits and cereals. Coal, petroleum, natural gas, and potter's clay are obtained in the vicinity. The manufactures include flour, pottery, brick, machinery, and cigars. It has a number of fine schools and churches, gas and electric lighting plants, waterworks, and a public library. The first settlement in its vicinity was made in 1869 and it was incorporated two years later. Population, 1900, 4,953; in 1910, 12,687.

**COFFIN** (kōf'fīn), a box or chest in which a corpse is inclosed for burial. Coffins were used by the ancients mostly for the bodies of distinguished persons. They are mentioned in the Scriptures in relation to the embalmed body of Joseph. The Egyptians used wooden coffins and sometimes placed the bodies in caskets of stone and baked clay. The Romans and Greeks employed cedar wood in constructing coffins, and in later times the former practiced cremation, placing the ashes in urns. However, the Greeks placed many corpses in coffins made of a limestone known as *sarcophagus*, which absorbed the tissues of the body in a few weeks, and the name soon came to be applied to the coffin itself. The Christians introduced the extensive custom of burying in coffins. Those used in modern times are made of wood or metal.

**COGNAC** (kōn-yāk'), a town of France, in the department of Charente, twenty-five miles west of Angoulême. It is situated on the Charente River, has an old castle in which Francis I. was born, and is famous for the manufacture of Cognac brandy. The surrounding country is devoted largely to the cultivation of the vine. Among its improvements are electric lights, a public library, and extensive transportation facilities by railways. Population, 1906, 19,590.

**COHESION** (kō-hē'zhūn), the force by which molecules of the same kind or of the same body are held together. It is strong in solids, weak in liquids, and absent in gases. It varies with the nature of the bodies and with the arrangement of the molecules in the same body. Thus, the tempering of steel alters the molecular arrangement in that substance, with the effect also of altering its cohesion. The hardness, ductility, and tenacity arise from modification in the cohesion of substances. See **Adhesion**.

**COHOES** (kō-hōz'), a manufacturing city of New York, in Albany County, at the confluence of the Mohawk and Hudson rivers. It is on the Erie and Champlain canals and on the New York Central and the Delaware and Hudson railroads. The chief buildings include the public library, the high school, the Episcopal Saint John's Church, and the Roman Catholic Saint Bernard's church. It has iron foundries,

COFFEE PLANT.

A, Flower; B, Fruit Stock; C, Fruit; D, Section of Fruit.

annual output is about 1,550,000 tons, more than one-half of which is grown in Brazil. Other countries that are extensive growers of coffee include Mexico, India, the Dutch East Indies, Arabia, and Central America. The United States and Canada secure their supply principally from Brazil. According to recent authority, the consumption of coffee in Holland is twenty-three pounds per year for each person; Belgium, eleven; United States, ten; Germany, six; France, four; Great Britain, one.

**COFFEYVILLE**, a city of Kansas, in Montgomery County, 170 miles southwest of Kansas City, on the Santa Fé, the Missouri Pacific, and other railroads. It is nicely located on the Verdigris River and is surrounded by a fertile

machine shops, rolling mills, knitting mills, pin and needle factories, cotton mills, and furniture factories. Cohoes ranks as one of the leading manufacturing cities on the Hudson and has a large trade in produce and merchandise. Gas and electric lighting, pavements, waterworks, public parks, and rapid transit are among the improvements. It was settled by the Dutch about 1630 and was chartered as a city in 1870. Population, 1905, 24,183; in 1910, 24,709.

**COINAGE** (koin'āj), the process of making money of metal by stamping certain characters upon it, giving it a definite legal current value. Coinage was practiced early in history, the first mention of brass money being made by Homer in 1184 B. C. The Lydians coined money of gold and silver. The most ancient coins now extant were made in the 5th century B. C. In Rome metal money was made of brass previous to 269 B. C., at which time Fabius Pictor began to coin silver, and gold was coined in 206 B. C. The early coin money of Rome contained the heads of deities, or those statesmen and warriors who had been granted divine honors. Julius Caesar was the first living Roman whose portrait was placed on coins, and the example was soon followed by various rulers in other nations. Much of the coin money of ancient times was made of iron and brass, but gold and silver were used more or less by the richer nations.

In Great Britain the coinage is regulated by Parliament, although the prerogative of coining is vested in the crown. The coinage of Canada is regulated by the Dominion Parliament and is directly in charge of the deputy master and the superintendent of the royal mint. Silver is used for small change in Canada, and the coins are of the same denominations and have the same names as those of the United States. Although gold is coined extensively, it is rarely seen in circulation, practically the whole stock in the country being held by the government against the issue of legal tender notes and as reserves in the banks.

The first coinage laws of the United States went into effect in 1792. They provided a double standard, that of gold and silver, the latter of equal legal value, coined fifteen times greater in weight than the former. Since then various changes have been made, which are fully explained in other articles. The metric system is used to a certain extent in determining the weight of silver coins, and the monetary system is based on the most convenient scale of increase and decrease. Gold coins at the present time consist of double eagles, eagles, half eagles, three dollars, quarter eagle, and the dollar. The coins of three dollars and one dol-

lar are quite rare. The silver coins consist of dollar, half-dollar, quarter-dollar, and dime, or ten cent, pieces, while the minor coins of nickel and bronze include five-cent, three-cent, and one-cent pieces. See **Mint**.

**COIR** (kōir), the fiber of the cocoanut and other palms, used in the manufacture of ropes, mats, bags, cables, etc. The fiber is obtained from the husk and is divided into two classes, the outer or ordinary fiber and the inner or brush fiber. Mats are made largely of the ordinary fiber, which is the coarser and less durable, while the brush fiber is the finer product and is shipped in great quantities to the manufacturers, who use machinery in making cable yarn and yard matting. The waste or refuse of coir supplies the stuffing for mattresses and other commercial products.

**COKE** (kōk), an article of fuel obtained by heating coal in ovens, or other devices, where little air is admitted. It is often prepared in heaps, but generally in ovens built for the purpose. The heat is applied until the volatile constituents have been expelled; thus, the coke consists largely of impure forms of carbon and contains earthy matter and often some sulphur. It is brittle, hard, and porous, and floats in water until it becomes saturated, when it sinks. Coke produces an intense heat when burnt, gives off no smoke, and is useful for cooking purposes and in manufactures. It is valuable in separating metals from their ores and for refining and smelting. Coal coke is formed in the manufacture of coal gas, being a residue left after all the gas has been distilled. Coal yields from sixty to seventy per cent. of coke. Large quantities of coke are made in Pennsylvania, West Virginia, Germany, and England.

**COLBY COLLEGE** (kōl'bi), an educational institution founded at Waterville, Me., by the Baptists in 1813. It was first named Waterville College, but changed to Colby University, in honor of Gardener Colby, a philanthropist, by whose generosity the institution prospered greatly. In 1899 the name was changed to Colby College. It has departments for the education of both sexes. The library has 38,500 volumes. It has an attendance of about 275 students.

**COLCHESTER** (kōl'chēs-tēr), a river port of England, in Essexshire, 50 miles northeast of London. It is located on a hill near the south bank of the Colne River, twelve miles from the sea, and has electric and steam railway facilities. The manufactures include boots and shoes, clothing, and machinery. Among the public utilities are waterworks, public baths, a public library, and substantial street paving. It is the seat of the Albert School of Science and Arts.

Colchester is an old town and dates prior to the Roman invasion. Many ancient vases, urns, and coins of imperial Rome have been found in the vicinity. Population, 1906, 40,425.

**COLCHICUM** (kōl'kī-kūm), a genus of plants allied to the lilies. The meadow saffron is a species of colchicum. About thirty other species have been described. They are stemless and thrive in meadows and pastures. The plants attract little attention in the spring, but the flowers are beautiful and appear from August to October. Most species are acrid and poisonous, but some yield valuable medicine for gout and inflammatory rheumatism.

**COLD HARBOR**, a locality in Hanover County, Virginia, about ten miles northeast of Richmond. It was the seat of several battles in May and June, 1864, between the Union and Confederate armies. The first battle began on June 1 and continued three days. Gen. Grant commanded the Federal forces and had advanced from Spottsylvania to Chickahominy. Gen. Sheridan occupied Cold Harbor, where he was joined on June 1 by forces from Butler's army. The assault made on the Confederates was partially successful, but resulted in a loss of 2,000 men to the Union army. An attack was made on the right flank of the Confederates on June 3, but little advantage was gained, though 7,000 men were lost. Later the Federal army gained some advantage by the battles at Petersburg. The several battles at Cold Harbor cost the Union army almost 13,000 men, while the Confederates lost not over 2,000.

**COLD STORAGE**, a system of preserving perishable articles of food, such as eggs, meats, and vegetables. Cold storage plants are very common in the cities having a population of 10,000 or more, and are controlled and operated as private enterprises. They are usually divided into a number of rooms or departments, and in nearly all cases are associated with plants maintained for the manufacture of artificial ice. The articles preserved in cold storage are placed in rooms where the temperature is little above the freezing point, whereby it is possible to preserve perishable articles of food so the market can be supplied with choice varieties in good condition at all times of the year. Cold storage is used in large hotels and breweries, and in the transportation of butter, fruits, vegetables, and meats. Furs are kept in summer to a considerable extent in cold storage.

**COLDWATER**, county seat of Branch County, Michigan, on Coldwater River, about forty miles southeast of Kalamazoo. It is located in a fertile agricultural country, on the Lake Shore and Michigan Southern Railroad,

and is a prosperous trading and manufacturing center. The city is the seat of a State school for indigent children. Among its institutions are a public school building costing \$100,000, a fine courthouse, and numerous churches. Electric lights, pavements, and a library are among the facilities. It was settled in 1830 and became an incorporated city in 1862. Population, 1904, 6,225; in 1910, 5,945.

**COLGATE UNIVERSITY**, an institution founded at Hamilton, N. Y., in 1820. The name was changed to Madison University in 1846. Later the name was changed to Colgate University in honor of James B. Colgate, a leading dry goods merchant of New York, who made a number of large gifts to the institution. The university is now endowed with about \$2,000,000. It has a faculty of forty instructors, 350 students, and a library of about 35,500 volumes.

**COLIMA** (kō-lē'mā), capital of the state of Colima, Mexico. It is located on a fertile plain and is surrounded by hills and mountains. Near it is the volcano Colima, which has an altitude of 12,743 feet. The city has railroad connections, a number of costly edifices, and a large trade in cotton and fruit. Among the chief buildings are the city hall, the state capitol, and the Hospital de San Juan. Colima was founded in 1522. Population, 1906, 22,445.

**COLLEGE** (kōl'lēj), an institution of learning which offers opportunities for study in advanced courses. The instruction is usually in the liberal arts, with a course of study, either fixed, or partly fixed and partly elective, commonly requiring four years for completion. Although there are many institutions that claim rank as colleges, the courses differ very widely. No distinct line of demarkation has yet been fixed between the requirements of a course of study for an academy and a college, and between that of a college and a university. Besides, many of the high schools carry courses covering college branches, in some cases even ranking higher in efficiency than some of the colleges. A typical college course contains provisions for the study of English, German, Latin, Greek, and French languages, mathematics, physics, literature, moral and mental philosophy, civics, engineering, and other allied departments. At the completion of a definite course a degree may be granted, which, in most cases, is recognized by universities where students wish to pursue still more advanced work. Some American colleges have departments for professional training, especially for teaching, while some of the universities have academic or collegiate departments. The list of colleges also includes institutions for special training, as colleges of pedagogy, theol-

ogy, medicine, music, agriculture, industrial arts, and others. It is thought that colleges had their origin in connection with the University of Paris, in the beginning of the 15th century.

Colleges have been established in many cities of the United States, some as private enterprises and others by State or Federal aid. In the leading towns and cities, from Maine to California and from Canada to the Gulf, there are one or more institutions doing college work. These institutions are usually open alike to both sexes, though there are some exceptions. Many have taken pride in building up extensive libraries, collecting museums, and attaching gymnasiums for the physical development of both sexes. The collegiate institutes of Canada occupy a place between the high school and the university, and pupils attending these schools are prepared for matriculation in the universities. Ontario had 42 collegiate institutes in 1906, and a proportional number is maintained in the other provinces. The name *college*, in Canada, as in England, refers more specially to the body of institutions that constitute a university. Several hundred college papers, including weeklies, monthlies, and quarterlies, fill a valuable field in cultivating an educational sentiment and in furthering knowledge, both among the students and general readers. College societies are maintained in all institutions of this character, having for their object the study of literature and other useful lines. In the larger colleges a number of these societies are supported, usually with courses of study and outlines for research fitted for the different classes of pupils, based upon age and educational attainments.

Many colleges have followed the plan now maintained by most universities in that they provide college extension work. By means of this department it has become possible for the instructors and officers to come in contact with people in adjacent cities and states, and to carry the benefits of higher study to localities remote from educational centers. Thus, a taste for higher education has been awakened in younger students, while older classes and professional and business men have remained in touch with wholesome reviews of branches, thereby enlarging and extending culture and learning. It is quite unnecessary to name the different colleges of the United States in this article. A number of leading institutions have been mentioned in special articles. It may be in place, however, to say that American colleges are so widely distributed and carry such a diversity of courses that it is possible for any person of thrift and brains to attain to educational power and usefulness. These colleges are open alike to poor

and rich, while the expense of attendance has been reduced to a minimum. The annual expense of college attendance in many good institutions does not exceed \$350, though some students can barely bridge over a year's work with less than \$3,000. This, of course, depends upon the habits of economy, the society surrounding college life, and the institution at which an education is sought.

**COLLEGE POINT**, a locality in Greater New York City, in Queens County, on the south shore of Long Island Sound, about ten miles east of Central Park. It has a number of factories, which are devoted chiefly to the production of India-rubber goods. The streets are well improved and many of the edifices are costly structures. It is the residence of many New York business men.

**COLLIE** (kŏl'ly), or **Sheep Dog**, the name of several kinds of dogs employed extensively in controlling flocks of sheep or cattle. It is a hardy animal with long hair, stands about 25 inches high at the shoulders, and is noted for its intelligence. The muzzle is tapering and the appearance is somewhat foxlike, and the ears are carried flat on the side of the head. Dogs of this class can be easily trained to take a flock of sheep to pasture and drive them home safely at the appointed time. Sheep become accustomed to their dog and regard it as a friend. It is peculiar in its remembrance of places and for protecting flocks from wolves. The collie is a favorite sheep dog in Scotland and the Scotch breed is a representative of this class. Other breeds include the *Welsh*, the *Schipperke*, and the *Pomeranian*. The last mentioned is known as the *Spitz dog* and is favored as a house pet, being somewhat smaller than the Scotch collie.

**COLLINGWOOD** (kŏl'ling-wŏod), a port town of Ontario, in Simcoe County, 94 miles northwest of Toronto, on the Northern Railway. It is nicely situated on Georgian Bay, Lake Ontario, and has important steamboat transportation facilities. The manufactures include flour, leather, spirituous liquors, and machinery. It has a large trade in lumber, manufactures, and merchandise. The public facilities include electric lights, several fine schools, and waterworks. Population, 5,755.

**COLLODION** (kŏl-lŏ'di-ŏn), a solution prepared by mixing pyroxylin with alcohol and ether, or by treating the pyroxylin in ether and afterward adding alcohol until it is completely dissolved. The process recommended is to treat eight parts of pyroxylin by weight in 125 parts of rectified ether and then add eight parts of rectified alcohol. The product is very volatile,

and on evaporating leaves a film which adheres to the surface of bodies, thus making it a convenient application to cuts and wounds in the place of sticking plaster. It is applied by brushing it alone over the edges of the incision, or by spreading it upon strips of ribbon. Collodion is used extensively in photography for preparing sensitive films, which are made by spreading a mixture of collodion and substances sensitive to light over glass plates. It is used in constructing small toy balloons, for making wood and fabrics waterproof, for coating to render pills and other medicinal preparations tasteless, and for a variety of other purposes.

**COLMAR** (kôl'mär), or **Kolmar**, a city of Germany, in Alsace-Lorraine, forty miles southwest of Strassburg. It is finely situated on the Lauch River, near the base of the Vosges, and is the converging center of several important railroads. The principal buildings include a college, a theater, a townhouse, and a cathedral. Among the chief manufactures are cotton goods, leather, hosiery, cutlery, ribbons, and machinery. It has a considerable trade in produce and merchandise. Colmar has electric railways, stone and asphalt paving, gas and electric lights, and a number of fine public schools. By the Peace of Ryswick, in 1697, it was ceded by Germany to France, but was returned by the Treaty of Versailles in 1871. Population, 1905, 41,791.

**COLOGNE** (kô-lôn'), (German, Cöln), the capital of Rhenish Prussia, Germany, on the Rhine River. It is strongly fortified, a number of its fortifications dating from the Middle Ages, but they have been vastly improved by the construction of modern defenses. It has a number of famous churches of various styles of architecture, including the Romanesque, Gothic, and Transition. The Cathedral of Cologne (see Architecture) is the finest specimen of Gothic architecture in Europe. It was built in the reign of Charlemagne, and was burned in 1248, but was rebuilt soon after, although it was not fully completed until 1880. The cost of this magnificent structure is estimated at more than \$10,000,000. The city is remarkable for its beauty and educational facilities. Its streets, public boulevards, botanical gardens, and zoölogical institutions are among the finest in Europe. The public school system and higher institutions of learning take high rank, while the public library and monuments embody much beauty and value. It is extensively connected by electric lines and railroads, and has a large interior and river navigation commerce. The manufactures embrace fabrics, clothing, musical instruments, glue, toys, tobacco, machinery, and the celebrated *eau de Cologne*, or Cologne water. It has grown

with remarkable rapidity in commerce since the beginning of the 20th century. Cologne dates from an early period of European history. It was founded about 30 B. C. by the Ubii. In 870 it became a part of the German Empire, entered the league of the Hanseatic cities in 1201, and was joined to Prussia in 1801. Population, 1905, 428,722.

**COLOMBIA** (kô-lôm'bê-ä), a republic of South America, located in the northwestern part of that continent. It is bounded on the north by the Caribbean Sea, east by Venezuela and Brazil, south by Ecuador, and west by the Pacific Ocean and the Republic of Panama. The location is between latitude 3° south and 12° 30' north and between longitude 67° 30' and 83° west. Choco Bay, Tumaco Bay, and Cupica Bay are the chief indentations on the Pacific Coast, while the Gulf of Darien is the principal inlet on the Caribbean Sea. The area is not definitely known, since some of the territory usually included is claimed by Peru, Ecuador, and Brazil, but it is generally given at 473,000 square miles.

**DESCRIPTION.** The surface may be divided into two regions, the great plains or llanos of the southeastern part and the Andean Cordilleras of the western section. A valley separates the Cordilleras from the highlands of Panama. The central range of the Cordilleras is the most elevated, including the volcanoes Tolema and Huila, the former reaching an altitude of 18,000 feet. The valley of the Magdalena River separates the central range from the eastern Cordilleras, which includes great tablelands and several mountains which are about 16,000 feet above the sea. In the eastern part is a great plain with streams tributary to the Orinoco and Amazon rivers. The coast line, including the indentations, is about 2,800 miles long, about half of which is on the Caribbean Sea.

The rivers belong to three systems of drainage, those flowing into the Pacific, those of the Caribbean Sea, and those draining by the Orinoco and Amazon into the Atlantic. Through the east central part flows the Magdalena, which traverses the country almost the entire distance from south to north and discharges into the Caribbean Sea. The Atrato flows northward near the western shore and discharges into the Gulf of Darien, while the Cauca is the chief tributary of the Magdalena. Among the principal affluents of the Amazon are the Japurá and the Uaupés, while the Meta and the Guaviare are the principal tributaries of the Orinoco.

The climate varies materially in different sections. It is hot in the valleys, especially where the mountains tower to considerable heights,

and the tablelands are pleasant. Two rainy seasons occur in the mountainous parts, while the coast region has an abundance of rain at all times of the year, and the extreme southwestern part is quite dry. The thermometer frequently registers about 100 at Magdalena and in the eastern plains, but sea breezes make the climate pleasant along the Pacific.

**FLORA AND FAUNA.** The flora is greatly varied, ranging from the tropical plant life of the lower regions to scant vegetation of the elevated tablelands. Among the forest trees are many varieties of palms, including the lofty wax palm and the useful rubber tree. Forests of considerable density clothe the mountains up to a short distance from the timber line, which is located about 10,000 feet above the sea. The region is well grassed and produces many medicinal plants, such as the aloe and sarsaparilla. The plains in the eastern part are covered with nutritious and useful grasses.

Colombia has many wild animals, such as the tapir, jaguar, sloth, puma, and ant-eater. Several species of the red deer are abundant on the plateaus, and numerous kinds of monkeys are found widely distributed. Among the birds are the condor, toucan, vulture, and humming bird. The reptiles include serpents, turtles, and lizards.

**MINING.** Nearly all the precious and useful minerals abound, but mining has not been developed to a considerable extent. Gold mining is carried on chiefly in Antioquia, and silver mines are worked in Cauca and Tolima. Valuable deposits of coal occur in the eastern Cordilleras, and emeralds are found in the state of Boyaca. Salt mining is a government monopoly and is carried on chiefly in the vicinity of Nemocón and Zipaquirá, where extensive deposits of salt rock and salt springs abound. Other minerals known to exist include lead, copper, iron, and platinum.

**AGRICULTURE.** Farming is the principal industry, but the methods are still primitive. It is confined largely to the elevated plateau in the western part, where the climate and soil are very favorable. Sugar cane, coffee, cacao, and tobacco are cultivated largely in the warmer districts, while corn, maize, and barley are the leading crops in the more temperate parts. Fruit is grown very extensively, especially the banana, orange, apple, and lemon. The tolu, valuable for its balsam, thrives in the uplands, and the rubber tree is native and yields large quantities of commercial rubber. All the domestic animals common to North America thrive, but cattle raising is receiving the greatest share of attention.

**TRANSPORTATION.** Public highways have been constructed in the settled districts, but the railroad lines do not exceed 500 miles. Many of the railways are short, ranging from 15 to 100 miles, and are operated largely as a means of connecting the streams or to penetrate a short distance inland from the coast. The Magdalena is the most important stream for inland navigation and together with the Cauca reaches the chief points of the interior. A considerable distance of the lower Atrato is navigable, and communication with the Orinoco is facilitated through the Meta River. Telephone and telegraph connections are abundant, and many steamers carry trade to the ports of Europe and North America.

**MANUFACTURES AND COMMERCE.** Manufacturing is confined largely to articles used in domestic consumption. They include straw mattings, cotton fabrics, pottery, and Panama hats. Sugar is manufactured to a considerable extent, and the government has a monopoly of the distillation of liquor from sugar. The chief exports include cattle, coffee, minerals, hides, and fruits, while the imports embrace principally flour, petroleum, ironware, drugs, chemicals, and machinery. Trade with the leading nations in the order named is with the United States, Great Britain, Germany, and France. The imports slightly exceed the exports.

**GOVERNMENT.** The government is constitutional, with the chief administrative power vested in a president chosen for six years by an electoral college. A ministry of six members assists the president, and there is a council of state of six members. The congress has full legislative power, and consists of a senate and a house of representatives; the former, of 24 senators, three from each of the eight departments, and the latter, of 66 representatives. A supreme court of seven judges, nominated by the president and confirmed by the senate, has the highest administration of justice, and subject to it are the supreme and provincial courts. Each of the states has a governor and is divided into smaller districts corresponding to a county in Canada or the United States. The army and navy are made up of all able-bodied citizens, but the peace organization embraces only about 1,500 men.

**INHABITANTS.** Colombia is inhabited by a people of Spanish descent. Roman Catholic is the official religion, but other denominations have been granted freedom in building churches and conducting public worship. The educational interests have been developed by a system of common schools supported by the government. Elementary education is free, but not compulsory,

and many private and parochial schools are maintained. Among the special and higher institutions are several normal schools, an agricultural college, four general colleges, and a national university. Spanish is the spoken and written language. Bogotá, in the west central part, is the capital and largest city. Barranquilla and Cartagena, both on the Caribbean Sea, and Buenaventura, on the Pacific, are the principal seaports. Magdalena, on the Magdalena River, is important as a river port and has connection by railway with Cartagena. Other cities of importance include Medellín, Pápayan, Sonsón, and Socorro. Population, 1907, 4,279,674.

**HISTORY.** The country now forming most of Colombia was formerly called New Granada. It was discovered in 1499 by Alonzo de Ojeda and was visited by Columbus in 1502, while he was on his fourth voyage to America. The first settlement was made by the Spanish at Santa Maria, in the Gulf of Darien, in 1510, and the whole region was organized as a province in 1547 under a captain general. In 1811 New Granada declared its independence from Spain and effected its liberation with the help of Venezuela, after a war lasting eleven years. The two states united with Ecuador under the name of Colombia, but separated in 1831 into three independent republics. New Granada adopted a constitution in 1863 and became known as the United States of Colombia. In 1884 the country was suddenly thrown into a revolution, which was terminated in 1886 and a new constitution was adopted, which gave the country a more strongly centralized government. Another revolution occurred in 1903, when Panama broke away from the mother country and organized as an independent republic. Since then the country has had an era of peace and is making material strides in constructing internal improvements and enlarging its influence among the states of South America.

**COLOMBO** (kô-lôm'bô), a seaport city and the capital of Ceylon. It is an important center for railway and navigation commerce. Among the public buildings are a museum, the government house, the supreme court, and several educational buildings. The post office and the palace of the governor are on Queen Street, which is the principal thoroughfare. A large majority of the houses are of one story, each having a veranda in front, and few are furnished by doors and windows. The harbor affords vast accommodations and has been improved by an extensive breakwater. Electric lights, street railways, and other municipal facilities have been provided. The city was founded by the Portu-

guese and was captured by the British in 1796. Population, 1906, 161,490.

**COLÓN** (kô-lôn'), or **Aspinwall**, a seaport in the republic of Panama, important on account of its location on the Caribbean Sea, forty-nine miles northwest of the city of Panama. It is situated at the northern terminus of the Isthmian Railway, near the Atlantic extremity of the Panama Canal, and has a deep harbor on Navy Bay. The site is low and somewhat unhealthy, but has been improved materially by constructive work of the United States in the Panama Canal zone. The streets are wide and regularly platted and are improved by grading and drainage. Among the chief buildings are a number of schools and churches, several fine business establishments, and the structures erected by the government. Colón was first named Aspinwall from its founder, who built the Isthmian Railway, but it is officially known as Colón, so named in honor of Columbus. A fine statue of Columbus was erected in one of its public places in 1883. Population, 1908, 14,825.

**COLONNA** (kô-lôn'nà), **Cape**, the most southerly point of Attica, Greece. The ruins of the celebrated temple of Minerva, of which sixteen columns of white marble remain, are on its highest elevation, 270 feet above the sea.

**COLONY** (kôl'ô-nÿ), a company of people who associate together for mutual advantage in the settlement of a remote country. The colonists usually have a common object and unite on account of similar social interests, or religious or political views. They may migrate from different countries, or from a single country. This mode of settlement is called *colonization*, and is due largely to the over-population or the suppression of certain liberties in the mother country. The name *colony* is commonly applied to a foreign dependency of a state or country. These dependencies are secured in various ways, often by settlement of large numbers, by purchase, or by wars of conquest. The tendency of Germany for many centuries was to direct emigration to various favorable regions for commercial enterprises, personal development, or religious liberty without seeking to profit by foreign possessions. Great Britain adopted a policy of colonization, directing emigration thither, and later sought to secure control by diplomacy or war. Spain and various other nations sent armies abroad largely for conquest by the sword, though many settlements were made under their direction similar to those of Germany and England.

**ANCIENT COLONIES.** The Phoenicians, the Greeks, and the Romans were the principal promoters of colonization among the ancient nations

of which we have an authentic history. The Phoenicians, though a small people, founded a majority of the most powerful colonies of antiquity. Isaiah called Tyre the daughter of Sidon, meaning that Tyre was originally a Sidonian colony. Later Tyre founded important colonies, such as Carthage in Northern Africa and Cadiz in Spain. Colonies were sent from almost every Greek state. They settled the whole of West Asia Minor, the islands of the Mediterranean Sea, and southern Italy, and extended into southern France. The colonies of the Phoenicians and Greeks were small states with a form of government which was almost entirely independent of the mother country, while Rome made her colonies subject to the parent government. The Roman colonies were of two classes, civil and military. Coins issued for the former contained a plow, while those of the latter were decorated with warlike designs. The Roman colonies extended over a vast area of Eurasia and Africa. Where they became sufficiently strong, the languages of the native races were modified or displaced by the Latin, the effect of which is seen in the modern French, Spanish, Italian, and Portuguese. The present languages of these peoples are modifications of the old Roman tongue and bear much similarity to the Roman.

**PORTUGUESE AND SPANISH COLONIES.** The Portuguese rank as the first great colonizers of modern times. They discovered Madeira in 1419, and shortly after followed the discovery of the Azores, the Cape Verde Islands, the Congo River, the Cape of Good Hope, and the Malabar coast of India. Later they established trading posts at Mozambique and Sofala in Southeastern Africa, at Muscat and Ormuz on the Persian Gulf, on the western coast of India, and at Goa and Daman. Their colonies in Ceylon were established in 1505, and were followed by settlements in the Moluccas, Brazil, India, and other localities. The foreign possessions of Portugal now include the Cape Verde and other islands, and several districts in Africa and Australasia. The Spanish colonization policy was one of the most extensive in the world. Columbus sailed under the Spanish flag in 1492 and discovered the island of San Salvador. His subsequent discoveries and those of other Spaniards caused Spain to occupy all of South America, except Brazil. The Spaniards also occupied Central America, Mexico, the East Indies, the Philippine Islands, large portions of the territory now included in the United States, and many other regions. However, the Spanish colonies have dwindled down to insignificance, owing to continued wars and dissensions.

**DUTCH AND DANISH COLONIES.** The Dutch were among the greatest colonizers. In 1620 several companies were formed to monopolize trade in the East Indies, at the Cape of Good Hope, in South America, in continental Asia, Australia, and many islands of the sea. Wars with France, Spain, and England caused a loss of many Dutch possessions. Their foothold in New York was absorbed early by the English, and later various other possessions passed from their control. The most important possessions now controlled by them are in the East Indies. Denmark has long pursued a policy of colonization. The dependencies of this nation are of considerable extent, but of small value. They include the Faroe Islands, Iceland, Greenland, a number of islands of the East Indies purchased of France in 1733, and several others colonized by them.

**FRENCH COLONIES.** France has long ranked as a colonial power. Citizens of France began colonizing in 1627 in various portions of the world. The most valuable parts of North America were once under the dominion of the French, and they likewise possessed vast colonies in Asia and numerous island archipelagoes. Their northern possessions in North America were lost in several wars with the British, while the western portions were sold by Napoleon in 1803 to the United States. The chief colonies of France at present include those in India, Tonquin, Anam, and Cochin China in Southeastern Asia; Tunis, Algeria, Madagascar, Guiana, and various islands, the whole constituting a large area of valuable regions.

**BRITISH COLONIES.** England began colonization in 1585 by encouraging settlements in North America, but made little success until 1607, when the first permanent settlement was made at Jamestown. Later, territories were acquired in Asia, Australia, Africa, and many islands of the sea. The principal possessions of the British now include Australia, British America, South Africa, most of India, Belize, Guiana, Ceylon, New Zealand, Tasmania, and various islands in different parts of the oceans and seas. The British possessions and dependencies embrace nearly one-sixth of the land surface of the earth and fully one-seventh of mankind.

**GERMAN AND OTHER COLONIES.** Germany has mainly directed its emigration to foreign countries without attempting to secure permanent foothold until within recent years. Its colonies at the present time are of considerable extent. The principal German possessions include a portion of New Guinea, the Bismarck Archipelago, Cameroon, Togoland, German East Africa, Ger-

man Southwest Africa, the Caroline Islands, Kiauchau, in China, and a number of islands. Various other European powers have a foreign colonial policy, especially Italy and Russia. The latter country is operating more particularly in the northern and western regions of Asia, and is endeavoring to control the larger portion of that continent, making its possessions largely contiguous to its home central government. The United States entered upon a colonial policy in 1898 by the annexation of the Hawaiian Islands. After the war with Spain, in 1898, Porto Rico, Guam, and other islands were annexed. The Philippine Islands are the largest colonial possessions of the United States.

The experience of past ages demonstrates clearly that the possession of foreign territory does not add to the stability of a nation. Hostilities generally growing out of the purchase or conquest of a region which is populated by an unfriendly people require a vast navy and a large colonial army even in the time of peace, while racial and commercial complications may be the causes of insurrections at any time. The colonial policy of Spain, though continuing for over 300 years, ultimately almost bankrupted the nation, while Great Britain, because of her vast colonial interests, has need for large naval and military forces. Aside from spreading particular religious beliefs and languages, no permanent advantages have accrued to the nations having colonial policies, while many have been materially weakened at home and even brought to a condition of retrogression. Colonization has given to Brazil the Portuguese language, and to all the rest of South America, Central America, and Mexico the Spanish, while all these vast regions have become Roman Catholic in religion. The English language has been carried to the United States, British America, Australia, and other regions in the same way.

**COLOPHON** (kōl'ō-phon), one of the twelve Ionian cities on the coast of Asia Minor, located eight miles north of Ephesus, on the Halesus River. It was celebrated for its navy and cavalry, and was one of the seven cities that claimed to be the birthplace of Homer.

**COLOR** (kūl'ēr), that quality of bodies by which they present different appearances in respect to hue or tint to the eye. In optics, color is studied chiefly in connection with the *solar spectrum*, which is the spectrum of solar light. The white lines that reach us from the sun disperse or decompose into several colors when passed from one medium into another. The solar beam may be developed into seven colors by means of a prism. They are red, orange, yellow, green, blue, indigo, and violet. Red, vio-

let-blue, and yellow are considered *fundamental* colors. Sir Isaac Newton was the first to decompose white light by a prism and then recompose it. According to his theory, bodies decompose light only by reflection, their colors depending upon their reflecting power for the different simple colors. Bodies that reflect all colors in proportions as they exist in the spectrum are white, those that reflect none are black. A wide diversity of colors exists between these two limits, this being dependent upon the extent to which bodies absorb some colors and reflect others. According to this hypothesis, it is presumed that bodies have no colors in themselves, but produce them by the kind of light which they reflect. When white light falls on a green leaf, all the colors but green are absorbed, and, this given off, makes the leaf appear green. A red cloth in the same way absorbs all colors but red, and therefore appears red. Thus, the different color effects of the beam of light depend upon the qualities of the substances on which they fall.

The rainbow is formed by drops of falling rain, through which light passes, and is separated into its prismatic colors, all the colors of the solar spectrum. Plant tissues are largely colorless, a silvery white, or a pale yellow. The green color taken on subsequently is due to the action of the solar light, which produces *chlorophyll*, the name applied to the green coloring matter of plants. The pigments or colors used by painters are distinguished from the colors of the solar spectrum. In the arts the pigments blue, red, and yellow are the *primary* hues and may be made to form any other colors, but they cannot be formed by any others. The national colors of the United States are blue, white, and red; of Germany, black, white, and red; of Russia, white, blue, and red; of Great Britain, red and blue; of Australia, red, white, and green; of France, blue, white, and red; of Spain, yellow and red; of Sweden, blue and yellow; of Denmark, red and white; of Switzerland, red and white.

**COLORADO** (kōl-ō-rä'dō), a western State of the United States, located in the center of the portion of the United States lying west of the Mississippi River. It is bounded on the north by Wyoming and Nebraska, east by Nebraska and Kansas, south by Oklahoma and New Mexico, and west by Utah. The State is quadrilateral in shape and is bounded by the parallels 37° and 41° north and the meridians 102° and 109° west from Greenwich. It is about 370 miles long and 280 miles wide, and has an area of 103,925 square miles.

**DESCRIPTION.** The continental range of the

Rocky Mountains extends across the State from north to south, near its center. Pike's Peak, west of Colorado Springs, is the most famous summit in the State, but not the highest, being one of many that have an elevation of 14,000 to

1, Denver; 2, Greeley; 3, Colorado Springs; 4, Leadville; 5, Pueblo; 6, Pike's Peak. Chief railroads shown by dotted lines.

14,500 feet. In the western section are three more or less prominent ranges, including the White River Mountains in the west, the Park and Saguache somewhat farther east, and the Front Range near the Saguache. Among the mountains are numerous plateaus known as parks, of which the surface is quite fertile and the climate is healthful. Two natural divisions characterize the general surface of the State, those embraced in the mountains and the plains, the former having an elevation of 5,000 to 14,500 feet, while the latter is located from 4,000 to 5,000 feet above the sea. In many places the scenery is beautiful and grand, especially in the localities known as Monument Park and the Garden of the Gods.

The western part of Colorado is crossed from north to south by the great continental divide. On the eastern slope, flowing toward the Mississippi, are the South Platte and Arkansas rivers. The Rio Grande drains the San Luis Valley, while the Grand flows toward the southwest. The Yampa and White are tributaries of the Green, which unites with the Grand in eastern Utah and forms the Colorado River. None of these rivers is navigable, but they with their numerous branches furnish a supply of water for irrigation purposes. A large number of the streams flow through canyons which are noted for their grandeur, and in many places are cold and thermal springs with distinctive medicinal properties. The most noted springs are located at Manitou, Cañon City, Idaho Springs, Glenwood Springs, Hot Sulphur Springs, Steamboat Springs, and Pagosa Springs.

The climate is delightful, the air is dry, and the sunshine is abundant. Rains fall throughout the warm parts of the year and snows occur in winter, but both are moderate in quantity. The altitude and dryness minimize the heat in summer and the cold in winter. The perpetual snow line varies between 13,000 and 14,000 feet, except on the side of the mountains sloping toward the north and in deep canyons, where it is considerably lower. Colorado has a mean annual rainfall of 14.8 inches, and it is distributed quite generally throughout the State, though it is heaviest in the mountains. In summer time the days are frequently quite hot, but the nights are cool and bracing. At Denver the mean temperature in January is 28.2° and in July, 71.8°.

**MINING.** Colorado leads in the production of the precious and allied metals all other states in the Union, producing twice as much gold and silver as any other State and more than one-fourth of the total output of the United States. It has extensive coal resources, both bituminous and anthracite, and in the output exceeds all the states west of Illinois and is seventh in rank among the coal-producing states, being surpassed only by Pennsylvania, Illinois, West Virginia, Ohio, Alabama, and Indiana, in the order named. It ranks second among the states in the output of anthracite, being exceeded only by Pennsylvania. The coal fields are situated on both sides of the Rocky Mountains, those on the western slope being the largest and most important in quantity and quality. Other minerals found extensively include lead, iron, copper, zinc, gypsum, petroleum, onyx, and kaolin. Cripple Creek, Leadville, Colorado Springs, Pueblo, Silverton, Creede, and Telluride are located in the vicinity of productive mining districts.

**AGRICULTURE.** Colorado was formerly regarded unsuitable for agriculture, owing to its aridity and elevation, but irrigation has been a potent influence in developing its resources. The rainfall is sufficiently large in some parts of the State in particularly favorable seasons, especially to induce the vigorous growth of native grasses, and wherever water is available the investments in farming are very profitable. The main canals and ditches constructed for irrigation have a total length of about 12,000 miles and the farms average 384 acres, which is much larger than the size of the average farm in the United States, due chiefly to the number of holdings used for stock grazing. Alfalfa is grown very extensively for fodder and yields from one to three cuttings per year. The culture of sugar beets has grown extensively the last decade, and the output is valued at about \$7,500,000 annually.

Other crops grown extensively are cereals, fruits, potatoes and vegetables.

The State is favored with the growth of many nutritious grasses suitable for grazing, and stock raising was an important industry before general farming was attempted. Large herds of cattle are grown for meat and dairy products, both of which form important items in the business enterprises. Sheep raising is possible in all sections, but the largest flocks are in the southern counties. Swine are not raised as extensively as in the states of the Mississippi Valley, owing to the fact that corn is grown on a comparatively smaller area, but horses and mules are reared in large numbers.

**TRANSPORTATION AND COMMERCE.** None of the rivers is navigable, but the State has many lines of railroads, aggregating about 5,250 miles, and they are well distributed in all sections. The lines include a number of the trunk railways which connect the commercial centers of the State with the business emporiums of the Mississippi Valley and the Pacific Coast, including many branch lines that penetrate in all directions, affording unexcelled highways of commerce. Denver is noted as a market and wholesaling and jobbing center.

**MANUFACTURING.** The great variety of raw materials give Colorado advantages as a manufacturing State. Among the leading industrial establishments are the iron and steel works at Pueblo and the foundries and machine shops at Denver. Coke is manufactured extensively, the State ranking fourth in the quantity of this product. A fine quality of brick clay is abundant in many localities, especially in the vicinity of Denver, where the brick plants have a large output. Other industrial enterprises include flouring and grist mills, canning factories, creameries and cheese factories, printing and publishing plants, beet sugar factories, and gold, silver, copper, and lead smelting works. Sawmills are located in many places for cutting fir, pine, and spruce forests, which cover a large area in the mountains below the snow line.

**EDUCATION.** Ample provisions have been made for the education of the youth. The State has a permanent school fund obtained from the sale and rent of about 3,550,000 acres of school land, and the income is apportioned among the schools of the State. The University of Colorado is located at Boulder; the State School of Mines, at Golden; the State Agricultural College, at Fort Collins; the State Normal School, at Greeley; the Mute and Blind Institute, at Colorado Springs; and the Industrial School, at Golden. Many private and denominational schools and institutions of higher learn-

ing are maintained, including Denver University, Denver, and Colorado College, Colorado Springs.

**GOVERNMENT.** The constitution was adopted by a vote of the people in 1876, when the State was admitted, but it has been amended several times. It requires a residence of six months as a prerequisite to vote and extends the right of suffrage to both sexes at school elections, and in addition provides that the Legislature may extend the right of suffrage to women, but such an act must be approved by a vote of the people. Executive authority is vested in the governor, lieutenant governor, secretary, treasurer, auditor, attorney-general, and superintendent of public instruction, each being elected for two years. The legislative functions are vested in the Legislature, which consists of the Senate and the House of Representatives. Senators are elected for four and representatives for two years. The aggregate membership in both houses cannot exceed 100. At present there are thirty-five senators and sixty-five representatives. The judicial power is vested in a supreme court, the district and county courts, justices of the peace, and such other courts as may be provided by law. Local government is administered by counties, townships, and municipalities.

**INHABITANTS.** Colorado has a larger population than any of the Rocky Mountain states. About one-fifth are of foreign birth, and fully forty per cent. reside in the cities with a population of over 4,000. Denver, the capital, is the largest city and chief commercial center. Other flourishing cities include Pueblo, Colorado Springs, Leadville, Cripple Creek, Boulder, Trinidad, Salida, and Rockyford. The State has had a steady growth in population, which, in 1900, was 539,700; in 1910, 799,024.

**HISTORY.** Colorado was acquired in three sections. About one-half was acquired from France by the Louisiana Purchase in 1803; a portion of the west and north, by the Mexican Cession of 1848; and the remainder, by purchase from Texas in 1850. Coronado visited the region in 1541. He is supposed to have been the first white man to set foot within the present limits of the State, which received its name from him. Zebulon Pike explored the region under the authority of the government in 1806. The next expedition was undertaken in 1819 by Stephen S. Long, and John C. Frémont began a series of five explorations in search of practical railway routes in 1842. Immigration was attracted by the discovery of gold in 1858, at which time the parks were inhabited by the Ute Indians and the plains were occupied by the Cheyennes, Arapahoes, Kiowas, and Comanches.

In 1861 it was organized as a Territory and was admitted as a State in 1876, hence is popularly known as the *Centennial State*. In 1893 the State adopted woman suffrage at a special election by a majority of about 4,500 votes. The capitol building, which cost about \$2,500,000, was completed at Denver in 1894.

**COLORADO, University of**, an educational institution at Boulder, Colo. It was incorporated by the territorial Legislature in 1861, and became the State university by the provisions of the constitution of Colorado in 1876. When it was opened formally, in 1877, it embraced a preparatory department and the college proper, to which were added the medical school in 1883, the law school in 1892, and the school of applied sciences in 1893. At present it embraces five departments, including the college of liberal arts, the graduate department, the school of law, the school of applied science, and the medical school. It is maintained by a direct tax upon the properties of the State and is governed by a board of regents. The library contains about 30,000 volumes. The faculty consists of one hundred professors and instructors and the average annual registration of students is about 1,000.

**COLORADO BEETLE**, better known as potato bug, an American beetle first described by Thomas Say in 1824 from specimens found by him in Missouri. It was first noticed as a pest in the potato fields of Colorado, hence its name. Subsequently it moved eastward rapidly, and reached the Atlantic coast in 1874. It is of a yellowish color, with black stripes along the back. The young are reddish, fleshy, and soft, and do most of the damage to the growing plants.

**COLORADO RIVER**, a river of Texas, rises near the southeastern boundary of New Mexico, and discharges into the Gulf of Mex-

Austin, Bastrop, Bay City, Lagrange, and Whar-ton. It is navigable for small boats to Austin, a distance of about 200 miles, and the total length is about 900 miles.

**COLORADO RIVER**, a large river of the United States, formed in the southeastern part of Utah by the junction of the Green and Grand rivers. It flows south and west in Utah, passes through the northwestern part of Arizona, and forms the boundary between Arizona on the east and Nevada and California on the west. Near its mouth it passes into Mexico and discharges into the Gulf of California. The length of the Colorado River proper is 900 miles, but with the Green, its largest confluent, it has a course of nearly 2,000 miles. It is remarkable for its great canyons, the principal one being the Grand Canyon. This natural phenomenon is about 300 miles long, with perpendicular walls at some places fully 6,000 feet above the water. In the northern part of Arizona the Grand Canyon is five to six miles wide at the top and 6,000 feet deep, narrowing by successive depressions until the narrow and gloomy gorge in which the river flows is reached, where the descent is almost perpendicular to depths varying from 2,000 to 3,000 feet. Among the chief tributaries are the San Juan in Utah, the Little Colorado and the Gila in Arizona, and the Virgin in Nevada.

**COLORADO SPRINGS**, a city in Colorado, county seat of El Paso County, sixty-five miles south of Denver, on the Denver and Rio Grande, the Santa Fé, and other railroads. It is the seat of Colorado College, an institution which carries full college courses. This institution has a library of 35,000 volumes, a faculty of forty instructors, and about 675 students. Ten miles from the city is Pike's Peak, which lifts its snowy summits in great beauty and may be reached by several railways. Manitou is a health resort six miles from the city, at the foot of Pike's Peak, and between the two cities is the wonderful Garden of the Gods. Fine natural and artificial scenery make the city one of the most delightful in the west. It has good schools, a fine trade, and numerous industries. Gas and electric lights, pavements, waterworks, and rapid transit are among its improvements. It was settled in 1870 and incorporated in 1872. Population, 1900, 21,085; in 1910, 29,078.

**COLOR BLINDNESS**, or Daltonism, a term used to describe a defect of vision, which is not usually accompanied by any other imperfection of the eye. It is incurable and peculiarly affects families, being transmitted from parents to child. The eye in a normal condition has three primary sensations, those of green, red, and violet, and color impressions are formed by

COLORADO BEETLE.

A, Eggs; B, Larvae; C, Pupa; D, Adults; E, Wing (magnified); F, Leg (magnified).

ico through Matagorda Bay. The Llano, San Saba, and Concho are its chief tributaries. Among the chief cities located on its banks are

the combinations of these. Color blindness is due to the absence of one of the primary sensations, usually the red or green, and very rarely the violet. About one per cent. of women and from three to four per cent. of men have a color blind vision. It is due to a defective retina or the admission of an insufficient amount of light. The latter is noticeable when examining any objects that are more or less colored by artificial light, since it is impossible to distinguish colors properly at night, except the shades of white and black. Color blindness is frequently acquired by the excessive use of tobacco and by children being confined in schoolrooms that are not sufficiently lighted. It may be detected by a selection of colored worsteds, a test devised by Prof. Holmgren of Upsala. In many countries a strict examination is required for those who are employed in the railway service, especially in the departments where color signals are used.

**COLOR PRINTING**, the art of producing several colors in printing. The process formerly required as many impressions as colors desired in the finished product. A card or chromo in which ten colors were desired required passing through printing presses ten different times, once for each color to be applied. Now color printing is done largely by three impressions. The principle involved is that if a photograph be taken in three colors of nature—red, blue, and green—and plates be made from each photograph by a photomechanical process, impressions of the plate may be taken in their appropriate colors, thus producing a combination which involves the colors of the original, even showing blendings much as are seen in nature.

**COLOSSEUM** (kōl-ōs-sē'ūm), the name applied to the greatest of Roman amphitheaters. It was built in the form of an ellipse, the length

COLOSSEUM AT ROME.

being 612 feet and the breadth 515 feet. It was begun by Vespasian and was finished by Titus in the year 80 A. D. The base covered five acres, and there was a seating capacity for about 87,000 people. It ranked as the largest and most important inclosure for the celebration of the

national games, and its ruins are still among the interesting relics of antiquity. Titus dedicated it by games lasting a hundred days, in which 5,000 wild animals were slain. It was surrounded by a row of pilasters, contained eighty openings on the ground story, over which were constructed three other stories, the whole rising to a height of 160 feet. Open galleries were constructed throughout the whole building, passing beneath the columns. The interior space was covered with sawdust or sand, in which the games were exhibited in the presence of vast multitudes occupying the seats in the different stories, arranged in circular order. These games were visited by the emperor, senators, and the populace, forming the most interesting of public demonstrations.

**COLOSSUS** (kō-lōs'sūs), a term applied generally to statues of great size built by the people of antiquity. The most important statue of this class built by the Grecians was the *Colossus at Rhodes*, being a brass statue of Helios, the sun god, which came to be counted among the wonders of the world. It was constructed from the spoils left by Demetrius Poliorcetes when he raised the siege of Rhodes. The work was done under the sculptor Chares of Lindus, who spent twelve years in finishing the work, completing it in 280 B. C. An earthquake threw it down about 224 B. C. The statue is said to have stood upon two moles, a leg being extended on each side of the harbor so that a vessel in full sail could enter between. Some writers assume its height to have been from 100 to 125 feet. It was in ruins for nearly nine centuries, and when the Saracens captured Rhodes they pulled it to pieces and sold it to a Jew. The Jew transported it to Alexandria about 653 A. D., requiring 900 camels to effect the transportation. A number of modern memorials are known by the general name of Colossus from their enormous size, such as the *Bavaria* at Munich, the *Germania* at Niedervald, on the Rhine, and the statue of *Liberty Enlightening the World*, in New York Harbor.

**COLTSFOOT** (kōlts'fōōt), a genus of plants native to Europe and naturalized more or less extensively in America. The common coltsfoot is a weed and is so named from the broad and heart-shaped leaves, which resemble the foot of a colt. It has yellow flowers. The leaves are somewhat glutinous and the lower side is downy. Bees seek the flowers for honey.

**COLUMBIA** (kō-lūm'bī-à). See **District of Columbia**.

**COLUMBIA**, county seat of Boone County, Missouri, 114 miles northwest of Saint Louis, on the Wabash and the Missouri, Kansas and

Texas railroads. It is the seat of the Missouri State University, Christian College, Stephens Baptist College for Women, and the State College of Agriculture. Besides doing a good jobbing trade, it manufactures flour, woolen goods, tobacco, and spirituous liquors. It has a system of waterworks and a monument to Thomas Jefferson. The first settlement in the vicinity was made in 1820. Population, 1910, 9,662.

**COLUMBIA**, county seat of Maury County, Tennessee, on the Duck River, forty-five miles south of Nashville. It is on the Louisville and Nashville and other railroads, and is surrounded by a fertile farming country. Phosphate is produced in the vicinity. The chief buildings include the courthouse, Jackson College, two seminaries, and a United States arsenal. Flouring mills, grain elevators, and cotton mills are among its industries. The city has electric lights, waterworks, and a sewerage system. It was settled in 1811 and incorporated in 1822. Population, 1900, 6,052.

**COLUMBIA**, a borough of Pennsylvania, in Lancaster County, on the Susquehanna River, eighty miles west of Philadelphia. It is on the Pennsylvania and the Philadelphia and Reading railroads. On the opposite side of the river is Wrightsville, with which it is connected by a bridge about a mile in length. It has a large trade in merchandise. The chief industries include cotton, flouring, and planing mills, iron foundries, stove works, and shops for the production of implements, railroad iron, and steam engines. Among the public utilities are waterworks, stone and macadam pavements, and electric street railways. Columbia was founded by the Quakers in 1726, when it was known as Wright's Ferry. Population, 1900, 12,316.

**COLUMBIA**, the capital of South Carolina, in Richland County, on the Congaree River, 128 miles northwest of Charleston. It is on the Seaboard Air Line, the Atlantic Coast Line, and the Southern railroads, and has transportation facilities by the Congaree River and the Columbia Canal. The site is on a beautiful plateau, about 200 feet above the river, and affords an excellent view of the surrounding country. The city has broad streets, many of which are macadamized and paved, and the residential sections are beautified by parkings and avenues of trees. The State capitol is a fine structure of granite, erected at a cost of \$3,000,000. Other noteworthy buildings include the Federal courthouse and post office, the city hall, and a number of excellent public schools and churches. It is the seat of the South Carolina University, which was organized as a college in 1806 and changed to a university in 1880. Other insti-

tutions of learning include the Ursuline Convent, the Presbyterian Theological Seminary, and the Winthrop Normal College. The State University has a library of 40,000 volumes, besides which other libraries are maintained. Among the industries are commerce and the manufacture of cotton goods, tobacco products, machinery and furniture. It has extensive systems of waterworks, sewerage, and electric street railways. Columbia was settled in 1700 and became the State capital in 1786. General Sherman captured it in 1865, when a large part of the city was destroyed by fire. Population, 1910, 26,319.

**COLUMBIAN UNIVERSITY**, a coeducational institution located at Washington, D. C., maintained by the Baptists. It was organized in 1821 as Columbian College, when it comprised courses in theology, medicine, and the classics, and it was reorganized under its present name in 1873. At present it embraces the Corcoran Scientific School, Columbian College, the law school, the medical and dental schools, the school of jurisprudence and diplomacy, and the school of graduate studies. It has a library of 25,000 volumes, a faculty of 185 instructors, and an attendance of about 1,500 students.

**COLUMBIA RIVER**, an important river of North America, rises in British Columbia, flows through Washington, forms the boundary between Washington and Oregon, and discharges into the Pacific Ocean. The total length is 1,350 miles. Its principal tributaries include the Willamette, Deschutes, Snake, Spokane, and Okanogan rivers. More than 650 miles are navigable. It contains a number of magnificent falls and rapids, and is valuable for its abundance of salmon fisheries. The scenery along its lower course is grand and in many respects surpasses that of the Hudson.

**COLUMBIA UNIVERSITY**, an educational institution in New York City, on Morningside Heights. It was chartered by George II. as King's College in 1754, but the name was changed to Columbia College after the Revolutionary War, in 1784. In 1896 the name was changed to Columbia University, which designates the entire institution, while the name Columbia College is restricted to the undergraduate department. At present it comprises Columbia College, Barnard College, the school of law, the college of physicians and surgeons, the school of political science and philosophy, the school of applied science, the school of fine arts, the Teachers' College, and the summer school. It has endowments of \$20,000,000, an annual income of \$880,000, a library of 350,000 volumes, a faculty of 575 instructors, and about 4,525 students. About 25,500 persons have grad-

uated from its courses. Its courses are extensive, ranking among the most thorough in America.

**COLUMBUS** (kō-lŭm'bŭs), county seat of Bartholomew County, Indiana, on the east fork of the White River, about forty-one miles southeast of Indianapolis. It is on the Pennsylvania and the Cleveland, Cincinnati, Chicago and Saint Louis railroads. It is surrounded by an agricultural country, and has large flouring mills, machine shops, and implement and furniture factories. Among the public utilities are waterworks, sewerage, and electric street railways. It has a brisk trade in merchandise and farm produce. Population, 1910, 8,813.

**COLUMBUS**, a city in Georgia, county seat of Muscogee County, on the Chattahoochee River and on the Southern, the Seaboard Air Line, and the Central of Georgia railroads. It is located about 300 miles from the Gulf of Mexico, with which it has steam navigation connections. The water power of the river is unlimited, and is utilized largely in manufacturing. The manufactures include hardware, textiles, machinery, cigars, clothing, and furniture. Its cotton and woolen mills are among the largest in the South and produce vast quantities of ginghams and colored goods. Besides an extensive public school system, the city contains a male academy, a female academy, and several public buildings and churches. The streets are broad and improved by pavements and avenues of trees. It has gas and electric lights, street railways, waterworks, pavements, sewerage, and a public library. Columbus was platted in 1828 and incorporated in 1829. Population, 1900, 17,614.

**COLUMBUS**, the capital of Ohio, county seat of Franklin County, on the Scioto River, 100 miles northeast of Cincinnati. It occupies a fine site near the geographical center of the State, on the Baltimore and Ohio, the Pennsylvania, the Cleveland, Cincinnati, Chicago and Saint Louis, and other railroads. An extensive system of electric railways furnish facilities to reach all parts of the city and many suburban and interurban localities. Natural gas is utilized largely for manufacturing and by private families for fuel and lighting. The leading industries include wholesaling and the manufacture of carriages, machinery, implements, cigars, clothing, furniture, earthenware, boilers, and engines. It has a large trade in coal, petroleum, and farm produce.

The public parks of the city cover about 200 acres and contain many improvements and attractions. Among the public structures are a fine State capitol, the State fair grounds, the

United States garrison, and the Ohio State University. The capitol building is in the Doric style and cost about \$2,500,000. It is the seat of the Capital University (Lutheran), the Columbus Law School, and the Columbus Art Institute. It has a hospital for the insane, asylums for the blind, deaf, and dumb, and a State penitentiary. In its public places are monuments erected to James A. Garfield, Salmon P. Chase, U. S. Grant, and W. T. Sherman. Columbus was platted in 1812, made the capital of the State in 1816, and incorporated in 1834. Its location in the center of the State and within a vast field of iron, coal, petroleum, and gas has given it marked commercial advantages. Population, 1900, 125,560; in 1910, 181,548.

**COLUMBUS**, county seat of Lowndes County, Mississippi, on the Tombigbee River, and on the Southern and the Mobile and Ohio railroads. It is surrounded by coal and iron fields, and has cotton mills, machine shops, foundries, and lumber yards. Columbus is the seat of several educational institutions, including the State Industrial Institute. It has a county courthouse, a public library, and waterworks. It was settled in 1830 and incorporated in 1832. Population, 1900, 6,484.

**COLUMN** (kōl'ŭm), in architecture, a pillar or post employed for the purpose of supporting a weight, such as a roof or other superstructure. In some classes of architecture the column serves chiefly as a support, but in others it is designed both to strengthen the building and to serve as an ornament. Many designs and sizes of columns were employed by the ancients, including those that may be designated as massive, decorative, smooth, square, and polygonal. The Egyptians crowded the columns together with the view of giving the building a heavy and massive appearance, while those of the Persians and Greeks were quite tall and slender. A column consists of three parts known as the *base*, the *shaft*, and the *capital*. The base is the portion on which it rests; the shaft is the central part, usually cylindrical in form; and the capital surmounts the shaft. Among the principal columns are the Doric, Ionic, Tuscan, Corinthian, and Composite.

The Doric column is common among the ruins of ancient Greece and is thought to be one of the oldest classic orders. It is usually without a base and has a plain capital, and the shaft is fluted and in height is equal to five of its diameters. The Parthenon at Athens contains good examples of the Doric column. As classical architecture advanced, greater lightness and elegance were obtained by diminishing the thickness of the shaft and increasing its

height. In this respect preference is given to the Ionic column, which was originated by the Asiatic Greeks, who made the shaft equal in height to eight diameters, ornamented the capi-

IONIC ORDER.

DORIC ORDER.

tal, and constructed a substantial and decorative base. A good example of the Ionic style is represented in the Erechtheum, on the Acropolis at Athens.

The Greeks originated the Corinthian style, which differs from the Ionic column in that the capital is beautifully ornamented, but it was

COMPOSITE ORDER.

CORINTHIAN ORDER.

developed in its higher artistic form by the Romans. The latter added the Tuscan, named from the Etruscans, and the Composite, which

is sometimes called the Roman or Italic order. In the Tuscan style the ornamentation is simple, but the Composite column is rich with carving and sculptured decorations. The Romans increased the size of the column as well as the material used in construction and combined with it the arch and the architrave. They not only employed the column in substantial and utilitarian architecture, but utilized it in constructing monuments to commemorate persons and events, such as the Column of Antonine and the Column of Trajan.

The early Christian architecture extended the use of the column by employing it in the interiors with the arch in the churches and basilicas. It served both for decoration and in the support of the roof or galleries, the latter being placed above the principal aisles. These columns were similar to the piers or pillars of more modern times, which divide the nave from the aisles in many churches. A second row of columns was frequently introduced to support the roof above the gallery, but these were usually of the lighter Ionic or Corinthian styles, while the lower columns were modeled after the Doric order. The column is not used extensively in modern architecture, neither in constructive work or for decorative purposes.

**COMA** (kō'mà), a morbid state which is regarded a symptom of apoplexy. It is attended by heavy, unconscious sleep, stupor, lethargy, slow breathing, and fevers of the typhoid type. Coma frequently accompanies Bright's disease, alcoholic intoxication, and opium and morphine poisoning. It is advisable to arouse the patient, if possible, in cases of poisoning.

**COMANCHES** (kō-măn'chěz), a tribe of North American Indians, formerly leading a roving life from the regions traversed by the headwaters of the Brazos and the Colorado to those of the Missouri. The French came in contact with them in 1719 and the Spaniards afterward engaged them in fierce wars. They were skilled hunters and warriors. Once a tribe of 12,000, they have been scattered and number about 4,000, the greater portion being located in Oklahoma.

**COMB** (kōm), a thin piece of horn, metal, shell, or other material with one or both edges made into teeth, suitable for cleaning, dressing, or holding the hair in place. The name is also applied to a fleshy crest on the head of a domestic fowl, especially developed in the male. The typical form is upright and notched, reddish in appearance, and often double or treble.

**COMBUSTION** (kōm-būs'chūn), in chemistry, the continuous combination of a substance with certain elements, as oxygen and chlorine,

accompanied by light and heat. Generally, combustion is the action or operation of burning. *Spontaneous combustion* is caused by the internal development of heat without the application of fire. It frequently occurs in heaps of slate and refuse coal, in rags, oils, moistened hay and straw, and in other substances closely confined or stored in large quantities. The alleged combustion of the human body caused by the saturation of the internal organs with alcoholic drinks coming in contact with coal or fire is not well authenticated. It is claimed by some writers that in advanced stages of drinking, besides being advanced in life, the internal organs burn with rapidity, after which oily substances and fetid ashes remain. Most chemists believe the combustion of the human body in this way to be impossible.

**COMEDY** (kŏm'ĕ-dÿ), that branch of the dramatic art which represents the manners of common life, the object of which is to amuse by presenting the laughable incidents and humorous style. The masterpieces of French tragedy were first called *comedies*, but later the term became confined to the compositions which paint the vices and follies of mankind and describe ridiculous situations. Comedy is opposed to the tragic, serious, or ceremonial form of dramatic art. Among the widely known comedies of modern literature are the following: Goldsmith's "She Stoops to Conquer," Jefferson and Boucicault's "Rip Van Winkle," Lessing's "Minna of Barnhelm," Moliere's "L'Avare," Sheridan's "The Rivals," Sheridan's "The School of Scandal," Shakespeare's "Comedy of Errors," "Shakespeare's "Merchant of Venice," Shakespeare's "Much Ado About Nothing," Shakespeare's "As You Like It," Shakespeare's "Twelfth Night." See **Drama**.

**COMET** (kŏm'ĕt), a heavenly body so named from the hairy appearance of its tail. Comets usually consist of three parts—the *nucleus*, the *coma*, and the *tail*. The nucleus is a bright point in the center of the head, the coma is the cloudlike mass surrounding the nucleus, and the tail is a luminous train extending generally in the direction from the sun. Some comets have no tail, others have several, while some have no nucleus. Those belonging to the last mentioned class consist of a fleecy mass known to be comets from their rapid motion in orbits. Comets, unlike planets, are not confined to the limits of the zodiac, but appear in every quarter of the heavens and move in every direction. A comet when first seen presents a faint spot of light on the background of the sky. As it approaches the sun its brightness increases, and the tail begins to become visible.

The greatest brightness occurs near perihelion, but gradually fades away as it recedes, and is finally lost even to the telescope.

Comets have excited attention in every age, and until recently have inspired terror in the minds of people who were ignorant of astronomical phenomena. Superstitious fears attended their appearance, and they were looked upon as threatening the world with plague, famine, and war. The Romans looked upon the comet that appeared in 43 B. C., after the assassination of Julius Caesar, as a celestial chariot conveying his soul heavenward. Josephus enumerates among the indications of the destruction of Jerusalem "a star resembling a sword which stood above the city, and a comet that continued a whole year." Aristotle thought comets were not higher than our atmosphere, and that they consist of igneous vapors. Seneca published the opinion that comets are a kind of planets, while Tycho Brahe, in 1577, demonstrated that a certain comet was at a greater distance from the earth than the moon. The concave orbit of a comet was ascertained by Hevelius, in 1668, and the former notion that a straight line represented the path was fully disproved. Sir Isaac Newton in 1704 proved that comets obey the law of gravitation and showed that they move in elliptic orbits. Halley demonstrated in 1682 that comets are periodic in their returns and that their approach may be foretold. He proved that the comet appearing in 1531 returned again in 1607 and again in 1682, and predicted its return in 1759, in 1835, and at regular intervals of seventy-six years. This comet was named *Halley's comet* from the discoverer.

More than 600 comets have been noticed and their appearance and characteristics recorded, but it is thought that no less than 17,500,000 exist in connection with our solar system. Only a small number of this vast aggregation are visible to the naked eye, and a few attract observation on account of their superior size and brilliancy. They move in the solar system and respond to the laws of gravitation. While their orbits differ from those of the planets, they revolve round the sun. The orbit of planets is very nearly circular and they never depart so far from the sun as to be invisible to us, while the paths of the comets are extremely flattened ellipses; hence, they may be observed by us only through a very small part of their paths. Comets that travel in greatly elliptical orbits pass vast distances from the sun, but return within a fixed time. However, some are thought to have a parabolic course and to pass from our solar system. It is probable that they never return.

Some writers think there are three classes of comets—one having an orbit in the form of an ellipse, while the other two pass in paths formed like a hyperbola and a parabola. Those having a highly elliptical orbit sweep very near the sun at perihelion and recede to great distances during their aphelion. Newton estimated that the comet of 1680 was very near the sun and that it had a temperature about 2,000 times that of red-hot iron, while the comet of 1843 was about 30,000 miles from the sun and passed around that body in two hours' time. The comet of 1844 was estimated to have a distance of over 400,000,000,000 miles from the sun at aphelion. Astronomers estimated that the comet of 1680 moved at a rate of 277 miles per second in perihelion, while the velocity in aphelion was only six miles an hour. The density of comets is exceedingly small, so small that stars may be observed through them by means of a telescope. It is thought that the earth passed through the tail of a comet in 1861, its presence being indicated by a peculiar phosphorescent mist. While it is believed that a comet coming

DONATI'S COMET.

in contact with the earth would disturb or destroy the surface at the point of direct contact, it would not dangerously affect the earth's orbit.

It is not known whether comets shine by their own or by reflected light, but the latter seems to be the most reasonable, since they become invisible on going away from perihelion. They are thought to decrease in brilliancy at each successive revolution round the sun. At the first appearance no tail is visible and the light is faint. With the increase of velocity, as it approaches the sun, the brilliance increases and the tail shoots out from the coma and becomes longer and of greater splendor each day. The tail of the comet of 1843 increased in length 5,000,000 miles per day. The length of the tail

depends upon the size and velocity of the comet. It often reaches a length of 200,000,000 miles. Examination and analysis of the light of comets by the spectroscope have shown that these bodies are composed chiefly of carbon combined with oxygen. Few other elements have been found, but those known to exist in comets include iron, sodium, magnesium, and nitrogen.

Among the remarkable comets is one that appeared in 1811. It had a head whose diameter was 112,000 miles, the nucleus was 400 miles, and the fan-shaped tail stretched out 112,000,000 miles. Its distance at aphelion was estimated at 4,000,000,000 miles, fourteen times that of Neptune, and it is announced to return in thirty centuries. *Halley's comet*, mentioned above, is one of the most remarkable and best known. It appeared in 1835 and has a period of 76.08 years. *Donati's comet* was discovered by Dr. Donati of Florence, June 2, 1858. Its periodic time is about 2,000 years. *Biela's comet* was discovered by W. Biela, a German officer of the Austrian army, on Feb. 28, 1826. The periodic time of this comet is about 138 weeks. It returned in 1832, in 1839, and in 1845. In 1846 it was separated into two comets, which came back together in 1852. Though it has not been observed since, its periodic time has been distinguished by a more or less prominent display of meteors. These displays occurred notably in 1867, in 1872, and several times since. *Encke's comet* was discovered by Johann Encke, director of the observatory at Berlin, Germany, in 1819. It has a periodic time of 1,210 days, and an orbit which is nearer to the sun at all points than that of Jupiter. Encke proved that this comet is identical with the one appearing in 1786, in 1795, and in 1805. With its appearance in 1822 and 1828 it was accurately examined and measured, and former observations were verified at its reappearance in 1881.

**COMMENCEMENT** (kōm-měns'ment), the occasion on which degrees are conferred by colleges and universities upon their graduates. The term is employed in the University of Cambridge, England, and in other institutions of Great Britain to designate the day when masters of art and doctrines received their degrees. In the United States it has reference to the elementary and secondary schools as well as the institutions of higher learning, and the exercises, usually held at the close of the school year, are meant to indicate the commencement of a fuller life after graduation. The alumni of many institutions hold a reunion at the time of the commencement, and usually the literary societies hold annual meetings and the presi-

dent of the institution receives the report for the past year. Members of the class deliver orations, those of the highest rank being assigned the places of *salutatorian* and *valedictorian*, and frequently an address or oration is delivered by a prominent educator or public man. Commencement exercises may be considered a potent agency in stimulating educational zeal among the students and their friends, and in promoting a spirit of attachment among the graduates to their Alma Mater.

**COMMERCE** (kōm'mērs), the exchange of goods or property of any kind, especially the exchange on a large scale between states, nations, and colonies. The foreign commerce of the United States, including exports and imports, is exceeded in value only by the commerce of Germany and Great Britain, although the interior commerce of the United States is greater than that of any other country. In fact the collection of raw material from the various portions of the United States at the points of manufacture or export, the distribution of manufactured products, and the distribution of foreign imports give rise to a commerce exceeding in extent the commerce of any other two nations in the world. This vast commerce has resulted largely from the building of extensive railroads, canals, and other avenues of transportation. Incident to it are the construction of factories and the location of vast storehouses. The larger commercial centers are in the cities, where the principal railroads converge and the vast factories and storehouses for distribution are located.

The Phoenicians were the great commercial nation of the ancient world. Their primitive seat was at Sidon and their next center was at Tyre. The prophet Isaiah speaks of Tyre in these words: "The crowning city whose merchants are princes, whose traffickers are the honorable of the earth." This was written about 588 B. C. Their trade was extended to all parts of the world which were known at that time. The Greeks and Romans ranked as commercial nations. In the Middle Ages the Venetians, the Hanseatic towns, and Flanders took the lead in commerce. With the discovery of America the Spaniards, Portuguese, Dutch, and British developed vast commercial interests, though the Hanseatic towns in Germany remained important commercial centers.

Germany and Great Britain both have a larger foreign commerce than any other nation of the world. In this respect the two countries are about on the same footing, sometimes one and then the other standing at the head, with the tendency of growth being in favor of Germany.

In 1907 the commerce of the countries named was as shown below:

Country	Imports	Exports	Total
Canada .....	\$340,374,745	\$272,206,606	\$612,581,351
France.....	1,064,587,361	910,650,450	1,975,237,811
Germany .....	2,395,850,280	1,719,600,925	4,115,451,205
Great Britain.....	2,390,680,240	1,690,325,840	4,081,006,080
United States.....	1,434,421,425	1,880,851,078	3,315,272,503

**COMMERCE, Chamber of**, a board or association organized by the merchants and traders of a city to protect the interests of commerce. Organizations of this kind are very common in the cities of Canada and the United States, where they are maintained to further the interests of trade and to build up manufacturing and commercial enterprises. Usually they work in harmony with the town or city council, and frequently petition the Legislature for the enactment of laws favorable to the extension of trade relations within the states and provinces, or among the different sections of the nation. These organizations have been united to a large extent in building up a system of international chambers of commerce, which is designed to promote trade within the country and on a larger scale with foreign nations.

**COMMERCE AND LABOR, Department of**, one of the executive departments of the United States. It was created by an act of Congress on Feb. 11, 1903, and is under the direction of a secretary, who is a member of the Cabinet. The head of this department, like the other cabinet officers, is appointed by the President, subject to confirmation by the Senate, and the salary is \$8,000 per year. The duty devolving upon this department, as set forth in an act of Congress, is to foster, promote, and develop the domestic and foreign commerce of the United States, manufacturing, mining, and the fishery industry. It is incumbent upon the department to promote improvement of transportation facilities, supervise the business of insurance, and develop the interests of labor. George Bruce Cortelyou (born 1862) was made the first Commissioner of Commerce and Labor, but he resigned in 1904 and was succeeded by Victor H. Metcalf (born 1853), of California.

The Department of Commerce and Labor includes an effective organization of bureaus. These are the Bureau of Labor, Bureau of Corporations, Bureau of Navigation, Bureau of Manufactures, Bureau of Standards, Bureau of Foreign Commerce, Census Bureau, and Bureau of Statistics of the Treasury Department. With it are affiliated the steamboat inspection service, the lighthouse board, the lighthouse establishment, the immigration service, and the fish

commission. The Bureau of Corporations is presided over by a commissioner of corporations. This officer receives a salary of \$5,000 per annum, and has partial jurisdiction of the investigation and control of trusts and trade combinations. It is his duty to investigate the business management of any corporation of joint-stock companies engaged in commercial pursuits, both domestic and foreign, except common carriers, whose business is subject to the interstate commerce law. In an investigation by the commissioner of corporations he may subpoena and compel the attendance and testimony of witnesses.

**COMMERCIAL LAW**, or **Mercantile Law**, the branch of law which regulates the affairs of trade and commerce. It originated largely from the customs of merchants in the Middle Ages, when the peaceful arts of exchanging commodities began to replace the methods employed by the stronger nations in conquering the less powerful peoples. Though the relations of the citizen to his family and the state may differ widely under climatic and economic conditions, it must be admitted that some satisfactory arrangement for buying and transmitting commodities can be devised among the nations of the world. Besides, each of the nations has a system of commercial law which refers particularly to the domestic trade. It includes the enactments that refer to contracts, promissory notes, bills of exchange, deeds of trust, etc.

**COMMISSARY** (kõm'mis-sã-rÿ), in military, the term applied to the civil officer appointed to inspect the musters' stores and provisions of the army. During the times of war a number of commissaries are appointed, each being charged with some specific department of duty.

**COMMISSION** (kõm-mish'ün), a document issued by civil authority conferring designated rank, power, or authority on the person or persons therein named. The instrument bearing this title is issued by the government to officers in the navy and army, postmasters, justices of the peace, and other similar officials. Another class of commissions are those granted to a number of persons who are intrusted with the performance of certain duties of a legal or public character.

**COMMITTEE** (kõm-mit'tê), one or more persons appointed or chosen by a larger number, or by an organized body, to give special attention to some matter or to perform some service. In legislative bodies committees are appointed in special lines of legislation to examine bills of a particular character and to report

on the advisability of their passage. The whole body often resolves itself into a committee to consider any bill or matter, in which case the chair is occupied by some member, called the chairman of the committee. The *Committee of Public Safety* was made up of members of the French national convention during the first revolution. In 1792 the national convention abolished the monarchy and proclaimed a republic. The Committee of Public Safety was appointed on April 6, 1793, and had authority to supervise the work of several committees, among whom the executive functions of the government were divided. Later extended powers were vested in this committee and all the executive authority passed into its hands. The communists established a similar committee in March, 1871, but it fell about two months later.

**COMMODORE** (kõm'mõ-dõr), a naval officer of the United States, ranking next above a captain. A commodore generally has command of a few ships of war when they are detached for any purpose from the rest of the fleet.

**COMMON LAW**, the law of England which rests for its authority upon usage and universal acceptance, rather than upon any express and positive declaration of a legislative body. Blackstone classified the civil law of England under two divisions, the *statute law* and the *common law*, and defined the latter as a system of laws which consist of general customs and are accepted by particular courts. The common law is overruled by a statute law, but has precedence in cases in which equity is opposed to it. The State courts of the United States as well as the courts of the provinces of Canada rely upon the English common law, which constitutes the basis of the jurisprudence of these countries. However, Louisiana is an exception to this rule, since the laws in that State are based quite largely upon the jurisprudence of France.

**COMMONS**, the term applied to the common people as distinguished from the nobility. In England the term includes all the people below the peers, comprising the class represented in the lower house of Parliament, the House of Commons. The term is applied in the same way to the Parliament of Canada.

**COMMON SCHOOLS**, the term usually applied to the public schools below the high school, although the educational system of the cities includes schools of several grades, such as primary, grammar, high, and manual training schools. Those located in the rural district are called district schools, being under the supervision and control of the officers of the school district, and those situated in the wards of a

city are sometimes called ward schools. The schools of most countries are not organized and maintained under a national law, but are usually supported and controlled by the states or provinces, or are dependent largely upon local taxation. The courses of study in the common schools cover eight grades, or years, and outline the study in the common branches, which include chiefly reading, writing, spelling, arithmetic, geography, history, physiology, and grammar. In some of the states and provinces a number of other branches are included, such as music, algebra, drawing, botany, and civil government. These are supplemented in the high schools by courses covering four years of more advanced work. See **Education; Schools**.

**COMMONWEALTH** (kŏm'mŭn-wĕlth), a state in which the government is vested in the people, as in a representative republic. The term was applied to England after the execution of Charles I., Jan. 30, 1649, soon after which Oliver Cromwell became protector. It ended with the restoration to the throne of Charles II., on May 29, 1660.

**COMMUNE** (kŏm-mŭn'), the smallest territorial and administrative division of France and Belgium. It is the unit for local self-government and is regarded a legal body, hence may sue and be sued, contract debts, and buy and sell property. The chief officer, called the *mayor*, is assisted by a deliberative assembly known as the *conseil municipal*. Communes usually embrace several villages, but sometimes coextend with a town or city, or several communes are located within the same city. Those having a population of more than 3,000 are more largely under the direction of the central government, by which the mayor is appointed, while the chief officer in the smaller communes is appointed by the prefect of the department.

**COMMUNE OF PARIS**, a revolutionary committee organized in Paris in the French revolution of 1789, which soon absorbed the supreme authority in the government. The leading characters included Danton, Marat, and Robespierre. Of this triumvirate Marat was assassinated July 13, 1793, Danton was guillotined on June 5, 1794, and Robespierre met the same fate on July 28, after being captured at the headquarters of the commune at the Hôtel de Ville. The same name was applied to an insurrection in Paris which occurred on March 18, 1871. The organization was formed to carry out the traditions of the old revolutionary commune, and was proclaimed on the 28th. This occurred after a siege by the Germans, when the people gave evidence of much discontent with the government. Among the notable deeds

were the burning of the Tuileries and the Hôtel de Ville, the destruction of the Column Vendome, and the defacement of many notable buildings of historic interest. For ten weeks the most bloody and desperate fighting continued, and during the last ten days of May fully 65,000 communists were killed. On May 28, 1871, Paris was taken by storm and the Commune fell, many of the leaders being either executed or transported.

**COMMUNISM** (kŏm'mŭ-nĭz'm), the theory of government and social order according to which property is held as a common trust, and the profits derived from all labors are devoted for the general good. This theory involves the abolition of all private property and the transfer of everything possessed by individuals to the state, which is then charged with the task of assigning work to each of the citizens and dividing the profits among them. There are several communistic bodies in the United States. A number of them are religious organizations, such as the Shakers, Altruists, Church Triumphant, Bruderhof, Mennonites, and Separatists. Besides these are societies known as the Amana Community, the Harmonists of Harmony, Pa., and the Oneida Community of New York. A certain form of communism was advocated by Robert D. Owen in his publication of "New View of Society" in 1833, in Great Britain. He attempted to found a society on the new plan, without government assistance, on the banks of the Wabash in 1825, but was unsuccessful. The most prominent communistic leaders in France included Saint Simon, Proudhon, and Fourier, who operated as communists; in Russia they are known as nihilists, and in Germany as socialists. The Amana Community, located in Iowa, has been quite successful, but many of the communities have not realized the hopes of their organizers. See **Brook Farm**.

**COMMUTE** (kŏm-mŭt'), to pay in gross less than would be paid for each separate item combined, or accept an easier, lighter, or different kind of payment, obligation, or service instead of one formerly understood. The term is applied in judicial proceedings to an alteration or reduction of a sentence, as the commutation of the death penalty to imprisonment for life.

**COMO** (kŏ'mŏ), a lake in Lombardy, northern Italy, located at the foot of the Alps, and formed mainly by the Adda River, which enters it at the north and flows from it at the southeastern extremity. The lake is about two and one-half miles wide and about thirty-five miles long. Its excellent climate and beautiful scenery have made it the most celebrated pleasure resort

in Italy, and caused its shores to be studded with fine villas, vineyards, and gardens. It was once the residence of Queen Caroline. Trout and other valuable fish abound. The lake is visited by large delegations of pleasure seekers.

**COMO**, a city of Italy, in the province of Como, twenty-five miles northwest of Milan, with which it is connected by a railroad. It is situated at the southwestern end of Lake Como and is surrounded by a picturesque country. It has a fine gothic cathedral of the 14th century. Among the chief manufactures are silks, woolen textiles, velvet, cigars, and machinery. It has a brisk trade in merchandise, fruit, and earthenware. The public utilities include a museum, a public library, waterworks, and electric street railways. Como is the birthplace of Volta, Innocent XI., and Pliny the Elder and the Younger. It was anciently known as Comum. Population, 1906, 39,125.

**COMORO ISLANDS** (kōm'ō-rō), or **Comores**, a group of volcanic islands in the Mozambique Channel, between Africa and the northern extremity of Madagascar. The islands include Mohilla, Comoro, Johanna, Mayotta, and a number of smaller islets. The total area is 790 square miles. They have a fertile soil, though they are of volcanic origin, and produce fruits, sugar cane, and rice. These islands were ceded to France in 1886 and are governed as a dependency of Réunion. The inhabitants are chiefly of Arabic and Negro descent and profess Mohammedanism. Population, 1906, 75,500.

**COMPANY** (kūm'pā-nŷ), in business, a number of persons associated for carrying on any business, or for the performance of any duty. The shareholders divide the profits among themselves in proportion to the amount of capital invested. The term is applied in infantry to the smallest command of a captain. In the United States the full strength of a company is one hundred men.

**COMPARISON** (kōm-pār'ī-sūn), the act of setting forth the points of similarity or contrast between one thing or person and another. In grammar comparison is that inflection of adjectives or adverbs which indicates difference in the degree of quality. The three degrees of comparison are *positive*, *comparative*, and *superlative*. The last two are usually expressed by adding *er* or *est* to the positive, or by using *more* or *most*, *less* or *least*, before it. Great, greater, greatest; truthful, less truthful, least truthful are examples of comparison.

**COMPASS** (kūm'pās), an instrument for determining direction by means of a poised magnetic needle. In surveying, such an instrument

is used for measuring horizontal angles. It consists of a rotating telescope, mounted above a card showing the cardinal and other points. In electricity, an instrument known as a compass is employed for measuring the intensity of a voltaic current, in which a small needle is placed. The intensity of a current is measured from its proportion to the angle of deflection. This deflection is ascertained by the instrument, after which its corresponding value is obtained from a table of tangents.

MARINER'S COMPASS.

In nautics the *mariner's compass* is used to determine the course of a ship. It is usually inclosed in a box and this is again placed in a larger one, called a *binnacle*, and located in the back part of the vessel. The essential part of the mariner's compass is the magnetized needle. This is fastened to the lower part of the card, which is made of a leaf of mica, an ordinary cardboard, or some similar substance. The arrangements are so constructed that the card revolves with the needle. On it the four *cardinal points*, north, east, south, and west, are marked and some smaller divisions are indicated so as to constitute thirty-two in all, each one having a name compounded from the cardinal points. The compass is supported on gimbals to keep it in a horizontal position, notwithstanding the moving and rocking of the ship. In large iron or steel vessels a notable deviation of the north and south line from the magnetic meridian is ordinarily noticed, which is due to the permanent magnetism of such vessels. To overcome this a permanent steel magnet is placed in the vicinity of the compass, by

means of which an opposite attraction to that due to the ship is exerted with equal force. The helmsman carefully observes the movement of the compass when steering the ship so as to move forward in a continuous and proper course.

It is believed that the Chinese were the earliest inventors of the mariner's compass, using it first on land and afterward to guide ships on the sea, but the name of its inventor is not known. It was brought to Europe by Marco Polo, a Venetian traveler, in 1260. The Swedes knew of the compass in 1250, in the time of King Jarl Biger. The variations at different degrees of longitude were first discovered by Columbus in 1492, and rediscovered by Sebastian Cabot in 1540. The hanging compass now used was invented in 1608.

**COMPASS PLANT**, an annual plant of the Compositae order, native to the prairies of the Mississippi Valley. It was so named from its radical leaves, which are sensitive to the light and in midsummer point quite nearly to the north and south. Asa Gray, the noted botanist, attributed this property to the fact that both surfaces of the leaves are equally affected by the light, hence their edges are turned vertically and their tips assume a north and south position so as to receive an equal amount of illumination on both sides. The stems contain a large per cent. of resinous matter, hence the plant is known locally as *resin weed*.

**COMPOSITAE** (kõm-põz'ĩ-tē), an order of plants, distinguished by compound or composite flowers. The order is given various designations by writers, such as aster family, composite family, sunflower family, and thistle and chicory families. About 12,000 species of this order have been described, hence it is the largest family of plants that bear flowers. The heads of flowers are composed of a number of florets congregated upon a common receptacle, which is surrounded by bracts in the form of leafy or scaly involucre, giving the appearance of a single flower. In many species the florets are so uniformly arranged that it is common to speak of the aggregation as a flower, instead of referring to the individuals that make up the head as separate and distinct blossoms. However, in some species the florets differ materially in shape, size, and color, and those near the outside are frequently imperfect and sterile. In the typical flower the stamens are five in number and are united together by their anthers, and the ovary has one cell and one ovule. The corolla is above the ovary, and is either tubular or strap-shaped, both forms frequently occurring in the same plant. Many species of this

order are cultivated for ornaments, such as the aster, daisy, goldenrod, dahlia, and chrysanthemum. Others are important for their medicinal value and for food, including the sunflower, chicory, tansy, salsify, lettuce, dandelion, chamomile, arnica, wormwood, artichoke, etc.

**COMPRESSED AIR** (kõm-prẽst'), the name applied to atmospheric air compressed by means of pumps and utilized to propel machinery by the general force of expansion. It is used for propelling engines constructed quite like steam engines; the force of the expanding air being exerted against a piston in a cylinder. It has been made serviceable in water pumps, in elevators, facing machines, hydraulic presses, motors, railroad engines, brakes, hydropneumatic hoists, for ventilation, and various other purposes. In compressing air sufficiently to force a hundred cubic feet to occupy one cubic foot, it becomes very hot and loses some of its force in cooling. However, it serves a useful purpose in many respects, especially in rock drills, mining machinery, and various other purposes in the industries. The first attempt to utilize compressed air was made in 1700, since which time many improved machines have been invented and its use has been vastly extended. See **Air Compressor**.

**COMPROMISE** (kõm'prõ-mĩz), an agreement entered into between two parties to refer a matter in dispute to arbitration, and to abide by the decision of the arbitrator. In recent years compromises have been the means utilized extensively to settle various disputes between nations, such as the boundary dispute between the United States and Canada and that of Venezuela and British Guiana. See **Ashburton Treaty**.

**COMPROMISE OF 1833**, a tariff measure passed by the Congress of the United States in 1833, as a compromise for the high tariff act of 1828. The latter had caused intense dissatisfaction in the Southern States, and its strict enforcement brought about the nullification by South Carolina and a threat that the State would secede from the Union. Henry Clay proposed a compromise in the Senate, but the House took up the issue and passed a bill which became a law, though it was practically the same as that introduced by Clay in the Senate. It was designed to reduce the high duties gradually, until after ten years a free trade basis should be reached.

**COMPROMISE OF 1850**, a name given to a series of measures passed by the Congress of the United States in 1850, designed as a compromise between the antislavery and proslavery parties. Clay's Omnibus Bill was proposed and

defeated a short time before and the two were practically identical. The compromise provided that Texas was to receive \$10,000,000 for New Mexico; California was admitted into the Union under a free constitution; Utah and New Mexico were organized as territories, with the power to adopt or reject slavery; the Fugitive Slave law was enacted, under which fugitive slaves were returned when their owners made certain affidavits; and redress to free colored seamen imprisoned in Southern ports was prohibited. Henry Clay, Daniel Webster, and John C. Calhoun made celebrated speeches upon the various compromises. The measures thus enacted after much controversy were rendered futile when Stephen A. Douglas introduced his Kansas and Nebraska Bill, in 1854, when the whole controversy was opened anew in Congress and on the plains of Kansas.

**COMSTOCK LODGE** (kūm'stōk), an extremely rich metallic vein on the eastern slope of the Virginia Mountains, in the western part of Nevada. In this large and productive vein the Big Bonanza and other mines have produced gold and silver to the value of \$350,000,000. It was discovered in 1859. The depth of the mines is about 2,250 feet.

**CONCENTRATION** (kōn-sēn-trā'shūn), in pedagogy, the connection between the parts of each study and such a spinning of relations and connecting links between different sciences that unity may spring out of the variety of knowledge. Herbart was the first educator to make use of the term, and it is now employed quite generally by the Herbartians. The theory of concentration makes the child's mind the center for concentrating efforts in education, and utilizes the natural tendency of the mind to unify all its ideas, feelings, and incentives. Consequently concentration is concerned chiefly with the relation of different studies to each other.

**CONCEPCION** (kōn-sēp'shūn), a seaport city of Chile, capital of a province of the same name, on the Biobio River, about seven miles from its mouth. It is a well built city and has a number of public buildings and a cathedral. Many of the streets are paved with stone, lighted by electricity, and traversed by electric railways. Its port is Talcahuano on the Bay of Concepcion, about eight miles distant, and one of the most important in Chile. The city was founded in 1550 by Pedro de Valdivia (1510-1554). It suffered at various times by attacks of the Araucanian Indians and has been damaged frequently by earthquakes. Population, 1906, 61,786.

**CONCEPTION** (kōn-sēp'shūn), the formation of an idea or image in the mind. It con-

sists of a conscious act of the understanding, bringing an object or impression into the same class with a number of other objects or impressions, by means of some character or characters common to them all. *Perception*, by which individual ideas are acquired through the senses, is the first step in forming ideas or concepts. The power of conception depends largely upon the ability of the mind to separate ideas and classify them according to qualities, and then group them into a class. To cultivate this faculty it is necessary that the mind receive clear and definite ideas of objects and their properties, that they be deeply impressed so they may be permanently retained and readily recalled, and that they be associated according to their intrinsic or logical relations. Conceptions of the highest order can be obtained only by a close and accurate observation of the objects from which they are derived. When training the perception, the instructor is at the same time training the conception, but the latter process is relatively more important than the former. In forming conceptions the mind is greatly influenced by its feeling, and the concepts formed under circumstances causing deep emotion, either of pain or pleasure, remain almost indelibly.

**CONCERTINA** (kōn-sēr-tē'nà), a musical instrument in which the sounds are produced by admitting air through metallic reeds, as in the accordion. It was invented by Charles Wheatstone in 1829. The form is hexagonal and at each end is a keyboard, which is worked by the finger while drawing out and pressing the bellows to obtain a pressure of air, which works on the reeds as the keys are pressed. Every sound in the scale is double and can be produced by pulling or pressing the bellows.

**CONCH** (kōnk), a name applied to many marine univalve mollusks, especially to the rose-lined *stromb* of Florida and the West Indies. Large quantities of these mollusks are obtained in the Bahama Islands, where they are gathered and exported for cutting shell cameos. The fleshy parts are prized as food by the natives and the Indians use the shells in making white wampum. The *triton* of the East Indies has a large spiral shell that is known as conch, and, like that of the *stromb*, may be perforated and fitted with a mouthpiece and finger holes and used as a sonorous musical instrument.

**CONCHOLOGY** (kōn-kōl'ō-jy); the science of shells. See **Shells**.

**CONCLAVE** (kōn'klāv), the apartments where the cardinals of the Roman Catholic Church assemble for the election of the Pope, or the assembly of cardinals convened for that pur-

pose. The cardinals are permitted to appoint the place for the election, but the conclave is usually held in the Vatican or the Quirinal palace at Rome. They assemble on the tenth day after the death of the Pope, the meeting being in a large hall connected with small rooms, two of which are assigned to an ordinary cardinal and three to one of princely rank. The deliberations are held in privacy and all of the members of the conclave are locked in and attended by two or three conclavists or attendants. No communication is allowed with any one on the outside, and the food is carefully inspected so no concealed missive may reach the conclave. The vote is by ballot taken twice a day until it is possible to secure an election, for which a two-thirds vote is necessary.

**CONCORD** (kɔ̃n'kɛrd), a town of Middlesex County, Massachusetts, on the Concord River, and on the Boston and Maine Railroad. It is the seat of the Massachusetts Reformatory, has a public library, and is a market for fruit and produce. The manufactures include harness, clothing, and rubber goods. At the bridge across the river the first shots of the American revolution were fired on April 19, 1775. A monument marks the spot where several British soldiers fell. The Battle of Lexington commenced at Concord, the Americans pursuing the British, who were on a rapid retreat. At that time the population of Concord was 1,300, and it sent 174 men to the army in 1775. The soldiers' pay was raised by the town. Among the persons of literary eminence who made their home at Concord are Alcott, Hawthorne, Emerson, and Thoreau. The town was founded in 1635. Population, 1905, 5,421.

**CONCORD**, the capital of New Hampshire, in Merrimac County, on the Merrimac River, 58 miles northwest of Boston. It is on the Boston and Maine Railroad and several electric inter-urban lines. The river divides the city into two parts, which are connected by a large number of bridges. The streets are well paved, lighted, and otherwise improved. It has street railways, waterworks, and a sewer system. Among the educational institutions are the high school and the Saint Paul's School. The city has a public library of 15,000 volumes. Among the noteworthy buildings are a State insane asylum, the city hall, two orphanages, a home for the aged, the State prison, and a beautiful State house built of granite. The manufactures include hardware, carriages, woolen and cotton fabrics, cutlery, flour, shoes, and musical instruments. Near it are some of the most valuable granite quarries of the East. It was first settled in 1725, when it was known as Pennock. In 1816 it be-

came the State capital and was incorporated as a city in 1853. Population, 1900, 19,632.

**CONCORD**, a city in North Carolina, county seat of Cabarrus County, twenty miles northeast of Charlotte, on the Southern Railroad. It has a public library, several county buildings, and a number of educational institutions. The manufactures include cotton goods, ironware, cigars, and machinery. The city has good municipal improvements. It was settled at an early date in the Colonial period and was incorporated in 1793. Population, 1900, 7,910.

**CONCORDANCE** (kɔ̃n-kôrd'ans), an index in alphabetical order to the words or topics of a book, especially such an index to the Bible. The first known concordance of the Bible in any language was that prepared by Saint Anthony (1195-1231), who issued such a work in the early part of the 13th century under the title of "Concordantiae Morales in Sacra Biblia." This work is a concordance of the Latin Vulgate. A more elaborate edition was prepared, using Saint Anthony's as a basis, and published in 1244. Since then various concordances have been published in the Greek, English, German, and other languages. The same name is applied to a work designed to facilitate reference to other works, such as were published to Shakespeare in 1790, Milton in 1856, and Tennyson in 1870.

**CONCORDAT** (kɔ̃n-kôr'dăt), any public act of agreement, as a treaty. The term is applied most frequently in papal history to an agreement between a papal see and a secular power for the settlement and regulation of the ecclesiastical affairs. Among the most prominent concordats are those concluded between Pope Calixtus II. and Emperor Henry V. of Germany, in 1122, which still regulates, to a limited extent, the affairs of the Catholic Church of Germany. A concordat was effected between Pope Leo X. and Francis I. of France in 1516, by which the election of the bishop and of several sees was regulated. The concordat between Pius IX. and Emperor Francis Joseph I. of Austria, in 1855, made provisions whereby the legal powers of the papacy were defined in application to the empire. It was set aside in all the dominions of the Emperor of Austria in 1868. Many other concordats were made with different countries.

**CONCRETE** (kɔ̃n'krêt), in arithmetic, a term used to designate a number or quantity applied to certain persons or things as opposed to an *abstract* number. Thus, the expressions five men or eight bushels are concrete numbers; five and eight are abstract. In logic, the name concrete is applied to any quality which is considered in connection with the object to

which it belongs. Thus, *wisdom*, when spoken of alone, is abstract, but when we speak of a *wise man* the quality is concrete.

**CONCRETE**, an artificial stone composed of a mixture of gravel or broken stone, sand, and hydraulic cement. The proportions of material depend upon the purpose for which concrete is to be used. In most engineering works one part consists of cement, one to three parts of sand, and four to six parts of gravel, broken stone, pebbles, shells, or some other hard material. The value of concrete in construction work consists in its property of changing from a plastic condition into a hard and rigid stone, due to the fact that the cement paste sets and hardens with age. It is estimated that concrete composed of two parts sand, one part cement, and six parts broken stone at the age of one year has a compressive strength of from one to two tons per square foot.

Within recent years concrete has become exceptionally popular as building material. This is true in all construction work, such as bridges, dams, foundations, and even large dwellings. For the last-mentioned purpose hollow concrete building blocks have come into extensive use. A fine example of the value of concrete is seen in the great sea wall at Galveston, Tex., which is about five miles in length and seventeen feet high, and supplies a safe and efficient protection of the city from overflows of the sea. This sea wall was constructed at an outlay of \$3,505,040. Concrete has also come into use in the construction of lighthouses and to reënforce breakwaters. An example of the former is in the lighthouse recently completed at the mouth of the Boug River, flowing into the Black Sea.

Prof. I. O. Baker summarizes the use of concrete in "A Treatise on Masonry Construction," as follows: "Concrete is admirably adapted to a variety of most important uses. For foundations in damp and yielding soils, and for subterranean and submarine masonry, under almost every combination of circumstances likely to be met with in practice, it is superior to brick masonry in strength, hardness, and durability; it is more economical, and in some cases is a safe substitute for the best natural stone, while it is almost always preferable to the poorer varieties. For submarine masonry, concrete possesses the advantage that it can be laid, under certain precautions, without exhausting the water, and without the use of a diving bell or submarine armor. On account of its continuity and impermeability to water, it is an excellent material to form a substratum in soils infested with springs; for sewers and conduits; for basement and sustaining walls; for columns, piers,

and abutments; for the pointing and backing of walls faced with brick, rubble, or ashlar work; for pavements in areas, basements, sidewalks, and cellars; for the walls and floors of cisterns, vaults, etc. Groined and vaulted arches, and even entire bridges, dwelling houses, and factories in single monolithic masses, with suitable ornamentation, have been constructed of this material alone."

**CONDENSED MILK** (kōn-dēnst), an important article of commerce made of cow's or goat's milk. The milk is placed in vacuum pans and evaporated to about one-fourth of its volume. Sugar is added to the amount of about one pound to the quart of condensed milk. The manufacture of this article is enlarging continually. See **Milk**.

**CONDIMENT** (kōn'dī-mēnt), any seasoning or sauce used to excite the appetite by communicating a pungent taste to food with which it is mixed. Many condiments assist in digestion, and, by tempting the palate, stimulate the appetite and increase the amount of food consumed. Among the most common are salt, pepper, mustard, nutmegs, vinegar, cloves, horseradish, and pickles. It is necessary to exercise moderation in using condiments, as an over consumption is injurious to digestion.

**CONDOR** (kōn'dōr), the largest vulture of South America, native principally to the Andean regions of Chile, Peru, and Colombia. The favorite haunts of this bird are elevations in the mountains, usually from 4,000 to 16,000 feet, but at times it soars to the tremendous elevation of 21,000 feet above the level of the sea. It floats with outstretched and motionless wings in airy circles. The size is about nine feet measured from wing to wing and four feet from the beak to the end of the tail. Humboldt found none exceeding this measurement, though rare specimens have been found that measure eleven feet from wing to wing, and in one instance a condor was captured which measured as much as fourteen feet. The head and neck are bare, the former being flattened at the top and crowned with a comb on the head of the male. The plumage is usually a deep black with a tinge of gray. The wing coverts in the males are white, and the legs are bluish gray. The powerful talons are large, but quite smooth and blunt.

These birds make no nest, but instead lay their eggs on the bare rocks, usually two in number, which are hatched after seven weeks by the warmth of the sun. The young are covered with down of a whitish color, reaching maturity at two years, and accompanying their parents for some time after being able to fly.

The mountain heights are their favorite abode, to which they return after descending into the valleys and plains for food. Their food consists of carrion, but in the absence of an abundance they attack sheep, deer, goats, and other small animals. Their mode of attack is to dart against the eyes of their prey and seek to inflict mortal wounds by means of the beak. When opportunity occurs they gorge themselves

CONDOR.

with carrion and are then easily caught by the Indians and hunters. The *king vulture* is closely allied to the condor and is found in the warmer parts of America. This bird has a reddish plumage above and white beneath, with a bluish-gray ruff and a black tail. It attains to about the size of a goose. The condor and birds of this genus have no voice; the only sound given out is a sort of snorting.

**CONE**, a solid figure that tapers uniformly from a circular base to a point. It is a *right cone* when the point lies in the perpendicular from the center of the base, other wise it is an *oblique cone*. Cones are similar when their axes and the diameter of their bases are proportional. In botany the cone is a kind of collective fruit shaped like a mathematical cone. The fruit of the Scotch fir is a cone.

**CONEMAUGH FLOOD** (kōn'ē-mā), the name of a flood occurring in Johnstown, Penn., on May 31, 1889. A dam was located across the

South Fork creek, ten miles above Johnstown, a little above its junction with the Conemaugh River, by means of which the water formed an immense reservoir. The artificial lake was stocked with fish, and its vicinity served as a pleasure and resort district for the people, most of whom were residents of Pittsburg. Heavy rain preceding the flood tended to weaken the dam and it broke on the afternoon of May 31, sweeping everything before it. The loss of life was 2,500; fully 99 entire families were lost. This loss was partly by drowning and partly by burning those who had been blocked in by the timbers, which had caught fire from an overturned stove. The villages below the lake had a total population of about 45,000, and more or less damage was done to them by the great water wave passing down the valley.

**CONEY ISLAND** (kō'nī), an island in New York, on the southern shore of Long Island, from which it is separated by a narrow tidal inlet. It is from a few hundred feet to nearly a mile wide and has a length from east to west of about five miles. Formerly it was nothing more than an entire sand waste. In 1874 a line of improvements was begun that transformed the district into a highly valuable region. It is lined with handsome summer hotels and concert and bathing houses, and is crowded with visitors the entire summer season. Manhattan Beach is located at the east end, constituting the portion patronized by the wealthier classes, and is improved by magnificent and expensive hotels and other edifices. Music halls, galleries, and concert pavilions furnish ample accommodation in the way of amusement and entertainment. Several steamboat companies carry passengers at regular intervals and land at tubular iron piers a thousand feet long. The island is joined by several railroad lines to New York City, and elevated and surface railways carry the pleasure seekers to different portions of the island. It was annexed to Brooklyn in 1894 and is now a part of New York City.

**CONFEDERATE STATES OF AMERICA** (kōn-fēd'ēr-āt), the name applied to the union formed in 1861, when eleven states seceded from the United States. The slave question was for many years the cause of extended political and social discussion, and the election of Abraham Lincoln to the Presidency was the immediate occasion for taking steps to dissolve the Union and establish a separate government in the southern portion of the United States. South Carolina seceded first and led in the movement to dissolve the Union. A convention assembled on Dec. 17, 1860, and three days later a resolution was adopted which declared that the Union

previously existing between South Carolina and the other states, under the name of the United States of America, was dissolved. Mississippi followed on Jan. 9, 1861, and proposed a convention to form a Southern Confederacy. The convention met at Montgomery, Ala., Feb. 4, with delegates representing six of the seven states that had then seceded. A provisional Constitution was adopted on Feb. 8, with Jefferson Davis, of Mississippi, as provisional President and Alexander H. Stephens, of Georgia, as Vice President.

The permanent Constitution adopted on March 11 set forth the doctrine of State sovereignty and recognized slavery, though it forbade the slave trade. It established free trade, allowed

CONFEDERATE FLAG.

members of the Cabinet to speak before Congress, authorized the President to veto single items in appropriation bills, and forbade the issuance of credit bills. The presidential term was fixed at six years, and the President was not to be reelected. All the seceded states, including South Carolina, Mississippi, Florida, Alabama, Georgia, Louisiana, and Texas, ratified the Constitution through conventions. Besides these seven states, Virginia, North Carolina, Tennessee, and Arkansas seceded and were admitted into the Confederacy. Richmond was made the permanent seat of government and Davis and Stephens were elected President and Vice President under the Constitution and inaugurated on Feb. 22, 1862. Large powers were given to the President and he was authorized to

direct the energetic prosecution of the war. Money was obtained by cotton loans, by treasury notes, and by requisition, while necessary supplies were acquired by every available means. The government secured belligerent rights from most maritime nations, but its independence was never recognized. The spirit entered upon in the war and the alacrity with which the southern people responded to the call to arms demonstrated great bravery and determination to prosecute the cause of the Confederacy. However, the Federal government never recognized its existence and treated its representatives sent to Washington as citizens of the United States. The history of the confederation is limited to the period covered by the Civil War, and the causes immediately leading up to it. It ceased to exist with the surrender of the Confederate army on April 9, 1865, at Appomattox, Va.

About fifty years have passed since the issues of the Civil War divided the nation into two great factions, each contending for what was held to be a sacred cause, a principle in human government worthy to be defended by life itself. The feeling of jealousy and mistrust that separated the two sections in sentiment long after the surrender of Gen. Lee has happily given way to a new era of commercial and political fellowship, a period in which all sections are united in the uplift that makes for the greatness and perpetuity of an intelligent nation. Oratory and editorial comment are now tempered with the spirit of the times, and the discussion of past events and future ambitions is that of a people united in every phase of national life. This is reflected in a recent article of Dr. G. R. Glenn, of the North Georgia Agricultural College, in which he says in part:

"The purpose of the Confederate Constitution was not revolutionary. There was in the instrument no encroachment on the rights of any northern State. All that the southern people asked of the United States was to be allowed to secede in peace and set up a government that comported with the aims and ideals of the governed. Conservative men on both sides urged a peaceful separation. Men like Mr. Greeley at the north and Mr. Stephens at the south plead for the preservation of the Union and, if that could not be preserved, then for a friendly separation.

"When the President of the Confederate States called for volunteers men came by the thousands to enlist. As we look back now, when about half a century has passed, their daring and courage seem colossal. Who were these men and for what were they to fight? Nine-tenths of them were poor and did not own a slave and

certainly they would not engage in a war for the preservation of slavery. The President of the Confederate States said at the beginning of his government that slaves would cease to be property, and Gen. Lee, the head of the army, freed all of his slaves in 1861. The volunteers were offering themselves to their government to defend a Bill of Rights and a Constitution. They were educated to believe that their State governments were their own, and that any encroachments upon their rights to manage their domestic institutions as they saw proper was a violation of a sacred compact. Slavery was to them only one of the incidents in the quarrel. It may have been the occasion; it was not the cause of the separation.

"The Confederacy died, but the cause for which it lived and struggled did not die. A recent writer says: 'So deeply, though silently, have the minds of the American people been impressed by the magnificent struggle of the Confederate soldiers for the right of local self-government that the hold of that right upon the public conscience has steadily increased in many of the northern states. Over and over again, moreover since the war, has the United States Supreme Court affirmed the limitation of the authority of the general government to the powers distinctly delegated, and the reservation to the states of all undelegated power. The prediction is made that the future historian will say that, while the armies of the North saved the Union from dissolution, the armies of the South saved the rights of the states within the Union.'"

About twenty years ago William D. Kelley, known as "Pig Iron" Kelley, said: "The development of the South means the enrichment of the nation." The truth of this expression must be apparent to all who take time to study the amazing progress of the industries and advancement in values in the southern states. Land in Louisiana that sold at 60 cents per acre in 1895 would command \$50 at present; the same proportional increase in values is true in practically all the states south, not alone in land, but also in iron-ore property, coal fields, and other mineral interests. In 1860 the valuation of property in the south was \$5,200,000,000, and in 1870 it was only \$3,000,000,000, but at present it is \$7,500,000,000, an increase of more than a hundred per cent. since the close of the war. The southern states dominate the cotton market of the world, receiving from Europe alone more than \$400,000,000 per annum for ginned cotton, or more than \$1,000,000 for every day in the year. Rice lands have advanced from \$12 to \$50 per acre; the rice-growing fields of Louisiana and

Mississippi are especially prolific. This is true also of the cultivation of other cereals and tobacco, the rearing of domestic animals, and the output of a large variety of products in the manufacturing industry. The following figures for 1890 and 1905 are of interest in studying the growth of industry in the south:

	1890	1905
Number of cotton mills.....	119	780
Railroad mileage.....	42,900	60,250
Phosphate mined, tons.....	510,299	1,875,480
Bales of cotton used.....	546,330	2,165,150
Pig iron made, tons.....	2,600,500	3,250,000
Coke produced, tons.....	2,534,475	6,245,270
Number spindles in cotton mills	1,712,000	9,205,100
Petroleum, barrels.....	498,632	42,495,802
Coal, tons.....	21,250,000	70,185,000
Capital invested in cotton-oil mills.....	\$12,800,000	\$74,600,000
Capital invested in cotton mills	60,000,000	225,000,000
Lumber products, value.....	90,700,000	250,000,000
Value of exports.....	306,000,000	555,480,000
Value of cotton crop.....	390,000,000	680,000,000
Capital invested in manufacturing.....	659,000,000	1,500,500,000
Value of farm products.....	773,000,000	1,750,000,000
Value of manufactured products	917,589,000	1,765,000,000
Property assessed.....	4,510,925,000	6,500,000,000

**CONFEDERATE VETERANS, United,** a patriotic organization of veterans of the Confederate States, founded in 1889 at New Orleans, La. The society was established to gather and preserve an impartial history of the Civil War, to cherish and cultivate the friendships formed during the conflict, to commemorate the valorous deeds of the dead, and to give aid and support to the widows and orphans. All surviving soldiers and sailors of the Confederate service are eligible to membership. The local organizations are classified in three departments, those of the Army of Tennessee, of northern Virginia, and of the trans-Mississippi. A button with a square miniature Confederate flag is worn in the lapel of the coat. About 1,500 local camps with a membership of about 70,000 comprise the society, which holds a general reunion each year.

**CONFEDERATE VETERANS, United Sons of,** a patriotic organization founded in 1896 at Richmond, Va. All the male descendants of the veterans who have an honorable military record in the Confederate army or navy are eligible in the society, which is organized in the three departments known as those of northern Virginia, of Tennessee, and of the trans-Mississippi. Local camps are maintained in all the southern states and reunions are held annually, both by the locals and by the departments. The membership is about 10,000. The society purchased Beauvoir, the home of Jefferson Davis, in 1902, and converted it into a home for Confederate Veterans.

**CONFEDERATION, Articles of.** See **Articles of Confederation.**

**CONGO** (kōŋ'gō), or **Kongo**, a great river of the Southern Hemisphere, in the equatorial regions of Africa. It was discovered in 1484 by Diego Cam and named Pillar River. Shortly after the Portuguese explored a portion of it and named it Zaire, by which it is still known in some countries. The English explored 175 miles of its lower course in 1816. Livingstone discovered a number of its tributaries in 1868, and Stanley explored and published accounts of it in 1876-77. The upper portions widen into Lakes Moero and Bangweolo, from which the waters flow toward the north, then make a bold sweep toward the northwest, thence toward the southwest, and finally enter the Atlantic Ocean. The principal northern tributaries are the Ubangi and Aruwini; the southern, the Kassai and Lulongo. It is divided into the upper, middle, and lower parts. The upper portion is navigable for more than a thousand miles by steamers, from Stanley Pool to Stanley Falls; the middle extends from the cataract regions to Stanley Pool, about 260 miles; the lower, from its mouth to the cataract region, 110 miles. The total length of the river is about 2,550 miles. It ranks as one of the ten great rivers of the world. The volume of water discharged by it is exceeded only by the Amazon.

**CONGO FREE STATE**, a colony of Belgium, located in Central Africa, containing an area of 900,000 square miles. Its boundary line is not well defined, but may be stated in general to be formed by French Congo on the northwest, German East Africa on the east, British Central Africa on the south, and by Angola and the Atlantic Ocean on the west. It owes its organization to the discoveries of Stanley, carried on largely under the International Association founded at Brussels in 1876, under the presidency of the King of Belgium. An international conference was held in Berlin in 1885, at which certain rights and privileges, such as free trade and international navigation, were guaranteed to the principal nations. The state was placed under the sovereignty of Leopold II., King of Belgium, who had contributed largely to the exploration and opening of the Congo district. By a treaty made in 1890 the king conveyed his rights to Belgium with the privilege of annexing it in the year 1900. Much dissatisfaction among the inhabitants was reported in 1907, owing to atrocities practiced by the authorities upon the natives.

The Congo region includes the principal part of the basin of the Congo River. It is exceedingly fertile and includes many valuable mineral and agricultural districts. The river system affords no less than 6,000 miles of navigation facilities, while a railroad line has been built

from the ocean to Leopoldville, a point immediately above the cataract. Its interior and foreign trade is fast developing under twenty-five commercial companies, representing a capital of about \$25,000,000. The principal products and exports consist of caoutchouc, ivory, wax, copra, coffee, cotton, fruits, sugar, and many others of value commercially. The principal minerals include gold, lead, iron, copper, and coal. It has extensive forests, yielding valuable wood, India rubber, palm oil, nuts, and palm kernels. A majority of the trade is with Belgium, Germany, Great Britain, France, and Holland. Manufactures have been developed by means of excellent water power from the numerous falls and cataracts of its rivers, and several important railroad lines have been built. Among the lakes are Moero and Leopold.

The government is administered by the King of Belgium, who is assisted in the affairs of the state by two ministers. A governor general at Boma represents the government in the state. The principal cities are Boma, on the Congo, which is the capital, Leopoldville and Equatorville. The last mentioned is located at the junction of the Bosira and the Congo rivers, under the Equator. Numerous other trading points have been developed from Belgium, under a commission, of which the king is the chief officer. The natives are peaceable and considerably advanced in civilization and industrial arts. They are chiefly of the Bantu race. The European population does not exceed 3,000, of which about two-thirds are Belgians. The total population is estimated at 30,000,000.

**CONGREGATIONALISTS** (kōŋ-grē-gā'-shūn-ā-l-ists), a body of Christian churches, most largely organized in England and the United States. The doctrine of these churches does not differ essentially from the other Protestant denominations, but in government they occupy a vastly different field. Each congregation has independent power of self-government, uncontrolled by any bishop, presbytery, or other external ecclesiastical authority. Deacons are subordinate rulers and ministers are recognized, but the congregation itself decides upon its membership and disciplinary power. They believe their form of government to be of divine authority, and to have been that of the apostolic churches. This view is rejected by the Presbyterian, Episcopal and various other churches, most of which claim similar descendency.

Among the first advocates of a system of government similar to modern Congregationalism was Robert Brown, born in the middle of the 16th century. He was a preacher, schoolmaster, and lecturer, and led a party in opposition to the

constitution of the Established Church. He set up a congregation in London about the year 1593, when the number of his followers was estimated at about 20,000. Owing to opposition against the leaders, especially on the part of the Established Church of England, he was compelled to remove to Holland, where several churches were organized. The history of this movement is an interesting one and connects Oliver Cromwell and his soldiers with the followers, then called *Dissenters* or *Independents*. After vainly petitioning for religious freedom, they became alienated from Parliament and the Presbyterians. From this time on they grew rapidly in numbers, and now constitute the third English denomination. In the United States they rank as eighth in number. An international council was held in Boston in 1899, the second in the history of the denomination, at which it was decided to establish extensive missions for Cuba and Porto Rico. This denomination has 5,850 ministers, 5,760 churches, and 684,500 members in the United States. Their institutions of learning include thirty, with more than 500 professors, 4,575 students, and an endowment fund aggregating about \$10,000,000. In Canada and Newfoundland they have 155 churches and 12,580 members.

**CONGRESS** (kōn'grēs), a formal meeting of persons regarded as representatives of a society or country for deliberation and discussion. The term is especially applied in political affairs to assemblies or conferences and to the legislative authorities of many nations. It is the name given to the legislative branch of the government of the United States, and in history is attached to three different bodies. The first was the Colonial Congress, which met in New York on Oct. 7, 1765, and was constituted of delegates from nine colonies. All the colonies except Georgia were represented in a similar congress at Philadelphia July 5, 1774, and declared certain rights. This body became known as the Continental Congress, and adopted the Declaration of Independence on July 4, 1776. The next Congress was the one organized under the Articles of Confederation. It met for the first time on March 2, 1781, and was succeeded by similar assemblies until March 4, 1789, when the Constitution went into effect. The first Congress under the Constitution met in New York in 1789, then the capital. Its meetings were held at Philadelphia from 1789 until 1800, when the capital was moved to Washington.

The Congress of the United States consists of a *Senate* and a *House of Representatives*, in which the legislative authority of the United States is vested, under the supervision of the

veto power granted to the President. It has power to lay and collect taxes, duties, imposts, and excises; to borrow money; to regulate commerce; to coin money; to constitute judicial tribunals; to declare war; to provide and maintain a navy; to grant letters of marque and reprisal; to raise and support armies; to provide for the calling forth of military forces; and to admit new states into the Union. Among the provisions common to both houses are the power to judge of the election and qualification of its members, to compel the attendance of members, and to determine the rules of its proceedings. Each may punish and expel members with the consent of two-thirds. A *quorum* of each is constituted of a *majority*, the presence of which is required to transact business. Neither body can adjourn for more than three days without the consent of the other, nor to any other than the usual place of meeting. The salary is \$7,000 per annum, payable monthly out of the treasury, and an allowance of twenty cents for each mile traveled by a usual route. The meetings of Congress occur on the first Monday in December of each year, but this time may be changed by law, and the President may convene the Congress in an extra session.

The first Senate consisted of 26 members. It is constituted of 92 members at present. Two senators are chosen by the Legislature of each state, for a term of six years. The qualifications are: age, thirty years; citizenship, nine years; and inhabitancy in the State in which chosen. The senators are divided into three classes, one-third going out of office every two years. They may be reelected for an indefinite number of terms. The Senate has concurrent legislative powers with the House, and, besides, has power to confirm appointments made by the President and to consent to treaties. In it is vested the power to elect the Vice President, in case the electoral college fails to make a choice. This occurred only in 1837, when Richard M. Johnson was elected Vice President. It is also a court of impeachment, having power to try those impeached by the House. The Vice President is the presiding officer, besides whom a president pro tem. is chosen by the body.

The House of Representatives is made up of members elected by the voters of the several states, the representation being based upon the population in accordance with the national census taken every ten years. The representation in the first Congress was based on 30,000 inhabitants, the membership consisting of 65. In 1901 Congress fixed the number at 386, an increase of 29 members over the basis of 1890. Each State is entitled to at least one representative. The con-

ditions of eligibility are: age, twenty-five years; citizenship, seven years; and inhabitancy of the State from which they are chosen. The election is held in the even-numbered years, and the term is for two years. Each Territory is represented in the House by a delegate, who may speak on any question, but cannot vote.

Besides having concurrent legislative powers with the Senate, the House has original and exclusive power to originate bills for raising revenues. It has power to impeach officers of the United States, and to elect a President in cases where the electoral college fails to make a choice. This occurred but twice; in 1801, when Jefferson was elected, and in 1825, when John Quincy Adams was chosen. The speaker and the officers of the House are chosen from the members by a general vote. The House more particularly represents the people than does the Senate, while the Senate represents more particularly the states. The plan of electing the Senators was proposed in deference to the view held, in the early history of this country, that states have certain rights greater than the nation, and which were not relinquished to the nation at the time of forming the Union. There is a large class of voters that hold to the advisability of electing both the representatives and Senators by popular vote of the people.

**CONGRESSIONAL LIBRARY.** See Library of Congress.

**CONGRESSIONAL RECORD,** the printed proceedings of the United States Congress. In the early history of the republic, up to 1799, the Senate held its sessions with closed doors and no journal of its proceedings was published, but since that time the record is printed daily. It cannot be said that the Congressional Record is an authentic publication, since members are permitted to revise their speeches after they appear in type, and they are also permitted to have remarks and speeches inserted that were not delivered in session. From 1789 to 1824 the journal was called the *Annals of Congress*; from 1825 to 1837, the *Register of Debates*; and from 1837 to 1874, the *Congressional Globe*.

**CONIFERAE** (kō-nīf'ēr-ē), an important order of plants, including the fir, yew, pine, cypress, larch, juniper, etc. Trees of this group are most abundant in the temperate zones and are very sparsely represented in the tropics. Most of the species have a central shaft extending almost to the top, while the branches grow horizontally and diminish upward, thus giving the tree a conical outline. The leaves are slender and firm, well constructed to endure cold, but are not formed to supply choice foliage. In some of the conifers the leaves are flat and

broad and in others they consist of disklike portions that appress and overlap each other, as in the arbor vitae.

Most species of the Coniferae are *evergreen*, that is they have no regular period of shedding their leaves, which fall from time to time as new growths take their place. To this there are some exceptions, such as the larch, or tamarack; which sheds its leaves annually. The fruit, which in most species is a cone formed of heavy scales, contains a number of seeds. The

LARCH.

A, twig with flowers; B, same with cones.

scales lie firmly against each other until the seeds ripen, when they open and the seed is carried away by the wind. In this class of conifers the seed is fertilized by a yellowish pollen, which becomes effective at the time the seed escapes. Some of the species produce berries, such as the junipers. These and the pines are widely distributed, but the bald cypress and sequoia are greatly restricted. Many fossil conifers occur in good preservation in all the geologic formations from the middle Devonian to the most recent.

**CONJUNCTION** (kōn-jūnk'shūn), in astronomy, the position of a planet when it is in the same straight line with the earth and the

sun. It is said to be *inferior* when between the earth and the sun, and the conjunction is called *superior* when the planet is outside the earth so the latter is the central body, or is beyond the sun so the latter is between the earth and the planet. The three bodies are never in a truly straight line, on account of the inclination of the planes of the several orbits. When several stars or planets are found together they are said to be in *grand conjunction*. These are of course extremely rare, but such a conjunction, according to Chinese history, is said to have occurred about 2430 B. C., in the reign of Tehuen-hiu. A conjunction of the moon, earth, and sun is called an *eclipse*.

**CONNEAUT** (kōn-nē-āt'), a town of Ash-tabula County, Ohio, in the northeastern corner of the State, on Lake Erie, and on the Lake Shore and Michigan Southern and other railroads. It has steamboat facilities and a considerable trade in coal and farm produce. Near the town, at the mouth of Conneaut Creek, is a lighthouse. The manufactures include brick, canned goods, and machinery. It is one of the oldest towns in Ohio, having been settled in 1796, and was incorporated in 1832. Population, 1900, 7,133.

**CONNECTICUT** (kōn-nēt'ī-küt), one of the original thirteen states of the United States, known popularly as the Nutmeg State. It is

1, Hartford; 2, Bridgeport; 3, New Haven; 4, Waterbury; 5, New London. Chief railroads shown by dotted lines.

included between latitudes  $40^{\circ}59'$  and  $42^{\circ}3'$  north and longitude  $71^{\circ}47'$  and  $70^{\circ}43'$  west. The boundary on the north is formed by Massachusetts, east by Rhode Island, south by Long Island Sound, and west by New York. Its greatest length from east to west is about 104 miles and its greatest breadth is 76 miles, with an average width of 57 miles. The total area is 4,990 square miles, which includes a water surface of 145 square miles. It is the third smallest State in the Union, but in population holds twenty-ninth rank.

**DESCRIPTION.** The surface of Connecticut is diversified, but it is not greatly elevated above the sea at any point. In the northern section are the highest elevations, where the highland region extends into the State from Vermont,

and the surface slopes gradually toward the south. The Berkshire Hills, which extend from the Green Mountains of Vermont into Massachusetts, traverse the northwestern part of the State. In the eastern part the hills are rounded and fertile and in the northwestern section they are often broken and precipitous, with bold bluffs of trap rock. Bear Mountain, the highest elevation, is 2,355 feet above the sea. Other summits include Girdley Mountain, Prospect Mountain, Riga Mountain, and Ivy Mountain. Level plains extend along the streams, and much of the country adjacent to Long Island Sound is level or characterized by low hills.

The principal river is the Connecticut, which crosses from north to south through the center of the State. Three river systems furnish practically all of the drainage, the Thames and its tributaries in the eastern portion, the Connecticut in the central part, and the Housatonic in the western section, and all of them flow into Long Island Sound. The Pawcatuck forms part of the boundary between Connecticut and Rhode Island, the Shepaug is a tributary of the Housatonic, the Farmington is an affluent of the Connecticut, and the Saugatuck drains the larger part of Fairfield County. Many of the streams flow through formations of solid rock and in the highlands the courses are cut deeply. In most places they furnish valuable water power.

The climate of Connecticut is quite uniform, ranging from a mean temperature of  $28^{\circ}$  in winter to about  $68^{\circ}$  in summer. In winter the temperature falls frequently as low as  $10^{\circ}$  to  $15^{\circ}$  below zero, while the extreme heat of summer ranges from  $90^{\circ}$  to  $100^{\circ}$ . Heavy snows fall among the hills and mountains, where the winters are quite severe and of long duration, but the summers are pleasant and all seasons of the year are healthful. The mean annual rainfall is about 52 inches and the precipitation is quite evenly distributed. In the highlands the soil is thin and is some places barren, but it is of value in growing grasses and fruits. The valleys and the southwestern part have a dark soil of much fertility. Fine forests abound along the Connecticut and other streams, and include pine, hickory, walnut, wild cherry, oak, and maple.

**MINING.** Iron ore has been mined since 1732; but the output is not important as compared to the production in Missouri and Minnesota. Tungsten ore is mined near Long Hill and deposits of lead, copper, and nickel are known to occur. Granite is the most abundant of the minerals and is quarried extensively for monu-

ments and building purposes. Large quarries of brownstone are worked at Portland and near Middletown. Limestone, clay, and cobalt are obtained in various localities.

**AGRICULTURE.** Farming is confined largely to the valleys of the rivers, where the soil is mostly fertile, but the hills and highlands are generally broken and stony. Hay is the most extensive crop and is cultivated on an area about three times as large as that utilized in growing all other crops. Tobacco has been an important product since 1640, and is grown chiefly in the valleys of the Connecticut and Housatonic rivers. Vegetables of all kinds thrive abundantly and large interests are devoted to the culture of fruit, especially apples and peaches. All of the cereals can be grown profitably, especially rye, corn, wheat, buckwheat, and oats, but there has been a steady decline on account of more profitable development in other lines, especially dairy and vegetable farming. The dairy products include milk, butter, and cheese, and a ready market is found in New York and other commercial centers of the East. Swine, sheep, and horses are grown, but dairy cows receive the greater share of attention.

**MANUFACTURING.** Manufacturing is the leading industry, in which about twenty per cent. of the people are engaged. The State ranks eleventh in the output of manufactures. About three-fourths of the total ammunition made in the United States comes from Connecticut. The State produces forty per cent. of the hardware, fifty-six per cent. of brass manufactures, sixty-three per cent. of the clocks, sixty-four per cent. of the pins and needles, seventy-six per cent. of the plated ware, and a large proportion of the rubber goods and textile fabrics produced in the United States. In the output of its fisheries it takes third rank among the New England states. A large share of the output is shipped fresh to market, but much interest is shown in curing and canning. Oyster fishing is the largest of the fishing industries and next in order are the lobster, cod, and menhaden fisheries.

**COMMERCE AND TRANSPORTATION.** The export trade of Connecticut is largely through the port of New York City, but foreign imports are entered direct at Hartford, Stonington, Fairfield, New Haven, and New London, all of which are ports of entry. Transportation facilities are furnished by the Connecticut River, which is navigable for large steamers to Hartford, about fifty miles, and river boats ascend to Holyoke by means of the Windsor Locks. Railroad building received attention at an early date, hence few extensions were made within recent years.

The lines include a total of 1,050 miles, most of which are controlled by the New York, New Haven and Hartford Company. The State has a large number of finely improved highways and many electric urban and interurban railways are in successful operation. Safe and commodious harbors are furnished by the numerous inlets on the coast.

**EDUCATION.** The State has long occupied a foremost position in the educational field, and elementary education was provided at public expense from the earliest Colonial period. About five-sixths of all persons of school age attend the public schools, while a nominal compulsory attendance law requires registration in some schools between the ages of four and sixteen. The general supervision and control of the educational interests are intrusted to the State board of education, and local administration is vested in a town committee or a board of education. Support is given jointly by local taxation and by income from the State school fund. Normal schools are located at New Haven and Willimantic.

Connecticut has no State university, but is well provided with representative institutions of higher learning. Yale University, one of the leading institutions of higher learning in America, is located at New Haven. Trinity College at Hartford, Wesleyan University at Middletown, and the Hartford Theological Seminary are among the chief educational centers. An agricultural college is located at Mansfield. A hospital for the insane at Middletown, a State prison at Wethersfield, a school for the feeble-minded at Lakeville, training schools for nurses at Hartford and New Haven, an industrial school for girls at Middletown, and an industrial school for boys at Meridian are among the benevolent and reformatory institutions.

**GOVERNMENT.** The present constitution was adopted in 1818 and has been enlarged by thirty-one amendments. It requires that those who vote must be able to read and write and have resided in the State one year and in the town six months. Executive authority is vested in the governor, lieutenant governor, secretary, treasurer, and comptroller, each elected for two years. A majority vote of each branch of the Legislature is necessary to overcome the veto of the Governor. The Senate consists of thirty-five members and the House of 255 members, both senators and representatives being elected for two years. Regular sessions of the General Assembly, as the Legislature is called, are held biennially, in even years, beginning on the first Tuesday after the first Monday in November. A chief justice and four associate judges con-

stitute the supreme court of errors. Other courts include a superior court of six judges, the courts of common pleas, district courts, and justices of the peace. Local government is administered by the towns and counties.

**INHABITANTS.** The population of the State has shown a steady and uniform growth the past two decades, owing largely to the increase in the demand for labor in manufacturing enterprises. Nearly sixty per cent. of the people reside in cities of over 8,000 population. Immigration has been chiefly from Ireland, Germany, England, and Canada in the order named. Hartford, the capital, is located on the Connecticut River. The leading cities include Bridgeport, New Haven, Waterbury, New London, Meriden, New Britain, Norwalk, Danbury, Norwich, Stamford, Ansonia, Middletown, Willimantic, Rockville, and Bristol. The total population in 1900 was 908,355; in 1910, 1,114,756.

**HISTORY.** The history of Connecticut is closely linked with the entire period since the early settlement of America. It was inhabited originally by Indians numbering about 20,000, the most numerous being the Pequots. The first settlement was made by the Dutch near Hartford in 1633. Two years before that date a grant had been given to Lord Say and Sele for a tract of land extending from Narragansett Bay to the Pacific Ocean. However, this grant, though made by the Earl of Warwick, was not considered legal, but the town of Saybrook was founded under it in 1635. In the meantime a number of emigrants from Massachusetts Bay settled at Wethersfield and Hartford, and New Haven was founded by English Puritans in 1638. The Dutch relinquished their possessions in 1650, and New Haven was annexed to Connecticut in 1662. John Winthrop, Jr., had previously obtained a liberal charter from Charles II., who granted absolute autonomy to the colony, but it was demanded by Sir Edmund Andros in 1687 and was secreted until 1689. In 1708 the Congregational Church was established and secular and religious affairs were long closely associated, but all other denominations were tolerated.

Connecticut furnished about 30,000 men for the Continental army in the American Revolution, and was raided a number of times during the conflict. It was the fifth State to ratify the United States Constitution, in 1788, and strongly opposed the War of 1812, when the celebrated Hartford Convention met in its capitol. The present constitution was adopted in 1818, by the terms of which slavery was abolished. The State furnished 56,000 men for the Federal army in the Civil War, and Buckingham, the

war Governor, was a prominent figure of that period. Hartford and New Haven were jointly the capitals until 1873, when the former was made the sole seat of government.

**CONNECTICUT RIVER,** the longest river in New England, rises in northern New Hampshire, forms the boundary between it and Vermont, flows through Massachusetts and Connecticut, and enters Long Island Sound at Saybrook. It is about 375 miles long and drains an area of about 11,250 square miles. Large steamers ascend to Hartford, a distance of fifty miles, and it is navigable to Holyoke for river boats by means of the Windsor Locks. It furnishes an abundance of water power and has a number of falls, including those at Olcott, 36 feet; Bellow's Falls, 55 feet; Turner's, 41 feet, and Holyoke, 59 feet. The White, Passumpsic, Chickopee, Farmington, and Salmon rivers are its principal tributaries. On its banks are many important towns and it carries a large inland trade.

**CONNECTIVE TISSUE** (kōn-nĕk'tiv), one of the elementary tissues of animals, found in nearly all parts of the body. It originates in the middle layer of the embryo, and includes the adipose, areolar, cartilaginous, osseous, retiform, white fibrous, and yellow elastic connective tissues. *Adipose tissue* is most abundant at the kidneys and under the skin, but is found in most parts of the body. It is penetrated by blood vessels, but the fatty parts do not have the termini of nerve fibers. *Areolar tissue* consists of fine fibers which interlace each other, is widely distributed in the body, and sheathes the nerves, glands, and muscles. *Cartilaginous tissue* furnishes the attachments for ligaments and muscles, incloses the larynx and trachea, and joins the bones to each other. *Osseous tissue* is the chief constituent of the bones. *Retiform tissue* is composed of crossing lines and interstices and serves chiefly in the attachments of organs, such as the retiform coat of the eye. *White fibrous tissue* makes up the ligaments around joints, the tendons of muscles, and the sclerotic coat of the eye, and is found in the pericardium and the periosteum. It varies materially in the number of cells and fibers, and in the main consists of parallel bundles which branch as the connections are made. *Yellow elastic tissue* consists of large and coarse fibers and is very elastic. It occurs in the trachea, veins, skin, and vocal cords. *Neuroglia tissue* is the connective tissue of the nervous system.

**CONNELLSVILLE** (kōn'nĕlz-vīl), a borough of Fayette County, Pennsylvania, on the Youghiogeny River, fifty-four miles southeast of Pittsburg. It is on the Pennsylvania and the

Baltimore and Ohio railroads. Among the noteworthy buildings are the public library, the high school, and a State hospital. The surrounding country has gas and coal deposits and fertile agricultural lands. The products of its industries include flour, tin, brick, hardware, machinery, and railroad cars. About one-half of the coke made in the United States is produced here. It was first settled by Zachariah Connell in 1770 and became a borough in 1806. It has a good trade and modern improvements. Population, 1900, 7,160; in 1910, 12,845.

**CONNERSVILLE** (kǒn'nĕrs-vĭl), county seat of Fayette County, Indiana, sixty-five miles northwest of Cincinnati, Ohio, on the White Water River and on the Cincinnati, Hamilton and Dayton and other railroads. The chief buildings include the courthouse, the public library, and the high school. It is surrounded by a fertile fruit growing and farming country. The leading industries are machine shops, flouring mills, iron foundries, and planing mills. It has a considerable trade in merchandise. Waterworks, sewerage, and electric lighting are among the public utilities. It was incorporated in 1813. Population, 1900, 6,836.

**CONSCIENCE** (kǒn'shĕns), the feeling that enables us to distinguish right from wrong in character and conduct, which commends us when we obey and condemns us when we disobey it. A right conscience is the result of wholesome teaching, and is strengthened by wise exercise and use.

**CONSCIOUSNESS** (kǒn'shŭs-nĕs), the power that the mind has to know its own actions and states. It implies the state of being aware of one's own existence and of one's mental acts and states. Consciousness differs materially in different persons, some possessing much greater powers of consciousness. It is not under the control of the will. We can be conscious only of thinking, willing, and feeling; of acts and states, as remembering, choosing, and perceiving; and the products of these actions—our thoughts, concepts, feelings, etc.

**CONSERVATIVES** (kǒn-sĕrv'ă-tĭvz), a political party of Great Britain. It is nominally the successor of the Tory party, and in leading issues stands opposed to the Liberals. The name was first used about 1832, when a large number of citizens favored the Reform Act of that year, and as compared to the Tories its members were generally classed as more liberal. Balfour and Chamberlain are the chief leaders of the Conservatives in recent years. The leading political parties of Canada are the Liberals and the Conservatives.

**CONSERVATORY** (kǒn-sĕrv'ă-tŏ-rĭ), a n

institution organized to give public instruction in and promote the study of music. Conservatories are of ancient origin and were first established in connection with religious societies for the purpose of improving the character of church music. Originally they were charity schools and were recruited by orphans and foundlings of both sexes. Giovanni di Tappia founded the first famous conservatory in Naples, Italy, in 1537. The Paris Conservatory of Music was established in 1784 and takes rank as the most noted institution of the kind in France. Mendelssohn founded the famous Conservatorium at Leipzig in 1842, and it still takes rank as the leading institution of that class in Germany. Five noted conservatories are maintained in England, of which the Royal Academy of Music, founded in 1822 at London, is the most important. Many institutions of this kind are maintained in Canada and the United States. Those of the former country are represented in Montreal and Toronto. The chief conservatories of the United States include the Peabody Institute at Baltimore, the National Conservatory in New York, the New England Conservatory in Boston, and the Cincinnati College of Music.

**CONSHOCKEN** (kǒn-shŏ-hŏk'ĕn), a borough in Montgomery County, Pennsylvania, on the Schuylkill River, twelve miles northwest of Philadelphia. It is on the Pennsylvania and the Philadelphia and Reading railroads. The chief buildings include the public library and a number of churches and public schools. It has manufactures of cotton goods, flour, ironware, machinery, surgical instruments, and earthenware. Electric lighting and water works are among the improvements. The surrounding country is agricultural. It was founded in 1830 and incorporated in 1852. Population, 1900, 5,762.

**CONSONANT** (kǒn'sŏ-nănt), a letter of the alphabet which cannot be sounded, or but imperfectly, by itself, and only perfectly in conjunction with a vowel. Consonants are divided into *mutes* and *spirants*. Mutes are sounds in the production of which the breath is stopped or checked, as *b* and *p*. Spirants are produced with a partial stoppage of the breath, as in *v* and *f*. A consonant sound differs from a vowel in that it is produced by an obstruction to the breath, while the vowel sound is produced by a continuous passage of the breath.

**CONSPIRACY** (kǒn-spĭr'ă-sĭ), in criminal law, a combination of two or more persons, by one concerted action, to accomplish some criminal or unlawful purpose, or to accomplish some purpose, not in itself criminal or unlawful,

by criminal or unlawful means. Conspiracies of various kinds are defined and their punishments are fixed by the laws of all nations. The grade of punishment differs according to the nature of the intent on the part of the persons who form the conspiracy.

**CONSTANCE** (kōn'stans), **Lake**, a fine sheet of water located between Germany and Switzerland, about 1,295 feet above the sea. The Rhine flows through it from east to west, a distance of forty-three miles. It is about eight miles wide and 960 feet deep, and covers an area of 208 square miles. It is surrounded by beautiful vineyards, orchards, wooded hills, and picturesque castles. There are fine fisheries of salmon, trout, and shellfish. Railroad lines connect its towns in all directions, while steamboats ply upon its surface. It is remarkable for beauty and much sought as a pleasure and health resort.

**CONSTANTINOPLE** (kōn-stān-tī-nō'p'l), called Stamboul by the Turks, the most celebrated city of Turkey in Europe and the capital of the Turkish Empire. It occupies an advantageous site on the Bosphorus, having the Golden Horn, an inlet to the Sea of Marmora, on the north, which affords ample anchorage and facilities for innumerable ships.

Constantinople occupies such an important position in warfare, commerce, and trade that its possession is regarded an international advantage. Its occupation is sufficiently potent to disturb the balance of power in Europe. The site is hilly and undulating. It is beautified by numerous mosques, palaces, cypress groves, monuments, gardens, and towers. The beauty of the Thracian Bosphorus is almost unrivaled. Among its most noted edifices is the Mosque of Saint Sophia, a fine example of Byzantine architecture, which was converted from a Christian church into a mosque by the Turks. The Mosque of Soliman and the Mosque of the Sultana Valide, built by the mother of Mohammed IV., are imposing structures. The palace or Seraglio of the Sultan occupies the extreme portion of the promontory on which the city is located. It and its surroundings consist of pavilions, beautiful gardens, and parks which occupy a large tract. The principal entrance to the palace is a lofty gate called the Bab Humayum, or *sublime porte*, from which the generally known diplomatic phrase originated. Fully 300 mosques are maintained in the city. Many other Turkish and Eastern edifices are distributed throughout various portions of the city, and it has an Oriental instead of an Occidental appearance.

The commerce of the city is very extensive

both by navigation and inland communication. Railroad connections have been made with many of the principal European cities and with portions of Asia through Asia Minor. The trade is largely in the hands of Greeks, Germans, Austrians, Italians, French, and British. The educational interests are greatly inferior to those found farther toward the northwest in Europe, but some degree of elementary education is given, while several higher institutions of learning are under the control of the Porte. An institution for medical research is conducted by Germans, while several other higher institutions disseminate knowledge in law, philosophy, commerce, and industrial arts. Both Turkish and Greek public libraries are maintained, and several periodicals are published in the Turkish and European languages. Many portions of the city have narrow streets, covered with filth, and there are large areas with miserable houses of wood and clay. Among the newer improvements are electric and gas lights, pavements, rapid transit, and a telephone system. The Crimean War and several great fires did much damage to the older portions of the city, which resulted in improvements and buildings on a more modern European style. The language spoken is Turkish, with Greek and other languages in isolated portions. Mohammedanism is the chief religion, but there are several Protestant, Greek Catholic, and Roman Catholic places of worship. The Greek Catholic has the most numerous following of any of the Christian churches in the city. Among the manufactures are tobacco pipes, perfumes, morocco leather, saddlery, fez caps, embroideries, textiles, earthenware, and machinery. Vast forests extend for miles around the city. The suburbs are beautified with numerous cemeteries, many of which have served as burying places for ages.

The city was founded by a colony from Megara about 658 B. C., and was known for years as Byzantium, its ancient name. On account of its commanding position between Europe and Asia Minor, it was the center of Persian, Greek, Roman, and Turkish ambition for centuries. It was occupied by Constantine the Great in 330 A. D., who made it the capital of the Roman Empire, and changed its name to Constantinople, the city of Constantine. The Crusaders occupied it in 1204 and held possession until 1261. The Turks conquered it under Mohammed II. on May 29, 1453, an event marking the extinction of the Byzantine Empire. Since then it has been constantly under Turkish dominion, largely because of the intense jealousy existing between European powers and the strength of

the Ottoman Empire of former years. Population, 1906, 1,031,845.

**CONSTELLATIONS** (kōn-stēl-lā'shūnz), the groups into which astronomers have arranged the fixed stars for convenience in studying magnitude and location. The grouping is not arbitrary, for the reason that the stars may be arranged in as many different groups as inventive imagination may direct. For general convenience the groups are so planned that the several stars occupy points within the limits of an imaginary figure, supposed to be traced on the vault of the heavens. Ancient astronomers agreed upon forty-eight, of which forty-seven are still accepted, the constellation of Antinous being now included in Aquila. At present there are eighty-nine constellations which are generally recognized. Many of the newer groups as classified are located in regions the ancients never beheld. The best known figures include the Great Bear, the Little Bear, the Ram, the Twins, the Great Dog, etc. Eudoxus in 370 B. C. borrowed from Egyptian astronomers the conception of the celestial sphere, brought it to Greece, and first outlined upon it the ecliptic and equator with the more prominent constellations.

The small letters of the Greek alphabet are used to indicate the more prominent stars of the constellations—( $\alpha$ ) represents its brightest star, ( $\beta$ ) the next, ( $\gamma$ ) the third, etc. The Greek letter is followed by the Latin genitive of the name of the constellation. Thus, ( $\alpha$ ) Orionis is the most conspicuous star in the constellation of Orion, ( $\gamma$ ) Virginis is the third star in the order of brightness in Virgo, etc. Constellations embracing more than twenty-four stars that require especial designation are indicated by the letters of the Latin alphabet and, if these are exhausted, the ordinary Arabic numerals follow. The stars visible to the naked eye are divided into six classes, called *magnitudes*, that of the sixth magnitude being the smallest visible without a telescope on clear, moonless nights. The twenty brightest stars of the firmament are of the first magnitude, and the number increases roughly in geometric proportions.

**CONSTITUTION** (kōn-stī-tū'shūn), the organic law of any organized body or association of persons, or the fundamental law of a nation or state. A constitution is the fundamental law of each State of the Union, while the national Constitution is the organic law that binds and holds them all in the national government of the United States. In the states the constitution serves as an engagement between the different portions of society as to the political rights they should enjoy, and the power

which they may respectively exercise. Supreme power cannot be wielded successfully by any class of men without abuse. The history of a multitude of emperors, including such as Nero, Caligula, and Tiberius, shows that uncontrolled power may be made a destructive and harmful element. The real power was in the hands of the masses of society during the French Reign of Terror, and gives evidence to what depth unchecked democracy may descend. The tyranny of popedom in the Middle Ages demonstrates that unlimited power cannot be safely intrusted even in sacred hands.

In State organization no class should be allowed full gratification of its desires, its claims should be conceded only with reference to the rights and counterclaims of others. In a government organized on this basis all classes from the lowest to the highest gain real advantage, and liberty is more secure than if the common people, nobility, or crowned sovereigns had full sway. State and national legislation of the United States is vested in the legislative power of the State and national legislatures; the governors and President have executive power, and all these officers are elected for a specified term, and are replaced in office at regular intervals, or may be removed by conviction after impeachment. The judiciary is restrained by prescription and statutes, and interprets and gives meaning to the law. The *habeas corpus* act guards the rights of the people, and they are further protected by the provisions of both the State and national constitutions. The right of trial by jury serves as a bar to malicious prosecution. When necessary, the constitution of the State or nation may be changed by the consent and ratification of the people at regularly appointed elections. The Constitution of the United States at present consists of seven original articles and fifteen articles of amendment, the last one enfranchising the Negro freedmen. It was framed by representatives of the people, who met in convention at Philadelphia, and adopted it on Sept. 17, 1787. It became the fundamental law of the nation on the first Wednesday of March, 1789.

The constitution of the Dominion of Canada went into effect on July 1, 1867, at which time the country consisted of the four provinces of New Brunswick, Nova Scotia, Ontario, and Quebec. However, provisions had been made for the admission at any time as provinces other colonies or territories. Accordingly, Manitoba was admitted in 1870; British Columbia, in 1871; Prince Edward Island, in 1873; and Alberta and Saskatchewan, in 1905. The constitution is similar to that of Great Britain. The execu-

tive authority is vested in the British crown and carried on in its name by a governor-general and a privy council. Legislative power is vested in a Parliament of two houses, the Senate and the House of Commons. Each province has a separate legislature and a lieutenant-governor. The right of suffrage varies somewhat in the different provinces and territories.

**CONSTITUTION**, a celebrated vessel of the United States navy, sometimes called *Old Ironsides* from the hard lumber used in her construction. This vessel was launched Oct. 20, 1797, but was not fully equipped until the following year, when she was put under Capt. Nicholson for service against the French, and in 1799 was the flagship of Commodore Preble in the War with Tripoli. In 1812 she was put under Capt. Hull, who started from Annapolis and ran into a British fleet of five frigates. For three days she avoided an attack by masterly seamanship and escaped after a spirited chase without damage. On Aug. 19, 1812, she encountered the English frigate *Guerriere* under Capt. Dacres off Cape Race, and after a spirited battle of thirty minutes succeeded in wrecking her antagonist. On Dec. 29 of the same year she encountered the *Java*, a British vessel under Capt. Lambert, in the West Indies. Capt. Bainbridge, who had command, fought two hours and forced the *Java* to surrender. In this battle the Americans lost 34 men, while the British lost 100 killed and 200 wounded. On Dec. 30, 1813, the *Constitution*, under Capt. Stewart, sailed toward the West Indies and the following February captured the *Picton* with sixteen guns. In February, 1815, she captured the *Cyane* with thirty-six guns and the *Levant* with sixteen guns, but the latter was afterward retaken by a British squadron and the *Constitution* barely escaped capture. In 1828 the *Constitution* was reported unseaworthy and the navy department concluded to break her up and sell her old timbers, but the execution of the order was arrested by the opposition of public sentiment created largely by the poem of Oliver Wendell Holmes entitled "Old Ironsides." She was partly rebuilt in 1877 and crossed the Atlantic for the last time the following year, and in 1897 was stored at the navy yard in Boston.

**CONSTITUTIONAL UNION PARTY**, a political organization of the United States. It was organized by the remnants of the Whig party in the South at a convention held in Baltimore on May 9, 1860, at which delegates from twenty states were in attendance. John Bell of Tennessee was nominated for President and Edward Everett of Massachusetts for Vice Pres-

ident. The platform was of a general character, recognizing "no political principle but the Constitution of the country, the union of the states, and the enforcement of laws." In the election it carried Virginia, Kentucky, and Tennessee, but received no support in the northern states. The popular vote cast for its candidates was about 600,000.

**CONSTITUTION OF THE UNITED STATES**. See **United States, Constitution of**.

**CONSUL** (kōn'sūl), the name originally given to the two supreme magistrates in the Roman Republic. They were placed at the head of the senate by joint efforts of the patricians and plebeians in 509 B. C., after King Tarquinius Superbus had been expelled. They were vested with equal authority and elected annually. As a condition of eligibility the age of forty-five years was required. It was further necessary that a candidate previously passed through the lower offices of quaesstor, aedile, and praetor, and that he be in Rome at the time of the election. At first patricians were alone qualified to hold the dignity, but a plebeian was elected in 366 B. C., and in 172 two plebeians were placed in the office. Their power included declaring war, concluding peace, and making alliances, and extended almost to the limits of power granted to preceding kings.

Consul is a term applied to one of three supreme magistrates in France, designated *First*, *Second*, and *Third* consuls, who held office between 1799 and 1804. Napoleon Bonaparte was the First Consul and soon assumed absolute power, being proclaimed emperor on April 10, 1804. At present the term is applied to an officer of his own country who resides in a specified foreign country, with a view of promoting the commercial interests of the nation he represents. On arriving at the foreign country he shows his credentials to the government, and obtains an *exequatur* sanctioning his appointment, and conveying to him all the rights and privileges of the office. He reports annually or at specified times to his own government the state of commerce in the foreign country so far as it affects the interest of his own country. The office of consul is now recognized by all leading nations. It was first instituted in Italy in the middle of the 12th century, and was made an official position in all European countries by the 16th century. There are generally three ranks: *consul general*, *consul*, and *vice consul*.

**CONSUMPTION** (kōn-sūmp'shūn), a wasting disease which affects the vital organs, but which is most common to the lungs. The

greatest number of cases occur between the ages of twenty and fifty, and it is more prevalent in women than in men. The remote origin is often hereditary tendency or constitutional predisposition. The complexion of those inheriting the disease is sallow or white, the veins are conspicuous, the circulation is languid, and the strength is small. Tubercles usually first become seated in the apex of one of the lungs, which cause a dry cough and later a difficulty in breathing. A frothylike saliva and blood are often expectorated. The average duration of the disease is twenty-three months, but death frequently results in nine months, and sometimes in three. There are several types, including the *chronic*, *latent*, and *acute*. Different climates are marked by a fewer or greater number of cases, though it exists in all countries. Florida, Colorado, Alberta, and the Pacific coast are the most favorable regions for persons afflicted with the disease. Dr. Koch, the great German authority, in 1880 announced the doctrine that tubercles are masses of bacilli which destroy the parts affected. He attained success by inoculating the patients with lymph containing specific morbid matter. Other remedies are the inhalation of dry hot air and balsams, and a change of climate. The best preventive is proper sanitation. In crowded workshops the disease is often spread by expectorations. The sputa on the floor dries and rises in the form of dust. This breathed into the lungs causes the bacilli to settle into the tubes and infect the individual. To prevent this, the spittoons should contain water and be emptied daily into sewers flushed by water.

**CONSUMPTION**, in economics, the use or expenditure of wealth. In general all commodities are destroyed in entering into new forms of wealth. It is in this way that wealth is increased by means of adding to the value of things existing, and by destroying forms of wealth that they may be reproduced as commodities of greater value. Consumption is characterized as *voluntary* or *involuntary*. The former implies destruction in one form for the purpose of producing another, or for the purpose of immediate gratification; while the latter implies the natural wear and tear, such as rusting of iron or wearing fabrics or metals away by friction. Consumption, from the standpoint of utility, is defined as *productive* and *unproductive*. Productive consumption is the kind that produces commodities of higher value or commodities of greater utility, while unproductive consumption is the form which is attended by loss and disappointment. The subject of consumption in economics is one of per-

sonal and political interest to every citizen. Upon the care exercised in commerce or in managing the products of labor and industry depends largely the fundamental success of the individual and the state.

**CONTEMPT** (kŭn-tĕm't'), in law, a disregard of the authority of a court or legislative assembly. It may be either *direct*, as by refusal to obey an order of the court, or *constructive*, as when officers of a court are guilty of any corrupt conduct, abuse of process, or culpable neglect of duty. The offending party is liable to punishment for contempt by summary order, without the ordinary form of criminal proceedings, as indictment and trial by jury. The punishment for contempts may be a fine or imprisonment, or both, but, if the contempt consists in the omission to perform an act which is yet in the power of the person to perform, he may be imprisoned until he performs it. All judgments and orders of courts are enforced in this way, except such as are for the payment of money or the delivery of property.

**CONTINENTAL SYSTEM** (kŏn-tĭ-nĕn'tal), the blockade of Great Britain ordered by Napoleon on Nov. 21, 1806, by the decree of Berlin. The object was to exclude England from all intercourse with the continent, hence the ports of France and its allied states were ordered closed against all vessels coming from England or her colonies, and it was directed that all commerce and correspondence from English ports wherever found be seized. The English government retaliated by prohibiting trade with France and declaring all harbors of that country and her allies in a state of blockade. Napoleon immediately issued new decrees from Milan, Trianon, and Fontainebleau, in which Denmark, Russia, and Austria were forced to join France against England and all ports of Europe were closed against English vessels, except those of Spain, Sicily, Sardinia, and Sweden. These decrees caused English goods to be smuggled to a vast extent, but British commerce lost heavily until 1812, when Napoleon declared war against Russia chiefly because her ports had been opened to English commerce, and his fall in 1814 was followed by a reopening of all the ports. The Orders in Council issued by England against Napoleon were similar to those enforced against the United States in 1812, and which were largely responsible for the War of 1812.

**CONTRABAND** (kŏn'trā-bānd), a term applied in commerce to all goods and commodities exported from or imported into any country contrary to law. Commodities imported in opposition or defiance of either of the two na-

tions engaged in war are regarded contrabands of war, and their transportation by neutrals may be prohibited by one of the belligerents. Gen. Butler regarded Negro slaves contrabands of war for the reason that the Negro was an element of strength to the Confederates and aided them in producing munitions of war or rendering assistance in active service.

**CONTRACT** (kōn'trăkt), in law, a bargain or agreement between two or more persons, who bind themselves to do or not to do a particular thing. A contract may be *verbal* or *written*, but in some cases, such as the sale of land or the transfer of title in personal property without a change of possession, the agreement must be in writing and acknowledged before a notary public or some similar officer. Usually contracts are made in express terms, but they may be implied from circumstances or the acts of the parties who are mutually interested.

Contracts made in relation to matters forbidden by law, such as gambling and fighting, are illegal. This is true likewise of contracts whose terms are contrary to public policy, such as restrain trade or limit the rights of a citizen. Contracts that imply or relate to bribery, immorality, and the obstruction of justice are illegal because they pervert the acts of government. A *voidable* contract is one made under duress or misrepresentation, and, though not necessarily illegal, may be set aside. An agreement not enforceable by law is said to be *void*. A contract which ceases to be enforceable by law becomes void when it ceases to be enforceable.

The contract is the foundation of all the business transactions. The common law and the constitution of most governments forbid the passage of laws which act to impair the obligation created by a valid contract, and such laws would be universally condemned as a violation of the fundamental principles of civilized society. Almost an indefinite variety of contracts arise in the affairs of business. However, all depend for their validity upon the capacity of the parties to the contract and upon the fact whether or not the agreement is based upon a sufficient consideration. Those who do not possess the capacity to contract include idiots and lunatics, persons of weak mind, intoxicated persons, minors, and habitual drunkards who are under guardianship. Formerly a married woman could not bind herself in a contract, but in most states she is given an equal standing with the husband. Corporations have capacity to contract only in relation to the objects for which they were formed. Whether or not a proper consideration is the basis of a contract is a

subject for question by a court. Considerations are of three kinds, that is, good, moral, and valuable. An agreement to give or do something in the future, if no payment is made, may be regarded a good consideration, but it does not bind the party who promises and therefore cannot be enforced. However, a transfer based upon the love and affection of a near relative is a valid agreement. A valuable consideration implies that money has been paid for a commodity that is a benefit to the payee.

**CONTRACTION** (kōn-trăk'shŭn). See **Abbreviation**.

**CONVICT LABOR** (kōn'vikt), the system of employing prisoners at penal and reformatory institutions. The primary object in giving employment to prisoners is charitable rather than profitable financially, since those confined to prisons usually prefer to work and are personally benefited by the exercise. Many writers regard idleness in prison life a much more severe punishment than the simple fact of being deprived of personal liberty. Three general schemes to employ prisoners are in vogue, those known as the contract, lease, and public account systems. In the *contract system* it is customary for the state to furnish the tools and materials with the prisoners, who are supervised by a contractor. Usually the contractor divides the proceeds from the sale of commodities manufactured with the state, or the contractor furnishes all of the tools and material to be used under the supervision of the state, receiving an equitable share of the product. In the system of *leasing* prisoners the state turns them over to a contractor, who furnishes ample security for their care and employment, and all of the products are the property of the contractor, who is required to pay a reasonable amount for the privilege of the lease. The *account system* implies that all of the work is to be done by the prisoners under the direct supervision of the state.

The employment of convict labor varies greatly in different sections. In many places the convicts are employed on public enterprises, such as road making and the construction of drains and canals. However, it is more common to have them do work within the prison, such as bookkeeping for the institution, laundry work, baking, and other lines necessarily connected with the prison itself. Additional lines of work include the manufacture of buttons, pottery, brooms, clothing, boots and shoes, and garden and field utensils. Some states work their convicts in stone quarries and coal mines. Labor unions have usually declared against the employment of convict labor in lines where it

comes in direct competition with free labor, since the tendency is to lower the wage scale. This circumstance and the fact that financial success should not be placed above prison discipline are the most potent arguments against the employment of convicts in lines that compete with free laborers in the market.

**COOKERY** (kōōk'ēr-ÿ), the art of preparing food by dressing, compounding, and the application of heat. It originated from the necessities of mankind, since the stomach is too small to contain sufficient vegetable matter to replace the daily waste of the system, hence it is required that foods be prepared and concentrated. Food is rendered more palatable and more easily digestible by cooking, since it loosens the fibers and solidifies the fibrin and connective tissues of meats. It develops the flavor and lessens cohesion, thus improving both the vegetable and animal foods. The art of cooking is as old as the human race, but cooking schools are comparatively of a recent date. Schools of this kind were first established in Europe, where they were introduced as an addition to boarding schools. In America, both in Canada and the United States, many private cooking schools are maintained, and in some of the cities cookery is made a branch of study in the public schools. These institutions study the theory of nutrition and the comparative values of foods, as well as to teach the practical application of methods in cookery. They aid to instill habits of economy in preparing the food for table use, and at the same time promote interest in the scientific preparation of healthful foods.

Foods are usually divided into meats and vegetables, and with the former are included fish and eggs. To prepare meats for table use, they are either baked, boiled, braised, broiled, fried, or roasted. The albumen on the outside of meats coagulates as soon as it comes in contact with heat, hence the best soups are made by placing the meat in slightly warmed water and letting it boil slowly, so the nutritious elements will pass largely into the soup, while meat intended for table use without soup should be placed in very hot water or in an oven highly heated so the nutritious parts will remain largely within it. Vegetables are prepared for the table chiefly by baking, boiling, steaming, or frying, though many varieties are eaten in a raw state. Cookery includes the baking of bread and other foods prepared from ground cereals. All foods should be slightly seasoned at the time of preparation, and additional seasoning may be added at the time of service by each of the guests to suit the taste. When foods are not

properly cooked, either too much or too little, they are less pleasurable and possess a smaller degree of nutritive qualities. See **Bread**.

**COOK INLET**, a bay of Alaska, extending inland about 200 miles from Shelikof Strait. Near its entrance is the northern extremity of the Alaska Peninsula, which is separated by it from the Kenai Peninsula. In the vicinity are lofty mountains and highlands, some of which are characterized by glaciers. Navigation is more or less dangerous on account of severe storms and high tides that sweep up the bay from the Pacific Ocean. Cook Inlet is so named from Capt. Cook, who explored it in 1778, thinking it a passage to the Arctic Ocean. It receives the inflow from the Sushitna and several other rivers.

**COOK ISLANDS**, an archipelago in the Pacific, located northeast of New Zealand and southwest of the Society Islands. They consist of six larger and a number of smaller islands and reefs, and the total area is 142 square miles. The largest island, Raratonga, has an area of thirty-one square miles. Coffee, copra, and fruits are the chief products. These islands were annexed for administrative purposes to New Zealand in 1900. They were named after Capt. Cook, who discovered the group in 1773. Population, 1906, 8,450.

**COOK STRAIT**, a channel of New Zealand, which is separated by it into the two parts known as North Island and South Island. It was discovered by Capt. Cook in 1770 and named in his honor. Wellington, situated on its northern shore, has a fine harbor and is the chief commercial center on its banks.

**COOPERAGE** (kōōp'ēr-āj), the ancient art of making vessels of pieces of wood held together by hoops. The products are very numerous, including tubs, pails, casks, barrels, and firkins. The staves are upright pieces forming the sides of a barrel or cask, at each end of which is a head, and the whole is held together by metal or wooden hoops or bands. Barrels whose staves are widest in the middle are said to bulge in the center and taper toward the ends. Those having straight staves form a cylinder, or they are larger at one of the ends than at the other. Cooperage is known as wet or dry, the former producing vessels for holding liquids, while the latter is concerned in the manufacture of an inferior product to hold dry goods, such as crockery and chinaware. The best barrels are made of white oak, which must be thoroughly seasoned before the work is done, and the parts are held together by strong steel bands or hoops, which are put on hot so the contraction on cooling binds the work together more firmly. For-

merly much of the work in cooperage was done by hand, but now the sawing and cutting is wholly by machinery.

**COÖPERATION** (kō-öp-ēr-ā'shūn), in economics, the association of a number of persons or societies for mutual profit in banking, manufacturing, or any of the industrial arts. It is a form of partnership in which the profits are wholly divided among those interested, in proportion to the contribution of each to the products. The enterprises of this character are usually divided into the three classes of *coöperative distribution*, *coöperative production*, and *coöperative societies for banking and loaning*. However, in a wider sense all production is coöperative, since it is mutually dependent upon nature, labor, and capital.

Robert Owen, the English social reformer, was one of the early advocates of this system in America, though it had long been in vogue in several European countries. The National Assembly of France voted \$600,000 at the time of the Revolution of 1848 to encourage coöperation among the workmen. About 300 coöperative societies were organized under this appropriation as well as others receiving no government aid, with more or less success. A large number sprang into existence about the same time in Germany, Belgium, Italy, and England, most of which were organized for coöperation in distribution, but some with the view of furthering production. Coöperation in distribution is designed chiefly to save the retail profits by dispensing with middlemen. This line is well represented in Canada and the United States by coöperative retail stores and jobbing houses.

Among the difficulties to contend with in coöperative enterprises are the reverses to which all business is liable that requires reserve capital in order to tide it safely over obstacles, as panics or eras of excessive production. If the capital employed is only sufficient to conduct the business when the times are prosperous, a failure may result in panics, or at times when there is a stringency of money in the financial centers. In ordinary business the employer must be a competent man to manage successfully. He should have skill sufficient to put capital and labor together so as to render them profitably productive, and must be an organizer and overseer. It is required that he call into use good financial ability, ready discernment, judgment in buying and selling, and an accurate knowledge of the wants of the public. An employer may be without capital of his own, but he must have the necessary elements to successfully supervise and direct the energy and application of the employees. It is often impossible to secure these

essentials in coöperative associations, from which cause many attempts to establish and conduct them on a stable and permanent basis have failed. Where all the members are qualified to do a certain portion of the work and a competent manager and supervisor is available, the system, once permanently established, may prove highly beneficial and render the most wholesome returns to all those interested in the enterprise.

**COOPER'S CREEK**, a river of Australia, formed in Queensland by the confluence of the Thomson and Victoria rivers. It flows in a general southwesterly direction through an arid region and discharges into Lake Eyre, which has no outlet to the sea. The river is low during the dry season and in places the water sinks out of sight, but in the rainy times it rises fully twenty feet and is about two miles wide.

**COOPER UNION**, an institution of New York City, established in 1859 by Peter Cooper for the advancement of science and art. Instruction is free for the working classes, who have access to courses in art, science, and social and political economy through the medium of individual teaching and lectures. This institution is housed in a large building on the Bowery, at a point where that street divides into Third and Fourth avenues, and was established at a cost of \$630,000. It remained practically without endowment until 1900, when Andrew Carnegie made a gift of \$600,000. The annual income at present approximates \$100,000, while the endowments are \$2,125,000, and the total value of all property is \$3,250,000. Instruction is given both to day and evening classes, so as to meet the convenience of working people, and the average enrollment is about 3,000 students. The success of this laudable institution must in a large measure be ascribed to its founder and those who constituted its original board of trustees. These included Peter Cooper, Wilson G. Hunt, Daniel F. Tiemann, Abram S. Hewitt, Edward Cooper, and John E. Parsons.

**COOSA RIVER** (kōō'sā), a river of the United States, formed in northwestern Georgia by the confluence of the Etowah and Oostanaula rivers. It has a general course toward the southwest into Alabama, where it flows through the southern extremity of the Appalachian Range, and near Montgomery is joined by the Tallapoosa River to form the Alabama River. It is about 340 miles long and the lower part of its course is navigable.

**COOS BAY** (kō-ōs'), an inlet of the Pacific Ocean, on the western shore of Oregon. It is about 15 miles long and one mile wide, and receives the inflow from the Coos River. Near

its entrance is Cape Arago, and on its banks are the cities of Marshfield and Empire City.

**COOT** (kōōt), a bird of the rail family, native to America and Eurasia, frequenting the coasts and inland waters. A number of the species are widely distributed, migrating to the colder zones in the spring. The common name by which most of the species are known is mud hen. The American coot has a black head and neck and a white bill and frontal plate, and is about fifteen inches long. The general color is brown or dark slate. Its wings measure fully 25 inches from tip to tip, and its weight is from one to two pounds. It is widely distributed in

· AMERICAN COOT.

North America from the West Indies to the Saskatchewan. The favorite resorts are the reed-lined borders of ponds, lakes, and rivers. Its skill to run, swim, and fly is well developed. The food consists chiefly of seeds, worms, insects, fish, grasses, and other substances found in shallow water. Its nest is made in the reeds, in which from seven to ten ash-gray eggs, with small black spots, are laid. The young are skilled in swimming shortly after being hatched. While its flesh is eaten, it is not preferred as an article of food.

**COPAIBA** (kō-pā'bà), or **Copaiva**, a valuable product obtained by making incisions in the stems of certain trees native to the tropical parts of America. It consists of a resin, known as the *resin of copaiba*, and a volatile oil called the *oil of copaiba*. The product has an acrid taste and a peculiar odor, and is valuable in medicine for treating chronic catarrh and other diseases. Castor oil is frequently used to adulterate the balsam of copaiba.

**COPENHAGEN** (kō-pen-hā'gēn), the capital of Denmark, situated on the islands of Zealand and Amager, which are separated by the

Kalvebod Strand, an inlet from the Sound. The portion situated on the island of Amager is called Christianshavn. An excellent harbor is located in the Kalvebod Strand, which is deep and well protected. The principal part of the city is well fortified with old and new fortifications, the strongest portion being the citadel of Frederickshavn.

The principal streets radiate from the Kongens Nystrov, an irregular square, in which is a fine equestrian statue of Christian V. Among the chief buildings are the Church of Our Lady, the Church of Our Redeemer, the Holmen's Church, the Palace of Charlottenborg, the Royal Academy of Art, and the Exchange Building. Many of the larger structures are decorated with works of art by Thorwaldsen, notably the Church of Our Lady, which contains a kneeling angel holding a shell for a font. The national capital, royal castle, and many other edifices are substantial in construction and beautiful in style. The royal library contains 750,000 volumes, while the National University, founded in 1497, has a library of 350,000 volumes and is attended by 2,000 students. Several botanical gardens, boulevards, and public parks beautify the city.

Copenhagen is the focus of many railroad lines that connect it in all directions. Electric street railways furnish convenient urban and suburban passage. It has gas and electric lights, stone and asphalt pavements, and an elaborate system of sanitary sewerage. In many parts of the city are fine equestrian monuments and fountains. The public schools and educational systems are efficiently organized and ably supervised and rank among the finest in the world. The manufactures include fabrics, machinery, clothing, toys, scientific apparatus, steamboats, musical instruments, leather, and earthenware. It is noted as a publishing center of books and periodicals. The commerce, both by railroad and ocean navigation, is extensive, and has long taken high rank among the most important of Europe.

The history of Copenhagen may be said to begin with the 12th century, when it was a small fishing village. It was fortified in 1167 and soon became of commercial importance, owing to its good harbor. In 1443 it became the capital of Denmark. At present it is the center of Danish art, literature, and education. Population, 1906, 426,540.

**COPIAPÓ** (kō-pē-à-pō'), a city of Chile, capital of the province of Atacama, 50 miles southeast of Caldera, its port on the Pacific Ocean. It is the focus of several railroads and is surrounded by a farming and mining country. Among the public utilities are a library, electric lighting, and a provincial high school.

It has large smelting works and machine shops. In one of the public places is a statue of Juan Godoy, who discovered the silver mines in its vicinity. The city was founded in 1707. Population, 1908, 10,510.

**COPPER** (kōp'pēr), a reddish ductile metal. It is the most ductile of the metals next to gold, silver, and platinum; the most elastic, except steel; and the most sonorous, except aluminum. Next to silver it is the most powerful conductor of heat and electricity. Several alloys are formed from copper. Brass is an alloy of one-third zinc and two-thirds copper. Bell-metal, gun-metal, and bronze are alloys of copper and tin. It forms a number of compounds and salts, all of which are poisonous. Copper was known in prehistoric times, the copper age preceding the bronze age. It was used in ancient Assyria and is mentioned in the Old Testament in Ezra viii., 27. The Greeks and Romans brought it in large quantities from Cyprus, where it was mined near Famagusta.

The United States ranks as the largest copper producing country of the world. The annual output was reported in 1907 at 898,750,640 pounds, which is about the average amount produced per year. This is about half of the entire annual output of the world. The three most important copper producing states are Montana, Michigan, and Arizona, in the order named. The principal sources of copper, aside from the United States, are Spain, Germany, Chile, South Africa, Mexico, and British Columbia, but it is found more or less widely distributed in all countries. It occurs native and with the minerals *cuprite*, *azurite*, *malachite*, *bornite*, *tenorite*, *chalcocite*, *chalcopyrite*, etc. In the upper peninsula of Michigan, on Lake Superior, it occurs largely as native copper. In Montana the ores yield about seven per cent. of copper and paying quantities of silver and gold, while the richest in quality found in Arizona yield about ten per cent. of copper. The use of copper is widening continually. Besides its use in electrotyping, engraving, and for household utensils, it is employed largely in shipbuilding, telephones, electrical appliances, cables, trolley wires, and cartridges. The world's supply of copper in recent years greatly exceeds that of former times, but the building of electric railways and electrical apparatus has developed a constantly increasing demand.

**COPPERAS** (kōp'pēr-ās), the hydrated protosulphate of iron, sometimes called *green vitriol*. It is found in a natural state, resulting from the decomposition of pyritous iron, and is prepared upon a large scale for various uses in art. The manufactured product is generally

contaminated with various mixtures, such as the salts of zinc, magnesia, alumina, and copper, and the oxide of iron. Copperas is used in medicine as a tonic, for producing black dyes, for making ink and Prussian blue, and for many purposes in dye works.

**COPPERHEAD** (kōp'pēr-hēd), a venomous serpent of North America, classed with the rattlesnake family. It is without rattles, but has loreal plates on the head. The full-grown copperhead is about three feet long, is a sluggish animal, and has a light copper color with darker transverse bars. It is more abundant in the southern than in the northern states, and locally is known under the names of moccasin, red adder, and cottonmouth. The bite is often fatal.

**COPPERHEAD**, a nickname given to a political faction during the Civil War, which was generally considered to be in secret sympathy with the South. The name was applied from the copperhead, a poisonous serpent that gives no warning of his intended attack, therefore typical of a concealed foe.

**COPPERMINE RIVER**, a river of North America, in Canada. Its source is in Point Lake and it has a general course toward the north, discharging into Coronation Gulf, an inlet from the Arctic Ocean. It is about 300 miles long, but is not valuable for navigation, having a large number of falls and torrents in its course.

**COPRA**, the dried kernal of the cocoanut, from which cocoanut oil is expressed. About 25 pounds of oil are obtained from 500 pounds of copra. See **Cocoanut**.

**COPTS** (kōpts), the descendants of the ancient Egyptians. They make up the remnant of the once numerous church of Egypt that maintained the celebrated school of Alexandria. Writers generally agree that they were converted to Christianity by Saint Mark, though they hold that one nature, not two, existed in Christ. The Greeks tyrannized over them, which caused them to submit to the Mohammedans, and to aid them in conquering Alexandria in the year 640 A. D. There are still about 250,000 Copts in Egypt, most of whom reside in its upper provinces. Their dress is similar to the apparel of the Mohammedans, and they are of middle height and dark complexion, and have curly hair. Their language bears the same relation to that of the ancient Egyptians that the Italian does to the Latin. The nucleus of the language came from the ancients, but the spoken tongue is very different from the early spoken tongue on account of the foreign words which were inserted by long contact with the Greeks, Arabs, and Moors. In the 10th century Arabic was used largely in-

stead of the Egyptian, since which time the language has been more or less transitory. The Copts speak a dialect of their own, but learn the Arabic and use it largely. They maintain several convents and a number of secondary monasteries, and support a patriarch, bishops, presbyters, archdeacons, and other minor church dignitaries.

• **COPYING MACHINE**, a device for duplicating letters and manuscripts. Machines of this class may be divided into two kinds, those used in copying writing done by hand or by a typewriter and those in which the copy and the original are made at the same time. In the former it is customary to use a book containing leaves of thin paper, so the letters or manuscripts can be indexed in alphabetical order, and pressure for copying is furnished by a letterpress. The ink used is made specially for the purpose, or common ink may be thickened by adding sugar or some other substance to prevent it from drying rapidly, and when letters written on a machine are to be copied it is necessary to use a copying ribbon. The general method of copying is to place the written manuscript in the copying book, with a piece of oiled paper beneath, then turn a leaf of the book over the writing to be copied, which is covered with a damp sheet of blotting or unsized paper, and over this is placed another piece of oiled paper to protect the book from absorbing moisture, after which it is placed in the letterpress, and the writing is transferred to the page of the book which lies between the writing and the damp sheet. Pressure is obtained by a screw or lever. Several letters can be copied on the same page or even on a number of pages at the same time. The copying books used most extensively contain 1,000 leaves, and when filled they are marked on the back and placed in the library of records.

More recently it has become customary to write and copy at the same time, which may be done either by hand or with the typewriter when carbon paper is placed between the sheet containing the original and that on which the copy is to be preserved. This method has an advantage where a large amount of business correspondence is necessary with one person or company, especially where it runs through a period of several years. In that case the copies are attached to the letters to which reply is made, hence it is possible to file in a systematic order both the letter received and the reply sent in answer to the same. By using a typewriter it is possible to obtain from one to five carbon copies from one writing.

Thomas A. Edison is the inventor of the

*mimeograph*, by which an indefinite number of copies of either hand or machine writing may be obtained. The work is done by placing a sheet of thin paper, coated on one side with a film of paraffin wax, over a plate of steel, known as the *baseboard*, and writing the copy with a fine-pointed steel stylus, using care that the impressions are made entirely over the steel plate, whose surface is corrugated much like a very fine file. When the stencil, or written page, is prepared, it is placed in a frame, which holds it tight and smooth, a sheet of paper is laid on the baseboard, the frame containing the stencil is turned over it, and an ink roller is passed over the surface of the latter, the pressure of which forces the ink through the stencil and produces the writing on the sheet beneath. Stencils prepared by the typewriter are likewise on paraffin paper, the type producing the perforations. A newer form of the mimeograph consists of a device with a revolving cylinder, on which the stencil is attached and the ink on the inner side is forced through and produces the writing on a sheet of paper placed on the baseboard beneath. It is possible to procure several hundred copies from the same stencil by either method.

The *blue print process* is used extensively in copying plans and drawings prepared by architects and engineers. Another device, the *hektograph*, may be used in obtaining from fifty to one hundred copies, but the original writing is done wholly by hand. It consists of a pad or tablet prepared with glycerin and gelatin. The original writing is done with an aniline ink, to which a small per cent. of glycerin is added, and is written on ordinary paper, and this is placed face down upon the hektograph, which receives the copy as soon as the writing comes in close touch with it. To reproduce the writing, a sheet of paper is pressed carefully down upon the hektograph, which transfers a copy to the sheet of paper. The writing is reproduced by slight portions of the ink adhering to the surface, and the number that may be obtained depends upon the care exercised.

**COPYRIGHT** (kōp'ŷ-rīt), the exclusive privilege secured by law to authors and their heirs or assigns to publish and sell their productions for a certain time. In the United States the copyright law requires the author, in order to secure a copyright, to file in the office of the librarian of Congress, or deposit in the mail within the United States, addressed to the librarian of Congress at Washington, D. C., a copy of the title of the book, or description of engraving or article, before publication. He is required to send two copies of the production

to the same office not later than the day of publication and to pay a fee of fifty cents. A certificate of the copyright is issued on the payment of an additional fee of fifty cents. In Canada the fee is the same, but one copy of the production must be filed in the library of the Parliament of Canada, and one copy in the British Museum, London. The copyright, both in the British possessions and the United States, extends for twenty-eight years, and, if at the end of that time the author is still living, he may obtain its extension for fourteen years longer; or, if dead, his living representatives may obtain its extension, making in all forty-two years. However, in Canada the author or proprietor must publish a notice of the extension in the *Canadian Gazette*. The productions that may be copyrighted include books, engravings, paintings, photographs, maps, blank forms, and many others produced by authors, painters, draughtsmen, etc.

In 1878 a movement began in Paris to promote the *international copyright*, whereby authors and artists hoped to secure protection in various countries. A conference met at Bern, Switzerland, in 1885, at which representatives were present from France, Germany, Spain, Great Britain, Sweden, Norway, Switzerland, Belgium, Italy, Portugal, Denmark, and Mexico to consider the copyright interests of those nations. Great Britain confirmed the Bern convention in 1887 and the United States Congress enacted a law in 1891 by whose terms international copyrights are recognized. The provisions include that the entire manufacture of the foreign copyrighted work must be done within the country where it is to be protected.

**COQUIMBO** (kō-kēm'bō), a seaport of Chile, in the province of Coquimbo, 10 miles south of La Serena, with which it is connected by a railway. The surrounding country is agricultural and mining. It has a good harbor and a large export trade, chiefly in copper, gold, silver, and fruits. The principal buildings include a theater, a number of schools, and extensive warehouses. Population, 1906, 8,530.

**CORAL** (kōr'al), the hard structure or skeleton secreted by the tissues of various marine polyps. These organisms so nearly resemble plants that they were long classed with plant life. They propagate themselves by a kind of budding as well as by the production of eggs and young similar to other animals. They are usually compound, many individuals being united into a colony. The coral assumes various forms, being branched fanlike, brainlike, featherlike, or chainlike. The hard coral formations seen on the market are composed of the lime of the

ocean, which is incorporated among the tissues of the body, and in this form the remains of these animals make up vast calcareous deposits in the warm seas. The calcareous deposition begins when the polyp is still newly formed, and adheres to a rock or some other object, to which it becomes affixed and on which the coral is built up or grows. In general the deposits of the former generations form the base to which the growing young life is attached. The reforming coral polyps grow only in regions where the winter temperature of the water is never lower than 68° Fahr., but there are several spe-

1, Red Coral; 2, Brain Coral; 3, Tree Coral; 4, Madre-pore Coral. A, Skeleton; B, Living Corals.

cies that grow in colder water. The region where reef-bearing corals live extends 1,800 miles on each side of the Equator, except in the vicinity of Bermuda, which lies in the warm waters of the Gulf Stream. The calcareous remains of polyps form coral reefs. They are classed as fringing, barrier, and encircling reefs, according to the particular manner in which they form coral islands.

Coral islands begin as a *fringing reef* or narrow belt of coral rock, lying near the shore of an ordinary island. *Barrier reefs* are wider than fringing reefs and lie at a greater distance from the shore. An *encircling reef* is similar to a fringing reef and usually encircles the island, forming an *atoll*. A *lagoon* is formed by the

island sinking, the coral polyps building upward from the reefs, which eventually leave an open space of water or lagoon in the center. Polyps do not grow at a depth exceeding one hundred feet, nor above the surface of the water. The action of waves breaks the delicate coral structures, and these, together with shells from various shellfish, are ground into fragments and thrown by waves over the general level of the water. In this way reefs and coral islands are formed, but they seldom exceed twelve feet in height.

The islands formed by the coral remains become covered with trees and plants, the seeds being conveyed through the agency of winds and birds from adjacent islands. Reptiles and small quadrupeds are carried to them by trunks of trees floating in the water. Thus, divers forms of life are brought to and extended on the island and reefs. Various products made of different species of polyps are the coral of commerce. Among the valuable classes are the pink, red, and black. The industry of coral fishing is carried on in various regions, particularly in the Mediterranean Sea. Many forms of coral are capable of taking on a polish and are useful in manufacturing ornaments, charms, and divers commodities useful in domestic and social life.

**CORAL SEA**, the name applied to the portion of the Pacific Ocean lying northeast of Australia. It is bounded on the north by New Guinea and the Solomon Islands, east by the New Hebrides, south by New Caledonia and the Pacific, and west by Australia. The extreme depth, according to soundings made in 1874, is 14,700 feet. It is so named from the large number of coral reefs and islands located within its confines.

**CORCORAN ART GALLERY**, a collection of works of art at Washington, D. C., founded by William Wilson Corcoran and opened to the public in 1869. The Corcoran donations, including the lot and building, amounted to \$1,600,000. The building is located on New York avenue, opposite the executive grounds, and has a length of 265 feet. It is constructed of beautiful white marble in the Neo-Greek style, after the plans of Ernest Flagg, of New York. The collections include sculptures, ceramics, paintings, and portraits, and a school of art is maintained to further interest and skill in painting and sculpturing. The famous collections include Hiram Powers's "Greek Slave" and Vincenzo Velas's "Last Days of Napoleon." Visitors are required to pay a small admission toward a charity fund and are admitted only on special days.

**CORDILLERA** (kôr-dî'l'ěr-à), a word of

Spanish origin, applied generally to a ridge or chain of mountains. In America it is the name of the vast mountain system which extends along the Pacific coast of North and South America, from the northern part of Alaska to the island of Tierra del Fuego. The Cordilleras of these continents include the Andes of South America and the mountain ranges of North America known as the Rocky Mountains, the Sierra Nevada, the Sierra Madre, and a number of chains in Canada and Alaska.

**CORDOVA** (kôr'dô-và), or **Córdoba**, a city of Spain, on the Guadalquivir, capital of the province of Cordova. It is situated at the base of the Sierra de Cordova, at an altitude of 325 feet, and has railroad and electric railway facilities. The cathedral, built as a mosque in the 8th century, is in the Moorish style of architecture. In the central piazza is an equestrian statue of Gen. Paz. Other noteworthy features include the university, the government palace, the public library, and the observatory. The vineyards, parks, and boulevards are very beautiful, though some of its streets are quite narrow. It is the seat of extensive manufactures and has a brisk trade in Cordovan leather, silk, cereals, clothing, and silver filigree. The Romans founded Cordova in 132 B. C., later it fell into the hands of the Goths, and subsequently became a possession of the Moors. It was the leading city of the Moorish kings from the 9th to the 12th century, and they built many mosques, palaces, and public places. Population, 1906, 60,148.

**CORDOVA**, or **Córdoba**, an important railroad and commercial city in the interior of Argentina, capital of the province of the same name. It is surrounded by a fertile country, which has productive mineral interests. The city is an important railroad junction between Rosario, on the Paraná, and Tucumán. Its manufactures embrace machinery, cigars, flour, clothing, and furniture. Waterworks, pavements, electric lights, and street railways are among the improvements. It was founded by the Spanish in 1573. The university was built by the Jesuits in 1613 and in 1871 it was the seat of the first national exposition of Argentina. Population, 1906, 56,457.

**CORDUROY** (kôr'dû-roi), a kind of cotton material in which the pile is cut like that in velvet, but the surface is corded or ribbed. The pile weft is bound to the cloth, causing the ribs which are separated by a but or division. Corduroy is used extensively in making wearing apparel for men.

**CORDUROY ROAD**, a highway built in marshy places by laying small logs side by side. It is so named from its rough or ribbed surface.

Corduroy roads are constructed only in sparsely settled regions, chiefly in the swamps and marshes found in many of the forests, and are used principally in hauling timbers and lumber.

**COREA** (kō-rē'ā), or **Korea**, a country in the eastern part of Asia, located between the parallels of 34° 17' and 43° north, and between the meridians of 124° 38' and 130° and 33' east. It is bounded on the north by Manchuria, east by the Japan Sea, south by Corea Strait, and west by the Yellow Sea. The country occupies mainly a peninsula, separated from Japan by Corea Strait and partly from Manchuria by the Yalu River. The length from north to south is about 600 miles; breadth, 135 miles; and area, 82,100 square miles.

**DESCRIPTION.** The surface is generally mountainous, with numerous fertile valleys and a productive sea coast. The highest mountains are in the northern part, where the elevations have a height ranging from 3,500 to 8,000 feet, and an elevated ridge extends the entire length of the peninsula, lying chiefly along the eastern seaboard. Most of the northern part and all of the mountains are well wooded, but the hills and fertile plains of the west and south have few trees.

Corea has few large rivers and the drainage is chiefly toward the south and west. The Yalu, on its northern boundary; the Ta-tung, in the central part, and the Keum, in the southern section, are the principal rivers, all of which discharge into the Yellow Sea. The Tuman, in the eastern part, is the only river of note that flows into the Sea of Japan. All sections of the country have an abundant rainfall, which has an annual average of 36 inches, and most of the precipitation is during the rainy season between May and September. The climate, like that of Japan, is equable and healthful. In summer the average temperature is 75°, while the range is from 5° in winter to 90° in summer.

Though Corea does not possess an extensive flora, it is quite rich in valuable forests. Among the chief species are fir, lime, pine, oak, birch, ash, bamboo, mulberry, and hornbeam. Forestry is promoted as an enterprise and the government has a monopoly in ginseng. Many wild animals are abundant, especially the fox, badger, deer, otter, and squirrel. The birds include the crane, ibis, hawk, egret, heron, oriole, cuckoo, kingfisher, duck, and goose. Water fowls are abundant along the coast.

**MINING.** The mining industry is carried on chiefly under concessions granted to companies organized by capitalists in Great Britain, Germany, Russia, and the United States. Coal de-

posits are worked in the west central parts, and gold is obtained by placer mining as well as from the ore. The value of the output of gold is about \$2,500,000 annually. Copper is found in many sections and most of the output is exported. Other minerals worked more or less extensively are iron, galena, granite, limestone, and sandstone. Most of the coal obtained is bituminous, but profitable veins of lignite and anthracite coal are worked.

**AGRICULTURE.** Farming is the principal occupation, and rice is the most valuable crop. Most of the land is held in small estates and the soil is tilled with a great deal of care, every available portion being worked to good advantage. Barley, oats, and millet are grown chiefly in the northern part, and tobacco, wheat, maize, hemp and cotton comprise the principal crops in the south. All kinds of vegetables and many varieties of fruit are grown extensively. Cattle raising has had a small share of attention, but this enterprise is being introduced, and milk, butter, and cheese, though largely unknown in Corea, are coming into use as articles of food. Oxen of large size are grown for the market and as animals of burden and draft, and the native horse is a small animal, not much larger than a Shetland pony. Goats, hogs, and poultry receive more or less attention.

**MANUFACTURING.** The Coreans possess little skill in manufacturing when compared to the Chinese and Japanese. Formerly they possessed considerable ability in this enterprise, and it is largely due to them that the arts and sciences of China were introduced to the people of Japan. Paper is at present one of the chief manufactures. Next in order are products made from hemp and grass, such as mats and cordage. Split bamboo screen, inlaid woodwork, brassware, coarse cotton and silk clothing, hats, and umbrellas are among the general manufactures. The Coreans make a fine grade of thread and a large variety of silk and cotton textiles. Little attention is given to the manufacture of modern machinery, but a large variety of implements and utensils used in gardening and farming are produced. The fisheries yield many articles of food and for export. Among the chief catches are the salmon, halibut, herring, shark, sardine, and whale, all of which enter more or less prominently into manufacturing enterprises, such as curing and canning. The meat of the whale is esteemed as an article of food among the native Coreans.

**COMMERCE AND TRANSPORTATION.** Corea was long tributary to China, hence its trade with foreign countries remained limited many centuries. Formerly it was almost entirely with

China and Japan, but eight of its seaports were opened to the commerce of the world prior to 1900. The imports somewhat exceed the exports. Among the chief imports are kerosene, tobacco, metals, and machinery; while the exports include copper, rice, hides, ginseng, whale flesh, and paper. Few highways have been improved in a first-class condition and travel is still largely in Sedan chairs and on horseback. The rivers are used largely for transportation. Railroads were unknown until 1901, when a line was constructed between Seoul and Chemulpo, a distance of twenty-five miles. A railway was built soon after from Seoul to Fusan, on the Corea Strait, a distance of 285 miles, and another line extends from Seoul to Wiju, at the mouth of the Yula. The total lines in operation do not exceed 1,000 miles, but there is a large mileage of telephone and telegraph lines, and electric railways penetrate from Seoul into the adjacent country.

**GOVERNMENT.** Corea paid tribute to China until 1895, when it became an absolute monarchy, but the Portsmouth Treaty, in 1905, made it tributary to Japan. The government is administered by a governor general resident at Seoul, the capital, but all diplomatic business is transacted from Tokio, the seat of the Japanese government. The country is divided for local administration into thirteen provinces and 339 *kun* or prefectures. In methods of education it remained distinctly Chinese until 1895, when a new public school system was inaugurated, and schools provide work from the primary department to the university at Seoul. A number of the higher institutions maintain departments for languages, including those under the instruction of Japanese, Chinese, German, Russian, English, and French. A number of mission schools are maintained by many of the Christian denominations.

**INHABITANTS.** Corea is populated largely with a class of people of Mongolian descent, who seem to have sprung from intermarriages of the Ainos, Japanese, and Chinese. Some writers class the Coreans immediately between the Chinese and Japanese, but they are somewhat taller and more robust and have a lighter complexion than either of these races, hence some think that they contain a mixture of Caucasian blood. Polygamy is practised to a limited extent, but is not authorized as an institution, and the women live in seclusion. Colored clothing and hats of horsehair are worn by the nobility, while the common people make use largely of white and uncolored clothing. Buddhism is the chief religion, but in practice it is more or less perverted by Shamanism, and has developed into a form

of ancestor and animal worship. The Protestant and Roman Catholic churches find Corea a prolific field for missionary work. Seoul, the capital, is located near the mouth of the Han River. Fusan, on Corea Strait, is important as a port of entry. Other cities include Chemulpo, Pingyang, and Kai-Ku. Population, 1908, 13,560,108.

**HISTORY.** The early history of Corea is shrouded in doubt and mystery. The nation is thought to have been founded about 1120 B. C., but little is known of it until 108 B. C., when it was made a part of the Chinese Empire. It was divided into principalities about the beginning of the Christian Era, but remained dependent upon China until about 960 A. D., when one of the principalities became independent and soon after annexed the others. It continued to remain an independent kingdom about 300 years, in which Buddhism was introduced and the arts and sciences made strides of advancement. In 1392 the dynasty was overthrown and the priests were banished, and the country was successively invaded by armies of China and Japan, each seeking to secure a preponderance of influence. Japan retained Fusan as a trade center many centuries, but the country was nominally a Chinese dependency until 1895, when it became an independent monarchy.

The first treaty with foreign nations was concluded in 1876, when the ports of Gensan and Fusan were opened to trade, and all the treaties now in force date since that year. The Sino-Japanese War of 1894-95 was caused by a contest of the two nations to control the trade and political tendencies of the country, but the defeat of the Chinese army at Pingyang and the destruction of their fleet in the naval battle off the Yula River decided the fortunes of war in favor of Japan. The treaty that followed made Corea independent, but the Treaty of Portsmouth, concluded after the close of the Russo-Japanese War, in 1905, made Corea tributary to Japan. Japanese occupation is stimulating internal improvement, widening educational influences, and enlarging the commercial and manufacturing enterprises.

**CORENTYN** (*kō-rěn-těn'*), a river of South America, forming nearly all of the boundary between Dutch and British Guiana. It rises near the boundary of Brazil, in the Tumuc Humac Mountains, has a northerly course, and discharges into the Atlantic Ocean. It is about 400 miles long and is navigable for large steamers only 40 miles, but small vessels navigate it about 150 miles. In its middle course are a number of large rapids and waterfalls.

**CORFU** (*kōr-fōō'*), the most northerly of

the Ionian Islands, located at the entrance of the Adriatic Sea. The area is 428 square miles. It has a mountainous surface, which is diversified by a number of fertile valleys, and the most elevated point is Pantokrator, 2,995 feet above the sea. Much of the soil possesses fertility and produces a fine quality of cereals, grapes, and fruits. Mineral salt is abundant. It was settled by a Corinthian colony in the 8th century B. C. and was a loyal supporter of ancient Greece. In 229 B. C. it was made a part of the Roman Empire. Since 1863 it has belonged to Greece. The capital, Corfu, is a fine city. It contains the government buildings, a cathedral, the university, a public library, and free schools. It has a good harbor and a considerable commerce. Population, 1906, of the city, 21,690; of the island, 128,548.

**CORIANDER** (kō-rī-ān'dēr), a plant native to many parts of Europe, belonging to the parsley family. When the fresh plant is bruised, it has an unpleasant odor, but when dried the smell and taste are agreeable. It has a branching stem from one to three feet high, and is cultivated for its fruit, which is the coriander of market. It is used in medicine as a carminative, and in cookery and confectionery as an aromatic. The plant has been naturalized in some parts of Canada and the United States.

**CORINTH** (kōr'inth), county seat of Alcorn County, Mississippi, ninety miles southeast of Memphis, Tenn., on the Memphis and Charleston and the Baltimore and Ohio railroads. In the Civil War it was regarded an important point and was held successively by both armies. The Confederates evacuated it on May 30, 1862, and it was occupied by Gen. Rosecrans with a force of 20,000 men until Oct. 3 of the same year, when it was attacked by the Confederates under Generals Van Dorn and Price, who were repulsed. The Confederates lost 3,648 men and the Union army, 2,359. At present it has a growing trade in farm produce and merchandise. The chief buildings include a library, several churches and schools, and a number of county buildings. It has manufactures of brooms, woodenware, and machinery. Population, 1900, 3,661.

**CORINTH**, a famous city of antiquity, on the Isthmus of Corinth, a neck of land uniting the Peloponnesus with northern Greece. Owing to its beauty and commercial importance, it was called "The Star of Greece." It had three harbors and was important mainly because of its location between the Adriatic and Aegean seas. Among the cities of Greece it was highly renowned, commanded a point of advantage between the trade from Africa and that of

Western Europe, and was fortified by walls of stone, on which stood its citadel. Its ancient splendor and magnificence are evidenced only by a few ruins. It was the seat of the Isthmian games, which attracted much attention during Grecian power. Corinth was founded by Sisyphus, an Aeolian, about 1350 B. C. The government was under an oligarchy and a king at different times; Periander was its greatest king and fostered its growth and prosperity. The rise of Athens caused the Peloponnesian War. Later the Corinthian War in conjunction with Thebes, Athens, and Argos was waged against Sparta, and it became the head of the Achaean League. Alexander the Great was elected leader of the Greeks at Corinth against the Persians.

The Romans destroyed Corinth in 146 B. C., but Julius Caesar rebuilt it and made it a prosperous trading center a hundred years later. It was the residence of Saint Paul for a year and a half, who founded here a Christian church, and later wrote his two letters to the Corinthians. After the fall of Rome it was taken by the Slavs, Franks, Turks, and Venetians, and later again by the Turks. It was freed from the Sultan in 1822, but was destroyed by an earthquake in 1858. The city has been rebuilt and is enjoying considerable trade, owing to the canal cut through the isthmus, which is the seat of a large commerce. It has several railroad connections. The new city is more properly called New Corinth. During its greatest prosperity it had 300,000 inhabitants. Population, 1906, 5,265.

**CORINTH, Gulf of**, an inlet of the Mediterranean Sea, between the Peloponnesus and northern Greece, about eighty miles long. It is beautifully located, has a large number of bays, and the Isthmus of Corinth is toward the east. The gulf has the appearance of an inland lake. It is sometimes called the Gulf of Lepanto.

**CORINTH, Isthmus of**, an isthmus connecting the Peloponnesus with northern Greece. It is from four to eight miles in width. A ship canal 3.91 miles long, twenty-six feet deep, and sixty-nine feet wide at the bottom has been constructed across it. The canal was opened to commerce in 1893. It saves a long detour in the coasting trade and avoids rounding Cape Matapan. The canal is located along the route on which work was prosecuted in the reign of Emperor Nero in the year 67 A. D. This canal is at sea level and without locks.

**CORINTHIANS, Epistles to the**, two canonical books of the New Testament, commonly called the First Corinthians and the Second Corinthians, both written by Saint Paul. The

*First Corinthians* was written at Ephesus in the year 57 to the Church at Corinth, which Paul had founded in 50, and is a rebuke for vanity, self-seeking, party spirit, impropriety at public meetings, and disrespect to the apostle's authority. It emphasizes the doctrine of the resurrection. In the *Second Corinthians* the apostle makes a summary of his true authority, but it is earnest as well as conciliatory in its statements. Both books have been almost universally received as genuine letters of Paul, and in this respect they rank with the epistles to the Romans and the Galatians.

**CORK**, a city of Ireland, on the Lee River, in the County of Cork. A part of the city is on an island, which is joined to the mainland by nine bridges, but the principal site is on the river banks. Though about fifteen miles from the sea, it has a vast commerce and excellent railroad connections with the interior. The exports consist largely of eggs, ham, butter, cereals, bacon, and live stock. Among the manufacturing enterprises are foundries, distilleries, tanneries, breweries, and immense shipyards. The city contains a number of excellent institutions of learning, among them Queen's College, founded in 1849. It has fine Roman Catholic and Protestant cathedrals, a customhouse, and other public buildings. The public park is a finely improved tract of 240 acres and includes a race course. Cork is well fortified and has ample wharfs and facilities for the anchorage of vessels. A part of the trade is carried by way of the fine harbor at Queenstown, about eleven miles below the city. Gas and electric lights, waterworks, pavements, and rapid transit are among the improvements. The Danes built walls around a portion of the city in the 9th century. It was surrendered to Henry II. in 1172. Two members represent Cork in Parliament. Population, 1906, 78,122.

**CORK**, the light, porous outer layer of bark of the cork oak. It is a very elastic tissue, consisting of thin-walled and nearly cubical cells. The *cork tree* or *cork oak* is abundant in Portugal, Spain, Northern Africa, and most countries bordering on the Mediterranean. It attains a height of from twenty to sixty feet and a diameter of three feet, and has oblong, evergreen leaves. The acorns, which ripen from September to January, depending upon the climate, are edible. Specimens are often seen in which the trunk has a circumference of fifteen feet, owing partly to the thick bark and the great age, which sometimes is from 300 to 400 years. When the tree reaches an age of from fifteen to twenty-five years, the bark is taken off. The first cutting is coarse, but the product improves

by successively taking off the bark. A crop is taken off about every eight years, the third being of the finest quality. It is removed with an ax, by which cuts are made both lengthwise and crosswise of the tree, and care is used not to damage the inner bark, else the tree will die. Cork is used extensively for artificial limbs, shoe soles, life belts, net floats, and stopples for bottles and flasks. For the purpose of manufacturing corks, machines are utilized by which many thousands can be cut in a day. The machines and instruments used are of superior material and have a sharp edge so they cut easily. This is necessary, owing to the elasticity of the article.

**CORMORANT** (kôr'mō-rant), the name of a large web-footed sea bird of the pelican family. Vast numbers of these birds frequent

CORMORANT.

islands in most parts of the world. They have a long neck, hooked bill, short wings, and stiff and rounded tail. The European species is larger than a goose, occupies cliffs by the sea, and feeds on fish and small quadrupeds. It builds its nests on rocky shores and in trees. The species of America and Australia are very numerous. Some species have been trained to fish, for which purpose they are still domesticated and used in China. The common plan is to fasten a string around the neck to prevent the bird swallowing the fish that it catches. Later it learns to bring the fish to its master without this precaution being necessary. The cormorants of the Columbia River and the eastern coast of North America are highly prized for their beautiful plumage.

**CORN, Indian, or Maize**, a well-known plant of the grass family, one of the most important cereals grown in the Temperate Zone. It is cultivated extensively as a food and for many purposes in manufacturing. The stem grows from three to twenty feet in height; the average in corn-producing districts is about ten feet. The

stem is filled with a pithy, fibrous structure, is divided by nodes at regular intervals, and its outside covering is of a siliceous formation. It sends out brace roots from the second or third nodes to aid in supporting the stalk when reaching its larger size. The ears are developed within the leaf-sheaf at one or two of the nodes, about four feet from the ground. They consist of a *cob* with from eight to twenty regular rows of grains. The grains of the species which are grown most extensively are yellow or white, but some are red or a mixture of red with white or yellow. Threads of corn-silk

corn-producing states of the Union, though a number of others take high rank. The Mississippi valley is the greatest corn-producing region in the world. It is grown profitably in many parts of Canada, but the largest yield is in Ontario, where the annual crop is about 25,000,000 bushels. Corn is planted by machinery in the months of April or May and is cultivated until about the first of July, and the crop is gathered in October and November. It yields from fifteen to ninety bushels per acre.

Many species of corn are grown and all are more or less useful for various purposes. *Pop corn* is a small species which is used for roasting, and is so named because the kernels break open when they are exposed to a brisk heat. This is due to the fact that they are enclosed by a tough covering, which prevents the steam from escaping, causing the kernels to burst open and turn the inner side outward. *Sweet corn* is used largely for eating before maturity and for canning on a very large scale. *Flint corn* is a hardy, yellow species which is grown in the regions where the seasons are short, since it matures early and is quite hardy. The common corn, known as *dent corn*, is the staple species for general use. It is used for meal, corn bread, cakes, and hominy. Alcohol, whisky, starch, and other staple products are manufactured from it. The cob is used for making pipes and as a fuel. However, the most important use of corn is for feed for hogs, horses, cattle, and other domestic animals, for which purpose the stalks as well as the grain are used. Since the adoption of the newer process of grinding grain by roller mills, corn meal has been used as an adulteration in wheat flour. The government of the United States sent commissions to Europe at different times for the purpose of stimulating the consumption of corn as a food among the laboring classes of the densely populated states. Corn is native to America. It was introduced by Columbus into Europe, though it is believed that the maize plant was known in Africa and Asia prior to that time.

**CORNCRAKE**, a name applied to the land rail of England, chiefly because its cry is *crek-crek*. The color is reddish-brown, or brown-gray, and it haunts the corn and grass land in early summer. The crane is a wader about seven inches long. Several species of American birds, especially the short-billed rails, are frequently called crakes.

**CORNEL** (*kôr'něl*), the name applied to various plants of the genus *Cornus*, which include about twenty species of shrubs and small trees. The *Cornus mas*, familiarly known as

CORN OR MAIZE.

are attached to the germs of the grains, which serve to carry pollen from the *tassel* above to the embryo. Corn is considered of greater value as a nutritious food than rye, buckwheat, or barley.

The annual production of corn in the United States exceeds 2,260,000,000 bushels, which is about twice as much as is produced in all the other countries of the world combined. The value of this enormous product is about \$780,000,000, nearly twice the value of the gold output of the world, and more than the total value of the product of gold and silver. The states of Iowa, Illinois, Kansas, Nebraska, Texas, Ohio, Oklahoma, and Missouri are the leading

cornel or cornelian cherry, has oval leaves and yellow flowers, and was formerly cultivated as a fruit tree. The fruit is fleshy, oblong in shape, and is eaten raw or used in making preserves. In some sections it is gathered green and pickled like olives. The *cornelian cherry* is native to Europe. The species common to the United States grow in damp woods and their fruit is not properly edible. About eighteen species are found in North America, some of which thrive as far north as central Canada. These plants are known locally as dogwood.

**CORNELL COLLEGE**, an institution of learning at Mount Vernon, Iowa, organized in 1857. It is under the direction of the Methodist Episcopal Church, and carries classical, scientific, philosophical, and civil engineering courses. The Bowman, Chapel, College, Conservatory, and Science halls are the principal buildings. The library contains 25,500 volumes. It is coeducational. Cornell College is noted for its high moral and intellectual standards. It has a faculty of thirty-six instructors and about 750 students.

**CORNELL UNIVERSITY**, a coeducational institution of higher learning on Lake Cayuga, near Ithaca, N. Y. It is situated on a hill 300 feet high with a view twenty miles down Lake Cayuga and seventeen miles up Enfield valley. This institution was founded in 1865 as a result of the Federal Land Grant Act of 1862, by which large tracts of public lands were assigned to the states for educational purposes, and received a gift of \$500,000 and 207 acres of land for use as a site from Ezra Cornell (q. v.), in whose honor it was named. Through the skillful management of western lands by Mr. Cornell and Henry W. Sage and through gifts the property of the university has been increased to about \$12,500,000. It has nineteen main buildings, which include the Rockefeller Hall of physics, the Morse Hall of chemistry, the buildings of the New York State College of Agriculture, the Goldwin Smith Hall of Humanities, the University Library with 340,000 volumes, the Law Library with more than 37,000 volumes, and numerous workshops and machine shops. About 150 State scholarships (free tuition) are awarded annually to residents of the State of New York by competitive examination. Eighteen undergraduate scholarships valued at \$400 each and forty graduated scholarships and fellowships of the total value of about \$16,000 are distributed annually. The faculty consists of 483 professors and teachers. In the years 1906-07 it had an attendance of 4,225 students for all departments, which is about the average annual enrollment.

**CORNET** (kôr'nĕt), a metallic wind instrument of the trumpet class, furnished with valves and stoppers. The name formerly applied to it was *cornopean*. Its tone is very agreeable and it is used largely in military bands and orchestras. A number of classes and forms are in general use, of which the *cornet-à-piston*, a French term signifying a cornet with pistons, is the best known. It is so named from the small pistons which are moved by the fingers in playing.

**CORN HARVESTER**, a machine for harvesting corn, fitted with a cutting apparatus and a device for binding the stalks into bundles or sheaves. The cutting apparatus differs from that of a reaping machine in that the knives move more slowly, and a balance wheel is utilized to maintain their uniformity in speed. The device used in binding is quite like that of an ordinary harvester, and it is usually fitted to bind the sheaves with sisal or manila twine. The machine ordinarily employed cuts one row of standing corn. The stalks are carried to the binding frame, where the bundles or sheaves are bound and then pushed to the side of the machine and dropped on the ground in such a position that the horses will not step upon them when the next row of corn is cut. Corn cut in this way is bound in small bundles or sheaves, which are afterward set up to form shocks. Other corn harvesters are employed when the grain has matured, and these both husk the corn and gather the leaves and husks for fodder, or they merely strip the ears of their leaves and by an elevator carry them into a wagon, leaving the stalks and husks on the field as waste material.

**CORNING** (kôr'nĭng), a city of Steuben County, New York, on the Chemung River, about seventeen miles northwest of Elmira. It is on the Erie, the Lackawanna, and the New York Central railroads. The noteworthy buildings include the public library, the city hall, the high school, and the Saint Mary's Orphan Asylum. Among the manufactures are railroad cars, flint glass, cigars, machinery, and clothing. It has electric lights and street railways, waterworks, and other modern municipal facilities. It was incorporated as a village in 1849 and as a city in 1890. Population, 1905, 13,515; in 1910, 13,730.

**CORN LAWS**, the laws enacted by the British Parliament for the regulation of the trade in grains, both the exports and imports. The exportation of grain was prohibited in many European countries during feudal times with the view of causing a lower price in food products, but this policy worked a hardship upon

the agricultural classes of England, and Parliament passed a law in 1436 which permitted exportation when the price of grain fell below a certain limit, though duties were still charged upon the exports. Subsequently the law was amended so as to provide a sliding scale of charges on imports, and these remained in force until the popular agitation of 1846, when Sir Robert Peel declared himself in favor of a repeal of the corn laws. The agitation was very intense under the leadership of Bright and Cobden, who were supported by the Anti-Corn Law League, and in June of that year an act was passed which provided for the gradual abolition of duties. The importation of grain was made entirely free in 1869. It has been a matter of controversy between protectionists and free traders whether the effect of the repeal measure has proved beneficial, and the former point to a decline in agriculture as a consequence of the policy, but the loss is probably more than equaled by the growth in commerce and manufacturing enterprises.

**CORNWALL** (kôrn'wəl), a port of entry and the capital of Stormont County, Ontario, sixty-six miles southwest of Montreal. It is on the Saint Lawrence River, the Cornwall Canal, and the Ottawa and New York Railway. Among the noteworthy features are the county courthouse, the high school, and the Lacrosse Club building. The manufactures include cotton and woolen fabrics, flour, paper, and machinery. It has public waterworks and other improvements. Population, 1901, 6,704.

**COROLLA** (kô-rôl'lä), the inner circle or set of leaves of flowers, usually bright colored. It is composed of leaves called *petals*, which surround the part that bears the fruit. Some flowers have a whorl of leaflike organs intervening between the corolla and the stamens, which are considered an appendage of the former and are prominent in some flowers, as in the daffodil.

**CORONA** (kô-rô'nà), in astronomy, a halo surrounding the moon when it is seen projected against the disk of the sun in a total eclipse of the latter luminary. Some scientists suppose it to be the atmosphere of the sun, which at other times is invisible, but this view is not generally accepted, since an atmosphere in the ordinary sense could not exist at so great a distance above the surface of the sun. Astronomers now generally regard it to be the prototype of the terrestrial auroras.

**CORONATION** (kôr-ô-nâ'shŭn), the ceremony or act of crowning a sovereign, as a king or emperor, at which he is invested with royalty. See **Crown**.

**CORONATION CHAIR**, the throne used at the coronation of kings in England since the time of Edward I. It is kept in Westminster Abbey, where the coronation ceremony takes place. This chair has the famous *Lia Fail*, the Stone of Destiny, beneath the seat, which was used in crowning the kings of Scotland. According to tradition, it is the stone that was used by Jacob as a pillow (Gen. xxviii., 11), and was taken by Tarra to Ireland in the 5th century, whence it was brought to Scotland and afterward to England.

**CORONATION GULF**, an inlet of the Arctic Ocean, located between Mackenzie and Victoria Land. It receives the inflow of the Copermine River from the south, and extends as Bathurst Inlet toward the southeast. Dease Strait connects it with Victoria Strait on the northeast, and northwest of it is Dolphin and Union Strait. Within its confines are many islands.

**CORPORATION** (kôr-pô-râ'shŭn), a corporate body empowered by law to act as a single individual and having a common seal. There are two classes of corporations—aggregate and sole. An *aggregate corporation* consists of two or more persons incorporated according to law in a society which is kept up by a succession of members, either perpetually or until it is dissolved by mutual consent or limitation. A *sole corporation* consists of a single individual and his successors, organized to perpetuate an office or function which cannot be done in the personal or bodily capacity of any man. For instance, the title to certain church property in Massachusetts is vested in a sole corporation composed of the pastor of the church. In transferring land to a corporation of this class the deed or instrument of conveyance must include the words "and his successors." The office of king or bishop in England is a sole corporation, for the reason that the office is regarded perpetual, and continues to exist though the possessor may die.

Aggregate corporations are under general law of two classes—public and private. *Private corporations* are organized for the purpose of conducting business, societies, coöperative associations, manufacturing, hospitals, colleges, and other enterprises. Organized in this way, the members forming the corporation are individually exempt from liability of the corporation, only the property of the corporation being subject for indebtedness of the organization. However, in some instances the personal liability extends to the amount of the capital stock owned by the individual stockholder. A corporation may sue and be sued as a single indi-

vidual. The great railroad, telegraph, telephone, banking, insurance, and other companies are organized on a corporate basis. The several states and provinces have laws regulating the formation of corporations. They supervise their organization and fix a minimum to be paid upon the capital stock at the time the organization is formed. Private corporations adopt articles when effecting an organization, in which the capital, indebtedness, privileges, and powers are limited by agreement.

*Public corporations* are those organized for the government of towns, cities, counties, provinces, and states. Another class of public corporations are those that have for their object the improvement and maintenance of public parks, cemeteries, and similar institutions. It is customary to adopt written by-laws for the government of corporations by the board of directors, who are elected by the members of the corporation. These by-laws may be changed under certain conditions, but must comply with the provisions and requirements of the articles of incorporation. The business of a corporation is managed primarily by the board of directors, who act principally through the officers, including the president, vice president, secretary, treasurer, etc.

**CORPUS CHRISTI** (kôr'pūs krīs'tī), a festival in the Roman Catholic Church held in honor of the body of Christ. It is observed on the Thursday after Trinity Sunday. It was first celebrated in 1241 at Liège by the canons of Saint Martin and was recommended in a bull issued by Pope Urban IV. in 1263, which was afterward confirmed by the council of Vienna. The name is also applied to a college at Cambridge, England.

**CORPUS CHRISTI**, a city and the county seat of Nueces County, Texas, on Corpus Christi Bay, about 200 miles southwest of Galveston. It is on the San Antonio and Aransas Pass and the Mexican National railroads, has a good harbor, and is the seat of a large trade in fish, oysters, cotton, and cereals. The noteworthy buildings include the county courthouse, the high school, and the customhouse. It has a canning factory, machine shops, and cigar and tobacco factories. Corpus Christi was settled in 1849 and incorporated in 1876. Population, 1900, 4,703; in 1910, 8,299.

**CORRELATION** (kôr-rê-lā'shūn), in pedagogy, the mutual or reciprocal relation of studies, or the act of bringing under relations of union, correspondence, or interaction. Both Froebel and Herbart regarded unity as the important law in education and both wrote much on the subject, making it a fundamental law in

their systems. Recent educators have generally supported this principle, and have sought to direct teaching with the view of more fully utilizing the law of association. - For instance, the reading lessons are chosen with a view of throwing added light upon contemporaneous lessons in history, botany, and geography. In this way these and similar lessons are made more serviceable in the school course.

**CORROSIVE SUBLIMATE** (kôr-rō'siv sūb'li-māt), the bichloride of mercury, prepared by heating mercuric sulphate with dry sodium chloride. It is a white crystalline solid, very poisonous, and is used to preserve both vegetable and animal substances. Surgeons employ it as an antiseptic spray and to clean and sterilize their operating instruments.

**CORRY** (kôr'rī), a city of Erie County, Pennsylvania, ninety miles southwest of Buffalo, N. Y., on the Erie and the Pennsylvania railroads. The noteworthy features include the State fish hatchery, the high school, and a number of mineral springs. It has flouring mills, iron mills, and door, lumber, and sash factories. In the vicinity are valuable deposits of oil, coal, and natural gas. The surrounding country is agricultural. Corry was settled in 1860. Population, 1900, 5,369.

**CORSAIR** (kôr'sâr), a pirate or the vessel used by pirates, applied chiefly to the freebooters of the Barbary States. The Corsairs were commissioned by princes to attack the merchant ships of foreign nations and for many years were a scourge on the Mediterranean. In 1800 Capt. Bainbridge sailed to Algiers to pay a tribute to the dey on behalf of the United States, but war was declared against Tripoli the following year and their capital was bombarded in 1804. Algiers declared war against the United States in 1815 on account of a disagreement in regard to the tributes paid, but Commodore Decatur appeared with a large fleet and compelled the dey to sign a treaty. Subsequently the Corsairs were annihilated by the European governments.

**CORSICA** (kôr'sī-kā), or **Corse**, an island in the Mediterranean, belonging to France, and forming a department of the same name. It is 110 miles long and 52 miles wide. The area is 3,367 square miles. It is traversed by a number of rugged ranges of hills and mountains, but has tracts of merchantable forests. Monte Rotondo, the culminating peak, has an elevation of 8,620 feet and is crowned with perpetual snow. Many of the rivers have their sources in the mountain ranges, the principal streams being the Golo and the Tavignano; the former is navigable for boats. The soil is fer-

tile in the river valleys and on the coast region, and produces many kinds of cereals, grasses, and fruits. Mineral oil and timber are the chief sources of wealth. The minerals include marble, iron, lead and petroleum. Large interests are vested in rearing sheep, horses, cattle, mules, and goats. The fisheries are a source of considerable profit. Ajaccio, celebrated as the birthplace of Napoleon, is the seat of government. Bastia is an important city.

Corsica was colonized by the Phoenicians and named Cynos. It was conquered by the Romans, who gave it the present name. After the decline of Rome it passed to the Goths, was conquered by the Saracens, and taken by the Genoese in the 15th century. France secured dominion over it in 1766. It became independent in 1794 and two years later was again made a part of France, to which country it still belongs. The industries are not in a high state of development, but several railroads have been constructed and other modern improvements are causing a change toward greater production, both in agriculture and manufacture. Population, 1906, 291,160.

**CORSICANA** (kôr-sĩ-kä'ná), a city in Texas, county seat of Navarro County, fifty-two miles southeast of Dallas, on the Saint Louis Southwestern and the Houston and Texas Central railroads. It is surrounded by a fertile agricultural country, which is rich in petroleum, gas, and coal. Among the chief buildings are the public library, the State orphan asylum, the courthouse, and the Odd Fellows' widows and orphans' home. The manufacturing industries include iron foundries, flouring mills, oil mills, machine shops, and cotton compresses. It has good public schools, pavements, electric lights, street railways, and many fine edifices. Population, 1900, 9,313; in 1910, 9,749.

**CORTES** (kôr'tēs), the national legislature of Spain and Portugal, consisting of an upper house and a chamber of deputies. The upper chamber in both countries is composed partly of hereditary peers and partly of elective members. The deputies of the lower chamber are elected in Portugal for a term of four years and in Spain for five years.

**CORTLAND** (kört'land), county seat of Cortland County, New York, about thirty-six miles south of Syracuse, on the Lehigh Valley and the Lackawanna railroads. The chief buildings include the courthouse, the public library, an academy, and a State normal school. Among the manufactures are stoves, furniture, carriages and wagons, wire, wall paper, and earthenware. The municipal utilities include waterworks, street lighting, pavements, and

street railways. It was settled in 1792 and incorporated in 1829. Population, 1910, 11,504.

**CORUNDUM** (kō-rŭn'dŭm), an alumina mineral found native in a crystalline state. This class of minerals includes a number that are highly prized as gems. Pure corundum ranks next to the diamond in hardness and its value depends upon the color. Sapphire is a blue species; ruby is red, emerald is green, amethyst is purple, and topaz is yellow. The star sapphire, known also as the *asteriated* sapphire, presents a six-rayed opalescent star. Species that have a dark color and possess opaque qualities are known in the market as corundum, while those of a granular formation are designated emery. Deposits of emery occur in Canada, at Chester, Mass., and in Asia Minor. Other species of corundum are widely distributed in all the continents.

**COSHOCTON** (kō-shōk'tŭn), county seat of Coshocton County, Ohio, on the Muskingum River, twenty-five miles north of Zanesville. It is on the Wheeling and Lake Erie and the Pennsylvania railroads and on the Ohio Canal. The chief buildings include the public library, the courthouse, and several fine churches. It has electric lights, waterworks, and manufactures of ironware, paper, and machinery. The first settlement was made in 1811 and it was incorporated in 1833. Population, 1900, 6,473.

**COSMOGONY** (kōz-mōg'ō-nŷ), from the Greek *kosmos*, world; and *gonē*, generation; an investigation of the origin or creation of the universe. The theories of this science are represented under three general classes: 1. The world as having existed in its present form from eternity. 2. The matter but not the form of the world as having existed from eternity. 3. Both the matter and form of the world having been created by a spiritual cause. The theory that the universe has existed in substantially its present form from eternity has long been accepted by some writers. It was embraced by a number of ancients and was supported by Aristotle. The theory that the matter but not the form of the world existed from eternity prevailed quite generally among various ancient philosophers. They proceeded to reason that no substance or body could have been made out of nothing, and thought that the elements existed in a state or condition known as *chaos*. Under modifications and changes covering long periods of time, the elements of the chaos were united and began to take on the form and conditions now manifest. After many periods or ages the present form resulted. The advocates of this theory held and still hold that changes go on continually, and that they are as rapid in

modern times as they were in any period of the history of the world. This theory in various modified forms was held by the Assyrians, Babylonians, Phoenicians, Egyptians, and other ancient peoples.

The theory that a spiritual cause brought the world into existence is held by the Jews, Christians, and other classes, and is taught in the book of Genesis in these words: "In the beginning God created the heavens and the earth." This theory differs from the second in that it does not hold to the eternity of matter. Having been created in the beginning, it is held that destruction and annihilation will cause it to cease existence in the end. On the contrary, the theory that matter is eternal presumes its continual endurance in the future as well as its existence forever in the past. The elements always existing may change in form by various combinations and movements, but cannot be destroyed or annihilated.

**COSSACKS** (kös'säks), a race of people which became known in Western Europe in the 10th century, when they inhabited the eastern and southeastern parts of Russia. They are thought to be a mixture of Tartar and Caucasian races, though their origin is not clearly established. They bear a close resemblance to the Russians. Their government was originally a kind of democracy with a chief or *hetman* as their ruler. They maintained both civil and military organizations, and were noted for their skill and daring in warfare. In the 15th century they fought against the Turks and Tartars, and were employed by Poland and Muscovy to guard the outposts of Russia. Later their democratic institutions gradually disappeared, when they were absorbed by the Russian dominion, under which government they pay no taxes, but instead render military services. The period in which they are subject to military duty extends from the age of eighteen to fifty, and each man is obliged to furnish his own horse.

Cossack cavalry has rendered the Russian Empire valuable services in many emergencies. The Cossacks were effective during the retreat of Napoleon after the burning of Moscow, when they inflicted serious damage to his army, as well as in the wars against Turkey and on numerous other occasions. They have rendered excellent services as scouts and skirmishers. In military service they wear a distinct uniform of dark green. Their principal rendezvous, called Tcherkask, was located on the Don in 1570, but, owing to overflows, New Tcherkask was founded in 1805, which is now the capital of the province of the Don Cossacks and constitutes a government of Russia. It has an

area of 63,532 square miles and a population of 3,125,718. In industry and intelligence the Cossacks have been described as superior to the average Russian, and they constitute a sober as well as a gallant people.

**COSTA RICA** (kös'tä rē'kä), a republic of Central America, located between Nicaragua and Panama. It is bounded on the north chiefly by Nicaragua, east by the Caribbean Sea, south-east by Panama, and west by the Pacific. The area is 21,500 square miles. Much of the surface is elevated and mountainous. The Talamanca Range of the cordillera of the Isthmus of Panama traverses the interior and includes a number of lofty volcanic peaks, reaching an elevation of 12,700 feet. Irazú and Turrialba, the former 11,500 and the latter 11,350 feet high, are active volcanoes. The western coast is indented by several extensive inlets, of which the gulfs of Dulce and Nicoya are the most important. Columbus discovered the region on his fourth voyage. It became free from Spain in 1821, and has since been a republic. A number of rivers drain the interior, among them the Trinidad, San Juan, Macho, and Dulce. A large portion of the surface along the coasts and in the valleys is exceedingly fertile. Owing to various altitudes, the climate is divided into three zones. The torrid zone lies below 3,000 feet; the temperate, between 3,000 and 7,500 feet; and the colder zone, above 7,500 feet, where frosts are frequent.

The principal industry is agriculture, the two most important products being coffee and bananas, but all cereals and fruits are successfully cultivated. There are productions of gold, silver, iron, copper, coal, and mineral oil. The foreign trade is largely with the United States, Germany, and Great Britain. The exports exceed the imports, the former having a value of \$9,550,500 and the latter, \$7,850,500. Railroads have been constructed by the government and under grants to European capitalists. Tramways and street railways are maintained in the larger cities, while the telegraph and telephone lines have a large mileage. San José is the capital. Other commercial cities are Cartago, Alajuela, Puntarenas, and Heredia. Limón and Puntarenas are the most important seaports.

The government of Costa Rica is vested in a president, whose term is four years, a legislature of one department, and a national judiciary. Education is compulsory. The common schools are supplemented by several institutions of higher learning. Roman Catholic is the state religion, but all denominations are granted liberty of conscience. About 3,200 Protestants and 350 Buddhists are in the country. Immigration,

### HARVESTING MACHINES.

The above shows a modern harvesting machine (a header) at work, as seen in the wheat fields of the western part of Canada and the United States.

PRICE-CAMPBELL COTTON-HARVESTING MACHINE.

One of these machines can pick 500 pounds of cotton per hour in an average field.

manufacturing, and agriculture are encouraged by a public policy under governmental supervision. In general the social and economic conditions are decidedly the best found in the Central American republics. Spanish is the official language, but only a portion of the people are of purely European descent.

Columbus visited the region included in Costa Rica in 1502. The first permanent settlement was made in 1530. It became free from Spain in 1821 and was a part of the Republic of Mexico until 1823, when it became a part of the United States of Central America. Since 1848 it has been an independent republic, with the exception of a brief time in 1897, when it was a constituent member of the Greater Republic of Central America. The foreigners number 6,295 and are chiefly from Spain and Germany. Population, 1906, 344,995.

**COTOPAXI** (kō-tō-päks'è), the most celebrated volcano in the world. It is located in the Andes of Ecuador, about thirty-two miles from Quito. The earliest eruptions on record occurred in 1532 and many have since been noted. Among the most remarkable are those of 1744, 1768, and 1864. During several of the eruptions the sounds were heard at a distance of 500 miles and ashes were carried 125 miles. Outbursts are attended by smoke and flames and large quantities of ashes are expelled. The volcano is crowned with perpetual snow. It was first ascended by Wilhelm Reiss in 1872, who estimated the height of the northwest peak at 19,500 feet and the peak toward the southwest at 19,430 feet.

**COTTON** (kōt't'n), the name applied to the fibers that surround the seeds of the plants belonging to the genus *Gossypium*, commonly called cotton plants. These plants are native to tropical regions, but they are cultivated extensively within the belt lying between latitudes 35° north and 35° south of the Equator. They are shrublike, have lobed leaves, mostly yellowish flowers, and a celled capsule which bursts open when ripe and liberates a quantity of black seeds covered with the cellular fibers. Several species are grown in the United States. The short fiber cotton has fibers about an inch long and the long fiber, about two inches. The former is known as *upland* and the latter as *Sea Island* cotton. In quality the Sea Island cotton is the best. It is cultivated upon the lowlands in a number of the Southern States and on the islands adjacent to the coast.

Cotton has been grown since immemorable times in history. It is spoken of in the writings of Herodotus as growing in India and its fibers being used in the manufacture of cloth. It is

mentioned by Aristobulus, one of Alexander's generals, and is referred to a number of times by Pliny. The Arabians made cotton goods in the time of Mohammed, about 627 A. D., and his followers introduced them into Africa and Spain. By the 14th century they had spread to Italy, and afterward came into use in the whole of Europe. Cotton fiber is mentioned in English history as early as 1436, when it was used on a small scale, but in 1736 it began to be made into cloth by machinery invented by Louis Paul. Cotton goods are among the leading staples of the world, and are manufactured extensively in most of the large industrial centers.

Cotton, showing flowers and bolls.

In the United States the leading manufacturing centers are at Manchester and other cities of New England.

The cotton plant was found native by Columbus in the West Indies and in South America. The early Mexicans used cotton cloth extensively. Cotton seed was brought to Georgia in 1786 and the first cotton mill in America was erected two years later at Beverly, Mass. The United States produces about 13,500,000 bales of cotton annually, which is about two-thirds of the world's product. In 1906 the world's crop was reputed at 19,942,500 bales. The bales are made by machinery and are held in position by hoops. They weigh about 515 pounds. Texas is the leading cotton State. Others taking high

rank are Mississippi, Georgia, Alabama, North Carolina, South Carolina, Louisiana, and Arkansas, though it is produced in large quantities in a number of other states. The principal supply of cotton, outside of the United States, is secured in India, Egypt, Russia, China, Brazil, Mexico, the West Indies, and the Asiatic islands of the Pacific Ocean.

Cotton is cultivated in fields like corn, the method differing somewhat. The ground is plowed in the spring and the seeds are drilled or planted about three feet apart, the plants appearing above the ground in about eight days. The young plants are cultivated and weeded, this being required two or three different times. After the plants flower no further cultivation is needed, and the seeds ripen after a period of about seventy days. Cotton is gathered within eight days after coming to maturity in order to prevent tarnishing. The gathering is done by picking the cotton fibers from the pods or bolls by hand into baskets or bags hung from the shoulders of the pickers, which is done several times during the picking season, as the bolls do not all ripen at the same time. The crop is spread out to dry as soon as it is secured. When sufficiently dried, the cotton is passed through machinery by which it is separated from the seeds. It was formerly separated from the seeds by hand. The invention of the cotton gin in 1793 by Eli Whitney greatly revolutionized, cheapened, and lessened the labor. By this machine it is separated rapidly from the seeds by means of teeth projecting through slits in the side of the chamber in which the seed cotton is placed. It is then baled and made ready for shipment to the manufacturer.

At the factory it is spun into cotton cloth, or it is mixed more or less with silk, wool, linen, and alpaca to form various fabrics. The early cotton-spinning machines were of rude construction. Among the earliest are Hargreaves' spinning jenny and a water frame made by Arkwright. In 1779 Crompton invented a machine propelled by a mule, while in 1785 the Cartwright power loom and Watt's steam engine were applied to cotton spinning and weaving. The machinery employed at the present time for cleaning, pressing, spinning, and weaving cotton has reached a high state of perfection. It is propelled largely by water, steam, or electric power. The consumption of cotton in manufacture in the United States is very extensive, and large exportations of the raw material as well as manufactured products are made to all portions of the world. Raw cotton is exported chiefly to Great Britain, Germany, France, Italy, and Canada. The exports of manufac-

tured goods aggregate about \$27,500,000 per annum, while the domestic consumption is much larger.

The cotton stalks are used in the manufacture of pulp, from which a good grade of writing paper is made. A fine class of oil is manufactured from cotton seed. It is useful for food and enters largely into the production of lard and fine grades of manufactured butter. Cotton-seed cake is a valuable food for domestic animals. The cotton acreage of the United States is about 28,000,000. In 1907 the total number of active spindles in the world was reputed at 123,332,971, of which 26,395,191 were in the United States. The chief uses of cotton goods are for wearing apparel, bedding, and carpets. Among the principal pests to the cotton plant are the boll moth and the boll weevil. The *boll moth* deposits its eggs on the under side of the leaves, where they hatch in about three days, and the larva, known as the *boll worm*, is very destructive to the plant. The cotton boll weevil is a beetle with an elongated head. It punctures the bolls of the cotton plant to lay its eggs within, where they produce white maggots, which do much damage. Another pest, the *redbug*, or *cottonstainer*, is suctorial and drains the sap from the bolls.

**COTTON FAMINE**, the name applied to the failure of the cotton industry in England, which occurred in 1861-65, when the Civil War was raging in the United States. The war caused the supply of raw cotton to be shut off and thus compelled the closing of the manufactories. About 300,000 English laborers were thrown out of employment and 2,000,000 people reduced to the verge of starvation. The government relieved the distress somewhat by granting charitable aid.

**COTTON GIN**, a machine for separating the seeds from cotton fibers. It was invented by Eli Whitney in 1793. See **Cotton; Whitney, Eli**.

**COTTON SEED**, the seed product of the cotton plant. From it the cotton batting, cotton-seed oil, and cotton-seed meal are manufactured. The cotton batting is made from the lint that clings to the seed after passing through the cotton gin, while the other two products are made from the seeds proper. Cotton-seed meal is a valuable food product for horses and cattle, while the cotton-seed oil, known in the market as cottolene, is wholesome as food for table use. Cotton-seed oil is employed extensively as a substitute for lard, linseed oil, and sperm oil. It is used for lubricating, soap making, treating leather, and divers other purposes. The annual value of cotton-seed oil exported from the

United States aggregates \$15,000,000, while the value of lint and oil cake is almost as large.

**COTYLEDON** (kōt-ī-lē'dŭn), the first leaf, or one of the first two leaves, developed in a plant. In exogens two such leaves are present in the embryo in every plant, while in endogens there is but one. The two cotyledons on exogens are always opposite, while in endogens the second leaf developed is alternate with the first. From these well-known characteristics have been developed the three primary divisions of the vegetable kingdom—the dicotyledons, monocotyledons, and acotyledons.

**COUGAR** (kōō'gär), the name given to the puma in Brazil, formerly called the American lion, and now often mentioned as the American panther. Formerly it was found throughout a vast region of both North and South America, but it has been destroyed in all of the former, except in its most southerly portions.

**COUGH** (kəf), a sudden and violent expulsion of air from the chest, caused by the relapse action of nervous or gastric disorder, or by irritation in the air passage. Coughing occurs when the source of irritation is in or below the posterior fauces, and sneezing when the irritating cause acts on the nasal mucous membrane. It may be dry, as in the first stage of pleurisy; or humid, as in certain stages of pneumonia and in advanced consumption. The act of coughing may be single and with distant intervals, or long continued, as in whooping cough and bronchial catarrh. In croup and whooping cough it has a metallic ring. As a general rule coughing may be taken as a symptom of disease.

**COUNCIL BLUFFS**, a city in Iowa, county seat of Pottawattamie County, on the Missouri River, opposite Omaha, Neb. It is on the Chicago and Northwestern, the Illinois Central, the Chicago Great Western, the Union Pacific, the Chicago, Milwaukee and Saint Paul, the Chicago, Burlington and Quincy, and other railroads. Next to Sioux City, it is the most important city of western Iowa, and is connected by several bridges and electric street railways with Omaha, Neb., across the Missouri River. The chief buildings include the county courthouse, the Carnegie Library, the Grand Hotel, the Federal building, the high school, and the Iowa School for the Deaf. Bayliss and Fairmont parks are popular public grounds. The manufactures include agricultural implements, machinery, carriages, engines, ironware, clothing, and earthenware. Its location at the western termini of a large number of railroads and connection with principal Pacific coast lines makes it an important jobbing and commercial

city. It has good municipal facilities, such as street railways, electric lights, pavements, waterworks, and sewerage. The city was named from a council held on its site by Lewis and Clark with the Indians in 1804. It was settled in 1846, when it was known as Kaneshville, but it was incorporated as Council Bluffs in 1850. Population, 1905, 25,231; in 1910, 29,292.

**COUNTERFEITING** (koun'tēr-fīt-īng), to make something in imitation of an article of value without legal authority and with a fraudulent intent. The act of uttering counterfeit coin, bank notes, or other currency is a felony punishable by fine or imprisonment. The government, as a safeguard against counterfeiting, has its paper currency engraved with designs that can be reproduced only at great expense. In addition, several secret marks and combinations of letters and figures are employed and paper and ink of a peculiar kind are used. The counterfeiting of coins consists of imitating the genuine by using a cheaper or comparatively worthless metal.

**COUNTERSIGN** (koun'tēr-sīn), the signature of a secretary or other public officer to attest that a writing has been signed by a superior. In military affairs the countersign is a watchword given daily by the commander of an army, in order that the soldiers on guard may distinguish whether those wishing to pass are friends or enemies. Those who are unable to give the countersign are not permitted to pass.

**COUNTY** (koun'tŷ), a name derived from a tract of land subject to a count or earl, and now applied to a division next smaller than a state or province. The name *parish* is applied to these divisions in some states and *shire* is the term used in England. A county has such officers as sheriff, attorney, auditor, treasurer, coroner, clerk, and commissioners, and in some cases a judge. In most states or provinces the roads, poor, local elections, and other interests are under supervision of the county. The county is divided into townships or parishes.

**COUPÉ** (kōō-pā'), a four-wheeled vehicle with a low body, drawn by one horse and provided with a seat for two passengers within and a separate outer seat for the driver. Coupés are closed carriages and are sometimes called cabs and broughams. In continental Europe the name is applied to a compartment in a railway carriage.

**COURT FOOL**, the name given in ancient and medieval times to the professional jesters employed at the courts of nobles. It was their duty to enliven the wealthy nobles, particularly at table, by jests and witty sayings. A jester employed by the King of Persia is mentioned in

the writings of Plutarch, but the office of court fool attained its highest reputation in the Middle Ages, when it was customary to employ them, not only for court service, but they became an adjunct in the apartments occupied by the queens and dauphins. The English kings had court jesters up to the time when the last Stuarts ceased to reign, after which the practice of employing them was abandoned. Court fools were clothed in peculiar costumes, made up of gay colors and unusual ornamentation, and they were permitted to use free speech in ridiculing the follies and vices of their contemporaries. They were abolished in France about the time of the Revolution, and ceased to be an adjunct in the courts of Germany and Russia about the same time. Shakespeare uses the court fool in "As You Like It" and "King Lear."

**COURT-MARTIAL** (kōrt-mār'shāl), a court authorized in the military and naval service, with jurisdiction to try all offenders in the army or navy. Such a court has no jurisdiction over a citizen who is not employed in the military service. It is made up of from five to thirteen commissioned officers and is presided over by a judge advocate.

**COURTS**, the tribunals established by law for the administration of public justice. They are composed of one or more judges or justices, and such other officers as the law authorizes. The courts are designated as either *civil* or *criminal*, depending upon the character of the business which they transact. In the civil courts all civil cases are tried, while criminal courts have jurisdiction of public offenses, as felonies and misdemeanors. In some instances the so-called *district courts* have jurisdiction of both civil and criminal cases. Each State of the United States has a supreme court made up of a number of justices, while the United States Supreme Court has the highest jurisdiction regarding cases which involve questions of national jurisdiction. The cases that may be tried in the United States Supreme Court involve issues between states, between individuals and the United States, and between the United States and a particular State. Most of the State supreme courts consist of from five to seven justices, while the United States Supreme Court consists of a Chief Justice and eight associates. In the states they are in most instances elected by popular vote, while those of the United States Supreme Court are appointed by the President with the consent of the Senate.

The Supreme Court of the Dominion of Canada as at present organized was constituted by a statute enacted in 1906. It is composed of a Chief Justice and five puisne judges, and has

appellate civil and criminal jurisdiction throughout the Dominion. Each Province has a supreme court, which is presided over by a supreme judge and a number of puisne judges. Locally, as in the United States, there are *district* and *county* courts and courts presided over by the *justices of the peace*. The towns and cities have *municipal* or *police* courts. In England the House of Lords constitutes the high court as well as the supreme legislative body.

**COVENANT** (kūv'ē-nānt), a stipulation in writing between two or more parties whereby the truth of certain facts is set forth, or an agreement is made to bind one or more of the parties to do or not to do some specific act. The Old and New Testaments contain a number of references to covenants between God and man, which were made by God on certain conditions of repentance, obedience, and faith on the part of man. After the deluge a covenant was made with Noah, and another was concluded for Abraham and his posterity, which was renewed to Isaac. The covenants of the Scriptures which are especially recognized by evangelical writers are the *Covenants of Works* and the *Covenants of Redemption*. All of the former are substantially promises of blessings upon the basis of obedience, while the latter are the New Testament promises of blessings upon the basis of faith in Jesus Christ.

**COVENANTERS** (kūv-ē-nānt'ērz), a term applied to a large portion of the people of Scotland in the 16th and 17th centuries, who bound themselves by covenants to defend the Presbyterian Church against the Episcopal and Catholic churches of Great Britain. Four of these covenants were made. The first was subscribed at Edinburgh Dec. 3, 1557; the second, at Perth, May 31, 1559; the third was the National Covenant and was signed at Edinburgh, Feb. 28, 1638; and the fourth was written by Alexander Henderson and accepted by the Scottish general assembly on Aug. 17, 1643. The last-mentioned covenant was subscribed to by the English Parliament at London on Sept. 25, 1643, and was regarded a league between Scotland and England. Obligation to it was abolished in 1661 and its renewal was prohibited, for the reason that the liberty of the church was deemed safe.

**COVENT GARDEN** (kūv'ent), a square of London, famous for its extensive market of flowers and fruits. It formerly belonged to the abbot and monks of Westminster. In 1831 the Duke of Bedford, the proprietor of the ground, erected the present buildings. These buildings include a flower market roofed with glass and a market house which covers three acres of

ground. Near it is the Covent Garden Theater, built in 1859, which occupies the site of the former Royal Italian Opera House.

**COVENTRY** (kūv'ēn-trĭ), a city in the County of Warwick, England, eighty-five miles northwest of London. It was the seat of Parliament during the reign of early monarchs and the residence of a number of them at various times. Saint Michael's church, built in the period between 1230-1395, has a spire 200 feet high. Another excellent edifice is Saint Mary's Hall, erected in the 14th century. It has exquisite tapestry, stained windows, and fine frescoes. A Benedictine monastery was founded at Coventry by Earl Leofric and his wife, Lady Godiva, in 1043. The city is noted for its many historical events, including the story of the trial by battle between the dukes of Norfolk and Hereford, an account of which is given by Shakespeare in his *Richard II.* Mary, Queen of Scots, was imprisoned here for some time. The city has railroad connections with the principal cities of Great Britain and manufactures of ribbons, bicycles, watches, textiles, and machinery. Among the public utilities are sewerage, public baths, a public library, and electric street railways. It is a brisk market for produce and live stock. Population, 1907, 77,627.

**COVENTRY**, a town of Rhode Island, in Kent County, twelve miles southwest of Providence, on the New York, New Haven and Hartford Railroad. It is finely situated on the Pawtuxet River and has a brisk trade in produce and merchandise. The manufactures include woolen and cotton goods, cigars, clothing, and machinery. Coventry was the home of Nathaniel Greene. It was incorporated in 1741. Population, 1905, 5,698; in 1910, 5,848.

**COVINGTON** (kūv'ing-tŭn), a city in Kentucky, county seat of Kenton County, at the confluence of the Licking and Ohio rivers, opposite Cincinnati. It is on the Chesapeake and Ohio, the Kentucky Central, and the Louisville and Nashville railroads, and has connections with other cities by a number of electric railways. The chief buildings include the county courthouse, the public library, the post office, the city hall, and the Roman Catholic cathedral. It has a German orphan asylum, a hospital and foundling asylum, and the Notre Dame Academy. Among the principal industries are flouring mills, breweries, distilleries, tobacco and cigar works, and carriage, wagon, and machine shops. It has a number of pork packing houses, silk factories, and glass works. The city has an extensive electric street railway system, sewerage, electric and gas lights, paved streets, waterworks, and a large trade. Two

bridges cross the Ohio River, one of which is a suspension bridge, 2,255 feet long, erected at a cost of \$2,000,000. Covington was settled in 1812 and incorporated in 1834. Population, 1900, 42,938; in 1910, 53,270.

**COW**, the female of the genus *bos* or ox, of which the bull is the male. It has been bred so as to obtain marked differences in color, size, and utility. Among the best kinds of beef cattle are the Galloway; for general purposes, the Hereford, Durham, and Holstein; and for dairying purposes, the Ayrshire, Jersey, and Guernsey. See **Cattle**.

**COWBIRD**, or **Cow Bunting**, a bird of North America, belonging to the blackbird family. It deposits its eggs, like the cuckoos, in the nests of other birds. Here they are incubated and the young are reared by their foster parents. The cowbird is brownish-black, about

COWBIRD.

seven inches long, and migrates toward the south to spend the winter. In the spring it moves northward into Canada as far as Hudson Bay and in autumn, usually in September, large flocks are seen associated with other blackbirds. It has a tendency to go with cattle, probably to secure the worms and insects which attend the animal.

**COWHAGE** (kou'hāj), or **Cowitch**, the hairs on the pod of a tropical climbing plant of the bean family, native to the East and West Indies. The hairs are brownish in color, stiff, brittle, and short, and easily penetrate the skin when coming in contact with it. They produce an intolerable itching, which, instead of being relieved by rubbing, is greatly increased. Cowhage is employed in medicine as a mechanical vermifuge, being taken in syrup and honey. The plant belongs to the genus *Mucuna*, but is commonly called cowhage.

**COW PARSNIP** (pārs'nĭp), a large plant of the parsnip family, native to the Northern Hemisphere. It is cultivated in the temperate

regions of Europe. In Scotland, where it is a rank weed, it is called *kiesh*. The tall branching stems grow to a height of two to five feet and bear white flowers in broad umbels, and the herbage is used as fodder. About fifty species have been classified, of which the *Siberian* is the largest, but its stem is quite coarse. Several species are common to Canada and the United States, and locally they are called *wild celery*. The Eskimos peel the leaf stalks and use them as food.

**COWPENS** (kou'pěnz), a village of Spartanburg County, South Carolina, near which the Americans under Gen. Morgan defeated the British under Col. Tarleton, Jan. 17, 1781. Cornwallis sent Tarleton with 1,110 men against Morgan, when the latter took a strong position at Cowpens under the slope of a hill. His militia was stationed in front, the regulars on higher ground, and at the top of the slope was Col. Washington with the cavalry. The British made the attack and met with a deadly volley, after which the regulars opened a stormy fire and followed by a bayonet charge. At the same time the American cavalry struck the right flank of the British and the militia formed again behind the lines and effected a rout. The British lost 230 killed and 600 prisoners, while the American loss was only seventy-two. This battle was one of the most brilliant of the war, when considered in point of tactics.

**COWPOX**, an acute contagious disease affecting the teats and udder of cows, characterized by slight fever and an eruption of the skin of the affected parts. The matter contained in the vesicles is the vaccine virus used to inoculate the human system as a security against smallpox. It was first introduced for this purpose by Dr. Jenner (q. v.).

**COWRY** (kou'ry), or **Cowrie**, a kind of mollusks found chiefly in the warm seas of the Eastern Hemisphere. Several of the species are noted for the beauty of their shells, which are used extensively in many parts of Southern Asia for money and as ornaments. They differ in value according to the size and the coloring of their surface. Many tons of cowries are gathered annually in the islands southeast of Asia, particularly in the Philippine Islands and the East Indies. Specimens with beautiful markings upon their smoothly polished surface are popular for ornaments to the dress and habitations of both civilized and uncivilized nations.

**COWSLIP**, the name of several species of plants which belong to the same genus as the primrose and oxlip. There is a close resemblance between the cowslip and the oxlip. The

flowers are delicate, possess marked beauty and fragrance, and are general favorites. In color they are greatly variegated, including white, yellow, and rose-colored bloom. The cowslip has a spreading flower cluster, in this respect differing from the common primrose. Its clusters of flowers have been called *fairy cups* for the reason that they were long thought to be the haunts of fairies. Many species of cowslips are well-known plants in Europe and America. One of the American species is known as the *shooting star*.

**COW TREE**, a class of trees native to the tropical regions, so called from the milky juice which is used as a food. The milky product is not the juice of the plant, but is derived from certain cells found in the stems, known in botany as the laticiferous vessels. It has the appearance of the milk of a cow and is wholesome as a food, and the natives use it in the regions where the trees are indigenous. The cow tree of Guiana and Venezuela grows to a height of 80 to 100 feet and has leathery leaves of a large size. The product is obtained by making incisions in the trunk of the tree.

**COYOTE** (kī'ō-tě), the prairie wolf common to the plains of the United States and the central part of Canada. In size it ranges between the fox and the ordinary wolf. It has a sharp snout and coarse, yellowish-gray fur mixed with black. The coyote is about forty inches long, with a tail sixteen inches. It has a prolonged howling cry.

**CRAB**, a class of ten-footed crustacean decapoda, of which the edible crab is a type. They have a short tail, which is folded under the body, short feelers, and a wide shield on the back for protection. In the mouth are several pairs of strong jaws, and the stomach is studded with hard projections that serve for grinding the food. A colorless lymph is propelled to the gills by the action of the heart, the liver is a rich yellow substance, and the edible portions are contained in the front claws, which are much larger than the other legs. Among the widely distributed species are the *oyster crab*, the *hermit crab*, the *blue crab*, and the *spider crab*. The crab is found in the waters near the shore, though there are several species that live on land. A species called the *swimming crab* is a fast runner, burrows in the ground, and is fond of fruits. The claws of the males are much larger than those of the females, and for this reason the former bring the higher price in the market. In a natural state the color is reddish-brown above and whitish beneath; the reddish color seen when in the market is produced by boiling.

The larger crabs in warm climates often weigh about ten or twelve pounds. They are caught in immense numbers off the coast, both in Canada and the United States, and are sold on the market as a delicacy. The front pair of limbs does not serve for locomotion, but answers the

HERMIT CRAB.

Oyster Crab.

purpose of defense and for strong claws and pincers. All species of crabs molt periodically, that is, they throw off their calcareous covering. In the molting period the crab is quite helpless for several days, after which a new covering takes the place of the old one. Their claws are easily lost, but grow anew after a short time. The eyes are movable and they are capable of seeing well and at great distances. The land crabs go into the water to spawn. Some species live in fresh water, though the larger crabs are found in the sea and salt waters. Their food consists of dead and living animal matter, but some subsist on vegetable substances, such as the *racer crabs* of the West Indies, which live on the juices of the sugar cane. Crab fishing is an important industry in most countries, particularly in the densely populated regions, where many laborers are employed in crab and other shell-fish fisheries.

**CRACOW** (krā'kō), or Kraków, a city in Austria-Hungary, on the Vistula River, 256 miles northeast of Vienna. The streets are well improved by grading and stone and asphalt pavements. It has an important river navigation and railroad trade and a line of important manufactures. Among the ancient and noted buildings are a Gothic cathedral, a library with over 300,000 volumes, and several monuments of Polish kings. The monument of Kosciusko is located near the city, on an eminence, and is 120 feet high. It is the seat of a famous university with 2,500 students. The manufactures

include clothing, cigars, textiles, leather, machinery, and earthenware. Cracow is well fortified by strong walls. It was the ancient capital of Poland and the residence of the Polish kings. Since 1846 it has belonged to the crown of Austria. Population, 1907, 104,836.

**CRANBERRY** (krān'bēr-rÿ), a plant common to the swampy regions of the Temperate and Arctic zones. The plant is a creeping vine with ovate, evergreen leaves, a terminal single-flowered peduncle, and a berry of a dark red color, about one-fourth of an inch in diameter. Several species are cultivated for the market. They thrive best in natural bogs or swamps that can be drained and flooded by ditches when desired. They are propagated by cuttings set in rows about fourteen inches apart, and the ground is covered by about three inches of sand to retain the moisture of the soil below and permit of greater ease in cultivation. The berries are gathered by hand. Their principal use is for pies and preserves. They are exported in large quantities from the United States, Canada, and Russia.

**CRANE** (krān), any bird of the genus *grus*. It differs from the storks and herons in having its hind toe higher than the front ones and in caring less about wet and marshy regions. All the species have long legs and a long neck, powerful wings, and a prominent bill, and are of considerable size. The length of the body is about forty-five inches. The plumage is usually ash-gray, but in some species it is white or bluish. Cranes are migratory, passing north in the spring in large wedge-formed flocks, led by

CROWNED CRANE.

single leaders, or in a long single line, and issue a discordant cry. They usually alight for food in daytime and fly continuously by night until their destination is reached. Their nests are made in rushes, in which two eggs are laid. The young are quite helpless and need to be fed

for several days. The food consists of insects, worms, roots, snakes, seeds, and small quadrupeds. Their means of defense lies in the bill, which serves as a dagger. The flesh of some species is regarded an excellent food, for which they are hunted. The *crowned crane* inhabits the northern and western portions of Africa. It has a tuft of slender yellow feathers on the head, which it is able to move at will, and is of a bluish, ash-gray color. The *demoiselle crane* has two tufts of feathers formed by an elongation of the ear coverts, and inhabits Central Asia and Africa. The *whooping crane* and *sandhill crane* are native to North America.

**CRANIAL NERVES.** See **Nerves.**

**CRANIUM** (krā'nī-ŭm), the bony case containing the brain. It is composed of eight bones, the occipital, ethmoid, sphenoid, frontal, two parietal, and two temporal. These bones form a spheroidal inclosure which offers substantial resistance to external violence. The cranium and face constitute the skull (q. v.).

**CRANNOGS** (krā'nōgs), the fortified lake dwellings found in Ireland and Scotland. These fortifications were constructed in about the 9th century, and were discovered in 1813 by George Chalmers, the author of "Caledonia." Several hundred have been located. The weapons and utensils found in them are of stone, bronze, and iron. They consist mostly of swords, knives, axes, daggers, spears, and whetstones.

**CRANSTON** (krā'stŭn), a town of Rhode Island, in Providence County, on the New York, New Haven and Hartford Railroad. It is a popular residential center of Providence business men, has a number of libraries, and is well supplied with public utilities. Among the public institutions are an almshouse, an insane asylum, a State prison, and an industrial school for boys and girls. The manufactures include cotton and woolen goods, clothing, machinery, and spirituous liquors. The first settlement at Cranston was made in 1638 and its incorporation dates from 1754. Population, 1910, 21,171.

**CRAPE** (krāp), or **Crêpe**, a delicate transparent fabric, made of raw silk which has been tightly twisted. It is either crisped or smooth, but all kinds of crapes are woven and dyed with the silk in the raw state. The silk used in making crisped crape is spun harder than for the single, or smooth kinds. Gum water is used to stiffen all classes after they are finished. The colors are black and dark brown, and the former is used extensively as mourning apparel. Many countries of continental Europe excel in the manufacture of crape, especially France and Italy. The crapes made by the Chinese and Japanese are white or highly col-

ored, when intended for mourning, but the varieties used in trimming hats and for ladies scarfs are made in standard colors.

**CRATER** (krā'tēr), the bowl-shaped depression forming the outlet of a volcanic vent. It is generally circular in form and surrounded by a cone of débris. A fissure in the earth is the beginning, through which great volumes of steam and other gases are evolved, the shattered lava forming the volcanic cone. There may be several openings, or the escape may be by long fissure instead of the usual form. The craters of extinct volcanoes often form lakes. The most remarkable one is Crater Lake, in Klamath County, Oregon. It is 6,240 feet above the sea, 2,000 feet deep, and surrounded by great cliffs from 1,200 to 2,000 feet above its surface. Springs are the source of its water supply and it has no outlet to the sea.

**CRAWFISH** (krā'fīsh), or **Crayfish**, the name of several species of fresh-water crustaceous animals resembling the lobster in appearance. About thirty species are native to America, where they are popularly called *crabs*. They have a long tail, ten jointed feet, and prominent feelers. The body is divided into two parts, the trunk and a long, six-jointed tail. The eggs are fastened to the legs of the mother, from which the young escape and molt several times before reaching maturity, which requires

CRAWFISH.

from three to four years. It is thought the molting occurs largely because the shell does not enlarge with the growing body. When the shell comes off the animal is quite helpless and exposed to many dangers, often causing fatal results. Large numbers of crawfish may be seen in sluggish streams and bodies of fresh water. They burrow in the ground near the water, and during the winter live in a semi-dormant state. Their food consists of worms, insects, small carrion, and the tender forms of vegetation, and they even attack each other for food. They are widely distributed on the conti-

nents and islands. The larger species are considered dainty food; the tail and claws being the edible parts. The burrowing habits of some cause damage to levees and milldams on a number of streams, particularly on the Mississippi.

**CRAWFORDSVILLE**, county seat of Montgomery County, Indiana, about thirty miles northwest of Indianapolis, on the Big Four, the Terre Haute and Indianapolis, and other railroads. It is surrounded by a fine farming country. The noteworthy features include the courthouse, the public high school, and Wabash College. Among the manufactures are flour, ironware, boilers, clothing, cigars, buggies, machinery, and furniture. It has sewerage and waterworks systems. The first settlement was made in 1822 and it was incorporated in 1865. Population, 1900, 6,649.

**CRAYON** (krā'ŭn), a pencil made of chalk, charcoal, or pipeclay, colored with various pigments and used for drawing on paper or other materials. Chalk is used largely in the manufacture of blackboard crayons, such as are in common use in schools, and lampblack and pipeclay supply the chief materials in making black crayons. Litmus, turmeric, and saffron are among the vegetable colors used as materials in making pastel, a mixture of chalk and coloring pigments. Crayon painting is practiced to some extent as an art, its chief advantage being in the facility with which it is executed and the richness in outline and coloring.

**CREAM**, the light yellow substance which rises to the surface of milk after standing a brief time. It is rich in fat, which ranges from ten to seventy per cent. Good cream for household use contains from eighteen to thirty per cent. of fat. Milk is creamed by two methods, that is by setting and by a separator. In the former the milk is usually placed in shallow pans and the cream rises gradually to the surface by gravity, owing to the fact that the fat globules of the cream are lighter than the water and other constituents of the milk. It requires about twenty-four hours for the cream to rise, but the milk must be set immediately after it is drawn, and the loss of fat by this method ranges from ten to twenty per cent. A better way is to put the milk in cans about eighteen inches deep, which are placed in cold water with a temperature of about forty degrees, which causes the cream to rise more rapidly and completely than under a higher temperature. The cream separator has superseded the shallow and deep setting of milk to a large extent, even among farmers, and is in general use in creameries. In this machine the cream is separated from the milk by centrifugal force, the work being done by a

bowl or drum which revolves at the rate of 5,500 to 8,000 times per minute. A good separator well operated separates practically all of the cream from the milk, not more than 0.1 per cent. remaining in the skim milk.

**CREAMERY** (krēm'ēr-ŷ), a factory at which butter is made from the milk or cream of cows. Creameries are now operated in practically all sections of the country where dairy farming is profitable. In farming communities they are conducted largely on the coöperative plan, under which the patrons themselves build and operate the plant and share equally in the profits. Under this form of organization the company may or may not buy milk or cream in addition to the product obtained from the stockholders, though usually more or less of the material is purchased. Another form of operating creameries is the plan under which a company or corporation purchases all the material, which is gathered by teams sent out from the plant or is delivered direct from the farms. The value of cream and milk is determined by a tester at the time the products are delivered. Skim milk is a by-product and is either sold or returned to the patrons, who use it to feed pigs and calves. Butter is the chief product obtained from creameries, but in some localities the milk is condensed and canned, and in others cheese is made as a by-product. Colleges of agriculture and government experiment stations have been potent factors in stimulating interest in the manufacture of butter of a high quality.

**CREAM OF TARTAR**, a bitartrate of potassium, which is obtained from a variety of food products, especially from the tamarinds and grapes. It is contained in the crude tartar or argol which collects as a crystalline deposit upon the bottom and sides of wine casks during the fermentation of the wine. To prepare it for commercial purposes, the argol is dissolved in hot water and the coloring matter is removed by clay or egg albumen, after which the cream of tartar is separated by crystallization. The commercial product is a white crystalline compound, is soluble in water, and contains a small per cent. of calcium tartrate. It is used in making baking powder, in medicine as a purgative, and for various purposes in the arts.

**CRÉCY** (krēs'sī), a small town in the department of Somme, France, about 100 miles north of Paris. It is celebrated on account of a battle on Aug. 26, 1346, between Edward III. with 30,000 men and an army of 100,000 French led by the Count of Alençon. The battle resulted in a victory for the English. About 30,000 French were slain, among them the blind King of Bohemia, who was assisting the French

army. This battle was one of the earliest in which the English used cannon.

**CREDIT** (krĕd'it), in economics, the trust or confidence placed by one individual in another, when he assigns money or other property in loan without stipulating for immediate payment. It is a postponement of the payment of a debt to a future time. Credit is given by the party that lends and obtained by the one who borrows. The credit system is based on the confidence the people have in the general solvency, honesty, and resources of others. It is a very important factor in the exchange and production of wealth. The man who is able and willing to work often has few resources, but, with credit extended to him, his ability becomes enlarged and his usefulness is correspondingly widened. Many men have much ability as organizers, but without borrowed capital they are unable to engage in commercial or industrial enterprises. Thus, the noncapitalist is generally benefited by an extension of credit, and the quality and quantity of his productions become vastly enhanced. On the other hand, the capitalist is likewise benefited by the credit system. Without it all his resources would remain in his own hands, and he would incur undue liability in endeavoring to manage all of them himself. Professional men and women, estates, and aged people often have means that they cannot well invest or manage in their own enterprises, but by the credit system others may be assisted while they themselves obtain profit. Banking, railroad construction, the development of a new country, and the material business interests are all more or less dependent upon a general credit system.

Another form of trust is the public credit of a nation. It is based upon the confidence the people have in the expressed or implied promises the government makes to meet public obligations or payments. National credit is represented in bonds, postal money orders, and the credit element in the paper currency and subsidiary coins. No nation has been able to remain out of debt for a long time, or to successfully manage its affairs without drawing upon future possibilities. This element in the credit system applies equally to the subdivisions of the governments, as in the states or provinces, counties, and municipalities. For this reason the public confidence is vital as an element in the success of a state as well as in the enterprises of an individual.

**CRÉDIT MOBILIER** (krā-dĕ' mō-bĕ-lyā'), the name applied to a financial institution organized under the laws of France in 1852. Its purpose was to promote industrial enterprises of

various kinds, among them the building of canals, construction of railroads, sinking of mines, and other vast projects. By the terms of the law the institution was authorized to hold shares in public companies and to meet payments by resorting to its own obligations. The operations conducted by this association assumed a very extensive scale. In 1854 large subscriptions were made to the Grand Central Railroad Company and the General Omnibus Company of Paris, and several large loans were negotiated with the government. At first a dividend of twelve per cent. was paid. In 1855 the dividend was forty per cent., while the next year it was reduced to twenty-two per cent., and the following year to five per cent. Owing to public mistrust, the speculative features were greatly curbed and the operations were lessened until the scheme failed totally.

**CRÉDIT MOBILIER**, a joint-stock company organized in the United States, in 1863, and which gave rise to a great congressional scandal known by the same name. The scandal was the result of attempts at bribery and corruption in connection with the construction of the Union Pacific Railroad from Omaha to the Pacific coast. The company at the time of organizing had a capital of \$2,500,000. The charter of this company was sold in 1867 to a company which undertook the construction of the railroad, and the capital stock was increased to \$37,500,000. In 1872 it was found that several members of Congress and the Vice President had been granted a number of shares of stock. This caused an investigation to be made by the House of Representatives. Oakes Ames, a wealthy Congressman from Massachusetts, Schuyler Colfax, Vice President of the United States, and several representatives were implicated in the charges. Resolutions of censure were passed by Congress against Ames and James Brooks of New York. The scandal died out shortly after and subsequent inquiries cleared the reputation of a number who were charged with bribery. The proposed railroad line was constructed and is in successful operation, being one of the highly important railroads in the United States.

**CREE** (krē), a tribe of the Algonquin Indians, one of the largest and most powerful branches of that family. It was chiefly confined to British America, inhabiting the country in the vicinity of Lake Winnipeg and the Saskatchewan River. The two main divisions are known as the Plains and the Wood Crees. Their language and customs were related to those of the Ojibwas. They are now confined to reservations and number about 10,000.

**CREED** (krēd), the statement or profession of fundamental points of belief of a religious body, or of the Christian Church at large. Many creeds sprang up at different periods in the development of Christianity, largely from the fact that Christ taught the simple truth in a concrete and informal manner; hence creeds may be said to have resulted from arguments and controversies as the teachings of Christ were drawn out into more precise and extended statements. The leading creeds include the following:

*The Apostles' Creed*, so named from the belief that the Apostles composed it, is accepted as a summary of the Christian faith by most churches. It is thought to date back to about 150 A. D., but it came down to us in its present form from the latter part of the 4th century.

*The Nicene Creed* was adopted by the Council of Nice in 325 and was promulgated to counteract Arianism. It is accepted as authority by the Roman and Greek churches and admitted by many of the Protestant denominations. It sets up the doctrine that Christ is of the *same substance* with the Father, and was supplemented in 381 by the Council of Constantinople, which emphasized the *divinity* of the Holy Ghost. This creed as modified by the Council of Constantinople is essentially identical with the form in which it appears in the Anglican prayer books.

*The Athanasian Creed*, which dates from the 6th century, was so named from Saint Athanasius, who supported the doctrine of the Holy Trinity and the *incarnation* of the Son of God. It is held as a creed of the Roman and Greek churches and is still read by the Protestant Episcopal Church of England, but is omitted from the services of the latter church in America.

*The Creed of Chalcedon*, adopted by the Council of Chalcedon in the latter part of the 5th century, embraces the Nicene Creed and supplements it with the doctrine of the person of Christ. The Council of Trent formulated a statement of the doctrines of the Roman Catholic Church, and it was published as a bull by Pius IV. in 1564. This bull enforces the doctrines of *transubstantiation*.

*The Augsburg Confession*, adopted in 1530, embodies the fundamental doctrines of the Lutheran Church, which approves of the Apostles', Nicene, and Athanasian creeds. In addition it has the Catechisms of Luther, the Articles of Schmalcald, and a number of other confessions. The Church of England has the *Thirty-nine Articles*, and the Presbyterians support the *Westminster Confession of Faith*, one of the most elaborate of the creeds. The creeds named are

the most important, and they constitute in a more or less modified form the basis of belief in the various churches. "Creeds of Christendom," published in three volumes, edited by Philip Schaff, is a reliable history of the confessions.

**CREEK** (krēk), an Indian tribe which was originally resident on the Coosa, Flint, Chattahoochee, and Alabama rivers and in the peninsula of Florida. The Creeks were first met by De Soto in 1540, and came completely under English influence after the overthrow of the French power in America. They joined the British in the Revolution and made an attack on Wayne's army in 1782. In 1790 they made a friendly treaty, but renewed hostilities two years later. Another treaty was made in 1796 and some land was ceded in 1805. They joined the English in the War of 1812, made an attack on Fort Mimms, Aug. 30, 1813, and massacred 400 people. After suffering numerous defeats they were completely overthrown by Gen. Jackson at Horseshoe Bend, March 27, 1814. A treaty followed in which some land was ceded, and early in the 19th century a portion of the tribe removed to Louisiana and later to Texas. In 1825 a treaty ceding some lands was agreed upon, but later it was repudiated.

Soon after the Creeks became divided into two factions, one favoring and one opposing emigration. A portion aided the Seminoles in 1836 against the government, and the remainder made an attack upon the frontier towns of Alabama and Georgia. Gen. Scott was sent against them, subduing them after numerous battles, and they were subsequently removed to a reservation between the Arkansas and Canadian rivers. In the Civil War a portion aided the Union and the others sided with the Confederates. A large tract of land was ceded by them to the government in 1866. This tribe of Indians held out against the teaching of the government for many years, but lately education has taken a firm foothold. Among the young people are many men and women who have taken readily to the common school and higher courses of study. They are skillful in the industries and are making rapid progress in the arts.

**CREEPER** (krēp'ēr), a general name of any bird that seeks its food by running or creeping in the branches of trees. The common creeper of North America is quick and restless in its movements, has a curved bill and rigid tail, and searches for insects and their eggs among the crevices in the bark. The upper part of the body is reddish-brown, the head is darker, and the rump is lighter. It is widely distrib-

uted and is often seen in company with the smaller woodpeckers and nuthatches. A species native to South America is known as the

TREE CREEPER.

tree creeper, and is somewhat larger than the common creeper of North America.

**CREMATION** (krê-mā'shūn), the act of burning a corpse instead of burying it. This process was practiced quite extensively among the Greeks and Romans. The Hindus long disposed of their dead to some extent by a ceremony called *mass*. Sir Henry Thompson, an eminent physician, advocated its introduction into England in 1873 on sanitary grounds, but made little progress, owing to public sentiment against the innovation. Lately it was introduced in many European countries and the annual cremations have increased steadily. In 1907 they reached 2,067. The first American crematory was established at Washington, Pa., in 1876, but there are now large crematories in New York, San Francisco, Boston, Chicago, Detroit, Saint Louis, Philadelphia, Buffalo, and many other cities. The number cremated in the United States in seven years, beginning in 1876, was twenty-five, but since then the custom has been making steady growth. In 1907 the number of cremations performed in that country was 2,682.

The retort of a crematory, in which the corpse is placed, is built of fire brick. Bodies to be cremated are placed over a fuel chamber in an inclosure heated through holes. The construction is of such a character that no flames reach the body, and the volatile matter passes through highly heated chambers and dissipates in the atmosphere. Coke and coal

gas are used chiefly for fuel. The body is entirely cremated in from one to three hours, depending upon the size, during which time it is subjected to a temperature from about 2,000° to 2,500° Fahr. In some of the newer crematories the construction is somewhat different, the doors being packed air-tight with asbestos, in which the body may be wholly incinerated in about fifty minutes. Crematory societies have been organized in European and American cities, who make it an object to look after and care for the cremation of corpses. After incineration, the ashes are placed in urns in buildings expensively designed and decorated. These urns are carefully sealed, labeled, and placed in niches for future reference, or are incased within the monument in the cemetery.

**CREMONA** (krê-mō'nà), a city of Italy, in a province of the same name, 47 miles southeast of Milan. It is finely situated on the Po River and a number of railroads, and has a considerable trade in merchandise and manufactures. The streets are wide and well improved with paving and sewerage. Electric lights, waterworks, a public library, two theaters, and electric railways are among the public utilities. It is the seat of a bishop and has several fine churches and palaces. Among the manufactures are porcelain, earthenware, mustard, cotton and silk textiles, and machinery. The Amati family, manufacturers of violins, resided at Cremona. It was colonized by the Romans in 218 B. C., was destroyed by Vespasian in 70 A. D., and was afterward captured by the Lombards. Population, 1906, 40,510.

**CREOLE** (krê'ōl), the name given to the descendants of French and Spaniards born in America and the West Indies. The application of the term has recently been widened to include all descendants of Europeans born in tropical America and the West India Islands. The Creole dialect is a mixture of different languages, including the native languages and Spanish, French, and English. Creoles are not a strong, robust race of people.

**CREOSOTE** (krê'ō-sōt), an oily, colorless liquid obtained chiefly from wood tar and coal tar. It was first made in 1832 by Reichenbach, who obtained it by the destructive distillation of wood. Creosote has a specific gravity of 1.037 at 68°, evaporates without residue, has a burning taste, and mixes readily with ether, alcohol, and chloroform. It is used in the preservation of meats, in the treatment of tuberculosis, and for various purposes in medicine and surgery.

**CRESCENT** (krês'sent), the name applied

to the moon in its first quarter, when its disk is enlarging and its horns are acute. A representation of the half-moon with upturned horns, called a crescent, was used by the ancients, especially the Egyptians and Greeks, as a symbol for their moon goddesses. The Byzantine Empire adopted the crescent as an emblem. After the capture of Constantinople by the Turks in 1543, it became the permanent emblem of the Turks and the Turkish Empire. Many of the churches in Russia have a crescent on the dome, surmounted with the cross, signifying that the Russian Church has a Byzantine origin.

**CRESS** (krēs), the name of several species of plants with acrid or pungent leaves, most of which belong to the mustard family. They are widely distributed in the temperate and northern parts of the earth. The water cresses are the most common species. They grow abundantly on the banks of small streams and ponds and are eaten as a salad. The *Virginia cress* is cultivated as a salad in Great Britain and many parts of North America. It is easily cultivated and thrives best in a damp or moist soil.

**CRESTON** (krēs'tūn), a city in Iowa, county seat of Union County, about 70 miles southwest of Des Moines, on the Chicago, Burlington and Quincy Railroad. It is surrounded by a farming country and has extensive railroad shops. The chief buildings include the courthouse, the high school, and a number of fine churches. It has manufactures of cigars, vehicles, and machinery. The public utilities include sewerage and waterworks systems. It was settled in 1868 and incorporated in 1869. Population, 1905, 8,382.

**CRETACEOUS PERIOD** (krē-tā'shūs), the division of geologic time which immediately follows the Jurassic and precedes the Eocene. It is so named from the chalk beds of England and France, where the term was first used, but the Cretaceous system is constituted only in part of chalk formations. Cretaceous rocks are found abundantly in North America. They extend from the mouth of the Mackenzie River southward into Mexico, occupy a great part of the Atlantic coastal plain from New York to Florida, whence they stretch westward to Texas and points near the Pacific Ocean, and are found in a large scope of the country from the mouth of the Ohio River to the Gulf of Mexico. Deposits of coal occur in the Cretaceous system west of the one hundredth meridian, which coal area embraces many sections of the Rocky Mountains. In some places they contain much greensand or marl, which is used

extensively for fertilizing land in New Jersey and elsewhere. The thickness of the deposits vary materially, being about 400 feet in New Jersey, 2,000 feet in the Missouri basin, and 12,000 feet in many sections of the Rocky Mountains. This system is rich in both plant and animal fossils. The plants include palms, maple, willow, poplar, oak, and birch. Among the fossil animals are the crocodile, sponges, fish, sea serpents, birds with teeth, dinosaurs, and sea saurians.

**CRETE** (krēt), or **Candia**, one of the largest islands in the Mediterranean Sea, located south of the Aegean Sea and the Archipelago. It is about 150 miles long, from six to thirty-five miles wide, and has an area of 3,500 square miles. The surface is mountainous, including several well-defined ranges, of which Mount Ida is the culminating peak, 8,050 feet above the level of the sea. The mountain ranges extend the entire length of the island. They are covered with forests and penetrated by a number of fertile valleys. Much of the coast plain is exceedingly fertile. The southern coast has few harbors, but the northern coast is indented by several inlets, including the Bay of Suda. Many of the valleys are irrigated by numerous springs, and are covered by a luxuriant vegetation. Crete has a mild climate, cool in summer on account of northern winds, and distinguished in winter by numerous showers of rain. The industries are not in a high state of development at the present time. It has valuable deposits of iron, building stone, cobalt, manganese, and granite. Agriculture is the principal occupation, yielding cereals, cotton, and fruits, while the silk industry is securing a strong foothold. The fisheries yield valuable products; the vineyards produce largely, and from the forests cork and essential oils are obtained. Among the domestic animals are horses, cattle, poultry, and sheep. However, the manufactures and transportation are insignificant. Fabrics, machinery, utensils, and spirituous beverages are the principal products of manufacture. Most of the harbors of former ages are silted up and in poor condition.

The history of Crete has its beginning in the period of Grecian mythology. Saturn, Minos, and Zeus are spoken of in Grecian fables among its kings. It was once a republic, then became the seat of Silician pirates, and was conquered by the Romans in 67 B. C. The apostle Paul visited Crete and established a church in it. In 823 A. D. it passed to the Saracens, but was returned to the Greeks in 962 by virtue of the conquest of Nicephorus Phocas II. It was given by the Byzantines to Boniface of Montferrat, who sold it to the Venetians in 1204, unde

whose dominion it remained until the latter part of the 17th century, when it fell to the Turks after a struggle of nearly twenty years. An insurrection occurred in 1868 against Turkish rule, but it was suppressed after a desperate struggle. Another insurrection broke out in 1877, which was followed by a declaration of union in 1878 with Greece. Peace was finally concluded by a concession of partial self-government under Mukhtar Pasha. Religious differences between the Cretans, whose religion is Greek Catholic, and the Mohammedans, led to difficulties which culminated in new troubles in 1884 and terminated in a war in 1897, in which the Cretans had the support of Greece. A number of European powers interceded and effected a blockade of the island with their fleets, but war was prosecuted between Turkey and Greece on the continent. While the conflict terminated in the success of Turkish arms, the interests of Crete were protected by the powers.

On Nov. 26, 1898, Prince George of Greece was announced as high commissioner of Crete by a number of European powers, who had agreed upon his nomination. He assumed the duties of his office in December of the same year. The arrangements acknowledged the suzerainty of the Sultan, guaranteed freedom of religion and security of life and property, and established a native army. In 1908 the Cretans again declared the union of the island with Greece. The language spoken is Greek. During its greatest prosperity Crete had a population of 1,200,000 and at the time of the Venetian dominion, about 900,000. Canea, the capital and largest city, has a population of 24,856. Candia is important as a port. In 1906 the island had a population of 312,514, of which 33,395 were Moslems and the remainder were mostly Greek Christians.

**CRIBBAGE** (krīb'bāj), a game at cards played by two, three, or four persons with a full pack of 52 cards. A game called five-card cribbage, played by two persons, is the most popular amusement of this class. In playing the cards have a value as marked, except that the ace counts one and the face cards each ten. The points are scored by *pegs* on a board perforated with the necessary number of holes, called the *cribbage board*, and sixty-one points constitute the game. The advantage lies with the dealer, who makes up a third hand for himself, called the *crib*, partly out of the hand of his opponent, who at the commencement of the game is entitled to score three points for having lost the deal, which is determined by the players cutting for deal. The rules depend somewhat upon the game played. Three-handed cribbage

is played by three persons on a triangular board, and in four-handed cribbage two persons play in partnership against the others.

**CRICKET** (krīk'ēt), a genus of insects which resemble certain kinds of locusts and include numerous species, among them the house, mole, field, and wingless crickets. The wings are straight, and, when not in use, are folded in a longitudinal position along the back. The jaws move transversely, like those of beetles, while the head is thick and the feelers are long, and they possess remarkable power of leaping and making a rasping sound. However, the organs of sound are possessed only by the males, and they are used to attract or excite the females. A large class of these insects, known as *field crickets*, are seen in vast numbers about harvest time. The *house cricket* is about one inch long, has a yellowish-brown color, and the feelers are about as long as the body. It has

CRICKET.

A, house cricket; B, mole cricket.

been associated with the fireplace of the home, largely on account of the noise made by the wing covers of the male, and feeds on crumbs, finding safety in cracks and crevices of the walls. In the daytime it remains secluded, but comes out at night in search of food, when its familiar noise is heard. The *mole cricket* has large fore legs developed for burrowing. Crickets are widely distributed in America and the other grand divisions. The *Sicilian cricket*, native to Sicily, issues the loudest noise.

**CRICKET**, a popular athletic game, the national game of Great Britain. It is played on a smooth greensward with bats, balls, and wickets. The players form two sides of eleven each. A ball, two bats, and two sets of wickets and bails are required to play the game. The *wickets* consist of thick wooden stumps, twenty-seven inches high, and are placed on the ground in sets of three, at a distance of twenty-two yards apart. On the top of each set of stumps are placed two small pieces of wood, called *bails*. The rival sides toss for first innings, and the director of the side that is to play first places two of his men at the wicket as *batters*, while a *bowler*, a *wicket-keeper*, a *long-stop*,

and *fielders* are placed in their several positions by the director of the opposite side. After these arrangements have been made and the *markers* or *scorers* are at their post, the *umpires* take their places and the game begins. The relative merits of the rival sides are decided by the total number of runs made by each eleven batters during two innings, the side whose players score the most being the winner. The bowler's object is to direct his ball by a swift movement of the arm toward the opposite wickets, at which one of the batsmen stands, and, if possible, to strike down the stumps or knock off the bails; while the object of the batsman, on the other hand, is to protect his wickets from the bowler's attack, by either stopping the ball when it reaches him or driving it out to the field.

**CRIME**, a grave offense against social order, morality, and law. The term cannot be defined in the same way in all ages and all countries, for the reason that the social and legal requirements differ widely. It has been made the object of statistical investigation for many years. Some writers regard crime as a disease, while others think that the environments and hereditary tendencies are largely instrumental in placing individuals in the list of criminals. The bureau of education in the United States made an investigation of the subject a few years ago and reported that eighty-two per cent. of the criminals examined were in good health, while eleven per cent. were in fair health at the time of committing the offense. Lord Brougham stated in 1860 that "criminal statistics are to the legislator what the charts and the compass are to the navigator." The object of study has been largely to ascertain the effects of criminal legislation, and to learn the real nature of crime, its extent, increase or decrease, and the influences that determine it.

The different conditions existing in various countries, together with the environments of the individuals, such as religious tendencies, climatic influences, form of government, scarcity of food and clothing, and social surroundings, have a marked influence on all material factors that enter into the production of the criminal type. On examining 82,329 prisoners it was found that two per cent. of the offenses were against the government; twenty-three, against society; twenty-one, against the person; forty-six, against property; and eight, of a miscellaneous character. Of the offenses committed in the United States it was found in a recent examination that fifty-six per cent. were committed by persons of foreign birth, and that climatic and geographical conditions influence in various respects. Those engaged as laborers

seem to show a greater disposition to commit crime against the person of others than against property, while the reverse is true of those engaged in trades and commerce. Males show a greater tendency to crime than females, which is partly accounted for by the fact that upon the former devolve more largely the means of getting a livelihood. However, the statistical reports on the relative tendency to crime in the sexes must be taken with some allowance, because in females crimes are often condoned. Education shows a marked tendency toward overcoming crime, since the illiterate commit more numerous the higher crimes. An investigation made in Germany in 1905 demonstrates that married men respect property more generally than single men. They do not often commit the crimes against property, such as fraud and robbery, and are less prone to commit offenses against morality and human life. The same investigation demonstrated that widowers commit more crimes between the ages of thirty and fifty than either the married or unmarried men, but their tendency to crime decreases with their advancing years.

Poverty, ignorance, and idleness are the three most prolific sources of crime. Individuals rarely steal when they have an intelligent conception of life, remunerative employment, and a natural bent to industry. The best reforms then would seem to lie in wholesome economical legislation, universal education, and such restrictions that each offender may receive approximately exact justice. Recent writers quite generally agree that punishments should not have retribution for their object, but the penalty should be calculated as to its efficacy in removing from society the cause of danger. A thorough system of right education induces habits of industry in the young, while remunerative employment is a preventive against falling into the necessity of violating law in order to subsist. The education must go beyond the schoolroom; it must be furthered by libraries, public policy, and the sum of effective external circumstances which influence the character of society.

**CRIMEA** (krĭ-mě'á), a peninsula in the southern portion of Russia, between the Sea of Azov and the Black Sea, and attached to the mainland by the Isthmus of Perekop. It is about 200 miles from east to west and has an area of 10,000 square miles. For governmental purposes it belongs to the Russian province of Taurida. The southern coast is elevated, while the remaining parts belong to the regions of the steppes. It is watered by numerous small streams, of which the Salghir and Alma rivers are the most noted. The climate is pleasant in

summer, but quite severe and changeable in the winter season. Among the products are flax, hemp, tobacco, cereals, and many varieties of fruits. In the mountain districts are limited areas of excellent forests, which yield good building material. The domestic animals consist of horses, cattle, swine, and fine-wooled sheep.

The chief city and part of the Crimea is Sebastopol, from which a railroad line extends through the central portion and connects with all parts of western and northern Russia. Owing to its location on the boundary between Europe and Asia, it has been the seat of many military contentions. It belonged to the Cimmerians in early history, passed over to the Greeks, and later became a part of Rome. After the decline of Rome, it was occupied by barbarian tribes, and in 1237 it was overrun by the Mongols under Genghis Kahn. The Genoese captured and fortified Kaffa in 1261. They occupied large portions of it until 1475, when they were expelled by Mahomet II., who made it a dependent khanate. The Russians took possession of it in 1783, and it has been under their dominion with more or less restriction since that time.

The Crimean War occurred between Russia and the allied forces of France, Turkey, and England in 1854-56. The war was caused by Russia's attempt to secure preponderance in the eastern part of Europe by crowding the Turks out of the Continent, occupying Constantinople, and making Servia, Bosnia, and Bulgaria principalities of the Russian Danube territory. Russia took this step with the avowed purpose of securing a protectorate over the Greek Church, which brought the issues to a crisis. In the war which followed were fought the battles of Alma, Tchernaya, Balaklava, and Inkerman. The contest terminated by the loss to the Russians of their strongest fortress, Sebastopol. The last-named fortress had been greatly strengthened by Catharine II. in 1786 with the view of overawing the Turks. After its fall, a treaty of peace was concluded at Paris, April 27, 1856, by the terms of which the Ottoman Empire was guaranteed independence. The Crimea has a population of 583,962, about half of which is Russian. The others include principally Tartars, Greeks, Jews, Germans, and Bulgarians.

**CRIMEAN WAR.** See **Crimea.**

**CRINOIDEA** (krī-noid'ē-ā), the name of a group of sea animals, so called from the fact that their body resembles the form of a water lily. They consist of an expanded or spreading disk upon the end of a long, slender, jointed stem, which is attached to the bottom of the sea during practically the entire period of their life. At present the species are limited to a small

number, but formerly, especially during the Carboniferous Age, they were very numerous, which is evident by the large number of fossil remains found in the deposits of that period. The first traces of their remains are found in the Silurian system, and most of the species appear to have become extinct with the formation of the more recent carboniferous rock. The animals of this class now living feed on spores of algae, minute crustaceans, and other food forms common to the sea. They are very sensitive to a change of temperature, inhabit the deeper water, and when disturbed fall on the bottom of the sea or swim away by movements of the arms. Their arms drop off when the animal is placed in an uncomfortable position, but are restored through a process of regeneration, if the main body survives.

**CRINOLINE** (krīn'ō-līn), a stiff fabric formerly made of horsehair, but now of various material, used for stiffening a collar, skirt, or other parts of a garment. The same name is applied to a hoopskirt, which has been fashionable at various periods. The hoopskirts worn in 1740 were three feet across the hips.

**CRIPPLE CREEK**, county seat of Teller County, Colorado, about ninety-five miles southwest of Denver, on the Midland Terminal, the Florence and Cripple Creek, and other railroads. It has a healthful climate and is surrounded by a picturesque country. The chief buildings include the high school, the courthouse, the public library, and several fine churches. It has extensive systems of street lighting and public waterworks. The industries consist chiefly of machine shops and enterprises connected with mining. Cripple Creek is among the most interesting and remarkable of the newer mining towns of the West. Gold was discovered in its vicinity in 1886, but the more productive veins were not found until 1891, when Robert Womack and others opened up a very productive lode. It was soon after developed by the Gold King Mining Company, and within a very short time the town had a population of 9,000. The output in 1891 was \$20,000, but this was enlarged annually until the normal output reached about \$18,000,000. A fire did considerable damage in 1896, but it was soon rebuilt and improved. In the vicinity are a number of other mining towns, including Altman, Anaconda, Lawrence, and Victor. Population, 1900, 10,147.

**CRITIC** (krī'tīk), one who possesses literary qualifications to judge of the qualities of anything by some standard, criterion, or canon. The term is applied particularly to one who reviews and judges productions of literature and art.

**CRITICISM** (krī'tī-sīz'm), **Higher**, the term

applied to the criticism of the origin, form, and value of the Bible and other books, in distinction from the *lower criticism*, which is concerned with their text. A few attempts at this criticism were made in the early centuries of the Christian era, but extensive work along this line is wholly modern. The first work of any extent was published by Jean Astruc in a book entitled "Conjectures Concerning the Original Memoirs used by Moses in Composing the Book of Genesis," which appeared in print at Brussels in 1753. The literature on this subject is now almost without limit. The most complete discussion is contained in the "Higher Criticism," by A. C. Zenas, New York.

**CRITTENDEN COMPROMISE**, a measure introduced by John Jordan Crittenden, in 1860, in the United States Senate. The proposition was in the form of a constitutional amendment which would permanently divide the Union into a free state and a slave state, the boundary being the line of 36° 30'. It provided that the United States was to pay the owner for any fugitive slaves, that the Federal government could not limit or prohibit the interstate slave trade, and that slavery was to be retained in the slave states and in the District of Columbia. The proposition caused much discussion in both branches of Congress and throughout the country. On Jan. 14, 1861, it was defeated in the House by a vote of 113 to 80, and on Mar. 2, 1861, in the Senate by a vote of 20 to 19.

**CROATIA AND SLAVONIA** (krō-ā'shī-ā, slā-vō'nī-ā), a province of Austria-Hungary, constituting one of the crown lands of Hungary. It is bounded on the north by Styria and Carniola, on the east and northeast by Hungary, on the south by Servia, Bosnia, and Dalmatia, and on the west and southwest by Istria and the Adriatic Sea. Croatia occupies the southwestern and Slavonia the northeastern part. The Drave river separates it from Hungary, and through the central part flows the Save river, which separates Croatia from Slavonia. The area is 16,675 square miles.

Most of the surface is mountainous, being cut up by ranges of the Julian and Styrian Alps, which attain heights of from 2,000 to 4,000 feet. Croatia contains the Agram Highlands, the Kapella, and the Croatian Karst. A fertile coast plain and productive valleys characterize the surface of Slavonia. Currents of the Adriatic sweep across the coast land of Croatia, hence its climate is raw and changeable, and numerous swamps make the climate of Slavonia somewhat unhealthful. The minerals consist chiefly of coal, copper, sulphur, and marble. Glass, paper, sugar, silk and cotton textiles, spirituous

liquors, and machinery are the principal manufactures. About thirty-five per cent. of the surface is arable land and a considerable portion is utilized for meadows and in forestry. Corn and wheat are the chief cereals and cattle and hogs are grown in large numbers. Fruit, especially grapes, and vegetables, are important products. Transportation is furnished by the Drave and Save rivers and a number of railroads. Fiume, on the Adriatic, is a port of entry and has railroad connection with the principal cities of the country. Porto Ré, Zengg, and Agram are commercial centers.

Both Croatia and Slavonia were a part of ancient Pannonia, a province of Rome. They comprised border territory in the conflict between Christianity and Mohammedanism for many centuries. Croatia was annexed to Hungary in the eleventh century, but it has continued a policy looking toward greater independence. The *Ausgleich* of 1867 was partially applied to both Croatia and Slavonia, and its ban, the chief executive, is appointed by the Emperor of Austria in the capacity of King of Hungary. The inhabitants consist largely of Serbs and Croats, with a small mixture of Germans and Hungarians. A large majority of the people belong to the Roman Catholic church, but the Greek Orthodox and a number of Protestant denominations are well represented. Population, 1906, 2,425,512.

**CROCODILE** (krök'ō-dīl), a large reptile which resembles a great lizard, found in portions of Africa, Asia, the Sunda Islands, and the Moluccas. Crocodiles are one of four living representatives of the order *Crocodylia*. The other three are lizards, serpents, and the class including turtles and tortoises. The group of crocodiles includes the crocodiles, alligators, and gavials. The alligators are native only to America, while the gavials belong exclusively to Asia and are found principally in India. All the animals constituting the *Crocodylia* are oviparous; that is, they produce eggs and hatch their young outside the body. They are characterized by long jaws and four short limbs; the fore feet have five toes and the hind feet four, the latter being webbed. Square bony plates cover the skin; the tail is long and compressed laterally. The tear glands are large, the heart is four-chambered, and the nostrils are located at the end of the snout, with capacity to close against ingress of water.

Crocodiles live mostly in water, but they are seen frequently on the sand in the warm sun. Their movement in the water is quick and well directed, while on land they move forward rapidly, but are slow to turn their bodies. The

best way to elude them on land is to turn rapidly and repeatedly in making a retreat from them. Their food consists of flesh, such as fish, quadrupeds, and carrion, and is preferred in a state of putrefaction. The eggs, about the size of goose eggs, are laid in the banks under covering and hatched by the warmth of the sun. The female of some species guards the eggs and shows marks of tenderness to the offspring. Crocodiles sometimes attain a length of thirty feet and attain a great age. The older individuals do not hesitate to attack larger animals and man. They are accompanied by a little bird, much like the cowbird associated with cattle. This bird consumes the insects and worms that fix themselves to their bodies and warns them in times of danger. They were held sacred by the

AFRICAN CROCODILE.

ancient Egyptians. At present they are not found on the Nile, except near its head waters.

**CROCUS** (krō'kūs), a genus of plants native to the eastern part of Europe and to Asia Minor. Several of the species bloom profusely. The flowers are violet, purple, yellow, white, striped, or saffron-colored. They are extensively cultivated in gardens; a sandy soil is best for prolific growth. According to their period of flowering, they are divided into the *vernal* and the *autumnal* crocuses. The dried stigma and style of several species form a powerful aromatic and are used to color an orange-yellow.

**CRONSTADT.** See **Kronstadt.**

**CROOKES TUBES,** the sealed vessels from which the air has been exhausted to the extent that a high vacuum is obtained, and which have electrodes at opposite ends. They are so named from the inventor, Sir William Crookes, and are used to secure various effects of electrical discharge. By a high vacuum is meant one in which the gaseous pressure is not

more than one-millionth of that of the atmosphere. Tubes somewhat similar were invented by Geissler, known as the *Geissler tubes*. They are of various forms and are supplied with platinum terminals and filled with different gases at different pressures. When the current of an electric machine is sent through them, it gives rise to many beautiful luminous effects. They are used in the spectrum analysis of gases and in the production of cathode rays.

**CROOKSTON,** a city in Minnesota, county seat of Polk County; on Red Lake River, in the valley of the Red River of the North. It is on the Northern Pacific and the Great Northern railroads. The surrounding country is fertile, producing hay and cereals. The chief buildings include the courthouse, public library, a gymnasium, a business college, and the high school. Among the manufactures are flour, clothing, machinery, and farming implements. It has systems of waterworks and electric lights. It was settled in 1872 and incorporated in 1879. Population, 1905, 6,794.

**CROQUET** (krō-kā'), a popular open air game played by two or more persons with balls and mallets. The ground should measure 36 by 72 feet and be raised two inches at the border.

Near each end of the ground is a *stake*, and nine *wickets* are set at convenient points between them. The game consists of driving a ball from the stake at the head of the ground through the wickets on the right hand side and to the stake at the foot of the ground, whence the ball is driven to the point of the beginning by way of the wickets to the left hand. When a ball has made the circuit of the field but has not touched the stake at the head of the ground, it is called a *rover* and may play on every other ball in the field in one turn. A complete croquet set consists of eight balls, painted in agreement with eight mallets, but in practice two or more persons play the game. The player loses his turn when he fails to drive the ball through a wicket, hence the game may be of considerable duration. Croquet is a very old game, but its popularity is of comparatively recent date. Interest in it is promoted in England and America by national and international associations.

**CROSS,** a figure produced by the intersection

of two lines at right angles. In ancient times a cross was formed by fastening a piece of wood across an upright post or tree, which served for the execution of criminals by nailing or binding them in an upright position. Christ

association and fancy give the shape of a cross. In 1679 it was added to the list of constellations by Olaus Römer (1644-1710).

**CROSSBILL**, the common name of several species of birds of the finch family, so named because the tips of the mandibles cross each other. The form of the bill gives them facility to shell pine cones to find the seeds, their principal food. The crossbills are found in the northern parts of North America and the colder parts of Asia and Europe. They attain a length of about seven inches. The male is reddish in color and the female is yellowish-green. Their nests are built in the limbs of trees, where they breed.

**CROSS FERTILIZATION**, the term used by botanists to describe the fertilization of plants by bringing the pollen from the stamens of a given species in contact with the pistils of another. This is done in the course of nature by insects, birds, or the movement of air. However, the term has a broader signification in the cultivation of plants, since it implies bringing together the generative parts of such flowers as will result in producing the best plants and improving the fruits borne by them. In-and-in breeding among animals is known to sterilize and degenerate, while cross breeding tends to so combine temperaments and physical structures that the offspring may be improved. This is true in a great measure with plants, and those interested in their culture single out

CROQUET GROUNDS.

was crucified by nailing the hands and feet to the cross and securing the limbs by means of cords. The cross was adopted early as a symbol of Christian faith. It was carried by the legions of Christian warriors and was displayed in churches, cemeteries, and other places as a symbol of loyalty to the Christian cause. The cross is still a sign of distinction from the crescent used as a symbol by the Moslems, and is seen in Christian print, architecture, and worship.

**CROSS, Southern**, the most conspicuous constellation in the Southern Hemisphere, seen near the Antarctic Circle. At a northern latitude of  $30^\circ$  it is at the southern horizon, but, owing to the haze and fog near the sea, it is not seen clearly north of the Tropic of Cancer. It contains four bright stars, to which Christian

CROSSBILL.

the best species so as to have a combination of the stronger and better specimens.

Cross fertilization in plants, like that in animals, must be guarded with considerable care, since species of vastly different characteristics

do not produce the most healthful and serviceable offspring. Perhaps this is better illustrated in the human race, where crosses between individuals of vastly different races, such as the Caucasian and Ethiopian, do not result in an advantage to the race more highly developed. Bees, humming birds, and many insects are a prolific source of cross fertilization, and where botanists conduct experiments it is necessary to provide protection against their coming in contact with plants.

**CROTON** (krō'tūn), a genus of plants which include herbs, shrubs, and trees. They occur in the warmer parts of both hemispheres. The leaves are variable and extremely acrid. Important medicines are obtained from the wood and seeds. Croton oil is expressed from the seeds of a number of species. It is brownish-yellow and has a nauseous taste. In large doses it is a dangerous poison, but in moderate quantities it acts as a drastic purgative, often causing vomiting. It is used as a counter irritant for obstinate constipation and accidental poisoning. About thirty species occur in Mexico and the southern part of the United States.

**CROTONA** (krō-tō'nà), or **Croton**, an ancient Greek colony in the southern part of Italy, on both sides of the Aesarus River and on the east coast of the Bruttian peninsula. It was founded by Achaean colonists about 710 B. C., and grew rapidly in wealth and commercial importance. The disciples of Pythagoras became rulers of the city of Crotona about 530 B. C., and the colony furnished a large number of men during the war with Sybaris, about 510 B. C., but the Pythagoreans were soon after expelled. It suffered greatly during the war between the Romans and Pyrrhus, when it was plundered and nearly destroyed, and was overrun by its enemies in the second Punic War. The modern city is called Cotrone.

**CROTON AQUEDUCT.** See **Aqueduct.**

**CROUP** (krōp), a common disease occurring mostly in young children. It takes the form of an inflammatory affection of the trachea and larynx, and arises largely from exposure to wet and cold and from digestive disturbances. It occurs most frequently at the ages of two and three years, and generally on the fourth or fifth day produces death by exhaustion and strangulation. The two forms of the disease are known as false croup and membranous croup. Both are attended by coughing. In *false croup* the child has a running from the nose and the breathing is labored and noisy. *Membranous croup* is due to the bacillus of diphtheria and is contagious and frequently fatal. Small pieces of membrane are coughed

up in severe cases. The operation known as tracheotomy, which consists of inserting a tube into the windpipe below the inflamed tract, is often resorted to in this malady. The tube serves as a means of breathing.

**CROW**, the common name of any bird of the genus *Crovis*, of which the American crow is the type. The plumage is glossy black, the wings are long, and the beak is conical. About 200 species have been studied. They are intelligent and may be easily domesticated. Nearly all species build their nests on the limbs of trees, near which they perch and utter their harsh but familiar cry. The crow is widely distributed in all the continents and islands. Its favorite food consists of various kinds of carrion, but it feeds on fish, small quadrupeds, grains, and nuts, and delights to rob the nests

HOODED CROW.

of other birds and poultry of the eggs and young. Its habits are more or less gregarious, but it is frequently seen by itself or in isolated pairs. The crow of America is smaller than that of Europe, measuring about eighteen inches in length. The *fish crow* is found along the southern coasts, resembling the northern species, but is somewhat smaller. The *rook* is a small-sized species, has a peculiarly bare face, and is quite tame.

The crows are found in climates far north at all seasons of the year, but large numbers move southward in winter to warmer districts. The *hooded crow* has a small black tufted head, which is quite distinguishable from the gray body. It feeds on fish and carrion. Other spe-

cies are found in Ceylon, where they live in towns, and several are native to New Zealand, New Guinea, and other islands. The *jabbering crow* of Jamaica has a peculiar and active voice. The jays, ravens, magpies, and jackdaws are closely related species. The flight of the crow family is not graceful, being marked by incessant flapping of wings, but most species are able to sustain the fatigue of traveling long distances. They usually fly in a direct line toward their destination, stopping to rest on the roadways or on the limbs of trees. Their scent is very marked, enabling them to detect and locate carrion at some distance.

**CROW**, the name of a tribe of North American Indians, a branch of the Sioux family. Formerly they inhabited the region of the upper Yellowstone and Missouri rivers, but they are now confined on a reservation in the State of Montana. They were friendly to the whites when the main branch of the Siouxs conducted a warfare against the settlers, and many of them were employed as guides and scouts. At present the total number is about 1,975.

**CROWN**, the name of a coin issued by several European countries. The English crown was originally a gold coin, first issued in 1527 by Henry VIII., but since 1551 it has been made wholly of silver. It is worth five shillings sterling, or about \$1.23 in the money of Canada and the United States. The crown of Sweden, Norway, and Denmark is equivalent to about 26.5 cents, and that of Austria-Hungary has a monetary value of about twenty cents.

**CROWN**, the ornament worn on the head of princes, kings, and emperors as a badge of sovereignty. Similar ornaments, called *coronets*, are worn by the nobility. The *tiara* is a decoration of the Pope. This custom is of considerable antiquity. The first King of Israel, Saul, wore a crown, and this is true of the King of Ammon. The first Roman sovereign who wore a crown was Tarquinius Priscus, in 616 B. C. In 306 A. D., when Constantine began to reign, he wore a crown. The practice was afterward extended to western monarchs, and later sovereigns were represented with crowned heads on coins. Many of the crowns are of great value. The crown worn by Queen Victoria had 227 pearls, four small rubies, one large ruby, seventeen sapphires, 147 table diamonds, 1,273 rose diamonds, and 1,363 brilliant diamonds. In the crown of the Prince of Wales are the German words *Ich Dien* (I serve). The most celebrated crowns are those of Germany and Italy. The former is spoken of as the *silver crown*, but is a wealth of gold and gems. The latter is known as the *iron Lombard crown*, but is of

solid gold, except that it contains an iron nail reputed to have been used at the crucifixion.

**CROWN LANDS**, in America, the lands located west of the English colonies. All of these lands were declared to be crown lands by a proclamation of Great Britain after the Treaty of Paris, in 1763, and they were held as reserves for the Indians and declared to be under the jurisdiction of the home government. The colonists were not permitted to make purchases of, or make settlement in, any of this reserve territory without the royal permission. The several states claimed these lands after the Revolution.

**CROWN POINT**, a town in Essex County, New York, on Lake Champlain, 110 miles north of Albany. It is on the Champlain Canal and the Delaware and Hudson Railroad. Iron ore and phosphate of lime are mined in the vicinity. It has a public library, electric lighting, and a number of churches. Crown Point is noted for the ruins of the fortifications constructed here by the British at a cost of about \$10,000,000, although they are now in ruins. Seth Warner, at the head of a company of Green Mountain Boys, on May 11, 1775, captured the fort, which was garrisoned by only twelve men. Population, 1905, 1,890.

**CROYDON** (kroi'dŭn), a market town of England, in Surrey, ten miles south of London. It is located on several railway and electric railroad lines, and is a favorite residence suburb for merchants and business men of London. Among the principal buildings are a Gothic church, the Whitgift's Hospital, and a number of fine schools and charitable institutions. The manufactures embrace clocks, cotton and woolen goods, clothing, machinery, and spirituous liquors. Many fine drives and parks beautify the place, which was once the residence of the Archbishop of Canterbury. Its growth is comparatively recent, due largely to the development of many commercial and manufacturing enterprises. Population, 1907, 154,342.

**CRUCIBLE** (kru'si-b'l), a vessel made of material which is capable of holding substances that are to be submitted to a high temperature, such as the material for melting metallic ores or those used in glass-making. The form is circular, conical, or triangular. The material used for making crucibles is either iron, porcelain, graphite, or platinum.

**CRUELTY TO ANIMALS**, The American Society for the Prevention of, an organization incorporated April 10, 1866. It was the first society organized in America for the protection of animals. Henry Bergh was the founder and first president, and to his tireless energy and

self-sacrifice the laudable work of protecting animals in a systematic way owes its origin. Through the efforts of this society the first law enacted in America for the protection of animals was passed by the Legislature of New York. The example was followed by the legislatures of other states, thus leading to much good in the care, use, and protection of all kinds of domestic animals. Branch organizations are now maintained in many parts of the United States and in other countries of America and the Eastern Hemisphere. Many cases have been attended by the society and its agents. The object is to prosecute offenders in the courts, temporarily suspend disabled animals from labor, humanely destroy animals that are past recovery, investigate complaints, and provide ambulances for the removal of disabled animals from the streets and highways for medical attendance. *Our Animal Friends*, a monthly magazine, is the official organ of the society, through which knowledge and interest is disseminated.

**CRUELTY TO CHILDREN.** See *Children, Society for the Prevention of Cruelty to.*

**CRUSADES** (krū-sāds'), the expeditions and wars conducted by the Christians of Europe to uphold the rights of pilgrims at Jerusalem, and ultimately to establish a firm foothold for Christianity in Asia. The Crusaders wore a cross made of white, red, or green woolen, sewed on the right shoulder of the dress, as a signal that they fought for the interests of the *Cross* as against the *Crescent* of the Moslem. Jerusalem and the Holy Sepulcher fell into the hands of the Mohammedans in their early conquest of Palestine. Notwithstanding, the Christian pilgrims still thronged to the Holy Land to worship on the scenes frequented by the Savior.

During the ascendancy of the Saracens in the East the Christians were shown tolerable kindness, largely as a matter of policy, but when the Turks secured dominion widespread outrages were perpetrated. Many expeditions of pilgrims were insulted, pillaged, or murdered. The returning remnants spread complaints of Turkish insolence and barbarity throughout Europe, causing intense excitement and solicitude in the various nations. That they should be driven from the region embodying the most sacred interest of Christians, and the places of concern be occupied by a class foreign and adverse to everything pertaining to their spiritual welfare, led to a widespread desire to depose the Turks and establish Christianity on a firm basis in the East. The first general agitation of a Crusade to the Holy Land began in the latter part of the 10th century, when Pope

Sylvester II. attempted to induce the Christian world to succor the afflicted of Jerusalem, but to this call only a feeble support was given by the people. However, later there were no less than eight great movements, including the *Children's Crusade*, to accomplish the object desired.

I. The first Crusade was induced largely by the agitation of Peter the Hermit, who traveled throughout Europe for that purpose and aroused general interest in the project. He was aided by Walter the Penniless and others interested in various parts of Europe. The Crusaders under Peter the Hermit numbered about 40,000, and under Walter the Penniless about 20,000, and besides these were about 15,000 Germans and various smaller organizations. As a whole, the participants were illy prepared, impatient, and poorly equipped to enter upon such an expedition. Later a stronger organization was led by Godfrey of Bouillon, Duke of Lorraine, and his brother Baldwin, Count of Flanders, aided by several others. Nice was taken in 1097; Antioch, in Syria, in 1098; and Jerusalem, in 1099, where a Christian kingdom was established with Godfrey of Bouillon as sovereign. Soon after the Battle of Ascalon was fought, in which he defeated the Sultan of Egypt. The first Crusade dates from 1096 to 1099. Palestine was in the hands of the actors of this Crusade for fifty years. During their dominion the two great military and religious orders were formed—the Knights of Jerusalem and the Knights Templar.

II. The second Crusade was undertaken in 1147 and ended in 1149. It was signaled by the fall of Edessa into the hands of the Mohammedans in 1144. Following this Bernard, abbot of Clairvaux, traveled over Europe preaching a second Crusade much as Peter the Hermit had preached the first. In 1147 Conrad III., Emperor of Germany, and Louis VII., King of France, took up the cross and started upon a Crusade with more than 300,000 soldiers. They passed through Germany, Hungary, and over the straits into Asia. By the unfriendly schemes of Manuel, the Emperor of East Constantinople, the plan was frustrated and proved an entire failure. Conrad was defeated in the mountains of Cappadocia and returned in despair to Constantinople. Louis gained a slight triumph over the Saracens on the banks of the Meander and struggled on through storms and famine until he reached Antioch. There he was joined by Conrad. They united their forces and entered Jerusalem, but failed in their siege of Damascus.

III. The third Crusade dates from 1189 to 1192. It was agitated for a number of years, finding its greatest support in Italy, Germany

and France. When the report was spread throughout Europe that Jerusalem had fallen before Saladin, the Sultan of Egypt, and that the golden cross which had glittered on the Mosque of Omar for 48 years had been trampled in the streets, the enterprise was assured. The Italian contingent sailed to relieve the Christians in the siege of Acre, which had yielded to Saladin. Later Richard I., of England, Frederick Barbarossa, of Germany, and Philip Augustus, of France, led large armies into Asia Minor. The armies of Philip and Richard were weather-beaten and sorely pressed, only 5,000 reaching Acre. A detachment sailing under Richard for the Holy Land was divided by a storm and driven to Cyprus. Jealousies arose between Richard and Philip, after which the latter returned to France and the former was successful in several engagements by which he excited the admiration of the Saracens. A truce followed for a time with Saladin, in which the latter was left potentate in possession of Jerusalem.

IV. The fourth Crusade was brought about largely through the efforts of Pope Innocent III., and covers the period between 1195 and 1197. In these expeditions the Western Christians captured Constantinople from the Greeks in the East and founded a Latin kingdom which endured fifty-seven years. During the siege of Constantinople many precious works of art were destroyed and much of the city was burned. The purpose was to build up a permanent power against the Moslems but in this the enterprise failed.

V. The fifth Crusade dates from 1198 to 1204. It resulted in a second siege of Constantinople terminating to the advantage of the besiegers. Baldwin, Count of Flanders, was elected emperor over one-fourth of the Eastern dominions and the remaining portion was divided between the republic of Venice and the barons of France. In the meantime the *Crusade of Children* was organized in 1212. About 30,000 boys and girls of France and 40,000 of Germany crossed the Alps and pushed forward with the expectation that the Moslems would embrace Christianity by miracles. Large numbers of them became discouraged and returned home, while others perished, were sold into slavery, or lost at sea. Frederick II., Emperor of Germany, proceeded to Jerusalem in 1227, where he secured a treaty with the Sultan of Egypt without expenditure of human life, under which he was crowned King of Jerusalem. However, he returned to Germany in 1229.

VI. The sixth Crusade was conducted by Louis IX., King of France, from 1248 to 1254.

He was taken prisoner in Egypt, but secured his release by paying an enormous ransom. From Egypt he went to the Holy Land, where he built a number of forts, but soon returned to France.

VII. The seventh Crusade was started by Louis IX., of France, in 1270, but he died of pestilence in Tunis. He had been associated with Prince Edward of England, later Edward I., who landed at Acre in 1271. Nothing was accomplished aside from a truce of ten years. Subsequently several other efforts to secure a permanent foothold were made, but they were greatly weakened by those undertaken in the early period of the movement. The Latin kingdom of Jerusalem expired in 1291.

The most important events of the Crusades include the capture of Jerusalem by the Crusaders in 1099. It was retaken by Saladin in 1187, restored to the Christians by a truce in 1227, and taken by the Turks in 1239. The empire founded by the Crusaders expired with the capture of Acre by the Sultan of Egypt in 1291. The Crusades with their attendant interests were promoted about two centuries and had a marked impression upon the several kingdoms of Europe. Immense sums of money were spent without securing productive returns, millions of lives were lost, and marked changes were wrought in the habits and customs of European nations. After these conflicts were over, attention again turned to commerce, the laboring classes receiving a new impulse. During this period the germs of new ideas were sown in inquiring minds, and bigotry and imperialism rapidly diminished. While attended by some elements of harm, they broke up old feudal systems and paved the way for vast commercial and industrial enterprises.

**CRUSTACEA** (krūs-tā'shē-ā), a class of aquatic arthropods, so named from the hard armor which covers the whole body. About ten thousand species are included in this group of animal life. The shell of the body is jointed, forming the principal part of the skeleton, and each joint or segment of the body has a pair of jointed appendages. Two of the appendages are usually modified into antennae or feelers, below or back of which is the apparatus for eating. The higher classes have the bodies divided into three parts: the head, thorax, and abdomen. All are oviparous and the sexes are distinct in most species. The crust or shell is cast off in one piece when it gets too small for the growing body and a new one better fitted develops. Limbs lost by accident or in combat are replaced by new growth in a short time. The outer hard shell consists of many parts

and allows movements by being jointed much like the joints formed by cartilages in higher forms of life. Some species of the crustacea have compound eyes borne upon long stalks, a pair of jointed feelers, and gill-like appendages for breathing. Various species occur in the seas, in fresh water, and on land. Fossil remains of these animal forms have aided greatly in studying the age of strata. Among the familiar examples of the living crustaceans are the lobsters, crawfishes, barnacles, and shrimps.

**CRYOLITE** (krī'ō-līt), a compound of sodium, aluminum, and fluorine, so named from its fusibility in the flame of a candle. In a pure state it is snow-white, partially transparent, and has a vitreous luster. It is used in the manufacture of soda and in making a beautiful glass somewhat resembling porcelain, and is a source of sodium hydrate, sodium carbonate, and other salts. Cryolite is found chiefly near Arksuk, Greenland, and in El Paso County, California.

**CRYPT** (krīpt), a chamber under a church or beneath a monument to receive the bodies of the dead. Originally the term was applied to a subterranean chapel in the catacombs and later it designated a room near the confessional, of which it was an extension or enlargement. Crypts were constructed very largely in the churches from the ninth to the thirteenth century and many are of beautiful construction. The crypt under the cathedral at Glasgow, Scotland, is one of the finest examples. Others of note include those in the Cathedral of Canterbury, the Church of Saint Mark at Venice, the Cathedral of Strassburg, Germany, and the Sainte Chapelle, Paris.

**CRYPTOGAMOUS PLANTS** (krīp-tōg'ā-mūs), or **Cryptogams**, the name applied by Linnaeus to all the plants that do not reproduce by flowering. The seed-bearing plants, to distinguish them from the cryptogams, are usually called *phanerogams*. Formerly it was thought that the distinction between the two classes should be based upon the theory that the cryptogams reproduce by spores and the phanerogams by seed, but this view is not correct, since both groups include representatives that produce spores, but the former do not produce seeds.

**CRYPTOGRAPHY** (krīp-tōg'rá-fý), a system of writing with sympathetic ink, or with secret characters or ciphers. The most common method is to choose a sign or mark for every letter of the alphabet, using the substituted characters in committing the subject-matter to writing.

**CRYSTAL** (krīs'tal), in mineralogy and

chemistry, the solid mathematical form which a chemically homogeneous body tends to assume by undisturbed and mutual attraction of its particles. Crystals may be developed by dissolving crystalline bodies in water, alcohol, or other fluids, and then abstracting the fluid by evaporation. Crystalline forms occur largely in nature. The study of their structure and the laws by which they are formed is called crystallography, which is an essential division of mineralogy.

**CRYSTALLOGRAPHY** (krīs-tal-lōg'rá-fý), the science of crystallization, which investigates the system of form among crystals, and treats of their structure and method of formation. A crystal is bounded by plane surfaces, which have a symmetrical arrangement around certain imaginary lines called *axes*. Crystals are formed in all inorganic substances when solidifying, whether natural or artificial, and many thousands of forms are thus produced. Since the qualities of crystals depend directly on the forces of the ultimate molecules or particles of matter, crystallography constitutes an important department of molecular physics and is concerned in the study of cohesive attraction. All solidification in inorganic substances is crystallization, hence cohesive attraction in solidification consists wholly of crystallogenic attraction.

The very numerous forms of crystals may be classified under six systems. 1. The *monometric system*, in which the crystals have three lines or axes of equal length, hence are of one kind, include such crystals as are formed by silver, gold, iron pyrites, and common salt. All the forms of this system are symmetrical. 2. The *diametric system* has axes of two kinds, the lateral axes being equal to each other, but differing in length from the vertical axis. Under this system crystallization is in the form of square octahedrons, equilateral eight-sided prisms, eight-sided double pyramids, and in a number of other forms. Among the examples are the crystals of tin idocrase and calomel. 3. The *trimetric system* includes the forms in which the vertical axis is unequal to the lateral and the two lateral axes are unequal to each other, hence the three axes are all of unequal length. The crystalline forms are right rhombic prisms and rhombic-based octahedrons. The examples include topaz, sulphur, epsom salt, and heavy spar. 4. The *monoclinic system* includes the crystals in which two of the axes are at right angles to each other and the third is inclined. All the axes are of different lengths and the crystals are oblique rhombic prisms. Copperas, borax, sugar, and carbonate of soda crys-

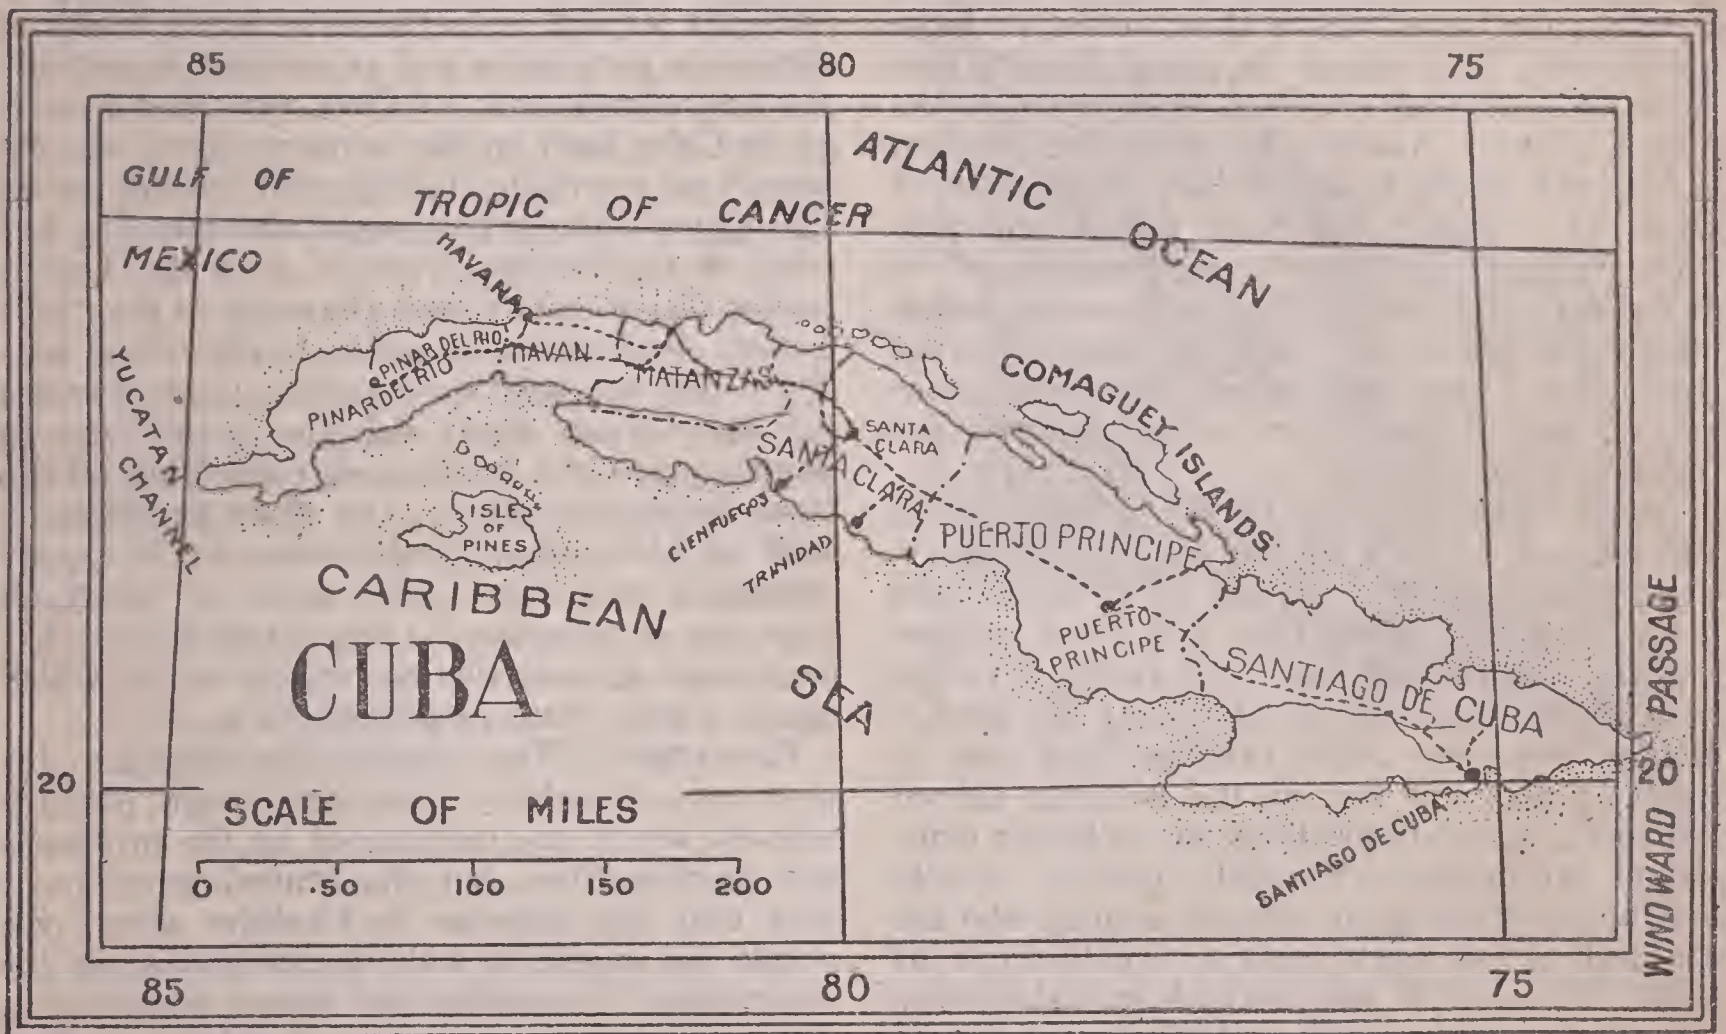

tallize according to this system. 5. The *triclinic system* includes the crystals that have three axes of unequal length, all the three intersections being oblique. The forms are oblique prisms contained under rhomboidal faces. The crystals of this system include those of sulphate of manganese and blue vitriol. 6. The *hexagonal system* includes the regular hexagonal prisms, in which the vertical axis connects the centers of the bases, and the three lateral axes join the centers of the opposite lateral faces or edges. It also includes the rhombohedron and its derivative forms. Among the crystals are those of many kinds of limestone and emerald.

**CUBA** (kū'bà), a republic in the West Indies, on the island of Cuba, the largest and most

from southeast to northwest across the island, known as the Copper Mountains, which vary in height from 1,000 to 4,000 feet. The most elevated summits are in the southeastern part, where Turquino, the culminating peak, rises to a height of 8,320 feet. Low and marshy lands lie west of Cape Cruz, near which is located the great Zapota swamp. Coral islands or reefs border the northern coast.

Cuba has no large rivers, but its streams that may be classed as rivers exceed 150 in number and only few of these are navigable. The Cauto, wholly in the province of Santiago de Cuba, is the largest stream. It is about 150 miles long and is navigable for a distance of fifty miles. The climate is variable inland, but along the coast it is very equable. At Havana

important of the Greater Antilles. It is situated mainly between latitudes  $19^{\circ} 20'$  and  $23^{\circ} 8'$  north and longitude  $78^{\circ}$  and  $85^{\circ}$  west, and between the Gulf of Mexico and the Caribbean Sea. The coast line is very extensive, containing numerous inlets and safe harbors. The northern coast is about 818 miles long and the southern 972 miles, the former having thirty-two harbors and the latter twelve. From east to west the island has a length of 760 miles, with an average width of eighty miles, and the area, including a number of small islands, is 45,881 square miles.

**DESCRIPTION.** A range of mountains extends

the rainfall is about fifty inches and in the northeastern section it ranges from 80 to 100 inches, but the southeastern region has a smaller precipitation. The winter season is marked by copious rainfall, but is not cold, while the summer breezes modify the temperature and render it quite pleasant in all portions. In summer the thermometer rarely rises above  $90^{\circ}$  and seldom falls below  $85^{\circ}$  in winter, but the mountainous regions have a lower temperature in winter, though rarely less than  $50^{\circ}$ . Normally the climate is healthful, but sickness prevails along the low coasts and in the marshy districts.

Cuba has a tropical vegetation and many of

the plants are luxuriant. The prairies abound with nutritious grasses and fully one-half of the surface is covered with forests, including the palm, mahogany, cedar, *lignum-vitae*, logwood, rosewood, acana, and Cuban ebony. Many species of fruit are native or have been naturalized. Animal life is abundant, especially birds, of which there are more than 200 species. They include the vulture, grouse, snipe, quail, wild turkey, and many birds of song. The reptiles are represented by the alligator, lizard, tree toad, and turtle. Many species of insects abound, including the scorpion, tarantula, firefly, ant, and a limitless number of others. The rabbit, bat, cat, and domestic animals are well represented. The waters of Cuba are rich in fish, including about 650 species.

**MINING.** Iron is found in the province of Santiago de Cuba, where it is mined in large quantities. The output is about 575,000 tons annually, nearly all of which is exported to the United States. Asphalt, an important product, is obtained chiefly in the vicinity of the Bay of Cárdenas. Copper has been mined profitably for many years and prior to the discovery of the deposits in the United States it was exported largely for use in the American manufacturing enterprises. Salt, gold, silver, petroleum, manganese, and a number of other minerals are found in paying quantities.

**AGRICULTURE.** Owing to the genial climate and general fertility of the soil, agriculture is the leading industry. Many of the cultivated fields have been tilled fully 200 years without artificial fertilization and their riches have not been perceptibly affected. Much of the land is divided into small tracts, ranging from eight to twenty acres, and few of the holdings exceed 100 acres, except in localities where larger plantations are managed by white owners. Nearly half of the farmers are colored tenants, who are confined almost exclusively to small tracts of lands. Agriculture was set back materially during the war with Spain, in 1897, but at present it is conducted with much profit.

Sugar cane has been cultivated since 1523 and takes rank as the most important product. The sugar plantations are operated on large holdings, usually several thousand acres, and they are equipped with private railways, plants to manufacture sugar, and numerous buildings for the occupancy of the laborers. Tobacco takes rank next to sugar as an important crop, and it has been cultivated with considerable success since 1580. The provinces of Havana and Santa Clara are the chief centers of the tobacco fields. Maize is cultivated in all parts of the island and rice is grown extensively, but the latter does

not yield sufficient for domestic consumption. Wheat and oats are not cultivated extensively, but vegetables, especially sweet potatoes, are grown in all parts of the island. Cocoanuts, lemons, limes, mangoes, guavas, figs, oranges, and pineapples are cultivated abundantly. Cattle, horses, swine, sheep, and poultry yield large returns.

**MANUFACTURES.** Sugar and tobacco products are the principal manufactures. The former consists chiefly of raw sugar and is made on the plantations largely as an adjunct of agriculture. Havana is important as a manufacturing center of cigars and smoking tobacco, large quantities of which are exported. Other manufactures include clothing, rum, flour, cordage, fabrics, and earthenware.

**COMMERCE AND TRANSPORTATION.** Havana, the principal seaport, is the focus of many routes in steamship navigation and is touched by numerous transatlantic routes. Cienfuegos and Santiago de Cuba, both on the southern coast, are the centers of a growing foreign and interior trade. The exports somewhat exceed the imports, and most of the foreign trade is with the United States, Great Britain, and Germany in the order named. Railroad construction has advanced rapidly within the last two decades. Lines traverse the island from Pinar del Rio in the west to Santiago de Cuba in the east, connecting all the more important cities. The lines aggregate a total of 1,500 miles, though some are in a poor condition, and about 4,500 miles of telegraph lines are in operation. Comparatively little has been done in constructing wagon roads, which are in a poor state of development.

**EDUCATION.** The constitution provides for free and compulsory attendance upon primary schools, which are maintained by the provinces and municipalities, but the central government may bear the expense in localities where the people are unable to make ample provisions for instruction. Secondary and higher education is under control of the state and culminates in a university at Havana. A large number of teachers from Cuba received normal training in the United States after the organization of the republic, and since then considerable progress has been made in public instruction. Many private and parochial schools are maintained, owing to the fact that the inhabitants are largely Roman Catholics.

**INHABITANTS.** The province of Havana is densely populated, having 187 persons to the square mile. About seventy per cent. of the people are white, and the remainder are negroes, mixed elements, and Chinese. Nearly half engage in agriculture, about one-fifth in domestic

service, and one-seventh in mechanical and manufacturing pursuits. Havana, the capital, is the largest city and most important commercial center of the West Indies. Santiago de Cuba, Cienfuegos, Matanzas, Pinar del Rio, Cárdenas, and Puerto Príncipe are among the leading cities. The last two censuses were taken under the direction of the United States, in 1899 and in 1907, from which the following table has been prepared:

PROVINCES.	POPULATION, 1899.	POPULATION, 1907.
Havana.....	424,804	518,524
Pinar del Rio.....	173,064	240,781
Matanzas.....	202,444	239,866
Santa Clara.....	356,536	457,897
Puerto Príncipe.....	88,234	117,432
Santiago de Cuba.....	327,715	453,782
Total.....	1,572,797	2,028,282

**GOVERNMENT.** Cuba is governed under a constitution adopted in 1901, by which the administration is vested in a president, who is elected by manhood suffrage for a term of four years and is limited to a service of not more than two consecutive terms. It is required that the president be a native Cuban or a naturalized citizen who served not less than ten years in the Cuban army during the wars for independence. The members of his cabinet, who are responsible to him for the administration of their offices, are appointed and removed at his pleasure. A congress of two departments, the senate and house of representatives, has full legislative power. The former is composed of twenty-four senators, that is, four from each province, elected by an electoral board of the provincial councilmen and electors, and hold office for a term of four years. Representation in the lower branch of congress is on a basis of one member for every 25,000 inhabitants, or a fraction of more than 12,500, and the term is for four years, one-half retiring every two years. Congress, which meets annually, has general control of the finances and foreign affairs, and has legislative power in matters concerning the republic. The chief judicial power is vested in a supreme court, members of which are appointed by the president subject to confirmation by the senate. Citizenship was extended to all Cuban and Spanish residents who were on the island Sept. 11, 1899, and to all foreigners who resided here since Jan. 1, 1899, and those not included in these classes may acquire citizenship by naturalization, which requires a residence of five years.

The six provinces of Cuba are Havana, Pinar del Rio, Santa Clara, Matanzas, Puerto Príncipe, and Santiago de Cuba. Each of these has

the power to legislate and administrate in regard to matters of local concern, but their laws and administration are subject to the constitution of the republic. Members of the provincial assemblies as well as the governors are elected by popular vote. Spanish is the official and spoken language, but it is mixed somewhat with native dialects.

**HISTORY.** Cuba was discovered by Columbus in 1492 while on his first voyage to America. It was first named Juana in honor of Prince John, son of Ferdinand and Isabella, and later received the name of Fernandina. Afterward its name was changed to Santiago in honor of the patron saint of Spain, and still later to Ave Maria in honor of the Virgin Mary. The name applied to it at present is the one by which the

FLAG OF CUBA.

natives knew it at the time of its discovery. The aboriginies were a peaceful, semisavage people, who lived in tranquillity and possessed some degree of development in rude industry and a primitive form of religion. Columbus revisited the island twice after its discovery, in 1494 and in 1502. Diego Columbus, son of Christopher, organized an expedition of 300 men under Diego Velasquez and founded the first permanent settlement in 1511. The first settlements in Santiago and Trinidad were formed in 1514, and the present city of Havana was founded in 1519. In the first quarter of the 19th century all the continental colonies controlled by Spain secured their independence, but Cuba and Porto Rico remained faithful to the mother country. Many of the Spaniards remaining loyal to the mother government left the con-

tinental possessions and took refuge in these islands, thereby enriching them with their skill, energy, and capital. The cultivation of sugar cane and tobacco was early developed, and, with the income of large capital and superior skill, made rapid progress, soon replenishing the coffers of Spain, which had been drained by continuous foreign wars.

The colony of Cuba was a seat of contention whenever Spain engaged in war with European countries. Havana was destroyed in 1534 and again in 1554 by the French. The Dutch captured it in 1624 and the English in 1762. Beginning in 1810, it was governed by a foreign captain general. Excessive taxation and other differences caused numerous dissensions, which led to a rebellion in 1836 and to insurrections in 1844 and 1848. A number of parties in the United States coveted the possession of the island, particularly the slave-holding interests, and offered to buy it with the intention of making it a permanent possession. In 1850-51 Narciso Lopez was assisted by adventurers, known as filibusters, from the United States, in an attempt to seize the island, but the expedition was expelled by the Cubans. The United States issued the Ostend Manifesto in 1854, which declared that the island would be seized if Spain refused to sell it. Soon after a strong party for liberation from Spain was formed, and Maximo Gomez conducted a war for Cuban independence during a period of ten years, beginning in 1868. It was terminated by the Elzanjon Treaty in 1878 with the acting captain general, Martinez Campos. The treaty provided for the early abolition of slavery and guaranteed certain personal and political rights to the Cubans. Slavery was abolished in 1886, but the policy of Spain remained as before in the interest of the mother country, rather than for the benefit of the colony.

Conditions rapidly formed that led to the Cuban revolution of 1895. The native patriots were aided by the Cuban exiles, the latter having their headquarters at New York. Secret preparations were carried forward with remarkable rapidity, arms and ammunition were smuggled into Cuba, and a formal declaration of war was made Feb. 24, 1895. The revolutionary forces were placed under the command of Maximo Gomez, who was supported with alacrity by the negroes and by the inhabitants of Porto Rico. The warfare carried on by the revolutionists partook of a guerrilla form, being mostly raids upon plantations and cities. Afterward the forces fell back into the mountain districts, where they were secure against Spanish troops, but came forward successively with surprises to the Spaniards.

Antonio Maceo landed in Cuba in the spring of 1895 and was hailed with much enthusiasm by the patriots. The total forces of the Spaniards numbered 200,000, while the insurgents had about 60,000. Gen. Valeriano Weyler, governor general, carried on the war with much cruelty, whereby needless loss of property and life was occasioned. The people of the United States manifested a decided feeling of friendliness toward the patriots, who were struggling for liberty as the early colonists had done in 1776. This occasioned a feeling of hatred on the part of the Spanish sympathizers against the United States, and culminated in the destruction of the United States battleship *Maine* then on a friendly visit to Havana, by a submarine mine, on Feb. 15, 1898, in which 262 men and officers lost their lives. A commission to investigate the conditions surrounding the destruction of the *Maine* was appointed by the President of the United States, and the report following the investigation intensified the feeling of hostility. War was formally declared on April 21.

The first decisive engagement of the Spanish-American War resulted in the destruction of the Asiatic fleet of Spain at Manila, in the Philippines, on May 1. On July 3 the strongest fleet of Spain was destroyed at Santiago by the Americans, Rear Admiral Schley commanding in action. Gen. Shafter laid siege to Santiago with the United States army and fought a decisive battle on July 1. Gen. Toral surrendered his army of 25,000 men to the Americans on July 17. The surrender of the remaining portion soon followed and the final treaty of peace was signed at Paris on Dec. 10, 1898. By its terms Spain ceded Porto Rico to the United States and relinquished all sovereignty over Cuba and the Philippine Islands. As a partial consideration to secure the relinquishment of the latter, the United States paid \$20,000,000. The treaty was ratified by the Senate on Feb. 6, 1899, by a vote of sixty-one yeas to twenty-nine nays, one vote more than the two-thirds majority requisite.

The first president, Tomas Estrada Palma, was elected in 1901, and the United States, having exercised supervisory functions in aiding to establish the government, withdrew formally on May 20, 1902. He was reelected to the presidency in 1905, and the following year his chief opponent raised an insurrection and tried to overthrow the government. The rebellion operated to destroy social order and render the national army powerless, hence the United States intervened. President Palma resigned and Charles E. Magoon (born in 1861) administered the affairs as military governor under the

direction of the United States. This condition continued until January, 1909, when José Miguel Gomez, a member of the Liberal party, was inaugurated as president. The new administration was authorized to issue bonds to the amount of \$15,000,000 annually for three years, the money to be devoted to internal improvements.

**CUBE**, in geometry, a solid body with six equal square faces. A body in which the volume is one cubic inch has six equal faces, each of which is one inch square. The volume of a cube is found by multiplying the length by the breadth and the product by the height; thus, 27 is the cube of 3, being equal to  $3 \times 3 \times 3$ . The number which is thus multiplied to make the cube is called the *cube root*. The problem of the duplication of the cube, or of constructing a cube of twice the volume of a given cube, is a famous mathematical problem which interested geometers in the time of Plato.

**CUBEBS** (kū'bēbs), the berries of a perennial plant of the pepper family, native to New Guinea and the West Indies. The berries are gathered before they ripen, and when dried are about the size of small peas and have a dark brown color. They yield a volatile oil, wax, resin, and cubebic, all of which are used in medicine, chiefly for the treatment of indigestion, chronic catarrh, and affections of the mucous membrane.

**CUCKOO** (kōōk'ōō), a widely distributed genus of birds which belong to the climbers. They are most abundant in Eurasia and Africa,

CUCKOO.

though a considerable number of species occur in America. The species of America are distinguished from others in that they hatch their own eggs, while those of the old world lay their eggs to be incubated in the nests of other birds. Their custom is to lay one egg in the nests of a number of birds, preferring the yel-

low-hammer, titlark, hedge sparrows, green linnets, and water wagtails. The young usually seek to monopolize the nests of their foster parents. It requires about five weeks to develop the bird sufficiently for fledging. The color of most species is ashy-gray, the belly is white, the tail is spotted, and the legs are light yellow. The African cuckoo attains a length of about fourteen inches. Its peculiar *coo-coo* cry heralds its return in the spring. The food consists of dragon flies, moths, caterpillars, and other insects. There seems to be a preponderance of males as compared with females in the ratio of about four to one. The species of the old world reach Central Europe in April from Northern Africa. The American species are about twelve inches long, and olive-green in color, and are found more or less widely distributed over the entire continent. In the spring they penetrate far into Canada, but move southward to winter in the warmer regions of the continent and in the West Indies.

**CUCUMBER** (kū'kūm-bēr), a genus of plants distinguished by their heart-shaped leaves, trailing stems, and conisexual male and female flowers in the axils of the leaf stalks. They are native to Egypt and the southern part of Asia, but were brought to Western Europe during the Crusades and to America shortly after its discovery. Several species form an important food product, both for use in the fresh state and for pickling purposes. The fruit product is valued only in an immature or green state, turning yellow and tough at maturity. The plant is attacked by the grub of several insects known generally as *cucumber beetles*, and both the young and the mature insects feed upon the leaves of the vine.

**CUCUMBER TREE**, a forest tree native to North America, so named from its fruit, which resembles a small cucumber. The tree grows to a height of from sixty to ninety feet, has a trunk about three to four feet in diameter, and the leaves are ovate and deciduous. The young leaf is downy and of a pale green color, but at maturity it is deep green and from seven to ten inches long. Owing to the lightness of the wood, it is used for making boats and troughs. The cucumber tree is confined to the warmer parts of the Temperate Zone and is found in the eastern section of the United States.

**CUENCA** (kwān'kà), a city of South America, in the Andean tablelands of eastern Ecuador, at a height of 8,650 feet above the level of the sea. It is the capital of the province of Azuay. Next to Quito, it is one of the most important cities, and has a cathedral and university, besides several other noted institutions.

It has a considerable trade in minerals and merchandise. The city has a number of modern improvements, including waterworks, a library, and several parks. Population, 1906, 44,484.

**CUFIC WRITING** (kū'fik), an ancient form of Arabic writing, so named from the town of Cufa, in the pashalic of Bagdad. It is supposed to have been introduced in Arabia about the sixth century, when it came into use in writing manuscripts, marking coins, and in placing inscriptions on monuments. Cufic characters were used in copying the earliest editions of the Koran and it continued to be the form of writing until about the tenth century, after which it was used more generally in marking coins and inscriptions.

**CUIRASSIER** (kwē-rās-sēr'), a soldier armed with a cuirass. This armor consists of a breast and back plate, lapping on the shoulders and buckled together beneath the arms. It has remained in use longer than any other form of defensive armor for the body and is still used in the heavy cavalry of some armies of Europe. The early cuirass employed by the Greeks was of linen, while the Romans made this armor of flexible bands of steel. Several regiments of cuirassiers were organized by Napoleon and maintained for effective service. A body of French cuirassiers swept across the plain to embarrass the British army in the first Battle of Waterloo. Cavalry equipped in this way is maintained by most European powers as an essential part of their armies.

**CULLODEN MOOR** (kūl-lōd'ēn mōōr), a Scottish heath five miles east of Inverness, celebrated for the decisive battle fought on April 27, 1746, between Prince Charles Stuart and the Duke of Cumberland. It was the last battle fought on Scottish soil, and ended all attempts of the Stuarts to recover the throne of England. Prince Charles was the pretender and was supported by a small army of Highlanders, who were in an unfit condition for battle, owing to exertion in marching, and soon fled before the disciplined troops and artillery of the Duke of Cumberland.

**CUMAE** (kū'mē), a Greek city of ancient Italy, in Campania, ten miles west of Naples. It was situated on the Mediterranean, founded by colonists from Chalcis in Euboea and Cymae in Asia Minor, and was noted for its extensive commerce. Citizens of Cumae built a number of port towns, including Naples and Messina. It was the most important city in the southern part of Italy for 200 years, between 700 and 500 B. C. It was attacked by the Etruscans, who came in contact with it as a maritime power, and it was conquered by the Samnites in 417

B. C. Hannibal failed to capture it in the Second Punic War and it held out as the last stronghold of the Goths in Italy, but was taken in 552 A. D., by the Byzantine army. The Saracens burned it in the ninth century and it was totally destroyed by the people of Naples in 1205.

**CUMANÁ** (kōō-mā-nā'), a city of Venezuela, in the state of Bermudez, on the Gulf of Cariaco. It is located near the mouth of the Manzanares River, in a hot and unhealthful climate, but has a large export trade in sugar, hides, coffee, and tobacco. The chief buildings include a college, a cathedral, and a number of government buildings. It was founded in 1520 and is thought to be the oldest city in America. Near it are several suburban towns, including San Francisco and Serritos. Population, 1906, 15,350.

**CUMBERLAND** (kūm'bēr-land), a city in Maryland, county seat of Allegany County, on the Potomac River and on the Pennsylvania, the Baltimore and Ohio, and other railroads. The chief buildings include the courthouse, the public library, an academy, and the high school. Gas and electric lighting, street railways, waterworks, and pavements are among the improvements. The surrounding country is rich in fertile soil and valuable deposits of bituminous coal. Among the manufactures are flour, ironware, carriages, clothing, cigars, machinery, cement, glass, and tin plate. It ranks second in size of the cities of the State. Cumberland was platted in 1785 and incorporated in 1815. The Chesapeake and Ohio Canal contributed to its early growth. Population, 1910, 21,839.

**CUMBERLAND MOUNTAINS**, a ridge of the Appalachian system, which forms a part of the boundary between Kentucky and Virginia and passes into Tennessee and Alabama. Its highest peaks rise about 2,800 feet above sea level. It is about fifty miles wide, well covered with maple, oak, hickory, chestnut, white ash, and pine timber, and is penetrated by numerous fertile valleys. Its mineral wealth consists of extensive coal, limestone, granite, and sandstone deposits.

**CUMBERLAND RIVER**, a tributary of the Ohio, rising in Kentucky. Its source is in the Cumberland Mountains, whence it flows toward the southwest into Tennessee, returns to Kentucky, and courses north until its waters unite with the Ohio. The total length is about 650 miles, of which 200 are navigable for steamboats in favorable seasons. A fall of sixty feet is near Williamsburg.

**CUMBERLAND ROAD**, a highway built by the United States government from Fort Cumberland, Md., to Vandalia, Ill., a distance of

800 miles. Congress authorized the President to appoint three commissioners to lay out the road and appropriated \$30,000 to cover the expenses. Work was begun soon after and the road was completed in 1838. The total sum appropriated was \$6,821,246. It was known as the Great National Pike and was controlled by the government until 1856, when the control was given to the various states in which the different portions were located. This highway was important as an avenue for emigrants from the Eastern states to the West.

**CUNEIFORM** (kū-nē'ī-fōrm), the name applied to various inscriptions that were made by the peoples of remote antiquity. The name is taken from the wedge-shaped characters that prevail largely. It is sometimes referred to as arrow-headed writing, from the resemblance that numerous strokes bear to the head of an arrow. Each of the hieroglyphic characters of the most ancient forms represents an idea or object, like the written characters of the Chinese, but they were corrupted later into forms found on the monuments of Babylon and Assyria. The early Accadians of Chaldaea, who spoke a language allied to the Turkish, invented the system and from them it was borrowed and modified by the Babylonians and Assyrians, who belonged to the Semitic races and spoke a language entirely different. Later it was used by the Persians and other races of Western Asia in a still greater modified state. The oldest form consists of about 700 characters; the remains of antiquity indicating that they were made in a period about 3,000 years B. C. The Accadian language ceased to be spoken about 1700 B. C., but it was employed in these writings for a longer period of time. Subsequent modifications made the characters partake more of the form of an alphabet, thus decreasing them in number but extending the meaning. Since the Persian cuneiform writings are among the latest, they contain about sixty characters, all having divers significations, but as a whole are greatly inferior in scope to the system of the highly cultured originators.

Cuneiform characters were regarded meaningless for centuries. By some they were thought to be the production of corrosive elements, others regarded them as ornaments, while still others looked upon them as records of hidden treasures. Karsten Niebuhr (1733-1815), a German historian and traveler, was one of the first to decipher them and give to them the vast value which they possess in preserving historic records of antiquity. He was followed by others, among them Rask, Grotefend, Lassen, and Rawlinson, by whose labors means of

translation were slowly discovered and perfected.

The cuneiform inscriptions of Babylon and Assyria are particularly of value in that they throw light upon the discoveries, achievements, and governments of ancient peoples. Many of the inscriptions are devoted to a history of the reigns and wars of the kings. The Persian are of special interest since they throw light upon the reign of Darius and other Persian sovereigns. For the purpose of study cuneiform inscriptions are divided into four classes, according to the period in which they appear to have been made, the *Archaic*, *Hieratic*, *Assyrian*, and *Later Babylonian*. The most celebrated inscriptions are found at Behistun, where large portions of the history of Darius and his ancestors are cut upon the face of a rock 1,700 feet high. As a rule the inscriptions are found on objects made of stone, glass, bronze, clay, and iron. In the museums of Berlin, London, and other cities many excellent specimens may be seen.

**CUPID** (kū'pīd), in mythology, the god of love, known to the Greeks by the name of Eros. He is described as a beautiful naked boy, armed with a bow and a full quiver of arrows, with which he kindles a desire for love in the human heart. Sometimes he is represented with a covering over his eyes, indicating that love may be blind. The darts sent from his bow are capable of piercing the birds of the air, the fishes of sea, and even the Olympian gods. He is represented as the son of Mercury and Venus.

**CUPOLA** (kū'pō-lā). See **Dome**.

**CURAÇOA** (kōō-rā-sō'), an island in the Caribbean Sea, about forty-five miles north of Venezuela. It is forty miles long, eight miles wide, and has an area of 210 square miles. The principal harbor is Santa Anna and Willemstad is the local seat of government. The climate is hot and dry, while the surface is quite hilly and partly barren. Salt, sugar, tobacco, maize, and cochineal are the principal products. This island and Saba, Bonaire, Aruba, Saint Eustache, and a portion of Saint Martin constitute the colony of Holland known as Curaçoa. The entire area is 403 square miles. The government is administered by the Netherlands through a resident governor appointed by the sovereign. These islands were discovered by the Spaniards in 1527, taken by Holland in 1634, and conquered by England in 1798 and again in 1806, but were restored to Holland in 1814. The school system and commercial interests have been developed under Dutch control. A kind of bitter orange growing in these islands, known as Curaçoa, is exported to Holland, where it is used in the manufacture of Curaçoa

liquor. Population, 1905, of the island, 31,090; of the colony, 53,466.

**CURARE** (kû-râ'rê), a poison used by the Indians of South America for poisoning their arrows, made chiefly from the juices of several plants. The principal ingredient is obtained from a tree which yields *nux vomica*, and to this product are added the scrapings obtained from the bark of several plants. Water is added to the component parts and boiled to form a consistence much like syrup. Death results from the poison when it is introduced into the blood, where it acts on and paralyzes the motor nerves, causing paralysis.

**CURASSOW** (kû-rās'sô), a large bird native to Mexico and South America, related to the partridges. The bill is strong, surmounted by a cere at the base, the wings are rounded, and in size these birds are similar to the turkey. Several species have been described, of which the *helmeted curassow* is the most noteworthy. It has a bony excrescence on the top of the head, which is bluish in color, and is somewhat larger in the males than in the females. The plumage is glossy black with a greenish hue on the breast. The flesh is eaten and resembles that of the turkey. This bird is reared in Guiana and has been domesticated in continental Europe.

**CURFEW** (kûr'fû), a signal given to the inhabitants of a town that the time to extinguish fire and lights and to retire has arrived. The usual time for ringing a curfew bell or signal is eight o'clock in the evening. The custom was introduced into England by William the Conqueror, and severe penalties were provided for those neglecting to comply with the requirements. In some countries a bell is rung in a similar manner for the purpose of indicating the time for evening prayer.

**CURLEW** (kûr'lû), a genus of birds of the same family as the woodcock and snipe and classed with the waders. The different species are widely distributed in most parts of the world. They inhabit marshy and wet regions. Most species have a bright ash color on the head and breast, with spots of red and white on the back and beneath. The bill is long and well adapted to catching animals under water, such as mollusks, fish, insects, slugs, and earthworms. The greenish eggs are deposited in a nest made of dry leaves, usually in rushes. A number of species are prized as food and several in America have migratory habits.

**CURLING**, a game played with smooth stones, which are shaped somewhat like a tea-kettle, weighing from 30 to 45 pounds. A handle of iron or wood at the top enables the

player to grasp it with a firm hold. Two games are usually played, known as the rink play and as playing for points. The *rink game* is played on ice, upon which a rink about ten yards wide and forty-two yards long is platted. The player endeavors to throw the curling stone as near the mark as possible, as well as to strike off that of his antagonist, in case the latter has thrown first. Two stones are thrown alternately from each end of the course or rink. In the game of

CURLEW.

*playing for points* there are no sides, but each player throws with the view of scoring for himself. Curling is a Scottish game and is played wherever settlements of Scotchmen are found. Match games played in a series are called *bonspiels*. Several national and international bonspiels are promoted in Canada and the United States. Interesting contests have been held between the champions of the two countries at Ottawa, Montreal, Winnipeg, Minneapolis, Chicago, Duluth, and other cities.

**CURRANT** (kûr'rânt), the name of a fruit-bearing shrub cultivated in orchards and gardens for its fruit. It is grown most extensively in the Temperate zones. The different species are hardy shrubs, bearing abundantly under cultivation, and their fruit is valuable for food. It is eaten raw as a dessert and is used in cookery for jelly, preserves, and pies. In some localities it is grown for making vinegar and currant wines. Among the species cultivated largely in America and Europe are the red and white, the latter being a cultivated species of the red. The black currant yields abundantly in the colder regions and in the higher altitudes.

Most species of currants ripen in May and June and are improved by training the shrubs against walls. The fruit grows in clustered bunches. The dried currants of market are made from the fruit of a small grape first cultivated on the Isthmus of Corinth, hence its name, but it has been naturalized in various climates. The fruit of this grape is small and is produced abundantly on the vines of the plants. Currant plants are greatly injured in the season when the fruit develops by the larvae of two sawflies. They are commonly called *currant worms*.

**CURRENCY REFORM** (kŭr'rĕn-sŷ), the policy advocated by a number of political parties in the United States since the early organization of the government as a means to reform the monetary system. It was the leading issue and reached its height of interest in the presidential campaign of 1896. The currency of the United States consists of gold, silver, nickel, copper, and paper money. Gold and silver were recognized as standard money of final redemption in the United States under various laws from the early organization of the government until in 1873, when the use of silver was partly limited by acts of legislation. Partially restored to its former position in 1878, it continued to be used as money with much of its monetary functions recognized until in 1900, when the single gold standard was given the validity of law by Congress. The theory of *bimetallism* and the issuance and control of paper currency by the government were advocated by the Democratic party, while the Republican party advocated a *single gold standard* and the enlargement of the functions of national banks. Partisans on both sides advocated their positions in Congressional and State elections and in Congress, which finally developed a line of national legislation relative to the issuance and control of the currency.

The position of the Democrats was supported by Senator Chandler of New Hampshire and other Republicans, while several Democrats supported the Republican position. The Democrats favored the continuance and use of both gold and silver as standard money. They demanded that the two metals should be coined into money of equal exchangeable value, the equality to be secured and maintained through international agreement, or otherwise, thus maintaining the parity in value of the coins of both metals. It committed the government to the establishment and maintenance of such a system of bimetallism as would insure parity at all times. They also held that the paper currency should be issued and controlled di-

rectly by the government, instead of through national banks, and favored the eventual payment of the national debt in coin. The position taken by the Republicans in Congress was favorable to the single gold standard and a modification of the national banking system. That party, having a majority in both houses and the administration, enacted a law favorable to this position. It passed the Senate on March 6, 1900, and the House on March 13, becoming a law on March 14 by the signature of the President.

The law as passed contains ten sections. Among them are the following principal provisions: That the gold dollar of 25.8 grains, nine-tenths fine, shall be the standard unit of value, that all forms of United States money shall be maintained at parity with it, and that all treasury notes and greenbacks shall be redeemable in gold. The sum of \$150,000,000 in gold is to be set apart by the treasurer for the redemption of these notes; he is to maintain this fund at not less than \$100,000,000, and is empowered to issue United States bonds bearing interest at not over three per cent. The treasurer shall retire and cancel treasury notes equal in amount to the standard silver dollars that may be coined, and issue silver certificates against the silver so coined. Gold certificates shall be issued against the gold held in the treasury under certain provisions. The highest denomination of silver certificates shall be ten dollars, and the lowest denomination of the United States notes and treasury notes shall be ten dollars. The Secretary of the Treasury is authorized to refund the United States bonded debt in 33-year bonds bearing interest at two per cent., principal and interest payable in gold. Any national bank shall be permitted to issue circulation notes of the face value of the bonds deposited by such bank as security in the United States treasury. See **Money**.

**CURRENTS**, the movements of oceanic waters with considerable regularity from and to the polar and equatorial regions. They resemble streams or rivers, but are much broader, deeper, and longer. Their temperature is either higher or lower than the waters through which they flow. They are formed on the surface and at great depths, the upper currents usually passing from the equator and the lower currents in an opposite direction. Currents are caused partly through the agency of evaporation, but principally by the variation in the density of the waters, owing to a difference between the temperature of the regions of the equator and those near the poles. The equatorial waters, becom-

ing lighter on account of the warm temperature, rise to the surface and flow both north and south, their place being taken by the denser, colder waters flowing in from the polar regions. In this way a constant interchange of the waters is effected between the equatorial and polar regions, which takes place mostly along the bottom from the poles to the equator and along the surface from the equator to the poles. Owing to a low temperature in frozen seas near the poles, the interchange is larger between the equator and the polar circles. These currents would flow due north and south, if the earth had no rotation on its axis. They are deflected from a direct course between the equator and the polar regions on account of the earth's rotation, the position of the land masses, the winds, and differences in the density and level of the sea caused by evaporation.

The currents of the ocean are of utility in commercial and agricultural enterprises. By means of them the climate of the countries located in high latitudes is modified materially by the warm equatorial currents, while the warmer climates in the tropical regions are pleasantly modified by currents from the polar regions. The speed of vessels has been materially increased in certain directions by entering into their paths. Both the Pacific and Atlantic oceans have great equatorial and polar currents, their courses extending between the equatorial and polar circles. In the Indian Ocean the movements are largely restricted to currents which flow southward, owing to there being no outlet toward the north. The Sargasso Sea is in the North Atlantic Ocean. It is a vast expanse of ocean in which seaweeds float upon the surface, owing to the water being undisturbed by extensive movements. The best examples of currents are the Kuro Sivo, or Japan Current, in the North Pacific, and the Gulf Stream, in the North Atlantic.

**CURVE**, in geometry, a line which continually changes its direction, or a line no part of which is straight. The circumference of a circle is the simplest of all curves. It is defined as a curve, each point of which is equally distant from the center, or one in which each part of the line is equally curved. The measure of curvature is based upon the circle. The circle which would exactly fit any curve at any point is called the circle of curvature at that point, and its radius is designated the radius of curvature. Curves, in modern geometry, are classified according to the degree of equation by which they are represented. Thus, a straight line is represented by an equation of the first degree and a curve by one of a higher degree.

**CUSCUS**, an animal of the phalanger family, native to New Guinea, the northern part of Australia, and the Solomon Islands. It is stoutly built, has a prehensile tail, and is covered with a woolly fur. Several species have been described, including the gray cuscus and the spotted cuscus. These animals are marsupials and are hunted for their flesh and fur by the natives. The spotted cuscus is about three feet long and has a yellowish-white color marked with spots of dark brown.

**CUSTOMS DUTIES**, the taxes levied on imports and exports of commodities. Duties on exports are forbidden by the Constitution of the United States, owing largely to the disadvantage at which the country would be placed by the competition of general commerce, if consumers in foreign countries were required to pay duties to secure American products. The import duties are paid by the importers for the benefit of the government. Customs duties were levied by Greece and Rome. The Venetian government and others supported customhouses during mediaeval ages. The Tariff Union, or *Zollverein*, as it was called, was maintained by the North German States from 1818 until they united and formed the German Empire after the War of 1870-71. The first customhouse was established in London in 1304. Legislation establishing the more modern customs of Great Britain dates from the conflict between the Parliament and the crown in relation to the right of taxation. The term *custom* was derived from the claim made by the crown that it had acquired rights in certain import and export duties by the right of custom. Beginning with 1846, the legislation of Britain has been largely in the interest of free trade, and duties are now levied only on a few articles.

The customs of Canada are collected under the Customs Act of 1907. It provides for three classes of duties known as the British Preferential Tariff, the Intermediate Tax, and the General Tariff. The *British Preferential Tariff* applies to goods as manufactures imported from any British country. On the other hand, the *Intermediate Tariff* applies to imports from any British or other country to which its benefits have been extended, hence is based upon the principle of reciprocity. The *General Tariff* applies to all goods that may not be admitted under either of the other two classes. A *surtax* is levied on imports from the countries which treat imports from Canada less favorably than those from other countries. The customs collected in 1907 amounted to \$53,006,546, which is about the annual average.

Alexander Hamilton, who became the first

Secretary of the Treasury of the United States, adopted the English system of customs with scarcely any modifications. In 1799 the earliest customhouse was established in New York City. The net revenues at first were barely sufficient to pay the officers and clerks employed in its management. At present there are about 160 customhouses in the United States. The ten most important are located at New York, Boston, Philadelphia, San Francisco, Chicago, Baltimore, New Orleans, Saint Louis, Detroit, and Tampa. The receipts at New York aggregate about as much annually as those of all others combined. In 1907 the total net receipts were \$311,985,647. The fiscal year begins on July 1, according to an act of Congress in 1842, hence the decade from 1841 to 1850 embraces only nine and a half years. Following are the total receipts by decades of the government through the customhouses since the organization of the system:

From 1791 to 1800.....	\$	50,321,485.87
“ 1801 to 1810.....		129,540,517.63
“ 1811 to 1820.....		163,804,167.09
“ 1821 to 1830.....		198,523,207.69
“ 1831 to 1840.....		204,703,913.92
“ 1841 to 1850.....		243,666,681.78
“ 1851 to 1860.....		544,980,470.30
“ 1861 to 1870.....		1,239,458,442.34
“ 1871 to 1880.....		1,663,973,043.74
“ 1881 to 1890.....		1,992,600,748.76
“ 1891 to 1900.....		2,195,396,503.80
“ 1901 to 1905.....		1,300,844,840.00
Total.....	\$	9,927,814,022.92

**CUTLERY** (küt'lēr-ȳ), the general name of sharp-cutting and many-pointed instruments, made chiefly of iron, steel, and cast steel. The first cutting instruments that may be classed as cutlery were made of flint and shells, and these were superseded by those in which bronze was used for the cutting blade. At present steel is employed almost exclusively, though the quality differs materially. The best grade of cast steel is used in making the better class of razors, scissors, penknives, and lancets. Knives and forks employed for table use are manufactured largely of shear steel. Cutlery of all kinds is made chiefly by a forging process, either hand or machine forging, the former being employed for small pieces and the latter for the larger articles. After forging, the piece is made true by filing, after which it is tempered, ground, and polished. Heavy cutting instruments, such as axes, are usually made of two kinds of steel, the cutting edge of the finest quality and the thick part of a soft, cheap, grade of steel.

**CUTTER** (küt'tēr), a small vessel with one mast and fitted with fore and aft sails. Most cutters are built with special reference to speed. They differ from the sloop in having no stay to support the jib and are used by yachtsmen

and for revenue cruisers. Large vessels usually carry four or more boats, known as cutters, as a part of the equipment. This class is fitted either for rowing or sailing.

**CUTTLEFISH** (küt't'l-fish), a genus of fish which includes the squid, octopus, nautilus, sepia, and other species of marine animals. They bear the scientific name *Cephalopoda*. The body of the cuttlefish is oblong and depressed, sacklike in form, and provided with two narrow lateral fins extending to the anterior part of the body. It has ten arms, each containing four rows of suckers. An internal shell is lodged in a sack, which is somewhat oval, light, and porous. The eyes are very large, and the long tentacles, furnished with suckers on one side at the extremity, serve as food catchers. When not in use, they are carried in pockets beneath the eyes, and may be thrown out with considerable force and skill in seizing the prey. The skin is whitish in color, dotted with spots of red, and the length of the fish is from eight inches to three feet.

The cuttlefish is provided with a bag containing a deep brown fluid that is thrown out to darken the water in cases of danger. By means of it the animal is able to make an easy escape. On account of this and its great activity, much difficulty is found in catching the animal. In early times this fluid was used in making India ink, but it has been superseded by the product made from lampblack and other substances. From the blade-shaped cuttlebone are made tooth powder, pounce, molds for small silver castings, polishing powder, and other useful products. It yields medicine useful for stomach and other complaints.

Cuttlefish are found in almost every portion of the sea. They habitate the bottom of the ocean and coast indentations, confining themselves along the shore and in moderately deep water. Their movements are largely by means of two fins through which streams of water are squirted in such a manner as to assist in propulsion. When in search of food, they watch the prey in a motionless position, but when within easy reach dart their tentacles forward with great rapidity and secure the victims. By a process of withdrawing air from the limbs, they are fastened with a viselike rigor to the victim and escape is rendered impossible. Fishermen have found cuttlefish harmful in devouring fish when caught in their nets. Some of the ancients regarded the flesh of the cuttlefish valuable for food. See **Octopus**.

**CUZCO** (kōōs'kō), a city of Peru, capital of a department of the same name. It is located in a broad valley between the headwaters of the

Urubamba and Apurimac rivers, about 11,250 feet above sea level. Railroad connections with the coast and Lake Titicaca make it an important seat of commerce and local industry. The manufactures include cotton and woolen goods, soap, sugar, leather, clothing, machinery, and furniture. It is the seat of a cathedral and a university. Many of the streets are paved with stone and macadam. The public utilities include a public park, electric lighting, waterworks, and a public library. Among the ancient Peruvian cities it held high rank. The Incas emperors occupied it as their capital for many years and beautified it by fortresses and massive architecture, specimens of which still remain. Pizarro conquered it in 1534. Population, 1906, 31,226.

**CYAMETER**, an instrument for measuring the intensity of the tint of the atmosphere. It was invented by Saussure and consists of a disk divided into sections, each of which is tinted, ranging from white to a deep blue. It is held by the observer in such a position that the color of the sky may be compared with the tints of the instrument, and as the disk is turned it is possible to find a color that corresponds with the blueness of the sky.

**CYCLADES** (sīk'lä-dēz), the southern group of islands in the Aegean Sea, belonging to Greece, so named because they encircle the sacred isle of Delos. They are mountainous and of volcanic origin, but contain fertile soil. Among the largest islands are Myconus, Andros, Tenos, Paros, Melos, and Naxos. The productions include silk, wine, cereals, live stock, olive oil, and fruits.

**CYCLAMEN** (sīk'lä-mēn), a class of plants belonging to the primrose family, native to many parts of Europe and Asia. Two species are cultivated for their flowers in greenhouses. The hardier variety is native to the southern part of Europe and is admired for its flowers, which are either white or rose-colored. The

CYCLAMEN.

flower has the appearance of being turned inside out, owing to the petals being strongly reflexed.

**CYCLE** (sī'k'l), a period of years or time in which particular phenomena or a succession of events take place, beginning again at the end of the cycle to pass through the same course. The cycle of the sun covers a period of twenty-eight years; that is, the days of the month return to the same days of the week. In the calendar the return to their former place is marked by the dominical or Sunday letters. The cycle of the moon includes a period of nineteen years, after the lapse of which time a new and full moon occurs on the same days of the month. From its discoverer, Meton, the latter is sometimes called the Metonic Cycle and the Golden Number.

**CYCLING** (sī'klīng), an art developed by the perfection and general use of bicycles. In many centers of population associations are maintained for the purpose of developing the art. It is their aim to promote interest with the view of establishing bicycle riding as a game and for the development of grace and skill in its use. Among the most celebrated organizations founded are the League of American Wheelmen and the National Cycling Association. The best records made by professional riders as to time include the following: One-half mile, 40 seconds; one mile, 57; two miles, 2:30; three miles, 3:52; four miles, 5:21; and five miles, 6:45. When the bicycle first came into use, wheeling was a fad, but now it is employed more specially for business purposes and scientific sports.

**CYCLOMETER** (sī-klōm'ē-tēr), an instrument used to record the revolutions of certain parts of machinery, such as the wheel of a carriage or bicycle. It is commonly attached near the wheel of an automobile, in such a position that a cam on the spoke will act upon a projecting part at every revolution, causing the clockwork within the cyclometer to move. The circumference of the wheel being known, it is possible to estimate the distance traveled by computing the revolutions recorded in the instrument. In most forms the mechanism is so arranged that the register will show every five, ten, and one hundred miles, as the case may be, when the instrument will begin anew in registering in these denominations.

**CYCLONE** (sī'klōn), the name applied to storms that have a circular or rotary movement. The diameter varies from a small extent to 500 miles, the rotary motion being rapidly round a center and the advance movement often reaching forty miles an hour. Cyclones are

caused by the rays of the sun falling within the tropics and heating the air so it rapidly ascends, thereby causing colder currents to rush beneath and take its place. The revolving motion is produced partly by the rotation of the earth, but more directly by the rapid inflow of the lower currents of air as the lighter currents ascend. No cyclones are experienced directly under the Equator. Those south of the Equator revolve in a direction the same as that of the hands of a watch, while those north of the Equator revolve in a diametrically opposite direction. Cyclones are most common to the western portions of the United States, the West Indies, the China Seas, and the seas surrounding the Mauritius Islands. The cyclones frequenting the West Indies originate mostly in the Caribbean Sea. This class of storms is extremely destructive, often tearing down forests, destroying cities, and causing great loss of life and property. Skillful navigators are able to escape them by sailing out of their course, or, if struck, they avoid serious damage by a careful and proper adjustment of the sails. The approach of cyclones is marked by a rapid fall of the barometer and is preceded by a singular calm. They are attended frequently by intense electrical disturbances.

**CYCLOPEAN** (sī-klō-pē'an), the name applied to a primitive style of architecture, which is fabled to be the work of the Cyclops. It consists of huge blocks of stone, unhewn and uncemented, and the corners are fitted accurately into one another. Other structures of this kind consist of regular blocks of equal height. Specimens are found in Asia Minor, Sicily, at Mycenae, in Greece, and other regions of the ancient peoples.

**CYDNUS** (sīd'nūs), a river of Asia Minor, in Cilicia, rises in the Taurus Mountains and flows into the Mediterranean Sea. Anciently it was navigable to Tarsus, about twelve miles, but its mouth is now obstructed by bars of sand. The Cydnus is celebrated as the meeting place of the fleets under Antony and Cleopatra in 41 B. C.

**CYLINDER** (sīl'in-dēr), a solid geometric form consisting of a long, round body, having two flat, circular surfaces which are equal and parallel. Any cylindrical portion of a machine is called a cylinder, especially if hollow and proportioned so the length somewhat exceeds the diameter, as the cylinder of a printing machine, the chamber in which the force of steam, or other power, is exerted on the piston, the barrel of a gun, etc. The axis of a cylinder is the straight line about which it revolves; the bases are the two opposite ends.

**CYMBALS** (sīm'bals), the name of plates of bronze, more or less basin-shaped, to which leather straps are fastened for holding by the hands in producing sounds in accord with music. They were used in very ancient times and are represented upon many monuments. In 1043 B. C. they were mentioned among other instruments in connection with the return of the ark of David. The Grecians used them in worshipping the goddess Cybele. Cymbals now made consist of twenty parts of tin and eighty of copper. The best are imported from China and Turkey. They are used mostly in military music and on the bass drum played in orchestras. One cymbal is fixed to the drum and the other is held in one hand by the player, while the drumsticks are held in the other hand. The best effect is secured by being struck together with a single sliding motion.

**CYMRI** (kīm'ri), or **Kymry**, a branch of the Celts of Britain. They succeeded the Gauls and drove them west into Ireland, into the Isle of Man, and toward the north into the Highlands of Scotland, while they themselves located in and occupied the southern portion of Britain. Later they were driven out of the Lowlands of Britain into the mountain regions of north-western England, and into the mountains of Wales by the invasion of the Saxons, Angles, and Jutes. Descendants of the Cymri are found chiefly in Wales at present.

**CYNICS** (sīn'iks), the name of a school of Greek philosophers, founded in the fourth century B. C. by Antisthenes, a pupil of Socrates. The seat of this school was in the gymnasium Cynosarges in Athens, and the most renowned disciples included Diogenes, Crates of Thebes, his wife Hipparchia, and Menippus. They taught that all speculative philosophy is detrimental to the real knowledge of truth, that it leads to sophistry and the destruction of human society, and that the true object of philosophy is to show how men might best live morally and peaceably. In this they harmonize with the Stoics, but differed from them in defining virtue to be the highest possible simplicity in living. Their devotion to the simple life was so great that they came to despise labor, decency, cleanliness, and the essential requirements of society. This caused them to become in disrepute. The name *Cynic* is still applied to one who disregards the proprieties of life, doubts the wisdom of protecting personal character or motives, or displays singularity in treating the social usages.

**CYPRESS** (sī'prēs), a genus of evergreen, cone-bearing trees or shrubs. The leaves are small and entirely cover the branches, while

the globe-shaped cones have woody scales that bear numerous seeds. The wood of most species is of a yellow or reddish color, very hard and durable, owing to its resinous constituents, and has a pleasant smell. It is not subject to destruction by insects, resists decay both in the dry and under water for many years, and is a favorite wood for cabinet work, owing to its beautiful color and property of being easily polished. It grows profusely in swamps and often attains a thickness of from ten to twelve feet at the ground. Some species have large spreading tops, while others assume a slender, cone-

CYPRESS.

*A*, male flower; *B*, female flower; *C*, fruit.

shaped form. In the United States there are large forests, especially in the south and on the Pacific slope, and some species are common to the far north of Canada and Alaska.

The name was derived from Kypros, the Greek name of the island of Cyprus, where the tree is found in great abundance. It is native to Persia, the Levant, and countries adjacent to the Mediterranean Sea. The Mohammedans planted it largely in burial grounds, which have taken on the form of immense forests. The Romans and Greeks cultivated it in their parks and gardens for ornamental and sanitary purposes. Cypress wood was used largely for coffins by the Greeks and for mummy chests by the Egyptians. The doors of Saint Peter's at Rome were originally made of it. Though subsequently replaced by brazen doors, they

answered the purpose for more than a thousand years. The cypress gates of Constantinople served their purpose for an equal length of time. Cypress wood is used largely at present for building purposes in Europe as well as in other portions of the old world.

**CYNTHIANA** (sĭn-thĭ-ă'nà), a city of Kentucky, county seat of Harrison County, thirty-three miles northeast of Lexington, on the Louisville and Nashville Railroad. It is finely located on the south fork of the Licking River, and is surrounded by a fertile farming region. The manufactures include machinery, cigars, and spirituous liquors. It has electric lights and other municipal facilities, several county buildings, and a number of churches and schools. In 1864 it was the scene of a battle between the Confederates under John Morgan and the Federals under General Burbridge, in which the former were defeated. Population, 1900, 3,258.

**CYPRUS** (sĭ'prŭs), an island in the eastern part of the Mediterranean, south of Asia Minor. It is sixty miles wide and 145 miles long. The area is 3,584 square miles. Two mountain ranges traverse its surface, one along the northeastern coast and the other in the southern part. Both ranges trend east and west. The southern chain is the most prominent, its highest point, Mount Troödos, having an altitude of 6,585 feet above sea level. Numerous bays and inlets indent the coast and furnish safe harbors. A number of small lakes occur in the eastern and southern parts. The Pedioes Potamos is the chief stream. Large areas of the surface are exceedingly fertile and productive. All parts of the island have a pleasant and healthful climate. The mountains are covered with forests of excellent timber and underlaid by rich mineral deposits. The chief minerals include copper and salt, which were produced in large quantities anciently, but are not worked extensively at present. Among the products are cotton, wheat, barley, tobacco, olives, raisins, carobs, and various vegetables. Silk culture is an important industry. The extensive pasture lands facilitate the rearing of large herds of sheep, goats, and cattle. The chief exports consist of raisins, cotton, wool, carobs, cheese, cocoons, and salt. The imports are exceeded greatly by the exports, thus adding annually to the wealth of the island.

The island is divided into the six districts of Kyrenia, Larnaca, Nicosia, Papho, Limasol, and Famagusta. The government is administered by a resident high commissioner with an executive council, and a legislative council of eighteen, of whom twelve are elected by popular vote. Nicosia, population 14,752, is the seat of

local government. Other towns include Larnaka, Limasol, and Famagusta. Under British rule a system of schools has been established, supported by public grants. A number of railway lines have been built, including one inland from Famagusta, where a harbor has been improved. A majority of the inhabitants are Greek Catholics and the remainder are mostly Moslems. Population, 1906, 238,312.

Cyprus was colonized by the Phoenicians and later fell successively into the hands of the Greeks, Egyptians, Persians, and Macedonians. It became a Roman province in 57 B. C., and was connected with the eastern division of the empire. The Cypriotes were visited by Saint Paul and were among the first gentile people to embrace Christianity. They were conquered by the Saracens after the decline of Rome began. Richard I. of England conquered them in the third Crusade to Jerusalem and restored the island in 1191 to Guy de Lusignan, but, after his line became extinct, it fell into the hands of the Venetians, in 1489. The Turks conquered it in 1571 and added it to the Ottoman Empire, but it was ceded to Great Britain in 1878 by the convention of Constantinople, with the provision that it should revert to Turkey when Batusm and Kars are restored by Russia. The island is rich in relics of ancient peoples. Among the remains discovered is the oldest copy of the Gospels and other early Christian writings of much value. Many of the remains may be seen in the museums of London, Berlin, and New York City.

**CYRENAICS** (sī-rē-nā'iks), a school of Greek philosophers, founded in 380 B. C. by Aristippus of Cyrenaica, a pupil of Socrates. It taught that pleasure is the highest object in life, that virtue consists in the art of producing the highest possible amount of agreeable feeling, and that all should live in moderate activity, but pains should be shunned. This school agreed with the Cynics in despising all speculative philosophy, but maintained a higher plane of morality and limited their practice to the amiable and moderate enjoyments of life. It was succeeded a century later by the philosophy of Epicurus, known as Epicureanism. The chief philosophers of the Cyrenaic school included Aristippus, the founder, his daughter Arete, his grandson Aristippus Metrodidactus, and Hegesias.

**CYRENE** (sī-rē'nē), an ancient city of Africa, the capital of Cyrenaica, located about ten miles from the Mediterranean. It was situated on an elevated tract of land about 1,800 feet above the sea, giving it a fine outlook over the surrounding country. A colony of Dorians founded it in 631 B. C. and made it a center of Greek learning. It had a large commerce with Greece and Egypt for many centuries. Among its famous men are the astronomer Eratosthenes, the poet Callimachus, and the philosophers Carneades and Aristippus. Grenna, a small town of the province of Barca, now occupies the site.

**CZAR** (zär), the title of the emperor of all the Russias, probably derived from the Roman title *Caesar*. Ivan IV., the Terrible, was crowned the first Czar of Russia in 1547. *Czarina* is a term used to designate the empress; *czarevitch*, the heir apparent; and *czarevna*, the wife of the heir apparent.

**CZECHS** (chěks), the branch of the great Slavonic family of races now having its chief seat in Bohemia. Nearly all of the Czech people, numbering altogether about 5,900,000, live in Austria. About half of these people are in Bohemia. They migrated from Carpathia, on the upper Vistula, about 451-495 A. D., and settled in Bohemia. The Czech language has an alphabet of forty-two characters. It is of great antiquity and is noted for its high culture. Its grammatical construction is complex. The language is highly inflectional, admitting of many inceptives, frequentatives, derivatives, and diminutives. As a musical language the Czech is classed next to the Italian.

**CZERNOWITZ** (chěr'nō-vīts), the capital of Bukowina, a crown land of Austria, on the Pruth River, about 136 miles southeast of Lemberg. It is the seat of a Greek Catholic cathedral, several synagogues, and a number of noted monuments. The university, founded in 1875, has sixty-two professors and lecturers, an excellent library, and is attended by 850 students. It has a public library of 60,500 volumes. The city is connected by railroads and has modern municipal facilities. Among the manufactures are carriages, clocks, silver plate, toys, cigars, implements, and machinery. It was occupied by the Austrians in 1774. A majority of the inhabitants are Germans. Population, 1906, 71,226.

D

DACIA

**D**, the third consonant and fourth letter of the alphabet. The name in the Greek is *delta*, which is a modification of the Semitic word *daleth*, meaning a door. It is interchangeable with *t* in some languages, since the two letters are similar in the mode of pronunciation. In English it is always sounded, though often but slightly, as in handkerchief. It represents a dental sound formed by passing vocalized breath into the mouth, after placing the tip of the tongue against the roots of the front teeth. In Roman numerals **D** represents 500 and is equal to 5,000 when a line is placed over it, as  $\bar{D}$ . As a symbol in music **D** is the second note of the natural scale of **C**.

**DAB**, a species of flatfish belonging to the same genus as the plaice and flounder. It is allied to the soles, turbot, and halibut. The length seldom exceeds twelve inches. The color is brown and yellow and it is characterized by a small mouth and eyes. It is common off the coasts of England and France. A similar fish, the *rusty dab*, is found on the coast of Nova Scotia and New England.

**DACCA** (*däk'ká*), a city of Bengal, capital of a district of the same name, on the Burhi Ganga, 150 miles northeast of Calcutta. The streets are narrow and angular and the older portion is not well improved. In the newer parts a number of fine buildings are maintained. Besides numerous schools, there are several colleges and mosques and places of worship belonging to the Greeks and Armenians. Railroad connections have been established with many commercial centers. Its navigation trade is large, especially in textiles and live stock, owing to its favorable location and safe harbor. It has numerous modern facilities, including tramways, electric lights, and telegraph and telephone lines. It became the seat of the Mohammedans in Bengal in 1610, and with a short intermission remained its capital until 1704.

Large manufactures of muslins were carried on in the city by the Dutch and French in the 18th century, when it had a population of about 200,000. Owing to civil disturbances and other causes, it declined for some time, but in recent years its prosperity has been revived. Population, 1906, 92,342.

**DACE** (*däs*), or **Dare**, a fish common to the streams of Europe and New England. The various species are fine anglers and favorites for table use. They are gregarious and swim in shoals. Their weight seldom exceeds a pound. The dace spawns in April and May. Artificial

A, Horned Dab; B, Brown Dace.

pearls are made of the scales of several species, especially of the roach. Several species, such as the chubs, are favorite fishes in the streams and lakes of the Rocky Mountains.

**DACIA** (*dä'shä-ä*), an ancient country of Europe, located between the Danube and the Carpathian Mountains. It was occupied by the Daci, a warlike people, and was annexed to

Rome by Emperor Trajan in 101 A. D., after a decisive battle near Torda. The Romans sent colonists into the country, constructed highways, and built a great bridge across the Danube. In 274, in the reign of Aurelian, the Romans relinquished Dacia and it was occupied by the Goths. At present the region is comprised in Moldavia, Transylvania, Wallachia, and the eastern part of Hungary.

**DAFFODIL** (dăf'fō-dīl), a group of plants of the genus *Narcissus*. Though native to Europe, many species have been widely acclimated and are grown in gardens in America. Most of the cultivated plants bear solitary flowers with a bell-shaped crown longer than the perianth tube. The flowers are mostly yellow and include both single and double forms.

**DAHLIA** (däl'yä), a genus of plants native to Mexico, named after the Swedish botanist Dahl. The plant has been greatly improved and its flowers variegated in color by cultivation. Specimens were first brought to Europe in 1784,

DAHLIAS.

but it is now known almost world-wide. The flowers are general favorites in gardens and parks, where the dahlia is cultivated as an ornamental plant. Some species have single flowers, but most of them are double, showy, and symmetrical. They are propagated by cuttings, seeds, and the roots, which are dug up in the fall and stored like potatoes in the cellar. The corolla of the dahlia yields a beautiful carmine.

**DAHOMY** (dä-hō'mä), a French colony in Africa, on the northern coast of the Gulf of Guinea, located between Nigeria and the German colony of Togoland. It has been the seat of some contention on account of conflicting

claims of France, Germany, and England. The area is about 60,000 square miles and it has a seacoast of seventy miles. It consists of two divisions, a native kingdom under the rule of a local African prince and a colony comprising the settlement of Benin on the coast, with a tract of country extending toward the interior.

The colony is governed by a local governor, who is assisted by a council. Two prominent residents, one of whom is native and one is white, are included with the higher officials. The capital is Abomey, near the port of Whydah, and it and Kotonu are the principal trading points, though considerable commerce is carried on at Grand Popo and at Porto Novo. The natives of Dahomey are Negroes, who are small of stature, but robust, and quite industrious. They engage in fetish worship. Their chief sacrifices are made to trees, snakes, thunder, and the sea. Agriculture, trading, hunting, and rude manufacture are their chief occupations.

The colony has a large area of fertile soil, is well watered by small streams, and is valuable for its coast line on the Gulf of Guinea. Large desert tracts extend throughout the northern part. The wild animals include lion, tiger, boa, hyena, elephant, and many species of reptiles and birds. Among the chief products are tobacco, cotton, indigo, sugar, palm oil, India rubber, millet, vegetables, and many varieties of fruits. The annual exports have steadily increased the past decade. The export of palm oil aggregates about 10,000 tons annually and of palm kernels about 20,000 tons.

Dahomey was organized into a native kingdom at the beginning of the 18th century, but reached its greatest strength under the reign of King Ghezo from 1818 to 1858. It was placed under the protectorate of Portugal in October, 1885, but fell to the French on account of local differences in 1892. A consistent development has been made under French influence. The slave trade has been abolished and the former custom of offering human sacrifices is almost extinguished. Population, 1908, 998,500.

**DAIRYING** (dä'rÿ-ing), the industry in which milk and butter are produced. This branch of agricultural industry has been greatly extended and radical changes in methods of work have been brought about. The improvements are notable not only in the United States and Canada, but in the dairying districts of Germany, Austria, Denmark, Holland, Belgium, and Sweden, where experimental stations and dairying schools are maintained for the investigation and study of rearing cattle and making butter and cheese. Denmark maintains about a

hundred high schools and a dozen agricultural institutes in which pupils learn dairying by practical work, and, as a result, the industry has been placed on a very high basis. About fifty institutions teach dairying and related productive arts in the United States, where the annual output of butter has a value of \$115,500,000 and cheese \$32,000,000. About 10,000 creameries and cheese factories are operated. The leading dairy schools of Canada are at Guelph and Toronto. Coöperation has been applied more successfully in dairying than in any other branch of industry. Many farmers have introduced coöperation in various places, uniting the milk products of the farms and sharing the results obtained at a central creamery. The effect has been that butter of a much higher quality is now obtained, the price of the product has been raised, and the quantity has been increased notably.

Much attention is given by agriculturists to the improvement of cattle for dairying purposes. As distinct butter producers the Jersey and Guernsey cattle have been found preferable, since their milk contains the best and largest quantity of butter fat and the flavor is of a high quality. The Holstein-Friesian cattle yield the largest quantity of milk, but their product is inferior in solid material, though they possess a high degree of beef-producing qualities. The Ayrshire cattle are midway between the Jersey and Guernsey on the one hand and the Holstein-Friesian on the other in the quality of milk produced, and have been found excellent for cross breeding with other stock on account of their rugged constitution. An average cow produces about 130 pounds of butter per year, while the higher grades of cattle produce from 300 to 350 pounds, but some individuals yield larger quantities.

The apparatus used in dairying has undergone marked improvements. The Babcock milk-tester, a centrifugal machine for separating cream in small tubes, formerly tested to about one-tenth of one per cent., but it has been so improved and modified that it is capable of testing to one-hundredth of one per cent. It is now used largely among dairymen for testing cattle by their milk product. Equally beneficial improvements have been made in machines for mechanical separation. There are now more than a dozen separators on the market, by which butter fat to within one-tenth of one per cent. can be extracted from the milk. Churns and machinery for working the butter have been improved correspondingly. Another improvement is in *Pasteurizing* cream, which is done by subjecting it to a temperature of 140° to

155° Fahr. Pasteurized cream contains forty to fifty per cent. of butter fat, is considered highly valuable for hygienic reasons, and retails for about forty cents per quart, thus rendering better profit than the butter.

The butter sold on the market is much better and more wholesome than that formerly produced. There are, of course, some exceptions, but as a rule it is much cleaner, more healthful, and pleasanter to the taste. Many of the improvements in manufacturing and in the quality of butter and cheese are due to legislation. The dairying enterprise as a whole has been benefited through the efforts of commissions, which have investigated the industry in foreign countries and utilized the more important discoveries in building up the enterprise in America. See **Creamery**.

**DAISY** (dā'zŷ), the common name of the well-known flowers and plants of the species *Bellis perennis*. It is widely distributed, being common to nearly all inhabited countries. The name was derived from its tendency to flower almost continually and means the *day's eye*. It was the emblem of fidelity in love in the age of chivalry. The common daisy of Europe has

DAISY.

Oxeye Daisy; Common Daisy.

been greatly improved and is the plant which is cultivated most extensively in gardens. It includes both single and double flowering species and nearly all shades of colors. The *Oxeye daisy* is a species of chrysanthemum.

**DAKOTA** (dā-kō'tā), a family of Indians native to the vast regions between the Mississippi and the Rocky Mountains. It includes among others the Winnebagoes, Sioux, Oma-

has, Iowas, Poncas, Kansas, Crows, Otoes, Missouris, Assiniboins, and Minnetarees. The Dakotas seem to have come eastward from the Pacific until they met the Algonquins. The language shows some similarity to the Mongolian, perhaps more than that of any other Indian language. The total number of Dakotas now aggregates about 60,000. Some writers use the name interchangeably with Sioux, since they consider the Siouan stock the predominating influence.

**DAKOTA RIVER.** See James River.

**DALLAS** (dāl'lās), a city of Texas, county seat of Dallas County, on the Trinity River, near the mouth of the West Fork. It is on the Missouri, Kansas and Texas, the Southern Pacific, the Texas and Pacific, the Texas and New Orleans, and other railroads. Lines of electric railways connect it with Fort Worth and other cities. The chief buildings include the county courthouse, the post office, the Carnegie Public Library, the Protestant Episcopal Cathedral of Saint Matthew, the Roman Catholic Pro-Cathedral, and a number of fine public schools. It has a fine Confederate monument. Oak Cliff and City Park are notable public grounds.

Dallas is surrounded by a productive farming country and has extensive wholesaling interests. The industries include iron factories, flouring mills, cigar and candy factories, cotton gins, grain elevators, machine shops, and farm implement manufactories. Many of the streets are substantially paved. It has gas and electric lights, waterworks, sewerage, and an extensive electric railway system. The first settlement was made in 1841. Population, 1910, 92,104.

**DALLES** (dālz), the name applied to various cataracts in the United States. The Dalles of the Saint Louis are cataracts located near Duluth, Minn. The Dalles of the Columbia are near Dalles City, Ore., on the Columbia River, about 200 miles from its mouth and fifty miles above the Cascades. Here the river is compressed by basaltic rocks to about one-third of its usual breadth, with lofty walls on both sides. The chasm formed in this way is fifty-eight yards wide, and through it the waters plunge in the form of a roaring torrent. The Dalles of the Wisconsin, near Kilbourne City, Wis., is about seven miles long and sixty feet wide. On both sides of the gorge are walls of Potsdam sandstone fully 100 feet high.

**DALLES, The,** or Dalles City, a city of Oregon, county seat of Wasco County, at the head of navigation on the Columbia River, eighty-eight miles east of Portland. It is on the line of the Oregon Railroad and Navigation

Company. The chief buildings include the high school, the county courthouse, and a number of churches. It has a large trade in grain, fruit, and live stock. The manufactures include flour, woolen products, clothing, and machinery. In the vicinity and down the river is much beautiful natural scenery. A military post was established at The Dalles in 1838 and the place was incorporated in 1858. Population, 1900, 3,542.

**DALMATIA** (dāl-mā'shī-à), a province of Austria, extending along the Mediterranean, and bounded by Croatia, Montenegro, Bosnia, Herzegovina, and the Adriatic Sea. The area is 4,940 square miles. It contains ranges of the Dinaric Alps, a large number of coast inlets, and numerous small lakes and rivers. The greatest elevation is reached by Mount Orien, which rises 6,230 feet above the sea level. A large per cent. of the soil is fertile and is farmed, pastured, or occupied by forests. The mountain districts yield minerals, though mining is not highly developed. Among the chief products are cereals, fruits, domestic animals, cheese, silk, and vegetables. Though the least developed of Austrian dependencies, it has considerable shipbuilding. The people along the coast are largely seafaring and engaged in fisheries. A number of thriving cities are located on the Adriatic, where the chief centers of manufactures and commerce are situated. Several railway lines connect them with the interior districts.

The province was once an independent kingdom of considerable strength. It was conquered by the Romans in the reign of Augustus. Afterward it was overrun by the Goths and conquered successively by the Slavonians, Venetians, French, and Italians. Since 1814 it has been a part of Austria, with the title of kingdom. The inhabitants consist mostly of Dalmatian Slavs, who resemble the Croats, and they are the modern representatives of the ancient Illyrians. Other elements include Germans, Italians, and Jews. Population, 1906, 598,764.

**DAM**, a bank or structure to confine the flow of a stream in order to raise its level. Dams are usually built of stone, earth, or wood, though in recent times cement, steel, and cast iron have been utilized to a large extent. Those constructed in ancient times were largely for protection against overflows from rivers; or for safeguards against waves and tides on lakes and seas. Among the most important modern dams of this class are the great dikes of Holland and the levees in the lower course of the Mississippi. The former protect the lowlands against overflows from the sea, while the lat-

ter provide safety against general overflows during excessively rainy seasons. Many dams are maintained in streams to obtain power for machinery. In this class the water is raised sufficiently to permit currents to pass rapidly through artificial channels parallel to the main bed of the stream, thus obtaining a permanent flow of water where the force is applied. Another class of dams built which are extensively used includes those constructed to provide water for cities and for irrigation purposes. The New Croton dam, on the Croton River, was constructed to provide an immense storage reservoir for the water supply of New York City.

Dam at Saint Anthony Falls, Minneapolis, to furnish power for large mills.

It is 290 feet high and 216 feet thick at the base, and the solid masonry is 700 feet long, besides which an earthen dam lined with a wall of masonry is extended to a length of 1,500 feet. The structure forms a reservoir eighteen miles long with a capacity of 32,000,000,000 gallons of water, the cost being about \$4,250,000.

A dam for irrigation purposes at San Diego, Cal., is 130 feet high and 545 feet long. It is constructed largely of steel and is protected from rusting by paints made of semiliquid asphalt. The capacity of the reservoir is 14,000,000,000 gallons. A dam almost entirely of steel is located near Ash Fork, Ariz., which has a capacity of 36,000,000 gallons. One of the notable dams is located on the South Platte River, Col., forming a reservoir for the water supply of Denver. The greatest height is 210 feet, but its site in a rocky gorge made it necessary to build it only twenty-five feet long at the base and 500 feet at the top. It is constructed of granite blocks, with an inner lining of steel plates, and is supported by steel beams. The reservoir is 200 feet deep at the dam, 150 feet three miles up the river, and fifty feet six miles above the dam. It has a storage capacity of 35,000,000,000 gallons of water. The Roose-

velt dam, across the Salt River, seventy-two miles above Phoenix, Ariz., is of the arched gravity type and is 284 feet high. It was completed in 1907.

The largest dam in the world is maintained by the Egyptian government across the Nile at the Assuan cataracts. The length of this remarkable structure is 6,400 feet, the width is eighty feet at the bottom and twenty-three feet at the top, and the height is ninety-two feet. It is constructed of granite masonry, its foundation being solid granite rock. It serves the purpose of collecting a supply of water from the Nile between November and April for the purpose of irrigating the land farther north during the months of May, June, and July. In the dry season the water is conducted by canals to the different cultivated fields. Through the agency of this improvement vast regions of arid land have been redeemed and made productive. The capacity of the reservoir is about 280,000,000,000 gallons. It is estimated that the entire cost of this dam, including locks and accessories, was \$8,750,000.

**DAMAGES**, in law, the amount of money a person may recover for the injury done by another to his person, property, or other rights. If damage is done through neglect or by a willful act, the party injured may recover in money the amount of the loss, and, if the damage results from a malicious act, the amount recovered may be larger than the actual loss. The courts of England and America generally agree that the person damaged may recover to make good the loss sustained, which is estimated in money, and in addition the defendant is required to pay the court expenses. When the damage results from causes over which no one has control, such as a storm or earthquake, or if it is chargeable to an accident for which no one is to blame, such as a horse running away, the injured party cannot recover.

**DAMARALAND** (dä-mä'ra-länd), the northern portion of German Southwest Africa, extending from Walfisch Bay to the Kunene River. The area is about 100,000 square miles. The coast region is arid and desert, but the interior contains fertile tracts adapted to agriculture. It has valuable mineral products, including gold, silver, iron, and copper. Cotton, tobacco, silk, fruits, and live stock are the chief

products. The drainage is largely toward the east by tributaries of the Zambezi. A large proportion of the inhabitants belong to the Bantu and Damara races. Population, 1905, 200,000.

**DAMASCUS** (dā-mās'kūs), the capital of the Turkish vilayet of Syria, regarded the most ancient city of the world, called *Dimishk-esh-Shâm* by the natives. The Scriptures mention it on numerous occasions, connecting it with the time of Abraham and successively with other distinguished men, including Saint Paul. It is still one of the largest cities of Western Asia, is beautifully situated in a fertile plain of the same name, and is bounded on the north and west by the high mountain range of Anti-Libanus. Jerusalem is located about 140 miles west of Damascus and a railroad line connects it with the Mediterranean Sea at Acre. While possessing many points of interest which are mentioned by travelers, it contains narrow and angular streets, and in the poorer portions has many low houses that are filled with filth. The courts are paved with marble and ornamented with fountains. Many of the public places are adorned with trees and beautified by fine architectural structures. The chief buildings include the citadel and the Great Mosque built in the eighth century. About seventy-five mosques of considerable size are maintained in the city, in addition to fully 175 chapels for instruction and prayer.

The Moslems regard Damascus one of the holy cities. Its general features are thoroughly Oriental and it is the gathering place of great companies of pilgrims. Pilgrimages to Damascus began soon after the time of Mohammed, a number of his revelations being associated with it. In several portions are colonies of Christians and Jews, who are allowed religious liberty and educational advantages. Among its notable features are numerous bazaars, the various classes being located by themselves on different streets. Among the bazaars are those of the saddlers, silversmiths, shoemakers, booksellers, and others. In the midst of these stands the Great Khan, which forms a market place for merchants. Straight Street, mentioned in connection with the conversion of Saint Paul, is one of the most important commercial thoroughfares.

Much of the trade of Damascus is in the hands of Europeans. The manufactures include tobacco, fabrics, silk and cotton goods, jewelry, olive oil, damask, soap, and furniture. Formerly the celebrated Damascus steel was produced largely in the city, but its manufacture is no longer carried on. The population is

made up of many classes, including Kalmuks, Turkomans, Afghans, Kurds, Circassians, and Europeans. A large trade is carried on with the interior of Asia by caravans of camels, while within the immediate vicinity it is facilitated by a number of canals. The building of railroads, telephone and telegraph lines, and other modern facilities has enlarged its importance commercially. A macadamized road was built between it and Beyrout in 1860. The educational status is somewhat better than formerly, owing largely to the work done by Christians. Damascus has been the seat of much military contention and passed successively under the Israelites, Persians, Greeks, and Romans. It has been under the dominion of the Turks since 1516. Population, 1908, 212,641.

**DAMASCUS STEEL**, a kind of steel made originally in Syria, so named from Damascus, where it was used largely in manufacturing cutlery and swords. It has been known to Europeans since the time of the Crusades, but the secret of making the Damascus blades, a kind of sword, is not well understood. Damascus steel is noted for its temper, hardness, and durability. It requires careful forging and workmanship and contains a larger per cent. of carbon than ordinary steel. The Damascus blades are beautified by ornamental designs, including inscriptions and landscapes. The art of producing these is called *damaskeening*.

**DAMASK** (dām'ask), a rich silk fabric originally made at Damascus, from which it is named. It is distinguished by raised figures of animals, landscapes, flowers, and fruits in their natural colors embossed upon a white or colored base. The name is now given to various products made of silk, wool, linen, or cotton, and to a mixture of several of these colored differently. Damask textiles are used for window curtains, fine towels, napkins, tablecloths, and furniture coverings. The figures of fruits, flowers, vases, and other objects placed on the surface are produced by a particular management of the warp threads. Damasks of this character are made extensively in America and Europe.

**DAMIETTA** (dām-ĭ-ĕt'tā), a city of Egypt, on the eastern branch of the Nile, about five miles from the Mediterranean Sea. The main part of the city is built irregularly, but some of the streets are well improved. It is the seat of several European consuls, a Coptic bishop, and an Egyptian governor. Among the public improvements are electric lights, marble baths, and a number of ancient mosques. Large vessels cannot ascend the river to Damietta, owing to sand bars at its mouth. It has railroad con-

nections with Cairo and other centers of commerce. The manufactures include clothing, cotton fabrics, and utensils. It was strongly fortified by the Saracens in the time of the Crusades. The construction of the Suez Canal has caused its commerce to decline. Population, 1906, 32,642.

**DAMPS**, the name generally applied to gaseous products fatal to animal life. Damps frequently occur in coal mines, wells, and other excavations, especially if they are covered up and unused for some time. *Choke damps* are composed of carbonic acid mixed with carbonic oxide, being so called from their tendency to extinguish life and fire. *Fire damps* consist largely of light carbureted hydrogen and are so named because of their tendency to explode when mixed with atmospheric air, after being brought in contact with a flame.

**DAMSON** (dăm'z'n), the name of a common plum tree which bears small oval fruit. Numerous species have been developed by cultivation. They bear fruit of various colors, such as yellow, bluish, dark purple, and black. They were imported originally from Damascus and are cultivated extensively in the Temperate zones. Some species are used in making a confection called *damson cheese*.

**DANBURY** (dăn'bēr-ī), a city and one of the county seats of Fairfield County, Connecticut, on the Still River, a tributary of the Housatonic. It is on the New York, New Haven and Hartford Railroad and on several electric lines. The noteworthy buildings include the courthouse, the public library, the city hall, and the high school. It has a fine public park and two monuments, one of which was erected to the memory of General Wooster in 1854. Among the manufactures are boots and shoes, shirts, clothing, sewing machines, machinery, and utensils. It has paved streets, waterworks, electric lights, street railways, and other modern facilities. The first settlement was made in 1684 and it was incorporated as a city in 1889. At the time of the Revolution, in 1777, it was captured by the British under General Tryon. Population, 1900, 16,537; in 1910, 20,234.

**DANCING** (dăn'sing), an amusement or exercise in which one or more persons move the body successively in rythmical order, usually accompanied by music. It consists of steps, bounds, and inclinations of the body, and all the movements are executed with a care designed to make them artistic. In ancient times dancing was a part of the religious observances and worshipers danced before the altars and images of their gods. The Egyptians considered their god Thoth as the inventor of dancing. In

Greece it expressed all the different passions from the genteel and beautiful to the dance of the Furies, which inspired the beholders with terror. It played an important part in the sculptures of Greece and was classed with poetry by Aristotle. In Rome dancing was permitted by free citizens only as a religious rite, but in Egypt and India it was employed in public, where dancing and singing girls entertained on public occasions.

Dancing was not practiced extensively after the fall of Rome, largely for the reason that it was discouraged by Christianity on the ground that it was inherited from the Jews and pagan nations. Its revival began in the fifteenth century, when it gained favor in Italy and was introduced by Catherine de' Medici into France. War and harvest dances were given in Germany even before that time. The *carole* and *egg dance* were among the dances of England. Savage warriors practiced dancing to a considerable extent, as exemplified by the American Indians in their celebrated war dances. The Protestant churches either forbid it or look upon it with a measure of disapproval.

The art of dancing has been modified from time to time and has varied in the extent to which it has been practiced. Among the dances characterized as national are the *polonaise* of Poland, the *fandango* of Spain, the *tarantella* of Italy, the *jig* of Ireland and Wales, the *waltz* of Germany, and the *reel* and *Highland fling* of Scotland. The *breakdowns* are popular among the Negroes and the *step dances* and *hornpipes* are quite common among sailors. Among the modern dances common in America are the *quadrille*, the *two-step*, the *polka*, the *lancers*, the *waltz*, the *ballet*, the *galop*, the *cotillion*, and the *schottish*.

**DANDELION** (dăn-dě-lī'ŭn), a plant native to Europe, but now common in America. It has a naked, hollow stock, with a composite, bright yellow flower. The leaves rise from a tap root in the form of a bunch. The seed has a white, downy tuft of hair and is scattered extensively by the winds. In many places the dandelion is an obnoxious weed in lawns and parks. Its blanched leaves are recommended as a salad and are eaten as lettuce in the form of greens. The plant yields a milky juice, which, in the form of extract, is employed for medicine. Its roots have been used to adulterate coffee in a way quite similar to chicory. Though small in the native state, the plants have been greatly enlarged and improved by cultivation.

**DANISH WEST INDIES**, a group of three islands belonging to Denmark, situated east of Porto Rico and classed with the Virgin Islands.

The area is 138 square miles, which includes some tracts of marshy lands. The area of each of the three islands is as follows: Saint John, 21 square miles; Saint Thomas, 23 square miles; Saint Croix, 74 square miles. A large part of the inhabitants consists of negroes and mulattoes and more than half are on the island of Saint Croix. Christiansted, on Saint Croix, is the seat of local government.

The Danish West Indies, though of little importance commercially, possess value as stations for steamship lines crossing the Atlantic.

DANDELION.

1, Floret; 2, involucre and floret; 3, involucre and fruit; 4, fruit with pappus; 5, involucre and ripened fruit.

Excellent harbors are located at Christianstad and Charlotte Amalie, on Saint Thomas, in fact, the latter is one of the deepest and safest in the West Indies. Two cable lines, one French and the other English, connect Saint Thomas with European ports. The exports consist chiefly of sugar and rum, and trade is almost exclusively with the United States and Denmark. A Spanish dialect is the chief language, but English and Danish are spoken in the courts. The revenue has been insufficient to cover the expense for a number of years, owing to the fact that it is obtained chiefly from customs, and the shortage arises because trade is not large. Negotiations were made a number of times to sell the islands to the United States, but in 1902 the treaty of sale was rejected by the Danish Parliament. It is considered that these islands will be valuable after the completion of the Panama

Canal, and they would add materially to the value of Porto Rico as an American trading center. Population, 1906, 36,152.

**DANTZIC** (dănt'zĭk), or **Danzig**, a seaport of Germany, capital of West Prussia, on the west branch of the Vistula River, about three miles above its mouth. However, its port, Neufahrwasser, is at the mouth of the Vistula. It is strongly fortified by a moat and ramparts and these are strengthened by twenty bastions and several detached forts. Among the principal buildings are a cathedral built in the fourteenth century, the Church of Saint Catharine, several monasteries, synagogues, observatories, and theaters. Langgasse is the finest street in the city, and, owing to its lofty gables built after the style of architecture common to the sixteenth and seventeenth centuries, its appearance is picturesque. Other noteworthy features include the public market, the city library of 150,000 volumes, and the railway depot. The commerce consists largely in wheat, amber, machinery, wool, starch, and leather. Shipbuilding and the manufacture of artillery and machinery engage large numbers of workmen. The general manufactures include hardware, clothing, and textiles. It has extensive railroad and electric railway facilities, municipal waterworks, gas and electric lighting, and stone and asphalt pavements. The first mention of the city was in 997, when it became identified with Christianity. In 1358 it joined the Hanseatic League. It has belonged to Prussia since 1793, except when it was set apart as a dukedom by Napoleon. Population, 1905, 159,648.

**DANUBE** (dăn'üb), the second largest river of Europe, being exceeded in length only by the Volga. The Brege and the Brigach, two streams having their source in the Black Forest of Germany, unite at Donaueschingen and form the Danube. The length is 1,750 miles and the area drained by it includes 315,000 square miles. At the union of the two rivers that form it the height is 2,265 feet above the sea level, the average fall is eighteen inches per mile, and its waters flow through a delta of seven branches into the Black Sea. The principal tributaries are the Drave, Save, Theiss, and Pruth rivers. After leaving Germany, it passes through Austria, between which and Serbia it forms a portion of the boundary, thence passes between Serbia and Rumania, thence between Rumania and Bulgaria, and thence makes a bold curve north and east to a point between Rumania and Russia, where its waters unite with the sea. Of its 400 tributaries about one hundred are navigable, while Ludwig's Canal connects it with the Rhine and

the Moldau and Muhl canals with the Elbe, and several others widen its sphere of commercial importance.

The three principal divisions of the Danube system include the river from its source to Passau, where it leaves German territory; thence the middle course, ending at the Iron Gate, below Orsova; thence the lower course to the sea. The middle course is especially beautiful in scenery, rapids, and cataracts. At the Iron Gate the stream has a width of only 129 yards and its waters are piled up to a depth of twenty-eight fathoms. At each side great ledges of rock tower above the surface and form a continuous line of beautiful panorama. The delta contains a vast area, equal to about 1,000 square miles, covered with dense rushes and cut up by winding channels, where sea birds and various animals find a safe and favorite haunt. Three main channels are included in the delta. They are known as the Kilia, Saint George, and Sulina mouths, and the last named is the one through which ships enter. The mouths farthest apart are sixty miles from each other. Owing to its favorable location through densely populated regions and to its deep water, the Danube is one of the most important rivers to commerce. Great numbers of steamboats ply on its surface and reach hundreds of commercial centers, the total connected navigation facilities constituting about 2,500 miles. The navigation is controlled by the International Navigation Commission, which is composed of delegates appointed by the riparian or great powers. This commission has made extensive improvements in various portions, particularly by a great canal at the Iron Gate.

**DANVERS** (dän'vēr-z), a town of Essex County, Massachusetts, about eighteen miles northeast of Boston, on the Boston and Maine Railroad. Among the chief buildings are the State insane hospital, the high school, and the Peabody Institute Public Library. The manufactures include lumber products, boots and shoes, ironware, clothing, machinery, and carpets. It has systems of waterworks, public lighting, and electric street railways. In 1692 it was implicated in the Salem witchcraft delusion. It was incorporated in 1752. Population, 1905, 9,063.

**DANVILLE**, a city in Illinois, county seat of Vermilion County, on the Big Vermilion River and on the Big Four, the Wabash, and the Chicago and Eastern Illinois railroads. The surrounding country is rich in coal deposits, building material, and fertile soil. Among the noteworthy buildings are the courthouse, the Carnegie Library, the post office, the high

school, and the Y. M. C. A. building. Douglas and Lincoln parks are fine public grounds. It has systems of paving, sewerage, waterworks, and electric street railways. It was settled in 1830 and incorporated in 1867. The manufactures include hardware, cigars, engines, farming machinery, clothing, and utensils. Population, 1900, 16,354; in 1910, 27,871.

**DANVILLE**, county seat of Boyle County, Kentucky, forty miles south of Frankfort, on the Cincinnati Southern Railroad. Besides having a fine school system, it is the seat of Cadwell's Female Institute, Danville Theological Seminary, Southern Collegiate Institute, Morrison Female Seminary, Center College, Hogsett Academy, and a State institute for deaf-mutes. The industries include machine shops, grain elevators, and stock yards. It is surrounded by a rich agricultural and stock-raising country. Danville was incorporated in 1789. Population, 1900, 4,285.

**DANVILLE**, a borough and county seat of Montour County, Pennsylvania, on the north branch of the Susquehanna River, 150 miles northwest of Philadelphia. It is on the Lackawanna, the Pennsylvania, and the Philadelphia and Reading railroads. The noteworthy buildings include the public library, the high school, the courthouse, and the State hospital for the insane. Among the manufactures are iron and steel wares, silk goods, stockings, suspenders, and custom-made clothing. It has extensive blast furnaces and rolling mills. The surrounding country is rich in agricultural and mineral products. Population, 1900, 8,042.

**DANVILLE**, a city of Virginia, in Pittsylvania County, on the Dan River, 140 miles southwest of Richmond. It is on the Danville and Western and the Southern railroads. An abundance of water power for manufacturing is furnished by the river. The manufactures include flour, cotton and knit goods, ironware, cigars, tobacco, clothing, and machinery. The output of the tobacco factories is particularly large. Besides fine public schools, it contains the Roanoke Female College, the Danville Male Academy, and the Danville Female Academy. Among the municipal improvements are gas and electric lights, waterworks, pavements, and an extensive street railway system. Danville was incorporated in 1792. It was the capital of the Confederate States for a short time near the close of the war. Population, 1900, 16,520.

**DAPHNIA** (dăf'nī-ă), a genus of freshwater crustaceans, known popularly as the water flea. These animals have a bivalve shell, long swimming antennae, and five pairs of feet. A compound eye is attached to the head, which

is elongated into a snout. They are abundant in ponds and are important as the diet of many fishes.

**DARDANELLES** (där-dä-nělz), the Hellespont of the ancients, so named from Dardanus, the mythical founder of Troy. The strait is forty miles long and from one to four miles wide. It separates Europe from Asia at this point, and connects the Sea of Marmora with the Aegean Sea. A current flows through it from the Sea of Marmora, which is often increased by winds. The country on the European side is hilly, but is in a high state of cultivation and densely populated, while on the Asiatic side is a fertile plain, rising toward the range of Mount Ida with gradual ascent. Two castles mark the sites of the ancient Sestos and Abydos, while strong fortifications guard it on both sides. In 1841 a treaty was made by the five great powers and Turkey to the effect that no warship shall pass the strait, except with the expressed permission of Turkey. Abydos, on the Asiatic side, is celebrated for the story of Hero and Leander. It is noted for the passage of the armies of Xerxes in 480 B. C., when invading Europe, and that of Alexander in 334 B. C., when leading his famous expedition into Asia. Lord Byron, to demonstrate the possibility of the reputed feat of Leander, swam across the strait.

**DARFUR** (där'fōor), the name applied to the western portion of eastern Sudan, in Africa. It has an estimated area of 200,000 square miles and a population of 2,500,000. In 1874 it was reduced by Ziber Pasha and placed under the control of Egypt. The British claims were strengthened by an agreement with Germany and Italy in 1891. A battle with the French troops at Fashoda resulted in an agreement between France and England, signed March 21, 1899. By the terms of this treaty the western boundary of Darfur is to mark the sphere of influence between the two powers in Central Africa. The district is drained largely by the head waters of the White Nile and Shari rivers. It contains large tracts of desert lands in the north, but there are quite productive regions toward the south. Cotton, wheat, tobacco, sesame, maize, and fruits are grown. Cattle raising is the principal industry. A majority of the inhabitants are Arabs, who profess Islam. The government is administered from El Fasher, its capital.

**DARIEN** (dā-rĭ-ĕn') **Gulf of**, a gulf extending from the Caribbean Sea, between the Isthmus of Panama and the mainland of South America. It receives the inflow of several rivers, including the Atrato, has a number of sea-

ports, and is the most prominent inlet on the northern coast of Colombia. The southern portion is known as the Gulf of Urabá.

**DARIEN**, **Isthmus of**, the name applied to a neck of land between the Gulf of Darien and the Pacific Ocean, and sometimes to the entire isthmus which connects North and South America, though the name usually applied to the latter is Panama. See **Panama**, **Isthmus of**.

**DARIEN SCHEME**, a proposition to establish a colony on the Isthmus of Darien with the view of controlling the trade between the Western and Eastern hemispheres. It was formulated by William Patterson, a Scotchman, in 1695, and about \$4,500,000 was subscribed to finance the scheme. In 1698 about 1,200 colonists sailed from Scotland to their prospective new home, which was called New Caledonia. A second company was sent out in 1699 and a third the following year, but the project proved an entire failure. The colonists found the region unhealthy, suffered by disease and starvation, and were harassed by the hostile natives and Spaniards.

**DARK AGES**, the name applied to a portion of the Middle Ages, including a period of about a thousand years, from the fall of Rome to the revival of letters in the fifteenth century. The period properly commences with the invasion of France by Clovis in 486 A. D., and closes with the invasion of Naples by Charles VIII. in 1495.

**DARLING** (där'ling), a river in Australia, the largest tributary of the Murray. It is formed by the confluence of several rivers rising in the Liverpool Range, has a length of 600 miles, with its tributaries 1,150 miles, and drains an area of 197,500 square miles. Its confluence with the Murray is at Wentworth, on the boundary between Victoria and South Australia. The name is applied to two districts in Australia, the Darling District and the Darling Downs. The former is in New South Wales and the latter in Queensland.

**DARLING RANGE**, a chain of mountains in the western part of Australia, extending parallel with the coast for a distance of nearly 300 miles. The highest summit, Point D'Entrecasteaux, has an altitude of 3,700 feet above the sea. The general altitude ranges from 1,200 to 1,500 feet, and many sections of this range are covered with fine forests.

**DARMSTADT** (därm'stät), a city of Germany, capital of the grand duchy of Hesse-Darmstadt, situated on the Darm River, fifteen miles south of Frankfort-on-Main. It is the converging center of several railroads and has a large jobbing trade. The streets are well

paved with stone and macadam. Among the chief buildings are the palace of Prince Henry, the town hall, the Victoria School, and the Grand Ducal Palace. The last mentioned contains a museum of rare paintings and a library of 500,000 volumes. A fine Doric column rises to the height of 134 feet in one of the public squares, upon which is mounted a statue of the Grand Duke Louis, who founded the newer portion of the city and greatly extended its commercial importance. The manufactures include hats, carpets, chemicals, clothing, and earthenware. It has modern municipal facilities, such as gas and electric lighting, public waterworks, and electric street railways. Darmstadt has been the capital since 1567. Population, 1905, 83,123.

**DARTER** (därt'ēr), the name of a group of small fishes found in the fresh waters of North America, so named from their quick motion. These fish belong to the perch family, are from six to ten inches long, and are classed among the smallest spiny rayed fish. They frequently lie concealed under stones at the bottom of clear running water, and when hungry or frightened dart suddenly for a short distance. Several species are familiar, most of them frequenting the streams of the central and southern parts of the United States.

**DARTER**, or **Snakebird**, a bird native to the tropical parts of most continents, closely allied to the cormorant. The feet are webbed, the bill is longer than the head, and the neck is long and slender. They are called darter from their quick motion. The name *snakebird* is applied to them from the fact that the head is scarcely thicker than the neck, giving that part of the body the appearance of a snake. When frightened while sitting on a branch over a stream, they dart quickly into the water or fly upward and circle in the air like a hawk. They are skilled in catching fish, at which they dart with a sudden and well-directed aim. The American darter is sometimes called water turkey and is about three feet long.

**DARTMOOR** (därt'mōor), an extensive and desolate upland in Devonshire, England, belonging to the duchy of Cornwall. It is noted because of its rugged scenery and as the source of several rivers. A large portion of it furnishes grazing for cattle and sheep during the summer months. The extent is fourteen miles from east to west and twenty miles from north to south, with an area of 150,000 acres. The minerals include China clay and tin. At Lee Moor, which is the seat of a meteorological observatory, are the largest kaolin works in England. A number of earthworks, Cyclopean bridges, and stone antiquities abound. A prison

was built on the Dartmoor upland in 1809 for the custody of French prisoners of war. The British impressed about 2,500 American sailors during the War of 1812, confining them in this prison until peace was concluded. The prison incloses about thirty acres and is now used as a depot for convicts.

**DARTMOUTH COLLEGE** (därt'müth), an institution of higher learning at Hanover, N. H. It is the outgrowth of a school which was established at Lebanon, Conn., in 1754, for the Christian education of Indian youth. This school was founded by Eleazer Wheelock and was known as Moor's Indian Charity School, so named from Josiah Moor, who contributed a house and two acres of land. The college received a royal charter in 1769, hence is one of the oldest of New England colleges, ranking next to Harvard and Yale. John Wentworth, the governor of the Province of New Hampshire, gave to the college the name of Lord Dartmouth, who was its most active patron in Great Britain, but he and other Englishmen who contributed to its support withdrew their patronage soon after it ceased to be devoted particularly to the education of Indians. It is at present one of the foremost institutions of higher learning in New England. Though surrounded by religious influences, it is nonsectarian, but it remains an institution for men only. The departments include those of medicine, classics, sciences, commerce and finance, and civil engineering. It has a library of about 100,000 volumes and 20,000 pamphlets. With it are associated the Dartmouth Medical School, founded in 1798; the Thayer School of Civil Engineering, founded in 1867; and the Amos Tuck School of Administration and Finance, established in 1900. In 1907 the academic department of the college was attended by 1,150 students drawn from thirty-five states. The State of New Hampshire attempted to gain control of the college in 1860, which gave rise to a famous case in the lower courts and the Supreme Court of the United States. See **Dartmouth College vs. Woodward**.

**DARTMOUTH COLLEGE VS. WOODWARD**, a case decided by the Supreme Court of the United States in 1819. It grew out of a controversy between the trustees of Dartmouth College and the Legislature of New Hampshire. George III. granted a charter to found Dartmouth College in 1769, and after the Revolution the State of New Hampshire claimed the same control as was exercised by the throne prior to the independence of the United States. William Woodward held the offices of secretary and treasurer of the cor-

poration of Dartmouth College under the trustees of the college, twelve in number, and a controversy arose between him and the trustees, who removed him from office. In the meantime the State Legislature passed an act to amend the charter so as to supervise the affairs of the college under a new board of twenty-one members. This board appointed William Woodward secretary and treasurer, and the old trustees brought a suit against him to recover the property of the college. A verdict for the defendant was given in the superior court of New Hampshire, but this was reversed on appeal in the United States Supreme Court and the plaintiffs were awarded \$20,000 damages. The essence of the decision is that the "charter of Dartmouth College is a contract within the meaning of that clause of the Constitution which prohibits the states from passing any law impairing the obligation of contracts." This decision was handed down by Chief Justice Marshall. The plaintiffs were represented by Daniel Webster.

**DARWINISM**, a term used to designate the views advocated by Charles R. Darwin, relating to the origin of species of plants and animals. The view that all things are susceptible to change by cultivation was held by a vast majority of naturalists before the publications of Darwin became known. It had been demonstrated that hybrids might originate from various species, but writers deemed the hybrids sterile and regarded any further change impossible. The views of Darwin were held by Alfred Russel Wallace and were foreshadowed by Aristotle. The theory of transmutation of species stands in direct opposition to the belief that each species was originally created as a separate type. It embraces the proposition that in every plant or animal exists a certain amount of variability. The offspring differ in some respects from each other and from the parent stock, this becoming aggravated by climatic conditions and environments through long periods of time, as is noticed by the domestication of animals. There is a tendency on the part of each animal and plant to multiply at a geometrical ratio, and, if a single one were not checked, it would in the course of ages fill the earth. On account of this there is a severe struggle for existence, in which all forms of life engage against other forms, and especially against their own kind.

According to this view, the types best adapted for the struggle of life survive, while others die by suppression and defeat. Those which endure are said to do so from *natural selection*. As the offspring of each class of animals and

plants resemble the parent stock in most respects, the less improved forms ultimately become exterminated, and each family is continued by the *representative* individual which it embraces. The result of this, and of sexual preference, leads to an endless progression by which evolve higher species, genera, families, orders, classes, and even subkingdoms. The theory may be illustrated by the claim that neither a horse nor an ox existed at a remote time in the past, but there was an animal that had the characteristics common to both. The various changes gave rise to specialized forms, until finally the horse came forth from an ancestor not so specialized as itself, and the ox from another. The theory, more briefly stated, is that the "Creator may have breathed life into one or more forms of life, from which the others originated."

**DASYURE** (dās'ī-ūr), the common name of a genus of marsupial animals native to Australia and Tasmania. They are allied to the opossums. Most species are spotted and have bushy tails. The dasyure of Tasmania is light brown or whitish beneath, gray and whitish above, and about two feet long. It lives in burrows, feeds on insects and flesh, and is particularly fond of poultry. Several species of Australia resemble the cat and are quite strong and fierce. Fossil remains of the dasyure are found in many sections of South America.

**DATE**, the common name of the fruit borne by a number of species of trees which belong to the genus *Phoenix dactylifera*. The tree itself is known as the date tree or date palm. It is the palm tree mentioned by classic writers and in the Scriptures. Its nativity is in India, Southwestern Asia, and Northern Africa, where it still flourishes, serving a useful purpose in the domestic and commercial life of the inhabitants. The trees have a straight stem, from twenty-five to sixty feet in height, and are of nearly the same thickness throughout the entire length. Date palms are divided into male and female, the former usually numbering about one in twenty-five when found in palm groves. The pistillate trees bear from 150 to 200 dates. In the larger species the bunches of dates weigh from twenty to twenty-five pounds, hanging below the leaves, at the top of the tree. The Arabs are among the most extensive producers, propagating them from suckers. In the eighth year they begin to bear. They reach maturity at about twenty-five and decline after growing fully a hundred years.

The fruit of the date tree is eaten fresh or is preserved by drying. Large cakes are made of dates by pounding and kneading them to-

gether, and these form the principal food of the Arabian caravans that traverse the deserts. Some species are used in the manufacture of wine and a sort of vinegar. The date stones or seeds are ground and fed to camels, or are used as a substitute for coffee. A valuable oil

DATE.

A, Male flower cluster; B, male flower; C, female flower cluster; D, female flower; E, fruit; F, single date.

is obtained from the seeds, while in some countries they are used in making ornaments and charms. Baskets, bags, and pouches are made from the leaves, while the fibers found near the bottom of the tree are used for making ropes, and the wood is valuable for fencing and building purposes. The fruit of several species native to Asia is used in the manufacture of toddy, which forms a pleasant drink. The date

palm, next to the cocoanut tree, is the most interesting and useful of the palms.

**DATE PLUM**, the name of several species of trees of the ebony family, usually large, thick-leaved, and hard-wooded. The low-growing date plum tree of Europe produces a small fruit. It is native to the southern portion of that continent. The American persimmon or date plum attains a height of from forty to sixty feet. Its fruit is about an inch in diameter, nearly round, very hard, and eatable after being frosted. The date plum of China is cultivated for its fruit, which resembles a small apple in size, and is useful in making preserves.

**DAUGHTERS OF THE AMERICAN REVOLUTION**, a woman's society of the descendants of the soldiers and sailors of the Revolution, organized at Washington, D. C., on Oct. 11, 1890. The purpose is to perpetuate the memory of those who fought upon the American side in the War of Independence, to promote the erection of monuments, and to encourage the collection of relics. A site was purchased in Washington, D. C., in 1902 for the purpose of erecting in that city a memorial hall. The society has about 700 local chapters and a total membership of 40,000, and is represented in nearly all states of the United States. A number of chapters are maintained in Canada, the Hawaiian Islands, and Europe.

**DAUPHIN** (dā'fīn), the eldest son of a French king, prior to the revolution of 1830. The title was originally held by the lords of Viennois, whose province was called Dauphiné. It was first assumed about the middle of the ninth century. The last lord ceded the province to the French king in 1349, on the condition that the title should be forever borne by the heir apparent. The wife of a dauphin was called a dauphine or dauphiness.

**DAVENPORT** (däv'ən-pōrt), a city in Iowa, county seat of Scott County, on the Mississippi River and on the Chicago, Burlington and Quincy, the Chicago, Rock Island and Pacific, the Chicago, Milwaukee and Saint Paul, and other railroads. Across the Mississippi is Rock Island, Ill., with which it is connected by a number of bridges. The public buildings include the county courthouse, a Federal building, the city hall, the public library, Mercy and Saint Luke's hospitals, Saint Ambrose College, the Masonic Temple, and Griswold College, a Protestant Episcopal institution founded in 1859. It has a number of fine public schools and churches, a State orphan home, and many substantial residences. Rock Island, opposite the city, is a beautiful island several miles long. It is owned by the United States government,

and is the seat of an arsenal and of military headquarters.

Davenport is important as a commercial center. It has regular steamship communication with ports on the Ohio and the Gulf. Among the manufactures are clothing, furniture, flour, railroad cars, farming implements, buttons, pottery, and woolen goods. It has large interests in shipping grain and in slaughtering. The streets are generally well improved by grading and paving. Among the public utilities are waterworks, sewerage, electric lighting, and electric street and interurban railways. It was settled in 1854 and named after Colonel Geo. Davenport. In 1838 it was incorporated as a town and in 1851 as a city. Population, 1905, 39,797; in 1910, 43,028.

**DAVIS STRAIT**, the portion of the sea which separates Baffin Land from Greenland and connects Baffin Bay with the Atlantic Ocean. The width is from 180 to 500 miles. It is valued for its whale fisheries. An Arctic current flows southward through this strait and passes along the Atlantic coast of America. It is thought to be the Ginnunga Gap spoken of in the Norse Sagas.

**DAWSON** (dā'sŭn), a river port of Canada, capital of Yukon, on the Yukon River. It is finely situated at the confluence of the Klondike and Yukon rivers, about 330 miles northwest of Skagway, on an elevation 1,450 feet above the sea. The surrounding country is a gold-mining region. Its importance dates from 1896, when gold was discovered on Bonanza Creek. The chief buildings include a number of schools and churches, several theaters, a public library, and the buildings occupied by government officials. It is connected with the coast by telegraph lines and has local telephone service. Transportation is chiefly by steamers on the lower and upper Yukon. It was so named from George Mercer Dawson, a noted geologist of Canada. Population, 1901, 9,142.

**DAY**, the term employed originally to distinguish the time of daylight from the space of night or darkness, but now used more frequently to denote the complete alternation of light and darkness caused by an entire rotation of the earth upon its axis. Only one-half of the earth can be in the light of the sun at once, owing to its being a sphere. Night is merely the shadow of the earth, the two, day and night, covering equal portions of the earth's surface, and together constituting twenty-four hours. The alternations of light and darkness are caused by the rotation of the earth upon its axis, and, on account of it, the several portions of the surface have each a proportional share of light and

darkness. The length of each varies at different seasons of the year, owing to the continual parallelism of the axis of the earth to any former position. The fact that different portions of the earth's surface are being turned consecutively toward the sun constitutes the cause of both the change of seasons and the variations of the length of day and night.

A *solar day* is measured from the sun's coming to the meridian and again returning to it. Owing to the revolution of the earth around the sun, the solar day varies in length. It is about four minutes longer than the *sidereal day*. The latter is measured by the time of a star's coming to the meridian and returning to it on the immediate subsequent night. The mean solar day is twenty-four hours, and the mean sidereal day is twenty-three hours, fifty-six minutes and 4.098 seconds. This difference is due to the sun's apparent movement at a slow rate to the east through the stars, by which they reach the meridian in a shorter time than the sun does, if estimated by sun time. The interval existing between two successive transits of the sun across the meridian is called an *apparent day*, while the *astronomical day* is a day beginning, since January, 1885, at noon and extending to the next. It is divided into twenty-four hours, not into two periods of twelve hours each. The day at the Equator is always twelve hours, while the longest day at the poles is six months. On the 21st of March and the 21st of September the days and nights are equal in all parts of the earth.

In different countries the day is counted to begin at different times. The Jews began the day at sunset and the Babylonians at sunrise; while the Egyptians and Romans counted from midnight, which is the basis used by most modern peoples. The Latin *post meridiem*, meaning afternoon, is abbreviated by writing P. M.; and *ante meridiem* (forenoon), by writing A. M. These are necessary on account of dividing the common clock time, or day, into two portions of twelve hours each.

**DAY LILY**, a genus of plants belonging to the lily family, native to Europe and Asia. Several species are cultivated in the flower gardens of America, especially the fragrant yellow day lily. These plants include many species that are noted for the variegated colors of their flowers. The leaves are long and grow from the ground and the stem is branching. In some parts of Europe the day lily is cultivated to furnish food for cattle.

**DAYTON** (dā'tŭn), a city of Kentucky, in Campbell County, on the Ohio River, opposite Cincinnati. It is on the Chesapeake and Ohio

Railroad. The noteworthy features include the city hall, the high school, and the Speers Memorial Hospital. Among the manufactures are cigars, machinery, cordage, shoes, and spirituous beverages. It was settled in 1849 and was incorporated the same year as Jamestown, but the name was changed to Dayton in 1893. Population, 1900, 6,104.

**DAYTON**, a city of Ohio, county seat of Montgomery County, sixty miles northeast of Cincinnati. It is on the Pennsylvania, the Erie, the Big Four, the Dayton, Lebanon and Cincinnati, and other railroads, and on the Miami and Erie Canal, which connects Lake Erie with the Ohio River. The city is divided by the Great Miami River, which is joined here by the Mad River. It is beautifully platted with wide streets, has extensive urban and interurban electric railways, and in the vicinity are numerous macadamized highways. Many of the streets are paved substantially with asphalt and stone. Twelve bridges span the river, a number of which are constructed of concrete. The city has fine systems of waterworks and sewers.

The business section is located near the river, whence the ground rises to heights of from 200 to 300 feet; and the residence sections are chiefly on these more elevated parts. The notable buildings include the courthouse, the Union Passenger station, the Steele High School, the Y. M. C. A. building, the Dayton State Hospital, and a large number of fine business blocks, the last mentioned including the Arcade and the Conover. Among the educational and charitable institutions are the United Brethren Theological Seminary, the Academy of Notre Dame, the Saint Elizabeth's Hospital, and a number of manual training and commercial schools. The public library is located in the center of the city, in Library Park. Near the city is the National Military Home for disabled soldiers of the Civil War, which occupies a beautiful tract of 640 acres. Dayton is the seat of the State asylum for the insane and the county orphan asylum. It has a handsome soldiers' monument and numerous fine boulevards.

The city takes high rank as a manufacturing and wholesaling center. Among the chief manufactures are railway cars, flour, bicycles, electrical machinery, automobiles, steam pumps, cash registers, stoves and hardware, cotton and woolen goods, and agricultural implements. In the vicinity are extensive limestone and marble quarries. The first settlement was made on its site in 1796, after a tract of land had been purchased from the Indians by a company which included Jonathan Dayton, from whom the city received its name. In 1805 it was incorporated

as a town. It received its charter as a city in 1841 and since then has had a prosperous growth. It was visited by an epidemic of cholera in 1849 and was several times damaged by floods. Population, 1900, 85,333; 1910, 116,577.

**DEACONESS** (dē'k'n-ēs), name of an order maintained among the women in the Christian churches. An order of deaconesses is mentioned in the New Testament, in I. Tim. v., 9-10 and Rom. xvi., 1. It appears that this order was established in Apostolic times, when the deaconesses assisted in the work among members of their own sex and to some extent supplemented that of the deacons. In the early centuries it was connected with the Roman Catholic Church, but was abolished in the twelfth century. Theodor Fliedner, a pastor of the United Evangelical Church of Germany, founded a home for deaconesses in 1836, in which it was made the duty of the inmates to do charitable work. Since then many similar homes were established in Germany and other parts of Europe, such as the various sisterhoods in the Anglican Church of England.

Among the first order of deaconesses established in America is that of Saint Andrew's Parish, Baltimore, Md., under the auspices of the Protestant Episcopal Church in 1855. The order is recognized by the Lutheran Church in America, which erected the Drexel Home for Deaconesses at Philadelphia, Pa., in 1888. In the same year the order was established by the general conference of the Methodist Episcopal Church. It is sanctioned by the Presbyterian and other Protestant churches, and many homes are maintained both in Canada and the United States. The work of the deaconesses in the different churches is quite similar. As a whole the order may be said to constitute an independent society of charitable women, including many trained nurses, who do a noble work in relieving suffering and in spreading Christianity.

**DEAD LETTER**, a letter that lies at a post office unclaimed for a certain period, or one so defective in address that it cannot be delivered. The postal departments of Canada and the United States maintain dead-letter offices, in their seats of government, where all unclaimed letters are sent, including those that do not show the address, or are unstamped. These letters are opened at the dead-letter office, and, if the address of the writer is found, they are returned to the sender; otherwise, they are destroyed. Not less than 8,000,000 pieces of mail matter that find their way annually to the dead-letter office of the United States, of which about 4,000 do not contain the addresses of the

senders. The money and drafts found in letters are returned to those by whom the letters were mailed, if their names and addresses are known, while many periodicals, magazines, and picture cards are sent to various hospitals and libraries.

**DEAD SEA**, a remarkable lake in the southern portion of Palestine, in the pashalic of Damascus. In the Scriptures it is called the Sea of the Plains, Salt Sea, and East Sea, and is thought to be the site of the ancient Sodom and Gomorrah. It is located about twenty miles southeast of Jerusalem and ten miles south of Jericho, where it stretches north and south a distance of forty-five miles, and has a width of ten miles. It receives the waters of the Jordan and numerous other rivers, though its surface, owing to the arid climate, is 1,317 feet below the level of the Mediterranean. It is bordered by lofty cliffs of limestone along its eastern and western shores, while its northern and southern extremities are marked by low and dismal marshes. Violent earthquakes that occurred in periods far remote are evidenced by lava and volcanic deposits. Thermal and sulphur springs, pumice stone, rock salt, and other phenomena abound.

The water of the Dead Sea is remarkable for the quantity of its saline ingredients. In every hundred pounds of its water there are over twenty-six pounds of saline substances, more than one-fourth. It is nauseous to the taste and smell, and so buoyant that the human body floats upon its surface. The maximum depth in the central portions is 1,315 feet, while the southern lagoon is twelve feet deep in the middle, and at the edges not more than three feet. Geologists have advanced the theory that the inflowing waters carry sufficient saline matter to transform the lake into solid saline deposits within a considerable period of time, unless present conditions become greatly modified by climatic or volcanic changes. The saline density increases as the arid atmosphere carries off inflowing moisture by means of evaporation.

**DEADWOOD**, county seat of Lawrence County, South Dakota, in the Black Hills, on the Chicago and Northwestern and the Chicago, Burlington and Quincy railroads. It is surrounded by a mining region which produces gold, silver, tin, lead, and clays. The chief buildings include the high school, the Franklin Hotel, and the Masonic Temple. Among the industries are flouring mills, brick and lime works, smelters and reduction works, and machine shops. It has waterworks, electric lights, macadamized streets, and telephone connections. Deadwood was settled in 1876 and owes its

growth largely to the development of its mining interests. Population, 1905, 4,364.

**DEAF-MUTES** (dĕf'-mŭts), the persons who are deprived of both hearing and speech, the dumbness resulting principally from deafness existing either at birth or in very early childhood. Dumbness results in this way because deaf children, being deprived of the sense of hearing, are unable to imitate sounds. Imitation being the basis of learning to utter regular sounds, deafness in early life, therefore, is the most prolific cause of dumbness. The per cent. of deafness varies somewhat in the different nations and stages of social and intellectual development, but usually rates one affected individual to every 1,500 to 1,800, the mean being about the usual average. Among the most prolific causes are local or climatic conditions, ill health of the mother, scrofula, and the heredity of certain physical defects. It is certain that deafness is not communicated by heredity, since what is transmitted is but the tendency to such disease, or some anomaly of the auditory organs or of the nervous system, of which deafness is the result or symptom.

Investigations made by the government indicate that about nine per cent. of the children born of deaf and dumb parents, or of whom one is thus affected, inherit tendencies to deafness. This is in accord with the law of heredity, that the offspring tends to revert to the normal type. Deafness is frequently acquired in old age and through such diseases as measles, paralysis, typhus, smallpox, and other cerebral affections, and particularly through violent attacks of scarlet fever, by which the patient suffers from an inflammatory state of the throat, which extends to the internal ear and more or less suppurates and destroys the delicate portions of the auditory organs. No defect is visible in most deaf-mutes, and no application has yet been discovered to render cure possible. Deaf-mutes are obliged to observe and imitate the expressions and actions which attend various states of the mind, by means of which they communicate their feelings and desires to others. This has resulted in the development of the *sign language*, through whose agency deaf-mutes have learned to acquire considerable advancement in educational arts.

Among the early discoverers of the principles underlying the teaching of deaf-mutes is Jerome Cardan (1501-1576), an Italian physician, who published a treatise on the association of writing with speech, and speech with thought, pointing out the fact that written characters and thought can be associated without the intervention of

vocalized sound. The practical instruction of deaf-mutes was demonstrated in France in 1743 before the Academy of Sciences, which institution attested the methods employed by Jacob R. Pereira (1715-1780), a Spanish teacher. In the United States there are ninety schools, including both public and private, for deaf-mutes. They are attended by more than 10,000 students. Nearly all the states have institutions supported by public appropriations for the instruction of deaf-mutes. A national college is located at Washington, and is under the immediate direction of the United States. Conventions and institutes of deaf-mutes have been held in the United States for more than fifty years, while the *American Annals of the Deaf and Dumb* has been published since 1847. The method employed makes use of the manual alphabet, combining it with observations of the lips of the teacher. There are two alphabets—a *one-handed* alphabet and a *two-handed*.

The method of teaching by watching the lips during articulation was first advocated by Samuel Heinicke (1729-1790), an educator of Germany. It is known as the *articulation and lip-reading* method. A public institution based upon his theory of instruction was established in 1779 at Leipzig, Germany, and the institutions of Germany and Austria are still based upon this system. The pupil is taught to recognize words by observing the motion of the lips and tongue of the instructor, who also makes use of diagrams and pictures to facilitate the work. Persons trained by this method are efficient in carrying on a conversation with any one not taught in deaf-mute methods, and it is often quite difficult to see that the speaker is afflicted in any way. In this respect it is superior to the alphabet method, but, like the latter, it is used within sight of the person with whom the conversation is conducted. The German method was adopted by the Clarke Institute at Northampton, Mass., in 1867. In this system pupils are not instructed as early as in public schools, or in courses using the alphabet method. However, it is quite certain that the articulation and lip-reading method is the superior, and is either used or largely combined with the other method in nearly all the schools for deaf-mutes.

**DEARBORN, Fort**, a fortress built in 1803 at the mouth of the Chicago River, near Lake Michigan, on the site of Chicago. Its purpose was to form a defense against the Indians. When war was declared against England in 1812, General Hull, the commander, ordered its abandonment and the withdrawal of the garrison to Detroit as a measure of safety. The Americans were attacked by Indians while retreating

and two-thirds were massacred, including twelve children. The remainder surrendered on promise of safety and were permitted to return to their homes, after being taken to Fort Mackinaw. In 1816 Fort Dearborn was rebuilt and was garrisoned till 1837. The last building was destroyed in the Chicago fire of 1871.

**DEATH** (dĕth), the extinction of life in animals and plants, resulting from a cessation of the vital functions. It sometimes occurs from decay of nature, as in old age, but more commonly from disease and accident. The two forms consist of death of the whole body, and death of a portion, or the *somatic* and the *interstitial*. There are three principal modes of dying—those that begin at the lungs, heart, and brain—and they are respectively designated as suffocation, syncope, and coma. Death by *suffocation* begins at the lungs. In this form the functions of respiration are suspended, after which the heart ceases beating in about three minutes, though the pulse may be felt for some time after all other signs of life have vanished. When the action of the heart ceases from loss of blood, death results by *syncope*, or *fainting*. Death may likewise take place in this form by a decline of the aortic pressure of the heart, by a loss of nerve power, and by starvation. Death by *coma* begins at the brain. It is indicated by profound stupor and the breathing is accompanied by snoring. Human life is of longest duration in individuals that have exercised the powers of the brain, generative system, and other vital organs in moderation, and is curtailed both by disuse and excess. Death ensues when all vitality and power of action is extinct. The claim that a dead body may possess all the organizations it had in life is not to be credited, since death is an entire cessation of all organization and vitality.

**DEBRECZEN** (dĕ'brĕ-tsĕn), a city of Hungary, capital of the county of Hajdú, 135 miles east of Budapest. It is located on a fertile plain, has railroad facilities, and is noted as a market for cattle and swine. The manufactures include soap, clay pipes, flour, sausages, and cotton and woolen goods. Among the buildings is the theater, a library, and the Rathaus. It is famous as the seat of a Protestant college founded in 1531, which has a library of 100,000 volumes. Debreczen became a Protestant town in the seventeenth century and was occupied by a German army in 1849. Population, 1906, 78,843.

**DEBT** (dĕt), an obligation, liability, or claim incurred. Debts are either personal, corporate, municipal, county, state, provincial, or national. It is a well-known characteristic of

many individuals and the government to draw financial aid from the prospects of future development in commercial enterprises. The total indebtedness of the United States, of all interests combined, though small when compared with that of other nations, is so vast that one is astounded when contemplating future payment. The possibility that individuals or states possess for going into debt is often a source of convenience and advantage, in that by means of it enterprises are developed and the prosperity of a country is affected more or less favorably. The total national indebtedness of the nations has been increasing constantly. In 1793 it aggregated \$2,433,250,000, while in 1900 it had reached the enormous sum of \$31,201,759,000, an amount wholly incomprehensible. At the beginning of the Civil War, in 1861, the principal of the public debt in the United States was only \$64,842,288, while the net receipts amounted to \$55,000,000 per annum. The requirement of meeting the expense of the war increased the indebtedness until its greatest height was reached on Aug. 1, 1865, being then \$2,756,431,571.

The following is an abstract showing the indebtedness of the principal countries as ascertained in the early part of 1907:

NAME OF COUNTRY.	TOTAL DEBT.	DEBT PER CAPITA.
Austria-Hungary.....	\$1,092,863,255	\$ 23.07
Brazil.....	512,213,359	37.83
Canada.....	253,997,742	39.44
France.....	5,655,134,825	143.90
Germany.....	855,963,454	14.21
Great Britain.....	3,839,620,745	88.33
Italy.....	2,767,911,949	82.37
Japan.....	932,445,798	19.43
Mexico.....	222,658,181	16.32
Russia.....	4,038,199,722	28.64
Spain.....	1,829,265,995	98.35
Turkey.....	458,603,213	18.39
United States.....	964,435,687	11.11

**DECALOGUE** (děk'á-lŏg), the ten commandments given to Moses on Mount Sinai. They are placed in the Bible before the collection of laws called the Book of the Covenant, but are also found in Deut. v., 1-21. Christ summed them up in two commandments.

**DECAPODA** (dě-kăp'ŏ-dă), the highest order of crustaceans. The members of this order have five pairs of legs, the first pair being enlarged to form claws, as in the crawfish, lobster, shrimp, and prawn. The term is also applied to one of the classes of cuttlefish. They have eight arms and two tentacles, the latter being longer than the arms and serve to seize their prey, or to moor themselves safely in a stormy sea.

**DECAPOLIS** (dě-căp'ŏ-lis), a word mean-

ing ten cities, applied to a district of eastern Palestine prior to the second century A. D. The ten cities included in the district comprised Canatha, Damascus, Dion, Gadara, Garasa, Hippos, Pella, Philadelphia, Raphana, and Scythopolis. It is probable that these cities were built by the Romans in 64 B. C. after the conquest of Syria, and received grants of certain commercial privileges.

**DECATUR** (dě-kă'tēr), a city in Illinois, county seat of Macon County, thirty-seven miles east of Springfield, on the Illinois Central, the Wabash, and other railroads. It occupies a fine site on the Sangamon River. The chief buildings include the courthouse, the public library, and the Millikin University. The manufactures comprise flour, woolen goods, spirituous beverages, ironware, farm machinery, engines and boilers, linseed oil, and furniture. It has gas and electric lights, waterworks, pavements, and street railways. The surrounding country is agricultural. It was settled in 1830 and incorporated in 1836. Population, 1910, 31,140.

**DECCAN** (děk'kăṅ), the name applied to a large scope of country in eastern India, particularly to the portion lying between the Kistna and Nerbudda rivers, but also in a general way to the whole country lying south of the Vindhya Mountains. When applied in the latter sense, it includes the Madras presidency, Mysore, Hyderabad, part of Bombay, Travancore, and other dependent states of India.

**DECEMBER** (dě-sēm'bēr). See Month.

**DECEMVIRI** (dě-sēm'vī-rī), the term applied to the ten men appointed to systematize and codify the public laws of Rome. With this end in view, a number of commissioners proceeded to Greece to study the laws of Solon and other celebrated Greek legislators. On their return in 451 B. C., ten patricians secured an appointment to write the laws under the leadership of Appius Claudius. The laws were set on twelve tables of wood in the Forum, and became known as the Laws of the Twelve Tables. This action on the part of Rome was due to the dissatisfaction of the plebians, because the patricians had no written law to direct them.

**DECLARATION** (děk-lă-ră'shŭn), the act of declaring, or making known, or publishing an avowal or affirmation. The most important declaration is the one issued by the American colonies, which see. A declaration of war is a formal notice that, by the practice of nations, belligerents are expected to give before hostilities begin. The *Declaration of Rights* is a document which was drawn by Parliament in 1689 and presented to William III, and Mary, when they accepted the crown of England. In this

document Parliament announced that the election of members of Parliament shall be free, that Englishmen have the right to carry arms for their own defense, that unusual punishments and excessive fines shall not be inflicted, that public revenues shall not be collected without the consent of Parliament, and that a standing army shall not be raised or maintained in times of peace. Subsequently the *Bill of Rights*, a formal enactment, contained these articles. The *Declaration of Paris* is an instrument signed by the congress of Paris in 1856, which was subsequently accepted by the principal powers. Among the declarations it contained these: Neutral goods, except contraband of war, are not liable to capture under an enemy's flag; privateering should be abolished; the goods of an enemy, except contraband of war, may be covered by a neutral flag; and blockades must be effective in order to be binding.

**DECLARATION OF INDEPENDENCE**, the solemn declaration that severed the thirteen colonies from Great Britain. At the beginning of the struggle a permanent separation was not contemplated. An independent government was so distasteful to the colonies, aside from New England, that Congress declared against it on July 6, 1775. Subsequent events and the publication of Thomas Paine's "Common Sense" set ablaze the spirit of 1776. The Legislature of Pennsylvania was so pleased with Paine's production that it voted him a grant of \$2,500. The Virginia convention instructed its delegates in May, 1776, to propose a resolution of independence. Accordingly Richard Henry Lee offered such a resolution on June 7. The Colonial Congress on June 10 resolved to appoint a committee to prepare a declaration "that the United Colonies are, and of right ought to be, free and independent states." The committee consisted of Thomas Jefferson, John Adams, Benjamin Franklin, Roger Sherman, and Robert R. Livingston. This committee reported a draft of the Declaration on June 28, and on July 2 the colonies were declared free and independent by resolution.

The Declaration of Independence was formally passed July 4, 1776. It was written by Thomas Jefferson and only a few changes were made from the original draft. At that time Congress was in session at the State House in Philadelphia, known as Independence Hall. The old "Liberty Bell" rang out the glad tidings and the beating of drums and firing of cannon followed. John Hancock was the president of the Congress, and the Declaration of Independence was signed by him and the representatives from the different colonies. Charles Carroll (q. v.),

of Maryland, was the last survivor of the signers.

**DECLINATION** (děk-lī-nā'shŭn), in astronomy, the angular distance of a heavenly body from the celestial equator, measured along a great circle passing through the poles of the heavens and through the center of the body. That is to say, it is the angle which a line drawn from the center of the earth to the heavenly body makes with the plane of the Equator. The place of a star in the heavens is determined by its right ascension and declination, which correspond to the longitude and latitude of the earth's surface. Circles of declination are great circles which pass through the poles and cut the Equator at right angles. Twenty-four of these divide the Equator into arcs of 15° each, known as *hour circles* or *hoary circles*. *Magnetic declination* refers to the magnetic needle in the compass, and is the variation of the magnetic needle from the true meridian of a place on the earth's surface. The variation may be either east or west of a place, differs at different points, and is not the same at a given locality at different times.

**DECOMPOSITION** (dě-kōm-pō-zīsh'ŭn), in chemistry, the separation of a compound into more simple substances. When the red oxide of mercury is heated, it undergoes decomposition and is resolved into mercury and oxygen. Water, when subjected to a current of voltaic electricity, is decomposed into hydrogen and oxygen. Decomposition in vegetable and animal matters is due to minute animals or plants, known as *bacteria* and *ferments*. Many decompositions are effected by light, as those of nitric acid and of the silver salts used in photography.

**DECORATION DAY** (děk-ō-rā'shŭn), the day set apart in the United States for commemorating by appropriate exercises the services of fallen soldiers and sailors. The practice originated in the South before the war closed; and for a number of years was observed by individual parties in the North. The widespread custom owes its origin to an official order made by Gen. Logan in 1868, then commander of the Grand Army of the Republic. This order contained the following: "The 30th of May, 1868, is designated for the purpose of strewing with flowers or otherwise decorating the graves of comrades who died in defense of their country during the late rebellion, and whose bodies now lie buried in almost every city, village, hamlet, and churchyard in the land. In this observance no form of ceremony is prescribed, but posts and comrades will in their own way arrange such fitting services and testimonials of respect as circumstances will permit."

The day is usually called Decoration Day, though in some portions of the country the term Memorial Day is used. Different days were observed by the various states for some years, but the 30th of May has been settled upon universally and is a legal holiday in most of the states of the Union. In the South it is commemorated by decorating the graves of those who fought to preserve the Confederacy. Usually the program includes processions, orations, and the floral decoration of the graves. The exercises observed on this day are among the most appropriate and beautiful connected with public events in the history of the United States, and have taken a deep hold upon the people.

**DECOY** (dĕ-koi'), a contrivance to entice wild game into a snare, or lure it to come within the range of a weapon. The decoys used differ according to the game to be secured. Success in the art of alluring depends to a considerable extent upon the close observation of animals and mechanical skill in constructing the contrivances. Wild ducks are attracted by decoys which closely resemble the living animals. They are placed in the water near the shore in such a position that they appear to be swimming. In this way it is possible to allure the ducks to alight, bringing them within gun range of the concealed sportsmen. Other decoys of a similar kind are used to allure geese, brants, and prairie chickens.

**DEDHAM** (dĕd'am), county seat of Norfolk County, Massachusetts, ten miles southwest of Boston, on the Charles River. It is on the New York, New Haven and Hartford Railroad. Among the noteworthy features are the courthouse, the public library, the town hall, the Historical Society building, and several fine churches. The manufactures include pianos, brooms, cigars, woolen goods, and machinery. The first public school supported by a general tax in America was established at Dedham in 1644. Population, 1905, 7,774; in 1910, 9,284.

**DEDUCTIVE METHOD** (dĕ-dŭk'tiv), the mode or process of teaching in which the student is taught to proceed from general truths to particular facts. It proceeds from rules and definitions to particular facts, instead of first investigating particular facts and then forming and applying rules. To illustrate, an explorer who begins at the mouth of a main stream and follows it to its source, then explores its tributaries from their mouths upward, employs the deductive method, which is the reverse of the inductive method. If the explorer were to use the latter, he would trace the various rivulets from their source to the common débouchure, or outlet. In the deductive method the student

reaches the smaller through the greater, the special from the general; while in the inductive method the process is reversed, and the greater is reached through the less, the general through the special. Many branches of study are taught by the deductive method, as geometry, in which the theorems form general truths, and are proven by the demonstration of particular propositions. In psychology we have attained to laws of high generality, hence it offers a wide scope for deduction.

**DEE**, a river of England and Wales, rises in Lake Bala, Merionethshire, and flows by an estuary into the Irish Sea, about 20 miles below Chester. The chief tributaries are the Alwyn and Treveryn, and a canal seven miles long extends from Chester to the estuary. It is about 85 miles long and is connected by canals with the rivers of central England.

**DEE**, a river of Scotland, rises in the vicinity of Ben Macdhui, and flows into the North Sea at the harbor of Aberdeen. The Geauley is the principal tributary near its source, and farther in its course it receives the Lui and Feugh. Balmoral Castle is on its banks. It is about ninety miles long. Another river of Scotland called Dee rises near the northern boundary of Kirkcudbrightshire, and after a course of about fifty miles flows into the Solway Firth. About seven miles of its lower course is navigable. It is noted for its fine salmon fisheries.

**DEED**, an instrument in writing, signed and delivered by the party bound to the donee or purchaser, conveying title to real estate. In some countries it is necessary that the deed be executed under seal, but in others the private seals have been abolished, hence a deed conveying land may or not have a seal, depending upon the state or country where it is executed. In most states it consists of an instrument in writing that has been acknowledged by a notary public or other competent officer, who certifies to it under his seal or official signature. A *warrantee deed* is one in which the party conveying title agrees to defend it against all claimants, while a *quitclaim deed* conveys only what title may be in the party making the deed. A *deed of trust* is similar to a mortgage, the title depending upon the payment of money from the seller to the purchaser. Instruments of this kind, to be valid in some states, must be witnessed by two persons. It is universally required that the wife join the grantor, if he is married, in making the deed, and it must be recorded in the office of the county recorder or register of deeds.

**DEER**, a family of ruminant mammals, most species of which are distinguished by decidu-

ous branching horns or antlers. The horns are solid structures growing from the frontal bone, with many branches and tines, growing to an enormous size. They appear the second spring and are shed each year. In the *reindeer* both male and female bear horns, while in other species the female is hornless. The horns appearing first consist only of the beams. In the second year a basal branch appears, the following year a second branch, and in successive years a greater or smaller number of subdivisions grow from the main beam. Each year's growth is at first covered with a sensitive skin or velvet, which later dries and peels off, and a bony ridge is formed on the antlers just above the base of attachment to the frontal bone. The *water deer*

RED DEER OF EUROPE.

of China and the *musk deer* have no horns. There are no deer in Australia and only a few species are found in Africa, though antelopes take their place, but they are widely distributed in many portions of the other continents and some of the islands. The smallest of the family include the Indian *muntjacks*, while the largest are the *moose* or *true elk*. Among the species common to the colder latitudes are the *reindeer*, *elk*, *caribou*, and *moose*, while in the temperate and warmer regions are found the *fallow deer*, *stag*, *roebuck*, *sambo deer*, and *muntjack*. The *red deer* of Europe is a fine animal, of which the female is known as the *hind* and the male as the *stag*, the latter having large antlers.

The deer family has sharp hoofs with a cleft between and the feet have two toes. In most species the ears are large and the hair is crisp

and thick. They vary in color, though they are mostly brown with reddish tints and white spots. The senses of sight, hearing, and smell are highly developed, thus enabling them to guard against their enemies. Swamps, plains, and forests are alike favorite haunts, though they are seen mostly on hills in the daytime, from which they can take a survey of a large scope and guard against danger. They are fleet of foot, moving with the speed of a race horse when danger confronts them. Their ability to swim is highly developed, the swiftest canoe being alone able to overtake them. The young are born in the spring and kept in a secluded place, which is visited only at odd times in the day by the mother, though it is made her exclusive haunt at night. The food consists of grasses during the warmer season, and of bark, tufts of dried grass, and rushes during the winter. While deer are easily tamed, the reindeer is the only one of the group that has been completely domesticated.

**DEERMOUSE**, or **Jumping Mouse**, a class of small mice that resemble the deer in color and in being active. They are about four inches long and have a tail somewhat longer than the body, and the hind legs exceed in length the fore legs. The deer mouse of Canada is a representative species. It is able to jump ten feet at a bound. Other species are distributed in various parts of Mexico and the United States, and all are rodents that show close resemblance to the jerboas.

**DEFIANCE** (dĕ-fi'ans), county seat of Defiance County, Ohio, fifty miles southwest of Toledo, at the junction of the Tiffin and Maumee rivers. It is on the Wabash and Erie Canal and on the Wabash and the Baltimore and Ohio railroads. The surrounding country is rich in agriculture. Among the chief buildings are the courthouse, the public library, and Defiance College. The industries include wagon works, woolen mills, machine shops, and cigar factories. It has systems of public lighting, waterworks, and street paving. Population, 1900, 7,579.

**DEGREE** (dĕ-grĕ'), in mathematics, the 360th part of the circumference of a circle. The circumference of every circle is supposed to be divided into 360 equal parts, each being called a *degree*. A degree is divided into sixty minutes, and a minute into sixty seconds. The signs respectively are °, ', ". They are written to denote values in this wise: 48° 16' 12", meaning forty-eight degrees sixteen minutes and twelve seconds. It is said that an angle contains as many degrees or parts of a degree as there are in the arc subtended by an angle at the cen-

ter of a circle. We speak of a star as located a given number of degrees above the horizon, or declined a given number of degrees from the Equator. Likewise geographical points are located at certain degrees of latitude or longitude.

A *degree of latitude* is the 360th part of the earth's circumference, north or south of the Equator, while a *degree of longitude* is the 360th part of the earth's circumference measured east or west of a fixed meridian. Since the length of a degree depends upon the magnitude of the circumference of a circle, it is evident that the length of the degrees of longitude is greatest at the Equator and diminishes gradually as we proceed toward the poles, at which a degree equals 0. A degree of longitude at the Equator contains sixty geographical or sixty-nine and one-sixth statute miles. Since the earth is flattened at the poles, the degrees of latitude increase slightly as the poles are approached. The term is also applied to a unit of difference in temperature, called a degree of *Fahrenheit*, when the difference between the freezing point and the boiling point of water is divided into 180 parts; *Centigrade*, when it is divided into one hundred parts; and *Reaumur*, when it is divided into eighty parts.

**DEGREE**, a mark of distinction conferred by colleges and universities on students and others as a testimony of scholarship in the arts or sciences. It is *ordinary*, when conferred upon students, and *honorary*, when conferred upon members or distinguished strangers as a mark of respect. The value and designation of degrees depend upon the branches covered by college and university courses, though they include mostly the degrees of *bachelor*, *master*, and *doctor* in the branches of medicine, law, divinity, music, sciences, and arts.

**DEHORNING** (dē-hōrn'ing), the practice of preventing the growth or removing the horns of cattle. It came into vogue in Europe about the middle of the nineteenth century, and is now practiced very extensively in Canada and the United States. Formerly it was held to be cruelty to animals, but actual experience has demonstrated that dehorning is beneficial to cattle, largely for the reason that it renders them more gentle and docile, hence they feed and may be housed to better advantage. However, the horns should be removed when the weather is mild and at a season of the year when flies are not troublesome. Dehorning is done by placing the animal in a substantial stall, in which its head is held firmly in place, and the horns are cut off near the base with a sharp saw. A better way is to prevent the growth of

horns as soon as the horn button is beginning to develop on the head of the calf, when about four or five days old, and this may be done by applying caustic potash. It requires only a few minutes to make the application, after which a scab forms, but this falls off in about a month, and the horns never grow on the smooth poll that remains.

**DEISM** (dē'iz'm), the tenets or doctrines of a deist. This system of belief admits the being of a God and acknowledges a number of his perfections, but does not hold to the existence and necessity of a divine revelation.

**DEKALB** (de-kālb'), a city in Dekalb County, Illinois, in the northern part of the State, about fifty-eight miles west of Chicago. It is on the Chicago Great Western and the Chicago and Northwestern railroads. The chief buildings include the city hall, the public high school, and the Northern Illinois Normal School. Among the manufactures are ironware, furniture, machinery, clothing, shoes, and farming implements. It was settled in 1838 and incorporated in 1877. Population, 1900, 5,904.

**DELAGOA BAY** (dēl-a-gō'ā), an indentation extending from the Indian Ocean into the coast of Southeastern Africa. It is about forty miles long and from sixteen to twenty miles wide. The Crocodile, Maputa, and other rivers flow into it. At the northern end is the town of Lourenço Marques, one of the chief ports of South Africa. This port is of special importance because it is only 52 miles from the Transvaal and about 350 from Pretoria, with which it is connected by railroads. Delagoa Bay is immediately south of Portuguese South Africa and is under the control of Portugal. The bay is available for vessels of large tonnage, though there are a number of flats and shoals, making navigation quite intricate. In the war between England and the South African republics the bay was a neutral district, and the only one by which the two republics had access to commerce not passing over British territory.

**DELAWARE** (dēl'ā-wār), a State of the United States, one of the thirteen original states, popularly called the Diamond State. Next to Rhode Island it is the smallest State in the Union. It is bounded on the north by Pennsylvania, east by the Delaware River, Delaware Bay, and the Atlantic, which separate it from New Jersey, and south and west by Maryland. The greatest length from north to south is 95 miles; greatest width, 35 miles; and area, 2,050 square miles. It has a water surface of 90 square miles. Cape Henlopen, opposite Cape May, N. J., projects into Delaware Bay.

**DESCRIPTION.** The larger part of the State is

located in the Atlantic coastal plain and has an elevation of about 50 feet above sea level, but in the extreme north is a small hilly section. The elevations are not more than 280 feet above the sea and are highest near the boundary of Pennsylvania. Much of the southeastern part is characterized by sandy ridges and the region

near Delaware Bay contains a number of extensive marshes. Cypress Swamp, in the extreme southern part, has an area of about 75 square miles.

A number of small rivers supply the interior drainage, most of which flow into Delaware River and Delaware Bay, and several flow toward the southwest into Chesapeake Bay. The soil is generally fertile, with forests in the northern and western parts. It has a temperate climate, with ample rainfall and healthful conditions throughout the year. In the extreme south the average annual temperature is about  $56^{\circ}$  and in the northern part it is about  $52^{\circ}$ . The lowest winter temperature is about  $17^{\circ}$  below zero, though this is rare, and the highest in summer ranges from  $90^{\circ}$  to  $103^{\circ}$ . The earliest frosts in autumn occur from the 10th to the

15th of October and plants begin to grow the early part of April. A slightly larger rainfall occurs on the coast than in the section inland, but the average for the State ranges between 42 and 48 inches.

**MINERALS.** Situated entirely within the Atlantic coastal plain, the State is underlain by rocks of recent geological formation. Kaolin and a good quality of clay are found in the vicinity of Wilmington, where they are quarried for use in manufacturing. In the vicinity of that city are deposits of granite and some feldspar. A good class of glass sand is widely distributed, and marls and bog iron ore deposits occur in many places. The output of granite is the most important.

**AGRICULTURE.** Nearly 75 per cent. of the surface is utilized in farms and agriculture ranks as the leading industry. Most of the farms are small, ranging from 50 to 75 acres in extent, and comparatively few have more than 160 acres. The soil is tilled with much care and fertilizers are used very extensively. Corn and wheat are the chief cereals and hay takes third rank in the acreage. Stock raising is a secondary industry, but considerable attention is given to the rearing of horses and to dairy farming. Many large orchards are cultivated, the chief products being apples, peaches, and many varieties of small fruits. Vegetables are grown extensively for the Philadelphia and New York markets. The soil and climate are especially adapted to the cultivation of tomatoes, and about 15,000 acres are planted in that product annually.

**MANUFACTURING.** The location of Delaware gives it good opportunities in the manufacturing industry, especially in that it has extensive transportation facilities and is located near large markets. Iron and steel products comprise the leading manufactures. The leather industry takes rank as the third in the value of the total output. Canning is an important enterprise, both in fruits and vegetables. Other manufactures embrace machinery, railway cars, sailing vessels, cotton and woolen goods, carriages and wagons, and clothing. The oyster and sturgeon fisheries yield large returns, much of the product being canned and cured for export. A small output of wood is obtained for manufacturing in the swampy districts, especially cypress.

**TRANSPORTATION.** The northern part of the State is crossed from northeast to southwest by two trunk railways, the Pennsylvania and the Baltimore and Ohio, and all parts of the State have convenient railway facilities. The lines in operation aggregate about 400 miles. They include the Philadelphia and Reading, the Queen

Anne, and the Baltimore and Delaware railroads. Electric railways are operated to a considerable extent and a canal fourteen miles long connects the Delaware River with Chesapeake Bay. At Lewes, near Cape Henlopen, is an extensive breakwater that cost about \$2,225,000. Much of the foreign trade is with Baltimore and New York, though a small per cent, is carried through the port at Wilmington, which is a customs district.

**GOVERNMENT.** The executive branch is vested in a Governor, who is elected for a term of four years, but is not eligible for a third term. A similar provision governs the election of the Lieutenant Governor, who presides over the Senate. Two houses constitute the legislative department, the Senate of 17 members and the House of Representatives with 35 members. Members of the Senate are chosen for four years and representatives for two years. Six judges constitute the judiciary, one of whom is chief justice and one is chancellor. All the judges are appointed by the Governor for a term of twelve years, subject to confirmation by the Senate. Delaware has one representative in the Lower House of Congress, hence is entitled to three electoral votes.

**INHABITANTS.** The population is 94 to the square mile. All of the leading religious denominations are represented, including chiefly the Methodist Episcopal, Presbyterian, Baptist, Protestant Episcopal, Roman Catholic and Lutheran. Dover, the capital, is located in the central part of the State. Wilmington, the largest city, is in the northern part, on the Delaware River. Smyrna, New Castle, and Lewes are among the business centers. In 1900 the State had a population of 184,735. This number included a Negro population of 30,687, or 16.6 per cent. Population, 1910, 202,322.

**EDUCATION.** The system of public schools is based upon a plan adopted in 1875. Support is obtained from direct taxation levied locally and from certain fees and licenses. No normal schools are maintained by the State, but each county has a teachers' institute. Separate schools are maintained for white and colored children. Delaware College, which is open to both sexes, is located at Newark. A college for colored students is maintained at Wilmington and an insane asylum at Farmhurst, and ample provision has been made for the education of the deaf, dumb, and blind.

**HISTORY.** Delaware was so named from Lord de la Warr, who explored Delaware Bay in 1611. The history of the State is closely linked with the early settlement and development of America. A company of Dutch traders, in 1631,

planted a colony near the present site of Lewes. In 1638 a number of Swedes and Finns made the first permanent settlement on the site of Wilmington, where they built Fort Christina. The Swedish claim was under a grant from Sweden. Peter Minuit, a Dutchman, was sent to purchase the land west of the Delaware River, situated between Cape Henlopen and Trenton Falls, from the Indians. The Dutch laid claims to a portion of this district and built Fort Cassimir, and in 1655 secured control of the entire Swedish possessions.

Delaware, together with New York, passed into the hands of England in 1664, and became vested in William Penn by purchase in 1682. In 1693 it was organized as a part of Pennsylvania, but was separated as a distinct colony in 1711. It adopted a constitution as a separate State in 1776, supported the Declaration of Independence in the same year, and in 1787 was the first State to ratify the Federal Constitution. Though holding slaves, it did not secede from the Union at the time of the Civil War, but many of its citizens joined the Confederate army. The Legislature denounced the fourteenth amendment to the Constitution, and an ill feeling prevailed against the negroes for many years after the Civil War. In the development of commerce and industrial enterprises it has made great strides of progress since 1865.

**DELAWARE**, county seat of Delaware County, Ohio, 23 miles north of Columbus, on the Whitstone (Olentangy) River. It is on the Pennsylvania, the Hocking Valley, and the Cleveland, Cincinnati, Chicago, and Saint Louis railroads. Among the chief buildings are the high school, the courthouse, the public library, and the Ohio Wesleyan University (Methodist). The manufactures embrace woolen goods, earthenware, furniture, machinery, and vehicles. Gas and electric lights, waterworks, telephones, and pavements are among the improvements. It was incorporated in 1827. Population, 1900, 7,940.

**DELAWARE BAY**, a large extension from the Atlantic Ocean, separating Delaware from New Jersey. It is about 50 miles long and 27 miles wide, and is important as an avenue of commerce. Besides receiving the waters of the Delaware River, it receives the inflow of the Maurice and other streams. The Delaware River is about four miles wide at the mouth, and the bay at the entrance between Cape May and Cape Henlopen has a width of about thirteen miles. The Federal government constructed an extensive breakwater from the latter point, by which the bay, at Lewes, is made an excellent harbor. It facilitates the safe pas-

sage of the largest vessels to Philadelphia and other commercial centers.

**DELAWARE RIVER**, an important river of the United States. It rises in southern New York, forms a part of the boundary between that State and Pennsylvania, the boundary between the latter State and New Jersey, and a portion of the boundary between Delaware and New Jersey. Its general course is southward, though it makes several bold turns, and it discharges into Delaware Bay. It passes through the Kittatinny Mountains near Stroudsburg, Pa., flowing through the Delaware Water Gap, a place remarkable for its beautiful scenery and rock gorges. Trenton and Philadelphia are the most important commercial centers on the river; the former is at the head of navigation and the latter is at the point reached by the largest vessels. The entire length of the river is about 300 miles. Its principal tributaries are the Schuylkill and the Lehigh. Several canals connect it with the Hudson River. The fisheries, consisting principally of shad, are noted for their commercial value.

**DELAWARES** (děl'á-wârz), an Indian tribe of the Algonquin family. They dwelt originally on the Delaware River and were largely under the control of the Five Nations. William Penn bought a large tract of land from them, and important trade relations were maintained with them by the Swedes, Dutch, and English. Their warriors fought at Braddock's defeat, aided in the war with Pontiac, and assisted the Union in the Civil War. Large numbers were converted to Christianity by the Swedes and Moravians, beginning in 1740. Shortly after the Revolution the tribe emigrated to Ohio, in 1818 to Missouri, in 1829 to Kansas, and in 1868 to Indian Territory (now Oklahoma). The United States granted to them the privileges of citizenship in 1866, divided their money and lands among them, and gave them educational aid. They are well advanced in the industries and professions, own their homes, and fill useful functions in life. At present they number about 1,000. Tammany was among their best known chiefs. His name has been given to an influential political society of New York.

**DELAWARE WATER GAP**, a narrow gorge in the course of the Delaware River, near Stroudsburg, Pa., on the borders of New Jersey and Pennsylvania. It is a low gap in the Kittatinny Range of the Appalachian Mountains, which rise in abrupt cliffs a height of 1,400 feet above the water. The region has been converted into a popular summer resort and is reached by rail from New York and Philadelphia.

**DELFT** (dělft), a city of Holland, on the

Schie River, about six miles southeast of The Hague. It is important as a commercial center, being situated on a number of railways and intersected by numerous canals. A Gothic church, called the Oude Kerk, dates from the 15th century. Another Gothic church, the Nieuwe Kerk, has a tower 375 feet high and contains 500 bells. William I. of Orange was assassinated in the Prinsenhof, which now serves as a museum. Among the educational institutions is a polytechnical school with an attendance of 700 students. The manufactures include delftware, a celebrated kind of earthenware, carpets, ammunition, soap, and cotton and woolen goods. Electric lights, waterworks, and extensive electric railway lines are among the public utilities. Population, 1906, 33,916.

**DELHI** (děl'hî), a city in the Punjab district of India, on the Jumna River, about 830 miles northwest of Calcutta. Solid stone walls secure three sides, through which entrance to the city is effected by ten gates, the other side being protected by the water front. The site of the city is on a high eminence, being clean and healthful, and it has important railroad connections with the principal commercial centers of India and Southern Asia. The former extent of this metropolis is marked by vast ruins of gardens, pavilions, palaces, and mausoleums. Among the noteworthy buildings is the celebrated Shah Jehan palace, commenced in 1631, located in the eastern part of the city. It has a length of 3,200 feet and a breadth of 1,600 feet. Its carvings and decorations are among the finest in the world. The Great Mosque, or Jamma Musjid, is a famous structure after the Byzantine-Arabic style, erected in the 17th century by Emperor Shah Jehan. Another structure of note is the Minar, built in the 13th century, containing pillars 48 feet in diameter at the bottom and 10 feet at the top, with a height of 240 feet. Numerous inscriptions from the Koran and fine fresco work adorn the winding staircases and the walls. The city has been improved greatly within recent decades. It has broad streets, electric lights, and street railways, and is noted as an extensive wheat market. Its bazaars are famous for trading in fabrics, precious stones, and gold and silver work. A public school system is maintained and a government college, founded in 1792, constitutes a center of higher learning. It has a number of Protestant churches, government buildings, and numerous Eastern places of worship.

Delhi was formerly the largest city of Hindustan and for some years was the capital of the Afghans, but subsequently became a part

of the Mongol Empire. In 1803 it was made a part of the territory of the British, who have controlled it since that time, except for a brief period during the Sepoy mutiny of 1857. More than one-half of the population are Hindus. Population, 1906, 219,468.

**DELIRIUM TREMENS** (dê-lîr'î-ûm trê'měnz), a derangement of the mind attended by extreme nervous agitation and hallucinations, due chiefly to the excessive use of alcoholic liquors. The disease is most prevalent among spasmodic drunkards, the principal symptoms being delirium and trembling. The former is constantly present, while the latter is not perceptible in many instances. At certain stages the sufferer is impressed by seeming to see frightful and extraordinary objects, during which he suffers great fear and mental agitation, which put him in a state of extreme terror. Total abstinence, rest, and wholesome nourishment are the chief requirements in the immediate treatment.

**DELOS** (dê'lôs), the smallest island of the Cyclades, in the Grecian Archipelago, with an area of about twelve square miles. The surface is a rugged mass of granite, and near its center the rocky peak of Mount Cynthus rises to a height of 350 feet above sea level. The island is celebrated in the song, myth, and history of Greece. Myths make it the scene of the birth of Apollo and Artemis, and, though once a floating mass, it was fixed to the bottom of the sea by Zeus that it might become celebrated by the birth of these noted personages. It was the scene of a festival to Apollo, at which the Greeks from many nations gathered. In 477 B. C. the Confederacy of Delos was formed with Athens at its head, the name being derived from the meeting of its deputies at the temple of Apollo, in which the treasures of the confederation were stored. Delos became a commercial center after the fall of Corinth in 146 B. C., and was famed for its favorite markets and fine harbors. Excellent palm groves grew in its public places, and brazen vessels abounded in vast numbers. In the year 87 B. C. it was laid waste by the Mithridatic War. At present brushwood is quite common and small fields of corn are cultivated by the natives.

**DELPHI** (dêl'fi), a celebrated town of ancient Greece, in the territory of Phocis, noted principally on account of the most important temple and oracle of Apollo. Its location was about six miles from the Corinthian Gulf, hemmed in on the north by the wall-like cliffs of Mount Parnassus, on the south by Mount Cirphis, and on the east by smaller ridges.

The Plistus flowed from east to west and drained the region of its surplus waters. The site of the ancient town is occupied at present by the village of Castri. The main point of interest still remains distinguishable, though it was somewhat altered by an earthquake in 1870.

Delphi was noted as the meeting place of the Amphictyonic Council and near it the Pythian games were held. The celebrated oracles were delivered by a priestess, who occupied a tripod over an opening in the ground, from which came intoxicating vapors accompanied by the inspiration of the Delphian god. The replies that came from the oracle were quite obscure and dual in meaning, but served in the regulation and support of the political, civil, and religious autonomy of the Greeks. These oracles grew in fame from the 9th century B. C. until they were abolished, long after the Christian era, by Emperor Theodosius. The temple of Apollo was destroyed, but rebuilt, and added to at various times. The last structure was built in the 5th century B. C., which was the most beautiful and magnificent, costing 300 talents, about \$575,000. In it were statues by the great sculptors of Greece, and it was decorated by paintings of the foremost masters of the Grecian art. In the times of Pliny, Delphi contained more than 3,000 statues, and a golden cast of Apollo stood within the temple. It was plundered at various times, but principally by Nero and Constantine.

**DELPHOS** (dêl'fôs), a city of Ohio, in Allen County, fifteen miles northwest of Lima, on the Pennsylvania, the Toledo, Saint Louis and Western, and other railroads. It is finely located on the Miami and Erie Canal and is surrounded by a farming section. Mineral oil is obtained in the vicinity. The manufactures include lumber products, machinery, and farming implements. It has a system of waterworks, electric lights, and several fine school buildings. The first settlement on its site was made in 1834 and it was incorporated in 1851. Population, 1900, 4,517.

**DELSARTE SYSTEM**, the name applied to a method of general physical culture now highly popular in America and Europe. It has been adopted in the schools of many cities, in colleges, and in private institutions, and is largely employed in regular courses of instruction. The originator, François A. Delsarte, asserted that every outward manifestation is the expression of an inner state. He classed the head as the *mental* organ, the trunk as the *emotional* organ, and the limbs as the *primary vital* organs. The mental movements proceed

toward the center, the normal around the center, and the vital from the center. In general the laws of force, rhythm, direction, reaction, succession, velocity, and opposition should govern bodily movements. The influence of systematic application has been efficient in developing the high quality of orators, dramatists, and elocutionists, giving them a fine quality of vocal utterance, gesture, and expression in accordance with the higher art of elocution. Besides the effect upon physical development, it has had a wholesome influence upon delivery and expression.

**DELTA** (děl'tà), the name of the Greek letter which corresponds to the letter D. The term was applied to the deposits of silt at the

DELTA OF THE NILE.

mouth of the Nile, on account of its resemblance to that letter. Since then the same name has been given to the alluvial tracts deposited by many of the great rivers, the waters of which flow into the sea by two or more branches. Deltas occur only where the mouth of a river is sheltered from the ocean and the tides and oceanic currents are weak, or in inland lakes and seas where the movement of tides and ocean currents are entirely absent. The delta of the Mississippi is the largest in America. It has an area of 12,300 square miles, two-thirds of which is permanently above water, while the remaining portion is a sea marsh. It begins a short distance south of the confluence of the Red River and extends far into the Gulf of Mexico. The delta of the Nile, which has its outlet into the Mediterranean, has an area of about 9,000 square miles, and is enlarging continually by the sediments deposited annually, which are carried from inundated regions. The delta of the Ganges and the Brahmaputra, in the Bay of Bengal, exceeds the size of the delta of the Nile. Countless islands have been formed by the deposits and numerous streams wind their way among them in various directions. Among the most important deltas of Europe are those of the Po, Rhone, and Rhine; in Africa, those of the Nile, Zambezi, and Sen-

egal; in Asia, those of the Ganges, Brahmaputra, Euphrates, Indus, Yang-tse-Kiang, and Hwang-ho.

**DELUGE** (děl'új), a flood or torrent of water, lava, fire, or melted stone. The name is applied in particular to the flood mentioned in Genesis vi-ix. This remarkable flood was predicted by Noah and is generally credited to the year 2348 B. C. There are various stories of vast floods similar to those mentioned in the Bible. They have been handed down from remote antiquity by various races. In the Hindu story the god Vishnu is represented as giving warning to Prince Satyavarata of an approaching flood, and a vessel was furnished to him in which he and a number of others were saved. The person told of in the Chaldaean history as surviving a flood is Xisuthros, who was carried by a ship over a deluge which is said to have lasted seven days, and he, like Noah, is said to have sent birds out for the purpose of ascertaining whether the flood had subsided. The people who lived prior to the flood of Noah are usually spoken of as antediluvians.

**DEMOCRACY** (dě-mök'rá-sỹ), that form of government in which the ruling power or the principle of sovereignty is exercised by the people. It first existed in Greece, where it was advocated by Pericles, and is mentioned in the writings of Herodotus and Aristotle. The result of experience in government for ages has demonstrated that public virtue and good intention are most likely to abound where the people have a voice in making and executing the law. The people as a whole generally mean to be just and do right, and are, as a rule, possessed of a degree of patriotism and public spirit. A pure democracy is impracticable in a large and populous country, but its principles may be embodied in a representative form. In such a government the people are represented by the voters, whose qualifications to vote are generally defined in a constitution called the fundamental law of the nation.

**DEMOCRATIC PARTY** (dēm-ō-krät'ík), one of the most important political parties of America, having been in continual existence for more than a hundred years. The rise of such a party in the nation under the new Constitution was natural. In the minds of most Americans the love of individual liberty was native, rather than the desire for a strong central government. Those who felt this need most strongly were naturally quite likely to look with apprehension upon the possibility of its being encroached upon by the Federal government. For this reason they advocated a strict construction of the Constitution and

states' rights. These elements of political thought drew the Anti-Federalists together in 1788, and party feeling was further extended by the strong sympathy of many Americans with the French revolution. The view that the government should extend aid to France in its contest with England greatly quickened the public pulse. Thomas Jefferson put himself at the head of the party drawn together by agreement in these views and led the opposition to the Federalists. The party became known as the Democratic-Republican, which is still its official title. Its members were commonly called Republicans before Monroe's administration and since then most commonly Democrats.

The party was in opposition to the administration from its origin in 1792 to 1801, and from the first was strongest in the Southern States. With the election of Jefferson in 1800 it came into power. Among the chief tenets of the party was belief in the freedom of speech, of the press, of religion, of politics; in economical government, popular rule, hospitality to immigrants, and the avoidance of foreign complications. The Federalist party went out of existence after the War of 1812 and the Democratic party came into the chief possession of the field. Later questions regarding commercial revenues, free trade, national banks, and other nationalizing measures divided the party and caused the organization of the Whigs. In 1829 Andrew Jackson led a new element into the party and gave to it the popular character under an enlargement of suffrage. From this time it won every presidential election but two until 1860, when it was divided regarding the slavery question. The Southern leaders advocated slavery, while the Northern portion favored preserving the Union, thus making it possible for the newly organized Republican party to elect its President.

Among the important measures obtained during the Democratic administrations may be named legislation favorable to agricultural interests; the purchase of Louisiana, Florida, and the Gadsden tract; and the enlargement of the commercial influence of the nation. It promulgated the Monroe Doctrine. The Democratic party carried the nation through the War of 1812 and the Mexican War, secured the annexation of Texas, discontinued the United States bank, and greatly widened civil service reform. Among the tenets in regard to which it differs from the Republicans at present are those relating to a tariff revenue, those in opposition to a large standing army, those relating to conquests in foreign countries, and the organization of the national system of finance.

It advocates the election of United States senators by a direct vote, strict adherence to the merit system in civil service, an opposing policy to trusts controlling productions and prices, and favors public ownership of various institutions of public utility. The presidents elected by the party, or representing Democratic views, include Thomas Jefferson, James Madison, James Monroe, John Quincy Adams, Andrew Jackson, Martin Van Buren, James K. Polk, Franklin Pierce, James Buchanan, and Grover Cleveland. These presidents represent administrations which cover a total of sixty years.

**DEMON** (dē'mōn), a name applied anciently to a spirit or immaterial being of supernatural powers, supposed to hold a middle place between men and the celestial deities. The ancient Greeks regarded demons in the same light that Christians look upon angels, but the name is now applied to an evil spirit or a fiend. Evil spirits are termed demons in the New Testament, but in making translations the name has come to be displaced by the word *devil*. *Demonology*, that branch of the science of religion which relates to demons, is obscured in the treatises of old writers in that the sources of information are related wholly to the civilized nations, instead of at least in part to the primitive and barbarous tribes. Ideas of demons still prevail to some extent even in civilized life, as is evident by the so-called spirit manifestations of modern times.

**DEMURRER** (dē-mūr'rēr), in law, a suspension of the proceedings in a cause until some point is determined by the court. A demurrer is a plea filed to a petition, answer, or reply, and raises a question as to the sufficiency of the case as stated by the opposite party, or some particular part thereof. Only questions of law are raised by a demurrer, which are tried by the court. When a demurrer is sustained, the effect is to lay the pleadings demurred to out of the case, unless the petition is so amended as to avoid grounds on which the court sustains the demurrer.

**DENARIUS** (dē-nā'rī-ūs), a silver coin used by the Romans. Originally it contained ten and later sixteen of the monetary denomination called *as*, which was a small copper or bronze coin. It had a monetary value equal to about fourteen cents of the money used in Canada and the United States. The gold *denarius* was equivalent to twenty-five silver *denarii*.

**DENISON** (dēn'ī-s'n), a city of Texas, in Grayson County, situated near the northern boundary of the State. It is on the Saint Louis and San Francisco, the Missouri, Kansas and Texas, the Texas and Pacific, and other rail-

roads. The noteworthy features include the Washington School, the public library, and the Saint Xavier's Academy. Among the manufactures are ice, ironware, canned goods, earthenware, and machinery. It has systems of electric lighting, sewerage, waterworks, and street pavements. The vicinity was settled in 1872 and the city was chartered in 1891. Population, 1900, 11,807

**DENMARK** (dĕn'märk), a kingdom in the northwestern part of Europe, including the peninsula of Jutland and an archipelago lying east, and comprising among others the islands of Laaland, Zealand, Falster, Fünen, Samsö, Lessö, Langeland, Aerö, Bornholm, and Moen. It is bounded on the north and west by the North Sea; east by the Cattegat, the Sound, and the Baltic Sea; and on the west by Germany. A part of the northern shore is on the Skager-Rak. The area, including the Faroe Islands and the islands of the Baltic Sea, is 15,592 square miles. Nearly the entire country is surrounded by the sea, the peninsula of Jutland being connected with the continent by a narrow neck of land which is less than forty miles wide.

**DESCRIPTION.** The North Sea washes the northwestern coast, which is low and cut up by bays, but the eastern coast is slightly more elevated and indented by a series of fjords. Limfjord, in the northern part of Jutland, extends across the peninsula from the Cattegat to the North Sea. The interior of Jutland is crossed by a ridge of hills, extending from the southern frontier to the Limfjord, and forming the watershed between the Cattegat and the North Sea. Guden Aa, the largest river of Denmark, has a length of 100 miles and flows into the Cattegat. About eighty per cent. of the soil is productive, the surface having no elevations higher than 600 feet above sea level. The coast is largely uninhabitable on account of drift sands that form a narrow line of unproductive flats called klitter.

Formerly Denmark had extensive forests of pine and fir, but these trees are now confined chiefly to cultivated lands. The fir was the prevailing tree in former ages, but now the oak and the beech are the most numerous. Other trees in the forests include the aspen, ash, elm, birch, willow, and pine, the last mentioned having been planted to some extent in the marshy and sandy districts. At Copenhagen the mean temperature is about 60° in summer and 32° in winter, and the islands have a somewhat milder climate than that of Jutland. Mists are frequent in summer and heavy rains occur in autumn. Aquatic birds are numerous, and salmon, oysters, and herring abound in the waters off the coast.

The climatic conditions are temperate and favorable to health and commercial activity, owing largely to the modifying influence of sea breezes.

**AGRICULTURE.** Much of the land is divided into small holdings and the system of tenure is largely peasant proprietorship. The importance of agriculture is constantly increasing, owing to the remarkable care and skill exercised in maintaining fertility and redeeming waste and unproductive lands. Dairy farming is the chief source of profit; the production of milk, butter, and cheese greatly exceeds the home consumption of these products. The coöperative plan is used in fostering the dairy industry as well as some departments of general farming. Oats, rye, barley, and wheat are the principal crops. Potatoes and beet roots are grown extensively. The culture of fruits and small gardening receive much attention. Cattle are raised chiefly for dairying purposes. Other live stock grown extensively include sheep, horses, and swine.

**MANUFACTURING.** Denmark has few mineral deposits, hence its manufacturing enterprises are conducted chiefly on a small scale. Salt, gypsum, and coal are found to a limited extent, though the output of the last mentioned is not sufficient to supply the demand of the industries. Copenhagen is the chief manufacturing center and is noted for its output of porcelain, locomotives, and spirituous liquors. Other manufactures include sugar, pottery, cotton and woolen fabrics, boilers, leather goods, and machinery. Iron smelting is carried on to some extent and fish and oyster canning is a productive industry.

**TRANSPORTATION AND COMMERCE.** All parts of Denmark have convenient railroad facilities, the lines aggregating about 1,950 miles, most of which are under government ownership and control. The chief commercial centers are located on the coast or navigable streams, or are connected by a network of canals. Telegraph and telephone lines furnish communication facilities with all urban and interurban points. The imports exceed the exports. At present the principal trade is with Germany, Great Britain, the United States, Sweden, and Russia in the order named.

**EDUCATION.** An excellent system of public schools is maintained. Attendance is compulsory from the age of seven to fourteen years. Practically the entire adult population has been educated in the elements of learning, while a large per cent. has enjoyed the benefits of higher education. The public schools, colleges, and universities under state or municipal control are maintained by public taxation. Schools for instruction in the industries and agricultural arts in the provinces are liberally attended.

Hulberg Academy at Sorö and the splendid university of Copenhagen are the chief institutions of higher learning.

**INHABITANTS.** The people of Denmark are almost exclusively Danes, including only a small per cent. of Jews and others. They are a Teutonic people of the Scandinavian group, and are characterized by a light complexion, blue eyes, and light brown or chestnut hair. Lutheran is the state religion and is the faith of nearly the entire populace, though religious liberty is extended to all. Copenhagen, the capital and largest city, is located on the island of Zealand, on the Sound. Other cities of importance include Aalborg, Aarhus, Frederiksberg, Odense, Randers, Horsens, and Fredericia. Population, 1906, 2,605,268.

**GOVERNMENT.** The government is a constitutional monarchy. Legislative authority is vested in the national legislature or *Rigsdag* which is composed of the upper house, or *Landsting*, and the lower house, or *Folkething*. At present there are 66 members in the Landsting and 114 deputies in the Folkething. The king is the chief executive and has power to veto bills. He is assisted by the eight ministers of finance, foreign affairs, interior, navy, justice, war, public instruction and worship, and agriculture. The supreme court of twenty-four judges is the highest judiciary, under which justice is administered by the courts of appeal and the officials in rural communities. The nominal war footing is 60,000 men and a standing army of 10,000 men is maintained. Its navy serves only for purposes of coast defense.

**COLONIES.** The foreign possessions of Denmark embrace Greenland, Iceland, and the Danish West Indies. The last mentioned include Saint Croix, Saint Thomas, and Saint John. These colonies have a total area of 87,614 square miles and a population of 121,500. The colonial trade is chiefly with the mother country, and Iceland is the most important colonial possession.

**LANGUAGE AND LITERATURE.** The Danish language is a branch of the Scandinavian division of the Germanic family of languages, and is closely associated with the Swedish and Norwegian. It was modified by the addition of foreign words in the 11th century, particularly by the introduction of Anglo-Saxon terms, and in the 18th century it was again affected by the extension of German culture. As a whole it may be classed as the most modern of the Scandinavian tongues, being influenced more largely by foreign elements than either the Icelandic or Swedish, and, as a whole, is soft and monotonous, making some of the sounds quite

difficult for foreign students to learn. Both the German and Roman characters are used in writing, and the language as a whole had a large modifying influence on the spoken language of Norway, owing to the fact that these countries were long united for governmental purposes. The literature dates from about the 12th century, when the codes of the ancient kings were collected, and many of the songs and ballads of the Scandinavian Sagas were incorporated with local folklore and short poetic productions. Christian Pedersen (1480-1554) translated the New Testament into the Danish at the time of the Reformation, and later published the complete Bible and various treatises written by Luther. Ludvig Holberg (1684-1754) founded the Copenhagen Theater and not only wrote poems and plays, but induced interest in other writers. He may be regarded the founder of the Danish stage, and from his time dates the modern period of Danish literature. His several writings include "Arabian Powder," "The Pewter Statesmen," and "History of Denmark."

Johannes Evald, a writer of considerable note, wrote the national song, "King Christian at the High Mast Stands," and several plays, including "Harlequin Patriot" and "Baldu's Death." Jens Baggesen holds first place among the song writers; Peder Andres Heiberg, among the comic dramatists, and Adam Oehlenschläger (1779-1850) is the most celebrated poet of the last century. The latter adapted many of the interesting details in the mythology of Scandinavia and was the means of bringing the tales of the Edda and the old Norse heroes to the favorable attention of the stage. Adolf Wilhelm Schack Staffeldt (1770-1826) was a contemporary of the former, and took first rank as a lyric poet, while Bernhard Ingemann produced lyric poetry and dramatic works of value.

Hans Christian Andersen ranks among the most famous Danish novelists. His works are largely in the form of short fairy tales, but they are charming to a large class of readers, and have been widely translated. Steen Blicher (died, 1848) is a novelist of note, and his writings are popular because of the beauty with which he describes the customs and characteristics of the people of Jutland. Carl Edvard Brandes (born, 1847), one of the leading recent writers, is the author of "The Remedy" and "Under the Law." Many Danish writers have contributed much of value to the general store of history, astronomy, mathematics, geography, and music.

**HISTORY.** The history of Denmark dates back to the remote past, when the Saga heroes were

noted for daring voyages and deeds of bravery in defense of their country. The oldest inhabitants of which we know were the Cimbri, who joined the Teutons and brought terror to Rome by successive invasions of the provinces of Gaul. Later the Angles, Saxons, and Jutes invaded and conquered England, while the Danes came from Zealand to take their places. Denmark was divided into a large number of small provinces for some time, but, invaded by the Franks and preyed upon by the famous vikings, the people were at last driven to the necessity of forming a united federation as a better means of defense. Later Gorm the Old united the islands and mainland under one dominion and opposed the advance of Christianity begun by the preceding rulers, though he greatly strengthened the general government.

Sweyn, grandson of Gorm the Old, began the conquest of Norway and England, which was accomplished by his son, Canute. His successor lost England in 1042 and Norway in 1047, and his reign was further weakened by the growth of the feudal system, by which the poorer class of people were reduced to serfdom. Norway was conquered by Waldemar I. and Waldemar II. made advances upon Germany, though these were lost under his successor. Queen Margaret ascended the throne in 1387 and established the Union of Calmar ten years later, by which Denmark, Norway, and Sweden became united and were governed with marked success. Under the rule of Christian I. Schleswig and Holstein were united with the other three, but in the time of Christian II. Sweden obtained its independence, and under Frederick I., who ruled ten years, beginning in 1523, Sweden was permanently separated from Denmark, while under Christian IV., Denmark took part in the Thirty Years' War and became involved in two unfortunate wars with Sweden.

The peasants asserted their rights in the latter part of the 17th century, and became free from serfdom at the beginning of the 18th. The British fleet bombarded Copenhagen and destroyed the Spanish fleet April 2, 1801. To avoid an alliance with France a second fleet was sent by the British in 1807, who demanded a defensive alliance or the surrender of the Danish fleet, which resulted in a second bombardment of the capital. Denmark was in the hands of Napoleon from that time until 1814, when it was forced to cede Helgoland to England in exchange for the Danish West Indies, and Norway passed over to Sweden. The German Confederation, headed by Prussia and Austria, in 1864 obtained the cession of Holstein, Lauenburg, and Schleswig.

Since 1864 the country has enjoyed a period of peace, its people being contented and the national conditions decidedly prosperous. Christian IX. succeeded to the throne in 1863, after the death of Christian VIII., and his reign of 43 years witnessed the material growth of Denmark in national and commercial importance. Through the marriage of his children, the reigning family became related with the sovereigns of many countries of Europe. Among the chief events of his time is the establishment of constitutional government in Iceland. He died in 1906 and was succeeded by his son, Frederick VIII.

**DENSITY** (dĕn'si-tĭ), that quality of a body which depends upon the close cohesion of its constituents. It is estimated by the proportion which the bulk bears to the weight. Thus, in two bodies of equal bulk, but differing in weight, the body of greater weight is also of greater density. In two bodies of equal bulk, but of different density, the body which is of greater density contains the proportionately greater amount of matter. In the case of two bodies containing the same quantity of matter, but differing in bulk, the greater density is ascribed to the one which is of less bulk; from this it is seen that the density is directly proportional to the quantity of matter and inversely proportional to the bulk. By a study of astronomy and the laws of gravitation the datum for ascertaining the density of the earth has been secured, which is now assumed to be about five times that of water. Since the surface consists chiefly of oxygen, it has been suggested that the nucleus may be largely of metals. The density of gases, fluids, and solids, as compared with that of water, is their *specific gravity*.

**DENTIST** (dĕn'tist), one engaged in the profession of cleaning, extracting, or repairing the teeth, or replacing them with artificial ones when necessary. Dentistry rose to a profession in the last century. The work now done by a dentist was largely in the hands of physicians prior to that time. The first institution founded in America to further knowledge in this profession is the College of Dental Surgery, Baltimore, which was chartered in 1839. Since then other excellent schools devoted to this branch of knowledge have been founded in the large cities, numerous periodicals are published in its interest, and many dental societies are maintained in Canada and the United States.

In dentistry there are two distinct departments—*mechanical dentistry* and *dental surgery*. The former is concerned with the artificial substitution of lost teeth, while the latter requires an extended medical knowledge of the diseases of

the teeth and the general system, and of the effects upon the body resulting from operations on and treatment of the teeth. The chief operations involved in dental surgery are scaling the tartar, regulating displaced and overcrowding teeth, filling the hollows of decaying teeth, and extracting teeth that are decayed to such an extent as not to warrant filling. Crown and bridge work are done largely by the use of gold, but shell crowns and porcelain are used to some extent. Tin and platinum were employed for filling broken or decayed teeth in the early history of dentistry, but now *amalgams* have come into general use. They are made by a combination of one or more metals with mercury.

**DENVER** (dĕn'vĕr), an important city of the United States, capital of Colorado. It is situated at the junction of Cherry Creek and the South Platte River, 1,025 miles west of Chicago and 1,456 east of San Francisco. It is the converging center of many trunk railways, which afford transportation facilities in all directions, and has an extensive system of urban and interurban electric lines. Among the principal railroads are the Union Pacific, the Denver and Rio Grande, the Missouri Pacific, the Chicago, Burlington and Quincy, the Atchison, Topeka and Sante Fé, the Chicago, Rock Island and Pacific, and the Colorado Southern.

The site is on a level plain located 5,250 feet above the level of the sea and about twelve miles from the foothills of the Rocky Mountains. It is noted as a healthful city, owing to its clear air and dry climate, and is a favorite center for the residence of retired and wealthy people. The atmosphere is remarkable for its clearness, owing to which many of the prominent mountain peaks may be discerned in clear weather, though located seventy miles and more from the city.

Denver is divided by Cherry Creek and the South Platte River into three natural divisions. North Denver is located west and north of the South Platte River, between that river and Cherry Creek is West Denver, and East Denver, the larger part of the city, is situated east of these streams. City Park, in the eastern part of the city, has an area of 320 acres. It is adorned with flowers and shrubbery, has fine statuary and zoölogical gardens, and is beautified by many lakes and driveways. The entire park system consists of twelve public parks, including Congress, Lincoln, Jefferson, and Highland parks. In the field of education it occupies a high position, having a fine school system and many charitable and higher institutions of learning. These include Denver University (Methodist), Baptist Female College, College of the Sacred Heart (Roman Catholic),

Wolfé Hall (Episcopal), and a number of medical, theological, and manual training schools. The hospitals and sanitariums are adequate to the demand and are well-managed institutions. A public library of about 100,000 volumes is maintained by the city, and in addition may be mentioned the State library and a number of others supported by societies and institutions of learning.

Denver owes its commercial importance largely to its favorable location in the proximity of productive iron, lead, silver, gold, coal, and copper mines. These natural products make the city important as a smelting center. About one-fourth of the manufactured products come from the smelting and refining works. Those of next importance are the machine shops, flouring mills, breweries, railroad car shops and foundries. The city is noted as a live-stock market and has a large jobbing and wholesaling trade, especially in dry goods and groceries. The architecture is substantial and includes many large buildings, such as the Tabor Opera House, the Equitable Building, the Denver Club, and the Brown Palace Hotel.

The first settlement in the vicinity of Denver was made in 1858. It was named in honor of Gen. J. W. Denver, at that time Governor of Kansas, of which Colorado was a part. The two villages, Auraria, west of Cherry Creek, and Saint Charles, east of Cherry Creek, were united in 1859 and incorporated, but the incorporation of Denver properly dates from 1861, when it received its charter from the Territory of Colorado. In 1867 it became the capital of the Territory. South Denver was annexed in 1894. Denver was the county seat of Arapahoe County until 1902, when its government was reorganized and it became the city and county of Denver. It has had a remarkable growth since 1870, when it had a population of 4,759. Population, 1900, 133,859; in 1910, 213,381.

**DENVER, University of**, an educational institution at Denver, Colo. It was founded in 1864 as the Colorado Seminary, but was reorganized in 1880, when the present name was adopted. The university comprises a preparatory school and seven colleges, the latter including a college of liberal arts, the Iliff School of Theology, a graduate school, the Denver and Gross College of Medicine, the Colorado College of Dental Surgery, a college of music, and the Denver College of Law. Three of its twelve buildings are in the heart of Denver and the others are in University Park, a suburb of the city. The university has a library of 12,500 volumes, a faculty of eighty professors and instructors, and an enrollment of 1,350.

**DE PAUW UNIVERSITY**, an educational institution located at Greencastle, Ind. It was organized by the Methodist Episcopal Church in 1837 under the name of Indiana Asbury University, but changed to the present name on account of an endowment of \$1,500,000 given by W. C. De Pauw. The campus comprises about 150 acres and the annual income is \$56,000. It has an advanced curriculum, in which elective studies and courses are permitted. The faculty consists of thirty instructors, and the attendance is about 825 students. It has a library of 35,000 volumes. The alumni number more than 2,000.

**DERBY** (dĕr'bi), a city in New Haven County, Connecticut, ten miles west of New Haven, at the junction of the Housatonic and Naugatuck rivers. It is on the New York, New Haven and Hartford Railroad and several electric lines. The noteworthy features include the public library, the town hall, the Housatonic Dam, and several schools. It manufactures cotton goods, furniture, machinery, and earthenware. The first settlement was made in 1646, when it was known as Paugasset, and it was incorporated as Derby in 1675. Population, 1900, 7,930; in 1910, 8,991.

**DERBY**, a city of Derbyshire, England, about 120 miles northwest of London, on the Derwent River. Among the chief buildings are the county hall, a school of art, an infirmary, and numerous churches. The chapel of Saint Mary's is a very old building, and the noted Tower of All Saints is an excellent specimen of architecture with a tower 175 feet high. Numerous railway lines furnish extensive inland connections. It has electric lights and street railways, public parks, and several fine monuments. The manufactures include porcelain, silk and cotton goods, paper, machinery, chemicals, ironware, marble, and spirituous liquors. It is surrounded by an agricultural country, in which fluorspar abounds. A station was built on the site of Derby by the Romans, to whom it was known as *Derwentio*. It became a royal borough in the time of Edward the Confessor. The city was the home of Herbert Spencer. Population, 1907, 125,774.

**DERRICK** (dĕr'rik), an apparatus for lifting and transporting heavy weights, such as stone in a quarry. It consists of a tall mast fastened on a pin, on which it may revolve, and is anchored by ropes extending from the top to the ground. A boom is hinged near the bottom of the mast, so constructed that the upper end may be raised or lowered by suitable rope tackle, which works through blocks fastened respectively near the outer end of the boom and near

the top of the mast. At the foot of the mast is a system of wheels, with which the tackle block is attached by a rope, and the weight is moved by turning the mast, which causes the boom to swing around. The traveling crane has displaced the derrick in most manufacturing establishments.

**DERVISH** (dĕr'vish), a Mohammedan devotee, who takes a vow of poverty and austerity of life. Numerous different orders are maintained. Some dwell in monasteries, others live as hermits, and some lead a life as wandering mendicants. The dancing dervishes are a class that accustom themselves to spin or whirl around for hours at a time, uttering *Allah*, and making violent motions of the body. After they reach a state of exhaustion, they claim to be inspired and to possess the power of curing diseases and interpreting dreams.

**DESCENT** (dĕ-sĕnt'), in law, a passing from an ancestor to an heir, a transmission by inheritance or succession. The laws of most countries are founded upon the principle of equal distribution, both of personal and real property, among the heirs in the nearest surviving degree. The three classes of kindreds are direct descendants, ancestors, and collateral relatives; the latter include those who have descended from the same common ancestors. There are two sets of collateral relatives, as well as two sets of ancestors, the *paternal* and the *maternal*. *Lineal descent* is where property descends directly from father to son and from son to grandson; *collateral descent* is where it proceeds to a brother or sister, nephew or niece, or to other collateral representatives. If an individual dies *intestate*, that is, without relatives or without leaving a will, his property usually escheats to the state.

**DESERT** (dĕz'ĕrt), a region in which plant and animal life is very scant or entirely absent. Some writers class the regions that are barren from cold or lack of soil as deserts, such as Greenland and the lands of the Arctic and Antarctic zones. However, the name is usually applied to the localities of continents that have a climate quite favorable, but whose barrenness is due to the lack of soil or the supply of moisture. Arid deserts are most extensive in Asia, Africa, and Australia, are almost entirely unknown in Europe, and occupy only a small part of the continents of North and South America. The Sahara Desert, which crosses the north central part of Africa, from the Red Sea to the Atlantic, is the largest arid belt of the world. It extends under different names into Asia, where it is known as the Arabian Desert, the Desert of Gobi, and the Salt Desert. The

Kalahari Desert, in South Africa, is bounded by the Orange, Zambezi, and Limpopo rivers. A large part of the interior of Australia is a desert. The Colorado Desert, in California, and the Atacama Desert, in northern Chile, are among the barren regions of North and South America.

Deserts vary considerably in the character of their surface. Some consist chiefly of sand and gravel, which frequently drift to form dunes, and others have a rocky surface. Oases are located in many desert regions owing to the presence of springs, or to the streams that rise from the precipitation of high mountains, irrigating the valleys below. Deserts are due to various causes, such as the direction of prevailing winds, which deprive them of moisture; long distance from the oceans; and isolation through surrounding mountain systems. The soil in many parts of the desert is quite fertile, needing only a supply of moisture to render it productive. See **Arid Region**.

**DES MOINES** (dĕ-moin'), the largest river in the State of Iowa. It rises in the southern part of Minnesota, flows in a southeasterly direction, and discharges into the Mississippi about four miles below Keokuk, after a course of 500 miles. Among its principal tributaries are the Raccoon and Boone rivers. It drains a fertile agricultural country. Belts of hard wood timber are on either side in Iowa, and it passes through regions rich in coal and limestone deposits. Among the cities on its banks are Fort Dodge, Des Moines, and Ottumwa. It forms the boundary between Lee County, Iowa, and Missouri.

**DES MOINES**, the capital and largest city of Iowa, county seat of Polk County, near the geographical center of the State. It is finely situated at the junction of the Des Moines and Raccoon rivers, both of which are crossed by a number of substantial bridges. It is on the Chicago, Rock Island and Pacific, the Chicago Great Western, the Chicago and Northwestern, the Chicago, Milwaukee and Saint Paul, the Wabash, the Chicago, Burlington and Quincy, and other railroads, and has extensive urban and interurban electric railway facilities.

The capitol building, one of the finest in the United States, was erected at a cost of \$3,000,000. Other public buildings include the United States Federal Court and Post Office, the State library, the State historical building, and the city buildings. The new county courthouse, a fine structure of stone, was completed in 1907, and the Auditorium, on Fourth Avenue, has a seating capacity of 3,000. Des Moines is the seat of Drake University, Des Moines College, High-

land Park College, several business collĕges, and a number of parochial schools. The Iowa State Fair Grounds are located in the eastern part of the city and several fine parks are maintained, including Ingersoll and Greenwood parks. The State library has about 50,000 volumes, the public library has 30,000 volumes, and several other libraries are maintained by the educational institutions.

Many of the streets are paved substantially with asphalt, brick, and macadam. Water power is obtained by means of a dam across the Des Moines River and the city supply of water is procured from the Raccoon River. Near the State capitol building is a fine soldiers' monument. The chief hotels include the Savery, Kirkwood, Chamberlain, and Victoria. Among the leading business buildings are the Fleming, Van Ginkle, Equitable, and numerous office and wholesale buildings. The surrounding country is agricultural and stock raising, while the river bluffs are rich in coal deposits, giving the city a large volume of raw material for transportation and use in manufacturing enterprises. Among the chief manufacturing establishments are medical and chemical works, flouring mills, furnaces, clothing and cigar factories, typewriter works, canning and packing establishments, and machine shops. It has a large retail and wholesale trade in manufactures and merchandise, and supplies these commodities to retail dealers in many towns and cities of Iowa. Des Moines occupies the site of Fort Des Moines, which constituted a United States garrison in 1832. It was incorporated in 1851 and chartered as a city in 1857. Fort Des Moines, a United States garrison, is located south of the city. Population, 1905, 75,626; in 1910, 86,368.

**DE SOTO** (dĕ sō'tō), a city in Jefferson County, Missouri, forty-four miles southwest of Saint Louis, on the Saint Louis, Iron Mountain and Southern Railroad. It is situated in a zinc and lead producing region, and is a shipping center of cereals and mineral products. The industries include grain elevators, flouring mills, and machine shops. It has electric lighting, a public high school, and other improvements. Population, 1900, 5,611.

**DES PLAINES RIVER** (dĕ plān'), a river of the United States, rises near Racine, Wis., and after a course of 150 miles joins the Kankakee River to form the Illinois River. The general course is south to Lyons, near Chicago, whence it flows toward the southwest. A low ridge separates its basin from Lake Michigan, and thirteen miles of its lower course is utilized in the Chicago Drainage Canal.

**DESSAU** (dĕs'sou), a city of Germany, capi-

tal of the duchy of Anhalt, eighty miles southwest of Berlin. It is situated in a beautiful valley of the Mulde River, near its junction with the Elbe, and is surrounded by a fertile country. The streets are broad and well improved with substantial paving. Electric and steam railroads furnish ample interurban and general transportation facilities, making it an important commercial center. Among the manufactures are cotton and woolen goods, sugar, carpets, pottery, tobacco products, and machinery. It has a gymnasium, three large libraries, many fine churches, and a number of charitable and educational institutions. In its public places are monuments of Wilhelm Müller, the poet, and Moses Mendelssohn, the philosopher, both of whom were born here. Dessau was the scene of a battle in the Thirty Years' War, in 1626, when Wallenstein defeated Count Mansfield at the bridge over the Elbe. Population, 1905, 55,134.

**DETROIT** (dê-troit'), the chief city and port of entry in Michigan, county seat of Wayne County, on the Detroit River, opposite the Canadian city of Windsor. It is about 18 miles from Lake Erie, 10 miles from Lake Saint Clair, and 285 miles east of Chicago. The site is on a fine eminence, the streets are well paved and shaded by avenues of trees, and the various portions are connected by a system of electric railway lines. It is the focus of many railways, and has dock facilities for large vessels, giving it extensive conveniences for transportation to the chief cities of America. The railroads include the Wabash, the Grand Trunk, the Lake Shore and Michigan Southern, the Michigan Central, and the Péré Marquette.

The city has a river frontage of nine miles and extends about four miles inland from the river. The area is 30 square miles, and the site rises gradually from the river toward the north. Most of the streets are platted to cross each other at right angles, but are intersected by broad avenues which radiate from a semicircular plot within the city known as Grand Circus. This park is crossed by Woodward Avenue, which divides the city into nearly equal parts, and is the principal business street. It becomes a residence street farther from the center of the city and is connected with Campus Maritus, a fine plot of ground a short distance from the river. Griswold Street is the banking center, Lafayette and Michigan avenues have notable buildings, and Jefferson Avenue and West Fort Street contain many fine residences.

**PARKS AND BUILDINGS.** The parks embrace about 1,200 acres and are well distributed in the different parts of the city. Belle Isle Park

is located on Belle Isle, an island in the Detroit River, and is one of the finest. It is connected with the city by a substantial iron bridge, has a number of interior lakes and canals, and contains about 700 acres. Palmer Park is located on Woodward Avenue, six miles north of the city hall. Clark and Voigt parks are beautiful grounds. Among the principal buildings are the city hall, in City Hall Square, the Majestic Building, near the city hall, the post office, the county courthouse, the Y. M. C. A. Building, and the Cadillac Hotel. The churches include Saint John's Protestant Episcopal, First Presbyterian, Trinity Protestant Episcopal, Sacred Heart of Mary, Fort Street Presbyterian, Woodward Avenue Baptist, and the Jewish Temple. A fine library is maintained in the Museum of Art, which occupies a commodious building.

**EDUCATIONAL.** Detroit is noted for its finely graded system of public schools, which are supplemented by a number of higher institutions of learning. Detroit College, a city normal school, Detroit College of Medicine, Detroit College of Law, and Michigan College of Medicine and Surgery are among the higher and professional institutions. The city library has about 200,000 volumes, and books are distributed in several branches for the convenience of reading and reference. Many charitable and benevolent institutions are maintained. It is the seat of the Saint Vincent's Orphan Asylum, Florence Crittenden Home, Protestant Orphan Asylum, Deaconess's Home, and many others.

**COMMERCE.** Detroit is favored in the expanse of its commerce and industry by its favorable location on navigable waters and numerous railroads. Among the northern ports it takes second rank in foreign trade, much of which is with Canada. The exports include cereals, live stock, hides, lumber, and machinery. It is favored as a center of wholesaling and ships large quantities of manufactures and merchandise to points in Michigan and adjoining states. Among the leading manufactures are automobiles, furniture, wagons and carriages, matches, chemicals and drugs, steel and iron products, and machinery. It is a slaughtering and packing center and has large establishments for the manufacture of paint and varnish. Large shipments of ore are received from points in northern Michigan and Minnesota, and coal is obtained from the mines of Ohio and Pennsylvania, hence its iron and steel industries have been making marked advancement.

**HISTORY.** The first settlement on the site of Detroit was made by the French in 1701, when Cadillac, governor of the French territory, built

Fort Pontchartrain. It remained a French trading village until 1760, when it was captured by the British. At the close of the French and Indian War, in 1763, it became British territory, and finally passed to the United States in 1796. It was incorporated as a town in 1802, but its charter as a city dates from 1824. In 1805-37 it was the capital of the Territory of Michigan, and remained the capital of the State until 1848, when it was superseded by Lansing. Population, 1904, 317,591; in 1910, 465,766.

**DETROIT RIVER**, the channel or strait which connects Lake Saint Clair and Lake Erie, by which the waters of the three upper Great Lakes reach the Saint Lawrence. It is about twenty-five miles long, three-fourths of a mile wide, and navigable by the largest vessels. For four months in the year it is ice-bound. Within the river are many islands and much fine scenery. The commerce is very extensive. It was named from the French, the name meaning strait.

**DEUTERONOMY** (dū-tēr-ōn'ō-mŷ), the fifth book of the Pentateuch and of the Bible. It is thought that Moses himself wrote this part of the Holy Scriptures, with the exception of the last four chapters, in which the closing events in the life of the great lawgiver are narrated. It repeats the laws which had previously been promulgated, hence the name. In it is the history of what passed in the wilderness during about five weeks, from the beginning of the eleventh month to the early part of the twelfth month, in the fortieth year after the Israelites departed from Egypt. Moses recounts in Deuteronomy the events which had taken place in the Israelitic history, and makes comprehensive references to particular phases in the law received at Sinai. The books which precede Deuteronomy are *Genesis*, *Exodus*, *Leviticus*, and *Numbers*.

**DEVIL** (dev'1), in theology, the sovereign spirit of evil, corresponding to the *Satan* of the Hebrews and the *Iblis* of the Mohammedans. In the Bible the devil is represented as the evil one and the father of lies. He is regarded a rebel against God, a being who is perfect in every kind of skill and knowledge, which he uses to pervert man and entangle him in the meshes of sin. In the Middle Ages, even as late as the 17th century, the belief in evil spirits was very common. In many instances, when a man of genius had made a scientific discovery or accomplished some extraordinary feat, it was supposed that his mind was assisted by the devil in some mysterious way.

As sovereign of the demons, the devil held a prominent place in the practice of magic and

in many of the poetical legends. In the mysteries (q. v.) he was often represented on the stage with flaming eyes, hooked nails, cloven hoofs, spreading horns, black complexion, and sulphuric odor. Milton and Klopstock, the former in the character of *Satan*, and the latter in that of *Abaddon*, introduced the devil as a fallen angel, still somewhat dignified amid the disfigurements of sin. The doctrine of the fathers of the church, founded upon certain passages of the Scriptures, makes him the leader of a rebellion among the angels, the enemy of God, the author and constant promoter of sin, now suffering chastisement for his crimes, and destined to eternal punishment. He is called the prince of this world and regarded the cause of man's fall from grace, yet his power was broken by the work of Christ, hence Christians can rise superior to the might of his influence.

**DEVIL FISH**, the name of a fish belonging to the ray family, common to the waters of the Atlantic and Pacific coasts. It has a winglike process on each side and the head is truncated in front, giving it a peculiar appearance when moving in the water. Divers dread it as a dangerous inhabitant of the sea.

**DEVILS LAKE**, a city of North Dakota, in Ramsey County, on the north shore of Devils Lake. This lake is forty miles long, about ten miles wide, and its surface is 1,465 feet above the sea. The water is saline and shallow in many places and the lake has no visible outlet. The city is the county seat of Ramsey County, located on the Great Northern Railway, and is surrounded by a fertile farming country. It has a growing trade in produce and merchandise. Among the chief buildings are a county courthouse, a high school, and several fine churches. Population, 1900, 1,729; in 1910, 5,157.

**DEVONIAN** (dê-vō'nĭ-an), one of the rock systems of the Palaeozoic period, located between the Silurian and Carboniferous systems. It is so named from Devon, England, where its strata were first distinguished from those of the Silurian and Carboniferous by Sir R. Murchison. Geologists usually divide it into three groups, the *Lower*, the *Middle*, and the *Upper*, of which the last mentioned is notably distinguished by the presence of large deposits of old red sandstone. The fossil remains are very abundant, especially those of fishes, and include crustaceans, corals, mollusks, crinoids, and cephalopods. The rocks of this system are especially abundant in the Catskill Mountains of New York, where they approximate a thickness of 2,000 feet. They are distributed in many parts of North America, being found in the Black Hills of South Dakota, in Utah and Ne-

vada, in many sections of the Appalachian Mountains, and in Ontario and other localities of Canada. See **Geology**.

**DEW** (dū), a condensation of moisture from the atmosphere in the form of minute globules upon the surface of certain bodies. On a glass filled with cold water, set out on a warm day, small drops of water form, which are derived entirely from the air. This is caused by the temperature of the air, coming in contact with the cold side, being lowered below the dew point; thus, it deposits the surplus moisture beyond its power of retention. The dew seen on plants and other objects has a similar origin. The earth absorbs more heat during the day than it emits, and at night, when the supply of warmth is cut off, it continues to radiate heat. Objects above the surface of the earth cool more rapidly than the air or the earth, thus resulting in a formation of dew as the air or radiated warmth comes in contact with plants and other objects above the surface. Dew is deposited as hoarfrost when the objects are colder than 32° Fahr.

Dew accumulates much more readily on some objects than on others, because some substances radiate their heat more rapidly than other bodies. The deposit is greater during a clear night than when it is cloudy, for the reason that the earth and air cool more readily when it is clear. The reason that more dew is deposited on a still night than when it is windy is due to the fact that air must remain for some time in contact with cold objects to enable them to lower its temperature and collect its moisture. The amount of dew deposited in warm countries greatly exceeds that of cold regions, and in some regions it is one of the principal sources of moisture for the growth and development of plants. Air is said to have reached its dew point when it contains all the moisture it is capable of holding. The dew deposited is from a comparatively thin stratum of air in the immediate proximity of the cool object. The general precipitations, including rain, snow, and hail, are caused by the cooling of large masses of air.

**DEXTRIN** (dēks'trīn), a brownish-white compound found in nature, as in the sap of plants, and formed by the action of heat or acids on starch. It is soluble in water and may be purified by precipitating it with alcohol. Dextrin is used in medicine as a substitute for gum arabic, in calico printing, and in stiffening textiles. It is employed to a large extent on the back of postage stamps.

**DHAWALAGIRI** (dā'wā-lā-gē'rē), or **Dhaulagiri**, an elevated peak of the Himalaya Mountains, in Nepal. Its height is 26,825 feet,

the fourth in height of that great system, being exceeded by mounts Everest, Kinchinjunga, and Shumalari.

**DIABASE** (dī'ā-bās), a crystalline rock of the igneous group, composed of feldspar, pyroxene, and lime soda. The texture is crystalline throughout and the composition is hard and compact. Feldspar found in diabase is usually formed in bladed crystals, which give the rock a mottled appearance, especially if the grains of pyroxene are coarse. Some specimens have a green color, owing to the presence of olivine. Diabase formations are widely distributed. They occur in the Keweenaw Peninsula of Lake Superior, in the Palisades of the Hudson River, in the Deccan of India, and in several sections of the Scandinavian Peninsula.

**DIAL** (dī'al), an instrument for ascertaining the time by means of the shadow of a stile or gnomon, through the agency of the rays of the sun or moon thrown upon a graduated plate or disk. It is certain that the dial is the invention of the Asiatics. When Ahaz went to Damascus in 771 B. C., he saw a beautiful altar and sent plans of it to Jerusalem. On his return an altar was constructed. He set a dial which is mentioned in connection with the cure of his son Hezekiah thirteen years after the death of Ahaz. This is, perhaps, the first dial on record, and is some earlier than the eclipse of the moon observed at Babylonia as recorded by Ptolemy.

Dials were in general use before watches and clocks became common as timekeepers. They are of various construction, either upright, horizontal, or inclined. The common dial has a horizontal plane, or dial plate. The stile, pointing toward the North or South Pole, north or south of the Equator respectively, is adjusted to retain its parallelism to the earth's axis. This form becomes a polar dial at the Equator. The hour lines intersect each other and the stile intersects the plane of the dial at all latitudes, except at or near the Equator. The shadows of the stile or gnomon cast upon the figures of the dial mark the several hours of the day, indicating the sun's distance from the meridian. Similar dials are made to indicate the time of the night by the shadow of the moon or stars. These instruments are not serviceable during cloudy weather.

**DIAMETER** (dī-ām'ē-tēr), a straight line drawn through the center of a circle or sphere, terminating at two opposite points of the circumference. A circle is divided into two equal parts by its diameter, which is its greatest chord. A diameter of a cylindrical body is that of one of its circular sections. The diameter

of a body is found by dividing its circumference by 3.1416.

**DIAMOND** (dī'ā-mūnd), one of the most valuable and the hardest of precious stones, being the purest form in which carbon is found. Its crystals are cubical in form and most commonly have twelve faces. Diamonds of the finest quality are colorless, perfectly clear, and said to be of the *first water*. Some varieties are green, orange, red, yellow, or blue, these being highly prized, if the tint is decided and equal throughout. It is transparent and translucent, and is so hard that it can be cut only by itself, and will scratch any other substance. When cut and polished, a diamond of the purest water weighing one carat is valued at about \$100, and the value increases as the square of the weight in carats is multiplied. Its commercial value is affected by the slightest tinge of color, though blue-colored diamonds are exceedingly rare and have commanded enormous prices.

The annual production of diamonds in South Africa is about 2,750,000 carats, equal to about five-eighths of a ton. The amount realized by the sale of this production is estimated at \$18,500,000. However, the output varies greatly from year to year, being greatest in 1901, when the production of the Kimberley fields was sold for \$23,144,225. Other productive diamond fields are located in Brazil, Australia, and India, though small quantities are found in various other regions, especially in the Ural Mountains, California, and several other states of the United States. The diamond fields of Brazil were discovered in 1728, and the largest single specimen found there weighed 254 carats. It was sold to the Gaikwar of Baroda for \$400,000, and became known as the "Star of the South."

Diamonds are found in the sand and gravel of river, lake, and sea beds, and in diamond-bearing rocks. The stones are separated from the sand and rock by washing; this requires elaborate machinery and a large water supply. The principal uses of diamonds are for polished gems, cutting glass, ornaments, and boring or drilling. Engravers use diamonds as etching points, for which purpose they are cut in various forms, the value depending largely upon skill in cutting. Recent experiments tend to show that diamonds may be produced by bringing carbon in contact with fused silicate mineral. It is thought that the African diamonds were formed in this way, since they are found in igneous rock adjacent to carbonaceous shale.

Among the diamonds celebrated in history is the Great Mogul, found in 1550, in Golconda,

which weighed 793 carats and was cut to 279 carats. The Austrian is a rose cut diamond weighing 140 carats. The great Russian diamond, now in the scepter of Russia, weighed 193 carats. It was purchased by Count Orloff for \$500,000 and presented to Catharine on her birthday in 1772. The Kohinoor, meaning "Mountain of Light," belonged in turn to Shah Jehan, Aurungzebe, Nadir Shah, the Afghan rulers, and afterward to the East Indian Sikh chief, Runjeet Singh. It was surrendered to the Queen of England in 1849 by the last ruler of the Punjab, when the annexation of his dominions to Britain took place. Originally it weighed 800 carats, but was reduced by unskillful artists to 279 carats. It was recut in 1852 and now weighs 103 carats. The Regent or Pitt diamond, now in the Louvre, Paris, weighs 136 carats and is said to be worth \$2,500,000. Among the largest diamonds found in South Africa is one that weighed 302 carats and another weighed 3,000 carats.

**DIANA, Temple of**, an architectural structure of Ephesus, in Asia Minor, one of the seven wonders of the world. It was built at public expense under plans made by Chersiphron of Cnossus, the chief architect. Pliny thought that it required 120 years to complete the building, which was 225 feet wide and 425 feet long, and had 126 columns that were 60 feet high and constructed of Parian marble. These columns were in four rows, two rows of eight columns each across the front and two rows of twenty columns each on the sides, with an additional number set near the main entrance. Herostratus is said to have burned it in 356 B. C., when a part of the temple was destroyed. The Goths plundered it in 262 B. C. Excavations made in 1869 led to a discovery of the site, and a number of sculptures and fragments of the architecture are preserved in the British Museum and other collections.

**DIAPHRAGM** (dī'ā-frām), the broad, almost circular muscle which separates the cavity of the thorax from that of the abdomen. It is thin and in its center has some fibrous tissue. Because of the constant pressure of the abdominal viscera and muscles, it arches up in the thorax. Through it pass the oesophagus, aorta, thoracic duct, inferior vena cava, and a number of the large nerves. During inspiration it ascends, thus increasing the capacity of the thorax, whose vacuum is filled with air, and in expiration it assumes its former position. Expulsions of air are governed largely by the diaphragm, hence it is a factor in laughing, crying, sneezing, and coughing. Sudden contraction of the diaphragm cause hiccoughing.

**DIARBEEKIR** (dĕ-är'bĕk-ēr), or **Diarbekr**, a city of Asiatic Turkey, capital of the vilayet of Diarbekir, on the Tigris River. Most of the architecture is inferior, constructed chiefly of rough stone or of sun-dried brick, but it has a number of fine bazaars, mosques, and Christian churches. The manufactures consist chiefly of utensils and silk and cotton textiles. Copper is mined in the vicinity. Anciently it was known as Amida. Constantinus fortified it, but it was captured by the Persians in 502 A. D. Population, 1907, 46,500.

**DIATOMS** (dī'ā-tōmz), a family of microscopic plants, widely distributed in nearly all parts of the world. They were first discovered by O. F. Müller near the beginning of the last century, and by 1824 only 49 species were known. It is thought that not less than 9,000 species exist. For some time writers differed as to whether they should be classed with the vegetable or animal kingdom, but from a study of their general structure, and more especially their modes of reproduction, they are now universally classed as plants. The diatoms are common to most fresh and salt waters, and are devoured in large numbers as food by the lower forms of marine animals. When examined by the microscope, it is seen that the cells are solitary, or united into colonies, and each cell has a small shell or covering, which in many species is beautifully ornamented.

**DICE** (dis), the plural of die, small cubes of bone, ivory, or serpentine stone, used in playing the game of dice. The faces are marked with a different number of points, from one to six, in such a way that the numbers on any two opposite sides count seven. In playing they are shaken and thrown from a box on a table, and the game depends upon the number of points presented by the upper faces. It is thought that the game was first used by the Lydians; and was played quite extensively among the Greeks, Egyptians, and Romans.

**DICKINSON**, a city of North Dakota, county seat of Stark County, 115 miles west of Bismarck. It is nicely located on the Heart River and the Northern Pacific Railroad. The surrounding country is agricultural and stock raising. It has a number of fine school and county buildings, several churches, and a large trade in produce and merchandise. It is important as a grain shipping point and has a number of large elevators and lumber yards. Population, 1905, 3,188.

**DICTATOR** (dik-tā'tēr), the highest magistrate in the ancient Roman Republic. The dictator was an extraordinary magistrate, endowed with absolute authority, and it lay with the

senate when the services of such an officer were necessary. The first dictator was appointed in 501 B. C., nine years after the Tarquins were expelled from Rome. Only those who had been previously consuls were eligible to the position. Originally the office could be filled only by a patrician, but later eligibility was extended to the plebeians. No one could legally hold the office longer than six months, but Sulla and Caesar were dictators for a longer period. The dictator had absolute power without any appeal, and his official acts could not be questioned by the senate. He was prohibited from leaving Italy, could not use the public funds, and was not permitted to ride on horseback without special permission from the people.

**DICTIONARY** (dik'shūn-ā-rĭ), a book which contains a large list of words in any language, arranged alphabetically, and treated in a systematic order. The equivalent words in another language are usually given, with the spelling, pronunciation, etymology, definition, and other illustrative features. The term is frequently applied to works on special subjects, such as law, medicine, music, biography, etc. Dictionaries of the English language were first published in 1573 by John Baret, in 1616 by John Bullokar, and in 1755 by Dr. Johnson. Noah Webster published the first edition of his dictionary in 1828, and the "American Unabridged Dictionary" by Joseph E. Worcester was published about the same time. The dictionary of Webster is issued at present under a number of titles, including "Webster's International Dictionary" and "Webster's Imperial Dictionary." Among the newer dictionaries are the "Oxford English Dictionary," published in England, in 1888, the "American Encyclopaedic Dictionary" (1888), "The Century Dictionary" (1891), and "The Standard Dictionary" (1895). The last mentioned is among the largest, containing about 320,000 words. It is thought that the earliest German dictionary was published by Hrabanus Maurus, a contemporary of Charlemagne. The most extensive German work is that of Wilhelm Karl Grimm and in the French, that of Maximilien E. Littré.

**DIDYMIUM** (dī-dīm'ĭ-ŭm), a metallic element discovered by Mosander in 1842, found chiefly in the mineral cerite. It is closely related to bismuth. Its chemical symbol is Di, and its atomic weight is 145.4. Chemists have separated it into two elements, *neodymium* and *praseodymium*.

**DIES IRAE** (dī'ēz' ĭrē), the title given to a Latin hymn whose first line is "Dies irae, dies illa." Its authorship is generally credited to Thomas of Celano, a native of the kingdom of

Naples, whose death occurred in 1255. The poem is dedicated to the last judgment, and was first published in Venice in 1250. Many of the eminent scholars of Germany translated it, among them Fichte, Schlegel, and Busenbaum. No religious poem has undergone as many translations in various languages, owing to the difficulty in producing its exquisite religious fervor. Several stanzas were introduced by Sir Walter Scott into his "Lay of the Last Minstrel," the first of which is as follows:

The day of wrath! that dreadful day,  
When heaven and earth shall pass away.  
What power shall be the sinner's stay?  
How shall he meet that dreadful day?

**DIET** (dī'ēt), the name of several political bodies of Europe, corresponding to the Parliament of Great Britain and the Cortes of Spain and Portugal. It is derived from the Latin *dieta*, and signifies a day fixed for the national deliberations of public affairs. In this sense it is used to designate the Reichstag of Germany, the Riksdag of Sweden, the Rigsdag of Denmark, and the Rijksdag of the Netherlands. The word *diet* is frequently applied by English writers to the legislative assemblies of Germany, Austria, and Hungary.

**DIET**, the food commonly eaten to compensate for the waste of tissue and provide means for the growth and development. See **Food**.

**DIFFRACTION** (dīf-frāk'shūn), in physics, the deflection and decomposition of light, causing the appearances of parallel bands or fringes of prismatic colors. It occurs when light passes by the edges of opaque bodies or through narrow slits, as by the action of a grating of fine lines or bars. A glass screen, commonly called a *diffraction grating*, is used in physical laboratories to illustrate these phenomena. It consists of from 10,000 to 20,000 parallel lines to the square inch ruled on glass, and as the light passes through brilliant spectrum colors result. A diffraction grating made by ruling lines on speculum metal produces a similar effect by reflecting the light from the polished and ruled surface. Such gratings are used in place of the prism in spectroscopic work, and with them it is possible to obtain spectra of wide dispersion. The spectrum given by the grating is called the *normal spectrum*, since in it the distribution of the different wave lengths is uniform. Diffraction gives rise to the play of colors seen in mother-of-pearl and the feathers of some birds.

**DIFFUSION** (dif-fū'zhūn), the property possessed by liquids of intermingling with each other when brought in contact. It may be illustrated by placing water colored with blue litmus into a glass jar, and then pouring a

small quantity of sulphuric acid, by means of a thistle tube, into the bottom of the jar. The acid will change the blue of the litmus to red wherever they come into contact. If the jar remains in a quiet place, the acid will intermingle with the litmus solution, and after a short time the entire contents of the jar will be red. Diffusion is more rapid where the surfaces of the two liquids are increased, as by placing them in a shallow vessel, or by stirring with some solid object, such as a spoon or a glass rod. Alcohol and water mix readily when placed together in a vessel, but water and mercury or oil and water do not mix, since there is no adhesion between their molecules. This may be illustrated by pouring oil and water into a bottle and shaking thoroughly, after which the two will separate into two distinct layers, the separation being nearly perfect. Diffusion takes place between gases, which may be demonstrated by filling two flasks, one with chlorine and the other with hydrogen, and connecting the two by means of a long tube through the corks fitted tightly into their necks. There being a difference between the color of chlorine and hydrogen, it is possible to observe the diffusion with the eye as the intermingling takes place.

**DIGESTION** (dī-jēs'chūn), the process by which foods are converted into soluble and diffusible products, capable of being absorbed by the blood. It may be said to begin in the mouth, where the solids are broken into small pieces, moistened with saliva, mixed with air and saliva, and formed into a bolus for swallowing. The saliva, by its active principle known as *ptyalin*, changes some of the starch at once into sugar. The glands of the stomach are excited to activity by the entrance of food, which has been made somewhat alkaline by the saliva and mucus, and the presence of acid lessens or stops the action of the ptyalin. A slight churning process in the stomach thoroughly mixes the ingredients, which are subjected to the action of pepsin, the active principle of the gastric juice. The starches and fats are loosened, the protoplasm is dissolved, and the proteids are converted into peptones. Food is acted upon in the stomach from three to four hours, depending upon its quality and quantity, as well as upon the condition of mind and physical health, both of which exercise a marked influence.

The partly digested food which passes from the stomach through the pylorus into the duodenum is known as *chyme*, and is a grayish liquid and is mixed somewhat with large lumps. By the action of the bile, the pancreatic juice,

and the intestinal secretions, in the small intestines, the starches are converted into sugar and the remaining proteids into peptones, and the fats are made into an emulsion, or a soapy substance. The digested food, known as *chyle*, is absorbed by the portal blood vessels and by the lacteals. The contents that pass into the large intestine again become acids, owing to fermentation, and a small amount of cellulose is digested. The absorption of the liquids contained in the fluid mass is an important function of the large intestine.

**DIGHTON ROCK** (dī'tŭn), a large mass of granite on the east bank of the Taunton River, near Dighton, Mass. It is remarkable for an inscription deeply cut with mysterious characters and has been the subject of much discussion among antiquarians. Mention was made of it by colonists as early as 1730. Some writers have expressed the view that the inscription was made by the Norseman in 1008, while others regard it the product of Indians.

**DIJON** (dê-zhôn'), the capital of the department of Côte d'Or, France, on a plain near Mount Afrique, 1,915 feet above sea level. It is conveniently located on a number of railroads and electric railways. The noteworthy features include a Gothic cathedral with a spire 300 feet high, dating from the 13th century. Other noted structures are the Church of Saint Michael, the theater, and the university. The public hall was begun in 1366 and served as a palace of the Burgundian dukes. It has an excellent museum, a library with 85,000 volumes, and several institutions of advanced learning. Among the manufactures are hosiery, chemicals, cotton and woolen goods, leather, machinery, and the celebrated Dijon mustard. The Romans knew the city as Dibia. It passed from Burgundy to France in the 5th century, was ruled by counts in the 9th century, and was united to the duchy of Burgundy in 1007. After the death of Charles the Bold it became a French possession. The German army occupied it in 1870. Population, 1906, 74,113.

**DIKE** (dik), in geology, a wall of trap or some similar form of igneous rock, which traverses other rocks, and appears to have been produced by the flowing of melted matter into a deep rent or fissure. Dikes differ from veins in being larger, and in their contents having greater uniformity. They frequently project above the surface like a wall, owing to the rocks around them being somewhat softer. In thickness they vary from a few inches to a mile. Dikes that occur between the layers of a sedimentary formation are called *intrusive sheets*. They consist chiefly of basalt and quartz porphyry.

Dikes are found in volcanic regions and are widely distributed.

**DILEMMA** (dī-lēm'mà), in logic, an argument which contains two or more alternatives, equally conclusive against an opponent which ever alternative he chooses. A person who is confronted by a dilemma must admit one or the other, hence is said to be caught between the horns of a dilemma. The following dilemma may serve to convey a clearer notion than could be formulated in a definition: "If this man were wise, he would not speak irreverently of Scripture in jest; and, if he were good, he would not do so in earnest; but he does it, either in jest or earnest; therefore, he is either not wise, or not good."

**DINAPUR** (dē'nä-pōor), a city of British India, in the province of Behar, twelve miles northwest of Patna. It is nicely situated on the Ganges River and a railroad, and has strong fortifications. The surrounding country is fertile, producing cereals and fruits, and the city has a large trade in produce and merchandise. In 1857 it was the scene of a mutiny. Population, 1906, 35,046.

**DINARIC ALPS** (dē-när'ik), a mountain range in southwestern Austria, trending parallel to the coast of the Adriatic Sea. It forms a connecting line between the western extremity of the Balkan Range and Mount Klech, at the southern extremity of the Julian Alps. The highest peak, Mount Dinara, is 6,010 feet above sea level.

**DINGO** (dīn'gō), the wild dog of Australia, thought to have originated from a breed of the domestic dog. It is from two to three feet long and about two feet high, and has an appearance somewhat resembling that of a wolf. The color ranges from pale brown to black, usually with tawny markings, the ears are erect, and the tail is bushy. In a wild state it utters a howl like a wolf, but when domesticated it soon learns to bark when placed in company with other dogs. The natives have domesticated the dingo and use it in hunting, but also hunt wild dingoes for their flesh, which they prize as an article of food.

**DINORNIS** (dī-nôr'nīs), a genus of extinct birds of the ostrich family, fossil remains of which are found in New Zealand. It is reasonably certain that six species existed and that the largest specimens had a height of from twelve to fourteen feet. They were stupid and indolent, incapable of flying, and subsisted on vegetable food. Fossils are found in the deposits of the post-Pliocene period.

**DINOSAURIA** (dī-nō-sā'rī-à), a group of large fossil reptiles, classed with the extinct

lizards. Remains of these animals are found in the Jurassic system of rocks. They resembled the crocodile on the one hand and the birds on the other, and most of the species walked on their hind legs. To this group belonged the *Clasaurus annecteus*, a birdlike animal whose body was thirty-five feet long. The

CLASSAURUS ANNECTEUS.

smallest of the group were three feet long, while the largest, such as the *Megalosaurus*, attained a length of forty to sixty feet. This animal was carnivorous, feeding on the animals that lived in the haunts it frequented, but the *Iguanodon* was herbivorous.

**DINOTHERIUM** (dī-nō-thē'rī-ŭm), a genus of extinct mammals allied to the modern elephant and the extinct mastodon. Fossil remains are found in the Miocene and Pliocene rocks of Europe, in the region lying between Greece and northern Germany. They had no tusks in the upper jaw, but two tusks projected downward and slightly backward from the lower jaw. It is thought that these animals did not inhabit America, but they were in Southern Asia, from Asia Minor to India.

**DIPHTHERIA** (dīf-thē'rī-à), a blood disease characterized by a false membrane composed of elastic fibers, found chiefly on the pharynx, tonsils, nostrils, palate, tongue, and gums, and sometimes on the oesophagus. The membrane is of an ashy color and leaves a bleeding surface when detached, often terminating in blood poisoning. It is a disease of all ages, spreads by contagion, and is highly dangerous. It frequently accompanies typhoid fever, croup, and scarlet fever, the chances of recovery in such cases being very doubtful. The fatality has frequently been as high as ninety per cent. in past years, but with the newer modes of treatment it has been materially reduced.

The treatment in diphtheria is both constitutional and local, in which iron, chloride of potash, cinchona bark, and quinine are largely employed, though carbolic acid, glycerin, and chlorine are used more or less extensively. The newer method is to use antitoxin in the treatment. In aggravated cases a tube is employed, through which the patient is enabled to breathe while the soreness and swelling are greatest. Accurate reports made in 1900 show that the mortality has been reduced very largely by the use of this remedy. In 1900 it was estimated that the death rate in Paris was thus reduced from 72 to 12 per 1,000 population; in Berlin, from 125 to 32 per 1,000; and in New York, from 187 to 45 per 1,000. It is estimated that fully 1,150 lives were saved in Chicago in the two years 1899-1900. This estimate is fully borne out by the experience in London in 1908. See **Antitoxin**.

**DIPHTHONG**, the union of two vowels which are pronounced together in one syllable, with one impulse of the voice, as in *out*, *soil*, and *low*. The term *improper diphthong* is applied to a word in which two vowels are written together, but only one representing a sound, as in *beat*, *bean*, and *bread*. Many diphthongs in modern English were developed from monophthongs, or simple vowel sounds, as the modern *mouse*, which was derived from the old English *mus*.

**DIPLOMACY** (dī-plō'mā-sī), the term applied to the art of negotiating and arranging treaties between nations. This branch of knowledge relates to the forms of international negotiations, the relation of independent states to one another, and the management of envoys accredited to foreign courts. Intricate diplomacy like that of modern times did not exist in the nations of antiquity for the reason that the scope of civilization was often confined within the limits of a single empire. In Greece, Rome, Persia, and other ancient nations political agents were employed to discuss national affairs. The primitive movement in bringing about the regular intercourse existing between civilized powers has been accredited to the efforts of Cardinal de Richelieu, though the representatives sent by the Florentine republic to Charles V. tends to show that he was not the first to perceive the benefits to be derived from such a system. Among the diplomatic agents recognized are ambassadors, envoys extraordinary, ministers plenipotentiary, ministers resident, *charge d'affaires*, secretaries of lega-

tion, and *attaches*. The powers and dignities of these agents are graded successively in the order named.

**DIPPER** (dīp'pēr), a bird of the thrush family, but quite similar in appearance to the wrens. The bill is sharply pointed and almost straight, the plumage is compact, and the tail turns slightly upward. Several species are noted for their song. They live near the banks of streams and the shores of lakes, and feed on mollusks and aquatic insects. The dippers are so named from their habit of dipping the head, which is accompanied by an abrupt up-jerking of the tail. Several species are found in the highlands of the United States and Canada, and others frequent many parts of Asia and Europe.

**DIPPING NEEDLE**, an instrument to test the magnetism of the earth at different places. It consists of a magnetic needle supported by a stirrup or within a frame so as to be free to move vertically. When placed horizontally and then magnetized, the needle will not remain horizontal, but will dip toward the nearer pole of the earth. The angle of dip decreases as the distance from the magnetic equator increases. There is no dip at the magnetic equator, but the needle will assume a vertical direction at the magnetic poles, hence the distance increases from zero to ninety degrees.

**DIPSOMANIA** (dīp-sō-mā'nī-ā), the morbid craving for alcoholic drinks, classed as a form of insanity. The attacks are periodical and when they occur the patient has an uncontrollable desire to drink excessively, but during the intervals he seems mentally sound and may abstain entirely from the use of liquor. The disease has been treated successfully in asylums for the inebriates. Institutions of this kind are maintained successfully in many states and countries.

**DIRECTORY** (dī-rēkt'ō-rŷ), the name applied to the government in France which was established by the constitution of Aug. 22, 1795. This body was composed of five members, who ruled in conjunction with two chambers—the Council of Ancients and the Council of Five Hundred. It was deposed by Napoleon Nov. 9, 1799, who assumed the government with Charles F. Lebrun and Jean J. Cambacérès as three consuls, on Dec. 15, 1799, his office being that of first consul.

The name directory is applied to a book which contains the names of the inhabitants of a city or district. Directories are published at frequent intervals. In them the names of citizens are given in an alphabetical order, together with the place of abode and business or

profession of the individual. Various directories are issued by the government, the principal and most used work of this kind being the "Official Postal Guide." Such a directory contains a list of all the post offices, giving the counties and political divisions in which they are located.

**DISCOUNT** (dīs'kount), a deduction from a sum of money due at a future date, or from the price at which a commodity is generally sold. Banks usually deduct a small per cent. from the face of a note when purchasing such a paper, called *bank discount*, and this deduction is an item of profit in addition to the rate of interest specified in the note. When a loan is made to a customer by a bank, it is quite usual to deduct the interest in advance, hence the person borrowing receives a sum slightly less than the face of the note he gives at the time the loan is made. Merchants usually get a discount from the wholesaler when they pay cash within ten days from the date of shipment, or a smaller discount if they pay within thirty or sixty days, and quite frequently the merchant has a similar system in giving his customers a small discount where a bill is paid cash or within a short time. Deductions of this kind are said to be based on trade or commercial discounts.

**DISEASE** (dīz-ēz'), a state of ill health, usually applied to the absence of health from all causes except old age. *Organic* diseases arise from an unhealthy condition of the organs of the body, while *functional* ailments are due to causes which prevent the organs from doing their work properly, though they may be sound. Diseases may exist without pain or uneasiness in the ordinary meaning of these words, but hardly without functional disturbance or incapacity of some kind. Bacteria, sudden exposure, and foreign substances that cause poisonous products within the body are among the prolific causes of physical ailments. Diseases are either *diathetic* or *enthetic*, the former arising from predisposition and the latter from without the patient.

**DISEASES OF PLANTS**, the ill health of plants, which causes their death or interferes with their normal development. The importance of this topic has been developed under a systematic study of plant life, and writers have become able to group and treat plant diseases with a high degree of accuracy. They are usually classified according to their causes, which are fungi, insects, bacteria, and physiological. The *fungi* include such diseases as mildews, grape rot, potato rot, and the smuts and rusts of grains. Diseases of this kind are spread by minute spores, which are carried from plant to

plant by insects, by the wind, and by other agencies. The plant on which they lodge is attacked, if the conditions are favorable, and the diseases make rapid progress when they are developed, causing either death or decay of a part or of the entire plant.

The diseases due to *insects* are numerous, especially in the forests and orchards. The phylloxera (q. v.), a prolific cause of disease among grapes and orange trees, is much dreaded in many parts of Europe. Carnations and many other flowering plants are attacked by the aphides, and eelworms attack the roots and cause galls in many economic plants. Diseases due to *bacteria* include the black rot of cabbage, the blight of apples and pears, and a wilt disease in cucumbers and melons. *Physiological* diseases are due chiefly to unhealthful conditions that surround the plants, such as unsuitable light and heat and improper nutrition. Plants subjected to ill health from these and similar causes turn yellow and rarely develop their fruit.

**DISMAL SWAMP**, a tract of marshy land located in North Carolina and Virginia. Formerly it was forty miles long and twenty miles wide, but it has been reduced somewhat by draining. It is covered largely with trees, consisting mostly of cypress, juniper, and cedar, with dense brushwood underneath. In the most elevated portions oak and beech trees abound. Canals have been constructed through it, being utilized for shipping timber for the manufacture of railroad ties, lumber, and shingles. Lake Drummond, six miles in length, is a sheet of water in the midst of the swamp. A navigable canal connects this region with Albemarle Sound and Chesapeake Bay.

**DISTAFF** (dĭs'taf), a simple instrument used in spinning, employed extensively by the people in ancient times. It is in the form of a staff, on one end of which the wool was rolled. The spinner held it in the left hand while the right hand was occupied in drawing out the fibers of the wool and at the same time twisting them. A small piece of wood called a *spindle* was attached to the thread, the weight of which continually carried it down as it was formed. When the spindle reached the ground it was unfastened, the thread which had been formed was wound around it, and it was then again fastened near the new thread. A modified form of the distaff is still used by the peasants of Greece. The Fates are represented in ancient and modern art with the distaff, with which they are busied spinning the thread of life.

**DISTEMPER** (dĭs-tĕm'pĕr), a mode of painting, in which the colors are coarser than

those used for higher artistic purposes, and are mixed in a watery glue, such as sizing and whiting. Formerly it was employed in the higher departments of art, but now it is used chiefly in making wall paper and in scene painting.

**DISTILLATION** (dĭs-tĭl-lā'shŭn), the process of heating solids or liquids in a retort or vessel so constructed that the vapors thrown off are collected and condensed. A representation of the apparatus used is shown in the accompanying illustration. The retort or vessel,

DISTILLING APPARATUS.

marked *a* in the figure, is called the body of the still, in which the vaporization takes place, and from it the vapor is carried by pipe *b*, to the refrigerator, which is cooled for condensing purposes by a stream of cold water flowing in through pipe *e*, and out through pipe *f*. The worm tub *d* contains the coiled tube, or worm *c*, in which the condensation takes place, and the distilled liquid flows out at *g*. Distillation is of great value in manufactures and the arts. It enables the chemist to obtain pure or distilled water. Sea water can be rendered wholesome by distillation, while essences and volatile oils may be extracted from plants by this process with alcohol or water. It is utilized most extensively in manufacturing alcoholic spirits. In the process of manufacture a wort is prepared from malt or some other substance at a temperature not above 160° Fahr. After separating it from the grain and cooling, a quantity of yeast is added. Fermentation takes place readily at about 65° Fahr., in which process the saccharine matter of the wort is resolved into carbonic acid and alcohol, the latter remaining in the liquid. The alcoholic mixture is run into

a still as soon as the liquor ceases to ferment and submitted to distillation.

The character and strength of the distilled product depend upon the construction of the still; the first distillation is quite weak, while the second has the effect of greatly strengthening it. In the process the easily vaporized parts are separated from the rest and retain the flavor of the juice from which they are made. The malt liquor is flavored with the essential oil of barley, rum with the oil of the sugar cane, brandy with the oil of the grape, and gin with the oil of the juniper.

*Destructive distillation* differs from the process described in that the temperature is raised sufficiently high to decompose the substance, and bodies are produced that do not exist in the original matter. The substances are subjected to the action of intense heat out of contact with the air. It is variously conducted, and for widely different purposes in the same or different substances. Wood is distilled partly to secure charcoal and partly for the tar and pyroligneous acid. Coal is distilled to obtain the gas, anthracene, benzole, and ammoniacal water, and sometimes to secure the fixed carbon or coke. In the distillation of bones the charcoal and oil are collected. Shale is submitted to the process solely to obtain the oil.

**DISTRICT OF COLUMBIA**, a Territory of the United States, located between Virginia and Maryland, on the east bank of the Poto-

mac River. The area is 64 square miles. It has a gently rolling surface, except along the Potomac, where flat and marshy tracts occur.

The southern part is crossed by the Anacostia River, which flows into the Potomac, and the northern part is traversed by Rock Creek. About one-fifth of the surface is in farms and gardens, although the soil is light and sandy. The remainder is occupied by the city of Washington, Uniontown, and a number of villages. Fruit, flowers, hay, and vegetables are the chief products.

Originally the District of Columbia contained 100 square miles, of which 64 were ceded by Maryland in 1788 and 36 by Virginia in 1789. It received the official name of the Territory of Columbia in 1791, and the capital was removed thither in 1800. The portion south of the Potomac was given back to Virginia in 1846; thus it lies wholly east of that river. Congress administered the affairs of the district prior to 1871, but in that year it was placed upon a territorial basis. Henry D. Cooke served as Governor from 1871 to 1873, and Alexander Shepherd from 1873 to 1874. Since 1874 the government has been vested in the hands of a local corporation, with an executive branch consisting of three commissioners, one of whom must be an officer of the engineer corps and the other two are appointed by the President of the United States. Subordinate municipal officers are appointed by the commissioners, while the recorders, justices of the peace, and judicial officers are appointed by the President.

The inhabitants are centered very largely in the city of Washington and the villages are properly suburbs. Though Georgetown was formerly a separate corporation, it has been a part of Washington since 1878. In 1900 the total population was 278,178. Of this number 218,196 were in the old limits of Washington; 14,529, in the old limits of Georgetown; and 45,973, in the remainder of the district. In 1905 the population was 323,143, including 95,695 negroes. See *Washington*.

**DIVERS** (dī'vērs), a family of swimming birds remarkable for their power and habit of diving. They are known by their webbed toes, short and rounded tail, short wings, and straight, strong, and pointed bill. In flight they are remarkably rapid, and their movement under water is speedy and well directed. They pursue fish for food by moving rapidly, propelling themselves by their feet and wings, and frequently remain under water for some time before emerging. Divers are most common in the north, where they breed in the summer, and they move southward in the autumn. Large numbers are found in Northern Europe and America. The *great northern loon* of Europe is the largest of the various species, being

nearly three feet long. It and several closely allied birds are valued for fine plumage.

**DIVIDE** (dī-vīd'), or **Watershed**, in physiography, the crest line which divides the slopes of two drainage systems. Divides are characterized by various physical features, ranging from the low watersheds in regions slightly elevated above the sea to the crest lines of mountain systems, where the slopes are usually quite abrupt or precipitous. However, gentle slopes are abundant even in regions elevated greatly above sea level. North America has three marked divides, those of the east, of the central part, and of the west. The Appalachian Mountains, in the eastern part of the United States, form the divide between the rivers of the Atlantic coastal plain and those flowing into the Mississippi from the west. The Height of Land, situated in the north central part of the United States, is the watershed between the northern section of the Mississippi valley and the rivers of Central Canada, and the Rocky Mountains, in the western part of North America, separate the headwaters of the streams flowing into the Pacific from those of the central part of the continent. In some places the divides are low and channels are cut through them by streams, causing them to change their direction, while in others a slight overflow occurs only during high water. Instances of this kind occur in the Des Plaines River, Illinois; the Twin River Lake, Yellowstone Park; and the Cassiquiare River, South America.

**DIVINATION** (dīv-ī-nā'shūn), the art of foretelling future things by revelations from oracles or omens. Those who profess the power to divine or foretell future events rely upon observing the flight of birds and clouds and the movement of the planets, or base their belief on the influence of spirits or supernatural causes. Various forms of divination were practiced by the ancient Romans and Greeks, who probably came to believe in the art from the practices which prevailed in Egypt and Chaldea. The laws of Moses prohibited it among the Israelites, who were not permitted to perform any kind of divination. The medicine men among the Indians of America practiced it to some extent, and it still has adherents in some countries.

**DIVINE RIGHT OF KINGS**, the claim made by some sovereigns that they hold their office by divine appointment. According to this view, they assert the right to govern their subjects without interference, opposition to the government being regarded in the light of a sin. This doctrine was held by numerous English sovereigns and princes, especially in the

time of the Stuarts. It is a tenet pleasing to despotic rulers, and proportionally displeasing to the mass of their subjects. It is spoken of by Pope in these words, "The divine right of kings to govern wrong."

**DIVING** (dīv'ing), the art of descending and remaining for a certain period of time under water, especially when using a diving bell. As an art diving is important, being highly serviceable in fishing for pearls, sponges and corals, and in examining the bottom of rivers and the sea. It is utilized largely for engineering purposes, recovering valuable stores of sunken ships, and raising or removing sunken vessels. A skillful diver may remain under water from two to three minutes without the aid of artificial appliances. This form of diving was practiced in early times near the shore, but has gone largely out of use. In order to do effective service, it is necessary to supply the

DIVING DRESS AND TUBES.

workman with apparatus by which fresh air can be conveyed in sufficient quantities to enable him to remain under water for some time. This is done successfully by various appliances.

The diving bell, though used in quite ancient times, was first made of material value in the 18th century. It is so named from its form, being shaped like a bell. The principle employed may be illustrated by inverting a tumbler and pressing it down into a vessel of water. While the water rises to some extent in the tumbler, yet the upper portion remains perfectly dry, and in it a candle will burn for

a short time with even increased energy, on account of the air being condensed by pressure. The diving bell is connected above the surface of the water by flexible pipes, making it possible to inject pure air by a force pump, while the impure air escapes at the upper part of the bell by a cock. It is generally made of cast iron, containing strong convex lenses in the roof or upper side for the admission of light to the person within and is suspended by chains from a vessel above. In the newer forms are provisions by which the workmen may move the apparatus or raise or lower it at pleasure.

A waterproof diving dress is another appliance used by divers. It is made of India rubber cloth inclosing the entire body, except the head. The head is covered by a helmet containing three eyeholes covered with glass and protected by guards. An air pump above supplies air by means of a flexible tube connected with the helmet and the impure air passes off through another flexible tube to the surface of the water, though in some the air escapes through a valve. The diver sinks to the bottom by leaden weights attached to the soles of the shoes or to the feet. A speaking tube enables him to converse with those above quite as conveniently as through a telephone. Recently an apparatus utilizing compressed air has been introduced. In this form the air is supplied by means of a self-regulating device corresponding to the water pressure. This and other classes of diving apparatus frequently have an appliance attached by which bubbles indicate the condition of the diver, and assistants stationed at the top are informed of his safety. A diver rarely remains under water more than an hour and a half, and about 150 feet is usually the greatest depth at which extensive work can be conducted with safety.

**DIVISION OF LABOR**, the term applied in the industries to a classification of the work done by the workman. The more or less clearly defined inclination in each individual, especially so far as it relates to occupation, and various desires in different persons, have led to the modern diversification in trade and industry. The consequent division of labor has given to modern industries enlarged and enormous productiveness. It has been found that a given number of persons can produce a greater total of wealth by confining themselves individually to one thing than if each person worked by himself, endeavoring to produce everything he desires.

To illustrate the advantage, each man of a thousand working by himself might produce a

coat, a barrel of flour, and a pair of shoes in a certain time, and the one thousand men might produce one thousand of each of these articles. However, if each one-third of the men devoted themselves to the production of one of the three different commodities, the output would be considerably larger. In this way a workman, producing more than one thing which others want, can get in exchange more of the things he himself wants, and in the end be the producer of vastly greater quantities of wealth. This principle has been acted upon to such an extent that a great diversity of occupation has been caused in every community, and by means of it the necessity of greater exchange has been created.

Among the several advantages coming from the division of labor may be enumerated economy of time, strength, skill, and tools. Besides, it facilitates economy of material and supplies, and improves, diversifies, multiplies, and cheapens the product. The general improvement in tools and machinery may be largely attributed to the principle underlying it, and the massing of labor and capital has likewise resulted, though it has had the effect of limiting somewhat the usefulness of the workman as an all-round laborer.

**DIVORCE** (dī-vōrs'), the partial or total dissolution of a previously contracted marriage. The former constitutes the judicial separation of the two parties, while in the latter the marriage itself is set aside. The ancient Spartans rarely granted divorces, while the Athenians and other Greeks allowed them frequently for trivial causes. During the early epoch of Roman history divorce proceedings were extremely rare, though in the later period, especially in the republic, they became common. The right to institute divorce proceedings in the Roman court was vested both in the husband and wife. The Scriptures limit the separation of husband and wife to very narrow channels, while in the Catholic theology marriages are indissoluble, though special dispensations have been granted in exceptional cases.

General provisions were made for the legal separation of husband and wife in the early history of the American colonies. All the states followed this course with the single exception of South Carolina, where divorces are not granted by law. The proportion of divorces to marriages in the United States is one to fifteen. However, provisions for granting divorces and the conditions justifying them under the laws of the several states are extremely various, though a divorce decreed by any of the states having competent jurisdiction is recognized as

effective by the other states. The general complexity of divorce codes has led to a discussion favorable to uniform legislation in all the states. It is thought that the divorce laws of the District of Columbia are generally satisfactory to the various states, and the agitation has been largely favorable to modeling the divorce laws of the several states after them. A proposition to change the Constitution whereby Congress would be given power to pass uniform divorce laws has been considered at various times, but has been uniformly rejected as impracticable.

In Canada the divorces are less common than in the United States. Only 135 were granted in the period of 21 years ending in 1905, and the larger number of these were in Nova Scotia and New Brunswick. This function of the government is vested in the courts or in the legislative bodies, and the number of divorces are uniformly larger where they are granted by the courts. In some instances the divorcees are not permitted to remarry. An *alimony* is an allowance made to the wife out of the estate or income of her husband, after she has been legally divorced or separated from him.

**DIXIE** (dīks'y), the name of a popular song, which became a rival of *Yankee Doodle* in the Southern States during the Civil War. The name was first applied to a negro melody originated in New York, where a man named Dixie was a slaveholder. As the abolition sentiment grew stronger, he shipped his slaves south, and the refrain expressed their regrets on account of leaving Dixie's Land, as his plantation was called. Later the term was applied in a happy way to all the Southern States.

**DIXON** (dīks'n), county seat of Lee County, Illinois, on the Rock River, about ninety miles west of Chicago. It is on the Illinois Central and the Chicago and Northwestern railroads. The noteworthy features include the high school, the county courthouse, and the Northern Illinois Normal School. The manufactures include condensed milk, musical instruments, furniture, lumber products, machinery, flour, and implements. It has systems of waterworks, sewerage, electric lighting, and street pavements. The surrounding country is a fertile farming district. It was settled in 1836 and incorporated in 1869. Population, 1900, 7,917; in 1910, 7,216.

**DNIEPER** (nē'pēr), an important river of Russia, next to the Volga and Danube the largest in Europe. Its source is in the government of Smolensk, at the foot of the Valdai Hills. It has a southerly course to Kiev, thence makes a bold curve toward the southeast, thence south,

and thence southwest, flowing into the Black Sea. The total length is 1,325 miles, and it is navigable from a point some distance above the city of Smolensk. Among its principal tributaries are the Pripet, Beresina, and Desna. The government of Russia removed the rocks forming a cataract between Kiev and Alexandrovsk, and otherwise improved it for the enlargement of internal navigation. It also caused the building of numerous canals, among them one connecting the Dnieper with the Dūnā, thus making a continuous water route from the Baltic Sea to the Black Sea. The Dnieper is crossed by many bridges, has on its banks numerous commercial centers, and is itself of vast value in commerce. The lower course is noted for valuable fisheries. In the early history of Europe it was regarded the largest river in the world, except the Nile.

**DNIESTER** (nēs'tēr), a large river of Eastern Europe, rises in the Carpathian Mountains, in northeastern Austria. The main course through Russia is toward the southeast, passing from near Chotin toward Odessa, near which it flows into the Black Sea, after a course of about 850 miles. Owing to numerous rapids and shallows, it is navigable only for small vessels, though canals have greatly increased its service to commerce. It is subject to overflow from the effect of snow melting in the mountains in May and June. The principal cities on its banks include Bender, Mohilev, and Akerman.

**DOBBS FERRY** (dōbz), a village of New York, in Westchester County, twenty miles north of the center of New York City. It is located on the Hudson River and on the New York Central and Hudson River Railroad, at the south end of an expansion in the Hudson known as Tappan Bay. Many New York business men reside here. It has a number of fine churches and many modern public utilities. Washington and Rochambeau met in the old Livingston mansion at Dobbs Ferry to plan the Yorktown campaign. Another conference was held at the same place in 1783, between Washington, Clinton, and Carleton, to consider the withdrawal of British troops from America. Population, 1900, 2,888.

**DOCK**, an artificial excavation or structure for receiving ships to be repaired, loaded, or unloaded. There are several classes, the most common being the wet docks, dry docks, and hydraulic docks. *Wet docks* are intended for loading and unloading vessels. They are made either by excavations near the shore, or by constructing walls of timber or solid masonry. The latter kind is used where tides cause ma-

terial changes in the level of the water, the ship entering at the time of flood tide, and, when closed, the water is kept at the desired level. This class of docks provides protection for ships against storms and the action of tides.

*Dry docks* are used to admit vessels to be examined and repaired. They are of such construction that gates can be closed after the vessel enters, when the water is pumped out, leaving the vessel resting on timbers while the shipwrights are engaged on the repairs. A *floating dock* is a form of dry dock. It is sunk below the surface of the water, allowing the vessel to float into it, after which it is raised and the water is pumped out of the surrounding tank. *Hydraulic docks* are likewise a kind of dry docks. They ordinarily have a system of iron columns, each containing a

DRY DOCK.

hydraulic press, by means of which the vessel is raised above the surface of the water. The hydraulic presses are worked simultaneously by powerful steam engines. The presses, working on iron pontoons, are first properly adjusted, and the ship is raised and securely suspended above the water by means of girders. After the vessel has been raised and secured in its position, the pontoon may be floated away and used for elevating other vessels, thus furnishing means whereby a number of vessels may be inspected and repaired at the same time.

Wet and dry docks are maintained in all important seaports. They are usually in charge of a dock master, the official who has control and general superintendence. *Dockyards* are inclosed magazines near harbors, in which all

kinds of necessary stores and material are deposited. Among the principal dockyards of the United States are those of New York, Washington, Boston, Pensacola, Portsmouth, N. H., League Island, Pa., Mare Island, Cal., New London, Conn., and Portsmouth, Va. The dockyards of Canada include those of Montreal, Quebec, Saint John, and Vancouver. Glasgow has the most extensive dockyards in Europe.

**DODDER** (dō'dēr), a genus of parasitic plants native to the temperate regions. They are leafless, climbing plants, and the flowers grow in dense clusters. The young plant begins its growth in the ground and twines upward, fastening itself to the plant from which it derives nutriment, and later the rootlets become severed from the soil. About fifty species have been classified, including those that are parasitic on hops, flax, clover, alfalfa, nettles, and leguminous plants. Some are very injurious to wheat and clover, especially in Europe. About twenty species occur in the United States.

**DODO** (dō'dō), a large bird that became extinct about two centuries ago. It inhabited Mauritius, an island in the Indian Ocean, east of Madagascar. Writers class this bird with the pigeons, though it was an extreme modification of that type. It had strong but ill-shaped legs,

DODO.

functionless wings, and a clumsy aspect, and the upper mandible was hooked like that of a bird of prey. The plumage was hairlike. In size and weight it was larger than a swan. Its extinction was caused by its inability to fly and the excellent quality of its flesh for food.

**DODONA** (dō-dō'nà), an ancient city of Epirus, in Greece, about eleven miles southwest of the site of modern Janina. It was located near Mount Tomarus, surrounded by rugged

hills, and was the seat of an ancient oracle dedicated to Zeus. The priestesses received their communications by listening to the rustling of the leaves of an oak tree, which was supposed to be the seat of the deity. In 1887 extensive excavations were made, when an acropolis and the temples of Zeus and Aphrodite were located.

**DOG** (dög), the common name of a family of quadrupeds of the genus *Canis*, with which are included the wolf, jackal, and fox. How-

SETTER.

ever, the last mentioned is termed a subgenus by some writers. The origin of the dog family is not known, but the animal is thought to have resulted from a crossing of various extinct and living species of quadrupeds, as wolves and jackals. The question of descent has been debated for many years among writers and naturalists. Though wild dogs inhabit several parts of the world, such as the *dhole* of India and the *dingo* of Australia, they are regarded merely domestic species that have merged into the wild type by being isolated from settlements for long periods of time. The dog has been a domestic animal from times far remote. Among the earliest allusions to it are those found in the books of Moses and in the writings of Homer. The figure of a mastiff is carved on an Assyrian monument, while an Arabian boarhound with its tightly curled tail is represented in Egyptian sculptures. From numerous Roman, Greek, and Celtic writings it is learned that dogs were sacrificed to certain deities. They were employed very early as executioners, and as living tombs for the consumption of carrion and human corpses.

In size and other respects dogs differ very largely, which fact has given rise to many species and different classifications. Some are not more than a few inches high, while others attain a height of from two to four feet, and are correspondingly proportioned in other respects. They represent all colors, have variously formed ears, heads, and limbs, and differ largely in the size and character of their hair. A species of dogs found in India has no hair

at all. Some have smooth, others straight, others curly or shaggy, and some long, wavy hair. The difference in voice and habit is fully as great as in size and appearance, and consequently they serve many widely different purposes.

Hamilton Smith arranged domestic dogs in six sections or groups as follows: 1. Wolf dogs, including such as the Saint Bernard, Newfoundland, Eskimo, Nootka, Siberian, and shepherd dogs. 2. Watch and cattle dogs, embracing the German boarhound, mâtin, dog of the North American Indian, and Danish dog. 3. Greyhounds, including the Irish hound, greyhound, brinjaree dog, lurcher, and Egyptian street dog. 4. Hounds, embracing the old southern hound, bloodhound, staghound, harrier, pointer, setter, spaniel, beagle, springer, cocker, poodle, and Blenheim dog. 5. Cur dog, including the terrier and their allies. 6. Mastiffs, embracing the different kinds of mastiffs, bulldog, and pug dog. In this classification he does not reckon the dingo, dhole, and several other species of wild dogs. These he does not include in the genus *Canis*. Besides, all the recognized species are not named under each division of this article. Other writers have made different classifications, but the one given here is among the most commonly accepted.

Cuvier regarded the dog as one of the most valuable domestic animals, owing to the useful purposes that it serves. It is true that each individual dog is devoted to his master, assuming largely his manners. It distinguishes and

SAINT BERNARD.

defends his property against intruders, often at the expense of life. The attachment formed remains until death, and springs rather from true friendship than from necessity. The highly developed sense of smell, strength, and swiftness has made the dog a powerful assistant of man in subduing other animals, and in serving many conveniences in society. The hunter is given valuable service by not only having the whereabouts of game located, but, after being

slain, it is brought to him, even if the danger of flood and precipice have to be undergone.

As a watcher of property in all hours of the night and under all circumstances, the dog serves a useful purpose and designs to protect life and property against the encroachment of enemies and the elements. The labor of man has been greatly lightened in that the dog has been employed in the economy of life and in various industries. It is not only an aid in securing wild animals for food, but furnishes means of conveyance, as in the case of Eskimos and Siberians, and in the lighter service of going on errands and carrying parcels in cities.

As a source of relief in danger the ability of dogs is illustrated by many adventures in saving life at sea and in prolonged and terrific snowstorms and blizzards. The acuteness of scent in some species is so highly developed, particularly in the bloodhound, that they are able to follow in the track of a pedestrian at some distance. The story is told that Robert Bruce, in order to escape capture by being tracked by bloodhounds, walked in the water of a stream for some distance, lifted himself out by the branches of a tree, and from its trunk proceeded on his course of escape. Bloodhounds were employed in many regions of the slaveholding states for the purpose of finding the whereabouts of fugitives and making their capture possible.

Dogs are used in some of the European army corps for service as guards in outpost work and for carrying ammunition and dispatches. They are favorite animals for performance in animal shows, and happily entertain audiences with many skillful and intelligent actions. They render good results in police work in the larger cities, where homes for lost dogs are kept, in order that those going astray may be killed or returned to their owners. In most countries a dog is regarded personal property, and the owner may be indemnified for willful injury, but may be held liable for damage done to others by the animal. During the warm summer season dogs are required to be muzzled in most of the larger cities to prevent injury on account of madness.

Most dogs have a long tail, which is curled upward. The teeth are well developed and enable the animal to pursue its carnivorous habits, though a portion of the food of some species consists of tender vegetable matter. The young are born with eyes closed, attaining sight in from eight to twelve days. Full maturity is reached at about two years, and the average life is from ten to twelve years, though a period of twenty years is not rare. The hide is

valuable in making wearing apparel, such as gloves, light shoes, and fur coats.

**DOGBANE** (dōg'bān), a perennial plant native to North America, found in open barren places from Canada to Alabama. A large number of species have been classified, including both herbs and shrubs. The common dogbane grows to a height of two feet, has a smooth stem, ovate leaves, pink flowers, and milky juice. It is valued for its medical properties, obtained chiefly from the bark of the root. The Indian hemp, a species quite common in Canada, yields a flaxlike fiber used by the Indians in making utensils and small wearing apparel.

**DOG DAYS**, a period of about forty days set apart by the ancients as the hottest season of the year, which occurred at the time Sirius, the dog star, rose in conjunction with the sun, about July 1. Owing to the precession of the equinoxes, the time is now different, and is usually counted from July 3 to August 11, the time being twenty days prior to the heliacal rising and twenty days after. The ancients looked upon the period of heliacal rising as having an evil influence on the earth.

**DOGFISH**, a species of fish allied to the shark and noted for its voracious and destructive habits. They are common near the American coast, especially off Massachusetts, and in the oceanic waters of Europe. Their characteristics include more or less spotted skin, blackish-brown color, length from three to five feet, and rough skin in some species. In weight they vary from six to twenty-five pounds. Some species are valued as food, but they are caught mostly for their oil.

**DOGGER BANK** (dōg'gēr), a large sand bank near the middle of the North Sea, about midway between Denmark and England. It is about 50 miles wide and 175 miles long, extending in a northeast and southwest direction. Near the coast of England it is about 50 feet below the surface of the water and the general depth is less than 120 feet. Important cod-fishing grounds extend across the Dogger Bank.

**DOGMA** (dōg'mā), a word used originally to indicate an opinion, but now applied generally to an article of belief derived from authority. In the latter sense it is applied to the essential doctrine of Christianity, based upon the Scriptures or the writings of the Fathers of the Church. The English-speaking people prefer to use the term *doctrine*, but in many countries of Europe dogma is preferred. A separate professorship in the study of science of dogmas (Ger. *Dogmen*) is maintained in many of the universities of Germany.

**DOG STAR.** See *Sirius*.

**DOG VIOLET,** or *Dog's Tooth Violet*. See *Violet*.

**DOGWOOD.** See *Cornel*.

**DOLL,** a toy usually representing a little girl, but sometimes a boy or man. Dolls are made largely in Europe of jointed wood, and elsewhere of stuffed cloth, wool, and India rubber. Their heads and hands are usually of porcelain or wax. The custom is thought to be more ancient than civilization, having been found largely among savage peoples. With the invention and perfection of phonography came the talking dolls. These dolls laugh, whistle, sing, and talk, and are almost as common as the wax dolls so long favorites with children. Dolls were displaced to some extent in the United States in 1908 by a toy figure representing a small bear, called the *Teddy Bear*, so named from President Roosevelt. This toy is inclosed in fur or a furlike cloth.

**DOLLAR** (döl'lër), a monetary unit of value, equal to one hundred cents in the United States and Canada. It is coined of silver and gold, though the latter is rarely used. The dollar is the smallest denomination of paper money now in circulation, and the largest issued in silver. The same name is given to coins in Mexico, the Philippine Islands, and in many countries of South America. Some writers assume that the name was abbreviated from *Jochimsthaler*, a coin circulated in 1518, in Bohemia, but some German writers derive the term from *talent*, the name applied to a pound of gold in the Middle Ages. The Dutch name is *daler*, and the German, *thaler*. The sign \$, generally used at present to signify a dollar, is supposed to date from the celebrated Pillar dollar of Spain.

**DOLLART** (döl'lërt), a gulf on the northwestern coast of Germany, at the mouth of the Ems River, on the boundary of the Netherlands. It is about seven miles wide and twelve miles long, and was formed by inundations of the North Sea. The land began to be worn away in the latter part of the 13th century and the inundations continued until about 1540. Many villages were destroyed within this period, but some of the land has since been reclaimed as polder by the construction of dikes.

**DOLLY VARDEN TROUT,** a large fish found in the cold rivers of the Pacific Coast. It has a large head and mouth and a stout body, and the sides are marked with round red spots. The tail is almost truncate and the adi-

pose fin is large. It is found in the northwestern part of North America, from the northern part of California northward to Kamchatka. In Oregon it is called bull trout and toward the Russian border it is known as *malma* or *golet*.

**DOLOMITE** (döl'ô-mīt), or **Magnesium Limestone**, a mineral composed of carbonate of lime and carbonate of magnesia, found widely distributed in all parts of the world. The colors are various, including reddish-white, brown, and yellowish-white. Pearl spar, so called from its luster, is a crystallized variety. Reddish dolomite contains manganese and cobalt, and brown spar owes its coloring to the presence of iron. Dolomite rock is employed extensively for building purposes. It is one of the materials that was used largely in the construction of the houses of Parliament in London. Large quarries are worked in Vermont, Tennessee, Georgia, and in the southeastern part of Canada.

**DOLPHIN** (döl'fîn), a genus of fish belonging to the same family as the porpoises and narwhals. They are distributed widely from the Equator to the poles and commonly swim in companies of large numbers, their habits being largely gregarious. Their movement is skillful and with much velocity, often swimming beside the fastest vessels. They display their agility by many graceful movements, leaping into the air and then plunging through the water with a playful and rapid motion. Tourists are often delighted by their gambols as they come to the surface or may be traced by a slender wake of foam beneath the surface.

The snout is sharp and long, and there are

DOLPHIN.

numerous teeth in both jaws, but no organ of smell, dolphins being the only mammals having this distinction. The flesh is coarse and rank, although it is used as food by savages. Their food consists chiefly of mollusks, fish, and other water animals. A blowhole of a semilunar form is located nearly over the eyes, and they come to the surface at short intervals to breathe. The length varies from six to ten feet. The young are watched with care and anxiety by the females, who suckle them for some time after birth. A species known as the *bottle-nosed dol-*

*phin* is most common on the eastern coast of North America, extending southward from New Brunswick. Other familiar species are the *black dolphin* and the *spotted dolphin*. A fish of the mackerel family, celebrated by poets on account of changing its color when dying, has been given the same name, though it is not a true dolphin. This species of fish is called *Dorado* by the Portuguese. It is native to tropical waters, attaining a length of from three to five feet.

**DOME**, the name given to a vaulted covering of the whole or a part of a building. It is applied more properly to the external part of a spherical roof, while the term *cupola* is used to designate both the external and interior parts. Most domes or cupolas have a circular form, though some are elliptical or polygonal, this depending on the figure of the base. A lantern or small dome is usually built at the top of a large dome, and is supported by the framework of the latter. In former times domes were constructed largely in the form of hemispheres of stone masonry, while those of modern construction are largely of timbers covered with a metallic surface protection. However, the newer domes have a framework almost entirely of iron or steel. The Rotunda or Pantheon at Rome, constructed under Augustus, is the largest masonry dome in the world, having an internal diameter of 142 feet and an internal height of 143 feet. It is still in a perfect condition. Other noteworthy domes are those of the Cathedral of Florence, Saint Peter's at Rome, Saint Sophia at Constantinople, and Saint Paul's at London. The finest dome in America is that of the capitol building at Washington. It is constructed of cast iron, has a diameter of 96 feet and a height of 180 feet, and is 288 feet above the base line of the east front. The weight of the iron in the dome and tholus is 8,009,200 pounds.

**DOMESDAY BOOK** (dōmz'dā), the name by which an old record of the lands of England is known. It contains an account of the statistical survey made in 1085-86 under William the Conqueror. There are two volumes written on vellum, a folio of 382 pages and a quarto of 450 pages. These books contain the names of the chief landowners, the value and extent of the estates, the kind and value of different personal property, and the name of the tenants. The record was made by a number of commissioners, who canvassed the country, being assisted in the work by the people of different sections. It furnished a basis for the organization of military forces and gave an account of the wealth and population, as well as

titles to property. It was printed in facsimile in 1783 and 1816, and since 1861 has been converted to metallic plates. The Domesday Book furnishes a valuable record for the investigation and study of many questions relating to the early history of Great Britain.

**DOMINICA** (dōm-ĭ-nē'kà), or **Dominique**, the largest island of the Leeward group, comprising a part of the British possessions in the West Indies. It is located between Martinique on the south and Guadeloupe on the north, and has an area of 291 square miles. The surface is mountainous, including some of the highest peaks in the Lesser Antilles. Morne Diablotin, the most elevated summit, has an altitude of 5,900 feet. Many of the valleys are fertile and well watered. Few indentations characterize the shore, hence the island has few good harbors. Among the principal products are indigo, coffee, cotton, sugar, and fruits, all of which are exported. Roseau, the capital, has a good trade and is well fortified. Columbus discovered Dominica on Nov. 3, 1493. In 1814 it became an English possession. Population, 1906, 29,695.

**DOMINICAL LETTER** (dō-mĭn'ĭ-çal), one of the first seven letters of the alphabet, that is A, B, C, D, E, F, G, used in calendars to mark the Sundays throughout the year. The marking begins with the first seven days of the year, and all the succeeding days of the year are marked consecutively in sets of seven days; hence the 1st, 8th, 15th, etc., of the year are marked by A; and the 2nd, 9th, 16th, etc., by B, and so on. The dominical letter would be the same year after year, if the number seven divided the number of days without a remainder but since this is not the case, the dominical letters go backward one day every common year and two every leap year. Hence, the series repeat themselves in four times seven, or 28 years. The dominical letters are used to discover on what day of the week any day of the month falls in a given year.

**DOMINICAN REPUBLIC.** See **Santo Domingo**.

**DOMINICANS** (dō-mĭn'ĭ-kans), the name of an order of friar preachers founded by Saint Dominic at Toulouse in 1215. Owing to a black cloak formerly worn by them, they were called Black Friars in England, and in France they were known as Jacobins, from the first establishment of the order in the church of Saint Jacques in Paris. The rules of the order are based on those of Saint Augustine. They are bound to observe silence and abstinence from fresh meat, and their vows include observance of poverty, chastity, and obedience.

The special aims of their institutes are the study of sacred sciences and ministerial duties. The order was confirmed by a bull of Pope Innocent III. in 1216. In the Middle Ages they divided the paramount influence in the church with the Franciscans, and in the 16th century the Jesuits took possession of the intellectual supremacy exercised by them. They gave to the church four popes and about seventy cardinals.

**DOMINOES** (döm'i-nōz), a game played by two or more persons, with flat, rectangular pieces of wood, bone, or ivory. The pieces are about half as broad as they are long, 28 in number, and usually are plain black on the back and white on the front, but the latter face is divided by a line across the center, on each side of which are black dots, except that the ends of one set from 1 to 6 are left blank, so that upon each domino there is a different combination of numbers. Each player takes an equal number of the dominoes, selecting them after they have been mixed with their backs up. The person who has drawn the one which has the highest number of points puts it down. The next domino played must be one with a number the same as one of the two numbers represented by the first, and the two similar ends are joined. The third player may match the remaining number of either the first or second domino, and thus the game continues until one of the players has put down all his pieces and can neither draw nor match. The winner scores the number of points equaled by the dots on the pieces held by his opponent. This game depends partly on chance and partly on the memory and calculation.

**DON**, a large river of European Russia, having its source in Ivan Lake, a small sheet of water in the government of Tula. It has a southerly course to the Sea of Azov, which it enters after flowing about 1,150 miles. The Don is navigable for large vessels during the spring floods, and at other times is fit only for small craft. Owing to numerous shallows, the water is spread in some places to a width of 1,750 feet. It is connected by a canal with the Volga system of navigation, and as a whole carries a large interior traffic. The principal tributaries are the Koper, Donetz, Manitch, and Sal. Productive fisheries abound in the larger portion of its course.

**DONALDSONVILLE**, a town of Louisiana, capital of Ascension Parish, on the Mississippi River, 64 miles above New Orleans. It is on the Texas and Pacific Railroad and is surrounded by a rice and cotton growing country. The industries include cotton mills, sugar works, tobacco factories, and machine shops. It has

municipal waterworks and an electric light plant. The place was settled in 1760 and incorporated in 1806. Population, 1900, 4,150.

**DONELSON, Fort**, an important fortification of the Confederates, on the Cumberland River, in the northwestern part of Tennessee. Grant moved his forces to the Cumberland and attacked Fort Donelson, after he had captured Fort Henry on the Tennessee, Feb. 6, 1862. The Confederates at first drove the Federal gunboats off, but General Grant's prompt action made it necessary for the fort to surrender. In a memorable letter General Grant demanded the surrender to be unconditional. About 15,000 Confederates were made prisoners and the fall of Nashville and Columbus became inevitable. General Wheeler made an attempt to recapture the place from the Federals on Feb. 6, 1863, with a force of 4,500 of Bragg's army. The garrison of the fort was held by 600 Federals, and by successful skirmishes the attack was delayed until a gunboat came up the river, causing the Confederates to withdraw.

**DONGOLA** (dōŋ'gō-lā), a province of the Egyptian Sudan, in the eastern part of Nubia, on both sides of the Nile. The surface is level and fertile. Wheat, dates, and cattle are the leading exports. The inhabitants consist chiefly of a mixture of Nubians and Arabs. Mohammedanism is the chief religion. The province was settled by Mamelukes in 1812, after they had been expelled from Egypt, but in 1821 it was retaken by the Egyptians under Ibrahim Pasha. In 1886 a force of British and Egyptians under Kitchener quieted a rebellion, and since then the country has been enjoying an era of peace. Dongola, or El-Ordeh, the capital, is situated on the west bank of the Nile.

**DONKEY** (dōŋ'kŷ). See *Ass*.

**DORCHESTER** (dōr'chēs-tēr), a city of New Brunswick, capital of Westmoreland County, at the junction of the Memramcook and Petitcodiac rivers. It is nicely situated on Shepody Bay and the Intercolonial Railway, 115 miles northeast of Saint John, and is important as a port of entry. Coal and building stone are obtained in the vicinity. It has shipbuilding yards and is the seat of the penitentiary of the Maritime Provinces. Among the prominent buildings are several fine schools and churches, and it has electric lights and other public utilities. Population, 1906, 7,108.

**DORDRECHT** (dōr'drēkt), or *Dort*, a city of the Netherlands, in the province of South Holland, ten miles southeast of Rotterdam. It is located on an island in the Meuse River, and has extensive transportation facilities by canals and railways. A large Gothic church, a public

library, a theater, and several fine schools are among the chief buildings. The industries include flouring mills, shipyards, sugar refineries, tobacco factories, and iron and salt works. Dietrich III. of Holland founded the city in 1018, and its commercial importance is due largely to its membership in the Hanseatic League. It was the seat of the Synod of Dort in 1618, by which the doctrines of Calvin were affirmed. Population, 1906, 44,449.

**DORIANS** (dō'rī-anz), one of the two principal branches of the Greeks, the other being the Ionians. According to legend, they descended from Dorus, a son of Hellen, and made settlement in the Peloponnesus. Among the cities of importance founded by them were Argos, Sparta, and Messenia. Their colonies included Sicily, Crete, and settlements in Asia Minor. The dialect of the Dorians was harsh and rough, while the Ionian was mild and polished, yet some admirable features of the former caused it to enter largely into hymns and choruses. Their philosophy and character are visible in the Pythagorean school, which shows a strong attachment to the aristocracy. The Dorian architecture is distinguished by strong and unadorned pillars, while the Ionian pillars are slender and profusely decorated. See **Column**.

**DORIC ORDER** (dōr'ik), the earliest and strongest of three Grecian orders of architecture. It is noted for its proportions being the same as that of a man; that is, the height of a man is about six times the length of his foot. In the Doric style the columns are six times the diameter. The simplicity and harmony in this order are remarkable, and render many of the excellent temples, such as those built to Mars, Minerva, and Hercules, celebrated on account of their long, unbroken lines. Simplicity marks the Doric capital, while the frieze and cornice are massive, but plain. See **Column**.

**DORMANT** (dōr'mant). See **Hibernation**.

**DORMOUSE** (dōr'mous), a rodent animal appearing to be intermediate between the squirrels and the mice. These animals inhabit all

temperate and warm countries, but are most common in Eurasia and Africa, where twelve species are found. The fur is soft, the eyes and ears are large, the tail is long and hairy, and the fore limbs are short. In habits they are quite

DORMOUSE.

timid and in size are larger than a common

mouse. The winter is spent largely in a dormant state, from which they have been named *dormice*. Their food consists of nuts, vegetables, and grains. They are easily domesticated and seem to enjoy moving about in a cage. During the warmer days of summer they are active in fields and woods laying up a store for winter, but in the rainy or cold seasons they lie curled up in their nests and sleep. The young, from three to four in number, are brought forth in the spring, and by winter are quite able to take care of themselves.

**DORTMUND** (dōrt'mōont), a city in the province of Westphalia, Germany, on the Ems River, about 48 miles northeast of Cologne. Its rapid growth the past several years is due to the development of large coal mines in the vicinity and the building of numerous railroads. Several thousand persons are engaged in mining, while as many more are employed in manufactures and railroad enterprises. Among the products are machinery, tobacco, porcelain, textiles, woolens, cigars, clothing, iron and steel utensils, and railroad cars. It has an interesting city hall, a large public library, and municipal baths and gymnasiums. The central railway station is an excellent building, and the churches and institutions of learning likewise include expensive and valuable structures. The city has well-paved streets, a large park, and many modern facilities, including electric lights, sewerage, and rapid transit. It was a member of the Hanseatic league and still has a large trade. Population, 1905, 175,577.

**DOUAY** (dōō'ā), or **Douai**, the name by which the version of the Bible used by English-speaking Catholics is known. The translation was made by divines connected with the College of Douay, France, under the direction of Cardinal Allen, the founder of that institution. It is based on the Vulgate and is authoritative among Catholics, having received the sanction of the Pope and the approval of the Council of Trent. The Old Testament was published in 1609, about two years before the authorized edition of King James's Protestant Bible appeared. The New Testament now published with the Douay version of the Old Testament was first issued at Rheims in 1582. Both have been revised at different times.

**DOUBLE STARS**, or **Binary Stars**, a pair of stars that revolve about each other, or both about a common center. Sir William Herschel discovered the first of these stars in 1803, and since a large number have been added to the catalogues, though the periods of revolution have been determined of only a few. About 10,000 apparently double stars have been cata-

logued, and it is reasonably certain that 250 are binary; that is, they have a revolution round their common center of gravity. It requires from five and one-half years up to perhaps a thousand to complete their periods of revolution, hence it is difficult to study them with any degree of precision. The double stars reveal a duplication of the spectral lines, hence they afford curious instances of contrasted colors. The color of the smaller star complements that of the larger one, the former being blue or green and the latter red or orange.

**DOUGLAS** (dūg'lās), a city of Great Britain, capital of the Isle of Man, on the east shore of the island, eighty miles northwest of Liverpool. It is located on a picturesque bay, near which is a fine promenade, and the city is popular as a watering place. The streets in the older part are narrow and tortuous, but in the newer section they are straight and finely improved. A public library, city waterworks, electric and gas lights, and a number of fine schools are among the public utilities. It has several slaughterhouses and a large trade in merchandise. An extensive breakwater and a lighthouse afford safety for steamships, with which regular communication is maintained with Belfast, Dublin, Liverpool, and Glasgow. Population, 1907, 23,530.

**DOUM PALM** (dōōm). See **Palms**.

**DOURO** (dō'rōō), a large river of the Spanish peninsula, rises in the northern part of Spain, and flows west through a portion of Spain and the whole of Portugal. The entire course is 500 miles and the most important tributary is the Pisuerga. Owing to rocks and sand banks, only about seventy miles are navigable. The mouth of the river is three miles below Oporto, where it flows into the Atlantic Ocean.

**DOVE** (dūv), a pigeon, especially the familiar species known as the *mourning dove* of North America and the *turtle dove* of Europe. Among the domestic doves are the tumblers, fantails, and carrier pigeons. In poetry the dove is regarded a symbol of gentleness, while in Christianity it typifies the Holy Spirit. See **Pigeon**.

**DOVER** (dō'vēr), the capital of Delaware, county seat of Kent County, about eight miles west of Delaware Bay, on the Philadelphia, Wilmington and Baltimore Railroad. It is located on elevated ground and has well-improved streets. In the State capitol, which is the largest building in the city, is a library of 35,000 volumes. Other noteworthy features include the county courthouse, the post office, the high school, and the Wilmington Conference

Academy. It has a number of monuments dedicated to prominent men of the Revolution. The manufactures consist of flour, canned fruits, glass, clothing, vehicles, and machinery. The surrounding country is largely devoted to fruit growing. Electric car lines furnish ample means of conveyance. It was made the State capital in 1777 and was incorporated in 1829. Population, 1900, 3,229.

**DOVER**, county seat of Strafford County, New Hampshire, on the Cochecho River, ten miles northwest of Portsmouth. It is on the Boston and Maine Railroad. The streets are broad and well paved. Among the chief buildings are the courthouse, the public library, the town hall, the opera house, the Joseph's Hill School, and the Franklin Academy. The manufactures include boots and shoes, cotton and woolen goods, machinery, earthenware, and prints. It has waterworks, sewerage, and electric street railways. Dover is one of the oldest cities in the State, dating from about the middle of the 17th century. It was incorporated in 1855. Population, 1900, 13,207.

**DOVER**, a town of New Jersey, in Morris County, 27 miles northwest of New York City. It is located on the Rockaway River, the Morris Canal, and the New Jersey Central and the Delaware, Lackawanna and Western railways. The manufacturing enterprises include iron works, machine shops, knitting and silk mills, and stove and range works. It has a fine system of waterworks and a number of good schools. Several summer resorts and a national powder depot are near the town. The first settlement was made in its vicinity in the middle of the 18th century. It was incorporated as a town in 1869. Population, 1905, 6,353.

**DOVER**, an important seaport of England, on the Strait of Dover, about sixty miles southeast of London. It is the nearest to France of the English seaports, being only twenty-one miles from the French coast. Numerous railroad lines join it with the interior cities, while electric railways furnish ample urban and suburban connections. Among the noteworthy buildings are the churches of Saint James and Saint Mary, the Dover College, the public library, and the town hall. The Castle of Dover, located on the chalk cliffs east of the city, was founded by the Romans. It has extensive systems of waterworks, sewerage, and stone and macadam pavements. The manufactures include fabrics, soap, machinery, clothing, and food products. Its harbor has been put in excellent condition by recent improvements, while the Admiralty Pier protects the entrance. The city and surrounding districts are rich in

relics of ancient times. Population, 1907, 43,792.

**DOVER, Strait of**, the sea channel which separates England from France, and connects the English Channel with the North Sea. The length is 24 miles. It is 25 fathoms deep at the time of the spring tides. The narrowest point is at Dover, where it is 21 miles wide. Chalk cliffs are more or less prevalent on both sides, and indicate that at remote ages Great Britain was connected with the mainland. The strait is the site of an important commercial life.

**DRACHMA** (dräk'mà), or **Drachm**, the name of a silver coin and of a measure of weight in ancient Greece. The measure of weight was composed of six *oboli*, or a handful. A *mina* contained 100 drachmas and a *talent* contained 1,000. As a unit of weight it varied somewhat at different times, from 6 to 6.5 grams. The *silver drachma* had a value of from 15.20 to 17.05 cents. The drachma is the name of a silver coin now used in Greece. It has the same value as the franc of France. The dram, a unit of the apothecaries' weight, contains three scruples, or sixty grains.

**DRAFTING**, or **Conscription**, the system or method of enlisting men for military service under compulsion. In modern times drafting men for the army has been resorted to only in cases of emergency, especially when the country was involved in a formidable military contest. The modern system is based upon the military constitution of ancient Rome, where conscription was resorted to each year as a means to recruit the army. In most countries of Europe military service is obligatory on every man of sound mind and normal physical development. The United States enacted a compulsory service law at the time of the Civil War, when President Lincoln recruited the Federal armies by levying drafts of men. In July, 1863, when the Union was in need of more soldiers, such a conscription act caused a riot in New York, known as the Draft Riots. This act required all able-bodied male citizens between the ages of 20 and 45 to serve in the army, but they were permitted to procure exemption by the payment of \$300.

**DRAGON** (dräg'ün), the name applied to several species of lizards found in South America, Asia, and Africa. The flying lizard is the best type of the genus. It is about ten inches in length, has a long tail, and is entirely harmless. On each side the skin is expanded in the form of a parachute, enabling it to make long leaps in passing from branch to branch, though it cannot fly in the ordinary sense. Most spe-

cies live in trees and feed almost entirely on insects, which they catch with much skill.

The name *dragon* applied in mythology to an animal or serpent of abnormal form. This fabulous animal is represented as serving various purposes, among them watching the garden of the Hesperides, and whose destruction was included with the seven labors of Hercules.

FLYING DRAGON.

In various paintings the dragon has the form of a winged crocodile, and is said to have dwelt in caves among cliffs and mountains. The fossils of the pterodactyl found in the rocks of the Mesozoic time show some resemblance to the flying dragon of mythology.

**DRAGON FLY**, the popular name of a large number of insects which are widely distributed, including not less than 2,000 species, of which about 300 occur in North America. They have a large, broad head loosely attached to the thorax. Their eyes are prominent, often meeting upon the crown of the head. The horny mandibles are toothed, the wings are closely articulated, and in many species the hind wings are about the same size as the anterior. They are remarkable for their voracity and feed on insects, which they catch with much skill. They deposit their eggs on plants growing beneath the surface of water, where the larvae and pupae lead an aquatic life. Their larval state occupies a year, after which the skin bursts along the back and the developed insect makes its appearance. Many species are from two to three inches long, of numerous colors, and not dangerous in any way. The common dragon fly of North America is known as the *devil's darning-needle*. About 75 species of fossil dragon flies have been described, appearing in the Lias and more recent formations. See illustration on following page.

**DRAGON TREE**, a tree native to the Canary Islands. The stem is usually short in proportion to its thickness, and the short branches terminate in tufts of sword-shaped

leaves. A celebrated specimen on the island of Teneriffe, near Orotava, was visited by Humboldt in 1799 and had a stem over forty feet in circumference. It yields a resinous substance known as *dragon's blood*, but this product is also obtained from a number of other trees, including several species native to the

DRAGON FLY.

East Indies and North and South America. This product is a colorless and tasteless substance, and is used in the preparation of varnishes and lacquers.

**DRAINING** (drān'ing), a term applied extensively in agriculture to the process of drawing off superfluous water by artificial means. Through the agency of draining, large tracts of otherwise wet and waste lands have been rendered susceptible to cultivation and the production of plants and cereals. The common way in extensive flats is to excavate a great open channel or ditch, through which the water passes off freely after rains or the melting of snow or ice. Lands used for cultivation are usually drained by the construction of tile drains. The common draintile is manufactured of clay, is circular in form, commonly twelve inches long, and has an inside diameter measuring from three to fifteen inches. The larger sizes, which range from eighteen to forty inches in diameter, are generally made two feet long, either of clay or concrete. In order to construct a proper tile drain it is necessary to make a careful survey of the district to be drained, forming an estimate of the approximate amount of water to be carried from the region, and locate the tile so a proper fall will insure the unobstructed passage of the water. A complete system of drainage requires a number of minor drains or laterals, which carry the water to the main drain. The number of

such laterals depends upon the character of the surface and the nature of the soil, since a hard clay soil is not so easily penetrated by the moisture as the loose and sandy formations.

In the colder countries the tile drain should be sufficiently deep to be below the frost in the winter, else water freezing within will burst the tile and impair the drain. The best drains are at least four feet deep at the shallowest places, which necessitates placing them at great depths through moles or hills. It has been found that the system of draining lands, though quite expensive in some cases, is a profitable investment, owing to the fact that the lands redeemed are usually the richest and most fruitful. Tile factories are operated in practically all of the states where drainage is necessary and the proper clays are found. By the use of this method the amount of arable land has been increased largely. There are other forms of drainage, such as open ditches made by plows, layers of stones covered by earth, and perforated drainpipe of circular sections covered by stones and earth, but the most common is the one employing tiles made of clay or concrete.

**DRAINAGE CANAL.** See **Chicago Drainage Canal.**

**DRAKENSBERG** (drä'kens-bërg), an elevated range of mountains in South Africa, extending through the eastern part of Cape Colony and along the borders of Natal and the Orange River Colony. Champagne Castle, one of the highest peaks, has an elevation of about 11,500 feet. Several railroads cross through its passes. During the Anglo-Boer War it was the scene of many battles.

**DRAKE UNIVERSITY**, a coeducational institution at Des Moines, Iowa, the largest independent endowed institution of higher learning in Iowa. It was organized in 1881. The chief benefactor, Gen. Francis Marion Drake, made a gift of \$20,000 to establish it. Afterward he made other donations at different times, the total amount of his gifts aggregating nearly \$250,000. As a mark of appreciation of his beneficence the institution was named Drake University. Another leading spirit in the founding of the university was George Thomas Carpenter, the first president, who was made chancellor and held that office until his decease, in 1894. Barton O. Aylesworth succeeded him as president, but resigned in 1897, when William Bayard Craig was chosen chancellor. He was succeeded in 1903 by Hill McClelland Bell, under whose presidency the institution has made phenomenal growth in resources and attendance.

The chief buildings include the Main Build-

ing, the Auditorium, Science Hall, the University Church, Howard Hall, the Medical Building, Cole Hall, Memorial Hall, and the Carnegie Library. Six colleges have been established in the university, the College of Liberal Arts, College of the Bible, College of Law, College of Medicine, College of Education, and College of Music. In the College of Liberal Arts, the work is largely elective, leading to the three degrees of A. B., Ph. B., and B. S. The library has a capacity of 150,000 books, a hall of history, and a number of rooms for officers and for recitations. Drake University, in 1908, had 110 instructors and 1,875 students.

**DRAMA** (drä'mà), a literary production which embodies a picture of real life and is to be represented on a stage by action. There are two principal classes of dramas, tragedy and comedy, with a number of minor kinds, such as the farce, burlesque, tragic comedy, and melodrama. A *tragedy* is a production intended to interest the mind in the highest degree, while a *comedy* is designed merely for amusement and merriment. The others are mixtures of the two chief classes, and alternately seek to interest, instruct, and amuse. Dramatic performances of some kind are found among all peoples, and their origin is to be attributed to the love of imitating the actions of others or of some deified personage. The Old Testament contains a number of compositions that partake of a dramatic nature, among them numerous dialogues in the Book of Job and the lyric poems in the Song of Solomon.

The dramatic literature in ancient India and China was particularly characteristic, each country possessing a drama peculiar to itself. The Greeks originated the European drama in both the tragic and comic forms. It is thought that the first comedy was given by Susarion and Dolon in Athens on a movable scaffold in 562 B. C. The first production in tragedy was from the pen of Thespis in 536 B. C. Aeschylus introduced dresses on the stage, by which means the imitation of action was rendered much more natural. The three greatest writers of tragedy in Greece are Aeschylus, Sophocles, and Euripides, while Aristophanes is the most eminent writer of comedy. In Rome the early drama was derived from the Greeks, though it never attained to so high a degree of perfection, even under Terence and Plautus, the most celebrated of Roman writers of comedy, and Andronicus, the writer of tragedy. The only dramas of ancient Rome extant are a few specimens coming to us from Seneca.

The drama of modern European countries took rise in the moralities, miracle plays, and

masterpieces of the Middle Ages, though the Italian drama began with the reproduction of classical models. Performances at banquets became common in most countries in the 12th century, and later scenes from the Bible were acted on stages in churches by priests and their assistants. The morality plays were fables, in which impressive moral lessons were recited with the view of overcoming vice and its baneful influences. Among the celebrated Bible plays is the famous Passion Play, illustrating the life of Christ, which is still counted among the most interesting and popular of the sacred dramas. In the 18th century the Italian drama took a new form of interest, both in comedy and tragedy, the later writers including Monti, Goldoni, Alfieri, and Manzoni. The other nations developed a taste for dramatic art much later than Italy. Spain followed Italy, reaching its acme in dramatic art through the works of Calderon and Lope de Vega, while the English reached their climax in Shakespeare.

The first period in the history of English drama begins with the reign of Elizabeth and terminates with that of Charles I. Within this time Shakespeare, Ben Jonson, Beaumont, Greene, Marlowe, and Fletcher were among the brilliant dramatists. The second period began with Charles II., including among its best writers Otway, Lee, Wycherley, Congreve, and Dryden. At first the plays of the latter period were marked by inferior productions, but later notable changes were made for the better. The most noted of English writers of more recent time include Coleridge, Shelley, Byron, Lord Lytton, Browning, and Tennyson. However, Shakespeare stands preëminent among the English dramatists and his plays are still more popular than those of any other English writer. Goldsmith's "She Stoops to Conquer" and Sheridan's "The School of Scandal" are very noteworthy. In France the drama was greatly improved by the advent of Corneille, who is regarded the founder of the higher drama in that country. Among the most distinguished of the later French dramatists are Hugo, Racine, Voltaire, and Molière.

The German drama was at first largely instituted by adaptations from the Italian and French, but scholarly additions were made by Lessing in 1755. He was followed by Schiller and Goethe, who rank among the best dramatists of modern times, the latter being regarded equal to Shakespeare by many critics. Schiller's "Wilhelm Tell" and Goethe's "Faust" and "The Sorrows of Werther" hold the stage with unceasing interest. Other noted German dramatic writers are Brentano, Körner, Schlegel,

Ludwig, Freytag, Laube, Kötzebue, and Von Moser. Hermann Sudermann, author of "Johannesfeuer," is one of the most recent German dramatists. The Dutch drama had its rise in the 17th century by the classical tragedies of Koster, and reached its acme in Vondel. Among the chief Scandinavian dramatists are Heiberg, Ibsen, Oehlenschläger, and Björnson.

The American drama originated by amateur players at Quebec, Canada, in 1694, though it is likely that the Spaniards introduced the stage in Mexico at an earlier date. Puritans looked upon dramatic art with disfavor and passed a law whereby players and spectators were fined five dollars on conviction of having participated in performances. This law was in force for fifty years. A company attempting to give a performance at Philadelphia in 1749 was bound over to their good behavior. The originators next went to New York, where they gave performances for sixteen months consecutively, the advertisement including "The Historical Tragedy of King Richard III., Wrote Originally by Shakespeare, and Altered by Colley Cibber, Esq." In the beginning of the 19th century the drama came into general popularity, first in the larger cities and later in towns and villages. John D. Burke, slain in a duel in 1808, wrote the successful plays, "Joan of Arc" and "Bunker Hill." John H. Payne, author of "Home, Sweet Home," wrote sixteen plays, while both George P. Morris, author of "Woodman, Spare That Tree," and Samuel Woodworth, author of "The Old Oaken Bucket," wrote numerous masterpieces. Among the noted American dramatists are Epes Sargent, W. E. Burton, and John Brougham. Denman Thompson's "Old Homestead" and Harriet Beecher Stowe's "Uncle Tom's Cabin" have been played more extensively than any others.

**DRAVE** (drä've), an important river of Europe, rising in the eastern part of the Tyrol. Its course is through Carinthia, Styria, and Croatia. It forms the boundary between Hungary and Slavonia, after which it joins the Danube a few miles east of Eszek. The entire length is 450 miles, about half that distance being navigable. The valley traversed by it is well populated and noted for its great fertility. Marburg, Lienz, and Eszek are among the cities on its banks.

**DRAVIDIANS** (drä-vīd'ī-āns), the name applied to a group of non-Aryan races in the southern part of India. They include the people who speak a number of dialects, including the Canarese, Malayālam, Tamil, Telugu, and a number of others. The Dravidian languages show no affinity to the Aryan or Indo-Germanic, except that these tongues have been

modified on account of contact with the Sanskrit. About twelve or fourteen dialects are spoken and some of these are intelligible to two or more of the different members of the group, but most of them speak only one dialect. The Tamil and Telugu show the highest degree of culture and are the dialects of about one-half of these Dravidian people.

**DRAWING** (dra'ing), the art of delineating the forms of objects on a flat surface by means of lines drawn with a pen, crayon, pencil, or some similar object. It is taught as a branch of study in many of the common schools and colleges, and is employed in making charts and maps. Architects employ drawing in preparing plans and views of buildings, machinery, and figures. In *geometrical* and *mechanical* drawing instruments are used to guide the hand, while *freehand* drawing is done from objects without an artificial guide, as the name indicates. Mechanical drawing includes *topographical* drawing, *ship draughting*, and *architectural* drawing. Another class of drawing, the *perspective*, aims to represent the aspect of an object from a given point of view as it appears to the eye. It approaches the artistic or freehand drawing in its results. This branch of instruction has proved of inestimable value and is an aid in determining relative proportions and forms. Paintings in water colors and sketches or colors in oils, in the arts, are usually called drawings. See **Painting**.

**DREAMS**, the ideas or images of a sleeping person, in which he seems to see things real and substantial. Dreams are accounted for by some writers as resulting from uninterrupted trains of ideas passing through the mind at all times at night as well as by day, and as being modified and influenced largely by the thoughts of the objects in which the mind is engaged during the period of wakefulness. A man full of projects in business and perplexed with anxieties goes to bed with an active mind, which is excited even in sleep by the importance of his daily occupation. This leads to imperfect sleep and vivid dreams, which remain in the memory after awaking. Irregular meals, eating shortly before retiring, and other irregularities are prolific causes of mental activity during sleep, but the trend of the mind is influenced very largely by the activities experienced during the day.

In dreams the train of ideas appears as a series of events passing before the eye, or as objects affecting the senses. The periods in which dreams occur are often exaggerated, since what appears as a long period of time may be but a few minutes or seconds. The ideas

seeming to pass before the eye may cover a brief period or extend over several years, though the actual time elapsing may be but a few minutes. Pleasurable dreams result to those who live a life of purity and experience an absence of remorse, while the contrary affect those whose minds are engaged frequently in evil thoughts and imaginations. There are cases on record where men claimed to be aided in professional and business engagements by the effect of mental activity during sleep. Benjamin Franklin expressed the view that during dreams he was instructed at various times regarding issues that were subject to mental study. Coleridge asserted that he composed several hundred lines of "Kubla Khan" during a dream and committed them to paper before he awoke.

**DREDGING** (drĕj'ing), a term applied by engineers to the process of excavating material under water and thereby improving the means of navigation. Many machines for this purpose have come into use, but they may be classed either as *dipper* or as *grapple* dredges. The former consist of spoons or scoops for scraping sand, mud, and silt from the bed of a stream, canal, harbor, dock, or some other body of water. On the other hand, the grapple dredges are fitted to close around solid earth or stone. In this way the landing places for vessels as well as channels and inlets are not only deepened, but are made safer and more serviceable for large vessels. The work is done by steam power applied to machinery. The deposits at the bottom of the water are torn up and raised sufficiently to be dumped into dredge boats, which carry them off, depositing them at some distance from the place to be deepened. The process of securing oysters, plants, and shells from the bottom of the water is usually called dredging. The common dredge for catching oysters consists of a scraper attached to an iron frame. A bag fastened to the frame at the rear of the scraper receives the oysters, from which they are taken after being landed on the shore or on boats. Naturalists employ an apparatus for securing specimens of marine forms for examination, which is constructed similar to that of an oyster dredge.

**DRED SCOTT DECISION**, a decision of the United States Supreme Court delivered by Chief Justice Taney on March 6, 1856, regarding a slave named Dred Scott. This slave was in the possession of an owner in Missouri. He was taken to Illinois and then to Minnesota, which was at that time a Territory. Illinois and Minnesota were then free soil, and on this Dred Scott was kept for a number of years, after which he was taken back to Missouri.

After the death of Dr. Emerson, the claimant of the slave, Dred Scott with his family claimed to be free, on the ground that they had been taken to free territory and could not be held in slavery after returning to Missouri. In the decision it was stated that Scott had no right to sue for liberty, because no colored person was regarded by the Constitution as a citizen and that colored persons had no rights which a white man was bound to respect. The decision attracted much attention, because it degraded the slave to the level of a machine and showed no respect for human sentiment.

**DREIBUND** (drĭ'boont), the compact formed between Germany, Austria, and Italy for mutual defense and friendship. Germany and Austria formed the Dual Alliance in 1879, and, by admitting Italy to the compact in 1882, the Dual Alliance was formed into a Dreibund. This compact long remained a balance of power in the continent of Europe and provided an important safeguard in the maintenance of peace.

**DRESDEN** (drĕz'den), a city of Germany, capital of the kingdom of Saxony, situated in the valley of the Elbe River. A number of boulevards lead up to and surround the city, while extensive orchards and vineyards abound in the vicinity. Portions of the city are on both sides of the Elbe, the newer part being especially beautiful by reason of broad streets and fine pavements. The population is largely Lutheran in religion and supports numerous fine churches, many of which have important connection with historical and international events. Many of the government buildings are beautiful in the interior, though rather plain externally. The royal library contains 450,000 volumes, including many rare and valuable specimens of ancient writings and numerous manuscripts. The museum attached to the library is famous for its ancient treasures as well as productions of recent artists and sculptors. Among the municipal buildings are several for local government and for public instruction. Besides the public school system, there are the Polytechnic School, the Conservatory and School of Music, the Academy of Fine Arts, and other noted educational institutions. Dresden is particularly famous for its gallery of pictures, which is counted among the most valuable in the world. It contains 30,000 pictures and 375,000 drawings and engravings.

The recent rapid growth of Dresden is due to its large commerce and industrial establishments. Among the chief manufactures are pianos, porcelain, jewelry, books and stationery, glass, chinaware, clothing, fabrics, and ma-

chinery. Local and general commerce is facilitated by extensive electric lines and numerous railroad connections, as well as by navigation on the river. It maintains systems of waterworks, sewerage, electric and gas lighting, and public baths. The streets are kept in a clean condition and in many places are adorned by monuments and fountains. Among the public parks and gardens are the Zoölogical Garden and the Grosser-Garten.

Dresden is mentioned in history in 1206, and has long been a city of importance, both from a commercial and educational standpoint. The sovereigns made it their residence since 1485. It was almost entirely destroyed by fire in 1491, but subsequently it was extended and improved by Augustus the Strong. The enlargements and valuable improvements made by Augustus I. and II. in the first half of the 18th century gave the city a basis for rapid growth

**DRESS**, the costume or clothing worn by a person as a protection against heat or cold, and at the same time to furnish the conventional covering of the body in the mode or style peculiar to a people. Ideas concerning modesty in dress have differed widely among the people of different ages, but a great majority of the civilized nations have worn garments that cover all parts of the body, except the head and hands. It is quite necessary that wearing apparel should not be uniform in all countries, since the seasons and general climatic conditions vary greatly, making it imperative that the clothing should differ materially according to the requirements of the climatic and other conditions which prevail.

The history of dress is quite as old as that of nations, but the earliest information is based upon traditions and rude sculptures. A good idea of some kinds of costumes is obtained

STYLES OF DRESS.

1, Assyrian. 2, Greek. 3, Roman. 4, German, 14th Century. 5, Spanish, 16th Century. 6, English, 16th Century.

during the last century and the impetus it has at present. During the Seven-Years' War, the Napoleonic wars, and the revolution of 1849 it suffered severe losses by fire and military destruction, which have since been entirely overcome. Population, 1905, 516,996.

**DRESDEN, Battle of**, a battle at Dresden, Germany, on Aug. 27, 1813. The French army of 30,000 men occupied Dresden and the allied army of Austrians, Prussians, and Russians, commanded by Schwarzenberg, appeared before it on Aug. 23. Napoleon came with the main army to relieve it on the 26th and a great pitched battle was fought the following day, in which the allies were defeated. The French lost about 7,500 men in killed and wounded, but the allies lost the same number and 20,000 of their men were taken prisoners.

from the mummies of Egypt and we have reasonably authentic accounts of the garments worn by the Babylonians, Assyrians, and Egyptians. Mention of raiment for the body is made in many places of the Old Testament, such as the vestments worn by the early priests, but the first account we have is of the rude covering of the body made with leaves by Adam and Eve. In Exodus xxviii., 42, this injunction is given: "And thou shalt make them linen breeches to cover their nakedness; from the loins even unto the thighs they shall reach." This passage and many others refer to sacerdotal vestments. Frequent mention is made of the raiment of needlework, of purple and fine linen, and of the sackcloth of sorrow and repentance. The mantles worn by the Hebrews were four-cornered and were bordered with

fringes and ribbons of blue. The Assyrians were advanced in the arts of dyeing, embroidering, and weaving, and their attire was both convenient and beautiful. They wore sandals after the style of the Egyptians, and their fabrics were made quite largely of flax and cotton.

The Greeks sought to maintain grace and beauty in the fashion of their clothing and wore garments that gave perfect freedom of action to the body. The *chiton*, a close-fitting but long garment, was worn both by men and women and corresponded to the modern shirt. Over this the men wore the *himation*, which was open on one side, and the women used a girdle below the bust, using a *peplos*, a sort of woolen shawl, as an outside garment. A kind of breast support was worn by both Greek and Roman women, but this differed from the modern corset in consisting of a single band of cloth, and it did not have the objectionable tendency of compressing the body. Though the character of dress in Greece and Rome was simple, the garments were well adapted to the climate and conditions of life, and the wealthy dignified them by fine embroidery and ornamentations. The *tunic*, a kind of *chiton*, was used extensively in Rome, over which an outer garment, the *toga*, was worn. Considerable attention was given to covering of the feet by *sandals* or shoes, and a legging in the form of the high military buskin furnished protection against extreme cold.

The barbarians of Northern Europe wore loose garments made principally of wool, and their chiefs had shirts with sleeves and striped *pantaloon*s. Their dress was greatly influenced by the Roman invasion, but from them the Romans came to value the *trousers* as of practical utility. However, they are not the originators of this garment, but this distinction belonged to the Aryan people of Asia, who came across the mountains into the valley of the Euphrates, and from them it came to be introduced among the people of Europe. While the Chinese and Japanese have steadily held to the dress worn from a remote period in history, the people of Europe, on the other hand, acquired a love of change in the form of dress. Careful cutting and fitting displaced the simple and loose garments of the early centuries of the Christian era, and the clothing came to be firmly sewed and closely fitted about the hips, bust, and waist. The loose garments gave way to the coat, vest, and pantaloons worn by men, who laced or buttoned their garments tightly and dressed the feet and legs by using tight-fitting stockings and shoes.

Exaggeration in the head gear came into

vogue about the 13th century, when women began to wear the *hennin*, a very large covering of the head. Later the *miter* and the *horned headdress* coverings for the head became celebrated, against which sermons were preached from the pulpit until they went out of use about the 16th century, but were followed by the grotesque and peculiar footwear in the time of Henry VII. The modern *corset* came into use about the time of Catherine de Medici, and starch was employed largely in preparing the absurd dresses and enormous ruffs of the time of Queen Elizabeth. In 1583 Stubbs wrote: "There is a certain liquid matter which they call starch wherein the devil hath learned them to wash and dye their ruffs, which being dry will then stand stiff and inflexible about their necks." The *farthingale*, a contrivance which extended the skirts out at the hips, came into use among women about this time, when all of the clothing tended toward excess in shape and ornamentation.

The French Revolution was followed by a tendency to simplify all articles of apparel, and may be said to be the beginning of the modern era of fashions. At present the older European costumes are worn only in isolated or remote sections, while the styles of European people are more or less similar and are changed quite uniformly. This is made possible through the publication of periodicals devoted to fashions, in which the newer styles are shown in elaborate plates and discussed quite clearly in directions for selecting the materials and making the garments. The style of dress changes more readily among Europeans than among any other class of people, and may be said to be transitory as compared with the styles of the peoples of Asia and those not materially advanced in civilized art. Indeed, a well-concerted movement for dress reform was inaugurated in 1873, under the auspices of the Crown Princess of Saxony, Germany, who pointed out the evils of unhygienic clothing worn by women. The following year an organization was formed at Boston, the National Dress Association, which declared against shoes with high heels and pointed toes, against wearing heavy veils, against the use of tightly laced corsets, and against garments that lodge a heavy weight on the hips. Though all the measures advocated by associations of this kind have not been looked upon with favor, it may be observed that there is a tendency toward more rational styles of dress for women.

DREXEL INSTITUTE OF ART, SCIENCE, AND INDUSTRY, a coeducational institution founded by Anthony J. Drexel at

Philadelphia, Pa., in 1891. This institute was established to train and instruct young men and women in the industrial arts and sciences. The courses include those of mechanic arts, applied and fine arts, commerce and finance, electrical engineering, domestic science, mechanical drawing and machine construction, physics, English, chemistry, and mathematics. Evening classes are maintained in the departments in addition to the regular academic instruction, and educational work is promoted through free public lectures. This institution has a library of 30,000 volumes, an endowment of \$2,000,000, and buildings and equipment worth \$4,000,000. The students in the day classes number 1,250 and in the evening courses, 2,000.

**DRIFT**, a loose accumulation of transported matter, constituting a peculiar geological formation found in the northern part of Europe and Asia and the eastern and central portions of North America. The drift matters consist of various forms of earth, which in many places are from fifty to a hundred feet in thickness. The surface of drifts is usually smooth with parallel ridges extending for some distances, and at places one set crossing another deposited at an earlier age. Extensive beds of gravel, pebbles, and sand that characterize the drifts are thought to have originated from adjacent rocks, while large stones show from their composition that they were carried long distances. Many of the larger rocks and boulders weigh from a hundred pounds to several tons. Those found in the northern drift of Europe extend to about 50° north latitude and in North America to about 40°. A similar drift is found in the Southern Hemisphere, which disappears between 40° and 50° south latitude. These drifts are more marked as one approaches the poles and gradually diminish in thickness toward the Equator. Near the Equator several similar drifts are found, though these are deposited usually around some great mountain, and traces of their movements are evidenced by scratches and erosion on the boulders of the mountain region.

The cause of drifts is attributed to the action of ice moving southward largely in the form of glaciers. The theory includes the view that in ages far remote the polar regions possessed a warm climate, which later gave way to cold, thus causing the formation of great fields of ice in the high latitudes. Fed by the polar snows, immense glaciers moved toward the Equator and melted as they reached the warmth of the lower latitudes. In this movement the great sheets of ice smoothed the surface of the rock and made scratches and erosions until

they melted in the sun of warmer regions. Many of the boulders and gravel found in all portions of the drift region bear evidence that they were moved long distances and dropped from the glacier carrying them as the warmer regions were reached.

**DRILL**, a metallic tool for boring holes in hard substances, such as stone, metal, wood, or ivory. The form and size depend upon the material in which the work is done. In stone drilling the tool has either a rotary movement or is lifted and dropped alternately. The drills for rock boring are made largely with black diamond, which constitutes the cutting edges. In metal and wood the action is rotary and the tool is made with two cutting edges, against which the work is pressed as the drill revolves.

**DRILLING**, a method of sowing seeds in parallel rows instead of planting them in hills or sowing them broadcast. Among the crops commonly drilled are peas, beans, carrots, onions, and other vegetables. These are cultivated more easily and the ground is kept in better condition when drilled so machine cultivation can be introduced. Seeds generally sown broadcast, such as wheat, barley, and flax, are sometimes drilled in rows close together, especially in poor soil, where bone dust or other fertilizing is needed. Corn is sometimes drilled, but is generally planted in hills, as cross cultivation is possible when parallel rows extend in two directions at right angles.

**DROMEDARY** (drūm'ĕ-dā-rŷ), the Arabian camel, so called from its ability to travel with much speed. It differs from the Bactrian camel in that it has a single hump on its back. The name is applied commonly only to one-humped camels that are noted for their swiftness in travel. See **Camel**.

**DROWNING** (droun'ing), the form of death that results from suffocation in water or other liquids. It was employed as a mode of capital punishment in many European countries, but long since went out of use as a form of punishment in practically all parts of the world. This method of execution was abolished in Switzerland in 1652, Scotland in 1685, Austria in 1776, and Iceland in 1777.

The deaths which result from drowning at the present time are due largely to accidents, and by careful treatment life may be restored within a limited time after breathing has ceased. Recovery is possible only so long as the heart beats, after that it becomes impossible. That death resulted from drowning is evidenced by finding water in the lungs, and usually by small objects held in clenched fingers at which the drowning person grasped while struggling to

escape danger. In one or two minutes after submersion complete insensibility ensues and death occurs in from two to five minutes. There are several methods of restoring persons apparently dead from drowning. One of the most common methods is to pull the body, face downward, over a roll of clothing placed under the stomach, by which the water may be expelled from the chest. The head should be supported during this movement, and the body turned on the back occasionally, though when occupying this position the shoulders should be supported.

To restore breathing in persons apparently drowned it is best to kneel over the body and place both hands on the lower part of the chest, immediately below the lowest ribs. By pressing forward the ribs may be raised, thus permitting air to enter the chest as the capacity is enlarged. As soon as the ribs are raised to the greatest possible extent, they are allowed to recoil to their usual position, by which means the air is expelled. By repeating this process at least twenty times per minute a tendency to restore breathing will soon develop. At the same time other persons should be rubbing the body and limbs upward with warmed flannel or their hands for the purpose of stimulating the flow of blood. Small quantities of hot brandy and water, hot coffee, or some other stimulant may be administered as soon as the patient has been restored to a condition in which he is able to swallow. To restore and maintain warmth after a case of apparent drowning is essential. This can be done best by means of rubbing, covering the body with warm clothing, and placing the patient in a suitable bed.

**DRUIDS** (dru'ídź), the priests of the early Celts of Gaul and Britain. Little is known of this class of people, though Julius Caesar gave some details of interest in regard to their worship and manner of living. He described them as a class that possessed chief authority among the Celtic people; that they had some knowledge of mathematics, philosophy, and astronomy; and that their religion was similar to the forms practiced by the Brahmans of India, the Chaldeans of Syria, and the Magi of Persia. They acted as judges, possessed complete control over the people, and were the teachers of the young. Their worship was in groves, and human sacrifice was not uncommon. The mistletoe and oak were sacred in their worship. A chief druid was elected by the people, who held his office for life. Ruins of their stone temples are still found in France and Great Britain. They were suppressed or exterminated at the time of the Roman invasion.

**DRUM**, a musical instrument of great antiquity. Several forms are in use. The common drum is made by stretching parchment over the heads of a wooden cylinder or a metallic vessel, which may be slackened or tightened at will by means of cords attached to screws or sliding knots. The drum mostly used is the *long* or *bass drum* with two heads, on both ends of which playing is done with stuffed-knob drumsticks. Another kind is the *side drum*, having two heads, the upper being the only one played by means of two sticks of wood; the lower head is formed with strings of catgut stripped across its surface. This kind is commonly called a *snare drum*. Another kind is the *kettledrum*, which is usually employed in pairs. It is formed of hollow brass or copper basins, on which a parchment is fastened by means of an iron ring. These instruments are used mostly in orchestras and military bands, where they are called *tympani*. The ancient Egyptians employed them in martial music and, like the Indians, beat their long drums with the hands. Bacchus is said to be the inventor of the drum. It is reputed that he gave the signal of battle by means of that instrument and the cymbal. The sculptures of Egypt and other ancient countries contain numerous inscriptions of drums, illustrating their use in military parades and in the conflict of battle.

**DRUMMOND ISLAND**, an island in Lake Huron, one of the Manitoulin group, forming a part of Chippewa County, Michigan. It is about ten miles wide and twenty miles long.

**DRUMMOND LIGHT**, an intense light invented by Thomas Drummond, of the British navy, in 1826. It is produced by turning two ignited streams of gas, one of hydrogen and the other of oxygen, upon a ball of lime. This light was first used in the coast survey service by placing it in a peculiarly shaped mirror, which served to reflect the rays in converging lines so the entire light was focused toward a central point. The light can be thrown in a straight line a distance of about one hundred miles.

**DRUSES** (dru'zéz), a peculiar political and religious people inhabiting the mountains of Lebanon and Anti-Lebanon. They are of mixed Syrian and Arabian origin and combine certain tenets of the Mohammedan with several of the Christian religion, and constitute a secret religious society. Their origin is found in El-Hakim Biamr-Allah, the sixth Fatimite caliph of Egypt, a fanatical ruler who lived in the 11th century. According to tradition he disappeared from his subjects while walking in

the vicinity of Cairo, and his followers were led to believe in his future return to earth to reign over them, though the natural explanation is that he was probably assassinated. A Russian named Ismail ed Derazi proclaimed the tenets of the Druses with such zeal in Lebanon that the converts were named after him and not after El-Hakim. They number between 75,000 and 100,000, are engaged largely in producing and manufacturing silk, and are noted for their sturdy resistance to Turkish dominion.

The Druses believe in the unity of God, who, they think, was manifested in the person of several individuals, but last of all in El-Hakim. Their day of worship is Thursday and their doctrines hold strictly to the transmigration of souls. In 1860, 12,000 Druses were cruelly massacred by the Maronites, when neither male nor female children were spared. The uprising was about to terminate in a general conflict between Christians and Mohammedans, but was suppressed by the arrival of French and Turkish troops. At present they are guaranteed certain religious and political liberties by Turkey, to which country they pay an annual tax. The three classes into which their adherents are divided include princes, chiefs, and the people. The greatest amount of knowledge obtained of these people was published by a Frenchman named De Sacy in 1838, entitled "An Exposition of the Religion of the Druses."

**DRYADES** (drī'adz), the tree goddesses or nymphs mentioned in the mythology of Greece. Each dryad partook of the characteristics of a particular tree to whose life it was wedded, and ceased to exist when it was felled or so injured that it withered and died.

**DRYING OIL**, an oil used in painting and which has the property of drying quickly. The name is applied in a general sense to linseed oil and other seed oils, but particularly to oils of this class prepared with the special view of hastening the drying, which is done by heating with oxide of lead. They absorb oxygen when exposed to the air, hence become a dry, tough mass. Drying oil is used to paint the woodwork and other parts of buildings.

**DRY TORTUGAS** (drī tōr-tōō'gās), a group of ten small islands of coral formation situated southeast of Cape Sable, Florida. They are low and barren and most of the surface is covered with low brushwood. Two lighthouses are maintained by the government, one of which is 150 feet high. Fort Jefferson is an important fortification on Garden Key, and was used as a penal station for Confederate prisoners in the Civil War. Prisoners under sentence for court-martial are still occasionally confined in

the fort. For local government the island belongs to Monroe County, Florida.

**DUBLIN** (dūb'lin), the metropolis and capital of Ireland, in Dublin County, on the Liffey River, at the entrance to Dublin Bay. The city is divided into two parts by the river which is crossed by numerous stone and iron bridges. Extensive docks and wharves are located at the mouth of the river. It has many beautiful streets and thoroughfares, the most noted being Sackville Street, which passes through the city at right angles to the river, and is 660 yards long and forty yards wide. The principal public buildings include the castle, the official residence of the chief officer of Ireland; Trinity College; the bank of Ireland; the customhouse; the court of justice; the post office; the commercial buildings; the city hall; and other large structures. Among the most important educational institutions are the Dublin University, Royal College of Science, College of Surgeons, Roman Catholic University, Royal University, Royal Irish Academy for Promoting the Study of Science, Literature, and Antiquities, Royal Hibernian Academy of Painting, Sculpture, and Architecture, and the Royal Zoölogical Society. Phoenix Park is a fine public resort northwest of the city, with an area of 1,760 acres.

The railroad facilities of Dublin are extensive. It has excellent harbor improvements and a considerable commerce. Electric car lines furnish convenient connection with all parts of the city and many suburban districts. All the principal streets are finely paved, beautified by trees and statuary, and lighted by gas and electricity. The chief manufactures are textiles, earthenware, machinery, and sailing vessels. Trinity College, founded by Queen Elizabeth, has a library of 200,000 volumes. Besides this library, there are reading rooms and libraries under the control of the city and educational institutions, and as a whole comprise collections of books, manuscripts, and antiquities of much value in educational arts. The city was captured by the Danes in the 9th century and taken by the English under Henry II. Large portions of the city were destroyed by fire in 1190 and visited by several great conflagrations since. The royal party of England captured the city during the protectorate of Richard Cromwell. James II. held a parliament here in 1681. In 1800 the flag of the United Kingdom was raised over the city, when Ireland became united with England. Population, 1907, 291,842.

**DUBLIN, University of**, an institution of higher learning at Dublin, Ireland, established

by Queen Elizabeth in 1591. The first University of Dublin was established in 1320, but perished from a lack of an endowment and the dissolution of Saint Patrick's Cathedral by Henry VIII. The official title is College of the Holy and Undivided Trinity, so named in the charter of incorporation. James I. granted it representation in Parliament, and it now is represented by two members in the House of Commons. The senate has power to elect the chancellor and grants degrees. This body consists of "the chancellor of the university, or, in his absence, of the vice chancellor, or such doctors and masters of the university as shall have and keep their names on the books of Trinity College." At present the faculty consists of a prevost, seven fellows, twenty-six junior fellows, and seventy foundation scholars. The fellows are of two grades, senior and junior, the former comprising the chief officers and the latter the larger part of the tutorial force of the college. Instruction is divided into a course covering four years. Students are admitted by examination. The library contains 260,000 volumes. At Dunsink, five miles from the college, is located the astronomical observatory. The total attendance is about 1,350 students.

**DUBOIS** (du-bois'), a borough of Clearfield County, Pennsylvania, on Sandy Lick Creek, about 125 miles northeast of Pittsburg. It is on the Pennsylvania and the Buffalo, Rochester and Pittsburg railroads. Among the noteworthy features are the high school and the public library. The principal manufactures are machinery, flour, railroad cars, spirituous beverages, leather, window glass, cotton and woolen goods, and hardware. Large quantities of coal and gas are produced in the surrounding country. It was settled in 1873 and incorporated in 1887. Population, 1900, 9,375; in 1910, 12,623.

**DUBUQUE** (du-bük'), a city of Iowa, county seat of Dubuque County, on the Mississippi River, 200 miles northeast of Des Moines. It is on the Chicago Great Western, the Illinois Central, the Chicago, Milwaukee and Saint Paul, and the Chicago, Burlington and Quincy railroads. Regular communication is maintained by steamboats with ports on the Ohio and the Gulf. It is regularly platted with wide streets. Several bridges cross the river. The manufactures include wagons, farm machinery, lumber, cigars, utensils, soap, flour, clothing, and hardware. An extensive grain market has caused the building of large elevators. The pork packing establishments produce packed and cured meat. It has large interests in lead,

being a depot for the lead-producing districts of northeastern Iowa.

The noteworthy buildings include the courthouse, the post office, the public library, and the city hall. It is the seat of Wartburg Seminary (Lutheran), the German Presbyterian Theological Seminary, an Episcopal seminary, Saint Joseph's College and Academy, Iowa Institute of Science and Art, Saint Mary's Academy, and a number of convents and business colleges. Electric street railways, public waterworks, stone and asphalt pavements, a sewer system, and public lighting are among the improvements. The site of the city is a portion of the region occupied by the first permanent settlement in the State. John King established the *Dubuque Visitor* in 1836, the first periodical published in Iowa. It was incorporated as a town in 1837 and was chartered as a city in 1840. Population, 1910, 38,494.

**DUCAT** (dük'ät), a coin of different value, chiefly of gold, and formerly used extensively in Europe. Ducats were first made in the 11th century by the emperors of Byzantine, and by the next century were used generally in the southern part of Europe, especially in Sicily and Italy. In 1559 the diet of Germany adopted the ducat, and it soon came into use in all parts of Northern Europe. At present it is not issued, except in Austria-Hungary, where the gold ducats are coined for use in foreign trade. The silver ducat used formerly had a value of seventy-five cents to \$1.10 and the gold ducat was valued at about \$2.32. Ducats coined in ancient Venice were valued at about \$1.46.

**DUCK**, the common name of a large family of widely distributed web-footed birds. They include many species and are met more or less in all portions of the inhabited world.

MALLARD DUCK—MALE AND FEMALE.

Many ducks are migratory, going to higher latitudes to breed in the summer season. They deposit from six to twelve eggs in a nest built among the reeds near the edge of bodies of fresh water, or in the hollows of trees or crev-

ices of rocks. Ducks are peculiarly awkward in walking, having a waddling movement, but their flight is brisk and their ability to swim is quite highly developed. The wild species are classed as sea ducks and true ducks. Ducks of the former class are migratory, being seen frequently in large flocks moving to and from the higher latitudes. The most common wild duck of Central North America in the primeval period was the *mallard*, a fine game bird, and it is still found in many regions. The female is of a grayish color, while the male has an attractive plumage. In the latter the head is bluish-green, the neck is chestnut colored with a fine ring of white, and the body is finely marked in various light, blue, and greenish shades. In the duck family the bill is large, though it is greatly diversified as to size and shape. Some are flat and rounded at the top, others are quite sharp, while the *scaup duck* has a spoon-shaped bill. The *pintail* is characterized by a pointed tail. The flesh of ducks is a wholesome and favorite food and is much sought at all times, except in the season of breeding. Domestic ducks have been developed from the wild species, probably largely from the *wood duck* and the *mallard*. They are grown extensively for the flesh and feathers. The eggs, though excellent food, are not as well liked as hens' eggs. Besides, ducks do not produce eggs abundantly. The *musk duck*, a native of South America, often erroneously called *Muscovy duck*, is almost as large as a goose and is the largest of the duck family. The drake or male of all domestic ducks and of many wild species is distinguished by marked differences in plumage, is somewhat larger than the female, and has four curved tail feathers. Its voice is low and basslike and quite different from the quack of the female.

**DUCKBILL**, or **Water Mole**, an aquatic egg-laying animal, the only living species of the order *Monotremata*. It is native to Australia and the adjacent islands, including Papua and Tasmania. The body is about twenty inches long, which includes the bill and tail, and is thickly covered with a brown fur. The head is small, the teeth are near the base of each mandible, and the males have spurs on the hind legs. This animal has a horny bill similar to that of a duck, but it breathes through nostrils at the tip of the bill. Though an aquatic animal, it can climb trees with facility, and is able to dig long burrows with its feet. The fore feet are strong and have five toes, and the hind feet are smaller and the five toes are armed with claws. It feeds chiefly on worms and insects and prefers to live in large colo-

nies. Reproduction is by eggs, which are covered with a soft and flexible shell, and only a few are laid at a time. At birth the young are blind and naked, but grow rapidly, subsisting on milk drawn from the milk glands of the mother. The duckbill has a gentle disposition and its voice resembles that of a young dog.

**DUCKING STOOL**, a kind of stool used for punishing scolds, especially scolding wives. It came into common use in many European countries in the 15th century, and was employed as an apparatus for inflicting punishment in Europe and America until the beginning of the 18th century. Many forms of ducking stools were in use, but the most common kind consisted of a mechanical arrangement whereby the culprit was fastened in the chair and moved up and down in the water, the head alone remaining above the surface, though it was sometimes submerged momentarily. Addison speaks of its use by saying, "Reclaim the obstinate and virulent woman, and make the ducking stool more useful."

**DUCKWEED**, the name of a small plant that floats upon the water, the rootlets hanging loosely beneath. It consists chiefly of flat green fronds and is found widely distributed on the surface of stagnant waters. The flowers are unisexual, destitute of calyx and corolla, and the fruit is rarely seen, since it propagates chiefly by new fronds budding from those already developed.

**DUCTILITY** (dŭk-tĭl'ĭ-tĭ), the quality of some substances by which they may be drawn into wire. Soft metals possessing only slight ductility cannot be drawn into wire, but may be converted into that form by a process of squirting or pressing. The degree of ductility in the important metals is in this order: gold, silver, platinum, iron, copper, zinc, tin, lead, and nickel. These metals are malleable, that is, they may be beaten into leaves or sheets, but in a relatively different order, as follows: gold, silver, copper, tin, platinum, lead, zinc, iron, and nickel.

**DUEL** (dŭ'ĕl), a word derived from the Latin *duellum*, signifying a premeditated and prearranged mortal combat between two persons for the purpose of deciding some point of difference, or establishing some question of honor. Dueling was practiced in early ages and is referred to by some writers as a trial by battle. In a modern duel at least four persons are required to be present, including the two *combatants* or *principals* and a *second* for each principal. The seconds arrange the time, place, and mode of fighting the duel, though

the choice of arms belongs exclusively to the person receiving the challenge. In former times it was thought a mark of honor to resent an insult by issuing a challenge, but modern public opinion has rendered dueling cowardly and disgraceful and has caused it to become almost obsolete. However, the practice is still regarded as honorable in some countries, particularly in the Latin states of Europe and some countries of Asia.

It is thought that the practice of dueling in modern Europe was the outgrowth of the custom of wearing a sword, and was most common in the 16th century. In many countries, particularly in France, challenges were issued on the most trivial and commonplace grievances, and the practice still occurs among students in the German army and some of the universities. In the reign of Henry IV. of France the number of persons falling in duels is estimated at fully 6,000. Sully, minister of Henry IV., opposed the practice with much energy, but the king favored it, because he thought it tended to maintain a spirit of militarism among the people. A decree was issued against it in 1602, but with little effect. More than 4,000 nobles lost their lives during the minority of Louis XIV. From France the practice was carried to England in the reign of James I., where it became quite common. Among the well-known men who fought duels in England are included William Pitt and the Duke of Wellington. The most celebrated duel occurring in America was the mortal combat between Alexander Hamilton and Aaron Burr, in which the former was slain. Great indignation was aroused among the people in the United States on account of the death of Hamilton, and the practice grew less common. It is now looked upon as a foolish and inhuman act to issue a challenge.

**DUERO**, or Douro. See Douro.

**DUGONG** (dū-gōng'), an herb-eating sea mammal of the genus *Halicore*. Cuvier classed it with his order of *Pachydermata*, which includes the rhinoceros and other thick-skinned animals, but the order is not recognized at present. The eyes are small, the upper lip is thick and fleshy, and the upper jaw bends downward almost at a right angle. It has a whitish color below and a slate-brown or bluish-black above. The common length is eight or ten feet, though some are twenty feet long. It is widely distributed in tropical seas, but is most common in the waters of Southern Asia and the East Indies. Its food is marine vegetation, principally algae, which it finds in shallows or at the river estuaries. The natives pursue it

for its flesh, which resembles the beef of young cattle and is highly nutritious. The mother has

DUGONG.

a feeble voice and shows intense affection for her young.

**DUISBURG** (dōō'is-burk), a city of Germany, in Rhenish Prussia, fifteen miles north of Düsseldorf. It is finely located between the Ruhr and the Rhine, with which it is connected by canals, and is the converging center of several railroads. The noteworthy buildings include the Church of Saint Salvator, the town hall, the public library, and a number of gymnasiums and *Realschulen*. The streets are straight and well improved with modern utilities, such as electric street railways, waterworks, sewerage and stone and asphalt pavements. It has manufactures of steel and brass wares, glue, tobacco, beet sugar, soap, furniture, chemicals, and machinery. In the vicinity are extensive coal mines and stone quarries. It has a large shipping trade in grain, coal, iron ore, and merchandise. Duisburg is an ancient town, but its larger growth is comparatively recent. Charlemagne fortified it and in the 13th century it became a member of the Hanseatic League. Subsequently it was made a free town, but was annexed to Prussia after the Napoleonic War. Population, 1905, 192,346.

**DULCIMER** (dūl'si-mēr), a musical instrument used in almost all countries. It dates from ancient times. In shape and construction it is similar to the dulcimer made many centuries ago, and as a whole the instrument has undergone fewer changes than any other musical device. It consists of a flat box with a sounding board crossed by bridges, to which wires are fastened and tuned by pegs at the sides. The operator performs upon it by striking the wires with small pieces of wood held in each hand, or with two hammers containing heads of cork. It differs from the psaltery in

the manner of striking the wires, while a pianoforte is in reality a dulcimer on a large scale.

**DULUTH** (du-lōōth), a city of Minnesota, county seat of Saint Louis County, at the west end of Lake Superior. It is on the Northern Pacific, the Great Northern, the Chicago and Northwestern, the Duluth, South Shore and Atlantic, the Duluth and Iron Range, and other railroads. Being situated at the western extremity of navigation on the Great Lakes,

AERIAL FERRY AT DULUTH, MINN.

opposite Superior, Wis., it is highly important as a wholesaling and distributing center. The harbor is nine miles long and two miles wide, and is protected by a narrow strip of land called Minnesota Point, which forms a natural breakwater and is cut by ship canals, through which large vessels pass. The largest of these canals, which is located near the city, is crossed by the celebrated aerial ferry. It is the only structure of the kind in America and has the advantage of leaving the canal clear, carrying pedestrians, vehicles, and street cars at regular intervals. The United States government has expended large sums in dredging and otherwise improving the harbor for heavy shipping.

The city occupies a fine site overlooking the lake. It stretches along the lake shore a distance of about twenty miles, and Superior Street, the principal thoroughfare, extends nearly parallel to the shore the entire distance. The ground rises rapidly from the margin of the water. The business section is near the lake, occupying a level and slightly elevated tract, while the finer residential sections are in the higher lands toward the west and northwest. It is one of the leading shipping points in the country. Among the industries are sawmills, grain elevators, machine shops, flouring mills, car works and blast furnaces. In the vicinity are quarries of sandstone and granite.

Duluth is generally well built and the public

utilities are modern and well managed. The public high school, one of the finest in the Northwest, was erected at a cost of \$300,000. Other noteworthy buildings include the Carnegie public library, the Federal building, the Masonic Temple, the Spalding and Saint Louis hotels, the State Normal school, the Board of Trade, the Lyceum theater, and many fine churches. Lincoln, Chester and Grand View are among the public parks. Daniel Gresolon (Sieur du Lhut), after whom it was named, visited the place in 1680, but it was not settled until in 1853. It became a town in 1867, and was chartered as a city in 1870. The growth of the city from 1880 to 1900 is one of the most remarkable in the United States, the population of the former year being 3,843, while in 1900 it was 52,969. Population, 1910, 78,466.

**DUMA**, or **Douma**, the lower branch of the legislative department of Russia, established by an imperial manifesto on Oct. 19, 1905, and frequently referred to as the National Assembly. It is composed of about 500 members, who are elected by the Zemstvos, and has joint legislative power with the Council of the Empire, but bills passed by both these branches are subject to veto by the emperor, and cannot be introduced the second time without the royal consent. Among the restrictions upon the дума are that it cannot take part in legislation regarding titles of nobility or entailed estates. Neither can it discuss the reports of the Minister of Finance, or consider charges of malfeasance against members of the council or officers of the government.

**DUMBARTON** (dūm-bār'tūn), a seaport and the capital of Dumbartonshire, Scotland, thirteen miles northwest of Glasgow. It is situated on the Leven River, near its entrance into the Clyde, and has transportation facilities by steamboats and railways. The castle of Dumbarton, located at the mouth of the Leven, stands on a basaltic rock which rises about 560 feet. This castle is maintained by the government under the treaty of union between England and Scotland, whose terms require that it and three other Scotch castles be kept in repair. Sir William Wallace, the Scotch hero, was for a time imprisoned in the castle. It was a residence of Mary, Queen of Scots, before she went to France. Dumbarton has extensive shipyards, iron foundries, cordage works, and machine shops, and is the center of considerable trade in

merchandise and produce. Population, 1907, 20,864.

**DUMFRIES** (dŭm-frēs'), a river port and the capital of Dumfrieshire, Scotland, 72 miles southwest of Edinburgh. It is situated on the Nith River, nine miles from its entrance into the Solway Firth, and has convenient railroad facilities. The chief buildings include the post office, an infirmary, the Crichton Institution, and a number of fine schools and churches. Among the manufactures are hosiery, baskets, clothing, leather, and boots and shoes. Dumfries is noted for its early history. In 1306 Robert the Bruce slew the Red Comyn in the Greyfriars' Monastery, which was built by Devorgilla, the mother of John Baliol. Robert Burns, the poet, is buried in the Saint Michael's churchyard. The Young Pretender made Dumfries his headquarters in 1745. Population, 1907, 20,150.

**DÜNA** (dü'nà), or **Southern Dwina**, an important river of western Russia, rises in the Valdai Hills, flows toward the southwest, and thence makes a bold curve toward the northwest and discharges into the Gulf of Riga. The entire course is about 650 miles, of which a large part is navigable, except four months of the year, when it is frozen. Canals connect it with the Black and Caspian seas, the Gulf of Finland, and other navigation centers. The course of the Düna is through a fertile and densely populated region and its importance in commerce is marked, having Jacobstadt, Riga, and Friedrichstadt on its banks.

**DÜNABURG** (dü'nà-böörk), or **Dvinsk**, a fortified city of Russia, in the government of Vitebsk, 110 miles southeast of Riga. It is situated on the Düna River and on the trunk railway from Warsaw to Saint Petersburg. The surrounding country is fertile. Among the manufactures are flour, matches, clothing, machinery, tobacco, and spirituous liquors. It has a large trade in produce and merchandise. Many of the streets are improved by paving with stone and asphalt. The French bombarded it in 1812. Population, 1906, 75,806.

**DUNDEE** (dŭn-dē'), the fourth city of Scotland, in Forfarshire, fifty miles northeast of Edinburgh. It is situated on the Firth of Tay, about ten miles from its entrance to the sea, and is the center of a large railroad and navigation commerce. The streets are regular in most of the city and are well paved and lighted, and many are traversed by electric street railway lines. It has a safe harbor and extensive dockyards. Among the manufactures are textile goods, clothing, confectionery, earthenware, and machinery. It is the seat of extensive warehouses, flouring mills, and machine shops. The

northern seal and whale fishery interests make it an important depot for operation, thus adding largely to its commercial importance. Among the noteworthy buildings are the Saint Paul's Episcopal Church, the post office, the county courthouse, the Kannaird hall, and the University College. In 1887 the large bridge, about two miles long, over the Tay, was blown down while a passenger train was passing over. The Firth is crossed farther up at present by a bridge 3,600 yards long. Dundee was besieged and sacked by the Duke of Montrose in 1645, and was stormed by General Monk about six years afterward. Its history in connection with Great Britain is quite interesting. Population, 1907, 165,748.

**DUNE** (dŭn), the name first given to the hills of sand along the coast which are blown together by the winds, but later applied to sandhills formed similarly in regions of sandy or arid soil. Dunes begin to form where the sand is blown against some obstruction, such as a log or boulder, and from this beginning low hills are built up gradually. They are common on the sandy Atlantic coast of North America from Cape Cod to Cape Canaveral, where they are frequently from ten to thirty feet high, and on the coasts of the Bahamas they have a height of more than a hundred feet. In France, in the department of Landes, the dunes cover a large area and encroach farther upon the land each year. Others are found among the cliffs of England, near the southern end of Lake Michigan, and in extensive areas of the Sahara.

**DUNEDIN** (dŭn-ē'dīn), a city of New Zealand, capital of the provincial district of Otago, on the east side of South Island. It is conveniently located at the head of Otago harbor, and has a large interior and domestic trade. A railway connects it with the principal cities of the island, and steamboats run regularly between it and Melbourne. It is the seat of Otago University, opened in 1871, and has street railways, waterworks, a public library, a fine post office, and several handsome government buildings. The streets are regularly platted and well paved with brick and stone. Among the manufactures are clothing, brick, pottery, utensils, and woolen goods. The first settlement on its site was made in 1848, but its prosperity dates from 1861, when extensive gold fields were discovered in the vicinity. Population, 1906, 56,020.

**DUNFERMLINE** (dŭn-fĕrm'līn), a city of Scotland, in the western part of Fifeshire, sixteen miles northwest of Edinburgh. It has railroad and electric railway facilities. The manufactures include cotton and linen goods, iron-

ware, pottery, clothing, and machinery. Lime beds and iron collieries are worked in the vicinity. It has a Carnegie public library, a fine high school, a public hall, and several county and corporation buildings. Dunfermline was a favorite residence of the early Scottish kings and is the birthplace of David II. and Charles I. Malcolm Canmore founded a Benedictine abbey here about 1075. The remains of Robert Bruce are beneath the pulpit of the Abbey Church. Population, 1906, 26,352.

**DUNKARDS** (dŭn'kĕrdz), a name derived from the German word *Tunkers*, meaning immersers, and by which a Protestant denomination is known. The society of Dunkards was founded at Schwartzenau, Germany, in 1708. It includes the Conservative, Old Order, and Progressive Baptists, and the German Seventh-Day Baptists. The entire Dunkard denomination comprises 1,095 churches, 2,885 ministers, and 118,875 members. It has the largest number of adherents in Ohio, Pennsylvania, Indiana, and the states in the Northwest. The publishing headquarters are at Elgin, Ill. Several colleges and seminaries are maintained. The bicentennial of the Progressive Baptists was held at Des Moines, Iowa, in 1908, when the society was renamed Church of the Brethren.

**DUNKIRK** (dŭn'kĕrk), a city and port of entry of Chautauqua County, New York, on Lake Erie, about 35 miles southwest of Buffalo. It is on the Erie, the New York Central, the Lake Shore and Michigan Southern, and other railroads. The noteworthy buildings include the public library, the high school, the Brooks Memorial Hospital, and the city hall. Many of the streets are paved and improved by grading and parkings. It was settled in 1809 and incorporated in 1837. Among the manufactures are flour, machinery, locomotives, clothing, lumber, utensils, and hardware. Population, 1905, 15,251; in 1910, 17,221.

**DUNKIRK**, or **Dunkerque**, a seaport in France, on the Strait of Dover, in the department of Le Nord. It is defended by forts and outworks, and surrounded by walls. The harbor is large and convenient. Among the manufactures are cordage, sugar, spirituous beverages, leather, soap, and machinery. Shipbuilding is an important industry. The railroad and electric car line connections are extensive. Among the public buildings are a library, the Church of Saint Eloi, the museum, and the town hall. Dunkirk owes its early growth to the church built by Saint Eloi in the 7th century. It has an interesting history in connection with that of France. The English under the Duke of York tried to capture it in

1793, but were defeated with much loss. Population, 1906, 38,287.

**DUNMORE** (dŭn-mŏr'), a borough of Lackawanna County, Pennsylvania, on the Erie and the Lackawanna railroads. Extensive anthracite coal and clay deposits are worked in the vicinity. It is the seat of the State Oral School. Among the industries are steel and iron mills, stone works, feed mills, and implement works. It has gas and electric lighting, electric street railways, and municipal waterworks. The place was settled in 1835 and incorporated in 1862. Population, 1900, 12,583.

**DÜPPEL** (dŭp'pĕl), a village of Germany, in the Prussian province of Schleswig-Holstein, sixteen miles northeast of Flensburg. It is located on the coast of the Little Belt, is strongly fortified, and has importance as a strategic point. In the war between Prussia and Denmark, in 1849, it was stormed and captured by the Germans. A second engagement took place at Düppel in 1864, when the Germans bombarded the Danish position and captured it after a siege of two months.

**DUQUESNE** (dŭ-kān'), a borough in Allegheny County, Pennsylvania, about ten miles southeast of Pittsburg, on the Monongahela River and on the Pennsylvania Railroad. The chief buildings include the high school and the Carnegie Library and Institute. It is an important manufacturing center and has a growing trade in coal and merchandise. The manufactures embrace ironware, machinery, earthenware, cigars, and utensils. It has modern municipal improvements, such as pavements and waterworks. Duquesne was settled in 1885 and incorporated in 1891. Population, 1910, 15,727.

**DURANGO** (dŭŏ-rān'gŏ), a city of Mexico, capital of the state of Durango, 475 miles northwest of the city of Mexico. The city is well built on an elevation 6,845 feet above sea level, has manufactures of cotton and woolen fabrics, leather, and machinery, and is the seat of a government mint and a cathedral. It has several fine school and church buildings. Mining, agriculture, and stock raising are carried on in the vicinity. It has railroad connections and a considerable trade. Population, 1906, 32,902.

**DURANGO**, county seat of La Plata County, Colorado, on the Las Animas River and on the Rio Grande Southern and the Denver and Rio Grande railroads. It is surrounded by a fertile country, which yields large quantities of agricultural products and contains extensive coal deposits. The noteworthy buildings include the high school and the county poorhouse. It has a considerable trade, and it is the seat of iron and steel works. Population, 1900, 3,317.

**DURBAN** (dûr-băn'), an important seaport of South Africa, the only port city of Natal, on the Bay of Natal. The bay has a lighthouse and is protected by fortifications. It has a public library, a museum, electric street railways, and a fine public park, and is the terminus of two railway lines. The domestic and export trade are important. It has manufactures of clothing, brick, utensils, and machinery. Durban was founded in 1823 by the Dutch. Population, 1906, 69,894.

**DURHAM** (dûr'ûm), county seat of Durham County, North Carolina, 26 miles northwest of Raleigh. It is on the Seaboard Air Line, the Southern, and the Norfolk and Western railroads. Among the chief buildings are the county courthouse, the public library, the Watts Hospital, and Trinity College. It is surrounded by an agricultural country and has a large trade in produce and merchandise. The manufactured products include tobacco, furniture, cotton and woolen goods, flour, ironware, machinery, and implements. Durham was settled in 1855 and incorporated in 1869. General Johnston surrendered with a Confederate army to General Sherman near the city in 1865. Population, 1900, 6,679.

**DURHAM**, a city of England, situated near the center of Durham County, on the Wear River. It occupies a site partly encircling a steep, rocky eminence, on the top of which are a castle and a cathedral. The ancient castle is now used by the university, which was founded in 1832 and incorporated by royal charter in 1837. Durham first became important in 995, when a church was located here to enshrine the tombs of Saint Cuthbert and others. The present cathedral was begun on the site of the old church in 1093, and constitutes one of the most characteristic specimens of Norman architecture. The main building has a length of 510 feet and the central tower is 214 feet high. The bishopric of Durham is celebrated for its efficient line of bishops, who exercised marked influence upon the religious aspect of Great Britain. Population, 1907, 15,382.

**DÜSSELDORF** (düs'sel-dörf), a city of Germany, in Rhenish Prussia, on the Rhine River, at the mouth of the Düssel. It has communication by lines of steamers, steam railroads, and electric railways, and is one of the leading commercial centers in the valley of the Rhine. Among its manufactures are carpets, tobacco, cotton and woolen goods, leather, ironware, chemicals, machinery, musical instruments, and objects of art. The cotton and iron industries are very extensive and merit special mention. It has a large export and jobbing trade.

Düsseldorf is noted as a center of art and education. The Academy of Art is one of the leading institutions of the kind in Europe. It was founded in 1767 and contains paintings by Rubens, Bellini, Dürer, Janssens and other famous artists. Among the noteworthy buildings are the palace of justice, the Church of Saint Lambert, the museum, and a number of gymnasiums. Among the public parks may be mentioned the Hofgarten, one of the finest in Europe, and within it are several fine monuments, including the War Memorial erected in 1892 to commemorate the campaigns against Austria and France. Düsseldorf was first mentioned in the 12th century. It was annexed with the Grand Duchy of Berg to Prussia in 1814. Population, 1905, 253,274.

**DUTCH**, the language and people of Holland, or the Netherlands. The name was originally applied to most of the Teutonic peoples, but beginning with the 17th century the people of Holland were designated as Dutch and all others of the Teutonic order as Germans.

**DUTCH EAST INDIES**, the territory of the East Indies under the control of the government of Holland. These possessions comprise Java and Madura; parts of Borneo, Sumatra, and New Guinea; the Riau-Lingga Archipelago, Banca, Billiton, Celebes, the Molucca Archipelago, and the Sunda Islands. The entire area is estimated at 736,500 square miles and the population at 35,095,500, of which about 75,000 are Europeans. As a whole it has remarkable fertility of soil and extensive productions of rice, coffee, sugar, tobacco, cotton, indigo, minerals, spices, and fruits. Many minerals abound, but the mines are not worked extensively. The government is administered by a governor general, who is appointed by the crown and assisted by a council of five members. Most of the islands are treated under separate titles, which see.

**DUTCH GUIANA** (gê-ä'nà), or Surinam, a possession of Holland in South America. See **Guiana**.

**DUTIES**, a term which signifies taxes, but in general use it is restricted to taxes levied upon imports and exports, and has much the same meaning as customs. *Ad valorem* duty is the duty levied upon imported merchandise at a given per cent. as invoiced by the importer. A *specific duty* is the duty chargeable on imported merchandise by quantity, weight, or number, without regard to value. The term *duty on water* is applied to the charges levied on water used in the irrigation of crops. See **Customs Duties; Tariff**.

**DVINA** (dvě-nà'), or Dwina. See **Dwina**.

**DWARF** (dwarf), a term used to designate any plant or animal that is much smaller in size than the average size of development. Individual dwarfs occur in all plant and animal life, though those of the human race have attracted the greatest share of attention and study. Charles I. of England had a dwarf, Jeffery Hudson (1619-1682), who was only eighteen inches high at the age of seven years, but afterward grew to three feet ten inches. Wybrand Lolkes, a dwarf born in the Netherlands in 1730, was 27 inches tall at the age of sixty years, weighing 56 pounds. These and other celebrated dwarfs were kept as pets in the courts of princes and families of nobles. Dwarfs are now shown at exhibitions. Among the most celebrated dwarfs of America was Charles S. Stratton, known as General Tom Thumb. In 1863 he married Lavinia Warren. He was 31 inches in height and his bride was about one inch taller. Together with their dwarf child and Commodore Nutt, they were exhibited extensively in America and Europe. A dwarf of New York known as General Mite was only 21 inches tall.

Many of the dwarfs are unusually strong for their size and exhibit considerable intelligence. Several races of dwarfs are mentioned in history and some still exist. Aristotle described a race of dwarfs who inhabited caves on the banks of the Nile. The Akkas, who inhabit Central Africa, are among the most noted of existing dwarf races. They were described by Stanley in 1881 as a brave people, though their average height does not exceed four feet ten inches. Several communities of dwarfs dwell in the Congo Free State, though they are more or less mixed with other tribes. The old Germanic legends mention numerous dwarf nations who had kings and a recognized form of government. It is quite probable that any of the stories met with as to their advancement in arts and sciences have been greatly exaggerated.

**DWARFING**, the process of training plants for ornamentation and useful purposes whereby their size is kept much below the normal. The process includes a special manner of planting, pruning of the roots, and pinching off of the stronger shoots. The art is practiced most extensively in China and Japan, where dwarfing is applied to ornamental trees and hedges. Besides pruning the stronger shoots, the limbs are bent and twisted in various ways and trained to develop into ornamental and beautiful forms. Some plants do not possess the characteristics which make them serviceable for dwarfing, even in fertile soil and under fa-

vorable climatic conditions. The osage orange, the acacia, and the arbor vitae are commonly dwarfed for hedges. Some fruits and the coffee tree yield larger returns when they are kept trimmed.

**DWINA** (dwē'nà), or **Dvina**, an important river of northern Russia. It is formed by the junction of the Jug and Sukhona, has a northwesterly course, and flows into the White Sea by four mouths. It has a length of about 435 miles from its mouth to the point at which it is formed, and about 750 miles to the source of the Sukhona. The Vytchegda is the largest tributary. The entire system drains an area of 140,000 square miles, affords valuable means of inland navigation, and is rich in valuable fish. Large vessels cannot enter from the sea owing to shoals at its mouth, and it is obstructed by ice for about 175 days in the year. At Archangel it is four miles wide. Canals connect it with the Neva and the Volga.

**DYAKS** (dī'aks), the name applied to the aborigines of Borneo, who chiefly inhabit the interior. They have made considerable advancement in agriculture and other arts. Their complexion is yellow, and in docility and industry they rank far above the Malays. In worship they are classed as pagans. Considerable advancement has been made in civilization, especially in the vicinity of Sarawak. The former practice of head hunting, an art in which they engaged to secure the heads of their enemies, has been abolished in all districts where Europeans have exercised influence. Most of the Dyaks are under the government of Holland.

**DYEING**, the art of fixing colors on linen, cotton, silk, wool, and other textile fabrics. Owing to a marked difference in which fibrous materials take color, it is necessary to pass the substances to be dyed through various preliminary operations. All matters preventing the dye from having free access, and the natural coloring that interferes with the production of the clear and bright tints, are removed. Bleaching is applied to linen and cotton fabrics before bringing them in contact with dyes, while silk is boiled to remove the fatty matter, and wool is scoured in soda, lye, diluted ammonia, or weak soap. The order in which substances have attraction for color is: wool, silk, cotton, flax, and hemp. Dyes are often applied to woolen goods before weaving, in which case they are called *wool-dyed*. If the coloring matter is applied after weaving, they are called *piece-dyed*. Some dyes will not adhere to the materials which are to be colored without an agent to fix them, that is, to cause a combina-

tion between the dyeing color and the stuff to be dyed. Such an agent is known as a *mordant*.

The dye materials used at present are derived from the mineral, vegetable, and animal kingdoms. The most common mineral dyes are known as arsenical greens, chrome yellow, cobalt blues, and Prussian blues. Vegetable dyes of different kinds are derived from *Rubia tinctoria*, munjeet, sandalwood, logwood, sapanwood, and Brazilwood. Animal dyes include those made from the cochineal insect and kindred species of insect life. In recent years aniline dyes derived from coal tar have been added to the list of coloring stuffs. Under various forms of treatment many organic substances yield coloring matter. Among them may be mentioned starch, lichens, wood, sawdust, cotton waste, mosses, soot, sugar, camwood, sumach, French berries, saffron, and turmeric.

**DYER'S BROOM**, or **Dyer's Weed**, a low and shrubby leguminous plant native to many parts of Europe. It has simple leaves and yellow flowers and is reputed to be the *Genêt*, a bush from which the Plantagenet family obtained its name. The tops are used in making a yellow dye, and it is said to possess medicinal properties useful in preventing hydrophobia. This plant has been naturalized in some parts of Canada and the United States.

**DYNAMICS** (dī-nām'iks), the science which treats of the action of forces. It is divided into statics and kinetics. *Statics* treats of forces that counterbalance each other, and which therefore produce no motion or change of motion; while *kinetics* treats of forces that do not counterbalance, and therefore cause motion or change of motion. The whole science is generally called *mechanics*, while dynamics is restricted to the branch commonly called kinetics. The three primary laws of force were first stated by Newton, and express the principal phenomena of mass motion. These are: 1. A body at rest will continue at rest, or a body in motion will continue in motion in a straight line with a uniform velocity, until acted on by some external force. 2. Any change in the direction or in the amount of motion is proportional to the force acting, and takes place in the direction in which the force acts. 3. Action and reaction are equal in amount and in opposite directions.

The first law is sometimes called the law of *inertia*, being a mere statement of the property of inertia. Matter at rest will continue at rest; or, if in motion, it must continue moving until it is acted on by some force, for the reason that it has no ability to start itself moving,

to stop moving, or to change the direction of its motion. The second law states the principle that the amount and character of motion produced by any force depends upon the elements of a force. An equal force, acting on two masses, one twice as large as the other, imparts to the smaller mass a motion twice as great as to the larger. From this we notice that the amount of motion of a mass or body depends upon the quantity of matter the body contains, as well as upon the intensity of force causing its motion. The amount of motion a body possesses is called its *momentum*, which is equal to the mass of the body multiplied by its velocity. The principle declared in the third law is well illustrated by the recoil or kick of a gun, when a ball is shot from it. The motion in the gun is equal to that of the ball and is opposite in direction, but the actual velocity imparted to the gun is comparatively small on account of its mass being much greater than that of the ball. Hydrostatics is included in dynamics, when a wide construction is applied to the term.

**DYNAMITE** (dī'nā-mīt), a powerful explosive compound invented by Alfred Nobel, a German chemist, in 1867. The name is from a Greek word meaning strength. It was first produced by combining nitroglycerin with a siliceous earth obtained at Oberlohe, in Hanover, and known in Germany as *Kieselguhr*. Nitroglycerin was discovered by an Italian in 1846, but was not brought into practical use until the invention of dynamite. The proportion of nitroglycerin mixed with kieselguhr is seventy-five per cent., the mixture being made to diminish the liability of the nitroglycerin exploding by shock, and not destroying its force as an explosive. This earthy matter is highly porous and friable, thus containing high absorbent power. The color of dynamite is reddish-brown and has much the appearance of raw sugar. Other substances are now used to form dynamite, many being superior to kieselguhr for some purposes, among them diatomite, sand, charcoal, and sawdust.

Dynamite is not impaired by age unless exposed to water. Small quantities may be burned without danger and give off a yellowish flame, but an explosion results if it is heated to a high temperature. As an explosive force it is several times more powerful than gunpowder, the explosion being effected by a fulminating cap. It is used extensively for blasting bowlders and may be employed under water, though about six per cent. of its power is lost when exploded in a submerged state. On account of its tendency to break rock into particles, it is not used for quarrying, gunpowder

still serving for that purpose. *Gun cotton* is a mixture of nitroglycerin and cotton or wood cellulose, and has the appearance of soft gelatin. It is used for some forms of tunneling and blasting in preference to dynamite, on account of giving off less fumes and having no tendency to cause headache to operators.

Dynamite has gone into use for firing guns in warfare, a dynamite gun suitable for that purpose having been invented in 1883. The dynamite gun made under the direction of Lieutenant Zalinski consists of a mechanism in which a tube from forty to sixty feet in length is utilized. This tube is supported by a truss frame to guard against warping by its own weight, and the dynamite projectiles are thrown from the tube by means of compressed air. The compressed air is stored in a chamber beneath the gun carriage, its pressure being usually 4,000 pounds, though not more than 2,000 pounds of effective pressure is applied in throwing the projectile. Usually the air is introduced back of the projectile at an effective pressure of 2,000 pounds, and is increased as the projectile moves forward in the tube, this being done as a safeguard against sudden explosion. By means of this arrangement dynamite projectiles may be thrown a distance of three miles, the destruction being effected when they explode by reason of the sudden jar with which they crash against a fortification or some other object at which they are aimed. Another dynamite gun is the Maxim-Schupphaus, in which a special powder starts the projectile with a low pressure and increases the velocity by maintaining pressure throughout the entire length of the gun. This gun is among the latest that has attracted attention and has given marked satisfaction, though there are others that have been used successfully in throwing dynamite projectiles and aerial torpedoes. Guns of this character were first successfully employed in actual battle during the attack on Santiago by the American forces in the war with Spain, but since then have had an extended use elsewhere.

**DYNAMO ELECTRIC MACHINE**, a machine for generating electricity by mechanical action, or for transforming electrical energy into mechanical energy. This is the definition of a dynamo-electric machine, which may serve either as a *generator* or a *motor*, depending upon whether it is supplied with mechanical or electrical energy; hence, whether it is giving out electrical or mechanical energy.

In Fig. 1 are shown the essential parts of a simple dynamo. Here the two magnetic poles, N S, of opposite polarity, are placed near to

each other. Between the poles is a field of so-called lines of magnetic force, which are represented in the illustration by dotted lines. As the pulley C is revolved rapidly in the magnetic field, it cuts the lines of force and an electromotive force is induced in the conductor. However, the magnitude of the electro-motive force in the conductor depends entirely upon the rate at which the lines are cut. Since one end of the conductor is raised to a higher electric potential than the other, owing to this electro-motive force, there is a tendency for electricity

DYNAMO.

to flow along the conductor. If the ends of the conductor are connected exterior to the magnetic field so as to form a closed circuit, a current will flow through it as is indicated by the two arrows in the illustration.

In a dynamo, as shown in Fig. 2 of the illustration, is an *armature*, A, of soft iron, around which a large number of wires are wrapped, the armature being revolved rapidly between the poles N and S of the large magnets M and M. By these means a current of electricity is induced which is conducted along the axis of the armature and taken up by brushes of metal and conducted over wires to the lamps or motor intended to be operated.

The *commutator*, C, is fixed on the collar

of the axis on which the armature revolves, and by means of it the direction of the current is reversed. In some machines the commutator causes the currents to be continuous or to have the same direction. The power of the machine depends upon the number of magnetic poles, within which the armature is moving, and the speed of rotation.

The effect of a dynamo is practically the same as that of a magneto-electric machine, but they differ in construction in that the latter has a permanent steel magnet instead of the electro-magnets used in dynamos. The dynamo is superior in that it possesses greater compactness, due to the fact that electro-magnets are stronger than permanent steel magnets of equal bulk. Their extensive use dates from the improvements made in their construction by Gramme of Paris in 1870. His invention became known as the Gramme machine, by means of which a powerful continuous current of uniform strength was obtained. Among the greatest dynamos ever built are those of Deptford Central Station, in London, and at Niagara Falls, the latter being propelled through the motive power of water wheels. At the Columbian Exposition there were twelve dynamos that weighed 900 tons, had a capacity of 180,000 lights, and were operated by engines with an aggregate of 12,000 horse power. Since then other notable dynamos have been constructed, those used at the London, England, exposition in 1908 being particularly noteworthy.

**DYNAMOMETER** (dī-nā-mōm'ē-tēr), an instrument to ascertain the strength of men and animals, and to determine the power exerted by machines. Three classes of dynamometers are in use, including those designed to indicate the force of *thrust*, of *traction*, and of *rotation*. A thrust dynamometer is attached to the screw shaft of a steamship and measures the force of the screw in driving the vessel through the water. A simple traction dynamometer consists of a spring balance, in which the power exerted is indicated by an index upon a scale

of figures. It may be fastened to a wagon or a plow, and when the team of horses pulls the load it shows the force exerted. The force of a shaft is measured by a rotary dynamometer, indicating the force transmitted by the shaft to other machinery.

**DYNASTY** (dī'nās-tŷ), a succession of sovereigns in one line of family descent, or derived from the same ancestral stock, and who govern the same country. Among the particularly noteworthy dynasties are the Hohenzollern of Germany, the Hapsburg of Austria, the Stuarts of England, and the Castile of Spain.

**DYNE** (dīn), the absolute unit of force, employed in the metric system for measuring force. It is termed the unit of the centimeter-gram-second system (C. G. S.), and is equal to a force that, acting upon one gram of matter for one second, will give it a velocity of one centimeter per second. Since the dyne is a small unit, it is more convenient to use the *megadyne*, which is equal to one million dynes.

**DYSODILE** (dīs'ō-dīl), a mineral closely related to amber, found chiefly in limestone. It is of a yellowish or grayish color, and emits an odor similar to that of assafoetida when burning.

**DYTICIDAE** (dī-tīs'i-dē), a family of water beetles which embrace nearly a thousand species. The body is flattened and the hind legs are furnished with hairs to aid in swimming. They pass the winter in a dormant state by being concealed in thick tufts of herbage or in mud, and become active in early spring. The antennae are smooth. Their habits are active, both in swimming and in flying from one pond to another.

**DZIGGETAI** (dzīg'gē-tā), a wild ass found on the plateaus of Central Asia, which resembles the horse more than any other animal. The color is brown and a black stripe extends along the back. Naturalists regard this animal of the same family as the kiang and koulan. It is thought to be the "half ass" mentioned by Pliny and Herodotus.

## E

**E**, the fifth letter and the second vowel of the English alphabet. It is used more frequently than any other of the 26 letters. Its natural or long sound is the same as *i* in the German, Italian, and French languages, as in *me*, *mere*, and *here*. The short sound of *e* is represented in words like *men*, *hen*, and *met*, while its sound equivalent to *a* is exemplified in *there*. Several modifications are recognized when long and short *e* are followed by *r*, as in *here* and *her*; and the *u* or *dropped sound*, as in *camel*. In pronouncing it the mouth is opened to a medium extent, the tongue is expanded to touch the upper molars, and the voice is gently expurgated. It is generally silent as a final letter, but serves to lengthen the preceding syllable, as in *plume*, *cane*, *mane*, though in some cases it exercises no influence on the preceding vowel, as in *give* and *gone*. The final *e* was pronounced in most cases up to the end of the 14th century, as is the case in Chaucer's "Canterbury Tales."

In music it is the third note of the diatonic scale of C. *E*, as a key in music, has four sharps in its signature, F, C, G, and D sharp; but minor *E*, as a key, has but one sharp, F. The abbreviation *E.* signifies East.

**EAGLE** (*ē'g'l*), the name by which many birds of prey are known. They are classed in the genus *Aquila* and the family *Falconidae*, with which the eagles, falcons, and hawks are included. Eagles are regarded the most noble and courageous of the rapacious birds, and soar higher than any other birds of flight. The *golden eagle* has a dark, tawny-brown color, with a yellowish tinge on the back of the head and neck, and is a large and beautiful bird. It attains a length of about three feet and is able to seize any kind of poultry, rabbits, and small quadrupeds and carry them to its nest in the rocky ledges and cliffs of mountains. This species is a common bird of many

## EAGLE

regions of Eurasia and North America. The *sea eagle* is found near the coasts of lakes and seas and feeds largely on fish and marine life. It has a grayish-brown color, white tail, and pale-colored head. The *bald eagle* is found in

BALD EAGLE.

America and northern portions of Eurasia, and has been adopted as the symbol of the United States and some other countries. Its general diet is more extended than that of the *tree*

*eagle*, and carrion is even taken in time of need. The *serpent eagle* is found in Southern Asia and Northern Africa, and in structure and habits approaches the buzzard. Other species include the *imperial eagle*, the *eagle hawk*, and the *crested eagle*. These birds are fond of fish and commonly feed on the dead fishes found along the shore. They are frequently seen in pursuit of the osprey and other birds, requiring them to drop the fish they may have caught.

**EAGLE**, the bird most noted as a symbol of societies and nations. The Persians bore an eagle as a symbol upon a spear in battle as early as 401 B. C., and from them it passed as a war standard to the Egyptians. Among the Romans it was customary to use eagles of silver as a standard and rarely of gold, the custom being introduced among them in 104 B. C. The dynasty of Napoleon adopted the eagle as a symbol for France. A double-headed eagle was introduced as the emblem of Russia, and Charlemagne introduced it into Germany as a standard. The Russians have an association known as the White Eagle Order of Knighthood, and in the German Empire are Orders of the Black, Golden, and Red Eagles.

The Prussian Order of the Black Eagle was founded by the elector of Brandenburg in 1701, and is still maintained with a degree of marked respect. Its decoration consists of a Maltese cross surmounted by a royal crown. This cross is given for meritorious service by the emperor. The double-headed eagle is maintained as the standard of Austria. France long held the eagle in high esteem as a symbol, but it was abolished with the rise of the republic in 1870. The bald eagle is the emblem of the United States and is represented with outstretched wings, having the olive branch in one talon, a bunch of arrows in the other, and a shield upon its breast. Its head is surmounted by thirteen stars, while in its beak is a band bearing the inscription "E pluribus unum."

**EAGLE**, a gold coin current in the United States, equal in value to ten dollars. It was coined in 1795, weighing 270 grains and containing  $247\frac{1}{2}$  grains of pure gold. Later the government began to coin of the same fineness and of proportional value the double eagle, half eagle, and quarter eagle.

**EAR**, the organ of hearing. It is divided into three parts: the external ear or concha, the middle ear or tympanum, and the internal ear or labyrinth. The *external ear* consists of a passage to the middle ear, is about an inch in length and a quarter of an inch in diameter, and is formed partly of flesh and partly of bone. Around its opening is a lobe, called the

*auricle* or *pinna*, which serves to collect sound waves. Rudimentary muscles are connected with the external ear and are so well developed in some persons that they can move their ears as a rabbit or a horse does. The outer half of the passage is provided with a number of glands that secrete a kind of sticky wax, which prevents dust and insects from reaching the drum membrane. The gland secreting the wax grows

A, anvil; B, hammer; C, stirrup.

outward towards the surface like the nails and prevents it from accumulating. Carelessness in picking the ears often causes the wax to crowd against the drum membrane and results in deafness.

The *middle ear* is provided with a special mechanism for transmitting the air vibrations to the inner ear through two outer cavities. The tympanum or middle ear is connected by a small aperture with the inner ear. As to the size, the breadth of the middle ear is about a quarter of an inch and its length a half an inch. It is lined with mucous membrane and filled with air. The drum membrane is a thin leaf which closes the outer end like a drum, and a similar membrane closes the aperture to the inner ear. The cavity of the middle ear is increased by extending backward into a bony projection, which can be felt behind the outer ear, and is called the *mastoid process*. From this a tube, called the *eustachian*, about the size of a knitting needle, passes to and connects with the pharynx, and is opened by the act of swallowing. A chain of three small bones, known as the *ossicles*, constitutes the essential part of the middle ear. These are called the *malleus* or *hammer*, the *incus* or *anvil*, and the *stapes* or *stirrup*, and extend across the cavity from one membrane to another.

When sound waves strike the ear drum, they are thrown into vibrations, which are transmitted to the inner ear by a chain of bones.

The vibrations are increased by the tympanum and its extension into the mastoid cells, which act like the sounding box of a violin. The *internal ear* or *labyrinth* is the most delicate part. At its center it is about an eighth of an inch in diameter, this part being called the *vestibule*. A small spiral tunnel extends from the vestibule, which is called the *cochlea* from its resemblance to the inside of a snail's shell, and, besides it, there are three other tunnels called from their shape the *semicircular canals*. A clear liquid fills the labyrinth, which is lined with epithelial cells, and in them the nerves of hearing end. Cilia are numerous upon the surface of the epithelium, and among them are hard particles called the *ear sands*. When the sound waves reach the liquid, they produce waves that beat against the cilia, thus causing the sense of sound.

In order to produce a sound it is necessary that the waves in the liquid surrounding the nerves occur at least sixteen times a second. When they occur more than 38,000 times a second, no sound will be heard for the reason that they are too rapid for the nerves to take account of their action. The nerves of action may be excited by the air in the middle ear being too dense or too rare, by too much blood circulating in the middle ear, and by a blow upon the head or wax in the ear. Quinine and other drugs tend to produce abnormal excitement. In some cases an impression passes to the brain by the auditory nerve as though a real sound had excited the nerves. Other illusions are caused by an excitement of the pulse in an insane person. In dreams persons often get vivid impressions of sounds, and they are afterward recalled to memory and seem to be real.

Birds and quadrupeds have ears corresponding to those in man. No outer ear is found in turtles and frogs, but the drumhead forms a visible circle behind the eyes, just under the skin, and the middle ear contains a single bone. Snakes have no external or middle ear, but a bone extends from the inner ear to a kind of membrane immediately below the skin by which they are able to hear. The vibrations in fish are transmitted only through the skull, since they have no external or middle ear, and the labyrinth has no cochlea. Other animals have ears more or less modified, and those that have ears at all possess a modified form of the internal ear. See **Sound**.

**EARRING** (ēr'ring), an ornament suspended from the ear, the lower part of which is pierced for the purpose. Orientals have prized this mode of adorning the person from remote antiquity. Anciently earrings were worn by both

sexes in many countries of Asia and Africa, especially in Persia, Egypt, Babylon, and Carthage. The fashion was confined to women in Greece and Rome, where the people looked upon this ornament as one especially fitted for those of rank. In the time of Queen Elizabeth it became fashionable to wear earrings by both sexes, and the custom still prevails to a considerable extent among men in some countries and among certain classes of laborers, especially sailors. However, earrings are worn chiefly in Europe at present, where the custom is quite general, but in America these ornaments are not used as extensively as in the past. Earrings are made chiefly of silver and gold, with settings of precious stones. All of the more valuable antique earrings are finely ornamented and contain settings of pearls. Many ornaments classed as earrings are not properly rings, but are attached to the ear with a hook, the size and value varying greatly according to changes in the fashion.

**EARTH** (ērth), one of the eight planets which revolve around the sun and from it receive light and heat. It is farther from the sun than Mercury and Venus, and is larger than Mercury, Venus, or Mars. A satellite, called *Moon*, revolves around it at an average distance, measured from the center of the moon, of about 239,000 miles.

**FORM AND SIZE.** Among ancient peoples the belief was current that the earth is an extensive flat surface surrounded by water, though many writers of antiquity suggested that its form is spherical, and some held the view that it revolves around the sun. Its spherical form is now admitted by the scholars of all civilized countries, and numerous proofs are submitted to establish that fact. The form is that of an oblate sphere, much like an orange, slightly flattened at two opposite sides and somewhat enlarged midway between. A diameter imagined drawn through the shorter distance is called the *axis*, the two ends of which are its *poles*, and a line drawn around it midway between the poles is the *Equator*. The length of the axis is 7,899 miles, and its equatorial diameter is 7,925.6 miles, or about 26.6 miles greater than the former. The *circumference* is 24,899 miles, and the entire surface is equal to about 197,000,000 square miles.

**PROOFS OF ROTUNDITY.** Among the proofs that the world is round is the fact that men have circumnavigated it. Magellan was the first navigator to pave the way for this enterprise, in 1519. Though he was killed in the Philippine Islands two years later, the voyage was completed successfully by Sebastian del

Cano, one of his officers. Sir Francis Drake successfully completed a trip round the earth in 1580, and since then many others have done likewise. The rotundity is also proven by the shape of the *great circle of illumination*, the line separating the portion of the earth's surface which is in the shadow from the part which is lighted by the sun's rays. Besides these are the facts that the horizon has a circular shape, that the earth's shadow cast on the moon during an eclipse of the moon is circular, that the tops of ships are seen first when sailing towards us and last when passing away, that the horizon of vision becomes larger as we ascend in a balloon or to an eminence, and that new constellations of stars appear as we pass from the Equator to the poles. The actual measurement of the arc of a meridian has not only demonstrated the earth's rotundity, but has

the quantity of matter it contains, is found by careful calculation to be 5,639 times that of water. This means that the real earth weighs 5,639 times as much as a sphere of water equal in size to the earth. The measurement of the earth's density was attempted about a century ago by calculating it from the attraction of a mountain on two plumb lines, one being suspended on each side. Since plumb lines suspended in this manner are attracted to the mountain mass, they indicate lines that converge toward the center of the earth, and by them geologists are able to compare the weight of the earth with that of the mountain, the latter having been first carefully examined and its weight calculated in tons. The mountain first utilized in making this important research is Schihallion in Scotland. Other methods include the test made by Cavendish, in which the

attractive force of the earth was compared with that of two large balls over two other small balls by means of the torsion balance, that ascertained by the difference of oscillation of a pendulum when placed at the sea level, and when at the top of a mountain, and the pendulum experiments at the top and bottom of a deep mine for determining the difference of gravity. There are other methods, but these are the principal ones and are regarded of greatest worth.

CREATION. It is thought that the earth originally existed in

HEMISPHERES, SHOWING PARALLELS AND MERIDIANS.

enabled us to know approximately the amount of its oblateness.

**SURFACE LINES.** We imagine the earth to be encircled by a number of curved lines, for the purpose of being able to locate places on its surface and to represent certain localities on globes and maps. They are divided into *great* and *small* circles, the former dividing the earth into two equal parts or hemispheres, and the latter dividing it into unequal parts. The Equator is a great circle, and divides the earth into the Northern Hemisphere and the Southern Hemisphere. Meridian circles are great circles that pass through the poles, while parallels are small circles that pass round the earth parallel to the Equator. Latitude is measured north and south of the Equator along the meridians by the parallels, and longitude is measured on the parallels, by the meridians, east and west of a prime meridian. Both latitude and longitude are reckoned in degrees.

**DENSITY.** The density of the earth, that is,

a nebular or gaseous state, and that its elements and those of other heavenly bodies were generally distributed throughout space. By the expulsive force of heat, the attraction of gravity was overcome, and the different portions collected about nebulae that formed the centers of the various bodies. In this way the earth took on its present form, the action covering long periods of time, perhaps many millions of years, each period represented in Genesis as days. The mass gradually cooled by radiation, the outer surface and the polar regions cooling first and forming a crust; while the interior, cooling by conduction, still retains a high temperature. The spherical form attests its former fluidity, while the highly crystalline state of rocks formed early and the warm climate during the geological past give evidence of great central heat during remote ages. That the interior is still highly heated is evidenced by a rise of temperature equal to 1° Fahr. for every 55 feet of descent into the crust.

If this general rise in temperature continues, it reaches the boiling point at a depth of two miles, and at fifty miles below the surface the heat is sufficient to melt every solid.

INTERIOR. As to the condition of the interior, various views have been expressed, among them that the earth has a solid crust and a solid center, with a heated, pasty layer between; that the earth is solid throughout, but has a highly heated interior; and that the crust is solid, but the interior is a pasty mass in a highly heated condition. The last mentioned view is held most commonly and likely is correct, since the immense pressure at the center probably operates to raise greatly the melting point and tends to hold the mass in a pasty condition, even if the temperature is very high. The cooling effect of the heated interior causes the crust to contract or shrink, thereby crowding the materials into a smaller space, and exerting a marked influence on the crust. In some cases gases exert a marked pressure, rocks are melted, and frequently pressure is removed by certain portions of the earth's surface being elevated. In some cases water undoubtedly comes in contact with melted rocks by soaking down and is converted into steam. By this hypothesis it is possible to account largely for the phenomena of volcanic action, earthquakes, nonvolcanic igneous eruptions, and gradual elevations and subsidences of the crust.

MOTION. The earth has two motions, the *diurnal* and the *annual*. The diurnal motion is its daily motion from west to east around its own axis, which requires twenty-three hours, fifty-six minutes, four seconds—about twenty-four hours—and is the direct cause of our common day and night. By annual motion is meant the revolution of the earth around the sun, which is completed in about 365 days and six hours, and is one of the causes of our common year. The orbit is in the form of an ellipse, and has a total length of about 577,000,000 miles. Since the sun is at one focus of the ellipse, the earth is nearer the sun at some times in its revolution than at others. The earth is at perihelion about the 1st of January each year, when it is about 3,000,000 miles nearer the sun than at aphelion, six months later. Its distance from the sun at perihelion is 89,897,000 miles and at aphelion, 92,963,000. The average velocity at which the earth moves in its orbit through space is about nineteen miles per second, while the rotation on its axis causes any point on the Equator to move about 1,042 miles per hour. However, the velocity caused by its rotation diminishes toward the poles.

The earth's axis is inclined  $23\frac{1}{2}^{\circ}$  to the plane of the ecliptic and points nearly to Polaris, the north star. Owing to this it is always approximately parallel to any former position, and different portions of the surface receive the vertical rays of the sun. From this it is clear that new portions of the surface are turned toward the sun every day during the revolution, thus causing the change of seasons. The winter solstice occurs on December 21 and the summer solstice on June 21. On the former date the days are shortest north of the Equator, while on the latter date the reverse is true. The vernal equinox occurs on March 20 and the autumnal equinox on September 22, at which two periods in each year the days and nights are of equal length in all parts of the earth. At the poles the longest days and nights are each six months, being caused by the constant parallelism of the earth's axis in its revolution. The Arctic Circle bounds the north polar zone and the Antarctic the south polar zone, each being  $23\frac{1}{2}^{\circ}$  from the pole, that being the distance the sun shines beyond the pole during the respective solstices, and include respectively the North and South Frigid zones. The sun shines directly on every point twice in the year throughout a region extending  $23\frac{1}{2}^{\circ}$  both north and south of the Equator, which is called the Torrid Zone. The circle in the Northern Hemisphere which bounds this region is called the Tropic of Cancer and in the Southern Hemisphere the Tropic of Capricorn, both being called tropics. Between the polar circles and the tropics are respectively the North and South Temperate zones, each occupying  $43^{\circ}$ .

SURFACE PHENOMENA. About 150,060,000 square miles of the surface of the earth are water and 46,940,000 square miles are land. The water surface is divided into five great oceans and numerous bays, seas, gulfs, and channels. Lakes, rivers, and glaciers are classed as features of the land surface, though the waters of most of them flow into the oceans. Tides, currents, and waves are great phenomena of the oceans, while earthquakes, rains, and winds equally affect both the water and the land surfaces. The Eastern Hemisphere contains the greater portion of the land masses, including all of Europe, Asia, Africa, and Australia, while the Western Hemisphere includes America. The only great land masses south of the Equator are Australia and portions of South America and Africa. Besides the five continents, there are numerous detached masses called islands. These are known as continental, when near the continent; oceanic, when far out in the oceans; volcanic, when of volcanic origin; and coral,

when built largely by the coral polyps. The greatest depths of the ocean are equal to the heights of the loftiest mountains, about 29,000 feet, and usually are found near the greatest land elevations. Land masses have irregular coast lines and a surface variously designated as valleys, plains, deserts, plateaus, mountains, and depressions below the sea level. The three kingdoms studied in relation to the earth are those of the minerals, plants, and animals. According to the latest reports, the total population is 1,500,000,000. See **Atmosphere**.

**EARTH CURRENTS**, the natural electrical disturbances which appear to be allied closely to the magnetic storms. They are associated with the magnetism of the earth. Though not well understood, they are known to be dependent upon or affected by the occurrence of spots on the sun and by the appearance both of aurora borealis and aurora australis. Communication by long lines of telephone or telegraph, and especially submarine connections, is affected constantly by earth currents.

**EARTHENWARE**, any object made of clay and dried in the sun or baked in a kiln, though the term is sometimes restricted to the inferior grades of earthenware as distinguished from stoneware and porcelain. See **Pottery**.

**EARTHNUIT**, the name of the tubers of certain plants of the parsley family and a number of others, so called because they grow and mature in the ground. Pignut and earth chestnut are other names of plants of this kind. A species common to Sweden produces tubers which are valued for their nutriment and these form an important article of trade. Another species is common to Greece. Most of these tubers are about the size of a chestnut, have a brownish color and sweetish taste, and grow on slender roots from four to six inches below the surface. When used as an article of food, they are roasted or cooked in soups. Earthnuts are prized as feed for swine and are fed in some localities for fattening purposes.

**EARTHQUAKE**, a sudden undulation of a portion of the earth's surface produced by forces acting from beneath. Several theories have been advanced as to the probable cause of the disturbances, and, while any great concussion upon the surface of the earth may cause a diminutive earthquake, steam is clearly the most

favorable agent, as its sudden generation or condensation on a large scale is sufficiently powerful to produce extensive movements in the earth's crust. Water probably finds its way through fissures in the earth's crust to heated rocks, where it is suddenly converted into steam. Some earthquakes are caused by the falling in of the roof of enormous subterranean caves formed by the solvent action of water on deposits of rock salt, limestone, or gypsum; by various gases that result from internal heat; and by the general contraction of the earth's crust, resulting from the radiation or conduction of heat. Earthquakes are classified according to the character of the movements, which may be *vertical*, *circular*, or *wave-like*. The circular or twisting movements are rare, but they are the most destructive.

There is little doubt that the cause of earthquake and volcanic action is the same, though

Record of the earthquake at San Francisco, Cal., in 1906, as recorded by the seismograph.

the latter is governed materially by permanent channels through which the discharge is made. Certain premonitory symptoms usually herald the approach of a great earthquake, such as subterranean noises like cars running over a bridge. Suddenly the fatal moment arrives, some portion of the surface becomes the center of impulse, and waves are propagated in all directions through the solid materials of the earth's crust. If the center of impulse is below the sea, as it often is, the vibrations of the ground are accompanied by inundations of water. The earth frequently heaves and swells like a rolling sea, fissures being produced in all directions similar to those on a broken window-pane, various noises accompanying the vibrations. These disturbances may consist of a single shock, lasting a few seconds, or a series of such shocks continuing for days or weeks. The principal shock at San Francisco, in 1906,

had a duration of twenty-eight seconds. It was wavelike and the earth moved about two inches east and west and three inches north and south. Great changes in the surface of the earth have been made in a few seconds of time, as in the earthquake of Italy in 1908, and many towns and many thousands of lives have been lost. It is estimated that an earthquake occurs somewhere every day, though most of them are barely perceptible. They are more numerous in winter than in summer and at

MAP OF THE REGION DISTURBED BY THE EARTHQUAKE OF 1908.

night than during the day, for the reason that the cooling of the earth's crust is more rapid. They are more frequent when the attractive forces of the sun and moon act simultaneously, which occurs during full and new moons.

Some of the most destructive earthquakes on record are: 742 A. D., Asia, 500 towns destroyed; 1531, Lisbon, Portugal, 1,500 houses and 30,000 persons destroyed; 1693, Sicily, 54 towns, 300 villages and more than 100,000 lives lost; 1731, Pekin, China, 100,000 persons killed; 1754, Cairo, Egypt, 400,000 lives lost; 1755, Lisbon, Portugal, 50,000 persons killed. The most severe earthquakes ever known in the United States occurred at Charleston, S. C., in 1886, and at San Francisco, Cal., and its immediate vicinity on April 18, 1906. At the time of the latter a large part of San Francisco, many buildings of the Leland Stanford Junior University, and much property in adjacent towns were destroyed. In the same year, on August 16, a destructive earthquake visited Valparaiso and other cities of Chile.

The most destructive earthquake of recent times visited Calabria and Sicily in December, 1908, when Messina and Reggio were almost totally destroyed. Suddenly and without warning, at 5:20 o'clock in the morning, the earth began to tremble. At Messina, after the city crumbled into ruin, a wave of water 35 feet high engulfed the streets at the water front. As the wave receded its surface was black with human corpses and the wreckage of houses. At Reggio a chasm eighty feet wide opened and belched out scalding water. The disturbance extended from the vicinity of Naples to some distance south of Catania, but it was centered largely in the Strait of Messina, between Messina and Reggio, whose shores were greatly changed by the upheavals and subsidences. The loss of human life is estimated at about 200,000.

**EARTHS**, in chemistry, a class of substances consisting of a metal combined with oxygen, erroneously regarded elementary by alchemists and early chemists. They are insoluble, inodorous, and tasteless, and constitute the larger part of the soil and gravel. Lavoisier classed them as compounds and they are so recognized in modern chemistry. The list includes baryta, lime, strontia, and magnesia, which are classed as alkaline earths, since they are less soluble in water than true alkalis. Thoria, zirconia, alumina, didymia, glucina, erbia, ceria, yttria, and lanthana are true earths.

**EARTH SHINE**, the faint light seen on the part of the moon not illuminated by the sun, but which is cast upon her by the earth. Sometimes the outlines of the full moon are made visible by the reflection, which occurs on clear nights at the time the moon is very old or very new.

**EARTHWORM**, or *Angleworm*, the common name of many species of worms found widely distributed in the tropical and temperate

EARTHWORM.

regions. They are called earthworms because they burrow in the earth, but are known in some sections as angleworms or fishworms, since they are used as bait in angling. After a hard rain they are seen on the surface, when they are said to have *rained down*, but their coming out of the ground is due to the fact that they crawl about in attempting to get away from the water. The body is formed of many narrow rings in contact with each other, and is covered with rows of bristles pointing back-

ward. It has no tentacles, eyes, ears, or teeth. The upper lip is extended, forming a kind of proboscis. Those commonly seen in the Temperate zones are three or four inches long, though some, when fully extended, are nearly a foot in length. They swallow the decaying parts of animals and vegetables and take with them into the ground a quantity of soil, which is subsequently ejected in small heaps called *worm casts*. It is estimated that on an acre ten tons of earth is thus improved and enriched every year. The passages they burrow in passing through the soil loosen and stir it, making room for roots to grow more easily, and for the elements of the air to destroy the poisonous alkalis. Charles Darwin expressed the view that vegetable soil in its present aspect and distribution was produced largely by earthworms. Besides their usefulness in the improvement of the soil, they are important as food for birds, fishes, and insects.

**EAR TRUMPET**, an instrument used by those who have defective hearing or are partially deaf. Many forms of this contrivance are in general use, but they agree in having a trumpet-shaped tube to collect and condense the sound waves, and thus intensify the impression upon the ear. The ear trumpet is held by the hand in the direction where the sound originates, while the other end of the tube is placed in the cavity of the ear. It is not necessary to have an expensive adjustment of the parts, since sound is readily reflected along conical tubes, whether they are straight or coiled. Small ear trumpets, called cornets, are attached to the ear by a spring, hence are concealed by the hair of the wearer, but these can be used to an advantage only where the hearing is very slightly impaired.

**EARWIG** (ēr'wīg), a genus of insects allied to the cockroach and classed with the runners. They have six feet well formed for running; two pairs of wings, an upper short pair and a lower gauzelike pair; a mouth formed for mastication; and a somewhat flattened body. The abdomen has strong pinchers and the head is provided with delicate antennae. The earwig is so named from the erroneous belief that it creeps into the ears of sleepers. Several species are widely distributed in Europe. In North America these insects are found only on the Pacific Coast and in the central and southern parts of the continent. Several small centipedes which frequent houses in the United States are known as earwigs.

**EASEMENT**, in law, the right which one person has in the real estate of another, not inconsistent with the general property of the

owner, such as a right of way over it or a right to lay pipes below the surface. It is distinguished from a mere license, since an easement is a permanent right. An easement is called a *dominant right*, while the land burdened is termed the *servient estate*. It is acquired either by *grant* or by *prescription*. The former is usually by a formal written deed, but an oral grant is sufficient when the possession passes

Earwigs, showing larvae and perfect insects.

to the grantee. An easement by prescription, or implication, is acquired through continued use, when the natural presumption arises that a grant was made when possession was obtained of the land. An owner of property who does not wish to have an easement created without his actual consent should not permit the use of his property for a long period of time without a written agreement or notice to the contrary, else such a right may be created by prescription.

**EAST AURORA** (ā-rō'rā), a village of New York, in Erie County, seventeen miles southeast of Buffalo, on the Western New York and Pennsylvania Railroad. It is surrounded by a fertile farming country, and contains the residences of many Buffalo business men. Among the facilities are electric lights, public waterworks, and a number of fine school buildings. Aurora is noted as the seat of the Roycrofts, a printshop which produces fine editions of standard and current books and hand-made furniture. Population, 1900, 2,366.

**EASTBOURNE** (ēst'būrn), a seaside resort of England, in Sussexshire, on the coast between Brighton and Hastings. It has railroad facilities, electric lights, finely paved streets,

and a commodious town hall. Along the shore is a fine drive two miles long. It has gained rapidly in population on account of its healthful situation and popularity as a coast resort. The town was incorporated in 1883. Population, 1907, 44,630.

**EAST CAPE**, the most easterly cape of Asia, extending into Bering Strait, nearly opposite Cape Prince of Wales, the most westerly point of North America. It is a rocky promontory and is almost cut off from the mainland by shallow lakes and swamps. The village of Uedle is situated on the northeastern side, containing a population of 300. The name Cape East is also applied to the southeastern extremity of New Guinea; the eastern headlands of North Island, New Zealand; and the easternmost point of the island of Madagascar.

**EASTER** (ēs'tēr), the festival kept in commemoration of the resurrection of Christ. It was observed by the early Christians as a continuation of the feast of the passover and generally lasted eight days, from Palm Sunday to Easter Sunday inclusive. It was a time of joy. The austerities of Lent were over; alms were given to the poor and needy; sports, dances, and farcical exhibitions were indulged; and stories and legends were recited by the clergy to stir the hearts of the hearers to laughter. On Easter day the people saluted each other with a kiss and the exclamation, "He is risen;" to this the reply was, "He is risen, indeed." A long controversy took place between the Eastern and Western churches as to the proper time for celebrating Easter, but in 325 it was fixed by the Council of Nice on the first Sunday after the full moon occurring upon or next after March 21. Easter, the feast of eggs, is considered emblematical of the resurrection and of a future life.

**EASTERN QUESTION**, the problem which relates to Turkey in Europe and the occupation of the Balkan Peninsula. It has been a complicated issue of international politics for many years, but its modern phase dates from 1856, when the Congress of Paris made definite declarations upon the questions involved in the Crimean War. The war between Russia and Turkey in 1877 opened the problem anew, after which the Congress of Berlin refused to permit the former country to receive the full benefits arising from the new status created by the conflict. It was likewise influenced by the annexation of Eastern Rumelia to Bulgaria in 1885, the war between Greece and Turkey in 1897, and the establishment of autonomy in Crete. The question was again opened in 1908, when Bulgaria declared its independence and

Austria-Hungary proclaimed the annexation of Bosnia and Herzegovina. It is not probable that the issues will be finally adjusted until the territory of Turkey in Europe becomes absorbed by the nations of Europe, when the status existing at the time of the ancient Byzantine Empire will be restored in a measure and the Turks will be confined beyond the Hellespont.

**EASTERN RUMELIA**. See Rumelia.

**EASTHAMPTON** (ēst-hämp'tūn), a town of Massachusetts, in Hampshire County, four miles southwest of Northampton. It is on the Boston and Maine and the New York, New Haven and Hartford railroads, and has a growing trade in merchandise and produce. The manufactures include yarn, rubber goods, cotton textiles, buttons, and machinery. It is the seat of Williston Seminary, a preparatory school for boys, and has a fine public library. Waterworks, electric lights, and several fine schools are among the public improvements. The settlement of Easthampton dates from 1665, and it was organized as a town in 1809. Population, 1905, 6,808.

**EAST HARTFORD** a town of Connecticut, in Hartford County, a short distance east of Hartford, on the New York, New Haven and Hartford Railroad. It has railroad shops and manufactures of paper, tobacco, clothing, and machinery. The noteworthy buildings include a town library, the Raymond Library, and the high school. It has public waterworks and electric lighting. The first settlement on its site was made about 1645. Population, 1910, 8,138.

**EAST INDIA COMPANIES**, the term used to designate companies organized in the 17th and 18th centuries for the planting of colonies and the promotion of trade. They were organized under the governments of Holland, Great Britain, Sweden, and Denmark, and were given a monopoly of foreign and colonial trade within certain districts. The company operating in a specified region was granted exclusive control in the matter of government and was permitted to organize armed forces, equip natives, and build defenses for the general good. Some of the companies paid an annual tax to the home government and in return received aid and protection. After a time difficulties arose regarding territorial claims, which resulted in several wars between some countries of Europe. The first English company was granted a charter by Queen Elizabeth in 1600 for the purpose of securing East Indian trade. It was chartered as "The Governor and Company of London Merchants Trading with the East Indies." It became the most powerful

body in its time, represented a large capital, and was controlled by a court of proprietors, who were large shareholders in the company. Parliament appointed a government board of control in 1784, and in 1858 made India a crown province, when the company ceased active existence, though for several years afterward it maintained an organization for the purpose of closing up its business.

In 1602 the Dutch company was organized and vied with the British until 1795 for the supremacy of the East Indian seas. The Danish company was founded in 1618 and had a varied existence until 1729, when its property interests were transferred to the state. In 1664 the first French company was founded. It continued operations until 1769, when its business interests were merged into the government. The Swedish company organized for the Indian trade in 1741, and reorganized on a government basis in 1806. Both the Danish and French made their chief seat of operations on the Coromandel Coast, while the Dutch operated in Sumatra, Java, and adjacent islands, and their possessions in the Dutch East Indies date from the operation of their company. The British company settled largely in India proper, at Calcutta, in Bombay, Bengal, and Madras.

**EAST INDIES** (ĭn'dĭz), the name applied to the region which includes the two great peninsulas of Southern Asia and the islands located from the delta of the Indus to the northern extremity of the Philippines. The appellation is made usually to distinguish these islands from the West Indies, and quite frequently includes all the islands southeast of Asia, except the Philippines and New Guinea.

**EAST LIVERPOOL** (ĭv'ĕr-pōol), a city of Ohio, in Columbiana County, on the Ohio River. It is on the Cleveland and Pittsburg Railroad and is surrounded by a fertile country. The noteworthy buildings include the public library, the high school, the city hall, and several fine churches. Many of the streets are substantially paved, lighted by gas and electricity, and traversed by electric street railways. The manufactures embrace furniture, cigars, machinery, ironware, and farming implements. It has large pottery interests and extensive machine shops. The place was settled in 1795 and incorporated in 1834. Population, 1900, 16,485.

**EASTON** (ĕst'ŭn), a city of Pennsylvania, county seat of Northampton County, 52 miles north of Philadelphia. It is at the junction of the Delaware and Lehigh rivers and on the Pennsylvania, the Lackawanna, the Central of New Jersey, and other railroads. Extensive slate quarries and coal and iron fields are

worked in the vicinity. Bridges connect it with South Easton and with Philipsburg in New Jersey. The noteworthy buildings include the public library, the county courthouse, and the high school. It is the seat of Lafayette College, a Presbyterian institution established in 1832.

Easton is an industrial center and a shipping point for coal and produce. The manufactures include machinery, wire, clothing, hardware, cordage, musical instruments, and food products. It has street railways, gas and electric lighting, waterworks, and pavements of stone and macadam. The place was laid out in 1750 and incorporated in 1789. Important treaties with the Iroquois were made here in 1756 and 1761. Population, 1900, 25,238; in 1910, 28,523.

**EAST ORANGE**, a city adjacent to Newark, N. J., twelve miles west of New York City, on the Lackawanna and the Erie railroads. Many business men of New York have handsome villas and make it their residence. The chief buildings include the public library, the town hall, and many schools and churches. It has electric lighting, well-paved streets, systems of sewerage and waterworks, and electric railways. It was a part of Orange until 1863 and was incorporated as a city in 1890. Population, 1905, 25,175; in 1910, 34,371.

**EASTPORT**, a city and port of entry in Maine, in Washington County, the easternmost settlement of the United States. It is located on Moose Island, in Passamaquoddy Bay, and has a deep harbor. The chief industries are fishing, shipbuilding, and sardine canning. Among the principal buildings are the public library, a customhouse, and several schools. The first settlement was made at Eastport in 1782, but it was claimed by England and captured in 1814. The British governed it under martial law until June 30, 1818. Population, 1900, 5,311.

**EAST PROVIDENCE**, a town of Rhode Island, in Providence County, across the Seekonk River from the city of Providence, on the New York, New Haven and Hartford Railroad. It is important as a manufacturing and commercial center. The chief manufactures include chemicals, fencing wire, handkerchiefs, clothing, and machinery. It was formerly a part of the town of Rehoboth together with Seekonk, Mass., but was set off from the former when the boundary line between Rhode Island and Massachusetts was definitely fixed. It was incorporated in 1862. Population, 1905, 13,750; in 1910, 15,808.

**EAST RIVER**, the name applied to the strait between Long Island Sound and New York Bay. It is twenty miles long and separates the

boroughs of Brooklyn and Queens on the southeast from those of the Bronx and Manhattan on the west and north. Blackwell's, Riker's, and Randall's are among the islands within the strait. It is spanned by the Brooklyn, the Williamsburg, and other great bridges. At the center of its course the Hellgate rock formerly obstructed the passage, but it has been removed by blasting. The strait is not properly a river. The misnomer probably arose from the powerful action of the tides, which resemble the current of a river.

**EAST SAINT LOUIS**, a city of Saint Clair County, Illinois, on the Mississippi River, opposite Saint Louis, Mo., with which it is connected by the famous Eads's Bridge. About twenty railroads enter the city, including the Illinois Central, the Wabash, the Baltimore and Ohio, the Chicago and Alton, and other lines. Among the noteworthy buildings are the public library, the city hall, the Howe Literary Institute, a Roman Catholic academy, and the public high school. Among the industries are rolling mills, car shops, gas works, foundries, nail factories, breweries, machine shops, flouring mills, and glass works. It has one of the largest stockyards in the United States and has extensive interests in beef and pork packing. The streets are well paved, drained, and lighted. It was incorporated as a town in 1861 and as a city in 1865. A tornado swept over the city in 1896, killing about 500 people and destroying property valued at \$10,000,000. Population, 1910, 58,547.

**EAU CLAIRE** (ō klār'), a city of Wisconsin, county seat of Eau Claire County, on the Chippewa River, at the mouth of the Eau Claire River. It has the advantage of steamboat navigation on the Chippewa, and is on the Wisconsin Central, the Chicago and Northwestern, and the Chicago, Milwaukee and Saint Paul railroads. The site of the city is divided into three parts by the two rivers, which are crossed by several bridges. It is the center of an extensive market in lumber and produce. The chief buildings include the county courthouse, the high school, the public library, and the Federal building. It is the seat of several institutions, including the Sacred Heart Hospital. Among the manufactures are flour, machinery, paper, hardware, lumber, and woolen goods. Gas and electric lighting, pavements, sewerage, and waterworks are among the improvements. An abundance of water power for manufacturing is obtained from both rivers. Population, 1905, 18,737.

**EBONY** (ěb'ŭn-ĭ), a hard, heavy wood, usually dark, susceptible of a high polish, and used in many kinds of ornamental cabinet work. In

various species of trees the heartwood becomes black and is the ebony of commerce. The Ceylon ebony is, perhaps, the best known, although the West India or Jamaica ebony of the bean family, a greenish-brown product, and the green ebony of the spurge family are of importance commercially. On account of jet black ebony being free from veins, it is considered the best. The different species are variously used for toys, mosaics, veneering, and inlaid work.

**ÉCARTÉ** (ā-kār-tā'), a game of cards which is popular in France, played ordinarily by two persons, but *pool écarté* may be played by three or more. In the latter the third player and others in the game act as advisers, remaining close at hand and advising one of the players, and, when one player loses a game, his place is taken by the adviser. The object is for the player to get all the tricks, but it is necessary for him to follow suit, if possible, and at other times he may trump. The game is interesting and is governed by elaborate rules.

**ECBATANA** (ěk-bāt'a-nā), an ancient capital of Media, founded about 728 B. C. It was inclosed by seven concentric walls, the innermost of which was gilded and the next was plated with silver, while the others were painted in order orange, blue, scarlet, black, and white, respectively. They rose in graduation toward the center, hence could all be seen at once by a spectator occupying an advantageous point. On a conical hill stood the beautiful temple of the sun. The city was about thirty miles in circumference during its prosperity. It was captured by Cyrus in 549 B. C. and later by Darius, who found there the edict of Cyrus the Great concerning the rebuilding of the temple of Jerusalem. Alexander the Great conquered it while on his famous Asiatic expedition. On account of its beautiful surroundings and mild climate it was made the summer residence of first the Median, second the Persian, and lastly the Parthian monarchs. It was pillaged by the Seleucidae and later by Antiochus the Great, and fell into utter decay, so that its exact site can no longer be fixed with certainty, though historians generally agree that the present Hamadan, containing the supposed tombs of Mordecai and Esther, occupies its ancient site.

**ECCENTRIC** (ěk-sěn'trĭk), a contrivance in mechanics for securing reciprocating rectilinear motion from a revolving shaft. It consists of a disc fixed on the axis or center of a wheel, which does not pass through the center of the other disc. Not being in the center, the result of its revolution is the same as a crank. It is used chiefly in machinery where a subsidiary motion of small power is required, as in operat-

ing the slide valves of steam engines and in working the force pumps of steam boilers.

**ECCLESIA** (ĕk-klĕ'zĭ-à), a popular assembly of the people, especially of Athens, to discuss public affairs. According to the laws of Solon these assemblages were held four times every 35 days, unless special meetings were called, when messengers were sent to summon the people from the country. Every citizen twenty years of age could vote and was required to attend under penalty of a fine. The poorer classes were paid a small sum for attendance. The meeting usually began by prayer to the gods, after which the business was introduced. Any regularly convened assembly came to be called *ecclesia*, and the name was afterward applied to the Church by the New Testament writers.

**ECCLESIASTES**, one of the canonical books of the Old Testament, commonly called the *Preacher* in the English versions. In the Hebrew it is called *Koheleth*, meaning the gatherer of the people. It is generally ascribed to the authorship of Solomon, but modern criticism places it at a much later date. The vanity of earthly good and the certainty of judgment are the two leading ideas of the Preacher. Some writers have imputed an epicurean meaning to several passages, but others regard them as mere ironical expressions.

**ECCLESIASTICUS** (ĕk-klĕ-zĭ-às'tĭ-kŭs), a book of the Apocrypha, commonly called the *Wisdom of Jesus the Son of Sirach*. The Jews and Protestants accept it as an apocryphal writing, but the Roman and Greek churches class it as canonical. It is recommended to be read for edification by the Articles of the Anglican Church. This book appears to have been written in Hebrew at Jerusalem about 250 B. C. It contains rules rather than principles for living, admonishes man to honor the law, and approves of the righteous life for the happiness that it brings.

**ECHIDNA** (ĕ-kĭd'nà), a genus of toothless mammals native to Australia. These animals have a long, slender muzzle, toothless jaws, long, thick fur intermingled with sharp spines, and feet provided with powerful claws. When frightened or in danger, they curl up like the hedgehog to protect the under parts, which have no spines. They are closely allied to the duck-bill and, like it, propagate by eggs. The food consists chiefly of ants and other insects, for which they burrow in the earth. The body is from a foot to eighteen inches long and somewhat broad and depressed, and the movement is quite rapid, considering the shortness of the legs. They lie dormant during the seasons of drought and come out most frequently at night.

Their flesh is prized as food by the Papuans and other natives.

**ECHINODERMATA** (ĕ-kĭ-nô-dĕr'mà-tà), one of the grand divisions into which the animal kingdom is divided. It constitutes an independent assemblage of organisms, formerly classed as radiates with the Coelenterates, and ranks as the third from the lowest of the divisions of the animal kingdom. The five parts of their body radiate from a central axis, hence the former classification, and their external skeleton is calcareous, which is leathery in some species and in others is covered with spines. The alimentary canal is distinct from the body cavity and is protected by the skeleton, and the nervous system is radiate. Reproduction is by eggs. The young are greatly different from the adult, especially in that they are bilaterally symmetrical, instead of having the radiate structure.

Some species of the Echinodermata effect locomotion by a peculiar water vascular system, by which the water is carried to a system of locomotor tube feet, or *ambulacra*, these being thrust outward and forward to produce movement. In some of the larvae movement is effected by long arms, which are stiffened by slender rods of carbonate of lime. These arms are absorbed at the time metamorphosis takes place. The sense of touch is well developed, but only traces of pigment eyes and of the blood system are found in some of the species, while in others they appear to be entirely absent. All the species, of which there are about 3,000 now living, are marine and are distributed through all seasons. Seven divisions have been made of the echinodermata, depending upon the form of the body. They include the sea cucumbers, sea urchins, brittle stars, starfishes, cystoids, and pentremites. See **Starfish**; **Urchin**.

**ECHO** (ĕk'ô), in Greek mythology, one of the Oreades or mountain nymphs, daughter of the earth and air. It is related that Echo fell in love with Narcissus, who was deaf to her entreaties. In her grief she wasted away until nothing remained but her bones and her voice. Later she was avenged by Nemesis, who inspired Narcissus with a love for himself. Many poets have used the story as a basis for exquisite productions.

**ECHO**, a Greek word meaning sound, signifying the repetition of a sound wave, in the air, reflected from some obstacle. When the reflecting surface is at right angles, the sound waves are returned to the person or object causing them, but, if oblique, the echo is sent in another direction and may be perceived in some other locality than the one from which the

waves were induced. No absolute law can be laid down for the exact distance the reflecting object must be from the speaker. Sound at 60° Fahr. has a velocity of 1,120 feet per second. If in ordinary speech five syllables are uttered in a second, then the speaker, standing in front of a reflecting surface 112 feet distant, can hear the last syllable. The other syllables are reflected, but reach the speaker just as he begins the next syllable, hence he does not hear them as distinct sounds. A sharp, quick sound may be heard 56 feet distant. In a properly constructed hall the voice of the speaker is strengthened in effect by the waves reflected by the walls and ceiling. If the walls are too close or too far the sound is confusing. Natural echoes are produced by woods, hills, rocks, and mountains, and many localities have become famous on account of them. Some echoes are repeated a number of times. It is said that the report of a pistol is repeated sixty times by an echo in the Simonetta Palace, near Milan, Italy. Lake Killarney, in Ireland, is noted for its echo, which belongs to this class.

**ECLECTICS**, a class of philosophers who selected or chose from others what they considered the best parts of all the recognized systems. As a school of philosophy eclecticism necessarily had its rise after other systems had been established, since it chose what was regarded the best and harmonized it into a new system. Since both Plato and Aristotle drew from the philosophies of those who preceded them, they may be regarded as eclectics in a certain sense. However, those belonging more particularly to this class include Plutarch, Plotinus, and Epictetus. Victor Cousin, the French writer on the history of philosophy, is the most eminent modern eclectic.

**ECLECTIC SCHOOL OF MEDICINE**, the school of medicine which relies upon treating patients as thought advisable by the physician rather than to follow closely the instruction of schools. It is an American system and is known also as the New School of Medicine, though it may more properly be said to be the modern representative of a system of healing that dates from the year 200 B. C. It must not be assumed that the eclectic practitioner is an absolute individual, but rather that he relies upon individual judgment while at the same time he keeps in mind what has been learned in medicine and the art of healing by experiments. Wooster Beach founded an eclectic college in New York City in 1826, and it may be said

that the modern eclectic school of medicine dates from the early part of the 19th century. He published a number of text-books which are still looked upon as standard, and founded colleges in a number of states. In 1870 the National Eclectic Medical Association was incorporated in New York and since then other associations of the same kind have been organized, all of which have for their aim the improvement in the art of healing. While the medicines generally employed in the treatment of diseases are used by this school, in theory it does not favor the employment of mineral substances and is an advocate of using native plants that possess medicinal properties. This position in relation to plants has been the means of obtaining much information regarding American plants useful in the treatment of diseases. In 1908 there were about 875 students in attendance at 24 eclectic medical colleges in the United States.

**ECLIPSE** (ĕ-klĭps'), an obscuration, partial or total, of a heavenly body by its entering the shadow of another body, as when the moon enters the shadow of the earth, or a satellite that of a planet. An eclipse may occur by the partial or total disappearance of the sun as the effect of the passage of the moon between it and an observer. Stars, planets, and the satel-

ECLIPSES.

S, sun; E, earth; M, moon; P P, penumbra.

lites of planets may be eclipsed, but the principal eclipses are those of the sun and moon. An eclipse of the sun begins by an obscuration of the western side of the disc and ends on the eastern, while an eclipse of the moon begins on the eastern and ends on the western side.

**SOLAR.** When the sun and moon are in conjunction at the time of new moon, the moon is necessarily between the earth and the sun, the three bodies being in a straight line, as shown in Fig. 2. This causes an eclipse of the sun. If the moon's orbit were in the same plane as

the ecliptic, an eclipse of the sun would occur at every new moon; but, since the orbit is inclined, an obscuration can occur only at or near a node. As a consequence of the diameter of the moon being comparatively small, the cone of the shadow cannot enshroud to exceed 180 miles in breadth of the earth's surface. Within this region occurs a *total eclipse*, and for a certain distance beyond only a portion of the sun's disc is obscured, where the eclipse is said to be *partial*. When the eclipse takes place at the time the moon is farthest from the earth, its disc does not cover the disc of the sun, thus leaving a ring exposed to the vision of the observer. This is known as an *annular eclipse*. The longest duration possible of a total eclipse

tions in Labrador unsatisfactory, but good results were obtained in Spain and Northern Africa. The Lick Observatory sent a party to Egypt, where a number of fine views were taken with photographic telescopes. In that region the shadow bands were nearly parallel and moved as fast as a walking man. During the eclipse little variation was shown by terrestrial magnetic elements.

LUNAR. Eclipses of the moon are caused by the moon passing through the earth's shadow, as shown in Fig. 1. They can only occur at full moon. The moon does not disappear completely even in a total eclipse, because of the refraction of the solar rays in traversing the lower strata of the earth's atmosphere. Since

PATH OF THE TOTAL ECLIPSE, AUG. 30, 1905.

of the sun in any locality is only about eight minutes.

An unusually interesting total eclipse of the sun occurred Aug. 30, 1905. In the accompanying illustrations are shown the path of the eclipse and the result of observations taken on board the *Lucania*, a vessel belonging to the Cunard Company, while at sea during a westward passage. At sunrise the path of the total eclipse came in contact with the earth near Lake Winnipeg, passed north of Newfoundland into the Atlantic, reached Spain at noon, passed over Northern Africa, and ended in Arabia. The maximum velocity was 2,000 miles per hour; average 1,000 miles; width of path of total eclipse, 160 miles; duration of totality,  $2\frac{1}{2}$  to  $3\frac{3}{4}$  minutes. Cloudy weather made observa-

a *penumbra* surrounds the shadow of the earth, it sometimes occurs that the moon does not reach the true shadow, passing only partly within the *penumbra*. There never can be an annular eclipse of the moon, for the reason that the earth's shadow exceeds in diameter the moon's disc. Total eclipses of the moon are rarer

events than those of the sun, yet are seen more frequently, for the reason that they are visible over the entire unilluminated hemisphere of the earth, and also because of the long duration of the eclipse, which may last several hours.

Total solar eclipses at any given point on the earth's surface are exceedingly rare; prior to 1715 none had been visible at Paris, France, for five and a half centuries. In ancient times the people were very much frightened during an eclipse, and thought them presages of dire events. All manner of frantic efforts were made to drive them away. At one time the laws of Rome made it punishable blasphemy to talk publicly of their being due to natural causes. See **Sun; Moon.**

**ECLIPTIC** (ĕ-kliĕp'tic), the apparent yearly

path of the sun around the celestial sphere. It was so called by the Greeks for the reason that they observed that eclipses of the sun and moon can occur only when these bodies are near this circle. The earth's axis is not perpendicular to the plane in which the sun appears to move, but is inclined  $23\frac{1}{2}^{\circ}$ . If the stars could be observed in the daytime, the sun would be seen to be moving slowly among them toward the east, just as the moon does at night; this path is the *ecliptic*. Now, if the earth's Equator is imagined to be extended as a great circle into the heavens immediately above its true position, it is known as the *celestial equator* and cuts the ecliptic at the equinoxes. The position of the sun on March 21 and Sept. 21 is on the Equator or equinoctial points. Then, there are two periods in the year when the sun has reached its greatest distance from the Equator—June 21 and Dec. 21. These four points are distant from each other by a quadrant of a circle, or  $90^{\circ}$ . Each quadrant is divided into three arcs, or  $30^{\circ}$ , from which are reckoned twelve signs of  $30^{\circ}$ , called *signs of the zodiac*, being named from constellations through which the ecliptic passes. The equinoctial points are not fixed, but recede westward about fifty seconds in a year, while the angle at which the ecliptic stands to the Equator is diminishing also about fifty seconds in a century. The decrease, however, has a limit, and there is a point beyond which it can never pass. It requires 8,000 years to change a degree, and this can never sensibly affect the seasons.

**ECLOGUES** (ĕk'lŏgz), a class of pastoral poems, so named from the *Eclogues* of Virgil. The poems of this class relate the loves and adventures of shepherds and shepherdesses. Spenser's "Shepherd's Calender" is a good example of an English eclogue. Pope made this class of literature popular in the 18th century.

**ECONOMICS** (ĕ-kŏ-nŏm'iks). See **Political Economy**.

**ÉCOLE DES BEAUX ARTS** (ă-kŏl' dă bŏ zăr'), the national school of fine arts in Paris, France, founded as an academic school by Mazarin in 1648. The present name was not given to it until 1815, and a system of workshops were added to the main institution in 1863. It is situated in the Villa Medici, on the Pincian Hill, and takes rank as one of the most important schools of fine arts in the world. Both men and women between the ages of fifteen and thirty have free access to the courses, which include drawing, sculpture, painting, engraving, architecture, modeling, and gem cutting. Foreign students are not subject to the age regulation and not eligible to the *Prix de Rome*, which

was established in 1666. Students may remain as long or short a time as they desire, but the regular course is from eight to ten years. About 40 teachers give instruction, twelve in the workshops and 28 in the École proper, and the students number approximately 1,350.

**ECUADOR** (ĕk-wă-dŏr'), a republic of South America, located mostly south of the Equator. It extends from  $5^{\circ}$  south latitude to  $1^{\circ} 45'$  north latitude. Its northern and eastern boundary is formed mainly by Colombia; southern, by Peru; and western, by the Pacific Ocean. The boundary between it and Peru and Colombia has been in dispute for many years, hence the area cannot be stated with accuracy, but is usually given at 118,500 square miles.

**DESCRIPTION.** The surface is divided naturally into the extensive plains in the east, the elevated mountain regions through the center, and a narrow coast region lying between the latter and the ocean. Many of the mountains are active volcanoes, and the ranges are traversed by longitudinal valleys and plateaus. Two chief mountain ranges, both containing snow-clad summits, traverse the country in a direction from north to south, though the western of these has the more highly elevated peaks. It contains the highest summit in Ecuador, Chimborazo, elevation 20,500 feet, but its peaks as a whole are generally lower than those of the eastern range. The loftiest mountains of the latter are Antisana, Cayambé and Cotopaxi, the last mentioned being 19,612 feet. The sea coast is quite uniform, being indented only by the Gulf of Guayaquil. Many of the plateaus take the form of valleys among the mountains and their soil is generally fertile. In the eastern part of the country, east of the Andes, is an extensive fertile plain belonging to the Amazon basin.

A larger part of the country slopes toward the east, and the drainage is chiefly by tributaries of the Marañon, as the upper course of the Amazon is called. These tributaries include the Napo, the Putumayo, and the Japura, and some of these streams furnish transportation facilities with the Amazon. The rivers of the western slope are short and flow rapidly. They include principally the Mir and the Esmeraldas. Ecuador has numerous lakes, but all of them are small.

The climate is tropical, but is greatly modified by differences in altitude. Excessive heat and moisture render the eastern and western plains unhealthy, but some parts of the elevated interior are delightful, especially the valleys of the Andes that have an altitude of about 8,000 feet. The regions that have an elevation of

more than 9,000 feet have a cold and rigorous climate, but habitations are met with at much greater heights in many of the mountains. It may be said that the dry and the rainy seasons form two divisions of the year, the former from June to November and the latter from December till May. In the deep river valleys the thermometer seldom registers below 80°, while the elevated summits are covered with snow perpetually. The rainfall is abundant in all parts of the country, hence fine grasses and thick forests are abundant. Tropical vegetation thrives in regions elevated less than 6,000 feet, and above that it becomes more rigid. Among the wild animals are the tapir, alpaca, jaguar, monkey, vicuña, and many birds of prey and plumage.

**AGRICULTURE.** Farming is the chief industry and cacao is the principal product. It is cultivated extensively in the provinces of Oro, Manabi, and Guayas. Coffee takes second rank and is grown chiefly in the lowlands. Sugar cane is cultivated quite extensively. Indian corn, rice, tobacco, wheat, barley, and oats are grown profitably. The forests yield chinchona bark, sarsaparilla, vegetable ivory, and rubber, and the trees yielding these products are grown with considerable care. Alfalfa is cultivated for hay. All the domestic animals common to North America thrive, but sheep and cattle receive the larger share of attention.

**MINING.** Many minerals are found in the mountains, including coal, iron, zinc, and the precious metals, but very little has been done to develop the mineral resources. Gold is the chief mineral product, and copper and petroleum are obtained, though in comparatively small quantities. The lack of development may be attributed both to the lethargy of the people and a general lack of transportation facilities.

**MANUFACTURES AND COMMERCE.** The manufacturing interests are developed but slightly, the most important products including flour, lumber, leather, cotton goods, clothing, and sugar. Coarse fabrics and straw braid used in making hats and other straw articles are produced in considerable quantities. Fruits and fish are canned to some extent for transportation. The exports usually exceed the imports. Foreign trade is chiefly with France, Germany, Great Britain, and the United States in the order named.

Most of the interior trade is carried by pack animals, owing to the fact that the highways are not improved and become almost impassable in the rainy season. A good highway is maintained most of the way from Quito to Guayaquil, the chief port. Not more than 265 miles of

railways were in operation in 1900, the principal line extending from Guayaquil inland, but a line from Quito to Guayaquil, about 300 miles in length, was completed in 1905. In 1908 the total lines in operation had a length of about 500 miles. Most of the telegraph and railway lines were built by foreign capital.

**INHABITANTS.** The population is composed largely of a mixture of Negroes, Indians, Spanish Creoles, and Whites. The white inhabitants are in possession of most of the land and manage the business enterprises, while the colored races engage in agriculture and hunting. It may be said that the Indians consist chiefly of two classes, of which the descendants of the Incas are the most numerous and most highly developed in civilized arts. Spanish is the official and spoken language, and Roman Catholic is the state religion, though other faiths are tolerated. Education has made little advancement among the common people, but a number of elementary and secondary schools are maintained. The national university is located at Quito. Quito, the capital, is the largest city and Guayaquil, on the Gulf of Guayaquil, is the chief seaport. Other cities include Cuenca, Riobamba, Latacunga, and Ambato. Population, 1906, 1,450,000.

**GOVERNMENT.** Ecuador is divided into sixteen provinces. The constitution vests the executive authority in the president and a ministry, and the president is elected for a term of four years. The congress consists of two houses, the senate and the house of representatives, the members of which are elected by direct vote, in the former for four years and the latter for three years. All male citizens who have attained to the age of 21 years and are able to read and write are granted the right of suffrage. The Indians were practically in a condition of slavery and were not represented until 1896, when they were admitted to citizenship under certain restrictions. A supreme court of six judges constitutes the highest judiciary. The standing army consists of only 3,500 men and the navy is not materially strong, being made up of a few torpedo boats and transports.

**HISTORY.** The early inhabitants of Ecuador were advanced in many of the arts of civilization, and they had many writings and records that were destroyed when their dominion was overthrown. At the time Pizarro conquered Peru for the Spaniards, Ecuador formed part of the great empire of the Incas. From 1564 until 1718 it existed as an independent presidency under Spain, and in the latter year became a part of the state of New Granada. A

revolution in connection with adjoining countries against Spain secured its independence in 1822, when the Spaniards were defeated in the Battle of Pichincha, and in 1831 it was organized as a separate republic. The present constitution dates from 1906, and since then the country has enjoyed an era of reasonable progress.

**EDDA** (ěd'dá), the name by which two ancient Icelandic works in literature are known. The term means "great-grandmother," and is a fitting appellation of this work, being an interesting forerunner of Scandinavian literature. The "Poetic Edda" was compiled in the 13th century and contains mythical poems, while the "Prose Edda" was written partly about 1230 and was discovered in 1628. The poems of the former praise the deeds of Scandinavian gods and heroes, while the latter treats of northern myths, exemplifies Scaldic poetry, and comments on the achievements of Haco of Norway, who died in 1263.

**EDDYSTONE LIGHTHOUSE** (ěd'di-stōn), a celebrated lighthouse of England, situated in the English Channel, on a group of rocks called Eddystone. Owing to tides covering the rocks daily, it became necessary to guard against shipwrecks at this point of danger. The first lighthouse was completed in 1700, but was destroyed by storm in 1703, and the second was burned in 1755. The third was a massive structure of limestone, with a granite inclosure at the foundation, and of sufficient height to cast a light thirteen miles. Owing to erosions at the foundation rocks by the action of sea waves, a new one was completed in 1882. This structure is the highest yet built at this place. It is equipped with the newer modern appliances and casts a light nearly eighteen miles.

**EDEN** (ě'den), the locality in which the first human family had its residence. In the eastern part of it was a garden, which was watered by a river and from thence the stream parted into four channels, though we have been unable to locate its exact place. Both the early Hebrew and Aryan writers believed that the human race first inhabited the mountains of Central Asia and that Eden was located in that part of the continent. At present it is generally assigned to Babylon and Armenia, with the preponderance of argument in favor of the former. The New Version of the Bible speaks of it as the Garden of Eden, and Milton calls it Paradise in his "Paradise Lost."

**EDENTATA** (ě-děn-tā'tà), or **Toothless Animals**, an order of mammalia established by Cuvier. The ant-eaters and pangolins are the

only edentata that are absolutely destitute of teeth; but, with the single exception of the armadillo, which has one, none of the order have any incisor teeth, and the back teeth are very imperfect, being destitute of enamel and distinct roots. The sloths belong to one tribe of this order and alone subsist on vegetable food. The armadillos, pangolins, and ant-eaters subsist on insects or on animal substances in a decaying state. No fossil forms of the ant-eaters and sloths have been found, but the edentata is represented by the extinct *Megatherium* and other mammals of gigantic size.

**EDGEHILL**, the locality of the first important battle of the Civil War in England. It was fought on Oct. 25, 1642, when King Charles had decided upon attacking London, but was met by 10,000 troops of Roundheads under command of the Earl of Essex. The army of the king numbered about 12,000, taking a stand on Edgehill, and their command rested largely with Prince Rupert. This commander led the right wing of the Royalists and made a gallant charge upon the left wing of the Roundheads, pursuing them for several miles. The Roundheads inflicted a severe loss upon the royal infantry and succeeded in driving the opponents back. Though the Royalists suffered the heavier losses, the battle terminated as an indecisive struggle.

**EDICT OF NANTES.** See **Nantes**.

**EDINBURGH** (ěd'n-bŭr-ŏ), the second city and the capital of Scotland, in the county of Midlothian, 46 miles east of Glasgow. It is located on a series of ridges and is surrounded on all sides by mountains, except the north, where the ground slopes gradually toward the Firth of Forth. The site of the ancient city was on the central ridge running from west to east, which is terminated on the north by a high, rocky cliff now containing the Castle, and on the east by Holyrood House. Castle Hill and Arthur's Seat, the latter 822 feet high, and several other lofty elevations overlook the city. Prince's Street, a fine promenade, divides the city into the two parts known as the Old Town and the New Town. Between the two parts are charming recreation grounds and the National Gallery and the Royal Institution. Cowgate Street and High Street intersect the Old Town and are the principal thoroughfares. Portobello, on the Firth of Forth, is included in the city.

Edinburgh is the seat of the supreme courts of Scotland and has several fine government buildings. Among the noteworthy structures are Saint Giles's Church, a beautiful edifice in the Gothic style; Victoria Hall; Tron Church;

the Bank of Scotland; the Advocates' Library, with 490,000 volumes; the Signet Library, with 70,000 volumes; and a fine public library built by Andrew Carnegie. The Palace of Holyrood, which dates from the 12th century, had its origin in the abbey founded by David I. In the crown room of the Castle, located on Castle Hill, are the crown regalia, known as the *Honours of Scotland*. This building was the scene of many events in the life of Mary, Queen of Scots, and here her son James was born.

The city is noted for its progressive position in the management of public utilities, such as the systems of waterworks, sewerage, and gas and electric lighting. It is well connected by railroads and electric car and telephone lines, and has beautiful parks, boulevards, and paved streets. Among its leading manufactures are beverages, machinery, soap, clothing, paper, fabrics, and earthenware. The public school system is well established. It is supplemented by numerous high schools, academies, and the famous University of Edinburgh (q. v.).

Edinburgh is mentioned as having been the capital of the King of Northumbria early in the 7th century, and was named from King Edwin, a powerful monarch, who absorbed the Lothians and added them to his dominion. Robert Bruce made the city a borough and caused the establishment of a port on the Firth, now called Leith. It became the capital of Scotland in the 15th century, the first wall for its defense being built in 1450. After the defeat at Flodden in 1513, the walls were enlarged to include Cowgate. The English burned the city in 1544, and Queen Mary made it the seat of her short reign in 1561. When Scotland became united with England in 1707, the city was materially affected by the removal of the Scottish nobility, but in 1745 the Pretender made it his seat of action for a brief period. Population, 1907, 345,747.

**EDINBURGH UNIVERSITY**, a noted institution of higher learning in Edinburgh, Scotland. It was founded in 1592 under a charter granted by James VI., though it did not attain its higher sphere of influence until the early part of the 18th century. Originally it had only four regents, besides the principal professor. At present it has a faculty of 125 and maintains four extensive departments, including medicine, law, arts, and divinity, each conferring appropriate degrees on graduation. The government is vested in a body known as the senate, and the officers consist of a chancellor, rector, and principal. It is provided that the acts of the senate are subject to review by a univer-

sity court, the members of which are appointed partly by the town court and partly by the university authorities. The present building of the university was begun in 1789. In its library are 2,500 manuscripts and 220,000 printed volumes, though this is supplemented by several large department libraries. In connection with it are numerous learned societies and museums devoted to natural history, general history, and anatomy. A number of fellowships and scholarships are granted annually. The number attending the different departments aggregates about 3,150. Some of the most eminent English teachers have been professors in this institution, and among its graduates are such prominent men as Scott, Carlyle, Goldsmith, and Darwin.

**EDINBURGH REVIEW**, a periodical established at Edinburgh, Scotland, by Sydney Smith in 1802. In this enterprise he was aided by Francis Jeffrey, Henry Brougham, Francis Horner, and a number of others. This publication was the first of the critical periodicals to be established in the 19th century. It exercised a wide influence in favor of the Whig party, but was relatively more important as a review of and factor in literature. Macaulay and a number of other eminent writers contributed to this periodical.

**EDMONTON** (ě'dmŭn-tŭn), a city of Canada, capital of the province of Alberta, 800 miles northwest of Winnipeg. It is located on the Saskatchewan River and on the Canadian Pacific, the Canadian Northern, and the Grand Trunk railways, and is surrounded by a fertile farming and grazing country. Coal, gold, silver, and platinum are mined in the vicinity. The principal buildings include those of the government, the public library, the city hall, the high school, and a number of substantial churches. The public utilities, including electric lights, waterworks, sewerage, and a gas plant, are well established. It is the center of a vast region which is easily reached by railways, hence is a growing market and has a large retail and wholesale trade in produce and merchandise. Population, 1906, 11,167.

**EDOM** (ě'dŭm), meaning *red*, the name given to Esau on account of the red pottage secured by him from his brother Jacob. The name was also given to the country settled by Esau, having been previously known as Mount Seir. It was about 100 miles long and twenty miles wide and was situated between the Dead Sea and the Gulf of Akabah, an inlet from the Red Sea. Bozrah, now Buseirah, situated in the extreme northern part, was its chief city and the capital. During the reigns of David and

Solomon, Edom was under subjection to the Israelites. Later the Edomites ravaged the southern borders of Palestine, and were denounced with considerable vehemence by some of the prophets of Israel. After the destruction of Jerusalem, in 70 A. D., the name of Edom or Idumæa disappeared from geography.

**EDUCATION** (ĕd-ŭ-kā'shŭn), a word derived from the Latin *educare*, meaning to lead forth. In a philosophical sense education is the natural inheritance of every individual, since he is impressed and developed for good or evil by all with which he comes in contact, everything he sees, feels, hears, and does influencing action and forming tendencies. According to this view, education begins with parental influence and terminates only when life ceases. The more common application of the term involves the efforts premeditated by parents and teachers to induce exercise of the powers of the learned in such a way as to become the most possible in physical strength, intellectual power, and moral goodness. To accomplish this high ideal, those instructing need to know the laws under which human development makes the most efficient progress; they must understand the possibilities of the student, and also be capable to administer precepts and examples to good purpose, in the process encouraging what is good to the individual and discouraging the tendencies that may result in harm.

**FUNDAMENTALS.** In a rational system of education it is necessary to enrich the life of every member of society with the fundamental elements and basic principles that underlie true development. This should be done for the universal good, and to the fullest extent of the personal capacity of each individual. In addition to the general culture that ought to be secured to all, there should be more or less technical training to fit for the calling in life by which the learner desires or is likely to support himself. Such an education necessitates a well-organized system of elementary schools at which all may be trained, secondary schools for a smaller number, and colleges and universities for those expecting to assume higher responsibilities or enter the learned professions.

However, education is not creative in its nature. Its aim is to attain the fullest development and highest right activity of the faculties of the body, mind, and soul. To accomplish this it is necessary to cultivate by right activity all the pliant, plastic innate powers by means of a continuous culture well adapted to individual needs. The culture must aim at harmonious training of all the faculties, having for its object the development of existing possibilities

into realities. It must take account of every need in order that the highest possible form of learning, development, and efficiency may result.

**THREEFOLD AIM.** The true aim in education is threefold and deals with the physical, intellectual, and moral. *Physical culture* should train the body that it may be strong, healthy, vigorous, graceful, skillful, and responsively active to the will. *Intellectual training* should engage the mind with and develop the love for knowledge, qualify for the independent acquisition of knowledge, and prepare for regular practice in the use of knowledge. *Moral culture* should strengthen the conscience and will by the formation of habit in carrying out pure feeling and good thought, to secure ready obedience to law as the embodiment of right, induce a consciousness of individual power and responsibility, and implant self-faith as the result of faith in a divine Providence.

**EDUCATIONAL SYSTEMS.** The systems of schools for the general dissemination of education have been and still are greatly diversified in courses of study, and the scope of education itself has shown marked differences in all ages and civilizations. All the countries that take some rank in educational arts maintain at least a portion of the general system that should be fostered in all highly civilized states. A complete system of the schools involves the establishment of many institutions with diversified courses of study, each aiming to cover its portion of a general system, and articulating in a well-connected way with others.

Among the schools recognized by the leading nations are: 1. *Kindergartens*, schools in which the young are trained to develop right activity of the body, though some attention is usually given to elementary growth in intellect. In communities not recognizing this class of schools essential in the process of education, the elementary work is done largely in the homes by mothers or private teachers. 2. *Common schools*, institutions designed for teaching the rudimentary branches, with courses of study so graded as to prepare the pupil for the various higher institutions. 3. *Schools of agriculture*, comprising courses in gardening, botany, horticulture, geology, vegetable chemistry, zoölogy, pomology, and surveying. 4. *Industrial schools*, including the teaching of industrial labors and work and the arts of trade. 5. *Schools of fine art*, those designed for educating artists in the various fine arts, such as sculpture, painting, music, poetry, and architecture in its character as art. 6. *Schools of technology*, institutions designed to teach civil, electrical, and military

engineering, geology and mining engineering, photography, engraving, building, navigation, telegraphy, and astronomy. 7. *High schools*, institutions having courses of study covering higher branches of learning than the common schools, and designed to prepare pupils for institutions in which they may secure such training as will best fit them for their vocation in life, among them those named below. 8. *Schools of business*, in which students are trained in all classes of business, such as banking, commerce, manufacturing, and office work. 9. *Law schools*, institutions for the education of lawyers. 10. *Normal schools*, the institutions established exclusively for the education of teachers. 11. *Schools of medicine*, those containing courses and facilities for the education of surgeons and doctors of medicine. 12. *Colleges*, institutions where the highest branches of knowledge and science are to be taught, and having courses designed to prepare a corps of men devoted exclusively to culture and science. 13. *Universities*, the highest institutions of learning, in which the most extended courses of study are offered to men and women who aspire to the more learned attainments in the arts and sciences, and to fit them for the greatest activity and highest good in the professions of law, medicine, ministry, and teaching, and for philosophical work. In each class the highest development of the moral faculty is to be made an objective point, which is the case in all the schools of the most progressive nations. The higher lines of education, above the basic, have been designated as moral, political, aesthetic, philosophical, and religious.

**HISTORY.** The history of education is concerned, more or less, with every epoch from which any record has passed down to us. Few studies are of deeper interest than the one that traces the systems under which man's influence upon nature was enlarged through the successive centuries, and by means of which he attained his present high development. Whether man in the beginning occupied a higher or lower status than at present has been a subject of controversy from remote times, though, so far as profane history is concerned, it is evident that he has been enabled to attain greater power and influence through the impulse of educational arts. Sacred history represents the first parents created in the image of God, and accords them efficiency to reason and converse with each other. Cain was not only a tiller of the soil, but is represented as a builder of a city which he named Enoch, after his firstborn son. In the seventh generation from Adam, and while that patriarch still lived, it is re-

corded that Tubal-Cain "was an instructor of every artificer in brass and iron," and that his half-brother, Jubal, "was the father of all such as handle the harp and the organ."

While it is impossible to determine the exact status of antediluvian education, it is evident that in the twilight ages man advanced materially in civilized arts. The invention of the organ and the harp, and the skill of artificers in brass and iron, imply that many others and related discoveries and inventions had been made. However, advancement in education dates from and is measured largely by the art of writing, this art being considered the prime meridian from which to measure. Committing thought to writing made it possible to pass funds of knowledge from generation to generation with much better results than by story and tradition. Besides, all succeeding generations were enabled to ponder the achievements of preceding ages, as well as profit by the failures and successes of the generation that preceded them. The writings were not necessarily made up of such characters as are used exclusively by the Caucasians at present, but included various forms of hieroglyphics and symbolical characters on monuments, stones, and architectural structures.

*Oriental Nations.* Among the early civilizations and antiquities the Chaldean, Babylonian, and Assyrian take high rank, and much knowledge of their skill and progress has come to us through various sources by means of monumental writings and architectural ruins, most of which are given us by the Greek historian, Herodotus, and the German, Max Müller. The rise of the Chaldean civilization dates from Nimrod, about 2300 B. C., when Babylonia was founded. These ancient peoples erected great cities, collected vast libraries, founded schools, and disseminated knowledge and learning for many centuries. Passing from their settlement on the Tigris and Euphrates to Egypt, we find a high state of civilization and a wide range of culture that had their beginning more than 4,000 years ago. In their city of Alexandria was a great university, which taught a system of geometry perfected by Euclid, and in accord with which and other productions the Egyptian intellect towered and expanded, attaining a foothold almost as durable as their gigantic pyramids and the time-enduring sphinx. Their system of education, like that of India, was largely characterized by the baneful influence of castes, resulting in classes who towered as educational giants on the one hand, and descended to the status of intellectual pigmies on the other.

In scrutinizing human history it is remarkable that practically every portion of value in education comes generally from the Caucasian race, the Mongolian being the only other race that presents any original theories and primitive acquirements of material knowledge. The educational system of China dates from Confucius, who lived about 500 years before Christ, and ever since his teachings have had a marked influence upon the Chinese and some effect among the Japanese, though Brahmanism and Buddhism have had more or less influence upon the education of both peoples. China still adheres closely to the educational theories and practices of the ancients, neglecting the education of women, but grading promotion in state affairs entirely upon educational merit, while Japan is breaking away from the old with remarkable rapidity and inaugurating schools and courses of study maintained in the systems of modern states. The latter people are distinguished by greater energy and independence of character than the Chinese, and are willing to inaugurate the newer and better, even if many traditional and time-tested institutions must be set aside.

*Ancient Classical Nations.* From Western Asia and Northern Africa education moved westward to Greece, and eventually from Greece to Rome. According to the writings of Homer, it is certain that the early education of Greece was patriarchal. Later four divisions arose, of which the Dorians and Ionians are the most noteworthy. The seat of influence of the former was at Sparta, and their higher education was largely the outgrowth of the codified laws of Lycurgus, though the teaching of Pythagoras influenced the whole of Greece by its strictness and aristocratic tendencies. Solon codified the laws of the Ionians. Their center of influence was at Athens. Socrates, Plato, and Aristotle are the great teachers of Greece, and rank highest in power and influence.

Numa Pompilius founded Roman education, though Greek culture was introduced in its entirety about 250 B. C. The great orator, Cicero, gave perfection to Roman rhetoric, while Seneca and Quintilian rank as the greatest educational writers. Greek education aimed to develop especially the beautiful and good. The Greeks as well as the Romans maintained a highly educated priesthood, though education was extended to all save the slaves and extremely poor. The young were trained early in life. Physical and intellectual strength were objective in all, while their religious culture consisted of the worship of representative gods, such as we read of in mythology. These were sacredly represented in statuary, temples were

built to their honor, and the young were admonished to do them reverence.

*Early Christian Era.* The influence exercised by the teachings of Christ is the most marked and contains the essential and basic principles of education. They oppose all external distinction among men, recognize the equality of women, and make capability the only limit of man's development. By their precepts man is taught to become perfect, and live, grow, be active, avoid stagnation, and seek progress and expansion. Its injunctions require activity, according to the talents possessed. Those who have the greater capabilities are presumed to accomplish the most and serve the higher and more useful purposes in society. Upon these principles of teaching every true system of modern education is based. They sustained the severest criticisms of the Middle Ages, were embraced by the early educators of modern times, and permeate the writings of the great master teachers.

*Education in Europe.* The Reformation (q. v.) is the beginning of the great epoch of modern education in Europe. Promoted by Luther, Melancthon, and Wycliffe, it taught the doctrine of justification by faith alone and the necessity of reading the Bible. This caused the Scriptures to be translated into the modern tongues and gave rise to schools which taught the people to read and write. Ultimately it made possible the great universities, such as those at Oxford, Cambridge, Edinburgh, Berlin, Paris, and Vienna. Among the teachers and writers who influenced educational thought in Europe are Bacon, Comenius, Locke, Francke, Rousseau, Kant, Fichte, Richter, Hegel, Rosenkranz, Herbart, Beneke, Pestalozzi, Froebel, and Spencer. Germany has been rightly named the *land of pedagogy*, and the influence of its great teachers has been felt in every civilized country. Its institutions have long had the highest reputation on account of their excellence for training teachers and inducing education, from the kindergarten system to the colleges and universities.

The education of modern Europe is largely statal, attendance is free and compulsory, and the courses of study cover, not only branches of classic learning, but disseminate knowledge and skill in the arts of industry. The primary schools have been given over entirely to women teachers, while grammar grades, higher instruction, and supervision are limited almost exclusively to men. Institutions and associations of teachers are maintained and exercise influences similar to those in America, while periodicals and books devoted to pedagogy are read extensively. The newer statistics place Sweden

in the highest rank among the nations of the world on account of its common school education, illiteracy there being limited to the lowest per cent. It is impossible to speak of all the many excellent qualities of European schools in this article, and it may be sufficient to say that all the progressive nations of Europe, and, for that matter, of the world, are giving closer attention to the building of schools and the education of the young for the state and for life than in any other period of history.

*Education in America.* Education has been a profound study in America, though the United States and Canada represent its greatest development and most marked influence. The representative form of government makes it necessary to educate universally, else our civil institutions must fail. The dangers of universal suffrage can be overcome only by universal education. In recognition of this fact legislation along educational lines was early directed to the building of schools and the founding of colleges. Massachusetts led the way in 1632 by requiring all children to be taught to read and write. Later, when the United States was established as an independent government, Congress set aside lands to aid schools, and in the newer states and territories sections sixteen and thirty-six of each township were reserved for that purpose. Normal training schools for teachers are maintained in nearly all the states by public taxation, at which admission is free, and through whose influence a strong profession of teaching is developing. The Commissioner of Education is an important officer of the Federal government, whose influence for good by means of treatises, lectures, and published reports is widening constantly in the entire nation.

The states maintain either State commissioners or superintendents of public instruction, while county superintendents and, in some states, commissioners, have local supervision. Teachers are called to convene in conventions and institutes by proper authorities, and are certificated to teach either by local officials, county superintendents, or State boards of examiners. In most of the states school attendance is nominally compulsory and in all it is free of tuition. Some states maintain free schools devoted to the industries and higher learning, though many of such institutions are aided by the Federal government. Public schools are open and alike free to both sexes, but in a number of Southern States separate schools are maintained for the education of Negro children. Besides the public schools and higher institutions, there are many denominational and pri-

ate schools, colleges, and universities. Collectively they represent an immense capital and wield a marked influence for good. In states which have compulsory laws, attendance at private schools, which have courses similar to the public institutions, is considered to be in compliance with law. Among the most prominent educators that have exercised a large influence in shaping educational theories we may name Kant, Richter, Hegel, Asa Gray, Herbert Spencer, Herbart, Rousseau, Froebel, Pestalozzi, Horace Mann, Aristotle, Socrates, Plato, Fichte, Rosenkranz, Haeckel, Max Müller, Locke, and Jonathan Edwards, all of whom are treated in special articles. To this list may be added the following American educators of recent date: G. Stanley Hall, W. T. Harris, David Starr Jordan, William R. Harper, Herman Eduard von Holst, Andrew Dickson White, George Payn Quackenbos, Joseph Baldwin, C. W. Eliot, Francis Wayland, W. M. Beardshear, Samuel Eliot, etc.

**EDUCATION, Commissioner of,** the title of the chief officer of education in some states and countries. The term is applied interchangeably with that of superintendent, though in some states and provinces it is recognized as the exclusive title. It is the duty of a commissioner of education to supervise the general management of schools and public institutions, and to publish recommendations and biennial reports upon the methods of teaching and the management of educational system. In Canada various names are used in speaking of officials who have charge of educational work, such as minister of education, in Toronto; superintendent of education, in Nova Scotia; and commissioner of education, in Saskatchewan.

The Commissioner of Education of the United States is the chief officer of the national Bureau of Education. He is appointed by the President with the consent of the Senate. The duties are to collect educational statistics, diffuse information regarding the organization and management of schools and school systems, to promote the cause of education, and to present annually to Congress a report embodying the result of his investigations and labors. The office was established in 1867 with Henry Barnard as the first commissioner.

**EDUCATION, Compulsory,** the term applied to the system of education in which attendance is required by the state for some fixed period. Nations have long recognized the importance of training youth for citizenship, hence attendance upon some schools has been compulsory, though in most cases the parent may select the particular school at which the child

is to attend, that is, the parent may choose to enroll the pupil in a public school or in a private institution where work of the same kind is done in certain branches. The law varies in fixing the compulsory period, usually beginning with the ages of five to seven years and extending to the ages of fourteen to sixteen years. In a majority of countries the compulsory period is eight years.

Since the state requires all of its citizens to pay taxes toward the support of the schools, it is held reasonable that the citizen should expect all children to get the advantages of an education. Since the safety of society is dependent upon morality and intelligence, it is quite essential to the state that no one should grow up without receiving proper training for the responsibilities of citizenship. Compulsory attendance laws were in force among the ancient, especially in Sparta and Athens, where training in military affairs and other branches was required. Germany has had a compulsory attendance law for many years, and similar laws are on the statute books of Great Britain, Sweden, Denmark, Switzerland, and France. In the United States and Canada they are enacted by the State or Province, since these countries do not retain supervision over the public schools, but instead delegated this part of the government to the individual states and provinces. Truant officers are provided for by the laws, and such officers are usually appointed by the local boards of education. It is their duty to see that the attendance law is enforced, and parents are subject to a fine where the child is not in attendance in compliance with the law, though they cannot be punished without due trial. The employment of very young children in mines and factories has made it quite necessary that these laws be enforced.

**EDUCATIONAL ASSOCIATION**, a society of teachers and educators to study methods and promote educational work. Many forms of societies of this kind are maintained. Local organizations are usually made up of the teachers and educators in a particular city or in a county, and these are tributary to the educational association of the State or Province. Societies organized within a city or county usually meet several times each year, while those of a State or Province hold meetings annually, and in these the work is assigned to different departments, such as that of elementary schools, high schools, and institutions of higher learning. In many states teachers are required to attend the meetings, and are paid for their attendance the same as if they were teaching in the schools.

The National Educational Association of the United States was incorporated in the District of Columbia in 1896, when it succeeded the National Teachers' Association, which was organized at Philadelphia, Pa., in 1857. This association meets annually in different parts of the country, and at these meetings prominent educators read papers or lecture upon topics of interest to teachers in the management of schools or the supervision of school systems. A complete report of the proceedings, including the principal papers and lectures, are published for the benefit of the members. This association has had a marked influence upon public instruction, especially by its celebrated report of the Committee of Ten in regard to secondary schools. It consists of seventeen departments and the National Council, the latter being a board which exercises general advisory power. The largest meeting of the association was held at Boston, Mass., in 1903, when 34,983 members were registered.

**EEL**, the name of a class of serpent-shaped fishes found in nearly all rivers and seas of the warmer zones. About fifty species have been described, differing somewhat in form, but all are covered by a soft, thick, slimy skin, some having minute cycloid scales. The gill orifices are very small and are situated far back, by reason of which they can remain out of water a long time. Some species frequent the land by night in search of food. Eels prefer to live in the mud, and in cold weather bury themselves in the muddy bottom or migrate to warm and sluggish waters. They are very sensitive to cold and not found in latitudes beyond 64° 30' north or south of the Equator. They are particularly abundant near the deltas and estuaries of rivers, where the adults spawn, and in the spring immense numbers of young eels pass up streams and canals, overcoming many obstacles in their progress. They are excellent and nutritious food. The *electric eel* found in the marshy waters of the llanos in South America attains the length of four or five feet and discharges a perceptible current of electricity when it is touched.

**EGG**, the cell or ovum and its accompanying products which are extruded from the ovary of females of various animals, containing the germ, origin, or first principle of life. It consists essentially of a single cell of protoplasm, in which rests the potentiality of life of an individual corresponding to the parent stock, but rarely two or more such cells are contained in the egg, when the life product is a deformity or results in more than one offspring. Repro-

duction in all animals is by eggs, except in the Protozoa, but in some animals the egg is incubated within the body and the new life is brought forth in a more or less immature state. Young produced in this way are said to be *born*, while those developed from eggs outside of the body are said to result from hatching or incubating.

In general the term *egg* is used only in connection with animals that do not produce their young alive, in other words, the oviparous animals. The most common oviparous animals include birds, reptiles, fishes, insects, and worms. Eggs usually contain, besides the germ, substances which serve for nourishment of the new life. In animals below the birds, the egg has only three parts, the germ, the germinal vesicle, and the yolk. In the egg of birds, besides these, are a calcareous shell, a tough skin, and a considerable amount of white or albumen. When the young animal is developing, it is nourished first by the albumen and then by the yolk, both of which are consumed before it comes out of the shell.

The eggs of birds and fowls are usually oval, but a few are nearly round. In one end of the egg, between the skin and the albumen, is an air cavity which is thought to facilitate the breathing in the early stages of the new life. The outer covering of the eggs of reptiles and lizards consists of a parchmentlike membrane, while in cartilaginous fishes, such as sharks and rays, the egg is inclosed in a four-sided horny case, with tendrils projecting by which it is moored to floating seaweeds. These, after the escape of the young fish, are washed upon the shores, where they are familiarly known as *mermaid's purses*. Eggs of animals now extinct have been found in Madagascar three feet in circumference, but the ostrich lays the largest egg of any animal now living.

The eggs of birds and fowls are hatched by being kept at a temperature of about 104° Fahr. for a period of from two to four weeks. Crocodiles, alligators, and turtles bury their eggs in the sand, where they are incubated by the heat of the sun or by the warmth of decaying vegetation. Eggs of the turtle are in repute as an article of food and luxury, and those of gulls, guillemots, and wild ducks are much sought by the inhabitants of the Orkney and Shetland islands, as well as Iceland and other northern regions. On the coast of Labrador an extensive business has developed by the eggers, who collect the eggs of sea birds and carry them to the markets of Canada and the United States. Tremendous precipices are braved by men, whom their companions let down

by means of ropes to gather the eggs from ledges.

Birds differ greatly in the number of eggs which they lay for a *set* or *clutch*, but in this respect the individuals of the same species are quite uniform. The larger birds of prey and many waterfowl lay only one egg in the year, while others, as the hen, produce a large number. Field and woodland birds, as the robin and crow, usually lay from five to seven, while the titmouse ordinarily deposits about ten. In some instances the color is quite similar to that of the nests, but it includes white, brown, greenish, and variously spotted species. The egg of the hen is the most important as a commercial product. It consists of 73.7 parts water, 13.4 parts protein, and 10.5 parts fat. Other eggs sold on the market are those of the duck, turkey, goose, and guinea. Besides being valuable as food, eggs are used for purifying liquids and the albumen is useful in preparing photographic paper. See **Evolution; Nest; Poultry.**

**EGGPLANT** (ĕg'plănt), a plant of the nightshade family, so named because the fruit resembles an egg in shape. It is native to the tropics, but may be grown in the northern portion of the United States and the southern part of Canada, when planted in a hotbed. About a dozen species are cultivated for the fruit, which is cooked in a variety of ways as a table vegetable. The species that yield a purple colored fruit is the best for general use, such as the New York purple and the black Pekin. The plant grows to a height of about two feet, has prickly leaves, and flowers of a violet color. The fruit varies from the size of a hen's egg to specimens from six to eight inches in diameter, depending upon the season and the richness of the soil.

**EGOISM** (ĕ'gō-iz'm), the doctrine of a class of philosophers, according to which a person can be certain of nothing but his own existence, and that of the operations and ideas of his own mind. As affecting mental sensations, egoists involuntarily regard the body as ego, that is, the being itself; but, so far as cognition is concerned, the body is regarded objective, or non-ego. Egoism, in an ethical sense, is now used as an antonym to altruism (q. v.).

**EGRET** (ĕ'grĕt), the name of several species of heron, especially those that have a well-developed crest during the breeding season, and whose back is adorned with long, loose flowing plumes. The American egret is about 37 inches long, measured from the tip of the beak to the end of the tail, and the extent of the wings is 55 inches. The snowy egret, native to the

region bordering on the Gulf of Mexico, is a beautiful bird. It is hunted for the sake of the plumes during the breeding season, hence is becoming rapidly exterminated. The reddish egret is remarkable in that some birds of the

SNOWY EGRET. LITTLE EGRET.

same species are nearly white while others have a bluish-slate color, and it appears that the differences in color are not dependent upon sex, age, or season. Several species are native to Europe and Asia, including the European and the white heron.

**EGYPT** (ē'jīpt), a country of Africa, situated between the Red Sea and the Libyan Desert, and extending from the Mediterranean Sea to the Nubian Desert. It is bounded on the north by the Mediterranean Sea, on the east by Syria and the Red Sea, on the south by a line drawn from the Red Sea to a point about 200 miles west of Wadi Halfa, and on the west by a line drawn from about 200 miles west of Wadi Halfa to the southeastern point of Tripoli, and thence north to the Mediterranean. The southern boundary coincides nearly with the latitude of 22° north. It includes the eastern third of the Libyan Desert. The extent from east to west is about 500 miles and the length north and south is 670 miles. The area of Egypt proper is 394,240 square miles.

**DESCRIPTION.** Most of the surface consists of a sandy desert, the cultivated portion being confined to the country more or less affected by the annual inundations of the Nile and the coast plains along the Mediterranean. This fertile

region includes only about 10,000 square miles, and contains almost the entire population of the country. The Nile flows through it from south to north, though it has no tributaries within Egypt, owing to the arid condition of the country. West of the Nile are the barren wastes of the Libyan Desert, much of which is elevated only a few hundred feet above the sea, while many small localities are below it and derive their water by infiltration from the Nile. In the eastern part is a region of mountains, extending from Assuan and Berenice in the south to Cairo and Suez in the north. The mountains cover a district about 150 miles wide and are highest near the Red Sea, where their summits approximate 7,000 feet. The country south of Assuan is made up largely of sand plains and desert hills, which form the northern part of the Nubian Desert.

The course of the Nile through Egypt is about 800 miles. A short distance south of Assuan is the First Cataract, the only one in Egypt, where a great dam is maintained to regulate the supply of water for irrigating purposes. The annual overflow of the Nile has a tendency to fertilize the soil and render it exceedingly productive. Usually the overflow begins the middle of July and is occasioned by excessive falls of rain in the mountains and lake region near the Equator. The irrigated land begins to dry in October and the crops are sown in November, maturing in March, when they are harvested. Southwest of Cairo is a fertile tract, the depressed valley of Fayum, and near its northern extremity is the lake of Birket-el-Kerun. Many of the localities adjacent to the Nile and some of its banks are characterized by masses of rock and broken cliffs. Extensive forests are entirely unknown in the upper valley, but small clusters of trees are found in some localities.

The atmosphere is dry and the sky is clear most of the year. At Cairo the rainfall is less than two inches per year, while at Alexandria, on the coast, it is about eight inches. Near the sea the temperature rarely reaches the freezing point, but the thermometer sometimes registers 114°. In April and May a large part of the country is visited by the khamsin winds, which cause a rapid rise of the temperature and fill the air with dust and sand. The sycamore is the prevailing tree and is rivaled only by the date palm. Many species of trees have been introduced and are cultivated in the regions where moisture is sufficient. The lotus and the durra, the almost extinct papyrus, are Egyptian plants. Fish are abundant in the Nile and off the coasts, and birds and insects are numerous.

The fox, jackal, wild ass, leopard, lion, and striped hyena are among the wild animals.

**AGRICULTURE.** About two-thirds of the people are engaged in agricultural pursuits. Three crops are grown annually in the districts that are well irrigated, this being possible on account of the large amount of organic matter deposited by the waters of the Nile. Clover, wheat, barley, and vegetables grow best from

attention is given to the rearing of sheep, cattle, and camels. Swine are raised by the Copts, and horses and mules are quite common in the cities.

**MINING.** Egypt is not rich in mineral wealth, though it is possible that deposits exist which have not been discovered. Gold mines were worked anciently in the rugged mountains of eastern Egypt and some of them have been rediscovered. Salt is obtained in the salt marshes of the Nile Delta and considerable saltpeter is manufactured. Vast deposits of limestone, granite, and sandstone were worked in ancient times, but comparatively little is done in this line at present. The material used in the construction of the great pyramids and many temples was obtained from the granite deposits near Syene, where the supply is inexhaustible.

**TRANSPORTATION AND COMMERCE.** Alexandria is the chief seat of foreign commerce, being favored by its location on the Mediterranean and a number of important railways. A large trade is carried on at Cairo and other points on the Nile and the Suez Canal. Inland trade is chiefly by caravans, by railways, and by transportation on the Nile, which is navigable the entire distance in Egypt. Many of the highways have been improved and are being maintained by local taxes. The country has 2,500 miles of railways, most of which are owned by the government. The Cape-to-Cairo Railroad is the most important line and will furnish transportation facilities to Cape Town. Telephones are utilized in the cities and many rural districts, and all of the principal trade centers have telegraph communications. Great Britain has the largest share of foreign trade, and next in order are Turkey, France, Germany, Austria, Italy, and the United States.

The weaving of fez and linen is an ancient industry, but modern customs in dress have caused it to decline. Sugar is manufactured quite extensively by the employment of foreign capital, and Egypt is an exporter of that product. Other manufactures include cotton and woolen goods, cigarettes, clothing, utensils and machinery of different kinds. Cotton, cotton seed, meat, hides, and fruit are the chief exports, while coal, wood, textiles, and metal products are imported.

**GOVERNMENT.** The government is a form of monarchy, tributary to Turkey, and the chief executive is the Khedive or Governor General. He is assisted by six ministers in the administration of government, those of justice, interior, finance, war, foreign affairs, and public works and public instruction. France formerly

December to March; sugar cane, rice, cotton, millet, and fruit thrive from April to July. The Nile Delta is the richest region and produces most abundantly. Among the tropical fruits are the orange, lemon, and fig, and the grape, pomegranate, apple, plum, and quince thrive in nearly all parts where moisture is sufficient. Raw silk is produced to some extent and tobacco can be grown profitably, but its cultivation is not permitted. The live stock industry is on a profitable basis, and especial

exercised the greatest influence politically, but since the rebellion of Arabi Pasha the predominant influence has passed to England and the public defenses are under the control of that country. Local conditions are such that internal improvements have been going forward and trade relations have been enlarged materially within the last two years. The legislative power is vested jointly in the legislative council and the general assembly. Local government is administered by six governorships and fourteen provinces.

**INHABITANTS.** Native Egyptians comprise the greater part of the inhabitants, but a majority of these are known as fellahs, who comprise the lower class. The people in the smaller towns are wholly Egyptians, while the larger cities contain many foreigners. Among the foreign inhabitants are the Arabs, Greeks, Italians, British, French, Germans, and Persians. Nearly all of the Mohammedans are of the Sunnite faith, constituting about 92 per cent. of the entire population. Next in order of number are the Christians, chiefly Copts, and Jews. Cairo, the capital, is located on the Nile in lower Egypt. Alexandria is on the Mediterranean and Port Said is the chief town on the Suez Canal. Other cities include Rosetta, Damietta, Suez, Tanta, Assiut, Gizeh, and Mansourah. The total population of Egypt is 10,134,405, which includes 112,810 foreigners.

**LANGUAGE AND LITERATURE.** Comparatively little is known in regard to the origin of the language spoken by the ancient Egyptians. It showed some affinity to the Semitic languages, but as a whole was quite distinct in its general construction. The history of the language is divided usually into four periods, including those in which prevailed the four systems of writing known as the hieroglyphic, hieratic, demotic, and Coptic. It is not known when the *hieroglyphic* system of writing originated, but there is an abundance of evidence that it prevailed extensively as early as 3000 B. C. The *hieratic* writings are those of the priests or sacerdotal class, while the *demotic*, a popular form of hieratic writing, came into literary use about the 7th century B. C. Greek letters were used frequently to write demotic words and later Semitic forms came to be added, thus giving rise to the *Coptic* language, the latest form of the Egyptian. At present it is employed only in the liturgy of the Coptic Church, and in its stead the Arabic is now in common use.

Though the Egyptian language underwent marked changes, there is a notable similarity in the literature of the different periods. In the epoch of history included in the reign of

the Rameses inventive genius was especially encouraged, particularly such talent as led to the production of novels and works of amusement. However, by far the most important writings are of a historical character, especially in the time of the Ptolemies, when the lore of the East was energized by western scholars, particularly by the Greeks. The works in religion are numerous, especially in the Coptic period, when church rituals, homilies, and other Christian literature were introduced.

Among the Egyptian writings is an interesting work entitled "Book of the Dead," a copy of which was found in a tomb of a queen of the 11th dynasty, which is thought to date from about 3000 B. C. It contains an account of the adventures of the soul after death, and gives directions by which it is possible to reach the hall of Osiris. The writings on astrology, moral philosophy, agriculture, medicine, physics, economics, ethics, mathematics, and poetry are numerous. A work on geometry, entitled "The

ANCIENT STATUE.

Principle of Arriving at the Knowledge of Quantities," dates from about 1100 B. C. Euclid, the Greek mathematician, who flourished at Alexandria about 300 B. C., gave impetus to mathematical research and wrote his "Elements of Geometry," a work still recognized as authoritative. "The Romance of Setna," written about the 3d century B. C., and "The Tale of Two Brothers," probably written about the time of the exodus, are two works in story form. Many writings are in the form of epistolary letters and epic poetry. In the "Epic of Pentaur" are described the events connected with the war conducted by Rameses II. against the Kheta.

**HISTORY.** No country contains greater wonders of remote antiquity than Egypt. The Sphinx and pyramids are remarkable for their great size and wonderful endurance through the centuries. When Napoleon and his legions reached the vicinity of these relics, he was led to exclaim, "Soldiers, forty centuries look down upon you." The catacombs and labyrinth of Upper Egypt are likewise remarkable curiosities. The labyrinth is partly under ground, cut out of marble, and originally consisted of twelve palaces and 3,000 chambers. Anciently the

Egyptians possessed a wonderful civilization, and built vast palaces, monuments, and canals. They were superior as scholars and statesmen. On many of the ancient ruins are forms of hieroglyphic writings from which we have learned much of their system of mathematics, astronomy, architecture, and religion, and of their utensils, machinery, costumes, and implements of war. Their commerce was among the most extensive of the ancient world, and their civil institutions ranked with the best. Modern Egypt is but the shadow, the ruins, of a once powerful civilization.

Egypt has a history extending back, according to different writers, to the year 3892 B. C., though some writers of profane history place its beginning about the year 5004 B. C. The priest Manetho arranged and published, in 250 B. C., a list of thirty Egyptian dynasties, and this record is still considered the best extant. In the reign of the fourth dynasty the great pyramids were built, the largest by the three kings, Cheops, Chephren, and Mykerinos—according to Lepsius, the German philologist and Egyptologist, within about the period of 2800-2700 B. C. The Pharaohs ruled the country until the Egyptians were conquered in 520 B. C. by Cambyses, King of Persia. It is thought Ramesses II. was the Pharaoh who oppressed the Israelites, and that the exodus occurred in the time of his successor, Merneptah. The country was subject to Persia until Darius was vanquished by Alexander the Great, which occurred in 322 B. C.

After Alexander's time Egypt passed to the Ptolemies, becoming under them and Greek influence one of the most progressive kingdoms. The Ptolemies controlled it nearly 300 years, after which it was made a Roman province and was held by them about 650 years. In 337 A. D. it became a part of the Eastern Empire, but the Romans were finally expelled by the Saracens under Caliph Omar in 640 A. D. The last dynasty of the Saracens was overthrown by the Mamelukes in 1250, who held the supreme power more than two centuries, but they were subjugated by the Turks in 1517 under Selim I., the Ottoman Sultan.

Napoleon I. conquered Egypt for France in 1798, though his army was driven out by the British and the country returned to Turkish rule in 1801. Mohammed Ali became pasha in 1805, after completely vanquishing the Mameluke chiefs, and introduced the elements of European civilization. He was succeeded by Said Pasha, during whose reign the French engineer, M. de Lesseps, commenced the Suez Canal, which was opened in 1869. Within re-

cent years both the French and the English have sought to enlarge their influence in Egypt. The latter under General Kitchener defeated the dervishes in the Battle of Omdurman in 1898, while Fashoda was occupied by the French, on account of which complications arose between the two nations, but all differences were settled by arbitration on Jan. 9, 1899. The terms of the treaty place a portion of the Egyptian Sudan district under the English and a portion under the French authority. In 1907 the country had a financial crisis, but it was overcome the following year, and since then the industrial conditions have improved greatly.

**EGYPTOLOGY** (ē-jīp-tōl'ō-jy), the study of Egyptian antiquities. The object of this branch of learning is to investigate the early life, language, customs, and achievements of the people of ancient Egypt. The study was induced largely by the discovery of the famous Rosetta stone by M. Boussard, a captain of Napoleon's army, in 1799. This stone contains a proclamation written in hieroglyphics, and is the key by which many of the inscriptions on Egyptian monuments may be deciphered ultimately. In 1883 a society was formed to explore the ancient temples and tombs, its object being to make historical investigations for the purpose of endeavoring to ascertain the history of the sojourn and exodus of the Israelites. The society has been able to enrich many of the museums of Europe and America with valuable specimens, and several works have been published in which descriptions and maps are given of many important ruins and relics found in the valley of the Nile between Assuan and Cairo.

**EHRENBREITSTEIN** (ā-rēn-brīt'stīn), a town and important fortress of Rhenish Prussia, Germany, situated opposite the confluence of the Moselle with the Rhine, and connected with Coblenz by a railroad viaduct and a pontoon bridge. It is built on a precipitous rock 387 feet above the river and is inaccessible from three sides. The fortifications were begun in the latter part of the 17th century, but were destroyed by the French. They were rebuilt in 1816-26 at a cost of \$6,000,000. The fortress has ample accommodation for 14,000 men and capacity for storing provisions sufficient to maintain an army of 60,000 for a year. The town is unimportant and has a population of 6,500.

**EIDER DUCK** (ī'dēr), a species of duck which is nearly twice the size of the common duck. It inhabits the rocky shores and islands of America and Europe. The male is black and white spotted, while the female has reddish-drab colors mixed with black, and white bands

on the wings. This species of aquatic birds subsists on insects, shellfish, small fish, and tender shoots of plants. The eggs are gathered by eggers for the market, while the down from the breast of the female is the well-known eider down of commerce. This down is used by the female to line its nest and cover the eggs. It is useful for its superior warmth and elas-

KING EIDER; 2, EIDER DUCK.

ticity in making beds and coverlets. In the districts of Iceland and Norway, where these birds abound in great numbers, they are guarded as valuable property. The *king eider* is an allied species, resembles the eider duck, and inhabits the same regions.

**EIGHT-HOUR DAY**, the term applied to what has been proposed as the ideal working day by trade and labor unions. It was first made an issue in England in 1833, and trade unions advocated it with more or less vigor in public meetings subsequent to that time. In 1869 a congress of tradesmen held at Birmingham passed a resolution which demanded the adoption of the eight-hour day in Great Britain. The issue was taken up by the National Labor Union of the United States in 1866, and it became the theme of much discussion in all sections of the country, especially after the strikes of 1872. It was put into effect by the national government at the navy yard in 1869, and it is now the working day in all departments of the government. Nearly all the states have recognized it, either in part or all

of the branches of work, and it is the common working day in all the mines and many other industrial enterprises. The socialists of Europe have made it an issue and secured its adoption more or less completely in a number of countries, but it is more completely in force in Germany than in the other nations of Europe. New Zealand and Australia have made notable progress in legalizing the eight-hour day. The movement to adopt it has large elements of strength in Canada, where it has been in vogue in most of the mining and a number of other industries.

**EISENACH** (ī'sen-äk), a city of Saxe-Weimar, Germany, situated on the northwestern limit of the Thuringian Forest. It is celebrated on account of the castle of Wartburg, which was built in 1067 on an elevation 600 feet above the site of the city. Luther occupied the castle as an asylum for ten months, in 1521-22, in accordance with the wishes of the elector of Saxony, remaining there for nearly a year after May, 1521. Visitors are still shown the chapel in which Luther preached, the chamber he occupied, and the point struck by the inkstand thrown at the head of the Evil One. The city has well-paved streets, statues of Luther and Sebastian Bach, and a palace erected in 1742. Among the churches are those dedicated to Saint Nicholas and Saint George. The manufactures include woolen, cotton, and linen goods, carpets, machinery, leather, soap, and meerschäum pipe bowls. It has electric street railways, municipal waterworks, and stone and asphalt paving. Population, 1905, 35,153.

**EISLEBEN** (īs'lā-ben), a city of Prussian Saxony, Germany, about 25 miles northwest of Merseburg. It is celebrated as the place where Luther was born and where he died. The city contains numerous memorials of Luther, a fine bronze statue erected to his honor in 1883, and the house in which he was born, the latter having been consumed partly by fire, though it is still preserved with studious care. The noteworthy buildings include the Church of Saint Andrew, in which are many memorials of Luther and Melancthon. Eisleben has railway and electric railway facilities and considerable trade. Copper is mined in the vicinity. It has belonged to Prussia since 1815. Population, 1905, 25,121.

**EKATERINBURG** (yè-kä-tyě-rën-böörk'), a fortified city of Russia, in the province of Perm, 180 miles southeast of Perm. It is located on the Isset River, near the eastern slope of the Ural Mountains, and is surrounded by a productive mining region. The trade is chiefly in iron, cattle, tallow, and cereals. A branch

connects it with Cheliabinsk, on the Trans-Siberian Railway, giving it good transportation facilities. It has a public museum of mineralogy, a government mint, a chemical laboratory, and a number of schools and churches. The public utilities include electric lights, waterworks, and electric railways. Peter the Great founded the city in 1722 and it was named after Catherine I., Empress of Russia. Population, 1906, 62,503.

**EKATERINODAR** (yê-kâ-tyě-rê-na-dâr'), a city of Russia, capital of the Kuban territory, 950 miles south of Moscow. It is located on the Kuban River, about 100 miles from its mouth, and is surrounded by a low and swampy region. The streets are regularly platted, but are not well improved by draining and sewerage. The chief buildings include a cathedral, a museum of natural history, and several government buildings. It has a considerable trade in cattle and cereals and is the seat of annual fairs. Cossacks founded the city in 1794 and named it in honor of Catherine II. Population, 1906, 68,704.

**ELAM** (ê'lâm), an ancient country of Asia, known by the Greeks as Susiana and Cissia. It comprised the great plain east of the lower Tigris and included the Zagros and Pushti mountains. The country formed a part of the ancient Persian Empire. Susa or Shushan was its chief city. It appears from the cuneiform inscriptions that Babylon and Assyria were conquered by a king of Elam about 230 B. C., but the Babylonians subsequently captured Susa. In 694 the Elamites overran Assyria and humiliated Sennacherib, and many of the Assyrians were carried away in captivity. Elam was conquered and Susa was razed to the ground in 642 B. C., when many of their valuable books and images were carried away to Nineveh.

**ELAND** (ê'lând), a species of antelope found in South Africa. Livingstone speaks of it as the most magnificent of all antelopes. It more nearly resembles cattle than other species of antelopes, having a broader muzzle, heavier limbs, and a greater bulkiness of form than the common antelope. The height at the shoulders is about five feet and the weight is from 700 to 900 pounds. The horns are two feet long, extending backward and outward, and the face has a gentle and ovine expression. Large herds formerly frequented the fertile hills and low plains, but European settlements have diminished very materially their numbers. They are hunted for their flesh and hide, both being highly esteemed in the market.

**ELASTICITY** (ê-lâs-tic'î-tÿ), that property of matter by which it resists change of shape,

and returns to its original form when the distorting force is withdrawn. If a body completely recovers its original volume the instant the stress is removed, its elasticity is perfect. Air and all gases as well as water and all liquids are perfectly elastic. Solids do not act this way, and their elasticity of shape is not perfect. For example, glass might be expected to be perfect, but experience proves that it is not, showing a notable degree of imperfection in the torsional elasticity of glass fibers. On the contrary, in copper, brass, soft iron, steel, and platinum, providing the distortion does not exceed a certain limit, the elasticity of shape is much more perfect than in glass. If the strain is too great, the body either breaks or receives a permanent bend. The elasticity of water was proved by John Canton (1718-1772) in 1762. Elasticity in gases is measured usually by the height of a column of mercury they sus-

ELAND.

tain. The term *compressibility* is used frequently in connection with elasticity of volume, and *rigidity* is employed in reference to the change of shape.

**ELBA** (êl'bâ), an island belonging to Italy, situated in the Mediterranean, six miles from the mainland, and separated from it by the Strait of Piombino. It is eighteen miles long and varies from three to eleven miles in breadth. It is traversed by a mountain range, the highest elevation being 3,500 feet above the sea level. The coast is rugged and precipitous, the mountains are bare, and the valleys and lowlands produce fruit, wheat, Indian corn, vegetables, and watermelons. Domestic animals common to the continent abound. Iron of an excellent quality, associated with granite and marble, forms a mountain two miles in circumference and 500 feet high. The island is famous in history for having been Napoleon's

place of exile from May 4, 1814, till Feb. 26, 1815. Porto Ferrajo is the capital. Population, 1906, 24,515.

**ELBE** (ě'l'bě), an important river of Europe, rises in the Riesengebirge of northern Bohemia, near the frontier of Prussian Silesia. It is navigable for seagoing vessels from its mouth to Hamburg, about 85 miles, and for smaller vessels a distance of 525 miles. The total length is 725 miles. An extensive system of canals connects it with numerous points of commercial interest. Among its principal tributaries are the Havel, Mulde, Moldau, Saale, and Eger. The general course through Germany is northwest and the mouth is at Cuxhaven, where its waters flow into the North Sea. Its extensive estuary is obstructed by numerous shoals and islands. It ranks as an important waterway and is rich in valuable fish. Since July 1, 1870, the navigation has been free to commerce from Melnik, Bohemia, to Hamburg.

**ELBERFELD** (ě'l-běr-fělt'), a city in Rhenish Prussia, Germany, about fifteen miles east of Düsseldorf, on the Wupper, a small tributary of the Rhine. It ranks as one of the leading commercial centers of the empire, owing to its extensive trade and manufactures, and has communication by electric and steam railway lines. Among the noteworthy buildings are the courthouse, the city hall, the public library, and the normal school. It has a fine public park and many monuments dedicated to prominent men. The manufactures include clothing, machinery, paper, ironware, and cotton, woolen, and silk goods. Large exportations of ribbons, tape, buttons, laces, carpets, and musical instruments are made. Among its numerous dyeworks are the celebrated Turkey red, which has given the city a reputation in the markets of the world. The city is a center of much wealth and has many modern improvements. Population, 1905, 162,853.

**ELBING** (ě'l'bīng), a seaport city of West Prussia, Germany, on the Elbing River, near its confluence with the Frisches Haff. It is connected with the Nogat by a canal, has good railroad facilities, and is the focus of several interurban railways. Among its noted buildings are the city hall, the gymnasium, and the public library of 35,000 volumes. The manufactures consist chiefly of cotton, linen, and woolen goods, soap, leather, clothing, beverages, and machinery. It is the seat of the Schichau ship-building works. Elbing dates from the 13th century and was long an important member of the Hanseatic League. It has belonged to Prussia since 1772. Population, 1905, 55,627.

**ELBURZ** (ě'l'bō̄rz), a mountain range of

northern Persia, trending parallel to the southern coast of the Caspian Sea. The average height of the peaks is from 5,000 to 8,000 feet, while the culminating peak, Mount Demavend, is 18,600 feet. Mount Demavend is a famous volcano. A short distance southwest of it is Teheran, the capital of Persia.

**EL CANEY** (ě'l kă'nă-ě), **Battle of**, an engagement of the Spanish-American War, which occurred on July 1, 1898. The Spaniards had a force of 520 men at the town of El Caney, about four miles from Santiago de Cuba, and were commanded by Gen. Vara del Rey. General Lawton with 4,500 Americans made the attack and met with desperate resistance, but the Spaniards were defeated. The Americans lost 423 men and the Spaniards lost about 400, including 100 prisoners.

**ELDER** (ě'l'dēr), a large shrub or tree found in both hemispheres, including several species. Most species have pinnate leaves and a small creamy-white flower, which clusters in terminal cymes, usually appearing in June. The berries are nearly black and are used to make a kind of wine. They are considered wholesome food, especially in the form of pies and jellies. The wood of the tree is yellowish, takes a fine polish, and is used in making mathematical instruments. Young shoots of the elder have a very large pith, which, when pushed out with a rod, leaves a hollow cylinder and in this form are used by boys in making popguns. The pith, being very light, is employed for various electrical experiments.

**EL DORADO** (ě'l dô-ră'dô), meaning the golden or gilded land, a term used by the Spanish conquerors of America to describe a country which they imagined to exist. Their vivid imaginations were stimulated largely by the successes in Mexico and stories told them by natives. Among the incidents of interest is the one connected with the vain attempt of Ponce de Leon to find a spring in the new world that would confer perpetual youth upon all who partook of its waters. Another is the story of fabulous riches reported by Orellana, a Spanish officer of Pizarro, after sailing down the Amazon in 1540. These stories inspired many Spaniards to enter upon voyages, and thereby stimulated the discoveries and settlements of many regions. Sir Walter Raleigh imitated the Spaniards by twice visiting Guiana in search of fabulous riches. El Dorado is the poetic name applied to a country which Orellana pretended he had discovered between the Orinoco and Amazon rivers. To this region he attached accounts of immense quantities of precious metals that he claimed to have discovered, and vividly de-

scribed a city called Manoa, which he represented as the capital of that country.

**ELDORADO**, a city of Kansas, county seat of Butler County, 135 miles southwest of Topeka, on the Santa Fé and the Missouri Pacific railroads. It is situated on the Walnut River and is surrounded by a fertile farming and dairying country. The industries include flour mills, carriage works, limestone quarries, and machine shops. It has electric lights, a number of fine schools, and several county buildings. The first settlement on its site was made in 1858 and it was incorporated in 1870. Population, 1904, 3,665.

**ELECAMPANE** (ĕl-ĕ-kām-pān'), a plant closely allied to the aster, native to Europe, and naturalized in various parts of North America. It attains a height of three or four feet, has root leaves about two feet long, and bears large yellow flowers. The root has an agreeable aromatic odor when dried, somewhat like that of camphor, and is used in medicine as a tonic and stimulant, especially in chronic diseases of the lungs. Several species are cultivated in gardens for their orange-colored flowers.

**ELECTION** (ĕ-lĕk'shŭn), the act or proceeding of selecting a person or persons for office, especially if done at a meeting in which the voting is by ballot. In the United States, Congress has power to fix the time for electing all Federal officers, except the President and Vice President. These two officers are chosen under a direct provision of the Constitution, by virtue of which the different states appoint electors under laws enacted by the legislatures of the several states. All general elections are governed by the laws of the states and electors are admitted to vote by State authority, subject to certain constitutional restrictions. In most of the states the right of suffrage is extended to any male citizen of the age of 21 years who has been a resident of the State, county, and election precinct for the period required by law, except those under sentence of imprisonment in the penitentiary and idiots. In certain states paupers are excluded. The right of suffrage has been extended in some states to women in school elections and elections to create bonded indebtedness, while in several the full right of suffrage has been accorded to them. Registration laws requiring voters to register their names and addresses a limited time before election day are in force in many states, but in some they apply only to the elections held in cities of a limited class.

The right to vote comes from the State, the power to abridge or extend voting privileges being vested in the Legislature. Naturalization

as a citizen of the United States can take place only under Federal law. The right to vote at all elections has been extended to aliens who have declared their intention to become citizens in nearly half of the states, and they thus enjoy equal voting privileges with citizens of the nation. However, citizens of the United States are the only individuals who may vote in some of the states. The Federal naturalization laws provide that an alien may be naturalized only after five years' residence; this applies alike to all the nation. A limited educational qualification, such as ability to read and write, is required in a number of states, while a property qualification is provided for only in Rhode Island. The 15th amendment to the Constitution, adopted March 30, 1870, extends full suffrage to Negroes. The Australian ballot system, a favorite system of voting, has been adopted in a more or less modified form in most of the states.

In Canada the constitution provides that the government shall be similar in principle to that of the United Kingdom. The members of the House of Commons, who are the highest officers chosen directly by the people, are elected for five years, unless that body is sooner dissolved. They are dependent for their election upon the constituencies in the provinces, by which the franchises are controlled. The voting is by ballot, but the qualifications for voting at the elections vary in the several provinces.

**ELECTIVE COURSES** (ĕ-lĕk'tiv), the term applied in American schools and colleges to the courses of study that may be chosen by undergraduate students. Formerly all students were required to pursue certain courses of study, but this plan has been supplanted in most of the institutions of higher learning. At present only a few institutions adhere absolutely to a required curriculum, and students are accorded the privilege of directing their studies along special lines or in accord with their inclination. However, the courses are divided into groups so each student must select certain studies from each group under the advice of members of the faculty. This arrangement avoids the danger of students selecting work that may be classed as one-sided, or regarded as unsuitable for the symmetrical development of the mental faculties. Harvard University, one of the older institutions, was a leader in the movement toward establishing elective studies and elective courses. At present nearly all of the State universities are conducted on this plan, while most of the institutions where it has not been fully adopted are giving at least some choice to students in the selection of particular studies.

**ELECTOR** (ĕ-lĕk'tĕr), or **Prince Elector**, the title of those princes who had the privilege of electing the Emperor of Germany. This title was established in 1256, when there were seven electors, those of Saxony, Cologne, Bohemia, Mentz, Treves, Brandenburg, and the Palatine. Later the electoral dignity was transferred from Palatine to Bavaria, but it was restored to the former in 1648, hence there were eight electors. In 1692 the number was increased to ten, but the office became obsolete on the dissolution of the Holy Roman Empire, in 1806. The term *elector* is applied to each of the persons chosen to elect the President of the United States. See **Electoral College**.

**ELECTORAL COLLEGE** (ĕ-lĕk'tĕr-əl), the body of men chosen by the people of the several states to elect the President and Vice President. The college is constituted of the entire body of electors chosen by the different states. Each State is entitled to select a number of electors equal to the whole number of members sent to both houses of Congress. Any person holding the office of Senator, Representative, or other position of trust or profit under the United States cannot serve as an elector. The first Tuesday after the first Monday in November is the day fixed by law of Congress for choosing electors. The electors of each State meet in the respective State capitals on the second Monday in January next after they are chosen for the purpose of casting their ballots for President and Vice President.

No discussion of the merits of the candidates takes place, the electors voting for the particular persons previously placed in nomination by conventions called for that purpose. This is a perversion of the intention of the authors of the Constitution, since they were originally intended to cast their votes according to their own judgment. In casting the ballots, electors are required to vote for candidates, one of whom, at least, shall not be an inhabitant of the same State with themselves. Lists of persons voted for at each capital are made, signed, and certified by the electors and transmitted to the seat of government of the United States, each list being directed to the President of the Senate. By law of Congress three certificates of all the votes given are carefully prepared, of which one is delivered in person to the president of the Senate at the seat of government, a second is sent to him by mail, and a third is delivered to the judge of the district court in the district in which the electors assemble.

At a joint meeting of both houses of Congress held on the second Wednesday of February following the reception of the certificates, the re-

ports are opened by the president of the Senate and canvassed in the presence of both houses. The persons having the greatest number of votes for President and Vice President are declared elected, but, if no candidate has a majority, the members of the House of Representatives choose the President by ballot from the three who received the greatest number of votes in the electoral college, each State being entitled to one vote, while the Senate chooses the Vice President in a similar manner. John Q. Adams was elected President by the House of Representatives in 1828, and R. M. Johnson was chosen Vice President by the Senate in 1837.

**ELECTORAL COMMISSION**, a commission appointed by an act of Congress, Jan. 29, 1877, to investigate certain alleged frauds regarding the electoral votes of Oregon, Florida, Louisiana, and South Carolina in the presidential election of 1876. The appointment of a commission in relation to the election has been deemed unconstitutional by a number of able jurists. Tilden and Hayes were the respective Democratic and Republican candidates for President. The commission consisted of five representatives, five senators, and five associate judges of the Supreme Court. It was constituted of the following: George F. Edmunds, Oliver P. Morton, Frederick T. Frelinghuysen, Thomas F. Bayard, Allen G. Thurman, Henry B. Payne, Eppa Hunton, Josiah G. Abbott, James A. Garfield, George F. Hoar, Nathan Clifford, William Strong, Samuel F. Miller, Stephen J. Field, and Joseph P. Bradley. Much political spirit was shown in the sessions of the commission. On February 27 the Presidency was given to Hayes by a strict party vote of eight to seven, and on March 2, 1877, the commission adjourned. The House voted to reject, the Senate to accept the findings of the commission, but on a concurrent session of both houses it was finally approved.

**ELECTRIC BATTERY**. See **Galvanic Battery**.

**ELECTRIC CLOCK**. See **Clock**.

**ELECTRIC FISH** (ĕ-lĕk'trĭk), the popular name of a fish that has the power of giving sensible shocks of electricity when touched with the hand. About fifty species of marine animals have this power. A fresh-water eel of South America is the most powerful of these animals in this respect. The body is from five to eight feet long, blackish in color, and about the same thickness throughout. Little is known in regard to its generation of electricity, but it is certain that this force is used in killing fish for food. The electric organs are intimately connected with the nervous system. The torpedo, a mem-

ber of the ray family, is an electric fish found off the Atlantic coast of North America. A catfish common to the Nile, known as the raash, is about four feet long, and gives an electric shock about equal to that of a Leyden jar.

**ELECTRIC GENERATOR.** See **Dynamo.**

**ELECTRIC HEATING,** a system of artificial heating by converting electricity into heat. The essential principle of an electric heater is that the temperature of a conductor which offers great resistance is raised by passing through it a current of electricity. Such a heater is made by constructing coils or circuits of some refractory metal, which are surrounded by air or some insulating material, and the heat is thrown off by means of a metallic box or radiator. When a current is passed through such a device, it heats the coils by meeting resistance, and the heat is carried off by the radiator. Another system is to pass the current through broad strips or plates of metal, which are covered by an enamel, the latter serving to carry off the heat generated, while the current passes through the metal.

By electric heating it is possible to obtain an efficiency of 80 to 87 per cent. It is used extensively in obtaining heat for housekeeping purposes, such as boiling and baking. An ordinary cooking stove in which solid fuel is used yields but two per cent. of the heat generated, since 12 per cent. is lost in obtaining the fire, 16 per cent. radiates into the room, and 70 per cent. passes out through the chimney. Electric heating is used extensively in bath rooms, street railway cars, and in many waiting rooms. It is employed largely in welding iron and steel, and many other metals which require a high temperature to unite firmly, having the advantage that no flux is required and that the surfaces do not oxidize.

**ELECTRICITY** (ē-lĕk-trĭs'ĭ-tĭ), the science which treats of an invisible agent producing various manifestations of energy, which is generally rendered active by some molecular disturbance, such as rupture, friction, or chemical action. The name was derived from the Greek word *elektron*, meaning amber, from the circumstance that the Greeks were acquainted with the fact that amber, when rubbed, attracts light particles, such as leaves, straw, or small pieces of wood.

**DEFINITIONS.** The general science of electricity embraces a consideration of *statical* and *dynamical* electricity, or electric force in a state of rest and electric force in motion. The former is often termed *frictional* electricity, since it is usually produced by friction, but also results from greatly increasing the intensity of

dynamical electricity. The latter is developed by magnetism, heat, chemical action, and other forms of energy, and exhibits its power in the form of currents. Electricity resulting from chemical action on metals is termed *voltaiic*, or *galvanic*, electricity. The phenomenon of statical or frictional electricity on a simple scale may be observed by rubbing a piece of glass with dry silk, and then placing the glass near small pieces of paper or pith, which will at once be attracted to it. Similar experiments may be made with amber, rosin, gum shellac, and sealing wax.

Formerly all substances that can be electrified easily were called *electrics* and all others were termed *nonelectrics*. When the subject of *conduction* of electricity came to be investigated, it was found that the substances formerly termed electrics are *nonconductors*, and the nonelectrics are *conductors* of electricity. Since all bodies can be electrified under proper circumstances, the terms electrics and nonelectrics were abandoned as incorrect, and the terms conductors and nonconductors were adopted, this classification depending on the ability to conduct electric currents, though there are no perfect nonconductors, with the possible exception of dry gases. The term *insulator* is applied to a substance that has small conductive power, and the word *resistance* is used to express the opposition which the conducting substances forming the circuit offer to the passage of electricity. A good conductor is said to have low resistance, and a good insulator to have high resistance. The following is a partial list of substances having low and high resistance, with the best conductors and the best nonconductors named first;

CONDUCTORS.	NONCONDUCTORS.
All metals.	Shellac.
Charcoal.	Amber.
Plumbago.	Resins.
Concentrated acids.	Sulphur.
Dilute acids.	Wax.
Saline solutions.	Jet.
Spring water.	Glass.
Rain water.	Mica.
Snow.	Diamond.
Vegetables.	Ebonite.

Electricity is produced for general purposes by a conductor being rubbed on a nonconductor, as in an ordinary electrical machine having appliances to cause glass to rub against an amalgam. Two opposite kinds of electricity are manifested by substances electrified, known as *positive* and *negative*, the positive accumulating in one of the substances and the negative in the other. The presence of the same kind of electricity in different bodies causes them to repel each other, while those being charged with

opposite kinds attract each other. It was long thought that electricity is a fluid, but scientists now regard it a condition of strain among the molecules of a body, a form of molecular motion, capable of being communicated like a fluid. However, nothing is known of its nature, and we are able only to understand the laws in accordance with which its phenomena are manifested. When a body is excited electrically, it is said to be *charged*. If the charge of two bodies is equal and opposite, it is neutralized by putting them in contact. When a body is charged positively, it is said to be at high potential; if charged negatively, at low potential, and when discharged, at zero potential.

**THE ELECTROSCOPE.** The electroscope is an instrument used to indicate the presence of electricity, and to identify electrical charges as positive or negative. A simple electroscope consists of a pith ball hung by a fine silk fiber from a glass support. It detects the charge by moving toward or away from the charged body, as in D and E. To illustrate: If the ball be charged from ebonite, it is negative. Now bring the ball near to a body whose charge is unknown. If it be attracted as in E, the charge is negative; but, if it be repelled as in D, the charge is positive.

**ELECTRIFICATION.** Electrical induction is the induced electrification of a body when brought near to an electrified body. The electrification is always of opposite kind to that of the inducing body on the side nearest the latter, and of the same kind on the farthest side. This may be illustrated by bringing an insulated conductor,

near the middle are practically neutral. All the electric charge on an insulated conductor lies on the outside of the conductor. However, this is true only of an electric charge. When the electricity is in steady motion, as an electric current, the current passes through the whole substance of a conductor.

When electrification passes from a higher to a lower potential, along a conductor, it is called

ELECTROSTATIC INDUCTION.

an *electric current*. This occurs when any other form of energy is converted into electric energy, and two bodies, charged to different potentials, are joined together by wire. In such a case there is a sudden and complete change to equal potentials by a momentary current through the wire, and a continuous current may be maintained by applying the electrification to the two bodies as fast as it is transferred; or, in other words, there must be a constant difference in potentials. In a voltaic battery the difference of potential is maintained by an expenditure of chemical energy; in a thermo battery, by an outlay of heat energy; and in a dynamo, at the expense of mechanical energy. The force produced by changing any other form of energy to electric energy is called *electromotive force*, and the means producing it is termed the *electric source*.

While light has a velocity of 186,000 miles per second, electricity has an estimated velocity of 230,000 miles per second. However, its velocity is not definite, since it depends largely upon the source and the condition of the conductor. Practical experience has demonstrated that its velocity is greater along lines suspended on poles in the air than those laid in subterranean passages. Since the former method combines speed with economy in construction, it is commonly employed, except in cities, where a multiplication of wires is objectionable.

**ELECTRICAL QUANTITIES.** George Simon Ohm, a German physicist, was the discoverer of the law in accordance with which electricity flows, or passes, through a circuit, which is commonly known as Ohm's Law. This law, briefly stated,

SIMPLE ELECTROSCOPE.

as the cylinder AB shown in the figure, near a positively charged ball, C, fixed on a glass support, when the cylinder will acquire a negative charge at the end nearest the ball, and a positive charge at the opposite end. The pith balls attached to the cylinder will show by their movement that the ends of the cylinder are excited most highly electrically, while the parts

implies that the current passing through any circuit is directly proportional to the electromotive force acting on the circuit, and inversely proportional to the resistance of the circuit. In computing electrical quantities certain units are employed, which are called the *volt*, *ohm*, and *ampere*. The volt is the unit of electromotive force, and was so named from Alessandro Volta (1745-1827), an Italian physicist. It is about equal to the blue-stone cell. The ohm, named from Dr. Ohm, is the unit of electric resistance, and is approximately equal to the resistance offered by two miles of ordinary copper trolley wire. The ampere is the unit of electric current. It was so named from Andre Marie Ampère, and is equal to such a rate of current as will pass through a circuit whose resistance is one ohm, under an electromotive force of one volt.

**USES OF ELECTRICITY.** The discovery of electric phenomena and the invention of instruments and machinery to practically apply electric forces in the arts, sciences, and industries have caused a remarkable revolution in all lines of economic enterprise. Having a prolific heating effect, electricity has entered as a heating agency into homes, offices, and railway cars. It is utilized to a large extent in electric welding. For lighting it possesses greater utility than any other form of energy, and its power to propel and move machinery exceeds the dreams of ancient philosophers. The electric spark serves in overcoming the danger formerly experienced in firing explosives, while it speeds symbols and words to all parts of the world, through the medium of the telephone and the telegraph, with the rapidity of lightning. The X-ray (q. v.) has added much of value to physical research and the practice of medicine. Among the latest electrical developments is a process for sending portraits and drawings by means of an electric current over a copper wire. This invention, called the *electrograph*, promises to be of vast value to newspaper publishers and in the detective service.

Past experience has demonstrated that water power is the most economical agent to generate electric currents, though coal, coke, gas, and mineral oil are in extensive use to produce steam for propelling electrical machinery. In many regions, as, for instance, at Niagara Falls, vast machinery is propelled by water power, and the electricity is conveyed by wire to factories at long distances. It is noteworthy that storage batteries at the places of consumption have proven highly profitable in manufacturing centers. While the use of electricity has greatly revolutionized many lines of industry and no-

ticeably modified the arts, it is not improbable that the greatest discoveries and the most useful applications of this force are yet to be made. Certainly, it offers a vast field for study and experiments.

**HISTORICAL.** As early as the 6th century B. C. the Greek philosopher Thales, one of the seven wise men, wrote of the attractive force of amber when rubbed with silk, and expressed the view that amber possesses a soul. Aside from this phenomenon, nothing was known of electricity until the 16th century, when, William Gilbert (1540-1603), physician to Queen Elizabeth, made some valuable experiments and published a work entitled "On the Magnet." Otto von Guericke, a German physician, the inventor of the air pump (q. v.), invented the first electrical machine about 1675. In this machine a ball of sulphur, so arranged that it turned on an axis, was electrified by friction with the hand, receiving negative electricity, while the positive flowed through the person to the earth. The Dutch writer Musschenbroek invented the Leyden jar and first exhibited it at Leyden, Holland. This invention made it possible to gather a greater quantity of electricity than ever had been produced before his time. He was not only able to discharge gunpowder by means of the current, but adapted a metallic conductor in transmitting electricity, and successfully demonstrated that the discharge along two miles of wire was practically instantaneous.

Benjamin Franklin in 1752 proved the identity of lightning and frictional electricity by means of a kite, which he elevated during a thunderstorm, tying a key at the end of a hemp string, and insulating the whole by fastening it to a post by a long piece of silk lace. Later he charged a Leyden jar and in both experiments obtained sparks. However, the former experiment was very dangerous, and a similar test later resulted in several experimenters being struck lifeless by electric currents. *Friction* was the only artificial source of electricity employed until Luigi Galvani in 1790 accidentally brought the limbs of a frog in contact with two metals. He noticed that when they came in contact with the metal a convulsion occurred as if they were in pain, and concluded that the effect was produced by what he termed animal electricity. It was his view that this electricity was different from that caused by friction, and that he had discovered the agent by which the will controls the muscles. Alessandra Volta (q. v.) rejected the idea of animal electricity, and developed the discovery of Galvani until he produced the *galvanic* or *voltaic battery*.

Hans Christian Oersted (1777-1851), of Co-

penhagen, Denmark, made discoveries in 1820 by which electricity and magnetism began to be studied as allied branches, instead of distinct studies. Andre Marie Ampère (q. v.), a French physicist, discovered that two parallel wires conveying an electric current in the same direction attract each other, but repel each other when in opposite directions. With this discovery the whole subject of electro-magnetism became generalized, and scientists turned their attention to the invention of the electric telegraph and hundreds of other modern devices. Among the inventors who made discoveries of vast value in the field of electricity are S. F. B. Morse, Thomas A. Edison, George Simon Ohm, A. G. Bell, Nikola Tesla, Michael Faraday, W. C. Röntgen, William Marconi, and Ernst Werner Siemens, all of whom are treated in special articles. See **Dynamo**; **Electrolysis**; **Galvanism**; **X-Rays**.

**ELECTRICITY, Medical Use of**, the employment of electricity in the treatment of diseases. In medical practice three forms are in general use; that is, the galvanic, static, and faradic. *Galvanic electricity* is obtained from a galvanic battery (q. v.), and is used extensively in treating many diseases of the nervous system. It produces a contraction of the muscle upon which it acts, and its application is accompanied by a sensation of heat and a buzzing sound. *Static electricity* is produced by a machine in which glass plates are revolved rapidly against chamois rubbers, and is seen in a succession of sparks that pass into the body of the patient, who is seated on a chair in which the feet are of glass. It has a great electro-motive force and is employed in medicine as a treatment of functional weakness, since it encourages respiration, secretion, circulation, and nutrition. *Faradic electricity* is obtained from a faradic battery, invented by Faraday (q. v.) in 1845, in which the current is made and broken with extreme frequency and rapidity. The current is applied by means of electrodes to the human body. It is used in treating paralysis of the muscles, hysteria, gout, and rheumatism. Another form of electrical machines is used in cauterizing and removing diseased or foreign tissues. Surgeons employ for this purpose an instrument in which the electrodes are joined by fine wire, the current raising the latter to a white heat. See **X-Rays**.

**ELECTRIC LIGHT**, the light obtained by conducting a current of electricity through a resisting medium, as a gas or a carbon wire. Many devices are employed for utilizing the luminous effects of electricity for lighting and in electrolysis. The chief systems for lighting

may be grouped as the arc and incandescent, both of which are in common use. In each of these a conductor conveys the current from a battery or dynamo D, and a brilliant light is obtained at any point where the current is broken. The so-called arc light is produced by connecting the two ends of the wire with two pointed sticks or pencils of carbon, and, when the carbon pencils are separated about one-tenth of an inch, the current passing from the positive to the negative pole, a light rivaling sunlight in whiteness results. The brilliant arc of light, called the voltaic arc, continues as long as the pencils are adjusted the proper distance from each other, which is provided for by a self-feeding mechanical contrivance. An intense heat is generated in an arc light, which is suffi-

Fig. 1.

Fig. 2.

## ELECTRIC LIGHT.

Fig. 1, arc lights; Fig. 2, incandescent lights.

cient to fuse quartz and magnesium and melt platinum. Both carbons decrease in size, though the positive decreases more rapidly than the negative, and the latter remains pointed. The intense heat tends to volatilize the carbon, causing small particles of the positive carbon to be carried in the form of an arc or bow and to become condensed in the form of graphite. Arc lights give a light too brilliant for small rooms, but are favored greatly for large buildings and for street lights. The dynamo must yield a current of constant strength, but of varying potential, according to the number of lamps. In some systems of lighting as many as fifty or even seventy-five lamps are lighted by one machine, each lamp ranging in intensity from 500 to 2,000 candle power.

The incandescent lamp is obtained by rendering incandescent a thread or filament of car-

bon by passing through it a current of electricity. While there are various modes of obtaining the carbon filament, the common way is to press a carbonaceous paste in a die plate, and then finish by carbonizing. In the Edison in-

ELECTRIC LIGHT.

A, carbon pencils; B, arc lamp; C, incandescent lamp.

candescent lamp a filament of bamboo, little thicker than a horsehair, is carbonized in the form of a loop. The ends of the filament are fixed to two insulated platinum wires, and, as the carbon readily burns in the air, practically all the air in the glass chamber must be exhausted. The lamp is then screwed into a socket, where the wires within the glass chamber are brought in contact with two insulated brass plates, in which the wire of the circuit terminates. Usually a large number of incandescent lamps are connected with the same wire, and all take current from one of the line wires, returning it to the other wire of the circuit as shown in the illustration. However, all the lamps in a given system require the same current as every other. A turn-off enables one to close or open the circuit, thus lighting or extinguishing any one or all the lamps. A sixteen candle power incandescent lamp requires a current of about a half an ampere at 110 volts, or 55 watts.

Improvements of vast value in electric lighting were made in 1907, when the flaming arc lamp came into use. In this lamp the carbon is impregnated or cured with metallic salts, whose luminous vapors give increased light. Other newer forms include the helion, the tungsten, and the metallized carbon lamps, but, while they have a greater candle power efficiency,

they are more costly and more fragile than the ordinary carbon lamp. Other improvements include those made in the mercury vapor lamp, which has been made highly serviceable in photography and other arts in which a brilliant white light is essential. Glass has been displaced to some extent in making the tube, from which the air is exhausted, and an intense light results when an electric current is passed from one electrode to the other through the vapor of mercury.

The electric currents ordinarily employed produce no marked mechanical effect, as those from a battery of Leyden jars, or a flash of lightning (q. v.), in which the results are destructive, especially if the path is formed of poor conducting material. Electric light, like solar light, acts chemically on chloride of silver in the photographic process. It is an important means of chemical analysis. When a current of electricity passes between two terminals or electrodes, through a compound liquid or electrolyte, it has the effect of decomposing the molecules of the electrolyte into constituent parts called ions or radicals. Decomposition occurring in this manner is called electrolysis.

**ELECTRIC MACHINE**, the name generally applied to any mechanism employed to convert mechanical energy into electric current. There is a very wide difference in construction and capacity of the machines in common use for producing powerful electrical effects. Any machine depending upon the principle of the electro-magnet is now generally called a dyna-

TOEPLER-HOLTZ MACHINE.

mo, which see. The mechanisms more properly designated electric machines include the two classes that depend upon friction and electrostatic induction, and are known respectively as *friction* and *influence* machines. The so-called plate electric machine is a common example of the former. It has a circular plate of glass, which may be turned on an axis by an insulated

handle. A rubber with a surface coating of an amalgam is pressed by a spring against the plate, and is in electrical contact with an insulated conductor, termed the negative conductor. At the opposite side is a device with metallic points, which connect the positive conductor. When the handle is turned, a negative charge is manifest in the rubber, and a positive charge in the glass. As the motion of the machine continues the negative charge is conducted to the negative conductor and the positive conductor becomes charged positively by the electricity on the glass. The Toépler-Holtz machine, which is generally a revolving electrophorus, comprises a common electrostatic induction machine. The machines generally used in experiments in high schools and colleges belong usually to one of these classes, but there are mechanisms of similar construction sufficiently powerful to serve many purposes in the arts and industries.

**ELECTRIC METER**, an appliance for measuring and recording the amount of electricity consumed. Three kinds are sold on the market, those known as clockwork recorders, motor meters, and chemical meters. The clockwork recorder has a stylus by which a record is made upon a chronograph sheet driven by clockwork as the current passes through a galvanometer. It is not used extensively on account of being expensive and because the clockwork devices are not easily maintained. The chemical meter is a zinc voltometer, and a record is obtained by weighing the plates from time to time. The motor meter is in general use. It is an electric motor, the speed of which is recorded by a dial device by means of a clockwork. This clockwork is connected with an armature, which revolves according to the speed of the current that passes through the meter. The watt, which is a current of one ampere, with a pressure of one volt, flowing for one hour, is the unit of measure. Each consumer of electricity usually has an electric meter, which is read once a month, and the amount paid for service depends upon the electric energy consumed.

**ELECTRIC MOTOR**, a machine used to convert electrical energy into the form of mechanical power. It is constructed on the plan of a dynamo (q. v.), but differs from it is that it is supplied with a direct electric current from an outside source, while the dynamo is used to generate electric currents. The iron masses or electro-magnets, called armatures, are set in motion by the action on them of stationary electro-magnets, hence the armature revolves as the effect of repulsion and attraction. The movement is at a uniform rate of speed, in case the

current is constant and the resistance even. In general any dynamo is reversible and can be used as a motor, but these machines are constructed for particular purposes and in practice are not interchangeable. Dynamos are much more powerful than motors and may furnish the power necessary to operate a number of motors, which may be located a long distance from the dynamo and from each other. Two motors of fifty horse power each, or ten motors of ten horse power each, may be supplied with power by a dynamo having 100 horse power.

Many machines are now operated by means of the electric motor, such as printing presses, cutting machines, elevators, pumps, etc. The advantage of the electric motor is chiefly in its convenience. It does not require a skilled operator and can be utilized in running machinery on a moment's notice. The power may be turned off as soon as a particular job or a definite part of the work is finished. The plant in which the dynamo is located may be a long distance from some or all of the motors, and the work of firing or looking after the power plant becomes centralized. In large factories, where work is done in many departments, the power plant may be in an isolated part of the building, and the employment of motors under such conditions entirely obviates the use of expensive belting, shafting, and pulleys.

**ELECTRIC RAILWAY**, a means of rapid transit on which the motive power is electricity. Various different mechanical devices are em-

ELECTRIC CAR.

ployed for this purpose, all depending upon the frictional or rolling contact of electricity supplied to a motor on the car or locomotive, either from a generating plant or from a storage battery. The electric railways are built similarly to the steam railroads, but in general the roadbed is not graded as level and is more tortuous, although the best service can be obtained on a straight and level track. The ties are of wood and the rails are iron or steel, but neither are quite as heavy as those used in steam railways. In cities the ties are now commonly laid in cement, so as to furnish a solid foundation for the street pavement, but in the outlying districts

and in the country they are usually placed in a trench excavated about four to six inches from the surface of the roadbed. The size and construction of the cars differ greatly, both for the freight and passenger service, and the manner of applying the electric current is not uniform in all systems. In most of the American lines the power plant is located at some convenient point on the line, from which the conducting current is carried on a copper wire *L* in a continuous circuit immediately overhead of the center of the street railroad track, where it is suspended from a line of poles. The motor car, to which trailers, or other cars, may be connected, has a trolley *CC'* attached to the roof, and by it the current is conducted by means of a wire through the switch *S* to the motor *m*, which has connection by gearing with the axles of the car wheels. Short copper wires or plates are bolted so as to connect the rails of the track, or the rails are united by electric welding, thus supplying a continuous circuit for the electric current, which passes through the motor into the car wheels, and thence back to the dynamo by the connected rails *R*.

Other methods include the underground or conduit, the third-rail, and the storage-battery systems. In the underground or conduit system the current is obtained by a sliding shoe, or some similar device, attached to an arm under the car, which comes in contact with an electric wire in a channel or conduit. The third-rail system is quite similar in its general operation to the overhead system, but differs from it in that a third rail is attached to the ties by means of insulated supports. Beneath the car is a sliding shoe, which operates to conduct the current to the motor, and it thence returns by the track rails. In the storage-battery system each car or train employs a storage battery, which is charged at the power plant, and usually carries sufficient power to supply motive force for one or more trips. All these systems are in use more or less, though the latter three more largely in Europe than America, while the overhead trolley system is the general system employed in America. The third-rail system is quite popular in Europe, and has the advantage of overcoming the overhead obstruction of trolley wires, but greater care must be exercised to guard against danger to pedestrians. Many of the elevated railroads make use of the third-rail system, as is evidenced in Chicago and other American cities.

Railway companies are now using electric locomotives to a considerable extent. They resemble the steam locomotive and are fully equal to it in power. The transmission used is either

the overhead trolley or the third rail. Locomotives of this kind have been in use for some time on some branches of the Baltimore and Ohio and other systems. A large locomotive has four motors of about 600 horse power each. It is provided with a whistle, sand boxes, and automatic air brakes.

The history of the electric railways dates from 1879, when Dr. Siemens (q. v.), of Berlin, Germany, demonstrated their practicability on a track 220 yards long at the Berlin Exposition. Two years later an electric railroad a mile and a half long was put in successful operation in Berlin, and from thence the enterprise spread to other European cities, and then to America. The first line in the United States was built at Allegheny, Pa., in 1882, though Edison experimented with a line at Menlo Park, N. J., some time before. At present practically all the cities of Canada and the United States with a population of about 10,000 or more have electric railways, and in the thickly settled portions hundreds of miles are operated through suburban and rural districts. There is scarcely a thriving city in the world that has not introduced electricity as a lighting or propelling agent, except in various portions of Asia. In 1906 Canada and Newfoundland had 1,073 miles of electric railways in operation, while the United States had 36,212 miles.

**ELECTRO-CHEMISTRY** (ě-lěk'trô-kěm'-is-trý), the branch of chemistry which treats of the chemical changes that are due to electrical energy, and investigates the chemical changes by which electricity is produced. That electricity causes chemical changes may be illustrated by placing two platinum rods in a strong solution of common salt, then connecting them with a battery or a dynamo, when the current will decompose the solution and the sodium will be set free at the negative electrode, while caustic soda will be formed as the sodium combines with the water, and at the same time the chlorine will escape in bubbles through the liquid being set free at the positive electrode. That chemical action produces electricity is demonstrated by placing a zinc bar in a solution of zinc sulphate and a copper bar in a solution of copper sulphate, the solutions being separated by a porous partition, and as soon as the rods are connected by wire a current of electricity will pass through the circuit. Electro-chemistry is employed in the manufacture of various chemical products, in extracting metals from their ores, and in electrotyping and electroplating. It enters into the manufacture of carborundum, chlorine, soda, and potassium chlorate.

**ELECTRO-CULTURE OF PLANTS**, the

method of stimulating the growth and development of plants by the use of electricity. Practical use has shown conclusively that electricity may be used as a stimulus in the form of electric light and by applying the current to the soil, the seed, and the plant. It has been demonstrated that seeds germinate more rapidly by applying electric stimuli before planting, requiring about half the time needed for seed untreated. Another method is to electrify a plot of ground by placing a system of wires in the soil, which are attached to a battery or electric machine at stated intervals. By either of these methods it is possible to increase the production of vegetables, especially peas, parsnips, tomatoes, beets, onions, and carrots. Both the arc and incandescent lights have a visible effect upon growing plants, in that they furnish beneficial rays and prevent injurious rays from passing through them. The flowering of Easter lilies has been hastened as much as ten days and at the same time the colors have been improved, while the yield of lettuce has been increased considerably. The use of electricity in the culture of plants is comparatively new, but it is reasonably certain that the yield of both flowers and fruit can be increased sufficiently to cover the expense.

**ELECTROCUTION** (ĕ-lĕk-trō-kū'shŭn), the method of inflicting corporal punishment by passing a current of electricity through the body of the criminal. The State of New York adopted this method in 1888, and since then it was adopted in Ohio and recommended by many commissioners and committees. It is looked upon as more humane than either hanging or decapitation, since death is painless and instantaneous.

**ELECTRODE** (ĕ-lĕk'trōd), the terminals by which electricity is conveyed into and out of different media. The term is applied especially to the ends of the wires or conductors which lead from the source of electricity and terminate in the medium traversed by the current. Faraday introduced the terms *anode* and *cathode*, the former being the positive and the latter the negative electrode. The term is applied especially to the poles of the voltaic pile or battery.

**ELECTROLYSIS** (ĕ-lĕk-trōl'ī-sīs), the decomposition of chemical compounds by the action of a current of electricity. When an electric current is passed between suitable terminals or electrodes, through a compound liquid, or electrolyte, it decomposes the molecules of the electrolyte into two constituent parts called ions or radicals, which appear at the positive and negative electrodes. The electro-positive ions or radicals appear at the negative electrode, and

the electro-negative ions or radicals, at the positive electrode. In salts of the metals, the metal itself is electro-positive, and the element or elements with which it is combined are electro-negatives. Electrolysis has been a subject for much discussion in the cities where strong electric currents are utilized in the industries, since it tends to destroy the metal pipes that are used in the construction of sewers and for gas and water mains. It is due to unsuitable lines for carrying return currents of electricity, hence these find their way back to the plant through the metal pipes lying underground. The subject has been one of considerable controversy between street railway companies and corporations having control of plants which utilize metal pipes, such as gas plants and waterworks.

**ELECTRO-MAGNET** (ĕ-lĕk-trō-măg'net). See Magnetism; Electro-Magnetism.

**ELECTRO-MAGNETISM**, the science which treats of the development of magnetism by voltaic electricity. Though the exact nature of electricity and magnetism is unknown, they are generally thought to be allied phenomena, as is evidenced by the fact that an electric current always produces a magnetic flux, or magnetism, when flowing through a conductor. Besides, a magnetic flux always causes electro-motive force when crossing an electric conductor, and enters or emerges from a bend or curve in a conductor. It has been observed that a magnetic flux, surrounding a conductor through which an electric current is passing, flows around the conductor in concentric circular paths, and decreases in intensity as the distance from the conductor increases. The direction of the flow is dependent upon the electric current, and changes with every change in the direction of the current. Since the flux of all magnets

ELECTRO-MAGNET.

flows from one pole and returns to the other, as shown by the armature A in the illustration, it follows that the loop or loops of an active conductor act as a magnet, and are similar to it in having two poles. The magnet produced in this way by an electric current is termed an electro-magnet.

The strength of an electro-magnet depends upon the quantity of magnetic flux flowing through the magnet. The strength of the magnet is increased by increasing the strength of the current, but also in the same current by increasing the number of loops. Thus, the strength of an electro-magnet depends on the number of turns or loops, or upon the strength of the current; both facts are taken advantage of in the construction of electric machinery. There is an attractive force between two unequally strong electro-magnets in proportion to the square of the sum of both currents. The accompanying cut shows the horseshoe magnet, which is the form preferred, since the two poles are sufficiently near together to permit the application of the armature A to both at once.

**ELECTROMETER** (ē-lĕk-trōm'ĕ-tĕr), an instrument used in measuring the difference of potential between two charged conductors. The difference of potential is also measured by a *galvanometer*, but this is generally of high resistance, and, if calibrated to read volts, is called a *voltmeter*. Other devices used to indicate the amount of electricity with which a given conductor is charged are the *torsion balance* and the *electroscope*. Sir William Thomson (Lord Kelvin) is the inventor of the electrometer, and his quadrant-electrometer is the principal form of this instrument now in use. It has a needle of thin aluminum suspended over four quadrants which are connected in pairs; and the needle is attracted by one set and repelled by the other when the charges of electricity are communicated to the quadrant, the deflection depending upon the potential difference to which the quadrants are charged. Another form of the instrument has a small movable mirror suspended by a fine thread, and by it a spot of light from a lamp is reflected to a paper scale. The spot of light is seen in the middle of the scale when the two conductors have the same potential, and the potential difference, if any, is indicated by its movement to either side. These instruments are sufficiently delicate to indicate the potential difference of the two plates of a single galvanic cell.

**ELECTRO-MOTIVE FORCE** (ĕ-lĕk'trō-mō'tiv), the force which produces, or tends to produce, electricity or an electric current. The words *electro-motive force* usually are contracted for convenience E. M. F. Any device by means of which an electro-motive force is

produced is called an electric source. A voltaic cell, a dynamo-electric machine, or a frictional electric machine is an example of an electric source.

The term electro-motive force is sometimes used to express the degree of electrification as equivalent to potential, or, more properly, the difference of potential at the terminals of a cell when it is on an open circuit. It is the sum of all the differences of potential in the circuit when a cell is sending a current. The practical unit of electro-motive force is the volt, which is about equal to the electro-motive force of a standard Clark's cell at a temperature of 15 C. Wires carrying an electro-motive force of less than 200 volts are not considered dangerous, but those connected with a large dynamo usually carry a voltage of from 800 to 2,000.

**ELECTROSCOPE** (ĕ-lĕk'trō-skōp). See *Electricity*.

**ELECTROTYPING** (ĕ-lĕk'trō-tīp-ĭng), the process of producing copies of engraved plates, printing type, woodcuts, and other devices used in printing by means of an electric deposition of copper upon a mold taken from the original. The process consists of taking an impression of

APPARATUS FOR ELECTROTYPING.

the object on beeswax, ozocerite, or gutta-percha, this being done on a powerful press. Various methods of treatment are employed, differing somewhat according to the material used. If beeswax is used, which is not a conductor of electricity, the surface is brushed with plumbago to render it a conductor. The mold is then suspended in a solution of copper sulphate in a vessel M, as shown in the illustration, from the negative pole B of a galvanic battery P, and a plate of copper is hung opposite on the positive pole A. As the copper is decomposed by the electric current, the metal goes to the negative pole and is deposited upon the mold.

On the other hand, the acid, passing to the positive pole, operates to dissolve the copper, thereby preserving the strength of the solution. While the process here described is still used, it is now common to obtain the electric current from a dynamo-electric machine.

After the process is completed, which usually takes several hours, the thin shell formed in the mold is removed from the beeswax and backed up with electrotype metal. When smoothed, it is ready for the printing press, is mounted on blocks provided with ratchet and a foot, or attached to a wooden block, making it type high in either case. Electroplating is a similar process, but the coating is of silver or gold. It is usually preferred to use German silver, copper, brass, or nickel silver as the base, as both gold and silver are readily deposited on these. It is necessary to thoroughly cleanse the articles to be plated. In plating with silver a plate or bar of silver is hung on the positive pole, and in about five minutes a coating is deposited to conceal the other metal, which may then be polished. Gold plating is a similar process.

**ELEGY** (ě'ě-jī), a poem written in an earnest, melancholy style. The ancient Greeks and Romans applied the term to the martial lyrics and the erotic poems, and sometimes extended its use to describe the lessons of practical wisdom by such writers as Solon. Catullus was the first great elegiac writer of the Romans, and after him came Propertius, Tibullus, and Ovid. Modern literature contains many fine lyrics, such as Tennyson's "In Memoriam," Milton's "Lycidas," and Gray's "Elegy Written in a Country Churchyard."

**ELEMENTS** (ě'ě-měnts), the constituent principles of anything which have never been resolved into more simple forms of matter. The term has a different signification in modern science than it had formerly. The Greek philosophers assumed that four elements—fire, air, water, and earth—give rise to all the things that are manifest. Modern science considers matter as existing in four forms—imponderable, gaseous, liquid, and solid—while the elements are treated as the component ingredients of bodies under whatever form they exist. Neither air, water, nor earth are elements, and fire is a component of heat. For example, water is composed of two parts of hydrogen and one of oxygen. If a molecule of water be divided into three atoms, two of hydrogen and one oxygen, each division is an element. The number of elementary substances is not known, but about seventy are now admitted without further investigation. Oxygen, hydrogen, nitrogen, and car-

bon are the chief constituents of all organic matter. Rocks are composed chiefly of oxides, silicon, calcium, magnesium, aluminium, iron, sodium, potassium, and carbon. These, together with sulphur, hydrogen, chlorine, nitrogen, and oxygen, constitute by weight 99-100 of the earth's entire crust. See **Chemistry**.

**ELEPHANT** (ě'ě-fănt), the largest living land animal, and the sole surviving representative of the suborder *Proboscidea*. Only two species of the family *Elephantidae* remain, the Asiatic and the African. The former is distinguished from the latter by its greater height, smaller ears, concave forehead, and four external hoofs on the hind foot, while the African has three. Elephants, when full grown, are from nine to fifteen feet high and weigh from 4,000 to 9,000 pounds. They live one hundred years and upwards. Elephants have remarkably large bodies, a thick skin, a scant growth of hair, a short neck, an enormous head, large legs and feet, and a proboscis or trunk. The proboscis is a huge elongation of the nose and upper lip, and is composed almost wholly of a mass of muscles, numbering, according to Cuvier, fully 40,000, which give it the greatest diversity of motion. The trunk is very strong and serves alike for respiration, smell, taste, touch, and prehension. At the extremity of the trunk, on the upper surface, are two fingerlike projections with a thick tubercle below, which acts the part of the thumb, the whole forming an organ of prehension comparable in many respects to the human hand.

With the trunk the animal collects food and takes in drink. It exercises extreme caution in using the trunk in combat; without it the animal is helpless, even to feed itself. It breathes through the openings in the trunk, which it can easily hold above the surface of the water while bathing or crossing a stream. Indeed, it is fond of an abundance of water and swims with ease and skill. It has no canine teeth and only two incisors on the upper jaw, which assume the character of tusks and attain an enormous size; a single tusk often weighs from 100 to 200 pounds. These tusks comprise the most elastic and best form of commercial ivory. In some species they attain a length of seven or eight feet, and serve to break off small branches, tear climbing plants from trees, loosen roots, fight other animals, and, in a state of domestication, to ply or carry timbers and move stones. Elephants have an ability to run quite equal to that of a horse. In lying down they do not place the hind legs beneath the body, but extend them backward in the manner of a person kneeling. The female breeds at fifteen years of

age, bearing a single young at a birth; the period of gestation is about 21 months. The young elephant sucks with its mouth and not with the trunk.

Elephants associate together in considerable herds, under the guidance of a single leader, usually the most powerful animal. It gives the alarm in case of peril and controls the movements of the herd. In times of danger the herd is remarkably anxious to protect it, which is done by crowding so eagerly to the front that the hunters often shoot some less valuable individuals before it can be reached. Sometimes an elephant is driven from the herd, and is never allowed to join another, but ever after leads a solitary life. Such individuals are known as *rogues*, or *low-castes*, and are by far the most dangerous to meet. Elephants are domesticated and serve for tiger hunting, beasts of burden, and in time of war. The Romans were frightened when Hannibal brought a troop of elephants over the Alps, but later learned to use them in war and various arts of peace. It

A, Asiatic elephant; B, African elephant.

is indicated from fossil remains of the genus *elephas* that at least fourteen species lived in former times, while the species classed with the allied genus *mastodon* were still more numerous. Fossil remains appear in the Pliocene of North and South America and in the Miocene and Pliocene of Europe, but they became extinct in the Western Hemisphere and emigrated from Europe to Asia and Africa in the Pleistocene period.

**ELEPHANTA** (ĕl-ĕ-făn'tà), a small island of British India, in the Bay of Bombay, about five miles from the mainland. It is five miles in circuit and the surface consists of two hills with a valley between them. Near the main landing place are a number of temples or caves cut into the solid rock. The largest of these is 130 feet long and 123 feet broad, the roof is

supported by pillars of great magnitudes, and the walls are sculptured by the Hindu trinity, Brahma, Vishnu, and Siva. These temples are used by the Baniya caste for certain Hindu festivals. It is thought that the temples are more recent than the birth of Christ.

**ELEPHANT BEETLE**, a giant beetle of Central America, so named from its large size. The length is about five inches, including a forked horn which projects from the head. It has a blackish color, but is covered with a yellowish fur. This fur is soft and upright and is easily removed by rubbing, hence most of the specimens are bare and appear almost black.

**ELEPHANT FISH**, the common name of the *chimaera*, so called from its upper extension of the nose, which resembles a proboscis. The flesh is esteemed as food, for which it is caught off the coast of the Cape of Good Hope and other regions of the South Pacific.

**ELEPHANTIASIS** (ĕl-ĕ-făn-tī'ă-sīs), a disease of the skin and areolar tissues, epidemic in the East and West Indies. It begins with headache and fever, after which the leg or arm becomes inflamed and tender and serum afterward exudes. Attacks will follow each other and the affected limb will become very large in size. Some cases are due to malarial infection, while others result from the bite of certain mosquitoes. The elephantiasis of the Greeks is a form of leprosy.

**ELEPHANTINE** (ĕl-ĕ-făn'tē-nâ), an island in the upper Nile, opposite Assuan, known anciently as Syene. It is formed of granite covered with a fertile soil, and is about a half a mile wide and one mile long. Herodotus mentions it as the boundary between Egypt and Ethiopia, but afterward Phyle was regarded as the southern landmark of Egypt. The island contains many ancient ruins, including several temples, fragments of pottery with Greek inscriptions, and a gateway of the time of Alexander. The Persians as well as the Romans fortified Elephantine as an important strategic point.

**ELEPHANT SEAL**, the proboscis seal, or sea elephant, so named from the proboscislike projection of the upper lip of the male. It is the largest of the seal family, often attaining a length of twenty to thirty feet. The female is much smaller than the male and has no proboscis. Two species have been described, one found off the coast of western Mexico and California, and the other in the vicinity of the Kerguelen Islands, Heard's Island, and Patagonia. However, both are becoming rare because of

extensive slaughter. These animals are hunted for their oil, which burns with a clear flame, a single individual yielding about twenty gallons. The skin is useful in making harness and other products made of leather.

**ELEUSIS** (ĕ-lū'sis), a celebrated city of ancient Attica, formerly situated on the Bay of Eleusis, near the confines of Megaris, and connected with Athens by the Sacred Road. Its fame is due largely to the festivals observed by the Greeks in honor of Demeter. The *Eleusinian Mysteries*, as the festivals were called, were divided into the greater and lesser, and, according to general account, held every five years. The lessons taught were of the highest moral character and were intended to inculcate the doctrine of the immortality of the soul. It was held that the souls of those who participated in them were filled with sweetest hopes, both of this and the future world, and that in them no one was sad. The ceremonies were awe inspiring, and their secrecy was strictly enjoined by the death penalty. Initiation in the lesser prepared for admittance to the greater, the initiation into both being followed by numerous games given amid great rejoicing.

**ELEUTHERA** (ĕ-lū'thēr-ā), an island of the Bahamas, about seventy miles long and from two to ten miles wide. The area is 235 square miles. It produces Eleutheria bark, a bitter, aromatic bark sometimes called cascarilla, fruits, live stock, and cereals. Governor's Harbor is the chief town. Population, 1908, 8,843.

**ELEVATED RAILWAY**, a line of railway built in large cities, usually on a framework erected on the surface of the street. Formerly the framework was constructed of timbers, but now it is entirely of iron pillars, spanned by crossbeams, and mounted by plate girders. Passengers ascend by stairways or elevators to the stations, which are usually from two to four blocks apart, and the fare is generally collected when passing from the depot to the platform at which the car is entered. Elevated railway transportation has the advantage of being more rapid than surface lines, since the cars stop only at the stations and are not obstructed by traffic on the streets. In 1867 the first elevated railway was built in New York, and the success of the enterprise caused the system to be extended in that city and established elsewhere. Extensive lines are now operated in Brooklyn, New York, Boston, and Chicago. The principal elevated railways of Europe are in Berlin, Paris, and Liverpool. Electricity is the chief motive power. Some of the cities in Germany have suspended railways, in which the

cars are suspended beneath the girder, such as the line between Barmen and Elberfeld.

**ELEVATOR** (ĕl'ĕ-vā-tēr), an apparatus consisting usually of a cage or movable platform, and used to raise and lower persons and goods in large buildings. These mechanical contrivances are comparatively modern and are in extensive use in the large cities of America, Australia, and Europe. They have materially increased the usefulness and convenience of high buildings. The public has become accustomed to the use of elevators, and general confidence in the efficiency and safety of these beneficial devices has led to their extensive employment. The security of the passenger elevator is assured by the multiplication of cables, by means of which the elevators are lifted and lowered while under perfect control of the operator. Four cables are usually employed to facilitate movement, two for attaching counterbalance weights, and several safety appliances are attached to guard against danger from moving downward at an excessive speed. The modern improvements added have rendered it as safe to ride in an elevator as on an ordinary street car, while the time consumed in passing to the highest fifteen or twenty story buildings has been reduced to only a moment.

Passenger elevators are operated either by hydraulic or electric power. The water pressure in hydraulic elevators is supplied from tanks, which are filled by means of powerful pumps located in the basement, air-pressure devices being utilized quite extensively for that purpose. By means of hydraulic passenger elevators it is possible to ascend with much smoothness of motion and entire safety at a rate of from 300 to 400 feet per minute. Within recent years the electric elevators of various construction have gone into general use, and are preferred to the hydraulic kind for various purposes. They are constructed in such a manner that a rope is wound around a large drum by the agency of electric motors, thus causing the cage or platform to be moved up or down with entire satisfaction. This form is simpler than the hydraulic and can be operated at a much smaller cost.

The construction of tall buildings with forty or more stories has made the hydraulic and the ordinary electric elevators undesirable, since the former occupies too much space and the latter requires a drum which is too large in size. Accordingly, a new type of the electric elevator has been devised, in which either the direct traction or the cable drive is employed. In both of these systems the application of power is identical with that employed in street railways. The term elevator is applied to buildings used for

the storage of large quantities of grain. It is applied also to a mechanical contrivance consisting of a belt to which boxes or buckets are attached, being used for the purpose of elevating grain and commodities. A good example of the latter is found in threshing machines. See **Grain Elevator**.

**ELGIN** (ĕl'jin), a city of Illinois, in Kane County, on the Fox River, about 35 miles northwest of Chicago. It is on the Chicago and Northwestern and the Chicago, Milwaukee and Saint Paul railroads and on the Chicago, Elgin and Aurora Electric Railway. The noteworthy buildings include the Northern Illinois Hospital for the Insane, the public high school, the Gail Borden Public Library, the Elgin Academy, and a college of music. Water power for industrial purposes is obtained from the Fox River. Among the manufactures are carriages, watches, farming implements, washing machines, cigars, and condensed milk. It has several cotton and soap factories and meat-packing establishments. The output of watches aggregates about 2,000 daily, in which industry 2,800 skilled laborers are employed. The streets are generally well paved and improved by grading and drainage. Elgin was settled in 1835 and incorporated in 1854. Population, 1900, 22,433; in 1910, 25,976.

**ELGIN MARBLES**, the celebrated collection of ancient sculptures brought from Greece by Thomas, seventh Earl of Elgin, and purchased in 1816 by Parliament for the British museum at a cost of \$175,000. The sculptures are among the best that adorned certain buildings on the Acropolis of Athens. They include those of Theseus or Hercules, the torso of Cecrops, the Fates, Proserpina, Iris, Ceres, the torsos of Neptune and Minerva, the heads of the horses of Hyperion, and one of the horses of Night. Their removal to England was generally condemned as an act of injustice, a view in which Lord Byron concurred.

**ELIZABETH** (ĕ-liz'ă-bĕth), a city of New Jersey, county seat of Union county, on Staten Island Sound, four miles southwest of Newark. It is on the Pennsylvania, the Central of New Jersey, and several electric railroads. The noteworthy buildings include the county courthouse, the post office, the public library, and a number of churches, schools, and hospitals. It is important as a shipping point of coal, iron, and merchandise. Among the principal manufactures are those producing cordage, sewing machines, ironware, railroad cars, machinery, fertilizers, and sailing vessels. The surrounding country is fertile and produces large quantities of cereals, fruits, and live stock. It has gas

and electric lighting, waterworks, sewerage, and a growing wholesale trade. The place was settled in 1609 by representatives of the East India Company. In the Revolutionary War it was the scene of a battle, and was made the point for exchanging prisoners during that period. It was chartered as a city in 1855. Population, 1905, 60,509; in 1910, 73,409.

**ELIZABETH CITY**, a city in North Carolina, county seat of Pasquotank County, on the Pasquotank River, forty miles south of Norfolk, Va. It is on the Norfolk and Southern and other railroads. The chief buildings include the high school, the customhouse, and the State normal school. It has a good harbor and a large trade in cotton, oysters, fish, and tobacco. Among the manufactures are cotton textiles, flour and grist, wagons, brick, lumber products, and machinery. Oysters are cultivated in the vicinity. It has systems of public sewerage and lighting. Settled in 1793, it was incorporated the same year. Population, 1900, 6,679.

**ELIZABETH ISLANDS**, a group of sixteen islands between Vineyard Sound and Buzzard's Bay, belonging to Dukes County, Massachusetts. Naushon has an area of eight square miles, is the largest of the group, and contains handsome private and summer residences. John Anderson gave Penikese, an island of this group, with an endowment of \$50,000 to Louis Agassiz, in 1873, for conducting a summer school, though the institution has since been discontinued. In summer the islands are visited by tourists and pleasure seekers. Population, 1900, 164.

**ELK**, or **Moose Deer**, the largest living species of the deer family, native to Europe and Asia. It stands, when full grown, about six feet and in weight averages about 1,000 pounds. The neck is very short and thick, adapting the animal for draft purposes. In all species the head is large, fully two feet long, and crowned with prominent horns, which branch out almost from the base into a broad, palmate form, with numerous snags. A single antler frequently weighs fifty or sixty pounds. The limbs are long and quite graceful. A fully developed elk will draw a sledge more than 200 miles a day, the gait being a shambling trot. The elk is timid and inoffensive, except when wounded, when it becomes aggressive. A single, well-directed stroke of its forefoot is sufficient to kill the largest dog. The flesh is esteemed a good kind of venison and is much sought as an article of food.

The so-called American elk does not belong to this class of animals, since it more nearly resembles the red deer, and the proper name

is Wapiti (q. v.). Occasionally one of these animals is seen in the northern part of the United States, but they are fast disappearing even in Canada. They inhabit marshy and dense timber regions and live separately, except during the rutting season. The Irish elk, which is now extinct, was closely allied to the fallow deer. Remains of it are found occasionally in the bogs and caves of the British Isles and the western part of Europe. This animal was re-

WAPITI, OR AMERICAN ELK.

markable for its large antlers, which in some specimens measured as much as eleven feet from tip to tip.

**ELKHART** (ĕlk'härt), a city of Indiana, in Elkhart County, at the confluence of the Saint Joseph and Elkhart rivers, 98 miles east of Chicago, Ill. It is on the Lake Shore and Michigan Southern and other railroads, and is surrounded by a fertile agricultural country. Among the noteworthy buildings are the Carnegie library, the high school, the city hall, and the Elkhart Institute. The principal manufactures include paper, starch, musical instruments, machinery, carriages, flour, and brass novelties. It has extensive railroad machine shops and other industries. The streets are well graded and paved, principally with brick, and the municipality has systems of sewerage and lighting. It is the center of a large trade in produce and merchandise. Population, 1900, 15,184.

**ELKHORN**, a river of Nebraska, rises in Rock County, flows in a general southeasterly direction, and joins the Platte River about 20 miles west of Omaha, after a course of 250 miles. The valley of the Elkhorn is noted for its fertility. It contains numerous enterprising

cities and is traversed by the Chicago and Northwestern Railroad.

**ELKS, Benevolent and Protective Order** of, a benevolent and fraternal society founded in 1868 in New York City. It is the outgrowth of a social club known as the Jolly Corks, a society of members of the theatrical profession, and its purposes are social and philanthropical. The largest membership is in the United States, where the order has about 950 subordinate lodges with a membership of 250,000. Eligibility to membership is limited to white male citizens of the United States of good moral character, 21 years of age, and subordinate lodges are not permitted in cities that have a population less than 5,000. This order has many fine buildings in the larger cities. Its official organ, the *Elks-Antler*, is a monthly publication.

**ELLESMERE LAND** (ĕlz'mēr), the name of a large tract of land in the Arctic region of North America. It is located north of Jones Sound and west of Greenland, from which it is separated by Smith Sound. It is part of the northernmost region of the Western Hemisphere and consists chiefly of a barren and uninhabited plateau. William Baffin visited it in 1616, and it was partly explored in 1899, when it was found that Hayes Sound does not separate it from Grinnell Land, which lies immediately north.

**ELLIPSE** (ĕl-lĭps'), an important figure in geometry. It is a plane curve, the sum of the distances of two straight lines drawn to two fixed points within the curve being always the same. These two points are called the *foci*, each being a *focus*. The diameter drawn through them is the major axis; the minor axis bisects the major at right angles. The distance from the center to the foci divided by the semimajor axis is called the *eccentricity* of an ellipse. The less the eccentricity, the nearer the figure approaches a circle. Kepler made the discovery that the planets' orbits around the sun are ellipses, the sun occupying a position in one of the foci.

**ELM**, a genus of trees which includes thirteen well-marked species, all native to the North Temperate Zone. In most species the branches are numerous and spreading, the bark is rugged, and the leaves are alternate, ovate, and doubly serrate. The flowers are small, but numerous and in clusters, and the fruit is either a small, one-sided nut, forming a winged samara, or a drupe. Elm wood is compact and very durable in water. The trees commonly grow to the height of 60 to 100 feet, and in some cases as high as 150 feet. Wagon hubs and ship locks

are made of the wood of the white elm, which is also largely taking the place of oak in the manufacture of the cheaper grades of furniture. The *slippery* or *red elm*, a native tree of America, contains a mucilaginous inner bark, while the *wych elm*, or *wych hazel*, is indigenous to Europe. Another species is the *weeping elm*, which is the most ornamental of the genus. The old white elm tree of the Boston Commons, destroyed by a storm on Feb. 15, 1876, measured 22 feet in circumference.

**ELMIRA** (ĕl-mĭ'rà), a city of New York, county seat of Chemung County, on the Chemung River. It is on the Pennsylvania, the Lehigh Valley, the Erie, and the Lackawanna railroads and is the focus of several electric lines. The streets are regularly platted, crossing each other at right angles, and are improved by grading and paving. Among the noteworthy buildings are the post office, the

ENGLISH ELM.

SLIPPERY ELM.

courthouse, the public library, and the city hall. The public school system culminates in an excellent high school course and is supplemented by Elmira College, an institution having an endowment of \$250,000. Among the charitable institutions are an industrial school, an orphanage, a home for the aged, the Arnot-Ogden Memorial Hospital, and the Anchorage. It is the seat of the State reformatory.

Elmira is important as a market and an industrial center. The manufactures include clothing, silk and woolen goods, engines and boilers, boots and shoes, steel plate, cigars, and machinery. It was settled in 1788 and incorporated in 1815. During the Civil War it had a Federal prison in which many Confederates were confined. Population, 1910, 37,176.

**ELMO'S FIRE, Saint**, the popular name of a meteoric appearance seen during thunder

storms at the tops of masts and other pointed objects. It is more frequent in southern than in northern climates, and is due to currents of electricity. It appears either as one or two flames. The former phenomenon, known as Helena, is regarded a bad omen by sailors, while the latter, called Castor and Pollux, is looked upon as a good sign.

**ELORA** (ĕl-lō'rà), or **Ellora**, a village of Hindustan, near Dowlatabad, celebrated on account of its remarkable temples hewn in rocks. These temples number about 35, some of which are cave temples, while others consist of excavations in higher strata of rock. Many of the larger structures are about 150 feet wide and 275 feet long, and are adorned by sculptures, sphinxes, and obelisks cut from solid granite. The caves are thought to have been constructed in the 7th century.

**EL PASO** (ĕl pā'sō), a city of Texas, county seat of El Paso County, on the Rio Grande. It is on the Southern Pacific, the Mexican Central, the Texas Pacific, and the Atchison, Topeka and Santa Fé railroads. The site is 3,830 feet above sea level, with a mean annual temperature of 63° Fahr., and the surrounding country has large interests in stock raising and general farming. Among the noteworthy buildings are the county courthouse, the high school, the Hotel Sheldon, the Federal building, and several private schools and hospitals. The streets are well paved and drained. It has a sewer system, gas and electric lighting, and electric street railways. The industries include smelting, cigar making, and machine shops. El Paso was settled in 1827 and incorporated in 1869. Near the city is a United States military post. Population, 1900, 15,906; in 1910, 39,279.

**EL RENO**, county seat of Canadian County, Oklahoma, on the Canadian River, 25 miles west of Oklahoma. It is on the Chicago, Rock Island and Pacific and other railroads. The surrounding country is fertile. Among the chief buildings are the high school and the county courthouse. It has manufactures of flour, earthenware, and machinery. The city maintains a system of waterworks and has electric lighting. Population, 1900, 3,383.

**ELVES**, the term applied to the mythical spirits supposed to inhabit wild and desolate places, and in various ways to exercise a mysterious power over man. See **Fairies**.

**ELWOOD** (ĕl'wōd), a city of Indiana, in Madison County, 37 miles northeast of Indianapolis. It is on the Pittsburg, Cincinnati, Chi-

cago and Saint Louis and the Lake Erie and Western railroads. Natural gas is obtained in the vicinity. The chief buildings include the county courthouse, the high school, and the public library. It has gas and electric lighting and electric street railways, and is a growing market for cereals and live stock. The manufactures include glass, machinery, cigars, and clothing. The municipality maintains systems of sewerage and waterworks. Population, 1900, 12,950.

**ELY** (ē'li), a town in the county of Cambridge, England, on the Ouse River. It has a superb cathedral founded by Etheldreda, daughter of the King of East Anglia, about the year 673. This building was burned by the Danes in 870, rebuilt as a Benedictine abbey in 970, and greatly enlarged after the first Norman conquest. It includes different parts which are built in the various styles of architecture that prevailed in Britain from the Conquest to the Reformation, is 517 feet long, and has a tower 275 feet high. The town is surrounded by a gardening district which produces vegetables for the markets of Cambridge and other cities. It was the last stronghold of the Saxons after the Conquest. Population, 1907, 8,471.

**ELYRIA** (ē-līr'ī-ā), county seat of Lorain County, Ohio, about seven miles south of Lake Erie, on the Black River. It is on the Baltimore and Ohio and the Lake Shore and Michigan Southern railroads, and is surrounded by an agricultural and dairying country. The chief buildings include the county courthouse and the public library of 17,500 volumes. Sandstone is quarried in the vicinity and shipped in large quantities. The manufactures include clothing, cheese, tobacco, machinery, and confectionery. It has pavements, electric lighting, and a large trade in produce. Population, 1900, 8,791.

**ELYSIUM** (ē-līzh'ūm), or **Elysian Fields**, in mythology, the place in which the souls of the blessed were supposed to dwell after death. The Orientals and most other peoples considered this abode to be in the upper regions of the sky, but the Greeks located it in the west, or beneath the earth, where the sun goes down. Homer described it as the Isle of the Blessed, where men live without toil or care, where snow and winter's storms are unknown, where the lovely and cooling zephyrs blow unceasingly with light murmur, and where the favorites of the gods are carried when passing from this life. He thought that Rhadamanthus, the most just of men in the upper world, alone ruled Elysium. Hesiod speaks of the happy isles of the ocean, but Pindar and the later poets put it beneath the earth.

**EMANCIPATION** (ē-mān-sī-pā'shūn), the liberation from bondage, applied in American history especially to the release of the negroes from slavery. The early constitution framed in Vermont abolished slavery in 1777 and Massachusetts did likewise in 1780. Acts of gradual emancipation were passed by Pennsylvania in 1780, New Hampshire in 1783, Rhode Island in 1784, Connecticut in 1784, New Jersey in 1804, and New York in 1799, though in the last-mentioned State an act of absolute emancipation took effect July 4, 1827. Slavery was permitted in the remainder of the colonies, and in the case of new states the question was settled at the time of admission. Soon after the Civil War commenced President Lincoln was urged by northern abolitionists to abolish slavery by proclamation. As early as 1862 laws were passed abolishing slavery in the territories, freeing escaped slaves of persons in rebellion, and abolishing slavery in the District of Columbia, the owners receiving compensation.

The Northern States entered upon the war to maintain the Union, not to liberate slaves. On Aug. 22, 1862, President Lincoln stated: "My paramount object is to save the Union, and not either to save or destroy slavery. If I could save the Union without freeing one slave I would do it; if I could save it by freeing all the slaves I would do it; and if I could save it by freeing some and leaving others alone I would do that." As the war progressed it became evident that slavery was a source of much military strength to the seceded states, and freeing them was decided on as a war measure. President Lincoln issued a proclamation on Sept. 22, 1862, in which the seceded states were notified that unless they returned to their allegiance by Jan. 1, 1863, he would declare their slaves forever free. Since the states in rebellion did not heed the notice, the Emancipation Proclamation followed on Jan. 1, 1863, by which all slaves in these states were declared free. It was given effect as rapidly as the Federal troops secured control of the territory held by the Confederates. In the proclamation the President declared it an act of military necessity, enjoined the freed slaves to abstain from violence, and offered to engage them in the military and naval service.

**EMBALMING** (ēm-bām'ing), the art of preserving the dead bodies of men and animals. There are many evidences that the art was practiced extensively in ancient Egypt, where the process was known at least 4,000 years B. C., this being evidenced by the embalmed bodies of Cheops and other sovereigns of the early dynasties. The origin of embalming is ascribed

by the Egyptians to Anubis, who embalmed his father, Osiris. One of the earliest records of embalming is that of the patriarch Jacob. We learn from reliable sources that the body of Joseph was thus prepared and transported out of Egypt. The practice prevailed, though not so extensively, among the nations of Asia and in Greece and Rome. Usually the bodies of the poorer classes were dried in the sand or washed in myrrh, and then salted for a period of seventy days.

Embalming among the middle classes consisted of removing the brain and soaking the corpse in a solution of natron, which destroyed the viscera and soft portions, leaving practically only the skin and bones. The wealthy frequently paid \$3,000 for the embalming of a single body, the process being nearly the same as among the middle classes, except that the corpses were swathed in linen bandages saturated with gum, and perfumed with aromatic substances. Within and about the bodies of different mummies have been found sulphate of soda, saltpeter, salt, soda, oil of cedar, turpentine, asphalt, myrrh, and cinnamon. Extended knowledge of the use and effect of chemicals has led to the employment of various compounds that are effective in artificial embalming, such as arsenic, sulphate of zinc, corrosive sublimate, and spirit compounds. They are forced into the blood vessels and cavities soon after death ensues, or the body is immersed for some time in spirits. At present the corpses are embalmed chiefly to prevent contagion, to make transportation less dangerous, and to overcome the necessity of immediate burial. See **Mummy**.

**EMBARGO** (ĕm-bär'gō), a prohibition by government authority of the departure of ships or merchandise from some or all its ports. It is either *hostile* or *pacific*, the former having reference to the detention of vessels of a foreign country and the latter to its own vessels. A hostile embargo is declared either as a means to settle a dispute, or to make a reprisal, while a pacific embargo is laid as a public policy or to protect the merchant vessels of a neutral nation. The first general embargo was laid by the United States in 1794. It was effective upon all vessels for sixty days, and was laid as a retaliatory measure against the British orders in council dated June 8, 1793. At the time of the War of 1812 another embargo was laid, in 1813.

**EMBER DAYS**, certain days in each of the four seasons set apart for prayer and fasting, one theme for supplication being that the blessings of God may descend on the crops. They

are the Wednesday, Friday, and Saturday after the first Sunday in Lent, after Whitsunday, after the 14th of September, and after the 13th of December.

**EMBOSSING** (ĕm-bōs'ing), the art of producing raised figures upon plain surfaces, such as paper, leather, bronze, and wood. In the two last mentioned the figures are said to be in *alto-*, *mezzo-*, or *bas-relief*, according to whether they are more or less prominent. Paper, leather, and the textile fabrics are embossed by powerful presses, in which the dies give their pattern to the object to be embossed. Steam is employed to keep the plate at a suitable temperature, depending upon the material to be embossed, and the power is applied by a treadle to straighten a bent arm, as in the old form of the printing press. Wood to be embossed is softened by steam and the impressions are made by iron molds into which it is forced. Metal is embossed largely by hand, the workman beating it up from the under side, and this method is called *repoussé work*. In embossing textile fabrics, it is done largely as needle work embroidered over figures padded with various materials, such as wool felt.

**EMBROIDERY** (ĕm-broid'ēr-ÿ), the name applied to ornamental needlework produced upon fabrics of any kind. Its production was one of the most important of the early arts in Oriental countries, and it is still practiced with much skill and diligence, the best work being done upon silk. The figures are either in colored silk or in threads of silver and gold. They consist of men, horses, dragons, etc., and are outlined with gold and filled with shades of silk, though sometimes are ornamented with beads, spangles, pearls, and precious stones. The fabric is stretched usually on a frame, with the design to be worked drawn upon it, or some other contrivance is used to guide the worker.

From the earliest times embroidery has been used to decorate the sacerdotal vestments, but it likewise has served other ecclesiastical uses. In modern times it has been employed to a large extent in women's dresses and undergarments. The Jews derived their skill in producing embroidery from the Egyptians. It appears to have been a common art, since even barbarous tribes were skilled in making showy designs upon cloth and other fabrics, using both linen and wool for the purpose. Many of the nomadic tribes of Asia and Africa still practice it as a domestic art. The process of doing embroidery work, even in modern times, employs simple tools and the work is largely by hand. They consist chiefly of needles of dif-

ferent sizes and scissors to cut the thread. The thread left on the surface of the cloth after each ply of the needle is called a *stitch*. The stitches differ in accord with the work to be done and include principally those known as the cross, darning, running, crewel, feather, rope, cushion, buttonhole, chain, canvas, and couching stitches. Various machines for making embroidery are now in use.

**EMBRYOLOGY** (ěm-brī-ōl'ō-gŷ), that branch of biology which treats of the formation of organisms. The study of this division of learning as a science dates from the last century, though Aristotle, Galen, and Harvey considered the subject and laid the foundation for the recent embryologists. The epoch of life in placental mammals, to which the study of embryology ordinarily is limited, extends from the time of conception to the period at which the anatomical connection between the young and mother is severed, though in a general sense it embraces the entire period from conception to the attainment of the perfect form. By *conception* is meant the *fertilization* of the ovum, which takes place through a spermatozoön, or male germ cell, penetrating into it, both in animals and plants. However, there are radical distinctions that give rise to divers limitations.

In most fishes and some other animals the embryo and parent have no anatomical connection, while fertilization of the ovum in many of these is effected outside the female. In oviparous animals the female retains the ovum within the body for some time after fecundation, where it is retained in a condition largely independent of the maternal body, though securing from it heat and protection. After a definite number of eggs have been ejected, the mother begins external incubation, which is continued until the young life bursts from the shell. However, a filial relationship exists after incubation by reason of which the new life is supplied with protection and food, while in other animals the lacteal function of the mother supplies the helpless young with support quite as vital as the nourishment previously extended through the placenta.

The laws announced by Rudolf Virchow (q. v.) and Karl Ernst von Baer (1792-1876), two German scholars, form the basis of study in modern embryology. The laws of the former imply that the organs and cells of new life forms originate primarily from cells deposited in the ovulum and gradually become complex through cell division and cell specialization, or the physiological division of labor. Von Baer's law maintains that the form primarily assumed

by an individual in the process of development is similar to that assumed by many types, later its organism becomes more specialized and, when fully developed, stands wholly apart from parallel types. Thus, the process of development leads to the special from the general, to the heterogeneous from the homogeneous.

Herbst explains the whole process of embryonic development by asserting that the protoplasm responds in a very intricate way to its surroundings; that it depends upon physiological responses to stimulations that come from without; in other words, that the cells and organs in the embryo move and change form in response to various stimuli, especially in eggs containing a considerable quantity of yolk. The yolk being food for the embryo, it is certain that the latter gives off waste products in the process of rapid growth, and later moves away to portions of the yolk not contaminated by such wastes.

It is quite well known that the development of the embryo differs materially in different animals, though in the successive stages there is much analogy, even in the human foetus, to the embryo or adult of the lower life forms. However, in this connection arises the discussion of the theories of *evolution* and *epigenesis*. According to the former theory the embryo exists preformed in the ovum and begins to unfold into the adult as soon as fecundation takes place; while in the latter we find the theory that holds the growth of the embryo to be a process of new formation, the cell mass giving birth to new cells in their own interior by stimulation from without, a view now most generally adopted.

**EMERALD** (ěm'ěr-ald), a variety of beryl, being distinguished in having an emerald-green color, in place of pale green, light blue, yellow, or white hues, which are the colors of the beryl. The emerald green of this gem is produced by the presence of chromium. Jewelers obtain the finest emeralds from Peru, but fine species are found in other places of South America, and an inferior quality is native to Europe. The emerald is usually in the form of a prism, and is most valuable when the surface is perfectly straight and smooth, so as to cast no darkening shadow on any of its particles. It is one of the softest of the precious stones, but acids will not affect it. Emeralds are cut on a copper wheel with emery dust, and polished on a tin wheel with rotten stone. As a gem it is considered inferior only to the diamond and ruby.

**EMERALD ISLE**, the popular name of Ireland, applied to it on account of the rich green

color of its vegetation. It came into general use through Dr. Drennan (1754-1820), who first used it in his poem entitled "Erin."

**EMERY** (ěm'ěr-ŷ), a variety of corundum, being allied to the sapphires, the ruby, and other precious stones. It is granular in texture and the hardest substance found native, next to the diamond. Emery is a dense, opaque, dull grayish-black substance, occurring in boulderlike masses and as granulates in soils. It is found in the islands of the Greek Archipelago, in Asia Minor, at Chester, Mass., and elsewhere. As a powder it is used extensively for cutting and polishing precious stones and for smoothing the surfaces of lenses and plate glass. When employed in this form, it is prepared by first breaking the stone into small lumps, then crushing them into powder by stampers. Emery paper and emery cloth are made by sifting the powder over strong sheets of paper or cloth, after brushing them with liquid glue. Emery wheels are commonly made of wood covered with leather or coarse cloth, with a surface of emery, or a compound of emery and caoutchouc molded into the shape of a grindstone and vulcanized.

**EMIGRATION** (ěm-ĭ-grā'shŭn), the removal from one country or region for the purpose of settling or residing in another. Inhabitants leaving a country are called emigrants, while those coming into a country or state are spoken of as immigrants. Among the principal causes that have led to emigration are over-population, political and social discontent, compulsory military service, religious persecution, the desire to attain greater liberty, and the general betterment of industrial conditions. The barbaric tribes of ancient times were induced to migrate and occupy territory more conducive to their arts of warfare and life, while civilized people have migrated more or less for higher purposes, especially to carry the benefits of civilization and religion to remote lands. All of Europe was settled by the over-population that pressed westward from Asia, and later, when the population of European countries became dense, the inhabitants in turn sought newer lands and greater opportunities. The fact that people are governed by certain laws of migration, such as passing to countries having a similar climate, the same natural resources, and an approximately equal altitude, has been well established.

Emigration to America on a large scale began with the departure of the Puritans, who planted colonies in New England. Soon after the Dutch colonized New York, the Germans settled Pennsylvania, the French occupied Canada and

Louisiana, the Spaniards made settlements in Florida, and the Swedes established a foothold in Delaware. In 1815 such an extensive breaking-up occurred in Europe that alarm was occasioned, though afterward it became manifest that the emigrants were made up largely of the over-population of various countries. The last century marks the greatest epoch of migration in the world's history, a period in which the Spanish and Portuguese languages were planted in Central and South America, the English in North America and Australia, and the Dutch, English, German, and French in various portions of Africa, Asia, and the Oceanic islands. Perhaps the planting of language is even overshadowed by the establishment of certain forms of religion, industries, and customs, and the molding of a new civilization. The colonial policy pursued in recent years by the great powers of Europe is tending to direct the over-population to various colonies, and thereby to strengthen more and more the foothold that these nations have in regions far remote from the mother country. This is particularly true of the Russians in Asia, and the Portuguese, French, Germans, English, and Italians in Africa.

**ÉMIGRÉS** (ă-mě-gră'), the name given to the royalists who fled for safety from France during the Revolution of 1789. The movement began shortly after the storming of the Bastille on July 14, 1789. When Prince Condé became alarmed at the course of events and was joined by many nobles in emigrating to Germany and the Netherlands. In October of the same year a concerted attack was made on Versailles, causing the royal family to remove to Paris, and this was followed by a renewal of emigration on a larger scale. The *émigrés* collected an army of 80,000 men at Coblenz under the Duke of Brunswick and the king made a disastrous attempt to join the forces, but was captured on the night of June 20, 1791. Condé and his adherents joined the Prussian army in Champagne, which caused the French government to confiscate their property and to proclaim the death penalty upon many for treason. When Napoleon gained the consulship, they were permitted to return, but the charter of 1814 made it impossible for them to regain their estates or former privileges. In 1825 the government voted to compensate them for the loss of their estates, but this was annulled as a result of the Revolution of that year.

**EMINENT DOMAIN** (ěm'ĭ-něnt dô-măn'), the supreme right possessed by a country or state to take or control private property for public use without the consent of the owner.

This right is justified in all civilized nations because it serves to promote the general welfare. It is not a confiscation of the property, since it is required that full and adequate compensation be made to the owner, and is to a large extent the outgrowth of the feudal system of land tenure in England and elsewhere. The Parliament of Great Britain provides for reasonable compensation to the owner of property taken for public use, but this is done rather as an act of justice than because of legal obligation. In the United States it is a constitutional requirement that no person shall be deprived of property without due process of law, and "private property shall not be taken for public use without just compensation." Nearly all of the states have similar constitutional provisions, and under them, or the statute laws, property may be taken for public use in the same way as it may be taken by the national government. The right of eminent domain is essential and necessary, since otherwise it might become impossible to construct public buildings, highways, canals, and railroads.

**EMOTIONS** (ĕ-mō'shūns). See **Feelings**.

**EMPEROR** (ĕm'pĕr-ĕr), the title of a sovereign who rules over an empire, considered superior to the rank of a king. It originated from the title of *Imperator*, which was conferred by the ancient Romans on the consuls in their military capacity. In later times it designated the highest authority in the state and Julius Caesar assumed this title and made Rome an empire. Charlemagne, who founded the German Empire, received the title of Emperor of the Romans in 800 A. D., and it was borne by his successors until 1806, when the Holy Roman Empire was dissolved. At present it is the official title of the emperors of Germany and Austria-Hungary. The King of England is Emperor of India, and the Czar of Russia is frequently alluded to as an emperor. China, Japan, and Turkey are empires.

**EMPIRICISM** (ĕm-pĭr'ĭ-sĭz'm), a system of practice based on the results of observation rather than on the scientific investigation of principles. It is evident from the very nature of progress in the learned professions that the early methods employed were more largely empirical than after material advancement had been made, though the value of any system of learning depends to a large extent upon practical observations based upon successful and continuous experiments. In the greater activities of modern civilization scholars aim to take advantage of every useful discovery and method made in previous ages, and, by a system of continuous investigation, to supplement such newer

and advancing methods as are evolved in consequence of thorough application. From this it is evident that all methods are to take into account the benefits of systems originated in the past, and to further accumulate and enlarge by experience and observation.

**EMPORIA** (ĕm-pō'rĭ-ā), county seat of Lyon County, Kansas, on the Neosho River, 120 miles southwest of Kansas City. It is on the Missouri, Kansas and Texas and the Atchison, Topeka and Santa Fé railroads. The surrounding country is a fertile farming region. Among the chief buildings are the county courthouse, the Carnegie library, a conservatory of music, and the College of Emporia, a Presbyterian institution. It is the seat of a State normal school. The manufactures include vehicles, ironware, canned goods, flour, dairy products, and works in marble. It has systems of electric railways, waterworks, and gas and electric lighting. Emporia was settled in 1856 and incorporated in 1870. Population, 1904, 9,346.

**EMS** (ĕms), usually called the Bath of Ems, a bathing place of Germany, about four miles from Coblenz, on the Lahn River, in the province of Hesse-Nassau. The thermal springs belong to the class which contain soda, have a temperature of 78° to 135°, and the waters are used both for drinking and bathing. It has numerous bathing establishments, many of which are finely constructed. The town is noted for its fine hotels, theaters, and private lodging houses. Thousands of visitors throng the place annually. The value of the springs was known to the Romans. Population, 1905, 7,614.

**EMU** (ĕ'mū), or **Emeu**, a large bird closely allied to the cassowary, standing from five to six feet high. It is native to Australia and the adjacent islands. The color is a dull brown mottled with gray-white, but the young are striped with black. The head is devoid of a helmet, as found in the cassowary, and the bill is depressed. Australian natives value the flesh and eggs for food, the former having a taste which resembles that of beef. Emus are easily domesticated and breed readily in that state. The eggs are not as large as those of the ostrich, being only about four inches in diameter, but require three months for incubation, which is sometimes performed by the male. They live on roots, fruits, and herbage. The only sound uttered is a loud, booming cry made by the female. This species of birds is unable to fly, but it possesses much speed in running. See illustration on following page.

**EMULSION** (ĕ-mūl'shūn), a medical preparation composed of a soft liquid resembling milk in consistency and color, its oily or resin-

ous property being united with water by a saccharine or mucilaginous substance. Among the best known is the emulsion of cod-liver oil, used in treating pulmonary disease.

**ENAMEL** (ĕn-ăm'ĕl), the name given to vitrified substances of various composition, applied to the surface of metals. It is generally put on like paint, with a brush, and then heated sufficiently to melt the enamel, which causes it to become a fixed part of the surface. The art was practiced by the Egyptians and Etruscans on pottery, and passed from them to the Greeks and Romans. In Western Europe, especially among the Saxons and Normans, it was early employed in manufactures. It is used for producing artistic designs, figures, and

CASSOWARY. EMU.

ornaments, when it belongs to the fine arts, and is employed in making the dial plates of watches and clocks and for coating culinary vessels. The basis of all enamels must be an easily fusible, colorless silicate or glass. All bases on which it is applied must be cleaned with weak acid, or some similar preparation, and moistened with gum water. Copper is the best base, but iron is used for ordinary purposes.

**ENAREA** (ă-nă'rĕ-ă), a region of Africa, in the southern part of Abyssinia, between 7° and 9° north. It is inhabited by natives of the Gallas tribes. The government is hereditary and absolute. Among the chief products are coffee, cloth, embroidery, gold, live stock, and fruits. In religion the people are largely Mohammedans. The slave trade is still sanctioned, though it has been abridged greatly in recent years. The government is administered from

Saka, a city near the Gibbe River. Population, 1908, 42,500.

**ENCAUSTIC PAINTING** (ĕn-kă's'tĭk), the method of fixing colors upon objects by the process of burning. The ancient Greeks employed the encaustic art in decorating the inner and outer walls of buildings and in ornamenting sculptures in marble. It was a common kind of painting among the artists of Rome during the empire. The colors were mixed with wax and resin, and the pictures were finished by the application of a hot iron, hence it gave the product a more glossy surface than that obtained in water-color painting. It has the advantage of being very enduring; hence the art has been revived to some extent. Polygnotus's "The Battle of Marathon" is a good example of encaustic painting and was preserved in an open portico at Athens about ten centuries.

**ENCYCLOPAEDIA** (ĕn-sĭ-klŏ-pĕ'dĭ-ă), **Encyclopaedia**, or **Cyclopaedia**, a work in which the various branches of science and art are treated separately, or in particular departments, and usually in alphabetical order. The authors of early encyclopaedias attempted to treat all subjects of human knowledge exhaustively, but, as knowledge extended, vocabularies enlarged, and specialists multiplied, it became necessary to confine the treatise to a smaller limit of subjects or make the work departmental and specialized. It is assumed that Terentius Varro wrote the first extensive work of an encyclopaedic nature in the year 30 B. C. Pliny the Elder soon after prepared his well known "Natural History," which long ranked as a highly superior work. Farabi, an Arabian writer, prepared an encyclopaedia in the Arabian in the 10th century, while Dominican Vincent of Beauvais, under the patronage of Louis IX. of France, collected the whole sum of knowledge of the Middle Ages, to which an anonymous author appended a valuable addition several years later. In 1677 Johann Jacob Hoffman published his great German work, "The Universal Lexicon," at Basel, Switzerland, and in 1697 Pierre Bayle, the French critic, issued his well-known "Dictionary of History." The most extensive of the newer German works are Meyer's "Neues Konversations-Lexikon" and Brockhaus's "Konversations-Lexikon." Ange de Saint-Priest's "Encyclopédie du XIXème siècle" is a modern work in French.

The first English encyclopaedia containing subjects in alphabetical order was the "Lexicon Technicum" published in 1704. Among the newer English works are the "Encyclopaedia Britannica," published at Edinburgh in 1788, Charles Knight's "Penny Encyclopaedia," and

"Chambers' Encyclopaedia." The English publications have been revised from time to time and have had a large sale in America. To make them more suitable in Canada and the United States, American supplements or additions have been combined with the English publications. The most extensive encyclopaedia ever published in the world is the Chinese "Encyclopaedia of Literature and Science," containing 5,040 volumes. It embraces information on practically every subject known to the people of the Celestial Empire. Among the leading American publications are "The Americana," "Johnson's Universal Cyclopaedia," and "The New International Encyclopaedia." Besides these are smaller editions of general character and numerous works treating on special subjects, such as biography, anatomy, ethnology, zoölogy, etc.

**ENDOGENS** (ĕn'dō-jĕns), one of the two primary classes of plants into which the vegetable kingdom is divided, the other being exogens. This designation of character is determined from the structure of the stem, which has the wood in threads mixed with the pith and scattered throughout every part, never forming layers, and from the wood of which the bark cannot be peeled, because of its being partly developed in the interior of the stem. The embryo has but one cotyledon, the leaves are nearly always parallel-veined, and the flowers have their parts in threes or a multiple of three, very rarely in twos or fours, but never in fives. In germination the original radicle issues from a sheath, and, in growing upward, each successive shoot of the stem issues from a former sheath. Palms, bananas, lilies, grasses, and sedges belong to this division.

**ENEMY**, in military, the term applied to either of two nations which are at war with each other. The state of enmity begins with a declaration of war, which may be either documentary or by actually taking up arms. Both parties in an armed conflict are called *combatants*, while all others that are interested but exempt from the operations of hostilities are known as *noncombatants*. During a state of war, when two or more nations are enemies to each other, all commercial relations are suspended. In some cases a state may permit its own citizens to trade with the enemy, but as a rule contracts made with an enemy cannot be enforced in the courts of law.

**ENERGY** (ĕn'ĕr-jĕ), the capacity to do work. Work is done at the expense of energy. All natural phenomena are caused by energy acting on matter. Whenever it is expended to produce a phenomenon, such energy must be

drawn or transferred from some stock of existing energy. For example, when the spring of a watch is run down, and has thus expended the energy it possessed, it requires a new store of energy to be imparted to it. If a book falls from the table to the floor, it requires that energy be imparted to it in order to raise it from the floor to the table. When the book reaches the table, it has acquired energy sufficient to enable it to do work exactly equal to the amount expended on it in raising it that distance. This energy of motion is called *kinetic energy*. So long as the book rests on the table the distance times the weight of the book is stored in the book, and the energy so stored is called *potential energy*.

Experiments in great number have proved that there is never any destruction of energy. It may be transferred from one body to another, or differently distributed among bodies at different times, but the sum total in all the bodies is not lost. Matter and energy never change. In order to effect transmission, when there is no solid or fluid matter to act as a conductor, it must either leap through empty space, or be carried by something in space which we cannot see or otherwise detect. Hence, physicists assume the existence of a medium called *ether*. The energy which resides in ether waves is called *radiant energy*. The form of energy is known by diversified terms, dependent upon the nature of its work. It is designated as light, when it affects the eye; heat, when it raises the temperature; actinic, when it produces chemical changes; and electric, when it gives rise to conditions of electrification.

Since the sum total of energy in the universe, like the sum total of matter, must constantly remain the same, it gives rise to the general law known as the *conservation of energy*. According to this law no form of energy can be produced except by the expenditure of some other form, nor can it be annihilated except by being reproduced in some other form. The general theory known as the *dissipation of energy* is based upon the tendency of all energy to be converted into heat, and in the form of heat it radiates into space and apparently is lost forever. According to this view, the sun will eventually become a cool and dark body like the earth, since its heat is constantly radiating off and is not returned to it.

**ENFIELD** (ĕn'fĕld), a town of Middlesex County, England, nine miles north of London. It is celebrated on account of the manufacture of rifles and small arms for the government. The noteworthy features include the town hall, the public library, and the remains of a royal

palace of Edward III. Enfield has a celebrated school at which Keats studied. It was the home of Charles Lamb. Population, 1907, 49,631.

**ENFIELD**, a town of Hartford County, Connecticut, on the Connecticut River, about ten miles south of Springfield, Mass. It is on the New York, New Haven and Hartford Railroad. Within the town is a community of Shakers known as Shaker Station. It has a public library and several fine schools. Among the enterprises is the famous Thompsonville carpet factory, in which about 350 looms are employed, having a capacity of 6,000,000 yards annually. It is the seat of the Hazzardville powder mills, one of the largest institutions of the kind in the world. Other factories produce vehicles, plows, sewing machines, timber products, and implements. Population, 1910, 9,719.

**ENGINE** (ĕn'jin), a machine of complicated parts for utilizing some force in nature to perform work. See **Steam Engine**.

**ENGINEERING** (ĕn-jĭ-nĕr'ing), the art of making, building, or using engines and machines, or of designing and constructing public works, requiring special knowledge of materials, machinery, and the laws of mechanics. The range of knowledge required for the different departments is quite diversified, and each of these does not admit of strict definition as now divided. The six principal divisions of this branch of learning consist of military, marine, mechanical, civil, electrical, and mining. *Military engineering* includes the planning, constructing, and maintenance of fortifications and gunnery, artillery, and telegraphy as applied in warfare. *Marine* and *naval* engineering are concerned with works partly of a military and partly of a naval character, such as the planning and construction of vessels of war, engines, and torpedoes. *Mechanical engineering* requires efficiency in the invention, contrivance, and adjustment of machinery. It is necessary that the mechanical engineer be acquainted with the quality and strength of the materials used, the power of steam, and the parts of engines. In addition it is essential that he should understand the construction of various kinds of mills, including those propelled by steam, water, and wind.

The work of a *civil engineer* covers the most diversified field of study and was not developed in England until about the middle of the 18th century. The engineers employed in that country prior to that time were generally secured from Holland. Civil engineers have to do with the construction of railroads, canals, aqueducts, harbors, highways, bridges, and drainage works. *Electrical engineering* as an art sprang into rec-

ognition in recent years, owing to the larger and more diversified uses of electricity in machinery and the arts. The work of an electrical engineer has to do with the construction, fitting, and care of electrical machinery and the building of electrical car lines, telephones, and telegraph and oceanic cables. *Mining engineering* is concerned with the construction and operation of copper, iron, coal, and other mines. The general tendency is to specialize more closely from time to time the various departments of engineering.

Many important associations of engineers have been organized and are maintained in the United States. The most important among them are the American Institute of Mining Engineers, American Society of Mechanical Engineers, American Institute of Electrical Engineers, American Society of Civil Engineers, and Western Society of Engineers. All of these have meetings at specified times to discuss important questions in relation to their interests, prepare published reports, and support libraries and periodicals for the general dissemination of knowledge and skill in their respective fields.

**ENGLAND** (in'glānd), a country of Great Britain, the most important member of the United Kingdom of Great Britain and Ireland. It occupies all of the southern portion of the island of Great Britain, except the region in the west, which is included in Wales. It is separated from Scotland by the Solway Firth, the Cheviot Hills, and the Tweed River. The outline is in the form of a triangle, with the southern base 315 miles long, and the greatest distance north and south about 360 miles. Its coast line is greatly lengthened by numerous windings and indentations, the most important of which are the Bristol Channel, the estuary of the Severn, Morecambe Bay, Solway Firth, the Wash, the mouth of the Thames, Lyme Bay, and Plymouth Sound. It is separated from Europe by the North Sea, the Strait of Dover, and the English Channel, and Saint George's Channel and the Irish Sea separate Wales and England from Ireland. The area, according to official determinations, is 50,930 square miles.

**DESCRIPTION.** The surface in the eastern and southern parts is low and gently undulating, and is nicely diversified by slightly rounded elevations and broad, fertile valleys. Ranges of mountains and hills characterize the northern and northwestern part, some of which extend into Wales and form a continuation of the highlands of Scotland. The highest elevations include the Cornish Heights, the Cumbrian Mountains, and the Cheviot Hills; the last mentioned trend from Solway Firth parallel

THE HOUSE WHERE SHAKESPEARE WAS BORN.

to the boundary line of Scotland. Scafell, one of the highest summits of England, is in the northern part and has an elevation of 3,210 feet. The Cumbrian Mountains, a region famed as the Lake District, is in the northwestern part of England and has peaks that rise about 3,000 feet above the sea. Toward the south, extending through Wales, are the Welch or Cambrian Mountains, and in the high peninsula of Devon and Cornwall are the lower summits of the Devon Range. As a whole the surface of England is more productive and better adapted to agriculture than any other part of the British Isles.

Numerous small streams drain the surface, the larger number of which flow into the North Sea, hence the general slope is toward the east. Among the rivers which flow into the North Sea are the Thames, Humber, and Tyne, all of which are important for navigation. The Severn, Mersey, and Wye flow into waters tributary to the Atlantic, and are rendered useful for navigation by various improvements and canals. Other streams include the Trent, Wear, Avon, Tees, Dee, and Eden. However, the Severn is the most important in commerce since it has tides of extraordinary height, flows through productive coal fields, and is the longest of the streams. The Mersey has its source in the Pennine Mountains, and flows through a great manufacturing district. All of the streams and the coastal waters are rich in fish, including the cod, herring, mackerel, and haddock. Hull, Grimsby, and Yarmouth are centers of the fishing industry, but London takes rank as the most extensive fish market in the world, having its center at Billingsgate. The annual production of fish is valued at \$32,500,000.

**MINING.** Coal is the most important mineral. It is produced in large quantities in Yorkshire, Lancashire, Derbyshire, and Nottinghamshire. Durham and York are among the centers of the coal mining region. Iron takes second rank in the mineral output and in its production England is exceeded only by the United States and Germany. Yorkshire and Derbyshire produce the greater portion of iron ore and tin is obtained chiefly in Devon and Cornwall. Lead and zinc are mined in Northumberland and small quantities of copper, gypsum, and salt are obtained in different sections. Building stone of all kinds is abundant, including limestone, granite, and sandstone.

**AGRICULTURE.** The land is owned by a small per cent. of the population. Fully eighty-five per cent. of the surface which is under cultivation is rented in small tracts. Much care is exercised in tilling the soil and maintaining fer-

tility. Estimated upon an acreage basis, more is paid for rent, labor, machinery, and fertilizers than in Canada or the United States. A large number of agricultural laborers have been displaced by the adoption of labor-saving machinery, especially in the sections where cereals are the principal crops. Indian corn is not grown, hence wheat, rye, barley, and oats are the chief cereals. Beans and peas receive much attention and considerable profit is obtained from fruit farming and gardening. Most of the farming is a mixture of crop growing and raising of live stock. England is noted for the Durham, Devon, Hereford, and Sussex breeds of cattle and the Cotswold, Southdown, and Leicestershire sheep. The Berkshire breed of hogs, which are grown extensively, have been naturalized in nearly all countries. Dairy farming receives marked attention. A superior class of horses is raised.

**MANUFACTURES.** Manufacturing is the principal industry. In the output of manufactures England is exceeded only by the United States. Fully five times as many persons are engaged in this enterprise as upon the farms. This condition is brought about from the natural advantage of having an abundance of coal and iron, and the additional fact that England has a large merchant marine to encourage foreign trade in the output of the manufacturing establishments. The textile industry is of first importance and the output consists largely of cotton and woolen goods. Manchester is the greatest center of cotton manufacture in the world, while Leeds has the largest woolen mills. Sheffield and Birmingham are centers of the iron and steel industry. Linens are made in large quantities at Leeds and Barnsley and silk manufacturing is carried on in Coventry and Macclesfield. Other manufactures include pottery, earthenware, chemicals, machinery, pins and needles, steel pens, chinaware, cutlery, and firearms. England has some of the largest shipyards in the world.

**TRANSPORTATION.** A fine system of canals was constructed before railroads were built and these are maintained in a high degree of proficiency. Almost every part of the country can be reached by the navigable waterways, which consist of the coastal waters, estuaries, and streams, and a system of canals that penetrates the trade centers. However, the bulk of the transportation is by railways, which have lines in England and Wales that aggregate 16,500 miles. Many of the canals are controlled by the railways and most of them have trunk lines into London. Much of the local traffic is carried by electric railways, which penetrate

from the cities into nearly all sections of the country.

COMMERCE. See **Great Britain.**

CITIES. London, situated on the Thames, is the capital of the United Kingdom and of Great Britain and is the largest city in the world. Fourteen cities, including London, have a population of more than 200,000. These include, in the order of size, Liverpool, Manchester, Birmingham, Leeds, Sheffield, Bristol, Bradford, West Ham, Kingston-upon-Hull, Nottingham, Salford, Newcastle-upon-Tyne, and Leicester. Eighteen other cities have a population of more than 100,000, including Portsmouth, Bolton, Sunderland, Oldham, Croydon, Blackburn, Brighton, Willesden, Rhondda, Preston, Norwich, Birkenhead, Gateshead, Plymouth, Derby, Halifax, Southampton, and Tottenham. About seventy-eight per cent. of the people of England and Wales live in towns and cities.

EDUCATION AND INHABITANTS. England is divided into forty counties, each of which has the right of local self-government similar to that of the counties in Canada and the United States. Educational facilities are provided under a system of local taxation and grants by the state. A nominal compulsory school attendance law is well enforced. Much of the instruction is in private and denominational schools. A board of education has control of elementary education under a law which went into effect in 1900, by which the efficiency of instruction has been greatly increased. Oxford and Cambridge were the only great centers of higher learning at the beginning of the 19th century, but within that century four others were organized. These include Victoria University and the universities of London, Durham, and Birmingham. The inhabitants number about 610 to the square mile. Emigration and immigration have been about equal the last decade. Those coming into the country are chiefly from other parts of Great Britain, Russia, Germany, and Belgium. Population, 1901, 30,805,466. See **Great Britain.**

GOVERNMENT. See **Great Britain.**

LANGUAGE. The English language spoken in modern times is entirely Germanic in its general character and grammatical construction, though it resembles more nearly the Low German than the higher class in general use. There are three periods in its history, including the Old English, Middle English, and Modern English. The first of these extends from the German Conquest of England in about 450 to the Norman Conquest in 1066; the second to about 1400; and the last embraces all the period from the latter date. Old English or Anglo-Saxon included several dialects, all of which

were highly inflected. Two languages were spoken from the Norman Conquest until about the middle of the 13th century, but these became greatly mixed, and, after a time, the French merged with the Anglo-Saxon, forming the Middle English, the language of Chaucer, Langland, and Wycliffe. Modern English differs so materially from the older forms that few words of the latter resemble the English of the present time. Discoveries, inventions, diversifications of industries, and advancement in science and subtlety of thought have all modified and enlarged the language, and, for that matter, all others. It is estimated that the English language is spoken by about 115,000,000 people, though it is understood by fully 120,000,000.

LITERATURE. English literature is naturally divided into three periods—from its beginning to the Norman Conquest in 1066, from the Norman Conquest to the Reformation under Henry VIII. in 1527-47, and from the Reformation to the present time. The literature of the period antecedent to the conquest may be divided into Celtic, Latin, and Anglo-Saxon, and is of a form that cannot be read except by students making its study a specialty. The most eminent Celtic writers include Llywarch Hen and Merlin or Merddhin, and the Latin writers embrace Ethelwerd and Bede. The Norman period extends from the Conquest in 1066 to the commencement of English literature in 1255. Prior to the Conquest a form of Anglo-Saxon literature had developed. It was represented chiefly in the *Anglo-Saxon Chronicle*, which continued to be published until 1154, when the native language went practically out of use. At that time Latin was generally used in history, law, and philosophy, while French was employed in poetry and the literature for general reading.

After the loss of Normandy, in 1204, the English-speaking people gradually attained to a majority, and we find English employed by Roger Bacon, Geoffrey of Monmouth, and Geoffrey Chaucer. The last mentioned is regarded the first great poet of England, and, though a student of French romance and chivalry, he wrote verse in the English. He translated "The Romance of the Rose" into English, and in later years made a study of Italian literature, thus giving the English the benefits of translations from Dante, Boccaccio, and Petrarch. Among the most famous writings of Chaucer are "The Assembly of Fowls," "The House of Fame," and "Canterbury Tales." Though city-bred, Chaucer was a lover of the fields and flowers and showed a marked sensitiveness to the charm and beauty of the world. His "Canterbury

"Tales" is the most noted of his works. It is written in a poetic form and relates the plan of a company of thirty who journeyed from London to Canterbury, where they designed to visit the shrine of Saint Thomas à Becket. The poem relates the different stories told by each member of the company. Among the contemporary writers of Chaucer are the poets, John Gower (1325-1408), Robert Langland (1332-1406), and the prose writer, John Wycliffe (1324-1384). The writings of this period took on the form of the English as written at the present time.

The writers of England between the time of Chaucer and the end of the 16th century were largely imitators of that poet, including James I. of Scotland, John Skelton (1460-1529), and Sir Thomas More (1478-1535). It may be said that this period was generally barren, but with the invention of printing an appetite for literature began to awaken. This was due largely to the fact that the crusades came in contact with Greek scholarship in Constantinople and Southern Europe, where a taste for Greek and Roman literature was still alive. When the Turks drove the Greek scholars from Constantinople in 1453, they spread rapidly toward the west and found many young persons eager to learn the classics and philosophy of Greek and Roman masters. There was not only a tendency to journey to Italy for the purpose of studying, but scholars were induced to come to Western Europe and gradually found their way to England. It was the height of ambition to be able to read Homer and Plato, and to discourse on the writings of Demosthenes and Cicero.

The discovery of America induced a greater interest in geography, opened new avenues of commerce and social activity, and rapidly prepared for a transition from the Middle Ages to the dawn of learning. While Erasmus, the Dutch scholar and philosopher, was teaching Greek at Oxford, he aroused an interest in the New Testament, and published "The Christian Soldiers' Dagger." William Tyndale translated the New Testament into English, which he published in Germany in 1525, and circulated it extensively in England. In the meantime the Reformation in England came on in the reign of Henry VIII., who separated England from Rome, thus paving the way for the enthusiasm always attending a great epoch prominently affecting a large number of people. Sir Thomas More, the author of "Utopia," was beheaded, and many other writers suffered a similar fate.

Among the prominent literary men immediately after the Reformation are Sir Thomas Wyatt,

the first artistic poet, and Henry Howard Surrey, a writer of sonnets and blank verse. These and other writers gave an impetus to literature by making songs and sonnets national, and prepared the way for the Elizabethan age of literature. This age is famous because of the large number of men who came forward with writings of merit, such as Edmund Spenser, William Shakespeare, Ben Jonson, Roger Ascham, Francis Bacon, and Lyle the Euphuist. Other writers of this period include Peele, Marlowe, Greene, Herbert of Cheshire, Middleton, Marston, Raleigh, and North. The writings of Shakespeare, which appeared between 1585 and 1616, are the most prominent of the period and in many respects are the finest in English literature. They possess a wealth of imagination rarely equaled, and embody passages of the gravest wisdom, the purest motives, and the tenderest feeling.

Ben Jonson holds a high rank as a song writer and produced a number of excellent comedies and other plays. Philip Massinger (1583-1640) ranks among the dramatists of this period; Abraham Cowley (1618-1667), among the lyric poets; Thomas Hobbes (1588-1679), among the historians; and John Milton, among the poetical and prose writers. Milton's "Paradise Lost" is a masterpiece of English literature. Other writings of Milton include "Paradise Regained," "Il Penseroso," "Hymn on the Nativity," and "L'Allegro." Other religious writers of the same period include James Usher (1581-1656), Jeremy Taylor (1613-1667), John Biddle (1615-1662), and Richard Baxter (1615-1691). John Bunyan, author of "Pilgrim's Progress," marks an epoch in English literature. Few works have been so widely translated and so extensively read as his masterpiece, the "Pilgrim's Progress."

John Dryden wrote many popular plays after the Restoration. He is the author of "Hind and Panther," a religious discussion, and "Absalom and Achitophel," a famous satire. The death of Dryden in 1700 marks the beginning of the Augustan age in English literature and its greatest poet is Alexander Pope. This age witnessed the advent of many scientific and philosophical writers, among them Sir Isaac Newton, John Ray, John Locke, Richard Steele, Joseph Addison, Jonathan Swift, James Thompson, and Thomas Gray. James Thompson is best remembered by his "Seasons," Thomas Gray by his "Elegy Written in a Country Churchyard," and Daniel De Foe by his "Robinson Crusoe." Samuel Richardson published "Pamela," one of the first modern novels, and Henry Fielding is favorably known by his

"Joseph Andrews," "Tom Jones," and other novels.

Samuel Johnson stands as the literary representative of the second half of the 18th century. His most famous works include "Lives of the Poets" and "Vanity of Human Wishes." The name of Oliver Goldsmith is inseparably connected with that of Johnson. He is the writer of "Vicar of Wakefield," "The Deserted Village," and the comedy "She Stoops to Conquer." William Cowper is an eminent poet of the latter part of the 17th century and is noted for his introduction of profound religious sentiment. Richard B. Sheridan is the author of "School for Scandal" and a number of other popular writings. David Hume, Adam Smith, Edmund Burke, and Edward Gibbon are among the most eminent historians and political writers of the latter part of the 18th century.

The 19th century is the greatest in the history of English literature, both in the character of the productions and in the number of writers. The early writers of this period include Samuel T. Coleridge, whose "Ancient Mariner" represents the finest type of ballads; William Wordsworth, author of "Recollections of Early Childhood," and Sir Walter Scott, writer of "Ivanhoe," "Rob Roy," "Kenilworth," "Lay of the Last Minstrel," and "Lady of the Lake." Other poets of the 19th century include Lord Byron, Percy Shelley, John Keats, George Crabbe, Leigh Hunt, Thomas Moore, Alexander Smith, Elizabeth Browning, Robert Browning, Lord Lytton, Robert Buchanan, Alfred Tennyson, William Morris, Matthew Arnold, and Charles Mackay. The novelists embrace Jane Austen, Lord Lytton, Benjamin Disraeli, Charles Dickens, Charlotte Brontë, Charles Reade, Charles Kingsley, George Eliot, William Thackeray, George Meredith, R. D. Blackmore, George MacDonald, and Thomas Hardy. Among the philosophical writers are John Stuart Mill, Alexander Bane, Sir W. Hamilton, Charles Darwin, Herbert Spencer, Max Müller, Thomas H. Huxley, John Tyndall, and T. H. Greene. The historical and biographical writers include Thomas B. Macaulay, Thomas Carlyle, John R. Green, Lesley Stephen, John Morley, Cornwall Lewis, James A. Froude, Alexander W. Kinglake, William E. Lecky, and Dean Stanley. Among the prominent theological writers are Isaac Taylor, Julius Hare, Stopford Brooke, Henry P. Liddon, Augustus Hare, John H. Newman, Richard Whately, and John Maurice. Other writers of note include John Ruskin, Harriet Martineau, W. E. Gladstone, Sir Arthur Helps, Matthew Arnold, Thomas De Quincey, George Grote, Michael Far-

aday, Edward A. Freeman, and Thomas Henry Hall Caine.

The beginning of the 20th century marks a period of great activity in the field of literature. In 1907, which is a representative year, there were issued a total of 7,701 new books in England, besides 2,213 new editions of books formerly published. The greatest number were in the line of fiction, a total of 1,862 new books and 920 new editions of old books. Those coming next in numerical order are books on the arts and sciences, theology, history, politics, education, and poetry. The period is noticeable for its greater exchange of books with Canada and the United States, especially in the lines of fiction, theology, and politics. Among the more widely read recent authors may be named Winston Churchill, H. Rider Haggard, Alfred Austin, Frances Hodgson Burnett, Edith Wharton, Rudyard Kipling, James Bryce, George Otto Trevelyan, Arthur James Balfour, Andrew Lang, and John Morley.

**HISTORY.** England was invaded by the military forces of Caesar in 55 B. C. and later became a Roman possession. Its history proper begins with the withdrawal of the Roman forces in the early part of the 5th century A. D., when the Germanic people invaded portions of what was known as Albion or Britain. These Germanic people first moved west from Germany into the lands now called Denmark and Schleswig. Later many removed to England, being attracted by opportunities of development and numerous settlements that had previously been made by the Gauls, Germans, Iberians, Dacians, Italians, Phrygians, and others that located in the country during the time of the Roman occupation. Those conquering the country were made up largely of Jutes, Angles, and Saxons, the term Anglo-Saxon originating from the latter two, and the country itself deriving its name from the Angles or Inglisc.

The German ideas and forms of local government began to be introduced about the middle of the 5th century, and from them the language and civil institutions largely originated. From this mixture of races, which was influenced, no doubt, by non-Aryan races that preceded them, among them the Euskarians and Celts, sprang the English, a self-reliant, industrious, ambitious, and daring people, who built up a language and institutions which have in a large measure influenced the trend of modern arts and civilization.

The early history and events that led to the final building of an independent kingdom were complicated by many civil and religious struggles, which extended themselves over a

period including many centuries. The Jutes formed settlements in the Isle of Wight, Kent, and adjacent regions, while the Saxons occupied tracts in the south, and the Angles in the north. The struggle for supremacy which resulted from conflicting claims cover a period of 150 years. It finally terminated to the advantage of the Teutonic tribes, who ultimately occupied the entire southern portion of Britain, except only Wales, West Wales, and Strathclyde. The territorial divisions were small, though seven of the most important formed an alliance of friendship known in history as the *Heptarchy*. This protracted struggle in the course of time resulted in annexing the smaller divisions to the more powerful neighbors. Egbert succeeded in securing sovereignty over the seven kingdoms in 827, and made himself ruler of a large part of the country, to which the name England was first applied. Prior to the Teutonic conquest Britain was largely isolated from continental Europe, but soon after the learning and culture of older civilization was introduced, a closer intimacy was established, and a written literature began to form. Though the conquerors were strangers to Christianity, they were converted district by district after a severe contest, which reached its height in the 7th century. Soon after the Danes began to make incursions. About fifty years after the formation of the United Kingdom they became masters of the whole of England, though their reign was only momentary.

Alfred the Great ascended the throne in 871 and succeeded in defeating the Danes at Ethandune in 878. The nine succeeding monarchs were more or less in conflict with Danish incursions, the latter of whom, Edmund II., was compelled to surrender a portion of his kingdom to Canute, and, when the former was assassinated in 1017, the sovereignty of the entire country fell into the hands of the Danes. The name *Great* was attached to Canute on account of his personal qualities and the extent of his possessions, which included, besides England, Denmark and Norway. He was followed by two Danish kings who managed the government with moderation, though their reign was disturbed by Norman incursions and Saxon revolts. Two Saxon kings followed the Danish, but in 1066 the country was conquered by William of Normandy. This military achievement, known in history as the *Norman Conquest*, caused the country to be governed by Norman kings 69 years. After the death of Henry I., Stephen, son of the Count of Blois, raised an army in Normandy with which he proceeded to England and claimed the kingdom. Civil

war was carried on for a series of years, but finally terminated in a peace, in which Stephen was recognized as sovereign for life, but Henry, son of Matilda, daughter of Henry I., was to succeed him on the throne. As Stephen died in 1154, Henry II. became his successor, and the Plantagenet line of succession ruled England for 245 years.

During the reign of the Plantagenet line the country was more or less disturbed by conflicting claims of the people against the feudal system of land ownership established after the Norman Conquest. Wars with Wales and Scotland likewise tended to distress the government, but they operated to unite the people of England as against foreign invasion, although they were divided by the conflicting pretensions of the Lancasters and Yorkites. The claims of the people to their ancient rights and liberties were recognized in the *Magna Charta*, called the Great Charter, on June 15, 1215, and, under the leadership of Simon de Montfort, Henry III. was seized and required to pledge the organization of Parliament, which gave the people the right of representation and led to the permanent establishment of the House of Commons. Richard II. was compelled to surrender to 60,000 malcontents. He was succeeded in 1399 by Henry IV., the first representative of the house of Lancaster, which governed England for 62 years. The prosecution of the Lollards took place in the reign of Henry IV. He was succeeded by Henry V., in 1413, who gained marked successes over the French and was to succeed to the throne of France. However, the advantages he gained were lost by his son, Henry VI., largely through the achievements of Joan of Arc. His reign was succeeded by the York dynasty after a long line of struggles for supremacy.

Henry Tudor gained the Battle of Bosworth in 1485, in which Richard III. was slain, and the throne was ascended by Henry VII. During the reign of his successor, Henry VIII., England was disturbed by the Reformation. Events formed quickly by which Elizabeth ascended the throne and became the nominal head of the Protestant faith. Her reign was characterized by remarkable rivalry in architecture, literature, and commercial competition for colonization in opposition to Spain. She was succeeded by James VI. of Scotland, son of Mary, Queen of Scots, who assumed the title of James I. of England. This placed the Stuarts upon the throne after a long contention, but their sovereignty was weakened by constant disputes with the Parliament and the rise of the republican forces, stimulated largely by Oliver Crom-

well. The people finally wrung from the king the right of petition, by which the power to levy taxes became vested in the House of Commons, and the king was abridged in his authority to govern in many matters of vast interest. Cromwell succeeded in establishing the Commonwealth in 1649, with himself as Lord Protector, though it survived him but a short time, terminating abruptly under the feeble protectorate of his son, Richard, and Charles II. was called to the throne by the Restoration of 1660.

The old dissensions between the king and Parliament soon broke out anew and William of Orange, supported by the Whig party, drove James II., successor of Charles II., from the country and became the first parliamentary king. When Queen Anne ascended the throne, she found the grand alliance with Holland and Germany of much value. Her government was further strengthened by the success of her army at Blenheim in 1704 and at Ramilies in 1706, under Marlborough. The history of England became merged into that of Great Britain in 1807, by virtue of the act of union passed in that year uniting England and Scotland. In 1714 the Hanover dynasty succeeded to the throne and the last attempt of the Stuarts was thwarted in 1715. For more recent history, see **Great Britain.**

Below is a complete list of English sovereigns:

DYNASTY AND TITLE.	BEGAN.	YEARS.
ANGLO-SAXON LINE.		
Alfred, King of Wessex.....	871	30
Edward I., King of Wessex.....	901	24
Athelstan, King of England.....	925	15
Edmund I.....	940	6
Edred.....	946	9
Edwy.....	955	4
Edgar.....	959	16
Edward II.....	975	3
Ethelred.....	978	38
Edmund II.....	1016	1
DANISH LINE.		
Canute.....	1017	19
Harold I.....	1036	3
Hardicanute.....	1039	2
SAXON LINE.		
Edward III.....	1041	25
Harold II.....	1066	..
NORMAN LINE.		
William I.....	1066	21
William II.....	1087	13
Henry I.....	1100	35
HOUSE OF BLOIS.		
Stephen.....	1135	19
PLANTAGENET LINE.		
Henry II.....	1154	35
Richard I.....	1189	10
John.....	1199	17
Henry III.....	1216	56
Edward I.....	1272	35
Edward II.....	1307	20
Edward III.....	1327	50
Richard II.....	1377	22

DYNASTY AND TITLE.	BEGAN.	YEARS.
HOUSE OF LANCASTER.		
Henry IV.....	1399	14
Henry V.....	1413	9

George IV.....	1820	10
William IV.....	1830	7
Victoria.....	1837	64
Edward VII.....	1901	..

**ENGLAND, Church of,** the dominant religious body of England and the established church of that country. It claims to be a true and apostolical church, teaching and maintaining the doctrines of the apostles. The law recognizes it as the national church and protects it in the endowments; that is, the gifts of land and tithes made to it in ancient times. As at present organized, it dates from the time of Henry VIII., who abolished papal authority in England and established the independence of the Church of England. He became the supreme head of the church, dissolved the monasteries, and convoked an assemblage of clergymen to pass upon ten articles of faith drawn up at his suggestion. This convocation declared against the invocation of saints, the worship of images, and the belief in purgatory, and expressed the view that the whole Christian faith is to be found in the Bible. This was soon followed by the publication of the Bible in English, which greatly tended to spread the reformed doctrine, and prayers and services began to be in English. During the short reign of Edward VI., son of Henry VIII., the reforming element had complete sway, and came to look with favor upon the teachings of Luther and Calvin, but a strong reaction occurred when Mary, who was a Catholic, ascended the throne. She exerted an unrelenting influence

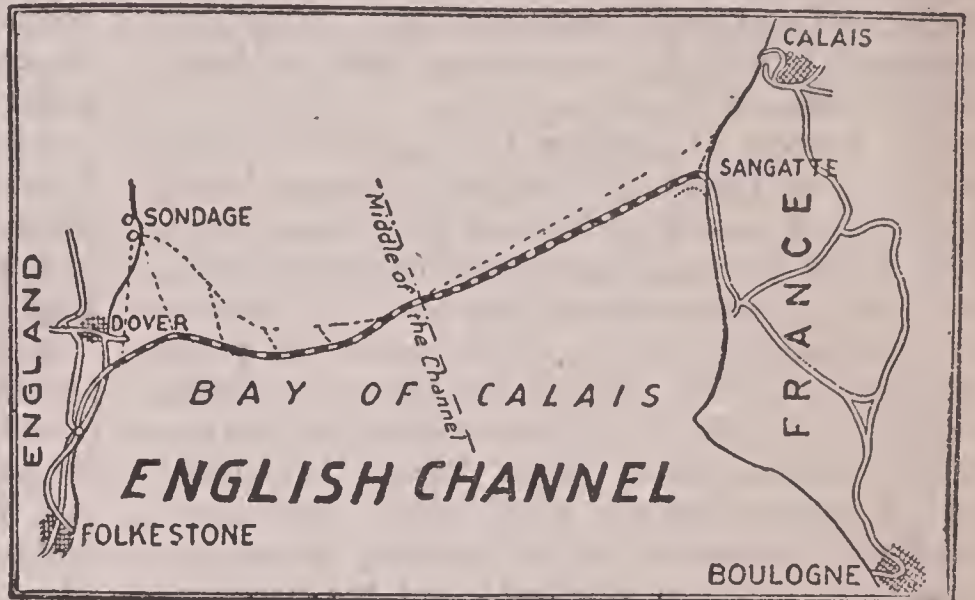

to reestablish Catholicism, and many of the reformed clergy escaped to the continent, while those remaining in England were persecuted as heretics or compelled to retract.

Queen Elizabeth ascended the throne in 1658 and favored the Reformation, but contentions now arose with the Puritans, who had gained many adherents during the reign of Queen Mary. The Thirty-Nine Articles, originally 42 in number, but now 39, had been drawn up in 1551 under Cranmer and Ridley, and these were reviewed and revised. A convocation of the clergy accepted the amended articles and they were ratified by the queen, and Parliament legalized them in 1563 and later made it compulsory for the whole clergy to subscribe to them. Together with the homilies and prayer books, they constitute a complete exposition of the tenets held at present by the Church of England on all the main points of doctrine and discipline. The church has possession of the ancient religious edifices and the cemeteries attached to them. It is protected by law in the exercise of its right and its teaching is accepted by the state. It is one of the states of the realms and has an integral part in all legislation.

The government of the Church of England is under a system of jurisprudence made up of three elements; namely, the common law, the canon law, and the statute law. The first consists of customs and precedents; the second, of canons passed or accepted by the English synods; and the third, of acts of Parliament relating to the church. Two archbishops, those of Canterbury and York, preside over the two provinces into which the country is divided, but the Archbishop of Canterbury is the primate of all England. The provinces are divided into dioceses, which are presided over by bishops, and those subject to them include the archdeacons, deans, canons, prebendaries, rectors, vicars, and curates. Missionary work is carried on in all parts of the civilized world. The Episcopal Church (q. v.) is a branch of the Church of England.

**ENGLEWOOD** (ĕn'g'l-wōd), a city of New Jersey, in Bergen County, fourteen miles north of New York City. It is situated near the Palisades of the Hudson River, on the Erie Railroad, at the edge of the Hackensack Valley. The chief buildings include the public library, a hospital, and the high school. Many New York business men reside in Englewood. It was incorporated as a village in 1860 and chartered as a city in 1896. Population, 1905, 7,922.

**ENGLISH CHANNEL**, an important body of water which connects the Atlantic Ocean with the North Sea and separates France from England. On its eastern end it is connected with the Strait of Dover, where it is twenty-one miles wide, and at the western end it has a width of about one hundred miles. A strong current running eastward passes through the channel, influenced largely by the Gulf Stream, and its waters are often disturbed by storms.

ROUTE OF PROPOSED TUNNEL FROM ENGLAND TO FRANCE.

The Isle of Wight and the Channel Islands are within the channel. Among the English ports are Brighton, Dover, Falmouth, Plymouth, and Southampton. The French ports include Boulogne, Calais, Cherbourg, Dieppe, and Havre. A plan to construct a railway tunnel from Dover, England, to Calais, France, was proposed as early as 1875. Several bills were before Parliament in 1908 and since, but no material progress has been made, aside from surveying the route from Dover to Sangatte. The estimated cost of the tunnel is \$80,000,000.

**ENGLISH LANGUAGE.** See **England**.

**ENGLISH LITERATURE.** See **England**.

**ENGRAVING** (ĕn-grāv'ing), the art of cutting marks or figures on wood, stone, or metal. Engraving is very ancient, being mentioned in Exodus xxviii, 36. The oldest records were cut in stone, some by making depressions and others by cutting the stone away and leaving the characters in relief. In Egypt the hieroglyphics were cut in the granite monoliths and on the walls of tombs and chambers. Later the Greeks learned the art from the Egyptians and Phoenicians. The discovery of the practicability of taking impressions upon paper from an engraving was made by a Florentine artist named Maso Finiguerra, about 1440. In taking a cast in sulphur of some engraved church ornaments,

a quantity of dust and charcoal, which had gathered in the lines of the engraving, came out upon the sulphur and gave an unexpected and suggestive effect.

Many kinds of engravings are employed in the arts, depending upon the purposes they are to serve. They include *line engravings* on metal plates, usually copper or steel; *etchings* on metal in which the lines are corroded by means of acid; *mezzotints*, in which there are no lines, but only shades produced by roughening the surface of the metal; and *woodcuts*. Wood engravings intended for printing long preceded those made of metal.

The process of printing from engravings was common in China in the 10th century, but it remained a secret with them for many years. The Italians and Germans attained considerable skill in engraving as early as the 13th century, but the earliest known niello proof on paper was made in 1452. Within the three succeeding centuries the art became extremely productive under such artists as Albert Dürer (1471-1528) and Peter P. Rubens (1577-1640), and developed until imitations of all varieties of engravings were made in woodcuts, but the practiced eye sees at a glance that the result is nothing but a woodcut. Through lack of encouragement, change of fashion, and the adoption of other cheaper methods of production the woodcut and line engravings are going rapidly out of use. Besides, there are not sufficient inducements for young men to pursue study in this particular process of engraving, for the reason that the newer and more rapid methods are supplanting it.

Copper is used extensively in making plates for certain kinds of engravings, especially those in which a soft metal is serviceable. The invention of steel engraving in the United States has brought that metal into use for the finer pictures, owing to its greater hardness, which enables it to overcome the wear of printing and makes it possible to take a larger number of impressions than can be gotten from a copperplate. Etchings are made by covering a prepared metallic surface with a thin coat or ground, which is not affected by acid. The design is traced with a pointed tool, which lays the metal bare wherever it touches. A wall of wax is raised around the design to hold the diluted acid, when poured on. For a copperplate this consists of five parts water and one part nitrous acid; for steel, pyroligneous acid one part, nitric acid one part, water six parts. The acid corrodes on the lines made through the ground. This is called biting in. When a sufficient depth is attained for lighter tints of

the etching, the acid is removed and the surface is washed and allowed to dry. The parts of sufficient depth are now varnished and, when dry, another biting in deepens the lines not varnished, and, when deep enough for the second tint, it is removed again. This may be repeated several times, if necessary. The process of deepening the lines in this way is called *rebitting*. Etchings are sometimes finished by a graver and partake of the character of a line engraving. Glass may be engraved in a similar manner. Soft-ground engraving is another of the many ways of drawing the design. In mezzotint engraving the entire surface of the plate is roughened slightly, after which the drawing is traced, and then the portions intended to show high lights or middle lights are scraped or burnished, and the shadows are strengthened. Engravings so produced resemble photographs.

It is to be noted that the photomechanical processes of engraving have been improved materially since 1880. These include the *half-tone process* invented by Frederic E. Ives, an American, in 1881; the *line-relief process*; the *intaglio-engraving process*; and the *wax process*. The half-tone is used largely in the better class of magazines; the line-relief process, for cheap newspaper illustrations; the chalk-plate, for small newspaper cuts and generally by the government in making weather maps; and the wax process, for making railroad, geographical, state, county, and town maps.

**ENID** (ē'nīd), county seat of Garfield County, Oklahoma, about 35 miles north of Kingfisher. It is on the Saint Louis and San Francisco, the Chicago, Rock Island and Pacific, and other railroads, and is surrounded by a fertile farming region. The chief buildings include the high school, the county courthouse, and several churches. It is important as a shipping center for grain and live stock. The manufactures include flour, brick, ice, clothing, confectionery, and machinery. It has grown very rapidly since 1893, when the Cherokee strip was opened for settlement. Population, 1900, 3,444; in 1910, 13,799.

**ENSILAGE** (ěn'sī-lāj), in agriculture, a process of preserving green forage crops for stock food. Dairy farmers have a method of storing green fodder in mass and covering it over in deep trenches cut in a dry soil, by which the natural condition is readily preserved, though the ordinary way of handling ensilage is by cutting the crop, usually corn, and placing it in an air-tight mow or silo for curing. The crop product is stored as near as practicable to the place of feeding in order to insure the greatest possible convenience. In corn culture

for ensilage farmers aim to produce the largest possible quantity of both corn and forage. The crop is cut a brief period before being ripe enough for ordinary cutting. It is then taken to the mow and, after being cut in proper lengths, is carefully stored by placing successive layers and tramping them as firmly as possible. The ensilage may be stored to a height of 20 or 30 feet, and, after settling several days, the upper portion may be refilled. Another method which has been introduced recently is to cut the fodder by a machine, which at the same time elevates the finely cut product into the top of the silo by a current of air. The silo should be air tight and so constructed that it can be emptied from the side. This class of forage crops is a very nutritious and wholesome food for cattle, sheep, and horses. Successive experiments have proved that more food can be secured per acre by the culture of crops and their preservation as ensilage than in any other way.

**ENTOMOLOGY** (ĕn-tō-mōl'ō-jŷ), the science which treats of insects. Aristotle called attention to one of the essential characteristics by pointing out that the bodies of insects are cut or divided into segments, from which their name was derived. See **Insects**.

**ENTOZOA** (ĕn-tō-zō'ā), the name given by Karl Asmund Rudolphi (1771-1832), a Swedish naturalist, to a class of animals living within the bodies of other animals. They are found in the intestines, liver, brain, muscles, and other tissues. According to a group of writers the entozoa are divided into three classes: coelmintha, or hollow worms; sterelmintha, or solid worms, as the tapeworms; and accidental parasites. Some writers treat them as equally mature and immature; the latter, inclosed in cysts, being far the most dangerous when found in inclosed cavities, as the lung or liver. See **Parasites**.

**ENVELOPES** (ĕn'vēl-ōps), in botany, the whorls of alternated leaves designed to protect the organs of fructification from injury. In very rare cases there are none, sometimes one, though generally two—the calyx and the corolla. The name also applies to paper coverings for letters or notes that came into extensive use with the growth of the postal system. They are now shaped, folded, and gummed by machinery. A single machine of the larger type has a capacity to turn out 50,000 envelopes per day.

**ENVIRONMENT** (ĕn-vī'rūn-mĕnt), a term used to indicate the sum of external conditions that limit or direct the activities of an individual. It is frequently used in distinction of the term heredity, which is the tendency possessed

by an individual to resemble the ancestral stock in general characteristics, while environment includes everything which is not identified with the individual self. The subject divides itself into two kinds, the physical and the social. The former includes all the outside influences with which one may come in contact, such as climate, food conditions, the physical features of a country, the absence or presence of enemies, etc. Social environments embrace principally the customs, habits, industries, religion, institutions, etc. Physical environments exercise a marked influence upon both animal and plant life, and social environments refer more particularly to the animal kingdom.

The word *environment*, in the field of education, expresses best the things which make for character by their silent influence. These mold lives from day to day by their silent impressions upon the individual. Children reared in clean and tidy homes, under the influence of moral and humane teaching, obtain a bent of desires and thoughts toward the orderly and noble. The home and the school share, perhaps, equally the responsibility of early impressions, hence the need of providing such environments as will tend toward and uplift the moral and physical life of the young. Such influences, together with the part exercised through outside factors, are potent in determining the character of an individual as well as of the community in which he lives. It may be said that under primitive conditions of civilization social environments exercise a minor influence, but with the advancement of society and the enlargement of communities comes the need of exercising great care in selecting or shaping the environments with which the young may come in contact.

**EOCENE** (ē'ō-sĕn), in geology, the first great division of the Tertiary period. It was the dawn of the present order of shells and mollusks, a few birds, reptiles, and all the invertebrate animals still living. Among the plants both endogens and dicotyledons were numerous. Man had not appeared upon the earth. The Eocene strata consist of marl, limestones, clays, and sandstones. In most cases the strata were deposited in salt or brackish waters.

**EOZOIC** (ē-ō-zō'ik), the name given to rocks of the Laurentian age, in which, so far as at present known, the earliest traces of life are found.

**EPACT** (ē'păkt), a number introduced into the Gregorian calendar, employed to express in days the age of the moon on Jan. 1, and thus to determine its age on March 21. The Council of Nice appointed Easter Sunday to be the first

Sunday after the first full moon following the vernal equinox, and this Sunday is now found by a formula. When the epact is known, it is possible to calculate the dates of all the following lunar phases throughout the year. To find the epact it is necessary to know the golden number, which is ascertained by adding 1 to the date of the year and dividing the sum by 19. The remainder is the golden number, except when the remainder is 0, when the golden number is 19. Having found the golden number, the epact of any year between 1900 and 2199 may be found by the following table. Suppose the golden number to be 15, it will be seen that the epact is 3:

GOLDEN NUMBER	EPACT	GOLDEN NUMBER	EPACT
1	29	11	19
2	10	12	30
3	21	13	11
4	2	14	22
5	13	15	3
6	24	16	14
7	5	17	25
8	16	18	6
9	27	19	17
10	8		

**EPHESUS.** (ěf'ě-sūs), an ancient city of Asia Minor, situated in Lydia, near the mouth of the Cayster River. It was classed with the twelve Ionian cities founded by the Greeks, and was regarded sacred from an early period, though its importance dates from a time quite more recent than the Trojan War. The first of its great temples was founded about 650 B. C., completed after 120 years, and destroyed in 356 by Herostratus. It passed successively under the possession of the Lydians, Persians, Greeks, and Romans. In the time of Augustus it attained its greatest importance as a trade center, and was for three years the residence of Saint Paul, who afterward wrote his "Epistle to the Ephesians," while in prison at Rome, to the church at Ephesus. The second magnificent temple was destroyed by the Goths in 262 A. D., and they so plundered the city that it never again recovered its importance. The Third Ecumenical Council of the Christian church was held at Ephesus in 431, at which resolutions condemning Nestorius were agreed upon.

The famous temple of Diana, counted among the seven wonders of the world, was located a mile east of the city, and at the birth of Alexander the Great the Ephesians burned it to add luster to his name. Many contributions were given and heavy taxes levied for the purpose of rebuilding it with even greater splendor, the new structure being the greatest of Grecian temples and containing 130 columns. This remarkable structure was 225 feet wide and 423

feet long, and contained statues and pictures of the most noted Grecian masters. Nero robbed it of its treasures and the Goths burned it, and its destruction was finally accomplished by an edict issued in 381 against pagan worship by Theodosius I. After numerous excavations were made by Europeans, the site of the temple was discovered in 1869, and many interesting remains were secured. In 1899 the Austrian Institute at Ephesus excavated several valuable relics, among them statues, a great market place, and a remarkable theater. Aiasoluk, a small village, is near the site of the city.

**EPIC** (ěp'ík), a poem characterized by its narrative and descriptive style, especially one that celebrates in stately, formal verse the real or mythical achievements of heroes or great personages. Epic poetry is distinguished from lyric by giving prominence to the narration of action rather than the expression of emotion, and from drama in that the epic contains frequent allusions to the author as narrator. Among the great sacred epics of the world are Dante's "Divina Commedia" and Milton's "Paradise Lost." The heroic epics include Homer's "Iliad" and "Odyssey," Virgil's "Aeneid," Tasso's "Jerusalem Delivered," and Aristo's "Orlando Furioso." Among humorous epics are Pope's "Rape of the Lock," "Battle of the Mice," and "Reynard the Fox." Byron's "Childe Harold" is written in a narrative style, but abounds in sentiment, and is both epic and lyric. This is true of Burns's "Cotter's Saturday Night," Bryant's "Thanatopsis," and Longfellow's "Evangeline."

**EPIDEMIC** (ěp-ĩ-děm'ík), a disease which attacks many persons at the same time, spreading suddenly, often extremely virulent and fatal at first, then gradually becoming spent and feeble, so that the earliest stages are usually the worst. The plague, cholera, influenza, and la grippe are epidemics, while scarlet fever, typhoid fever, smallpox, diphtheria, and chicken pox are usually so regarded. However, some of these are classed more generally as contagious diseases. All that can be said with certainty about epidemics is that at the beginning there must be some distempered conditions around us, and our systems be predisposed to the reception of the specific poison, which causes the disease.

**EPIDERMIS** (ěp-ĩ-děr'mīs), in anatomy, the cuticle or scarf-skin, constituting the external layer of the skin and protecting inner ones. In man it is thickest on the palms of the hands and soles of the feet. It possesses an organized structure, but has no nerves or blood vessels. The outermost layer of cells covering

the surface of plants, when there are several layers of tissue, is also called epidermis.

**EPIGRAM** (ěp'ĩ-grām), a name given by the Greeks to a poetic inscription on a public monument. It was applied originally to a short verse or poem having only one subject, and was finished by a witty or ingenious turn, but is now applied to any short composition expressed neatly and happily, as "The child is father of the man."

**EPILEPSY** (ěp-ĩ-lěp'sŷ), or **Falling Sickness**, a disease which derives its name from the suddenness of the attack. Usually the patient becomes unconscious and falls to the ground convulsed, turgid, and livid. This condition is generally accompanied by frothing at the mouth, a choking sound in the windpipe, biting of the tongue, and a suffocating tendency. After the patient reaches an exhausted, comatose condition, life is no longer in danger. Epilepsy may be caused by fear, passion, or an injury to the brain. In severe cases there is little hope of a cure, but patients may be afflicted with it from childhood until old age. Children often outgrow it at the period of adolescence.

**EPILEPTICS** (ěp-ĩ-lěp'tiks), the persons afflicted with epilepsy. Within recent years considerable progress has been made in colonizing persons suffering with this disease, the purpose of which is to treat and care for them in the most satisfactory and efficient manner. The first colony for epileptics was established by Pastor von Bodelschwingh near Bielefeld, Germany, in 1867, and is known as the Bethel Colony. In 1890 the settlement contained, with its officers, physicians, nurses, and employees, about 3,600 persons. Under frugal treatment it has been possible to render much good to the unfortunates afflicted with the disease, the number of cured discharged at the end of each year aggregating twenty-one per cent. of the entire number treated, while about the same per cent. are discharged as incurable.

The marvelous development and success of the German colony led to a widespread movement in Europe and America to establish like institutions. Similar colonies are now located at Zurich, Switzerland; in Holland, France, and England, while the movement in the United States has attracted the attention of many State legislatures. The colony for epileptics in the State of New York is located at Sonyea; that of Pennsylvania, at Oakbourne; that of Massachusetts, at Monson; and that of New Jersey, at Skillman, though there are many others. Colonies of this class are usually located on farms comprising from 200 to 1,200 acres of land, on which the labor of those afflicted is

utilized in facilitating the support. A late report shows that the number of epileptics in the United States is 135,000, of which 9,500 are in Illinois, 12,500 in New York, and a proportional number in the other states and territories.

**EPIPHANY** (ě-pĩf'á-nŷ), a festival of the Christian church, instituted to commemorate the visit of the Magi or wise men to the infant Jesus Christ, for whom they brought presents from the East. It is celebrated on January 6th and is sometimes termed the *manifestation of Christ to the Gentiles*.

**EPIRUS** (ě-pĩrŷs), a country of ancient Greece, surrounded by Illyria, the Ambracian Gulf, the Pindus Mountains, and the Ionian Sea. It corresponded quite nearly to modern Albania. Among the interesting towns were Donoa and Ambracia. The region was noted on account of its supply of heavy timber and the production of corn and domestic animals. Among the people were several colonies, the Grecians proper occupying largely the southern coastal district. Pyrrhus was the most celebrated king of Epirus and long waged war upon the Romans, but it finally became a province of Rome in 168 B. C. To prevent further insurrections the Romans plundered the country, razed seventy towns, and sold 150,000 of the people into slavery. It shared in the fortunes of the Roman and the Byzantine empires for many centuries, and was conquered by the Turks in the 15th century. Since the 14th century a large per cent. of the inhabitants have been made up of Albanians. A small strip of land situated east of the Arta River was ceded by Turkey to Greece in 1881, along with most of Thessaly.

**EPISCOPAL CHURCH** (ě-pĩs'kō-pəl), or **Protestant Episcopal Church**, a Christian denomination, the American branch of the Church of England. It became an independent ecclesiastical body in 1789, when it adopted its constitution at Philadelphia, Pa. It adheres strictly to the doctrine, discipline, and worship of the mother church, but the prayer book is altered so as to be consistent with the changes in the political condition of the country. Little progress was made in extension work until 1811, and within a period of ten years churches were organized in thirteen of the states. A movement toward suppressing the outward developments of what is known as ritualism caused extended controversies, especially in the general conventions of 1868 and 1874, and the two factions came to be known as the *low church* and the *high church* parties. Those opposing the ritual belong to the former, but the high churchmen are the dominant influence.

Changes in the prayer book or the constitution of the church can be made only by the general conference, which holds a session every three years. This body is composed of two houses, known as the house of clericals and lay deputies, and as the house of bishops. Within the United States there are 65 dioceses and 22 missionary jurisdictions, and an extensive line of missionary work is done in all the continents. In 1907 the church had 7,564 parishes and missions, 5,203 clergy, and 860,998 communicants. Among the organizations to promote Christian and charitable work are the Brotherhood of Saint Andrew, the Daughters of the King, the Church Temperance Society, and the Foreign and Domestic Missionary Society.

**EPITAPH** (ěp'ĩ-táf), an inscription upon a tomb or monument in honor or memory of the dead. The Egyptians first used epitaphs, usually with some prayer to Anubis or Osiris, and a similar custom was in vogue among the Greeks and Romans. Subsequently the practice became general throughout all Christian nations. The usual characteristic features in modern epitaphs are the name, date of birth and death, and some sentiment or expression of faith or affection. In many cases the sentiment is a quotation from the Bible, though epitaphs exemplify every variety of sense and taste, from lofty pathos to the vilest scurrility. Curious as it may seem, books containing collections of epitaphs are among the most amusing.

**EPITHELIUM** (ěp-ĩ-thě'lĩ-ŭm), the layer of cells which lines the internal surfaces of the body, being continuous with the epidermis, which covers the external surface of the skin. Its main function is to act as a covering for the soft and moist surfaces that secrete the various fluids of the body. It lines the entire respiratory tract and the alimentary canal, and forms essential elements in the true glands, such as the pancreas and liver. The ciliated epithelium has hairlike projections known as cilia (q. v.), which have a continuous vibratory motion. Epithelium of this kind is found in the bronchial tubes, the air passages, the Eustachian tube, and the lachrymal appendages.

**EPIZOA** (ěp-ĩ-zō'á), the name given to parasitic animals which live upon the external surface of other animals, such as lice, itch insect, etc. See **Parasites**.

**EPIZOÖTIC** (ěp-ĩ-zō-öt'íc), an epidemic disease among animals. It is usually mispronounced in America as *ep-i-zoo-tic*. The very fatal contagious catarrhal fever which raged throughout the country in 1870 and at different times since was a form of the disease.

Thousands of horses and cattle died at that time. Some pathologists claim to trace a connection between this disease and la grippe. See **Influenza**.

**E PLURIBUS UNUM**, meaning one out of many, the national motto of the United States. Adams, Franklin, and Jefferson were a committee to prepare a seal and proposed this motto, which was adopted on July 4, 1776.

**EPOCH** (ěp'ök), or **Era**, a point in the course of history from which preceding and ensuing years are computed. The creation of the world and the birth of Christ are the most important epochs, and on the former are based many notable chronologies. The *Era of Creation* is placed by Catholics and Protestants at 4004 B. C., the *Era of Constantinople* at 5508 B. C., the *Era of Antioch* at 5502 B. C., and the *Era of Alexandria* at 5492 B. C. In Jewish writings the creation is placed at 3760 B. C., on which the Jews base their era. The *Christian Era*, a mode of computing time from the birth of Christ, went into extensive use among Europeans about the year 1000, though it was introduced in the 6th century. The event of Christ's birth took place four years earlier than the date written in our calendar. The *Julian Epoch* begins with 4713 and is based on the coincidents of the lunar, solar, and indictional periods. Mohammedans compute time from July 16, 662, this being the anniversary of the *Hegira* of Mohammed. Among the Chinese it is customary to compute time by cycles of sixty years, and to apply a different name to every cycle.

**EPPING FOREST** (ěp'pĩng), a beautiful pleasure resort near London, England. It comprises 5,600 acres of magnificent woodland, rises 760 feet above sea level, and is improved by many structures and conveniences. In early ages it formed a portion of the hunting ground of the kings, and constituted a part of the forest that covered all of Essexshire. The crowded populations of London utilize this resort extensively for pleasure walking and driving.

**EPSOM SALT** (ěp'sŭm sàlt), or **Magnesium Sulphate**, a cathartic salt, so named because it was first obtained from the famous mineral springs of Epsom, a market town of England. It is soluble in water and is used as a purgative. This salt is obtained by an artificial process from magnesian limestone, the latter being treated with sulphuric acid, or by dissolving it in boiling water and allowing the insoluble matter to settle. Afterward the water is evaporated from the solution, leaving the salt.

**EPWORTH LEAGUE** (ěp'wŭrth lēg), a

young people's religious society of the Methodist Episcopal Church, organized in 1889. In 1908 it had 31,340 chapters and a membership of 2,700,000. The chapters are classed as *senior* and *junior*, about one-fourth of the members belonging to the latter class. The object is to promote an earnest, practical, intelligent, and loyal spiritual life in the young people of the church, and corresponds to societies maintained for similar purposes by the Baptist, Lutheran, Catholic, Presbyterian, and other churches. It is the largest denominational society in the world. The *Epworth Herald* is the official organ.

**EQUATOR** (ĕ-kwā'tēr), the great circle imagined drawn around the earth midway between the poles, and which divides it into the Northern and Southern hemispheres. The distance from it to the poles is 90°. It forms the basis for measuring the latitude of places both north and south. Twice in the year, on Sept. 21 and March 21, the rays of the sun shine vertically on the Equator, when the days and nights are equal all over the earth, from which the name *equinox* has been derived. The *magnetic Equator* of the earth corresponds quite nearly to the geographical Equator, and marks the point midway between the magnetic poles. On the Equator the magnetic needle is horizontal, and, as the poles are neared, the dip of the needle increases, while at the poles it points vertically downward. Lines connecting places which have the same angle of dip are *isoclinal* and correspond in a very remarkable manner to the isothermal lines, showing a dependence of the intensity of magnetism on the distribution of the sun's heat.

**EQUATORIAL TELESCOPE** (ĕ-kwā-tō'rī-āl tĕl'ĕ-skōp) an instrument mounted upon a fixed axis parallel to the axis of the earth, which renders its motion parallel to the plane of the ecliptic. The principal axis turns upon a second movable axis, making it possible to continuously observe and note the right ascension and declination of heavenly bodies. Some equatorial telescopes revolve round the polar axis by an attached clockwork, which may be regulated to vary the velocity of rotation to meet the requirement in examining a particular heavenly body, such as a planet, a fixed star, a satellite, or the sun.

**EQUESTRIAN ORDER** (ĕ-kwĕs'trī-ān), or *Equites*, an order of the people in ancient Rome. Originally they were a military organization and formed the cavalry of the army. Livy attributed their origin to Romulus, who is said to have selected the first three hundred out of the three chief divisions of the patricians.

They were divided into *turmoe* of thirty men each and again subdivided into ten, and in the time of war were obliged to serve on horseback. The *equites* continued as an exclusively military body until 123 B. C., when a law was enacted that required that the jurors (*judices*) be selected from them. In addition they enjoyed the privilege of officiating as *publicani*, or farmers, of the public revenues. They wore a robe with a narrow purple border and a gold ring to distinguish them. During the republic they exercised much influence, but disappeared from the political life under the later emperors.

**EQUINOX** (ĕ'qwī-nōks), the time at which the sun, in passing the Equator, renders the days and nights of equal length over the entire earth. This occurs when it enters one of the *equinoctial points*, the two equinoctial points being where the ecliptic and celestial equators intersect each other. The *vernal equinox* occurs on March 21, when the sun is in the first part of Aries, and the *autumnal equinox* takes place on Sept. 21, when it is at the first of Libra. At all other times of the year the length of the day and night is unequal, the greatest difference occurring at the poles. After the vernal equinox, the sun passes from south to north, causing the days to lengthen in the Northern Hemisphere; while, after the autumnal equinox, it passes from north to south, causing the days to shorten in the Northern, but lengthen in the Southern Hemisphere. The precession of the equinoxes is due to the equinoctial points moving westward at the rate of 50" in a year. The equinoxes, in March and September, are accompanied by gales which are known as *equinoctial storms*. They are most severe on the Atlantic coasts of America and Europe.

**EQUITY**, in law, a particular system of jurisprudence, which is based upon justice rather than precedent. It is sometimes defined as natural justice to distinguish it from the fixed and technical rules of law. In some countries, as in England, equity is administered by courts of chancery, but in some states the cases in equity are referred to the courts of law. The aim is to extend relief in causes which are not recognized in a strict sense by the law, hence the decisions are based upon modifying circumstances rather than upon the statutory law. Usually the plaintiff and defendant state their claim and defense in a formal statement, which is termed *pleadings*, and the question raised in this way constitutes the *issue*. In some instances the issues of fact are disposed of by the judge and jury, while in some countries the cases in equity are tried only to the court. In

general, it may be said that courts of equity serve to bring all parties interested in a cause before the tribunal and adjust the rights of the several parties according to the circumstances which bear upon the issues.

**ERA OF GOOD FEELING**, the name applied to the period of United States history between 1817 and 1823, during the administration of President Monroe. At that time national political contests were suspended, the Democratic party had a large majority, and the Federalists had dwindled down to a very small number. It succeeded the War of 1812, when the new issues of tariff and internal improvements had not arisen, which soon after came into prominence and caused much political strife in Congress and the nation.

**EREBUS AND TERROR**, the names of two volcanoes in the Antarctic region, located in the northern part of South Victoria Land. They were discovered by Sir James C. Ross in 1841 and were so named from the two vessels used in the expedition. Mount Erebus is 12,370 feet high and is situated 30 miles east of Mount Terror, which has an elevation of 10,900 feet.

**ERECHTHEUM** (er-ekh-thē'um), the name of a sacred edifice on the Acropolis, in ancient Athens. It was so named from Erechtheus, a fabulous hero of Greece, and it is thought to have contained the shrine of that hero and of Athene. The original building was burned by the Persians, but a new temple was built on the same site in 393 B. C. and dedicated to the Ionic order. It had three porticos and contained the sacred olive tree of Athene and a salt spring said to have been made by the trident of Poseidon. The ruins of this building, located north of the Parthenon, contain the Porch of Caryatides, in which six female figures somewhat larger than life support the entablature.

**ERFURT** (ēr'fōort) a city of Germany, in the Prussian province of Saxony, 145 miles southwest of Berlin. It is conveniently connected by numerous railroad lines with the important commercial and educational centers of continental Europe. The cathedral, a splendid Gothic structure, is one of the finest in Germany. This structure has a famous bell, the Maria Gloriosa, which weighs thirteen tons. The University of Erfurt was founded in 1378, but was suppressed in 1816, and now ranks as an academy of science. Its buildings have been well maintained and its library contains about 75,000 volumes. The monastery is now called Martinsstift (Martin's establishment) and has been converted into an orphanage. It was the residence of Luther from 1501 to 1508. The

surrounding country is agricultural. The city has modern facilities and produces woolen, cotton, silk, and linen goods, machinery, tobacco, leather, chemicals, and scientific instruments. The city was founded in the early part of the 5th century, when it was called Erpesford from its founder, Erpes. In the Middle Ages it grew rapidly, became strongly fortified, and until 1873 was counted a fortress of second rank. Owing to its convenient location, it has been a point of contention by foreign invaders, became a part of Prussia in 1803, and was the seat of the celebrated congress of Erfurt in 1808, which was attended by the Emperor of Russia, Napoleon, and various German monarchs. Population, 1905, 98,849.

**ERGOT** (ēr'güt), a fungus found in rye, wild rye, and other grasses, the principal symptom being that the seed, besides becoming black, grows elongated so as to resemble a rooster's spur, whence the name ergot comes. When the disease begins, sphacelae appear upon the pistils, and after a time a viscid fluid exudes from them. The disease is very fatal to the plants attacked, and, if eaten with sound grain, is dangerous to both man and animals. It causes contraction of the minute arteries by acting on their muscular walls, and is useful to check bleeding in parturition. In large quantities it produces nausea, delirium, stupor, and death. On the western plains it appears largely in wild rye, often causing much damage to large herds of domestic animals.

**ERIE** (ē'rī), a city in Pennsylvania, county seat of Erie County, on Lake Erie. It is on the Pennsylvania, the Philadelphia and Erie, the Pittsburg, Bessemer and Lake Erie, the Lake Shore and Michigan Southern, and other railroads. The harbor is one of the best on Lake Erie, being the only harbor in Pennsylvania, and is protected by Presque Isle, a peninsula which forms a natural breakwater about six miles long. The city is midway between Cleveland and Buffalo, in close proximity to the coal and natural gas fields of Pennsylvania. It has a large export and import trade with the cities on the Great Lakes, being on the route of many steamship lines. The streets are well lighted and paved. They are lined with elegant mansions and beautified by fine trees and gardens. An abundant water supply is secured from the lake, the water being pumped into a tower 251 feet high, which is classed as the highest water pipe in the world.

Erie has an area of about seventy square miles. The noteworthy buildings include the county courthouse, the Federal building, the public library, and the high school. It has a

number of fine public parks, a soldiers' monument, and several well-improved boulevards. Among the noted institutions are the Soldiers' Home, Saint Vincent's Hospital, Home for the Friendless, Erie Academy, Clark's Business College, Erie Art School, and Saint Benedictine Academy.

As an industrial and jobbing center it holds a high rank. It has extensive machine shops, refineries, and foundries. The manufactures include fabrics, lumber products, tobacco, beverages, machinery, ironware, and hardware. Erie occupies the site of Presque Isle, a French fort built in 1753. The English captured it in 1760. In the War of 1812 it was the headquarters of Commodore Perry. The first settlers came here in 1795 and it was incorporated in 1805. Population, 1900, 52,733; in 1910, 66,525.

**ERIE, Battle of Lake**, a naval engagement of the War of 1812, fought near the island of Put-in-Bay, in the western part of Lake Erie, on Sept. 10, 1813. The American fleet under Commodore Perry consisted of nine small vessels, which had been built hastily at Presque Isle, and the British fleet under Commodore Barclay had six vessels. Commodore Perry used the *Lawrence* as his flagship, on which the British concentrated their fire and disabled it, hence he was compelled to shift his flag to the *Niagara*. The fighting became general and the British were compelled to strike their colors. Perry reported the victory to the government officials in these words: "We have met the enemy, and they are ours—two ships, two brigs, one schooner, and one sloop." As a result of the battle the Americans secured control of the Great Lakes and the Northwest Territory.

**ERIE CANAL**, the largest and most important canal of the United States, extending from Buffalo to Albany, N. Y., a distance of 351 miles. The canal was first suggested by Gouverneur Morris and he was appointed at the head of a commission of seven members in 1810. The project was delayed by the War of 1812, but a law authorizing it was enacted in 1817, and the first canal boat passed through from Buffalo on Nov. 4, 1825, Governor Clinton being a passenger on the same. This canal greatly revolutionized trade with the lakes and the interior, since railroads were yet unknown. By means of it the time of travel between Buffalo and Albany was shortened from twenty to ten days, and the freight per ton was reduced from \$100 to \$3. The canal as originally constructed was forty feet wide and four feet deep, and cost \$7,602,000. In 1895 the sum of \$9,000,000 was appropriated to deepen the canal to

nine feet and otherwise improve it. However, the work cost more than twice that amount. Up to 1871 the propelling power consisted almost entirely of horses, though at that time steam-propelled boats were introduced, and at present electric motive power is used with success. However, the greatest share of freight is still carried in tow boats drawn by horses. The canal is twice carried over the Mohawk River on aqueducts, contains 72 locks, of which 57 are double-lift locks, and is considered one of the most scientific canals in the world.

**ERIE, Fort**, a fortified place in Welland County, Canada, on the Niagara River, nearly opposite the city of Buffalo, N. Y. It was occupied by the British under General Vincent, who abandoned and fired it with all its stores on May 28, 1813. The same day it was occupied by the Americans, who afterward withdrew from the Canadian shore, and the British rebuilt it. General Brown invaded Canada in July of the same year and required the fort to surrender. The fort was now strengthened by the Americans, and in August of the same year the British under General Drummond assaulted it and captured the main bastion of the fort, but a magazine blew up and rendered the attack unsuccessful. In November, 1814, the Americans finally abandoned Canada and Fort Erie was blown up.

**ERIE, Lake**, one of the five Great Lakes of North America, between lakes Huron and Ontario. It washes part of the northern boundary of New York, Ohio, and Pennsylvania, the eastern shore of Michigan, and the southern shore of the Province of Ontario. The discharges of lakes Superior, Michigan, and Huron flow into it through the Detroit River, while the outflow is into Lake Ontario by the Niagara River. Its width is from 30 to 65 miles; length, 260 miles, and area, 9,600 square miles. The Sandusky, Maumee, Detroit and Grand (in Canada) are the principal rivers flowing into it. Canal connections are maintained with the Hudson River by the Erie Canal, with the Ohio by the Ohio and Miami, and with Lake Ontario by the Welland. It has excellent fisheries and a large commerce. The naval victory gained by Commodore Perry over the British in the western part of the lake is commemorated by a monument at Cleveland and by a stone on the island of Gibraltar, near which the battle was fought. Among the chief harbors in the United States are those of Erie, Buffalo, Sandusky, Cleveland, Toledo, and Dunkirk. Those of Canada include Harrow, Rondeau, Port Rowan, and Welland.

**ERITREA** (â-rê-trá'á), or **Erythrea**, a possession of Italy, on the western coast of the Red

Sea, extending as a narrow strip of country about 670 miles along the coast, from Nubia to French Somaliland. The area is about 50,500 square miles. It is inhabited chiefly by nomadic tribes of Arabs, but the southern part has some settlements of Afars or Danikils. A resident civil governor is nominated by the King of Italy and is under the direction of the Italian minister of foreign affairs. Farming is largely pastoral, its products being butter, meat, and hides, supplied by cattle, sheep, and goats. There are pearl fisheries of considerable importance along the coast, while the import and export trade is quite large. Massowah is the capital and local seat of government, with a population of 9,250. It is connected with Saate and several other points by railroad and telegraph lines. Numerous wars between the Italians and dervishes have occurred, though the boundary line was fixed at its present limit in 1897. Population, 1906, 279,551.

**ERMINE** (ēr'mīn), or **Stoat**, a small mammal allied to the weasel family, found in the

ERMINE.

northern portion of Europe, Asia, and America. The body in summer is reddish-brown above and white beneath, and in winter it is wholly white, except the tip of its tail. Its body is about ten inches long, without the tail, which is about five inches. The fur is soft and silky and is used for ladies' winter garments, and in some countries for robes of kings, judges, and other high officials. When used as linings for cloaks, the black tufts of the tail are sewed to the skins at irregular intervals. The ermine lives in holes in the ground and under rocks, and feeds on mice, rats, birds, chickens, and other small animals, sucking the blood.

**ERNE** (ēr'n), a river and lake of Ireland, in Ulster County. The river rises in Lake Gowna and flows into Donegal Bay, passing through Lough Erne in Fermanagh County. It is sixty miles long and is navigable from Ballyshannon to the outlet. Lough Erne consists of two lakes, the upper and the lower, and is usually

known as Lake Erne. It is rich in fish and eels, and the scenery is interesting and attractive.

**EROSION** (ē-rō'zhūn), in geology, the influence of running water, waves, and wind in wearing away rocks and other substances. Immense quantities of silt are deposited at the mouths of rivers as deltas, which show that the geological structure of the earth's crust is changing from this agency. The erosion theory attributes the excavation of valleys and other depressions chiefly to the erosive power of water in the form of glaciers, instead of regarding them as due to depressions, cracks, or fissures in the strata produced by strains during upheavals through volcanic action.

**ERRATIC BLOCKS**, or **Erratics** (ēr-rāt'īks), in geology, the boulders on the surface of the ground which have been transported from their original location by the action of glaciers and icebergs. They consist largely of granite, and in some cases were transported great distances from their original location. Many rocks of this class are found in the south central part of Canada and the north central part of the United States, extending from Saskatchewan through North and South Dakota and southward into Iowa.

**ERYSIPELAS** (ēr-ī-sīp'ē-lās), an inflammatory disease of the skin. It is attended by fever and diffused redness and swelling of the parts affected, and later by peeling off of the scarf-skin in the milder forms, or by suppuration of the deeper parts in severer cases. There is usually considerable pain, with heat and tingling in the affected parts. The treatment consists for the most part in watching closely the progress of the case, keeping the bowels well regulated, and obviating special dangers as they may occur. Iron is sometimes used as a specific remedy. The disease is frequently an epidemic.

**ERZERUM** (ēr-zrōm'), a city of Turkish Armenia, situated in the southern portion of a wide valley, at an elevation of 6,200 feet, and surrounded by mountains of considerable elevation. It is the capital of a Turkish vilayet, which has an area of 19,180 square miles and a population of 645,728. The streets of the city are angular and the houses largely ancient, though there are numerous fine buildings, bazaars, and public edifices. The manufactures consist largely of ironware, clothing, copper, fabrics, and utensils. Erzerum forms an important strategical center. It has considerable trade with many points in Western Asia and the Persian pilgrims gather here in large numbers, when on their way to worship at Mecca. In 700 A. D. it fell into the hands of the Arabs, and was later successively conquered by the

Byzantines, Mongols, and Turks. The Russians took possession of it in 1829 and again in 1878, though later restored it to the Turks. The governments of Germany, France, Russia, and England maintain consul residences and are represented officially. Population, 1907, 41,865.

**ERZGEBIRGE** (ěrts'gē-bēr-gē), a range of mountains in Europe, trending a distance of 120 miles and forming a natural boundary between Bohemia and Saxony. The name in German means Ore Mountains and originated from the wealth of iron, copper, cobalt, lead, silver, coal, and arsenic found in the region. The culminating peaks in Germany attain a height of 3,850 feet and the average elevation is 2,500 feet.

**ESCANABA** (ēs-kā-nā'bā), a city in Michigan, county seat of Delta County, near the central part of the northern peninsula of the State. It is on the Chicago and Northwestern and the Chicago, Milwaukee and Saint Paul railroads, has a good harbor on Green Bay, and is an important shipping point. The chief buildings include the county courthouse, the high school, and the public library. Among the manufactories are mills, iron foundries, and woodenware factories. Among the municipal improvements are waterworks, gas and electric lighting, sewerage, and street paving. It was settled in 1863 and incorporated as a city in 1883. Population, 1910, 13,194.

ESCAPEMENT.

lock d j, and through these the power imparts to the pendulum c, or balance wheel (time measurer), an impulse sufficient to overcome the friction and resistance of the atmosphere, and thus keeps up the vibration. These alternate motions of the lock serve to arrest and release the escape wheel at uniform intervals, thus governing the movement of the timepiece. The principle is the same whether the moving power consists of springs or weights. Among the different escapements in use are the chronometer, anchor, lever, cylinder, duplex, and horizontal.

**ESCURIAL** (ēs-kū'rī-āl), or **Escorial**, a

building about 30 miles northwest of Madrid, Spain, celebrated as a palace, church, convent, and burial place. It was built by Philip II. on a slope of the Sierra de Guadarrama, about 3,700 feet above sea level, and dedicated to Saint Lawrence in commemoration of the victory of Saint Quentin over the French on Saint Lawrence's day, Aug. 10, 1557. Since Saint Lawrence suffered martyrdom by being broiled to death on a sort of gridiron, its form is considered to be on the plan of a gridiron. The main building was begun in 1563 and completed after 21 years. This great building has a length of 740 feet, a width of 580, and a dome with a height of 220 feet. Its collection of pictures long ranked among the finest in Europe, but large numbers of the more noted were transferred to Madrid in 1837. A fire injured the library in 1691, but Ferdinand VII. restored it, and in 1808 the French army inflicted damages to the masonic portion. Marble tombs contain the remains of all the kings of Spain from Charles V. to Alfonso XII., except Philip V. and Ferdinand II., the tombs being in tiers over each other in niches constructed in the walls. A bolt of lightning struck the Escorial in 1872, by which serious damage resulted.

**ESDRAELON** (ēs-drā-ē'lōn), or **Plain of Jezreel**, a fertile valley of Palestine, extending from the Mediterranean toward the Jordan, along the eastern side of the Carmel range. It is drained by the Kishon River and noted for its present high state of cultivation, though prior to 1869 it was laid waste periodically by the Arabs. This valley is the site of Gideon's victory over the Midianites and that of Napoleon over the Turks in 1799.

**ESDRAS, Books of**, the name of two apocryphal books of the Old Testament. They are usually given as the *First Book of Esdras* and the *Second Book of Esdras*, and generally appear as the first two books of the Apocrypha. The former contains a portion of *Nehemiah*, the *Book of Ezra*, and two chapters of *II Chronicles*, and was translated from the Hebrew. The latter, according to recent critics, was composed about the year 90 A. D., and was written in Hebrew or Greek. See **Bible**.

**ESKIMOS** (ēs'kī-mōz), or **Esquimaux**, a race of people supposed to be of Turanian descent, found native in the northern part of North America, Greenland, the Arctic islands, and the northeastern portions of Asia. The name applied to them is supposed to be of Indian origin, meaning *eaters of raw fish*, though the designation they applied to themselves is *Inu-it*. There are at least three principal divisions of this race—the Eskimo proper, in Labra-

dor; the Greenlanders; and those occupying the country west of Baffin Bay and extending westward along the Arctic region to a district about 400 miles west of Bering Strait. Their height and coarse, black hair correspond to those of the American Indians, but the color of the skin shows a tendency toward brown. The eyes are often oblique, the cheek bones are prominent, the nose is flattened, and the weight is quite large considering the average height. Their summer residence consists of tents made with poles and skins.

In the winter time the Eskimos build houses

ESKIMO FAMILY AND DOGS.

of snow and ice, though in some cases their habitations are permanent, being constructed of stone in which turf is used for cement. The food consists of the flesh of the walrus, whale, seal, and other animals, though this is usually eaten raw. They use a boat, or *kyak*, made of oiled skins with much skill. From fifty to several hundred inmates occupy a single house, which in the winter time is warmed by lamps consuming whale oil as fuel. The attire of the males and females is similar, consisting of trousers and a coat or sack, with a hood of skins drawn over the head.

Government among the Eskimos is tribal. The oldest are selected as chiefs, who officiate among the tribes and groups of tribes. Large numbers have been converted to Christianity by Danish missionaries, though some still adhere to totem worship. As hunters and fishers they show much skill with spears, arrows, and lances, these usually having bone or metal points. The Eskimo dog is their only domestic animal, and serves as a valuable help in hunting and drawing sledges. It is larger than the English pointer and has short, but strong, legs, and from its bushy tail has a wolfish appearance. By means of a team of trained dogs the Eskimo is able to travel sixty miles a day. The total number of Eskimos is now placed at 45,000.

**ESKIMO DOG.** See Eskimo.

**ESPARTO** (ěs-pär'tō), a species of grass grown extensively in Spain and Northern Africa. It is especially valuable for its strong fiber, which is used in the manufacture of paper, maps, nets, and cordage. It has been acclimated in the United States and is grown to some extent as a commercial product.

**ESPERANTO** (ā-spā-rān'to), a universal language invented by L. L. Zamenhof, a scholar of Warsaw, Russia. He prepared an exhaustive grammar in that language in 1887, which has since been translated into about thirty of the leading languages, and a large number of publications are issued regularly to disseminate interest in its use. Esperanto societies are maintained in the leading cities of Europe and America. Regular courses of study are carried by many periodicals, such as the *English Review of Reviews*. The new language combines the more commendable features of the leading languages of Europe, in which respect it is superior to the Volapük (q. v.) and students may learn to read and speak it with facility

in a comparatively short time. The English sentence, "The international language should be comprehensible to the whole educated world," appears as follows in Esperanto: "La lingvo internacia estas komprenita de la tuta mondo edukita."

Some one language has occupied a place of supremacy at all times. The Babylonian tongue was the language of diplomacy in the 2d century B. C. Alexander the Great made Greek the leading language, but it in turn gave way to Latin during the prosperity of Rome, which remained the language of scholars in Europe

throughout the Middle Ages. French became the language of diplomacy in the 18th century. English sprang into use as the language of commerce in the 19th century, while German came to be indispensable to the scholar.

In a perfect system of communication each idea has its own separate symbol, as we find in the mathematical formulas and the chemical signs, but the connotation in the natural languages is very imperfect. English is the most imperfect in respect to spelling, while the inflected languages, as Latin and German, demand plural forms of the article, adjective, and verb with the plural nouns. An artificial language is intended to correct these and other difficulties. In Esperanto these faults are reduced to a minimum and each sound represents only one idea. Since it has no synonyms, puns are impossible in Esperanto. Those who have taken a leading part in the spread of the language maintain an organization known as the International Esperanto Congress. The fourth meeting of this body was held at Dresden, Germany, in 1908, at which about thirty countries were represented by delegates.

**ESQUIMALT** (ěs-kwí'malt), a seaport of Canada, in British Columbia. It is located on Vancouver Island, three miles southwest of the city of Victoria, on the Strait of San Juan de Fuca. The harbor is landlocked and contains a navy yard and a dry dock. Esquimalt is the headquarters of the British Pacific squadron, is strongly fortified, and is connected by railway with the coal mines at Nanaimo. Population, 1906, 1,845.

**ESSAY** (ěs'sâ), a literary composition shorter and less formal than a treatise, and which embodies the opinion of the writer on some general subjects. The term is sometimes used interchangeably with the word *treatise*. The writing of essays as a separate form of literature began in the 16th century, although such ancient writers as Plutarch and Cicero are rightfully classed with the essayists. Montaigne, the eminent French writer, may be credited as the father of the essays. Voltaire, Lamartine, and Rousseau are among the leading French essayists, and those of Germany include Lessing, Schlegel, and Hermann Grimm. The following list contains the leading essays of European and American literature:

Joseph Addison's....."The Spectator"  
 Matthew Arnold's....."Essays in Criticism"  
 Francis Bacon's....."Of Studies"  
 Thomas Carlyle's....."Sartor Resartus"  
 Ralph W. Emerson's....."Conduct of Life"  
 Hermann Grimm's....."Fifteen Essays"  
 Oliver W. Holmes's... "Breakfast Table Series"

Washington Irving's....."Salmagundi Papers"  
 Samuel Johnson's....."Rambler"  
 Alphonse de Lamartine's....."Confidences"  
 Charles Lamb's....."Essays of Elia"  
 Gotthold E. Lessing's....."The Laokoon"  
 John Locke's....."Essay on the Understanding"  
 James Russell Lowell's....."Among My Books"  
 Thomas B. Macaulay's....."Milton"  
 Jean Jacques Rousseau's....."Emile" and  
 ["Confessions"  
 John Ruskin's....."Sesame and Lilies"  
 Friedrich von Schlegel's... "Philosophy of Life"  
 Henry David Thoreau's....."Walden"  
 Jean Voltaire's....."Essay on the Nations"

**ESSEN** (ěs'sen), a city of Germany, in the kingdom of Prussia, about twenty miles northeast of Düsseldorf. Numerous railroads and electric car lines connect it with cities at a distance. The streets are well paved and its architecture is durable and imposing. The cathedral, founded in 873, contains many treasures of art. Other noteworthy buildings include the courthouse, the town hall, the municipal theater, and many schools and hospitals. A fine monument of Alfred Krupp stands in front of the town hall. Among its industries is the celebrated Krupp steel and iron works, rated among the most extensive establishments in the world. These works were founded with only two workmen in 1827, but at present occupy a site of 1,000 acres and give employment to 45,500 workmen. The guns, steel plate, and munitions of war produced at this establishment are known in all the civilized countries. Other manufactures include clothing, fabrics, tobacco, earthenware, and machinery. The municipality maintains systems of sewerage and waterworks. Essen was founded in the 9th century, but its growth is comparatively recent. In the 17th century it was captured by the Dutch and the Spaniards. Since 1813 it has belonged to Prussia. Population, 1905, 231,360.

**ESSEQUIBO** (ěs-sâ-kě'bô), the largest river of British Guiana, rises in the Tumuc Humac Mountains, and flows into the Atlantic near Georgetown. It has a course of about 600 miles and its estuary is 20 miles wide. Several tributaries flow into it, chiefly from the west, and the region through which it flows has fine forests of ebony, locust, ironwood, and greenheart.

**ESSEX**, the name of a United States frigate used in the War of 1812, then under command of David Porter. The *Alert*, a British sloop of war, commanded by Captain Laugharne, made an attack upon the *Essex* on Aug. 13, 1812, but was captured by its opponent. Later the *Essex* was attacked at Valparaiso, South America, by two British men-of-war, the

*Phoebe* and the *Cherub*, and her crew was forced to surrender. This engagement took place on March 28, 1814.

**ESTATE**, the interest which an owner may have in property, either real or personal. The term *fee simple* is applied where the ownership is absolute, hence the owner may encumber or sell it as he may choose. An estate in *fee tail* is one which is owned by the possessor, but he may dispose of it only to his own issue. A *life estate* pertains to the ownership of land, but the title is held only during the lifetime of the possessor. In general, the term estate has reference to the degree, quantity, nature, and extent of interest which a person has in real estate. From this circumstance we speak of an estate in *expectancy*, in *remainder*, in *common*, in *reversion*, etc.

**ESTHER, Book of**, a book of the Old Testament, so named from Esther, a Jewish maiden and the foster-daughter of Mordecai. It recounts how Esther was raised to the position of queen by Ahasuerus, King of Persia, that she and her uncle Mordecai frustrated the plans of Haman to extirpate the Jews, that Haman fell and was succeeded by Mordecai, and that a festival was instituted to commemorate the deliverance of the Jews from their enemies. Recent critics think that it was written about 640 B. C. The language of the original manuscript is Hebrew, intermingled with numerous Persian words. The purpose of the book is to illustrate that God takes care of His people.

**ESTHETICS.** See **Aesthetics.**

**ETCHING.** See **Engraving.**

**ETESIAN WINDS** (ĕ-tē'zhan), the name of winds that prevail in the southern part of Europe during the summer season. They blow from the north and northeast across the Mediterranean, and are due to the sun heating the surface under the Tropic of Cancer, causing the air to be drawn in over the desert of Sahara. Though the air is charged with moisture in passing across the Mediterranean, the clouds are dispersed when they reach the margin of the hot sands and the vapor is dissipated in the rarefied air.

**ETHER** (ē'thēr), in astronomy and physics, the tenuous fluid that fills all space. It is regarded the medium for the transmission of light, heat, and electric action, through the molecules of solids and liquids as well as throughout all gases. This medium is thought to be more elastic than any ordinary form of matter. Electric and magnetic phenomena are but strains and pulsations in the ether. Physicists assume the existence of ether from the wave theory of the motion of light (q. v.).

**ETHER**, the name of a volatile liquid, usually divided into two classes known as simple ether and compound ether, or as ether and ethereal salt. These liquids are fragrant substances, burn easily, and have a wide use in medicine. Ether is employed in the solution of iodine, sulphur, phosphorus, strychnine, and other alkaloids. It is useful in the preparation of freezing mixtures. When inhaled, it produces intoxication. Sulphuric ether, so called from the use of sulphuric acid in its preparation, is employed to dissolve fats and resins. It is much used in medicine as a stimulant and anaesthetic.

**ETHICS** (ĕth'iks), or **Moral Science**, the science which relates to human duty. It investigates the nature and the right of conduct, actions, and aims, embracing the supreme good and the ultimate ground of obligation. Writers usually treat the science of ethics under two divisions—theoretical and practical. *Theoretical ethics* aims to ascertain the principles of the ideal moral manhood and life, while *practical ethics* applies these principles in directing man to the attainment of the ideal character and life.

Ethics as a science is frequently compared in various aspects to geometry. In geometry we have an intuitive idea of extension; then special forms of extension, as a line, a circle, etc.; and finally we arrive at intuitive truths called *axioms*. Similarly, in ethics we first have an intuitive idea of right; then an idea of particular forms of right, as kindness, honesty, etc.; and ultimately recognize certain principles, as "it is right to be kind," "it is our duty to be honest," which may be regarded *moral axioms*. Various systems of ethics have been proposed, all differing more or less widely in their conclusions as to the origin and nature of the faculty by which human duty is recognized. Many of the systems had their origin in antiquity, and with them the names of Socrates, Plato, Epicurus, Aristotle, and the Stoics are associated. With the introduction of Christianity ethical speculation turned on a new element, and among Christians moral obligation came to be based on the injunctions of the Scriptures.

Most modern writers regard the true, the beautiful, and the good as the three rational ideas of the mind, and of these the good, which is by some called the right, is held to be the highest idea. There has been a wide difference of opinion as to the question of right, the essential query being as to what it is that makes a thing right. Among the answers proposed are utility, highest happiness, divine law, the divine nature, and the eternal nature of things.

Those holding to the view founded on *utility* urge that whatever is best adapted to the welfare of man is right, while the opposite things are regarded as wrong, because they retard the individual and the race in progress toward the ideal life. Those holding that right is based on the *highest happiness* of the individual similarly commend all that is essential to the happiness of man. By *divine law* is meant the revealed will of God, which some writers hold to be the ultimate right, but there is a wide difference of opinion as to what the revealed will of God is, which is likewise the case of the character of *divine nature*. Those holding that right is based on the *eternal nature of things* regard right and wrong as self-existent. Viewed from this aspect, they are said to have no origin, and that they are eternal. The view that right and wrong are eternal principles is probably correct, since we cannot conceive a condition under which either can change or be terminated. When looked upon from this high plane, we conceive that right is wrapped up in the universe, one ever-existing ultimate principle.

Locke, in his "Essay on the Understanding," assailed the theory that morality is intuitive, and urged that there are no principles universally received among men, that children are not possessed of any moral rules, and that moral rules require a reason to be given for them, these all being conclusive that virtue is not innate. In reply to this view, writers have urged that all nations agree in enjoining some moral rule, but this is a departure from the original question, since we are to determine which of any opposite standards of morality is correct, as, for instance, monogamy or polygamy. Those who oppose the idea of innate virtue usually hold that the idea of right is the product of education. According to this view virtue depends wholly upon the manner of instruction, which likewise determines how the individual will class conduct in the categories of right and wrong. Others hold that education does not account wholly for the origin of the idea, but refer its development at least partially to instinct. In the philosophy of Kant, reason is held to recognize the obligation of right conduct, and action is classed as good only when it is done from a good motive, though the motive must be entirely freed from natural inclination to the act performed. Adam Smith, in his "Theory of Moral Sentiments," suggests that the sympathetic feelings of the impartial and well-informed witness of an act constitute the criterion of right, while William Paley (1743-1805) holds that virtue consists in

doing good to mankind for the sake of everlasting happiness.

**ETHIOPIA** (ē-thī-ō'pī-à), the Kush of sacred history, the ancient name applied to all the nations inhabiting the Southern Hemisphere, as known in early ages. However, some writers applied the name to the dark-brown or black-colored people, who are generally spoken of as Ethiopians, meaning *sunburned*. Later it had reference particularly to the country lying south of Egypt and the Red Sea, which corresponded to modern Abyssinia, Nubia, Kordofan, and other districts, though the boundary was not clearly defined. It was also applied to an island formed by two tributaries of the Nile, known as the kingdom of Meroë, whose capital was Napata. This island was fertile, producing an abundance of cereals, animals, and metals. It was given credit as the site of an oracle of Jupiter Ammon. Ethiopia, as a country, had a large trade with Egypt, Libya, Carthage, Arabia, and even India, but it attained its greatest prosperity about 1000 B. C., and formed a distinguished and powerful kingdom of ancient history. About the middle of the 8th century B. C. it became independent of Egypt, secured a predominating influence in the valley of the Nile, and imposed a dynasty on Lower Egypt.

The Persian Cambyses invaded Ethiopia in the 6th century B. C., though independence was maintained until it became a possession of the Romans in the reign of Augustus, the Ethiopian queen, Candace, becoming one of his vassals. The only evidences remaining of the ancient civilization of Ethiopia are numerous ruins of monuments and temples on which battles, religious ceremonies, and the industries are represented by sculptures. Their first king was Menelik, who is supposed to have been the son of Solomon and the Queen of Sheba. The names of thirty kings and queens have been found sculptured on some of the ruins. Later the country came to be known as Abyssinia, but the monarchs of the present Abyssinia still designate themselves rulers of Ethiopia. The language of the Ethiopians, more correctly called the Gees language, was introduced from South Arabia, and formed the ancient ecclesiastical and official language of Abyssinia. Semitic in construction, it resembles the Hebrew, Aramaic, and Arabic. The modern nomadic tribes of the Sudan and Tigré speak a language quite closely allied to it. The literature of the Ethiopian language includes a translation of the Old and New Testaments and the Apocrypha, besides other important Christian literature.

**ETHNOLOGY** (ěth-nŏl'ŏ-gŷ), the science which treats of the various races of mankind, investigates their distribution, and attempts to trace them to their origin. The science was developed from *ethnography*, which relates to particular tribes and localities, and to which it has a relation similar to the connection between geology and geography. *Anthropology* is the general science or natural history of mankind, of which ethnology and ethnography are important branches, while anthropology again is a branch of *biology*. In this article we can give only the leading facts of the unity of plurality of the species of mankind, since the whole study covers a wide range of details to be investigated. The distribution of man is much more general than that of lower animals, owing to the greater power of adaptation to change of circumstances. On account of this, man is found in all climatic zones and at all elevations above sea level, except only the small areas above the snow line.

The view that all mankind descended from a single family or species is the one most commonly supported. This view holds that Adam and Eve were the first parents, the common progenitors of all, racial differences now existing being attributed to climatic influences acting on individual families for a long period of time. Another view is that the various types have not descended from a single family, but were created separately in different localities. The advocates of this theory maintain that the physical form, personal characteristics and general appearance of mankind could not have been so greatly diversified, as demonstrated by the different races, through mere climatic conditions. However, the difference in color, stature, size, and intelligence is largely overcome by the anatomical structure, which is invariably the same in all races. Besides, the racial differences are characterized by almost insensible gradation, which points to a gradual modification of an original race through changes in external circumstances, by means of which the principal species were produced. According to this view, it is assumed that all the varieties of races have descended from the Caucasian. Other evidences pointing to a single parent family are found in the similarity of earlier myths and legends, from which it is reasonably certain that the remote ancestors of the various races originally dwelt together. There is a close resemblance of the language of widely separated races, this being regarded the strongest proof of the early unity. By extended comparisons many scholars have been led to believe that the languages had their origin in the one parent nation, which dwelt in

the neighborhood of Mount Ararat in prehistoric times.

Various classifications of mankind have been attempted. However, it has been difficult to find physical characteristics that belong exclusively to a single race, though there are some that predominate in certain races. The Dutch anatomist, Pieter Camper (1722-1789), attempted to make a scientific racial distinction by measurement of the facial angle. Though Camper's method illustrates nicely existing differences, they may be paralleled quite as distinctly by variations found in a single community. He classifies, for instance, the facial angle of the anthropoid apes at  $42^\circ$ , the African Negro at  $70^\circ$ , and the Europeans at  $80^\circ$ . J. F. Blumenbach (1752-1840), a German ethnologist, classified the human family into five races, basing the distinction on the differences found in the shape of the head, while Cuvier classified mankind in three divisions. As classified by this writer, the races are Caucasian, Mongolian, Ethiopian, Malay, and American, the two last mentioned being considered by him as subdivisions of the Mongolian. There is a more recent classification into three strongly marked types, the Caucasian, Mongolian, and Negro, and the three secondary races, the Malay, American, and Australian.

The *Caucasian* race is found in Southwestern Asia and most of Europe and America, and is widely distributed in small colonies in other portions. The *Negro* type prevails most largely in Africa and the *Mongolian* in portions of Eurasia not occupied by the Caucasian. Among the chief characteristics of the Caucasians are a round, oval face, fair complexion, arched forehead, symmetrical features, vertical teeth, smooth hair, and ample beard. The Mongolians have an angular face, broad head, oblique eyes, straight, coarse, black hair, high cheek bones, pale lemon to brownish-yellow skin, and a scanty beard. This race includes the inhabitants of most of Asia, the Laps and Finns of Northern Europe, the Magyars of Hungary and the Turks. The Eskimos, who inhabit the northern portion of North America and Northeastern Asia, are commonly classed with this race. The Negro race is characterized by a narrow and elongated head, projecting jaws, thick lips, crisp, curly hair, black or dusky skin, scanty beard on upper lip, and broad feet. It shows great differences in civilization, ranging from the cruel and vindictive Gallas to the debased Hottentots, from the cringing slave to most profound and enlightened scholars. This race is found in large numbers on the continent of Africa and has migrated to all portions

of the warmer zones. The *Malay* race resembles the Mongolian. However, the eyes are horizontal, the hair is coarse and straight, and the skin is mostly a dark olive color. It is found in large numbers on the island of Madagascar, the southern Malay peninsula, and the islands of the Indian and Pacific oceans.

The *Australian* race is considered a sub-species of the Papuan branch of the Malays. It is characterized by deep-set eyes, large head, abundant beard, dark hair, and dark brown skin. In civilization it is wholly destitute and has shown little, if any, tendency to improve under a system of education. The *American* race resembles the Mongolian in some respects, though it is characterized by the top of the skull being more rounded and the sides less angular. This race once occupied all of America, though since the discovery and settlement it has been more or less assimilated. This is true especially of South and Central America, where the most highly advanced tribes of this race were found. At the time of discovery of America the people of the Andean plateaus were advanced in civilization, understood the art of working metals, and possessed remarkable temples, tombs, aqueducts, and pyramids, while those of Central America showed evidences of a still higher and more ancient civilization. The former probably were of Asiatic origin, while the latter have been traced by some writers to a Semitic or an Egyptian source. Placing the entire population of the earth at 1,500,000,000, the numerical strength of the different races is as follows: Mongolian, 650,000,000; Caucasian, 575,000,000; Negro, 175,000,000; Malay, 40,000,000; America, including all of the red race, 20,000,000; Australian and mixed races, 40,000,000.

**ETIOLATION** (ē-tī-ō-lā'shŭn), the process of bleaching plants by excluding the light of the sun. It is made use of in bleaching celery, by which it is rendered quite tender and less acrid. Plants subjected to etiolation for some time become pale and almost colorless, since no chlorophyll is produced in the absence of sunlight. See **Chlorophyll**.

**ETNA** (ĕt'nà), a borough of Pennsylvania, in Allegheny County, on the Allegheny River, opposite the city of Pittsburg. It is on the Pennsylvania and the Pittsburg and Western railroads, and has electric railway facilities. Etna has extensive furnaces, rolling mills, and machine shops. Population, 1910, 5,830.

**ETNA**, or **Aetna**, the most celebrated volcano in Europe, situated in Catania, Sicily, towering 10,865 feet above sea level. This mountain rises abruptly from the sea, having a

circumference of over one hundred miles at the base, and ends in a single cone, in which a crater nearly three miles in circumference and 1,000 feet deep has been formed. A number of smaller cones are situated on the side of the mountain, the principal one being Monti Rossi, formed during the eruption of 1669. The mountain contains three climatic zones—the lower mild region, the central temperate, and the upper or snow covered. In the milder regions many varieties of lemons, oranges, date palms, olives, almonds, figs, and bananas are cultivated. The temperate belt has forests of oak, birch, chestnut, cork oak, maple, and pine, and in the upper part is a desert region covered partly with stunted vegetation and partly with ashes, lava, and sand, and much of it is buried most of the year with snow. A splendid view of the whole of Sicily, Malta, Calabria, and the Lipari Islands is obtained from the summit. At the height of 9,080 feet is an observatory, which is the highest inhabited structure of Europe.

Several great eruptions of Mount Etna occurred long before the Trojan wars. They are related in the mythical writings of the ancients. The earliest to which a definite date is given occurred in 475 B. C. and the most remarkable overwhelmed Catania in 1169, when 15,000 persons were destroyed. In an eruption in 1329 a new crater opened. About a century later, in 1444, a large cone formation fell into the crater during an eruption, and in 1669 a chasm twelve miles long burst open and lava flowed over the country for forty consecutive days. An earthquake accompanied the eruption in 1693 and caused the destruction of 60,000 lives. Vast eruptions occurred in 1832, 1853, 1865, 1874, and 1879, and there were numerous minor manifestations of external disturbances, numbering in all about one hundred, fully twenty of which occurred in the last century. Premonitory symptoms generally precede eruptions, thus giving ample warning to the people that danger is imminent.

**ETON COLLEGE** (ĕ'tŭn), an educational institution situated in Eton, England, about twenty miles from London. It was founded by Henry VI. in 1440, though its completion was retarded by political contentions until 1523. The institution is managed by a board or governing body, whose members are nominated by learned electors, including those of Oxford and Cambridge. Students from Eton may obtain valuable scholarships at Cambridge on merit, which is determined by competitive examinations. The buildings are substantial and convenient and associated with them are libraries,

apparatus, a beautiful campus, and several parks. The attendance numbers about 1,000. Its courses of study are still based somewhat on the mediaeval idea that Greek and Latin are the basis of all good education. Among its distinguished graduates are Fielding, Fox, Chatham, Bolingbroke, Channing, Gray, Hallam, Wellington, Shelley, and Gladstone.

**ETRURIA** (ē-trōō'ri-à), the ancient name of the portion of Italy which is situated south of the valley of the Arno and west of the Tiber and the Apennines. In its greater prosperity it embraced the valley of the Arno, extending south of the Tiber, when it included the valley of the Po. For practical purposes it may be said that Etruria corresponded to modern Tuscany, but included several adjoining regions. The traditional history of the Etruscans begins about 1044 B. C., and its fairly authentic history precedes the foundation of Rome more than two centuries. The state was formed as a confederation of twelve great cities or cantons, each of which constituted a representative republic. Among the most flourishing of these cities were Cortona, Veii, Caere, Volsinii, Tarquinii, and Perugia. Veii was a rival of Rome for four centuries, and in its prosperity covered sixteen square miles, but was destroyed under Camillus in 396 B. C. The famous tomb of the Tarquins is located at Caere. Volsinii resisted Roman attacks for many years and constituted one of the most powerful centers of Etruscan strength.

The naval power of the Etruscans was a strong element in their prosperity, enabling them to control large portions of the Mediterranean, establish supremacy over central and northern Italy, and include Rome itself within their territory for several centuries. From them the Romans secured the circus, many arts of industry, architectural methods, and the gladiatorial combats. They formed an alliance with the Carthaginians in 538 B. C. for the purpose of expelling Greek colonists from Corsica, fought against the Greek colony of Cumae in 525 B. C., and were rated the greatest military power of Italy in 467 B. C., though two years later their strength was partly shattered by the Greeks. Subsequently their territory was invaded by the Gauls, Samnites, Greeks, and Romans. The Roman victory over Veii in 396 B. C. completely destroyed Etruscan power, while their last determined resistance ended at the Battle of Lake Vadimonian in 283 B. C. Even after this their state was considered an independent ally of Rome, though Roman customs were gradually adopted until the final union was effected in 89 B. C., after which many of the leading families

of Etruria attained to high positions in the Roman government.

The name applied to the people of Etruria by the Romans was *Etrusci*, while the Greeks called them *Tyrrheni*. These people constituted a sturdy race. They were characterized by black hair, a dark color, and a large head, and more nearly resembled the people of Western Asia than the Europeans. Their civilization was marked by culture, a definite literature, codified laws, and a flourishing commerce. Although their poems, dramas, and histories are numbered among the extinct writings of the past ages, we know something of their ability to compound and apply medicine, calculate mathematical and astronomical problems, mine and work metals, build highways, and construct architectural edifices by studying their ruins and deciphering the inscriptions found on monuments and in the tombs.

Many products of the Etruscans are extant, such as vases, lamps, and utensils. The vases made by this race are especially noteworthy, being ornamented by bands of beautiful foliage and figures of a highly artistic character. It is known from excavations that their homes were adorned with decorated walls, mirrors, jewelry, pottery, and convenient furniture, though in art they borrowed largely from the Greeks. Many of the exquisitely painted vases known and preserved as Etruscan were undoubtedly the production of Grecian workmen, for the reason that many of the inscriptions are in the Greek. The language of the Etruscans is known as Rasena and was spoken for about 1,000 years before the Christian era, when it gave way to the Latin. Numerous coins and gems bearing inscriptions in Rasena are extant.

**ETRURIA**, a kingdom founded in Italy by Napoleon I. in 1801. It comprised the territory of Tuscany and was governed by the Bourbons of Parma until 1808, when it was incorporated with the empire of France. Elise Bacciocchi, a sister of Napoleon, was made Grand Duchess of Tuscany in 1809, but it reverted to Ferdinand III. after the fall of Napoleon in 1814.

**ETRUSCAN VASES** (ē-trūs'kən). See *Etruria*.

**ETYMOLOGY** (ēt-ī-mōl'ō-jŷ), that branch of philology which treats of the origin, form, and meaning of words. Numerous Greek philosophers, including Plato, the grammarians of Alexandria, the Roman Varro, and scholiasts of different ages, wrote on etymology and traced the origin and history of particular words and forms of language. In more recent times the intense interest given to the investi-

gation of Sanskrit has led to its scientific study. By means of extended investigations language has been classed in groups and families and the similar and dissimilar words have been studied from the standpoint of relationship and origin. This has led to a recognition of the fact that the growth of language is not accidental or premeditated, but enlarges or declines under certain laws. In grammar etymology is the division which treats of the parts of speech, their inflections, and the elements of the sentences.

**EUBOEA** (û-bē'â), an island of the Aegean Sea, formerly called Negroponte. It is ninety miles long and thirty miles broad at its widest point, and is the largest island in the Aegean Sea. The narrow channels of Talanti and Egripos (*Euripus*) separate it from Greece. Much of the surface is fertile and well wooded, though several mountain peaks rise to a height of about 7,000 feet. Chalcis and Karysto are the principal towns and trading centers. Besides minerals, there are productions of live stock, cereals, and fruits. Euboea was settled by the Ionians in 1100 B. C., after which it became the home of Aristotle and the seat of the Euboean school of philosophy. Athens subdued it after the Persian wars and it became a possession of the Turks in 1470. It is now a province of the kingdom of Greece. Population, 1907, 107,218.

**EUCALYPTUS** (û-kâ-lîp'tûs), a genus of trees, mostly native to Australia, which grow

EUCALYPTUS.

to the height of 480 to 500 feet, and form one of the most characteristic features of the vegetation in that part of the world. The leaves, instead of having one of their surfaces toward the sky, often grow with each side equally exposed to the light. Many of the species abound

in resinous secretions and are known as gum trees. The bark is thick and hard, containing a large per cent. of tannin. In the red gum, bay king, and iron bark species, a red juice flows freely from a wound and hardens into irregular, inodorous, transparent masses called *eucalyptin*, which is analogous to tannin. The wood is used extensively for shipbuilding. A species of the eucalyptus known as the blue gum tree has been introduced into Cape Colony, Algeria, Mexico, Roman Campagna, and elsewhere. The climate and soil of many parts of California and Florida are well fitted for the cultivation of the eucalyptus tree, hence it has been introduced with good results. It has acquired a reputation for drying marshy soils and absorbing malaria, on account of which it is called the fever tree. A saccharine substance similar to sugar, a powder having the qualities of quinine, and a secretion resembling manna are obtained from these trees.

**EUCHRE** (û'kêr), a game of cards played by two, three, or four persons, but only the aces, kings, queens, jacks, tens, nines, and eights are used. The cards rank in the order named, except that the trump suit jack is called the *right bower*, which is the highest, while the jack of the next suit which is like in color is called the *left bower*, hence is the second highest card. The game is one of the most popular played with cards.

**EUDIOMETER** (û-dî-ôm'ê-têr), an instrument used to determine the composition of gases. Priestley invented an apparatus of this kind to analyze atmospheric air and determine its proportion of oxygen. Many forms of the eudiometer are now in use, but the kind employed most extensively is a U or V shaped graduated glass tube, one end of which is closed and provided with electrodes fused into the glass. The air is tested by removing the carbonic acid contained in the air within the tube by means of a strong liquor potassae over a mercury bath, when the proportion of carbonic acid in the atmosphere is indicated by a rise of the mercury within the tube. An electric current is used, by means of the electrode, to explode a given quantity of hydrogen introduced in the tube. The volume of free oxygen in the tube is determined after cooling, and is equal to one-third of the loss of gas in the explosion. It is necessary to use a very thick tube in order to withstand the shock.

**EUFAULA** (û-fa'la), a city of Barbour County, Alabama, on the Chattahoochee River, eighty miles southeast of Montgomery. It is on the Central of Georgia Railroad. The chief buildings include the high school and the Union

Female College. The surrounding country is agricultural and fruit growing. It has manufactures of cotton goods, vehicles, canned fruit, lumber, and tobacco. The municipality owns and operates the waterworks. Population, 1900, 4,532; in 1910, 4,259.

**EUGENE** (û-gên'), a city of Oregon, county seat of Lane County, 125 miles south of Portland. It is finely situated on the Willamette River and the Southern Pacific Railroad, and is surrounded by a fertile farming and fruit-growing country. The Willamette River furnishes excellent water power for manufacturing purposes. Among the manufactures are leather, lumber, furniture, brick, and flour. It is the seat of the University of Oregon and has a number of fine public schools and churches. Electric lights and waterworks are among the public utilities. The first settlement in its vicinity was made in 1854 and it was incorporated in 1864. Population, 1900, 3,236.

**EUPHRATES** (û-frâ'têz), an important river of Western Asia, rising by two head streams in the Anti-Taurus range, in Armenia. The western branch, known as Kara-su, rises about 25 miles northeast of Erzerum and joins the Murad Chai, the eastern branch, some distance to the southwest of that city. The great river is joined by the Tigris at Kurna, and the united streams take the name of Shat-el-Arab for the remaining distance to the Persian Gulf, into which its waters flow. The total length of the Euphrates is 1,740 miles, and the area of its basin is 260,000 square miles. It is navigable about 1,200 miles, though the larger warships cannot safely ascend farther than 125 miles, owing to rapids and shallows. During May and June vast floods are caused by the melting snows on the Taurus and the Anti-Taurus ranges, causing the current to rise in velocity from three to five miles an hour and often occasioning great floods. The Bible mentions the Euphrates as one of the four rivers of the Garden of Eden, in Gen. ii, 14. In the prosperity of Babylon extensive canals served in irrigating the flood lands. Nebuchadnezzar connected that city by canals with the interior, and converted the flood lands into the most productive district of the ancient world.

**EURASIA** (û-râ'shî-â), the region included in the two continents of Europe and Asia. The term *Eur-Asiatic* is frequently applied to the geological formations of the two continents. In like manner, *Eurasian* has reference to both Europe and Asia, as the Eurasian plain.

**EURASIANS** (û-râ'shans), the name applied to the people of India who descended from Hindu and European parents. They are the

result of inter-marriages, and are usually educated in the manner of Europeans. Though they speak English quite well, their pronunciation is not clear and concise. Young men of this class engage in mercantile pursuits or enter the government service, and many of the girls marry British officers. The Eurasians have a much darker complexion than the Europeans.

**EURE** (êr), a river of France, rises in the department of Orne, and flows into the Seine after a course of 115 miles. It receives the inflow from the Iton, its principal tributary, and is navigable about 50 miles.

**EUREKA** (û-rê'kâ), the exclamation of Archimedes when he discovered a method of detecting the exact amount of alloy in the crown of King Hiero, the meaning being "I have found it." The word is now used to signify an expression of triumph at the time of making a discovery.

**EUREKA**, county seat of Humboldt County, California, on Humboldt Bay, 225 miles north of San Francisco. It has a good harbor and is a shipping point for lumber and produce. The noteworthy buildings include the county courthouse, the Carnegie library, the high school, and several churches. Sequoia Park is a fine public resort and contains a tract of redwood forest in its virgin state. Among the manufactures are dairy products, lumber products, woolen goods, and machinery. It has a large export trade in wool, lumber, fruits, butter, and fish. The surrounding country is lumbering, mining, and agricultural. It was settled in 1850 and incorporated in 1856. Population, 1900, 7,327.

**EUREKA**, a city of Utah, in Jaud County, 65 miles south of Salt Lake City, on the Rio Grande Western and the San Pedro, Los Angeles and Salt Lake railroads. It is surrounded by a productive gold, silver, and lead mining district. Near the city is a canyon of the Oquirrh Mountains, which is noted for its valuable silver mines. It has several fine schools and a considerable trade. Population, 1900, 3,085.

**EUROPE** (û'rûp), a grand division lying north of Africa and west of Asia, and with the latter forming Eurasia. From the standpoint both of history and politics it is the most important of the grand divisions. It is the most densely populated, but is smaller than any of the others, except Australia. The northern boundary is formed by the Arctic Ocean; eastern by the Ural Mountains, the Ural River, and the Caspian Sea; southern by the Black Sea and the Mediterranean; and the western by the Atlantic Ocean. The extreme northern point is Cape North; eastern, a point in Russia lying

PHYSICAL MAP OF EUROPE.

about 65° east of Greenwich; southern, Punta da Tarifa, in the Strait of Gibraltar; and western, Capt Finisterre, in the Iberian Peninsula. Its greatest length from north to south, between Capt Matapan and Cape North, is 2,400 miles, and the greatest distance from east to west is 3,400 miles; that is, measured from Capt Saint Vincent on the west to Ekaterinburg on the east. The total area is 3,782,000 square miles.

The coast line is characterized by a large number of indentations, hence it has a more irregular and extended coast in proportion to its size than any of the other grand divisions. Including the more important indentations, the coast line is about 25,000 miles, but it is nearly double that length if all of the indentations are followed. Many islands lie off its southern and western coasts. The former, which are the more important, include Ireland, Iceland, the British Isles, and the Faro Islands. South of Europe are Corsica, Sicily, Sardinia, Crete, Malta, the Ionian Islands, and the Balearic Islands. Numerous seas and inland waters abound near all of its coast line. These include Cheskaya Bay, the White Sea, the North Sea, and the Baltic Sea on the north; the Caspian Sea, the Black Sea, the Adriatic Sea, the Aegean Sea, and the Mediterranean on the south; while the expansive Bay of Biscay is on the west. The Mediterranean and other seas have arms extending far inland, such as the Sea of Azov, the Gulf of Genoa, the Gulf of Finland, and the Gulf of Bothnia. No lakes occur in the eastern part of Europe, and those of considerable extent are in the northern portion. These include Onega and Ladoga, in Russia, and Vener, Vetter, and Mälar, in Sweden.

**SURFACE.** The surface of Europe is characterized by a great plain extending from the Black Sea to the White Sea, and occupying the interior from the mountains in the south and west to the Asiatic boundary on the east. Its mountains form several complicated groups belonging to different geological ages, and occupy largely the southern and western portions. The most prominent system extends in a curved line from the Strait of Gibraltar along the Mediterranean to Asia Minor, and continues as the Caucasus Mountains between the Black Sea and the Caspian. This system is highest in the center, where the Alps attain a general elevation of about 12,000 feet, though Mont Blanc is 15,787 feet above sea level and forms the highest peak in Europe. However, Jungfrau, Matterhorn, and Monte Rose are but little inferior in height. Communication between the

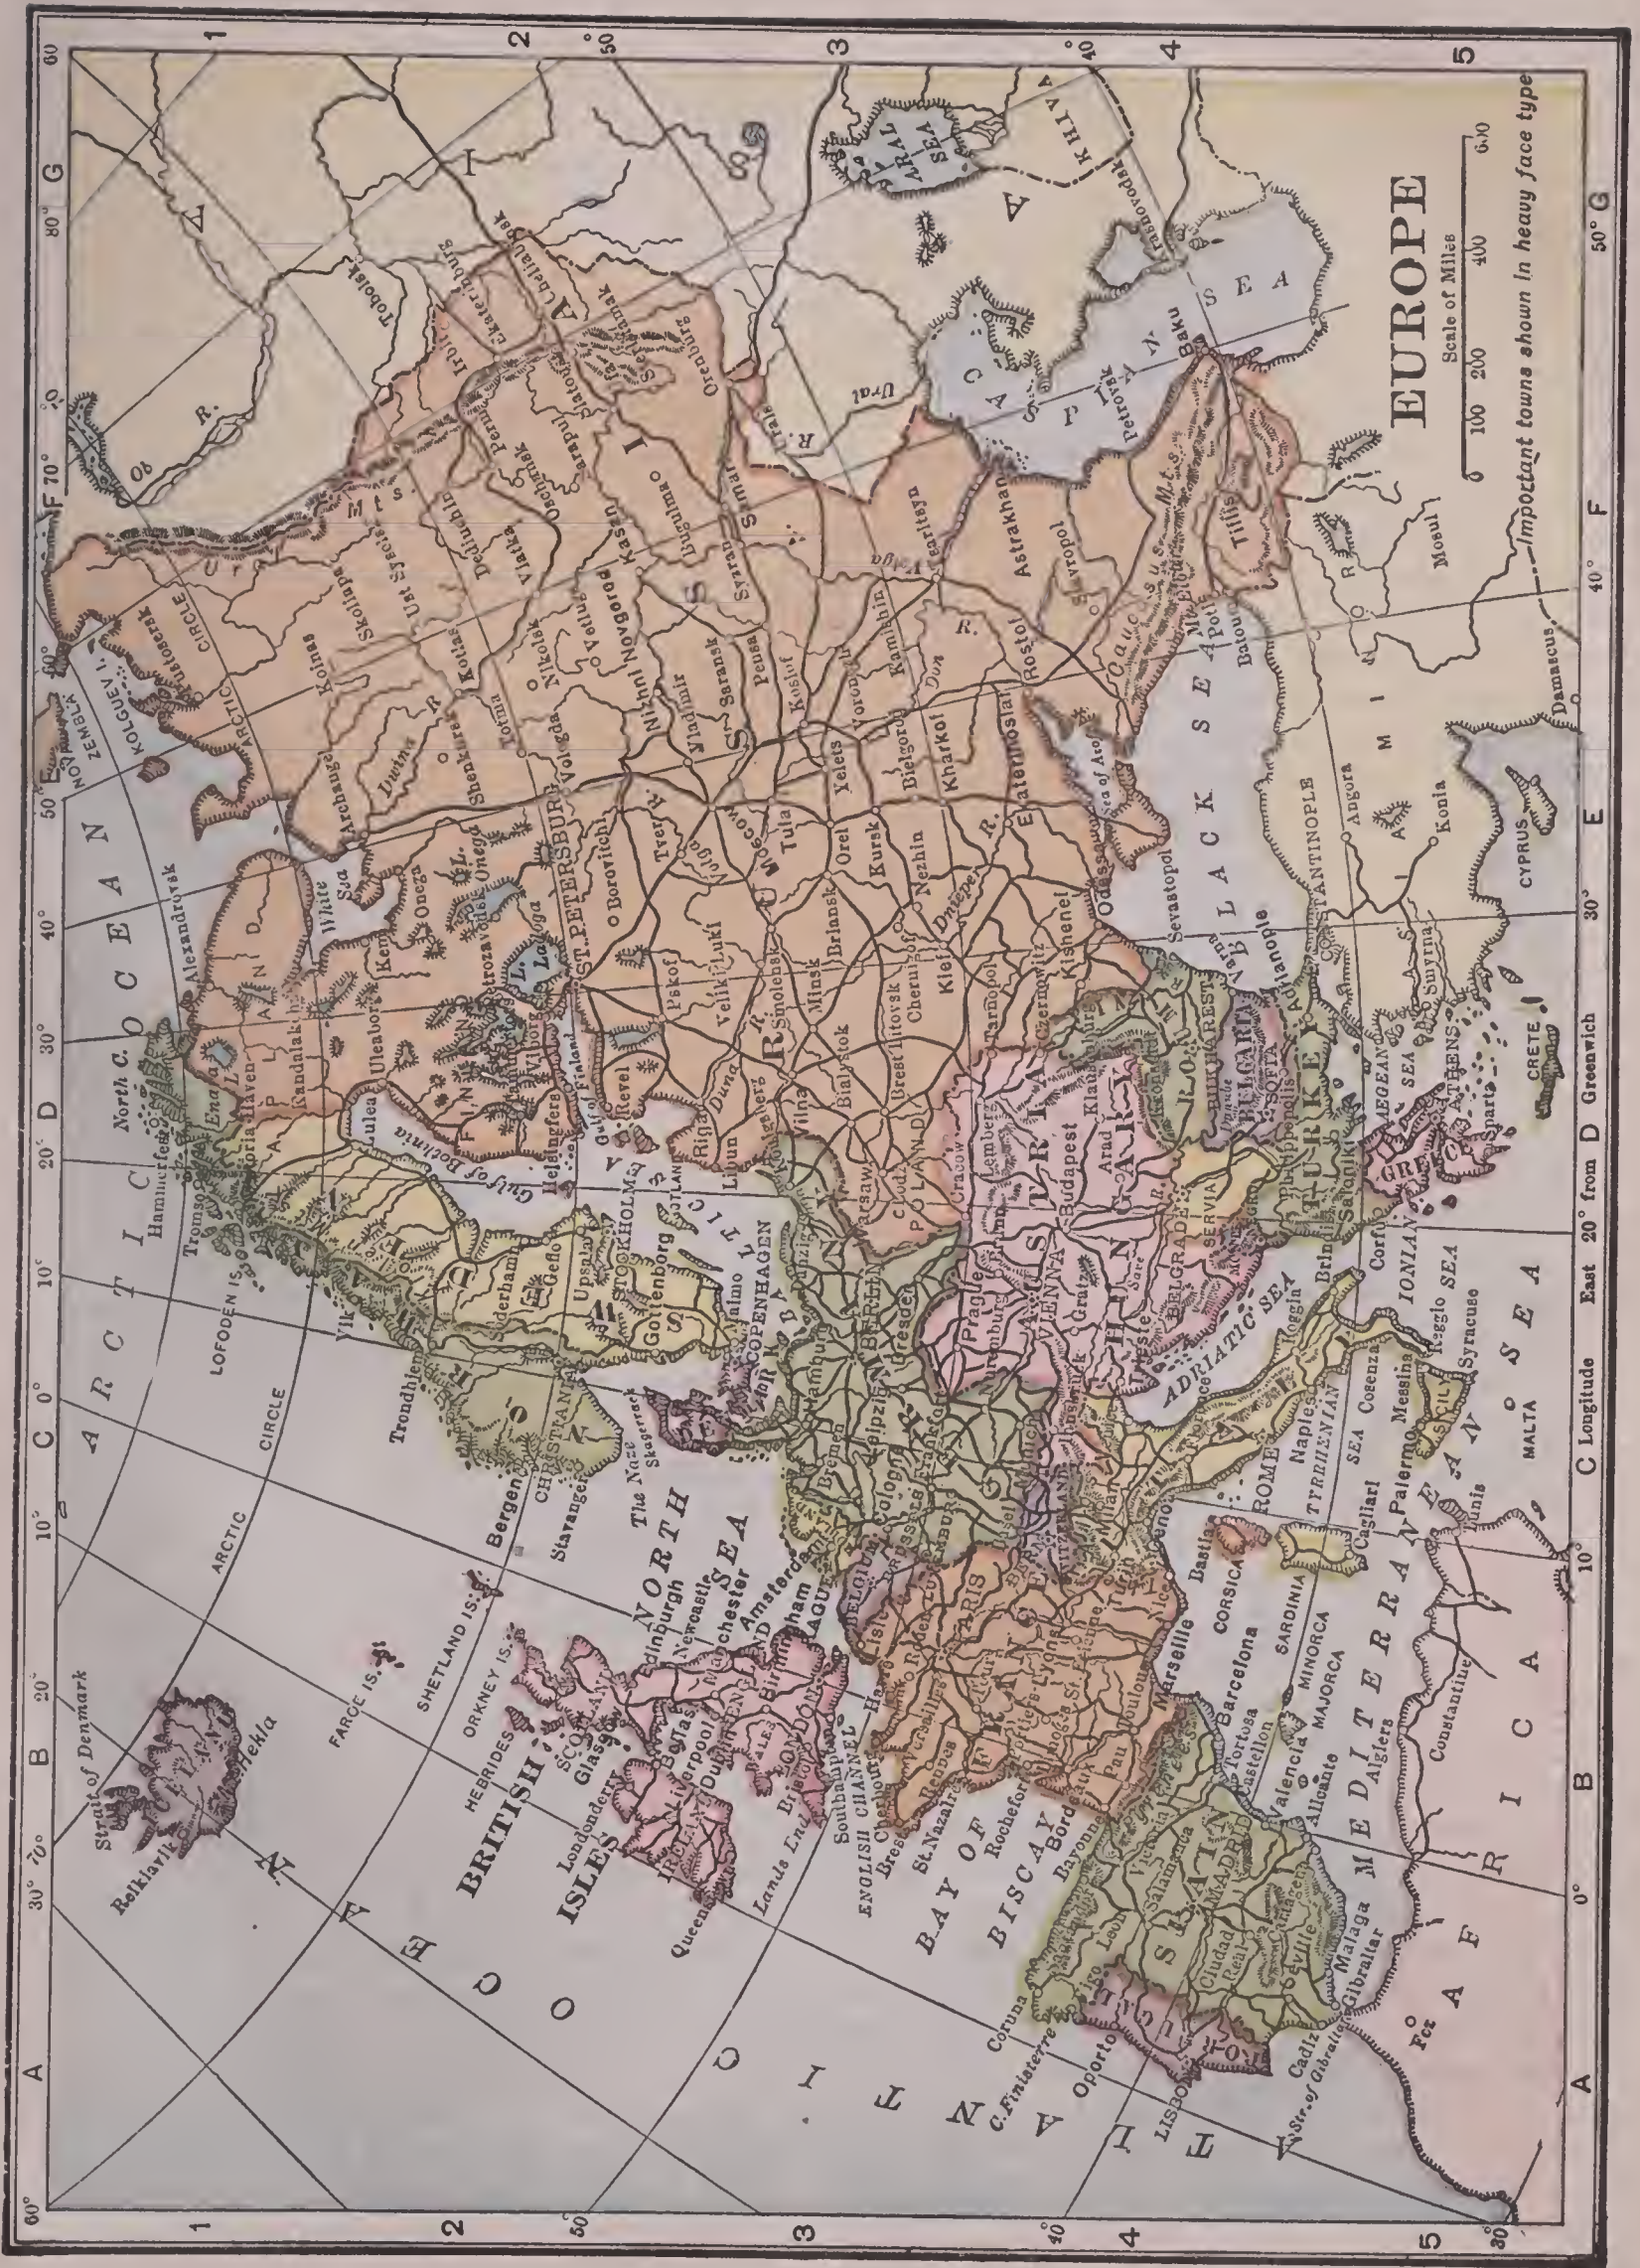

north and the south through these mountains is made possible by a number of famous railway tunnels, which include the Simplon, Mount Cenis, and Saint Gothard tunnels.

Several ranges extend from the central group, among them the Cevennes and adjoining ranges in France and the Cantabrian and Pyrenees in Spain, the latter containing peaks over 11,000 feet high. The system extends eastward in two curves to the Black Sea by the Transylvanian and Carpathian, which trend north of the Balkans and Dinaric Alps. North of the Alps are the ranges lying between the valleys of the Upper Danube and the Oder, and the different chains extending through Austria-Hungary. The mountains in the Scandinavian peninsula extend from the southern point of Norway to the Arctic Ocean, a distance of about 900 miles, the highest summit being about 8,000 feet. These ranges include the Kjölen and several broad plateaus that descend abruptly into numerous deep-cut valleys called *fjords*, and which are penetrated by the sea almost to the heart of the plateaus. The Ural Mountains extend along the boundary between Europe and Asia, in the north, and some distance to the west of the boundary in the center, trending on a line almost parallel to the meridians, and terminate in a plain north of the Caspian Sea.

**RIVERS.** Most of the rivers flow in a southeasterly direction, and have their source either in the great central plain or in the mountains of the central west. The four largest rivers rising in the Alps are the Danube, Rhine, Po, and Rhone. Of these the Po flows into the Adriatic; the Danube, into the Black Sea; the Rhine, into the North Sea; and the Rhone, into the Mediterranean. These four rivers have large deltas. The central plain is drained toward the northwest by the Dwina and Petchora into the Arctic; by the Oder, Vistula, Duna, and Nieman into the Baltic; and by the Rhine, Weser, and Elbe into the North Sea. Toward the south and east it is drained by the Dnieper, Don, and Dniester into the Black Sea and the Sea of Azov, and by the Ural and Volga into the inland basin of the Caspian. Numerous rivers are found in all the peninsulas, the most important of these being the Tagus, Douro, and Gaudiana in Spain and Portugal; the Po in Italy; the Loire, Seine, and Garonne in France; the Ebro and Guadalquivir in Spain; and the Glommen in the Scandinavian peninsula.

In the northern part of Europe the lakes are frozen the greater part of the year, especially lakes Onega and Ladoga, in Russia, and Stor Lake, in Sweden, but the lakes of the south, though small, are important for their fisheries

and as a basis for inland commerce. The most important of these are located near the Alps. Those south of the Alps include lakes Iseo, Como, Maggiore, Garda, and Lugano; those on the north include lakes Thun, Geneva, Zurich, Lucerne, Neuchâtel, and Constance.

**CLIMATE.** The climate of Europe is peculiarly genial, though it is marked by periods of extreme cold in the north. The shores are exposed to the warm winds and warm oceanic currents from the southwest, by which the temperature is moderated and rendered favorable to the development of plant and animal life. As we proceed east the extremes of temperature become greater, the summer being hotter and the winter having greater cold. The most favorable effects of the oceanic currents are those experienced on the British Isles and the Scandinavian peninsula, in fact these otherwise would be almost uninhabitable. Northern Russia and the extreme north of the Scandinavian peninsula lie partly within the Arctic zone, and correspond in temperature to the extreme northern parts of North America.

As a whole, the climate of Europe is less severe in the western than in the eastern part, since the mean temperature is not perceptibly affected by the sea in the interior. At Sartov, in eastern Russia, the mean temperature is  $41^{\circ}$ ; at Warsaw,  $45^{\circ}$ ; at Berlin,  $48^{\circ}$ ; and at Greenwich  $49^{\circ}$ . All parts of the grand division have an abundance of rainfall, but in some places it does not occur at the time of the growing season. This is true of Spain, where irrigation is resorted to in agriculture. However, rainfall is most abundant on the western coast and decreases toward the east in proportion of the increase of distance from the Atlantic.

**MINERALS.** Europe is rich in the useful minerals and many of these have been worked from times immemorial. Carboniferous coal deposits are abundant between the parallels of  $40^{\circ}$  and  $60^{\circ}$  north. They are worked with a high degree of efficiency in Great Britain, Germany, France, Belgium, and Austria-Hungary. Iron ore is found in the same or adjoining fields. The output of iron is especially important in Spain, Germany, and Great Britain. Sweden has large deposits of superior steel-making ores, hence the products of this country are shipped very extensively. Nearly all of the world's supply of platinum is obtained from Russia, while sulphur is secured in large quantities from Sicily and Italy. In the production of gold in the world, Russia takes fourth rank, while Germany ranks fourth in the output of silver, and Spain and Portugal are exceeded only by the United States in the production of

copper. Fine grades of marble are obtained in Italy, and granite, limestone, and other building materials are abundant in widely separated regions. Other mineral products obtained largely include petroleum, tin, quicksilver, and lead.

**VEGETATION.** The great range of temperature makes Europe suitable for many species of plants. In the north, which extends beyond the Arctic Circle, the continent assumes the aspect of the tundra, where vegetation is very scant or entirely absent. Here thrive the saxifrage, crow-foot, poppy, scurvy-grass, and other forms common to the Arctic region. Forests of considerable value extend almost to Cape North, where the birch predominates, and farther south are fine forests of fir. The northern part of Russia and the Scandinavian peninsula do not yield cereals, but barley can be grown as far north as  $70^{\circ}$  north latitude and wheat thrives at about  $60^{\circ}$ . As we proceed south from this locality, we come in contact with fine forests of oak and beech and enter sections where all classes of cereals thrive.

Rye is grown extensively in many parts of Europe, while maize, oats, and barley yield abundantly. Rice is cultivated in some parts of Spain and Italy. Much attention is given to the culture of the mulberry in the vicinity of the Mediterranean. Many varieties of fruits thrive in the southern portion, such as lemons, oranges, vines, olives, almonds, and peaches, while the hardier varieties are cultivated extensively far into the north. The steppes of Russia are very similar to the great prairies of North America and extend as treeless plains from the borders of Holland to the Ural Mountains. They are especially rich in grasses and have been converted into a productive field for agriculture.

**ANIMALS.** Formerly the continent was peculiarly rich in wild animal life, but it is now quite rare, except in the northern part and in regions under government protection. Polar bears and reindeer are numerous in the north, while wolves, foxes, bears, and lynxes infest the forests and mountains. Other species more or less widely distributed include the roebuck, ibex, porcupine, stag, and fallow deer. The fisheries are valuable, especially those bearing the cod, anchovy, salmon, mackerel, herring, and tunny. Much interest is vested in the rearing of domestic animals, hence the grades are superior from careful breeding. They are very similar in all sections of the grand division, except in the extreme north, where dogs and reindeer are used as animals of draft.

**INHABITANTS.** The people of Europe belong to various races and are greatly intermingled in

most of the states. At an early period the Celts occupied the region from the Alps to the British Isles, but they were driven westward by successive waves of migration under the Roman conquests and the insurrections of the Germanic tribes until they were pressed largely to the extreme west, or were assimilated by the most powerful divisions of the Germanic people. The Celtic language is represented at present only by the Gaelic in the islands of Scotland, the Irish in portions of Ireland, the Cymric in Wales, and the Armorican in Brittany. Next eastward we find the Teutonic races, comprising the Germanic and Scandinavian divisions. In the former the Germans, Dutch, and English are included, while the latter comprise the Danes, Norwegians, and Swedes. Farther east the Slavonians are mixed with the Teutons to a greater or less extent. The different branches comprise the Russians, Poles, Bohemians, Czechs, Servians, Croatians, and other minor branches. The Greek and

the non-Aryan, by about 18,000,000. Each of the languages has numerous dialects, though the number of distinct forms of tongues is about fifty.

The Christian religion prevails almost exclusively, the only exceptions being the Jewish in widely distributed but minor communities and the Mohammedan in Turkey. In the western part of the grand division various sects of the Protestant and Roman Catholic religion prevail, while the Greek Catholic is the predominating religion of Greece and Russia. Europe holds an important place in the field of education, but the advancement in educational lines has its greatest development in the Protestant nations of the western part, especially in Germany, England, and the Scandinavian Peninsula, where illiteracy has been reduced to a minimum. However, great universities are maintained in France, Austria-Hungary, Italy, and Russia, and the educational uplift in all the countries is marked.

**POLITICAL DIVISIONS.** The countries of Europe as at present organized are governed wholly as independent states, and all of the more powerful nations have extended their political influence by the acquisition and control of territory in other grand divisions. All of them are monarchies, except Andorra, France, and Switzerland, which have republican governments. The alphabetical list of European states is as follows: Andorra, Austria-Hungary, Belgium, Bulgaria, Denmark, France, Germany, Great Britain, Greece, Italy, Liechtenstein, Luxemburg, Monaco, Montenegro, Norway, Portugal, Rumania, Russia, Servia, Spain, Sweden, Switzerland, The Netherlands, and Turkey.

**HISTORY.** According to some writers, Europe was named from Europa, a mythical person of Greece, who was carried off by Jupiter, though other authorities attribute its origin to the Phoenician traders, who applied it to the land of sunset, from the word *Erebh*, meaning darkness.

It is quite certain that Europe was first peopled by successive waves of migration that moved westward from Asia, each pressing the weaker farther and farther westward toward the Atlantic Ocean. The date of these great movements is unknown, though their occurrence is evidenced clearly by the present and past settlements in the European countries. Writers generally agree that authentic history dates in Greece from about 776 B. C. All the earlier periods are estimated from circumstantial evidence. The most successful epoch of Greece is assigned to about 430 B. C., and this date marks approximately the time when all

GERMANIC.

ROMANIC.

Latin people occupy the south and southwestern parts of Europe. Among the Latin, or Roman, races are the French, Spanish, Portuguese, and Italians. All the peoples named above are of the Aryan or Indo-European family.

The Mongolian race is represented in Europe by the Turks, Magyars, Lapps, and Finns, all these having emigrated into Europe within comparatively recent times and secured a foothold by successive conquests or friendly terms of settlement. Another class comprises the Basques, who are thought to belong to the Turanians. Owing to the great mixture of the population it is difficult to classify them on a racial basis; the better way is, perhaps, to base the classification upon languages. By this test it is found that the Teutonic language is spoken by 125,000,000; the Slavonian, by 110,000,000; the Roman, by 114,000,000; the Letts and Lithuanian, by 3,000,000; Armenian, by 1,150,000; Greek and Albanian, by 5,450,000; Celtic, by 3,600,000; and

colonies pressed westward. Grecian education moved westward to Rome and made it the predominating influence for many centuries. Greece was conquered by Rome in 146 A. D., and the latter soon made itself master of Spain, Gaul, Helvetia, Illyria, Dacia, and portions of Germany and Brittany. Roman extension carried superior laws, greater industrial activities, and social advancement to the regions conquered, and by its theory of government provided favorable conditions for the spread of Christianity. The northern nations migrated extensively shortly after the Roman Empire began to decline, and paved the way for great commercial and educational activities in the northwest. These movements were accompanied by the settlement of the Anglo-Saxons in England, the Franks in France, the Lombards and Ostrogoths in Italy, and the Visigoths in Spain, who by superior arts rendered the original inhabitants subject to their institutions or became assimilated with them.

A great Germanic empire was established under Charlemagne in 771. After the decline of the Holy Roman Empire, as the German nation came to be called, the territory was organized into the kingdoms of Germany, France, Burgundy, Italy, Lorraine, and Navarre. These movements were followed shortly by the populations of Eastern Europe establishing themselves in regions now more or less influenced by their occupation. The most prominent movements among them were directed toward establishing kingdoms in the north of Germany, Bohemia, Russia, and Poland, while the Magyars invaded Hungary and the Normans established principalities and governments in France, England, and various regions of the southeast.

The Christian Crusades, organized to rescue Jerusalem from the Mohammedans, exercised a wide influence on the habits and learning of the western peoples, while the Turkish conquest of Constantinople, in 1453, distributed the Greek teachers and philosophers throughout Western Europe. This caused a great impetus in the revival of learning, led to the invention of printing, and ultimately resulted in the Reformation. Spain became the most powerful nation shortly after the discovery of America. France soon after rose to a high plane of influence and the territories of Prussia and Russia were greatly enlarged and the sphere of their power was widened. A vast emigration to America greatly affected all the countries that had become over-populated and was the indirect cause of several extended wars. These conflicts were followed by the French Revolution, the Napoleonic wars, the dissolution of the

German Empire, and the colonial development of several nations.

Among the more recent events in European history may be enumerated the independence of Greece; the absorption of Poland by several states; the unification of Italy; the consolidation of Germany into an empire; the establishment of the French Republic, as a result of the Franco-German War; the curtailing of Turkish influence by the independence of Bulgaria, Rumania, Servia, and Montenegro; and the War of 1897 between Greece and Turkey. The Anglo-Boer War (1899) strengthened the foothold of Great Britain in South Africa, the Russo-Japanese War (1904) deprived Russia of its preponderance of influence in the East, and the dissolution of the union between Sweden and Norway (1905) restored the independence of Norway among the nations.

**EUSTACHIAN TUBE** (û-stā'kī-ān), in anatomy, the canal extending from the pharynx to the middle ear. Its function is to equalize the pressure of the air on either side of the tympanic membrane. In birds, reptiles, and mammals it is closely connected with the auditory organs. Diseases of the Eustachian tube impair the hearing.

**EUTAW SPRINGS** (ū'tā), **Battle of**, an engagement of the American Revolution, fought about sixty miles northwest of Charleston, S. C., on Sept. 8, 1781. General Greene commanded the American forces of 2,000 men, while the British under General Stuart numbered 2,300. The former made an attack at four o'clock in the morning and were victorious, but the British rallied and held their position until night, when they withdrew to Charleston. The Americans lost 554 and the British lost about 800. Though a tactical defeat for the Americans, it proved a strategic victory in that the British were shut up in Charleston.

**EUTERPE** (eu-ter'pe), in mythology, one of the nine Muses, the inspirer of delight. She presided over lyric poetry and played on the flute, of which she was the inventor. In sculpture she is usually represented as a virgin crowned with flowers, holding a flute or some other musical instrument in her hand.

**EVANGELICAL ALLIANCE** (ē-vān-jěl'ī-kāł āl-lī'āns), an association of Christians of various denominations. The first effort to form such an organization was made at London, England, in 1846, when a meeting was held by representatives of a large number of Protestant churches. About 800 persons were in attendance, representing the Baptists, Lutherans, Methodists, Presbyterians, Episcopalians, Moravians, and a number of other denominations.

Among the countries represented were England, France, Germany, Ireland, Switzerland, and the United States. A branch was organized in America in 1867, and this is well represented in Canada and the United States. General conferences in the form of Protestant ecumenical councils represent officially the whole Alliance, but influence is exercised only to promote moral and spiritual lines of action. The purpose is to unify the Protestant missionary work, to cooperate along lines of Christian work without interference of denominational barriers, and to extend religious liberty in all parts of the world. This association has accomplished much good in obtaining reform and greater religious liberty in Japan, Russia, and Turkey.

**EVANGELICAL ASSOCIATION** (äs-sō-sī-ā'shūn), a religious denomination founded by Jacob Albright in Pennsylvania in 1807. He was a member of the Methodist Episcopal Church and traveled as an evangelist in the large German settlements of his native State, and carried on a line of effective work in promoting a higher religious life. The book of discipline does not differ in essential points from that of the Methodist Episcopal Church, which it resembles in polity, government, and methods of worship. In 1891 a division was made on account of a difference of opinion in regard to church government, which resulted in organizing the United Evangelical Church. This branch has about 40,000 members and the Evangelical Association proper has 115,000 communicants. The latter is represented by organizations in Canada, the United States, Germany, Japan, and Switzerland. Originally the members were exclusively German or of German descent, but now a large membership is English-speaking. Many charitable, missionary, and educational societies are maintained. The Young People's Alliance is an auxiliary organization.

**EVANSTON** (ēv'anz-tūn) a city of Illinois, in Cook County, about twelve miles north of Chicago, with which it is connected by surface and elevated electric street railways. It is on the Chicago and Northwestern and the Chicago, Milwaukee and Saint Paul railroads. The site is on a beautiful plat of ground on the margin of Lake Michigan. It is the seat of the Northwestern University, the Norwegian-Danish Theological School, the Garrett Biblical Institute, and the Visitation Academy. The streets are finely paved and lighted by electricity. Evanston was the home of Frances Willard. It was settled in 1835 and incorporated in 1890. Population, 1900, 19,259.

**EVANSTON**, a city of Wyoming, county seat of Uinta County, in the southwestern part of the State. It is located on the Bear River and the Union Pacific Railroad, and is surrounded by an agricultural and coal-mining district. The manufactures include flour and machinery. Mineral oil and building stone are obtained in the vicinity. It is the seat of the State institution for the insane and has a number of fine schools. Population, 1905, 2,741.

**EVANSVILLE** (ēv'anz-vīl), a city of Indiana, county seat of Vanderburgh County, on the Ohio River, about 160 miles northeast of Saint Louis. It is on the Louisville and Nashville, the Illinois Central, the Southern, and other railroads, and has communication by regular lines of steamboats. Productive coal fields are worked in the vicinity. It has a large shipping trade in coal, timber, brick and tile, flour, pork, grain, and tobacco. Among the manufactories are flouring mills, iron foundries, furniture factories, cotton mills, sawmills, breweries, and machine shops.

Evansville has regularly platted and well-improved streets. Much of the paving is of brick, stone, and asphalt. The chief buildings include the county courthouse, the Federal building, the city hall, and the Willard Library. It has a marine hospital, an insane asylum, and a fine high school. Cooks and Garvin parks are well-kept public resorts. Evansville was founded in 1816 and so named from Gen. Robert M. Evans. It was incorporated in 1847. Population, 1900, 59,007; in 1910, 69,647.

**EVAPORATION** (ē-vāp-ō-rā'shūn), the conversion of a liquid or solid by heat into vapor. Some solids, such as arsenic and camphor, pass into a state of vapor and are said to be sublimated. The rapidity at which evaporation proceeds depends upon the extent of surface exposed, for the reason that it takes place at the surface; the quantity of the same vapor already present in the air, because when the air is saturated no more of the liquid can evaporate; on the removal of the air, because evaporation ceases when the air over the liquid is saturated; on the temperature, because warm air can hold more vapor than cold air; and on the pressure on the surface, since diminished atmospheric pressure increases the rapidity of evaporation. From every water surface and even from masses of ice and snow there is constantly arising, at all temperatures, an invisible vapor. A volatile liquid, when placed in a vacuum, rapidly evaporizes without external heat. If a drop of such liquid be passed into the empty space above the mercury of a thermometer tube, it disappears by changing into vapor. When

the vapor more than fills the vacuum, the mercury is depressed, thus showing that it possesses tension. If more liquid be passed into the tube, it reaches a point when no more can be evaporated, but simply floats on the surface of the mercury. The vapor is then at its greatest tension and the space it occupies is said to be saturated.

The pressure remaining the same, there is for every liquid a certain temperature at which it boils. After it boils, all the heat it receives is rendered latent, and it can never be raised above that temperature while its vapor is allowed to escape. When vapor loses heat and condenses, the latent heat again appears as sensible heat. Thus, large buildings are heated by steam being passed through pipes, and, as it condenses, these pipes give out its latent heat. We are cooled by fanning because the warm air, thus brought in contact with the skin, causes a rapid evaporation of the moisture of the skin, thereby lowering the temperature. If water be placed in a vacuum space and the vapor which escapes from it be removed as rapidly as it forms, it is frozen by its own evaporation. Various machines used in manufacturing ice utilize this principle. The moisture taken up by the atmosphere in the form of vapor rises to considerable heights, forms clouds by partial condensation, and descends in rain when the point of saturation is reached.

**EVELETH** (ěv'ě-lěth), a city of Minnesota, in Saint Louis County, seventy miles northwest of Duluth, on the Duluth and Iron Range and the Duluth, Missabe and Northern railroads. It is surrounded by an iron-mining district. The chief buildings include a number of schools and churches. It has a large trade in merchandise and produce, and is important on account of the enterprises connected with the iron industry. Population, 1905, 5,332.

**EVENING SCHOOLS**, a class of schools established in many countries, generally in large cities, as a part of the public school system. The purpose is to give to those of school age, who cannot avail themselves of the advantages of the day school, an opportunity to obtain an elementary education and to enable adults, who have finished the course of instruction in the public day school, to acquire additional knowledge, especially on subjects relating to their particular occupation or profession. Schools of this class are now maintained in Austria, France, Germany, Great Britain, Switzerland, and other countries of Europe. In some countries they are supported at the expense of the state and are attended by both sexes, and the purpose is to furnish educational facilities for

children employed in factories. Schools for the education of the children belonging to the industrial classes were formerly open on Sunday and evening schools more recently succeeded the Sunday schools, though in some countries the two are combined.

The evening schools of America may be said to date from 1850, when they were made an adjunct to the educational system in many large cities. They have been particularly proficient in teaching the English language to foreigners, and for that purpose many employ teachers who speak the language of the students. However, the main purpose is to teach the common school branches and to give instruction in commercial lines. The Drexel Institute of Philadelphia and Cooper Union of New York City are among the noted institutions that maintain evening classes for general and special instruction. Experience has demonstrated that evening schools constitute an essential part of every common school system, particularly in large communities, in which many children are obliged to leave the day school before they acquire the rudiments of an education. The office of technical schools, while different, is no less important, since an increase of skilled labor in any community is one of the most valuable elements of its wealth and prosperity.

**EVEREST** (ěv'ěr-ěst), **Mount**, the highest mountain peak in the world, situated in Nepal, Asia, among the great peaks of the Himalayas. Its height is 29,002 feet above sea level. The name was applied in honor of Sir John Everest (1790-1866), who was surveyor general of India.

**EVERETT**, a city of Massachusetts, in Middlesex County, in the extreme eastern part of the State. It is on the Boston and Maine Railroad and a number of electric interurban lines. The noteworthy buildings include the Whidden Memorial Hospital, the Parlin and Shute libraries, and the high school. It has systems of sewerage and waterworks, graded and paved streets, and a large trade in produce. The manufactures include bicycles, chemicals, baby carriages, furniture, hardware, and gloves. The surrounding country is agricultural. It was settled in 1643 and became a city in 1892. Population, 1905, 29,111; in 1910, 33,484.

**EVERETT**, a city of Washington, county seat of Snohomish County, on Puget Sound, about 35 miles north of Seattle. It is on the Northern Pacific, the Great Northern, and other railroads, and has a fine harbor. The customhouse, the public library, the high school, the county courthouse, and the theater are the chief buildings. It has extensive shipyards, railroad

shops, flouring mills, machine shops, and smelting mills. The public utilities include electric lights, sewerage, waterworks, and paving. It was settled in 1891 and incorporated in 1893. In recent years it has had a rapid growth in wealth and commerce. Population, 1900, 7,838; in 1910, 24,298.

**EVERGLADES** (ěv'ěr-glāds), a tract of swampy land in the southern part of Florida, 150 miles long and 50 miles wide. It includes numerous marshy islets covered with dense thickets and groves of pines and palmettoes. Many shallow streams and lakes characterize the region. Formerly it was infested by vast numbers of alligators. The Everglades were made historical by the Seminole Indian War, in which the chief, Osceola, took a prominent part against Gen. Andrew Jackson.

**EVERGREEN**, the trees and shrubs which retain their verdure through all seasons, as the fir, laurel, cedar, holly, cypress, juniper, etc. Evergreens usually shed their leaves in the spring, after their successors have reached a state of development, but in some instances a set of leaves lasts several years. The leaves are generally of thicker and firmer texture than those of deciduous trees, and the undiminished thickness of the foliage, characteristic of the northern scenery both in summer and winter, affords exceptional winter shelter for animals. Evergreens form very popular ornamental shade trees, and their boughs are used on festive occasions for decorative purposes.

**EVERLASTING FLOWER**, the popular name of various flowering plants, the bloom of which may be kept many years without a material diminution of beauty. They include the amarath, some species of cudweed, and a number of others. See *Immortelles*.

**EVIDENCE** (ěv'ĩ-děns), in law, that which tends to prove or disprove any matter in question. It differs from the proofs by which human judgment is ordinarily determined in non-judicial matters, chiefly in certain rules established for the sake of felicity in disposing of complicated questions of fact, or of public policy, when by lapse of time or other causes there would be a deficiency of evidence. The rules under which evidence is admitted differ more or less, though in general they have many points in common, and for convenience are reduced under four heads, as follows: 1. Cases in which evidence is excluded on the ground of being untrustworthy and tending to show by its very nature that it likely is untrue. 2. Cases in which a rule is prescribed for the purpose of getting at a certain conclusion, though arbitrarily, when the subject is intrinsically liable to doubt from

the remoteness, discrepancy, or actual defect of proofs. 3. Cases in which a legal presumption is substituted for actual proof, or in place of what could be proved, being supposed to be more consistent with the real rights of the parties than any result which could be expected from positive testimony. 4. The graduation of the weight of evidence, which will be found in some instances to be arbitrary in its origin, and, perhaps, not altogether in accordance with the ordinary process of judgment.

Evidence is usually studied under four heads: oral or documentary, direct or circumstantial, primary or secondary, and prima facie or conclusive. *Oral evidence* consists of statements made under oath by witnesses in court, while *documentary evidence* includes proofs in writing, which are submitted to the court or jury for inspection. *Direct evidence* is proof in itself of the existence of a fact, while *circumstantial evidence* is indirect, tending to show by circumstances that the fact sought to be established has existence. *Primary evidence* proves a fact by the best evidence obtainable, while *secondary evidence* is admissible only when primary evidence cannot be shown. For instance, when a case hinges upon a written contract, the agreement in writing must be produced if possible, but, if it is shown that it cannot be procured as evidence, then its existence may be proven by a copy or by oral testimony. *Prima facie evidence* is such as the law declares, or in fact appears, to be sufficient proof, while *conclusive evidence* establishes a fact and renders inadmissible any evidence to contradict it. While the rules governing evidence are very extensive, the essence of this branch of the law hinges upon what can be proved, rather than what is true.

**EVOLUTION** (ěv-ō-lū'shŭn), in biology and geology, the steps by which organic and inorganic matter came to exist in their present forms. It is evident to every inquiring mind that times come when both the infantile and philosophic are led to ponder the question of the origin of things. In attempting to answer man has constructed a cosmogony which seeks to give an account of the origin of the universe. There are three classes of cosmogonies that merit thought. These represent that the world has existed in its present form from eternity; that the matter, but not the form, of the world existed from eternity; and that the matter and form of the world are due to a spiritual cause. The last two are termed evolution and creation, respectively. Evolution seeks to trace the growth of the world and the expansion of life forms from cause to effect, while creation dis-

poses of the whole matter by attributing all laws of the universe, of life and being, to a divine godhead.

The very nature of the universe, with its varied changes through long periods of time, renders philosophies attempting to account for the laws that underlie cause and effect incapable of being grasped by even the highest effort of the intellect, and they are contradicted by various other philosophies and by the evidence of experience. The study of natural sciences has thrown light upon various questions relative to astronomical, geological, and biological phenomena. Through it have been fathomed many questions formerly incomprehensible, but there always remain conditions that point to a first cause which the most powerful intellect cannot comprehend. The theory of evolution involves a hypothesis which precludes a sudden and unexplained bursting forth of worlds and abrupt formations of physical laws to hold them in space, a miraculous springing up of life forms to inhabit and utilize nature's forces, but aims to account for all phenomena by natural laws, as the consequence of positive forces that operate under the will of a creator, or assume forms and undergo changes as the natural result of fitness. As a theory it superseded the crude anthropomorphisms that did not recognize the growth of the universe as the unfolding of a cosmic drama, as a development under laws that bear scientific scrutiny.

In former times it was held that the universe is permanent and at rest, having neither motion nor sensible change. The static views of ancient astronomers gave way to those of Kepler, Copernicus, Galileo, Herschel, and Newton, by which a conception of the kinetic forces was recognized and the nebular hypothesis was established, which assumes to explain the commencement and motion of the planets and the sun by gradual condensation from a nebulous mist that occupied space. Geology led to a study of the earth's crust and to the belief that our sphere was once a globe of fire, which gradually contracted by cooling and caused the formation of an outer crust. The condensation of atmospheric waters gave rise to the oceans, which finally became confined to definite regions and left large tracts of projecting lands, and after successive ages rivers and mountains were formed.

That life existed during at least a large portion of the time required to form the earth's crust is demonstrated by fossil remains of animals and plants, which abound in many of the aqueous and metamorphic rocks. These rocks bear evidence that the lowest forms of life ap-

peared first, and the higher gradually succeeded them and in many cases caused the disappearance of the earlier forms. The earlier animals were the protozoa, and after them, as if from evolution, came successively the radiates, articulates, mollusks, and finally the vertebrates. The earlier mollusks were followed by fishes, then came reptiles, later amphibious animals, and lastly mammals and man.

As a whole the fossil remains indicate that early life forms were general in character and gradually developed into the special; or, in other words, the evolution proceeded from the general to the particular, from the homogeneous to the heterogeneous. The changes were not abrupt, but proceeded gradually, one distinct form existing long periods of time after another had come into life. It is evident that the reptiles succeeded the fishes, though both existed afterward contemporaneously, and the reptiles were succeeded in a similar manner by birds. In this way the different forms of animals passed into each other by slight changes, though these effected very various results after long periods of time. In the process of evolution, rudimentary or useless organs gave way, and later became either entirely lost or existed only as an evidence of the changes that had previously occurred. To illustrate, the fins of a fish were small organs, though afterward they became modified as the wings of a bird, and later the paws of a dog, and still later the arms of a man. In the life forms still existing there are evidences of rudimentary organs, such as teeth rarely found in some birds, and hind legs concealed under the skin in some species of snakes.

All that is true of animal life in the process of evolution is true of plant life. The lower forms which prevailed at first gradually extended into other species, and after successive changes multiplied into thousands of forms that exist at present. Besides, it must be borne in mind that there are fully as many extinct forms of plant as of animal life, the extinct species having been crowded out by others more nearly fitted to exist under the changed conditions of climate, and doubtless possessing greater ability to battle for place. In connection with this phenomenon may be mentioned the evolution of mind from the uncultured and crude to the alert, scrutinizing, and moral. In society mind has undergone a long line of evolution, by means of which it has acquired useful arts and has developed a higher life and a more complete civilization.

Among recent writers on the theory of evolution are Huxley, Haeckel, Darwin, and Spen-

cer. Huxley speaks of evolution as the system that "embraces in one stupendous analogy the growth of a solar system from molecular chaos, the shaping of the earth from the nebulous cubhood of its youth, through innumerable changes, and development of a living being from the shapeless mass of protoplasm we term a germ." Spencer attributes all the changes of nature to three agencies—force, matter, and motion—while Haeckel traces both the vegetable and animal kingdoms to one very low form of life, consisting of a cell, and supposes this cell to be produced by or from inorganic matter by spontaneous generation. This he asserts to be possible for the reason that some forms of animal and vegetable life are so nearly similar that it is difficult to classify them. Darwin in his "Origin of Species" intimates his belief that life may have been originally breathed by the Creator into a few forms or into one, and that the others sprang from them in successive stages. See **Darwinism**.

**EXCHANGE** (ěks-chānj'), the division of economics which treats of the interchange of articles of value, as in commerce, or the transfer of commodities between different parties. The conditions peculiar to life confine the sphere of human activity largely to a particular place, while human wants are satisfied only by the productions from many different regions. From this localization of the efforts of man and the vast extent of his needs comes the necessity of transportation and trade. To be equitable, the exchange must be mutual and voluntary between two or more parties, and the right of property must exist. These are primary conditions, since transfer without a consideration is a gift, involuntary relinquishment is robbery, and no exchange can be effected unless the parties interested possess a right to the property exchanged.

The general law of exchange requires that value be given for value. In this connection the term *value* is used in a relative sense. It is defined as the estimate of the sacrifice requisite to come in possession of a desired object, and is sometimes spoken of as the *cost of production*. Hence, prices depend upon the *supply* and *demand* of a given article, or the quantity offered for sale on the one hand and the desire to possess on the other. It is understood that the desire must be more than mere longing, and must be attended by ability to purchase.

To promote exchange is one of the prime objects of government. In order to promote commerce and bring about the most beneficent results, legislation must aim to foster international and domestic trade, provide a wholesome

monetary system, and regulate banking. It must guard against the evils which are likely to result from the monopolistic control of certain avenues of trade and transportation, as well as the limitation of certain lines of production for the purpose of controlling prices.

The term *exchange* is likewise applied to a class of transactions in commerce by which the debts of persons or corporations located in a distant city or country are canceled by a bill of exchange, as a check or draft, without the actual payment of money. This is effected by the payer depositing specie or its equivalent in a bank for the purpose of forming a basis whereby the checks or drafts issued can be redeemed. The greatest volume, both of domestic and foreign business, is transacted by this system of exchange.

**EXCISE** (ěk-sīz'), a tax levied upon commodities produced at home, as distinguished from customs or duties on imports. It is used generally in Great Britain to describe the system known as internal revenue in the United States. The excise system of England dates from 1643, when the Long Parliament levied duties to support the army against Charles I. After the restoration of the monarchy, it was continued, and subsequently it became widespread and oppressive. Sir Robert Peel headed a movement to repeal a number of the excise tax laws, and many of these duties were reduced or abolished after 1844. Excise taxes are levied in many countries upon beer, wine, tobacco, and cigars, such as are provided for by the laws of France, Germany, and the United States.

The first excise law of the United States was advocated by Alexander Hamilton and was adopted after an excited debate in 1790. It levied a tax ranging from nine to twenty-five cents per gallon upon liquors distilled within the country, and a higher rate was charged on imported liquors, but lower rates were established in 1792. Much opposition finally caused the Whisky Insurrection of Pennsylvania in 1794. The excise was abolished in the administration of Thomas Jefferson, but was revived during the War of 1812, when a tax was imposed on sugar, salt, liquors, carriages, and instruments of exchange. These duties were repealed in 1817 and no excise duty was levied until 1862, during the Civil War. This system was finally merged into the internal revenue, which continues to the present time. At the outbreak of the Spanish-American War, in 1898, the tax on tobacco and liquors was doubled and many proprietary articles were made subject to taxation. Subsequently the

excises were reduced and the war tax was discontinued in 1902. See **Tax**.

The excise duties of Canada are levied chiefly on spirits and tobacco, in addition to which the manufacturers of these products pay a nominal license. However, both the duties and the licenses are preferential in favor of those who make the products from commodities produced within the country. The distiller pays a license of \$250; the brewer, \$50; the manufacturers in bond for exportation, \$300; and the manufacturers of cigars and tobacco from Canadian products, \$50, and when cigars and tobacco are made from imported leaf tobacco, \$75. The tax per proof gallon on spirits is \$1.90; on tobacco per pound, \$0.05; on cigars made of domestic tobacco per thousand, \$3; and on malt per gallon, \$0.015.

**EXECUTIVE** (ĕgz-ĕk'ŭ-tĭv), the branch of a nation, state, municipal government, or corporation which controls the administrative functions. All free governments recognize three departments—the executive, legislative, and judicial—and no state can long exist without a distribution of its power and functions. The term *executive* is applied to the chief magistrate, whether he is a governor, president, king, or emperor, and extends more or less to the principal officers in all civil institutions. In the United States the chief executive power is vested in the President, who is assisted by a Cabinet which has advisory functions. The President is by the terms of the Constitution made ex-officio commander in chief of the army and navy of the United States and of the militia of the several states, when engaged in the actual service of the nation. The principal officer of each department of the government may be required to furnish to the President an opinion in writing on questions relative to public interest. With the advice and consent of the Senate, the President is empowered to make treaties and nominate certain civil, military, and naval officers of the United States. Besides the duties especially enumerated in the Constitution, it devolves upon the President to control the subordinate departments whose heads are known as Attorney-General, Postmaster-General, and secretaries of State, Treasury, Interior, War, Navy, Agriculture, and Commerce and Labor. The business of the government is carried on through these departments under the direction of the President, statutes are enforced, and special laws passed by Congress are put in operation.

**EXETER** (ĕks'ĕ-tĕr), a city and river port of Devonshire, England, on the Exe River, about 170 miles southwest of London. The

site is on the summit and slopes of a beautiful ridge rising 150 feet from the bank of the river. It is surrounded by an agricultural country and has many industrial enterprises. The modern utilities include steam and electric railways, stone and asphalt paving, and gas and electric lighting. Though dating from the early history of England, it has been outgrown by many newer cities. Among the manufactures are agricultural implements, machinery, clothing, paper, gloves, and Honiton lace. The buildings of interest include Saint Peter's Cathedral, Saint Michael's Church, Albert Memorial Museum, and the remains of the castle of Rougemont. A canal connects the city with the tideway and provides convenient access for ships and steamers. The city was founded before the invasion of the Romans, was captured by the Danes in 876, and was taken by William the Conqueror in 1068. A new theater building burned on Sept. 5, 1887, at which time 190 lives were lost. Population, 1907, 43,368.

**EXETER COLLEGE**, an educational institution located at Oxford, England, and formerly called Stapledon Hall. It was founded by Walter de Stapledon and received its present name at the request of Edmund Stafford, Bishop of Exeter, who added two fellowships. Exeter College is a department or college of Oxford University.

**EXETER HALL**, an assembly hall with a seating capacity for 5,000 persons, situated on the Strand in London, England. It was completed in 1831 and in 1880 was purchased at \$100,000 for the Young Men's Christian Association. Formerly it was used for religious assemblies of various kinds and for musical concerts. At present it is the headquarters of the local Y. M. C. A. and is let for religious assemblies.

**EXHIBITION** (ĕks-hĭ-bĭsh'ŭn). See **Exposition**.

**EXODUS**, the second book of the Pentateuch and of the Old Testament. It consists of two distinct parts, which include an account of the deliverance of the Israelites from Egypt and a description of the giving of the law. The book begins with the death of Joseph, recounts the oppression of the Hebrews in Egypt, the birth and call of Moses, the deliverance from Egypt, and the way to Sinai. It includes a description of the tabernacle, the wanderings in the desert, and the establishment of the Covenant with Jehovah. Tradition and evidence affirm the Mosaic authorship of the Book of Exodus, but it is questioned by a number of eminent scholars.

**EXOGEN** (ěks'ò-jěn), or **Dicotyledon**, a plant whose stem increases in thickness by successive additions on the outside of what surrounds the central pith. The structure is best seen in the bodies of trees having a central pith, which is surrounded by as many concentric layers as the tree is old in years, and the whole is inclosed by a cylindrical sheath of bark. Rays called medullary radiate from the central pith to the bark. Exogens have two seed leaves, or cotyledons, and are now generally called *dicotyledons*. The leaves, with a few exceptions, are reticulated, while the flower usually has four or five parts. In all these respects exogens differ from endogens. The greater number of the trees in tropical climates and all of those in cold regions are exogens.

**EXPANSION** (ěks-păn'shŭn), in physics, the increase in bulk which a body undergoes in consequence of a change in its temperature, so that it occupies a greater space while the weight remains the same. Heat is the most common cause of expansion. Water in cooling ceases to contract at 39.2° Fahr. and, in lowering its temperature, it expands again until frozen, when the expansion reaches about one-eleventh of its original bulk. Thus water, when at its greatest density, which is at 39.2° Fahr., presents the curious phenomenon of expanding whether heat or cold be applied. Expansion is common to all substances, though gases expand more than liquids, and liquids more than solids. It is due to this force that wagon tires are made somewhat smaller than the wheel. Hence, when heated, they may be slipped on easily, and in cooling contract sufficiently to hold the parts of the wheel securely together. Winds are caused by the air expanding under the heat of the sun, and the phenomenon of oceanic currents is due to the same cause.

**EXPLOSIVES** (ěks-plò'sivs), the substances which may cause an explosion by their sudden combustion or decomposition. The remarkable fact that explosives will not explode in vacuums was discovered early after gunpowder came into use, though the first definite experiments made in this connection were those of Priestly more than a century ago. These experiments were effected by placing gunpowder in vacuums and heating it by concentrating the sun's rays on it with a lens or burning glass. Some writers have expressed the opinion that the discovery of explosives has been, next to that of printing and the application of steam power, the most valuable. It is true that their utility in the arts of peace is very important, as otherwise the vast engineering enterprises of modern times would have been entirely

impossible or required a vast additional expenditure of time and labor.

As a matter of convenience, explosives are classed as explosive mixtures and explosive compounds. *Explosive mixtures* are those that can be separated more or less completely by mechanical means not involving chemical action. In a separate condition the ingredients, as a rule, do not possess explosive properties. *Explosive compounds* are chemical compounds or chemical combinations which possess a definite explosive molecule, and contain both the combustible and the supporter of combustion in a closely united form. Most explosive mixtures require a particular period of time for combustion, while in explosive compounds the action is much more sudden and violent. Among the list of explosives may be classed gunpowder, nitrate mixtures other than gunpowder, chlorate mixtures, compounds containing nitroglycerin, and gun cotton. To these may be added the nitro-substitution compounds, including picric powders, springel explosives, and fulminates. Aside from these are numerous compounds that may be grouped with each of the above classes, all more or less valuable in war, for mining, and for purposes which require the sudden development of a powerful force. Some of the newer explosives that have gone into use are smokeless, or are unaccompanied by a loud report at the time the explosion takes place. However, explosions in these, as in all others, is due to the sudden formation and expansion of gases, owing to chemical agencies acting upon them. See **Gunpowder**.

**EXPOSITION** (ěks-pò-zish'ŭn), a national or international exhibition of the works of art and industry for the purpose of stimulating public interest, promoting manufactures, and expanding trade. The first great industrial exposition of the world was held at Paris in 1798, and its success caused a similar display of French industries to be made in 1802. The effects of these expositions were so widespread and the results so beneficial that many other European and American nations were induced to organize similar enterprises. Great expositions of more or less importance to the industrial arts were held prior to 1850 at Berlin, Vienna, Saint Petersburg, Brussels, Moscow, Stockholm, Dublin, Lisbon, Madrid, Manchester, Philadelphia, New York, and other great centers of population. Among the noteworthy international expositions held since are several that attracted the attention of practically every civilized nation. The first British exhibition of an international character was held at Crystal Palace, London, in 1851. Soon after, in

1853, the United States made its first general effort in this direction at New York. The first universal French exposition was opened in Paris in the Champs Elysées in 1855 and contained exhibits of about 24,000 different persons and interests. A great international exposition was given in Haarlem, Holland, in 1861. The Belgians opened a similar enterprise at Brussels in the same year, and Great Britain followed with an international exhibition in 1862.

The second international exposition of France opened on the Champ de Mars in 1867. It was followed by the exposition at Philadelphia, Pa., in 1876, to commemorate the centennial of the Declaration of Independence. The main building of the Centennial Exposition alone had a floor space of twenty acres, being 460 feet wide and 1,180 long, while the other buildings were proportionally grand and extensive. France held a third international exposition at Paris in 1878, the area of its site being 140 acres, and in 1889 gave the fourth to commemorate the centenary of the French Revolution. One of the prominent features of this exposition was the famous Eiffel Tower (q. v.). The next great exposition was held at Chicago, Ill., in 1893, being designed to commemorate the 400th anniversary of the discovery of America. In many respects it may be said to have been the most successful and popular display ever made in the Western Hemisphere. However, it was closely rivaled by the Louisiana Purchase Exposition held at Saint Louis, Mo., in 1904, to commemorate the Louisiana Purchase. Both before and since the Chicago exposition numerous national or district expositions have been given, such as the Cotton States Exposition at Atlanta, Ga., the Trans-Mississippi at Omaha, Neb., the Pan-American at Buffalo, N. Y., and the Alaska-Yukon Pacific at Seattle, Wash. The most successful and greatest of European expositions was held in Paris in 1900. It attracted a large number of visitors and the most valuable exhibits ever made in the arts and sciences.

The leading expositions of the last thirty years, with the total paid and free attendance and the total receipts, including admissions and concessions, are as follows:

EXPOSITIONS.	ATTENDANCE.	RECEIPTS.
Vienna, 1872.....	7,254,687	\$ 6,917,832
Philadelphia, 1876.....	9,910,996	3,813,724
Paris, 1878.....	16,032,725	2,531,650
Paris, 1889.....	28,149,353	8,300,000
Chicago, 1893.....	27,539,521	14,117,332
Paris, 1900.....	50,120,540	24,788,360
St. Louis, 1904.....	18,741,073	10,162,380

See **World's Columbian Exposition.**

**EX POST FACTO** (ěks' pōst fāk'tō), a law which is retroactive and makes an act criminal that was not criminal when committed, or increases the severity of the punishment attached to the crime when it was committed. The United States and the several states are forbidden by the Constitution to pass such a law.

**EXPRESS** (ěks-prěs'), a system of rapid conveyance and safe delivery of merchandise and parcels. The express business of the United States is the outgrowth of the custom under which stage-coach drivers, railroad conductors, and others were intrusted with parcels for delivery, and was formally organized by William F. Harnden (1813-1845), of Boston, in 1839. He contracted with the Boston and Worcester Railroad Company for the transmission of packages. The project commended itself to business men, and soon after express lines were organized and connections established in all directions. In 1849 the Adams & Company's California Express was established; in 1852, the Wells, Fargo & Company's; and in 1855, the American-European Company's. The express business is carried on by these and similar companies under contract with the railroad companies, the latter furnishing carriage along their lines, while the express companies attend to the receipt and safe delivery of parcels.

At present the capital stock of the express companies amounts to millions of dollars, the leading organizations being the Adams Express Company, United States Express Company, American Express Company, and Wells, Fargo & Co. These and other lines have direct connections with responsible express companies in Canada, Newfoundland, and the leading countries of the world. Among the leading companies of Canada are the Dominion Express Company, the Canadian Northern Express Company, and the Canadian Express Company. The business comprises, besides delivering parcels of merchandise, the issuance of checks, collection of accounts, and in some cases the care of deposits. A system of C. O. D. business, meaning *collect on delivery*, comprises the plan of transporting goods to consumers or dealers and collecting the purchase price when delivered.

In most European countries the carrying service is performed by the post office system under the direction of the government, though in Great Britain the railroad companies themselves handle this branch of business on all lines where the parcel post has not been established. The law includes express companies with the list of common carriers, by which they are held liable for losses the same as such carriers, even though their bills of lading declare otherwise. Express

money orders are receivable at banks, and payable in nearly all civilized countries of the world on an equal basis with drafts issued by banks or government postal money orders.

**EXTENSION** (ěks-těn'shŭn), in physics, that property by virtue of which matter occupies space and possesses volume. An atom is exceedingly small, yet it has definite size; that is, it has extension, or occupies space in three dimensions—length, breadth, and thickness. Extension is necessarily possessed by molecules and masses and is, therefore, a general property of matter.

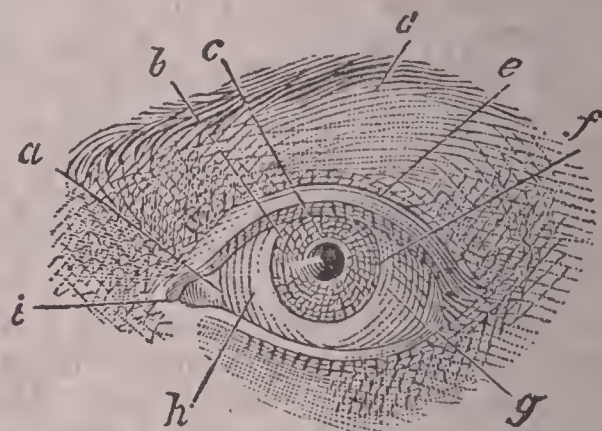

**EXTRACT** (ěks'trăkt), in pharmacy, the products obtained by evaporating solutions that contain medical principles. The substances are chiefly of vegetable origin and yield solids and liquids, the former being known as *extracts* and the latter as *fluid extracts*. Solid extracts are obtained by digesting vegetable substances with water, alcohol, ether, or acetic acid, and evaporating the products until they are reduced to a pasty or dry consistence. Liquid extracts are made by crushing the plants to obtain the juices, which are heated and evaporated. Various methods are employed, the process depending upon the kind of extract to be obtained. In some cases the juices are allowed to stand a brief time after the maceration, when they are carefully filtered, and then are evaporated or distilled a number of times to obtain the strength required.

**EXTRADITION** (ěks-tră-dĭsh'ŭn), the right to demand the delivery of a fugitive from justice from one state or nation to another. In the absence of treaties it is not the duty of a nation to turn over a fugitive criminal to the state from which he has fled, a position maintained both in England and the United States, hence extradition between nations is based upon treaties. However, extradition between the states or provinces of a particular country is usually regulated by the constitutional or national law. This is provided for by the Constitution of the United States, which requires that "a person charged in any State with treason, felony, or other crime who shall flee from justice and be found in another State, shall, on demand of the executive authority of the State from which he fled, be delivered up to and be removed to the State having jurisdiction of the crime."

The Jay Treaty of 1794 was the first treaty of the United States to provide for extradition, but it was not carried into effect by an act of Congress. The Treaty of 1842 was the first to provide for extradition between Great Britain and the United States. It is the general rule

that a criminal who has been extradited for a particular offense cannot be tried on another charge. This question arose in 1875, when the United States procured the extradition of a criminal who had committed an offense not mentioned in the treaty, being extradited on one and then tried on another, and against this Great Britain protested. Extradition treaties are in force among all the leading nations.

**EYE**, the organ of sight, consisting of a globe about an inch in diameter, situated in a bony cavity of the skull, and protected by the overhanging brow. It is formed of a tough membrane called the *sclerotic coat*, which gives form to the eye, the transparent, convex part in front forming the *cornea*. A thin, black membrane, termed the *choroid coat*, lines the sclerotic coat, which contains the blood vessels, while its black color serves to prevent the reflection of the rays of light. A very thin and

THE HUMAN EYE.

A, semilunar fold; B, iris; C, pupil; D, eye-brow; E, eyelid; F, cornea; H, sclerotic coat.

transparent membrane, called the *retina*, is inside the choroid coat and is an expansion of the optic nerve. The anterior and posterior chambers are filled with a liquid, that in the former being a thin, clear liquid called the *aqueous humor*, and that in the latter a thick, jellylike fluid termed the *vitreous humor*. These humors serve to keep the eye distended and in shape. Between the two chambers is the *crystalline lens*, which operates to bring the rays of light to a focus on the retina and is kept in place by the *ciliary process*. A curtain, called the *iris*, is hung behind the cornea, whose center is a hole called the *pupil*. The several colors observed in the eyes of different persons are merely the iris, which varies from blue to a dark brown and is seen through the pupil. The colorless effect seen in the eyes of the albino is due to the absence of color cells; the pink tint often seen in them is caused by the blood affecting the appearance of the iris on account of the absence of other coloring matter.

The eye is protected by close-fitting shutters called *eyelids*, and by a padding of fat situated between the eyeball and the walls of the orbit in which it is situated. A mucous membrane lines the inner side of the eyelids, and, by being exceedingly sensitive, aids in protecting the eye from irritating substances. The edges of the lids are lubricated by oil glands situated within the *eyelashes*, which prevent them from adhering to each other. Besides, the lashes guard against dust, while, with the lids, they serve to shield against a blinding light. The mucous membrane and cornea are moistened by a saltish fluid called *tears*, which is secreted by the *lachrymal glands*, two oblong bodies situated immediately above and to the outside of the eyeballs. Several ducts facilitate a flow of tears upon the inner surface at the outer edge of the upper eyelid, thus washing the eye and keeping it clean from dust, the tears passing into a little basin at the inner part of the eye near the nose, called the *lachrymal lake*, from which they are drained into the nose by the *nasal duct*. The lachrymal lake overflows upon the face in disease, old age, and when crying.

The phenomenon of sight is one of intense interest to the student of natural history. It is dependent upon a substance called *ether*, which is infinitely more subtle than air and is thought to be a thin gas filling all space. Waves of light are produced in the ether as sound waves are caused in the atmosphere. The motion waves of ether are produced by a light, for example a lamplight, pass through the pupil of the eye to the retina, and are carried by the rods and cones through the *optic nerve* to the brain, where the light is seen. The variously shaped rods and cones serving to carry the light are to the eye what bristles, otoliths, and Cortian fibers are to the ear. The optic nerve, which has its root in the brain and enters the eyeball, is itself insensible to light. There are no rods and cones at the point where it enters the eye and this is called the *blind spot*. The rays of light are bent by the convex lens so they meet at a point called the *focus*; a good example of this can be given by the use of a common burning glass, through which the focus point is heated to burning by bending the rays of the sun. When entering the eye, the rays of light are converged similarly by being brought to a focus on the retina, and are influenced somewhat in a like manner by the cornea and the humors of the eye.

Distant objects tend to diverge rays of light less than those near by, and under such conditions the crystalline lens does not need to bend so much as in seeing objects near at

hand. This property of adjusting the lens of the eye to far or near vision is called *accommodation*. The ordinary adjustment of the eye muscles when at perfect rest is of such a character that objects at all distances over twenty feet can be seen clearly. Objects at a smaller distance than twenty feet away from the eye require that the muscles adjust the lens to a more curved position. In this way it is possible for the eye to see clearly at a distance

AN OPTICAL ILLUSION.

of about five inches, while vision is best at about ten inches from the eye.

The field of view in which a person can clearly recognize objects is confined to a small space immediately in front of the eye, while only indistinct shadows seem to occupy the remainder of space near at hand. In reading not more than two or three words can be seen distinctly, but by rapid and unconscious movements of the eyes sidewise the field of view is greatly enlarged. When the eyes are directed toward an object, the sensation of sight is produced almost instantly, but the image persists about one-tenth of a second. It is due to this property that a lighted stick waved rapidly by the hands appears as a circle of fire. Exhibitors take advantage of it by throwing a succession of pictures of a moving object upon a screen at a particular rate, and thus convey to the auditors the effects of movement without interruption. If two shining lights are waved, they appear as one, and two colors revolved quickly give the effect of a mixture of two. Thus, a yellow and a blue surface placed side by side and revolved quickly before the eye appear as a single green spot. The eye is sub-

ject to many illusions, which is taken advantage of by exhibitors and in the manufacture of many toys and fireworks. The vertical lines in the illustration are perfectly parallel, but the diagonal hatching, as the result of contrast, cause them to appear tapering in alternate directions.

*Color-blindness* is due to an impairment of the nerves of the retina, leading to an inability to recognize certain colors. Since locomotive engineers and sailors are guided by differently colored signals, this defect is a serious one. The retina becomes exhausted when the eye looks steadily at an object for a long time. It is fatigued by bright-colored objects much more readily than others, and during a state of exhaustion is often confused in the recognition of colors, being made color-blind. The intensity of light has an effect upon the pupil, bright light causing a contraction. This results from a strong light exciting the reflex centers of the optic tubercles and has the effect of contracting the muscles of the iris. In the dark, on the other hand, the pupil is enlarged so as to admit all the light possible. In this way, and by means of the muscles that control the upper and lower lids and the eyebrows, it is possible for the eyes to protect themselves against a light too strong to be admitted, though the contracted muscles become easily tired and pain results. *Far-* and *nearsightedness* are caused by defects in the crystalline lens. If the lens is too convex, the rays are brought to a focus before they reach the retina; if too flat, the retina is reached before coming to a focus. In each case the sight is more or less indistinct. Another common defect is a flattened or elongated shape of the globe of the eye. *Farsightedness* results when the globe is flattened and *nearsightedness* when it is elongated. The former is overcome by convex and the latter by concave lenses.

The care of the eyes is an important matter, since the loss of vision is a source of much sorrow. Glasses should be worn when they serve to improve the sight, since straining impaired power results in even greater weakness. Fine print and reading by a dim light are harmful, while the sight is often impaired by reading on cars, for the reason that the lens becomes wearied by striving to adapt itself to continuous variations of distance. Light should never be in front when reading or working, but should come over the left shoulder. Alcohol and tobacco tend to cause dimness of vision by weakening the optic nerve. Röntgen (q. v.)

discovered a kind of light produced by electricity, in 1895, which penetrates flesh, wood, and other substances. By means of this light it is possible to determine by sight the forms of different organs of the body, to examine the bones in the living body, and to locate many substances foreign to the system. Several valuable discoveries relative to the eye have been made by means of it.

The eyes of fishes, reptiles, birds, and quadrupeds are essentially the same as in man. In insects the eyes are immovable and have a dome shape. Thousands of smaller eyes like honeycomb make up each of the two eyes. At the bottom of the cavity is a nerve to which each little eye may conduct light by means of a lens. As the scale of animal life descends, there is a marked decrease in the power of vision. For instance, in the leech the nerves of sight end in a spot of dark coloring matter of the skin by means of which it is able to receive some idea of its surroundings. Still lower in the scale we find life forms that are barely able to recognize the difference between light and darkness, while those that live wholly in the dark lose the use of this organ, as, for instance, the fish found in the Mammoth Cave of Kentucky.

**EYELIDS.** See **Eye**; **Lachrymal Glands.**

**EYLAU** (i'lou), a town in Germany, 22 miles south of Königsberg, on the Pasmur River. It was the scene of an indecisive battle on Feb. 8, 1807, between Napoleon and the allied forces of the Prussians and Russians under Count Levin Bennigsen (1745-1826). The army under Napoleon consisted of about 80,000 men, while the allied forces were smaller, but the latter possessed more artillery. A brisk struggle continued during the day, and as night approached the troops of Napoleon were driven before the allies. In the night the French army retreated. The loss on each side is estimated at about 18,000 men. The town has a population of 3,600 and is connected by railway with Königsberg.

**EYRE** (âr), one of the largest lakes in Australia, in the State of South Australia, at an altitude of 80 feet. It has an area of 3,708 square miles. Its name is from Edward John Eyre, who discovered it in 1840. The water is highly salty and in dry seasons evaporates largely, leaving a great salt marsh. The waters of the Macumba, Cooper, and Warburton rivers flow into it, but it has no outlet to the sea. A railway extends from Lake Eyre to Spencer Gulf.

## F

**F**, the sixth letter and fourth consonant of the Latin and English alphabets. It is formed by the passage of breath between the upper front teeth and the lower lip, is classed with V as a labio-dental, and belongs to the class of consonants called *aspirates*. The figure of F corresponds to the *digamma* of the Greek and resembles it closely in power. F, in music, is the fourth note of the natural diatonic scale of C. F major, as a key, has one flat at its signature, namely, B flat. The tone F is called *fā* in Italy, France, and some other countries.

**FABLE** (fā'b'l), a feigned story or tale intended to enforce some moral precept. In modern literature the fable is confined to short stories, either in prose or poetry, in which inanimate things and animals are represented with human interests and passions. By the novelty and utter impossibility of the representation, the interest of the hearer or reader is excited, and thus its symbolic meaning and moral become apparent to him, at least if the fable is well contrived. The ancient fabulists were simple, clear, and earnest, and seem to have sprung up in the East. Among the more celebrated are Bidpai, or Pilpai, and the Arabian Lokman, who lived at the time of King David. Among the Greeks the greatest fabulist is Aesop. Phaedrus, the most celebrated Roman fabulist, cleverly imitated Aesop, but with considerable modification, thus giving force to his writings. In later times Gay among the English, Lessing and Gellert among the Germans, and Krylov among the Russians are celebrated. La Fontaine, a French writer of fable, for delicate sarcasm, sagacity, and felicity of expression takes high rank.

**FAÇADE** (fā-sād'), the exterior face or front of a building. This term is applied chiefly to classic architecture and buildings of some magnitude. The façade contains the principal entrance. The term is used with a qualifying

## FACIAL ANGLE

adjective when it refers to other faces of a building, as *court façade*, *rear façade*, and *lateral façade*. Many mediæval churches have *false façades*, which are different in outline than the buildings themselves.

**FACE**, the front part of the human head, extending from the chin to the line of the hair on the forehead. It includes the nose, eyes, chin, mouth, cheeks, and forehead. The bony foundation is composed of fourteen bones, twelve of which occur in pairs. The single bones are the *vomer*, which separates the nostrils, and the bone of the lower jaw, or *inferior maxillary*, which is the only one that is movable. The *superior maxillary*, or upper jaw bone, contains the upper teeth. Two *malar* bones form the cheeks; two *palate* bones, the palate; and two *turbinated* bones, the outer walls of the nostrils. Between the eye socket and the nose are two *lachrymal* bones. The bridge of the nose is formed by two *nasal* bones. All of the bones of the face are irregular in form. Beneath the *frontal* bones, which belong to the cranium, are two deep quadrangular cavities, called the *orbis*, which contain the eyeballs, the tear apparatus, and the protective organs of the eye. In the depressions and small cavities are located glands, nerves, and blood vessels. Projecting jaws and a receding forehead are prominent features in the face of brutes.

**FACIAL ANGLE** (fā'shal ān'g'l), an angle formed by two imaginary lines—one drawn from the most prominent part of the forehead to a point opposite the incisor teeth; the other from the external ear to the same point, the object being to measure the elevation of the forehead. This angle was made the basis for classifying the races by the Dutch anatomist, Pieter Camper, and is sometimes called *Camper's Angle*. While it has served a useful purpose in ethnology, it is not an infallible criterion of the intellectual capacity of an individual.

The general facial angle of anthropoid apes is  $40^\circ$ , of the African Negro  $70^\circ$ , and of the Europeans  $80^\circ$ . Since angles almost as varied can

FACIAL ANGLES.

be found in a single large community, the Camper method has been superseded by those of Blumenbach, Cuvier, etc.

**FACTORY** (făk'tō-rĭ), a name derived from the word *factor*, which, in Great Britain, has reference to an agent who sells goods for another. In America it is more common to call such an agent a commission merchant, since his compensation is based on a commission or a percentage upon the goods he buys or sells. On the other hand, the word *factory* has reference to the place or house where such agents transact business.

Within recent years the term factory has come to be applied to an establishment devoted to the manufacture of various articles of commerce. In this sense it includes the machinery and buildings necessary to such manufacture. The establishment of great factories is comparatively recent and resulted from the invention of useful machinery, the extensive subdivision of labor, and the construction of vast avenues of commerce that facilitate the transportation of manufactured commodities to distant consumers. Doubtless material advantages have sprung up from the factory system. They include the increased productiveness resulting from the division of labor; greater mechanical accuracy and a lessening of the cost of production, two results of bringing together different laborers with varied capacity; and the wholesome effects that follow coöperation and co-partnership among the masses of the workingmen. Trades unions and the various forms of organization that have sprung into existence are the direct result of the concentration of laborers in manufacturing centers.

It is probable that the good which springs from the factory system is counterbalanced to a large extent by the curtailment of independent intelligence, which follows the minutely subdivided operations resulting from the piecework of each individual workman. Other disadvantages urged against the factory system

are the evil influences upon the health of the workmen, brought about by being crowded into small rooms; the contract system, by which large colonies of foreign laborers are imported; and a reduction of wages as a natural consequence of employing many children and women.

The factory system as now found in America, both in Canada and the United States, has made it necessary to regulate by law the manner of managing workshops, mines, and factories. Legislation along this line has been intended to improve the sanitary conditions of all places where large numbers of workmen are employed by making them subject to public inspection, and establishing rigid rules under which vast enterprises may be managed efficiently. Among the primary objects of legislation are the protection of life and health of the workmen, prevention against spreading infectious diseases and vermin by reason of the manufactured product, and protection of the laborers and operators against strikes, disorders, and general disorganization of institutions. Legislation has been directed more commonly with respect to the number of hours the workmen may be employed daily and the improvement of the conditions of factory work. Other objects have been to limit the labor of women and minors and to regulate the manner of and time for which laborers shall receive compensation.

Statutory provisions in some cases forbid the employment of minors under certain ages, while in others it is necessary for children to be able to read and write, or to have attended school for a certain period, before being admitted to the factory. These safeguards are intended to prevent the corruption of morals among children and vouchsafe to them conditions under which they may secure a suitable education. The supreme courts in a number of states, among them Ohio, Pennsylvania, Missouri, West Virginia, and Illinois, have decided that laws which require the payment of laborers in money are unconstitutional, though others have held them sound and operative. Among the many questions of general concern, in which a large number of people are interested, those relating to the rights and privileges of both the employer and employee take high rank. However, the legislation which may tend to secure the best business conditions, which will operate to the highest interest of both the capital and labor employed in the factory system, is yet awaiting solution by statesmen and legislators.

**FACULTY** (făk'ül-tĭ), the term employed to designate collectively the teachers and professors of an institute, college, or university, or

the instructors in any department of such an institution, as the faculty of law, of theology, of arts, or of medicine. It is applied collectively to the members of the learned professions, as the faculty of advocates, the medical faculty.

**FACULTY**, in mental science, a natural power of the mind by which it acts uniformly and with facility in some specific way. Hewett defines faculty as a power under the control of the will, having a specific work to do, and as examples enumerates memory, seeing, love, and judgment. Crabb holds that faculty is a power derived from nature, and differs from ability in that the latter is derived either from circumstances or otherwise.

**FAÏENCE** (fâ-ê-âns'), a term applied generally to all classes of porcelain and glazed earthenware. The name was derived from the town of Faenza, Italy, where *majolica*, a fine grade of pottery, was manufactured in the 14th century. The faïence manufactured at present was invented in the 16th century as an imitation of majolica and obtained its name in France. However, the faïence of the market is made of a ruddy earth, covered with an enamel, and is frequently painted in rich colors.

**FAINTING** (fânt'ing), or **Syncope**, a sudden loss of consciousness, with pallor and feeble respiration and heart action. The morbid condition generally continues from a few seconds to a minute, but in some cases lasts for hours and even days. It is produced by loss or sight of blood, pain, or impure air generated in overcrowded public buildings. Fright and sudden joy or grief may cause fainting in some persons. It rarely ends in death and more commonly affects women than men. Recovery is most rapid when the body is in a recumbent position. Fresh, cool air, cold water sprinkled on the face, and the loosening of any tight articles of dress contribute to a speedy close of the syncope.

**FAIR**, a stated or regular market where buyers and sellers gather to transact either a particular or general class of business. Fairs of this character originated on account of the convenience resulting from the buyers and sellers of agricultural products common to a region coming together. The fairs held in the Middle Ages were chartered by public officials, who announced them by proclamation. This class never obtained a wide foothold in America, though there are fairs at which an exhibit of agricultural products, manufactures, and other articles of value are exhibited for public inspection and study. The term is applied in a general sense to bazaars where fancy articles are offered for sale either at special times or

permanently, and to the agricultural and industrial exhibitions held under the direction of counties, states, or nations. In Europe it is quite common to hold fairs at which buyers and sellers are brought together. Among the great periodical fairs are those held at Novgorod, Russia; Lyons, France; Leipzig and Frankfurt-on-Main, Germany; the Donnybrook Fair, Ireland; the Glasgow Fair, Scotland; and the Greenwich Fair, England.

**FAIRFIELD**, a city of Iowa, county seat of Jefferson County, 48 miles northwest of Burlington, on the Chicago, Burlington and Quincy and the Chicago, Rock Island and Pacific railroads. It has a fine county courthouse and is the seat of Parsons College. The manufactures include wagons, clothing, machinery, tile, and farming implements. It has electric lights, waterworks, and a considerable trade in produce and merchandise. The first settlement in the vicinity was made in 1839 and it was incorporated in 1847. Population, 1905, 5,009.

**FAIRHAVEN**. See **Bellingham**.

**FAIRIES** (fâr'iz), the name applied to imaginary beings, ordinarily small and of graceful human form, but capable of assuming any shape and working good or evil to mankind. A belief in fairies has been among the superstitions of many peoples. Some other names for these imaginary creatures are *elves*, *brownies*, *goblins*, *dwarfs*, *pixies*, *kelpies*, and *gnomes*. It is difficult to give any scientific definition of the nature of fairy superstitions, because they followed no regular law, human or divine, but obeyed the impulse of their own caprice. Hence, every fairy tale differs from others in some respects. In the parts of the world where there are mountains, mists, cataracts, and stormy oceans all superstitions are naturally exaggerated, while in flat and well-cultivated countries the fairies are simple and homely, and connect themselves with matters of domestic routine, such as sweeping the floor, skimming milk, preserving butter, and other household duties. In Scandinavian countries the fairy people are connected with storms and convulsions. They are represented in the act of betraying people into dangerous places, flying away with them into cloudland, or as leading them through endless caverns within the earth. They have been spoken of in Ireland as a wandering remnant of fallen angels.

The tales of some nations divide fairies into three classes—those that dwell in the upper air, those within the interior of the earth, and a third class that frequent the waters. The last mentioned are known as *mermaids* and *sirens*. Fairy stories were introduced into France and

Germany as early as the 12th century. They became generally popular in the latter part of the 17th century, the Italians taking the most extended interest in them. Literature in all countries abounds more or less with fairy tales. Among the best collections of later times are those of the Grimm brothers in Germany, Knightley's and Craker's in English, and Hans Andersen's in Danish. Many fairy tales and legends have been translated into modern languages and in this way became the common property of all. The translations have been devised suitably for home and school reading. Many of the eminent teachers, among them Herbart, Froebel, and Pestalozzi, have recommended them as of special value in child culture during the formative period. Their use for that purpose in American and European schools is very extensive.

It is quite probable that fairy tales and legends are the outgrowth of mythology and folklore. Since primitive peoples are unable to express ideas in the abstract, their customary forms gave rise to the use of familiar and concrete terms. The mystery of storms, zephyrs, caves, ocean waves, mountain echoes, passage of clouds, and the strangeness of life and death all had more or less influence to impress them with awe and to inspire and amaze. The early history passed from generation to generation, not in written story, but as a living tale, and later became perverted in mythology, folklore, and fairy tales. To their own legends were added those of near or distant peoples, by which the tales they told grew into vast numbers and took on diversified and complicated forms. The giant stories of the Orient, the one-eyed Cyclops tales of Asia Minor, and the mysteries of the Greek and Roman gods were capable of almost indefinite expansion and contraction, especially when brought in contact with the northern heroes and the tales of the *Nibelungenlied*. In pondering the early peoples it is not difficult to comprehend how the folklore, mythology, and hero worship became prolific sources for the growth of numerous and diversified tales, and, associated with the romance of the ages, gave rise to a vast number of stories that have come down to us. Many of the fairy tales remain highly interesting and fruitful objects of study.

**FAIRMOUNT** (fâr'mount), a city in West Virginia, county seat of Marion County, on the Monongahela River, 75 miles southeast of Wheeling. It is on the Baltimore and Ohio and other railroads. The surrounding country is a farming and coal-producing region. Among the noteworthy features are the county court-

house, the high school, and a State normal school. The manufactures include earthenware, flour, cigars, machinery, and furniture. It has systems of electric lighting, sewerage, and water-works. Population, 1910, 9,711.

**FAIR OAKS**, a railroad station in Virginia, near the Chickahominy River, in Henrico County, six miles east of Richmond. It was the scene of a battle between the Confederates under General Johnston, numbering 38,000 men, and a detachment of General McClellan's army under Gen. Silas Casey (1807-1882) and General Keyes, including about 11,000 troops. The engagement at Fair Oaks took place on May 31, 1862, after General Johnston had retreated from Williamsburg toward Richmond, and was the first important encounter between the army of the Potomac and the army of northern Virginia. General Longstreet drove the Federals back toward the Chickahominy and at nightfall the victory seemed to rest with the Confederates. However, the following day the Federals were reënforced and the battle continued at Seven Pines, about a mile east of Fair Oaks, when the Confederates were repulsed and withdrew to the immediate vicinity of Richmond. The loss on the Union side in both engagements was 5,031 and on the Confederate side, 6,134 men. General Lee succeeded General Johnston while the battle was in progress and General McClellan likewise succeeded General Casey. The battle ground may be reached by an electric railway. A national cemetery is maintained at Seven Pines.

**FAIRWEATHER**, a mountain on the western coast of North America, in Alaska, between Glacier Bay and the Alsek River. Southeast of it are a number of elevated peaks, including Mount Crillon. It is 15,292 feet above the sea, is covered perpetually with snow, and is the source of several glaciers.

**FAITH CURE**, the treatment of diseases without the use of drugs, usually practiced by making an appeal to the hope or belief of the patient. It differs from hypnotism and healing by mental science in that its methods require the exercise of religious faith, but the term *faith cure* is applied in a broader sense by some who believe in treating diseases without employing material means, and when applied in this form it includes every method of treatment in which the patient is to rely upon hope and faith. The practice of using home remedies and patent medicine is sometimes designated as a form of faith cure and some include Christian Science, but the latter term is not admitted to be similar by those who believe in it.

Faith cure is not of modern origin, but, instead, dates from the most ancient times. That prayer is of utility in effecting cures has been taught by the Christian Church from its origin, and many eminent divines have preached that prayer is potent in the cure of bodily ills as well as in the forgiveness of sin. Some have gone so far as to teach that the atonement includes the healing of the body, since, as they believe, God would be dishonored if it were claimed he could not do more than preserve the soul. To this class belongs A. B. Simpson, of New York, who anointed with oil and practiced the apostolic methods. John Alexander Dowie, first apostle of the Christian Catholic Church, taught that diseases may be cured by prayer and the laying on of the hands. In the chapel of that church at Zion City are many canes, crutches, and trusses that are claimed to have been left there by people who came diseased and crippled and went away healed. Many others could be named who practiced the art and professed to effect cures. Those who believe in some form of faith cure have multiplied greatly within the last few decades.

While the cure of diseases and the treatment of patients must necessarily involve the use of material means and the employment of drugs, it is admitted on every hand that hope and expectation are mental states of great utility in those who suffer pain and disease. Digestion is favored by happiness, emotions stimulate action of the bladder, and sorrow causes secretion of tears in the lachrymal glands. There is no difference between those who practice medicine and those who believe strictly in faith cure so far as the favorable influence of hope and expectation is concerned, but the disagreement lies in the fact that one employs drugs and other material means, while those who hold distinctly to faith cure rely exclusively upon some mental or psychological influence, or place reliance wholly in the efficacy of prayer. No doubt, many forms of nervous diseases can be remedied by faith-cure methods. However, their efficiency in the treatment of other ailments likely depends largely upon improved conditions of living and a change to better conduct and habits. It is undoubtedly natural for those who become converted to a new teaching, or a different plan of living than that they formerly embraced, to have mental changes which influence, more or less. In some diseases, such as consumption, cancer, and diphtheria, few if any cures are reported, though conditions are frequently improved.

**FAKIR** (fā'kēr), a Mohammedan religious

mendicant who wanders from place to place. A fakir is regarded by the common classes of Mohammedans as a character of sanctity, though fakirs are of the lowest priesthood. The term is applied by some writers to the Anglo-Indian and the Hindu mendicants, but the latter are more properly called *Gosavee*. In some regions of the Mohammedan countries they live in communities, but usually the life is solitary. Their attire is coarse and generally black or brown, while the headwear consists of a black turban, over which is tied a red handkerchief. To gain the veneration of the lower classes, they often mutilate their persons and practice absurd penance.

**FALCON** (fā'k'n), a long-winged, high-couraged, raptorial bird, which takes its prey as it moves in the air. Technically, in falconry, the female alone is termed a falcon, the male, which is smaller and less courageous, being known as a *tiercel* or *tiercelet*. Naturalists generally apply the name falcon to various birds of prey, which they separate into distinct groups, including the *peregrine falcon*, *northern falcon*, *desert falcon*, *merlin*, and *hobby*. For symmetry, strength, and power of flight the falcon is the most perfect of the feathered race. The beak is strong and short-hooked at the point, the upper mandible having a notch or tooth on its cutting edge. In all species the legs are heavy and stout, the claws are sharp and long, and the wings are powerful. The average length of falcons is about two feet. The peregrine is most commonly used in falconry and is exceedingly swift, its flight being fully 65 miles per hour.

NORTHERN FALCON.

The average length of falcons is about two feet. The peregrine is most commonly used in falconry and is exceedingly swift, its flight being fully 65 miles per hour.

**FALCONRY** (fă'k'n-rĭ), or **Hawking**, the pursuit of game by means of falcons or hawks. In ancient times the sport was called hawking, when the hawk was employed, but later the

HOODED FALCON.  
(ready for use)

peregrine and other falcons became popular. The history of this pastime has been traced back to a period prior to the Christian era. At one time, in Germany, even kings and nobles devoted the greater portion of the hunting season to it. After the Norman Conquest, England indulged in the sport until the rank of the individual was indicated by the particular species of hawk carried on his gloved hand or wrist. Later it went largely out of fashion, but at present an attempt is being made to restore this sport, which is attended with growing success. The training of hawks is a matter requiring much care and patience. They are usually taken while young and hooded with a piece of leather, leaving an aperture for the beak, and are trained to sit on the hand and to eat from the lure. The lure is a device made of a piece of wood or leather covered with the wings and feathers of a bird and attached to a cord, to which a piece of meat is fastened. The falconer swings the baited lure round and round his head, accompanying the action by some call. When the falcon has been taught to obey the lure, it is trained to catch live birds, and soon learns to seize the game. The hood is kept on the falcon during hunting excursions, until the bird is wanted to fly.

**FALKLAND ISLANDS** (făk'lănd), a group of islands belonging to Great Britain, situated in the South Atlantic Ocean, about 295 miles east of the Strait of Magellan. The total number of islands is about one hundred, with an area of 6,490 square miles, of which the two larger are East Falkland and West Falkland,

containing respectively 3,000 and 2,300 square miles. The surface is hilly, with bogs extending from various points on the shore toward the interior region. Forest trees are entirely absent, but many grasses abound, on which herds of cattle and sheep are reared with much success, this constituting the principal industry. Many penguins and other sea fowls are native to the islands. The fisheries are valuable. The climate is healthful and well adapted to the production of cereals found in temperate climates.

The Falkland Islands were discovered by John Davis (1550-1605), Aug. 14, 1592, and were named by Captain Strong while cruising in 1689, in honor of Lord Falkland. Permanent settlements were first made by the French and later immigration followed by the Spaniards and English, the last mentioned securing permanent control in 1833. The principal exports are wool, hides, skins, and tallow. Machinery, wearing apparel, and building material are the chief imports. Local government is administered by direct appointees of the crown, and education is supported by government grants and local taxation. Stanley, on East Falkland, with a population of 916, is the capital. Population, 1906, 2,065.

**FALLACY** (făl'lă-sĭ), in logic, an invalid process of reasoning, which leads to an erroneous conclusion. Since fallacy is a violation of some logical law, many rules have been devised to govern sound reasoning and when one of these is violated the result is a logical fallacy. No agreement has been reached as to the proper classification, though the subject has been one for extended discussion from remote antiquity. Writers usually divide fallacies into three classes, assumptions, sophisms, and aberrancies.

*An assumption* is that which is taken as true without evidence. It may be true or false; but, resting on no basis of evidence, it is, in both cases, invalid, not because it is known to be false, but because it is not known to be true. To assume an assumption false, because of its lack of evidence, would be a procedure as invalid as to assume it true. Assumptions arise from want of attention, superstition, prejudice, hasty generalization, and preconceived opinions.

*A sophism* is an invalid argument, and may be said to constitute a fallacy that is designed to deceive. It originated from the Sophists of ancient Greece, who doubtless cared little for truth or morality, and merely professed to teach how to make the worse appear the better reason. Sophistry is a fallacious reasoning which is sound in appearance only and puzzles the inquirer after truth.

An *aberrancy* is a wandering from the conclusion warranted by the premises and drawing another which is unwarranted. One who infers the reasoning valid because the conclusion is true is misled by an aberrant fallacy, since it does not follow, because the conclusion is true, that the argument is valid. Many unsound arguments have escaped detection, because the conclusion of the speaker coincided with the opinions of the hearers. Again, one who infers that the conclusion is false because the premises are false, or the reasoning is illogical, is misled, since the proper inference is not that the conclusion is false, but that it is not proven.

**FALLING BODIES**, a term used in physics when demonstrating the force of gravity. All terrestrial bodies, if unsupported, fall or move toward the earth's center by this force. That the acceleration due to gravity is the same for all masses was proved by Galileo. His experiments consisted in dropping unequal balls of iron from the top of the leaning tower of Pisa. He discovered that, whatever their masses, the balls reached the ground at the same instant. Using balls of iron and wax, he found that the iron balls struck the ground first. From this phenomenon he concluded that bodies less dense are similarly influenced by gravity, but that the unequal velocities are due to the resistance of the air acting on different extents of surface. It was later demonstrated by Newton that all bodies in a vacuum fall with the same velocity, which proves that the effect of gravitation on bodies is proportional to their masses, but the resistance of the air causes the apparent exception to the law.

In a body falling freely from a state of rest, the velocity at the end of the first second is equal to about 32.16 feet per second. At the end of the next second it is 32.16 times two, and equals 64.32 feet per second; at the end of the third second it is 144.72 feet, etc. If the time is known, the distance through which a falling body passes may be found by multiplying the square of the time in seconds by 16.08. Thus, in two seconds,  $2 \times 2 \times 16.08 = 64.32$ . The acceleration varies in different parts of the earth's surface, being least at the Equator and increasing slightly with the latitude to a maximum at the poles.

The distances fallen by an unsupported body in successive seconds increase at the odd numbers. Thus, a body falling from a state of rest passes through 16.08 feet during the first second, and attains a velocity of 32.16 feet. During the next second it falls through  $3 \times 16.08$  feet, or 48.24 feet, and the third second,  $5 \times 16.08$

feet, or 80.40 feet. The total distance in feet through which a body falls in a given time is proportional to the square of the time, and is equal to the square of the time in seconds multiplied by 16.08. Thus, a falling body passes four times as far in two seconds as in one second and nine times as far in three seconds as in one second. In the first second a body falls 16.08 feet, and in the next second it falls 48.24 feet. At the end of the second second it has fallen through a total distance of  $48.24 + 16.08 = 64.32$  feet. Thus, 64.32 feet is four times 16.08 feet, or  $2 \times 2 \times 16.08$ , as per the statement above.

**FALLOW DEER** (fāl'lō), a species of deer native to Europe and Northern Africa. In a wild state it is found chiefly in the mountainous regions of the southern part of Europe, but it is very common in the parks and forest reservations. The male or buck has palmated antlers, about 25 inches long, and is somewhat larger than the female or doe, which is without horns. It has a brownish color, characterized by pale spots, and the hair is smooth and fine. The young fawn is mottled and accompanies the mother at an early age. Fallow deer go in herds under a master, an old buck, who keeps an outlook for danger and appears to command the herd. The flesh is highly esteemed for food.

**FALLOW LAND**, the name applied to ground which is left untilled in crops, but is plowed in the summer, as a means to regain productiveness after continuous cultivation. Such plowing is usually called summer fallow. All land, no matter how productive, if used continually for a number of seasons, becomes partly exhausted, and this method is employed to allow it to rest and recover its fertility. In other instances various forms of fertilizing are used for the same purpose. Strictly speaking, the land should remain idle the entire year, but the term is likewise applied to various modes of treatment, such as plowing the ground immediately after the removal of a spring crop, known as bastard fallow; or planting the ground with some crop that can be planted in rows, as corn or potatoes, which admits of the intermediate spaces being cleaned, stirred, and pulverized during the growth. The latter is known as green-crop fallow.

**FALL RIVER**, a city of Massachusetts, in Bristol County, on the Taunton River and Mount Hope Bay, an arm of Narragansett Bay, about fifty miles southwest of Boston. It is on the New York, New Haven and Hartford Railroad and many electric railway lines. The site is at the head of deep-water navigation, forming the terminus of steamships from New York and other ports. It is the greatest cotton goods

manufacturing city in America, employing about 3,200,000 spindles. The products include calico, yarn, gingham, and thread. Calico printing and the dyeing of cotton goods are extensive enterprises. Other manufactures include nails, boots and shoes, soap, rope, carriages, and granite quarry products.

Fall River is a modern and regularly platted city. The streets are well graded, lighted, and paved with stone and macadam. Among the public buildings are the city hall, the United States customhouse and post office building, the State armory, and the public library. Other buildings of note include the Mount Hope School, the Fall River Conservatory of Music, the Notre Dame College, the Union Hospital, and the Boys' Club. In 1887 the Durfee high school building was donated to the city. It is a fine structure of granite and is well equipped with apparatus for teaching the sciences. Fall River was a part of Freetown until 1803, when it was incorporated under its present name. In 1804 it was named Troy, but the present name was restored in 1834. The growth of the city is due largely to an abundance of water power obtained from Fall River, the outlet of Watappa Lake, which is located on the eastern border of the corporation. Population, 1905, 105,697; in 1910, 119,295.

**FALSE IMPRISONMENT**, the unlawful restraint of one's liberty by detention without authority of law. The false imprisonment of a person is a crime, whether the detention is in a prison, police station, or a private house, even if confined without bars or bolts, and a person guilty of the offense is liable to prosecution as well as reparation to the party injured. However, several exceptions are made, such as detaining a madman or persons who are known to have committed a crime. Other exceptions are those made in favor of parents, guardians, and teachers, who restrain children under their authority within reasonable limits.

**FALSE PRETENSES**, in law, the willful misrepresentations of fact to obtain money or other property of value. Any person who is guilty of obtaining a valuable consideration in this way may be punished by fine or imprisonment or both. However, the pretenses must relate to a fact or state of facts which are represented as existing at the time or already passed. Representation or promises as to what a party will do or what facts will occur in the future, no matter how false or groundless, are not considered misdemeanors. Besides, the party claiming to be defrauded by a false pretense must have relied upon the representations as true.

**FALSETTO** (fal-sět'tō), in music, the artificial tone of the voice. The voice contains three registers—chest voice, head voice, and a third, which is not natural, and is called falsetto or false voice. It is usually blended, by practice, with the chest voice so as to make no perceivable break.

**FAMILY COMPACT**, the name of an alliance concluded between France and Spain in 1761. It was designed to unite all the branches of the house of Bourbon as a counterpoise to the maritime ascendancy of England. By its terms the American colonies secured the aid of Charles III. of Spain, and Pitt proposed to declare war against that country, but he was outvoted and resigned.

**FAMINE** (fām'īn), a widespread and distressing scarcity of food, usually resulting from drought, war, flood, or insects. Tropical climates subject to irregular rainfalls are most commonly affected by famines, though defective economic systems, such as the absence of articles of food and imperfect means of transportation, are prolific causes. In the Middle Ages famines were more numerous than at present for the reason that modern communication and transportation makes it possible to supply quite successfully the districts in want with the necessary means of sustenance. The most widespread famines of recent times have been experienced in Asiatic countries, particularly in India and China. The great famine visiting northwestern India in 1837-38 caused 800,000 persons to perish, and the one occurring in Bengal and Orissa in 1865-66 resulted in about a million deaths. In 1847 a famine visited Bengal, but it was not excessively destructive of human life for the reason that supplies were transported rapidly to the afflicted districts, though nearly a half million died during the great famine in 1877, which visited Bombay, Mysore, and Madras. It is estimated that 9,000,000 persons perished at the time of the great famine in China in 1877-78, while the one in 1888-89, caused by the overflow of the Yellow River, was equally destructive. One of the most remarkable famines of India occurred in 1897, which was followed by a very destructive and widespread dearth of food in 1900. The most destructive famine of recent times visited China in 1902, when about a million people died of starvation.

**FAN**, an instrument for agitating the air by the movement of a flat surface, especially for cooling the face or causing the movement of air in a room. Devices for cooling the face by agitating the air were in use among the Greeks and Romans, and were introduced into western European countries shortly after the

Roman invasion of Gaul and Germany. Those generally used are made of palm leaves, feathers, thin skin, wood, paper, or ivory, and are of various construction. Ventilating fans are propelled by steam or electric power. Those of the latter class have a simple motor with alternating electric currents, a fifty-volt transformer current usually being sufficient to propel the fan. These ventilating fans are frequently seen in department stores, offices, and dining rooms, where currents of air are put in motion for the cooling effects. In mining, for winnowing grain, urging combustion, cooling fluids, and other purposes contrivances of flat disks or waves are utilized, which, when propelled by machinery, revolve rapidly and induce strong currents, the force of the current depending upon the velocity at which the fan moves. See **Blowing Machine**.

**FANATICISM** (fā-năt'ī-sīz'm), the term used to designate intemperate zeal or ferocious enthusiasm. The spirit of fanaticism has frequently characterized political and religious movements, in which advocates of reforms were unduly enthusiastic, and often resorted to radical measures in endeavoring to further their ends.

**FANCY** (făn'sy), in psychology, a term used in connection with imagination, of which it is a form. When the imagination combines the subjects it uses in such a way as to give a result that is pleasing, light, and playful, but still shows nothing of high purpose or of noble and cultivated taste, it is called fancy. Images of the fancy are dealt with by many of the poets and orators. The comparison made by Longfellow, in which the moon is likened to the paper kite of a school boy, is a mere fancy. In early life the imagination inclines more commonly to the fanciful. This is evidenced by the productions of great writers, particularly of Shakespeare, whose early writings partake more of the fancy than do his later productions.

**FANDANGO** (făn-dăn'gō), a famous dance of the Spanish people, dating from the Moorish occupation of Andalusia, though it is rarely danced, except at theaters and in parties given by the lower classes. It is said to have come into favor on account of the ecclesiastical authorities in Spain threatening to prohibit dancing. Accordingly, two parties were brought before the judges of a court, in which the fandango dance was given, and this resulted in its approval. In this form of dancing the parties never touch each other, but retreat, approach, and pursue each other in varied movements, voluptuousness being indicated by the movements.

**FAN PALM**. See **Palms**.

**FARALLONES** (fär-räl-lōnz'), an island group off the coast of California, situated thirty miles west of the Bay of San Francisco. It belongs to the State of California. The group consists of six islands, on the largest and most southern of which is a lighthouse with a flash light of the first order, at an elevation of 360 feet above sea level. Great numbers of gulls and murrets breed on these islands and furnish vast quantities of eggs, which are gathered for the market of San Francisco. Many sea lions and several species of seals frequent the group.

**FARCE**. See **Drama**.

**FAR EASTERN QUESTION**, the problem of international politics which at present is receiving attention from the leading nations of the world. In respect to territory it refers to Farther Asia, which in this sense includes all of the eastern portion of that grand division. It may be said that this issue of international politics dates from the time Prince Henry the Navigator explored an eastward route to the Indies, since which time the leading European powers have sought to control both the territory and commerce of the Orient. However, the beginning of the 20th century intensified interest in Far Eastern politics, particularly since the means of navigation have been improved and railroad building has become greatly extended, by which changed conditions western people have been enabled to compete more successfully in the Asiatic market.

The rise of Japan as a political power is a potent factor in the Far Eastern Question, and the war between Japan and China in 1894-95 is the beginning of an important epoch. The United States became more directly interested by annexing the Philippines in 1898, though it had already established itself as a factor by the annexation of the Hawaiian Islands. The policy of the United States has been to advocate the preservation of the integrity of China, and it has insisted that all nations, irrespective of spheres of influence, be granted equal rights of trade in the Chinese Empire. Russia has long sought preponderance in Manchuria, principally because the control of that region is an essential in securing a broad outlet to the Pacific for the great Siberian railway system. However, Russian influence became greatly lessened through the fortunes of war with Japan, and the latter country is not only a claimant to consideration, but is destined to exercise a wide influence in forming the future policy in regard to China and its industrial development. Germany, Great Britain, and France are the other three powers most concerned, since each has a foothold on the eastern shore of Asia. The

trade of Shan-tung and the fertile valley of the Yellow River are largely in the hands of Germany, while Great Britain is strengthening her position in the Yangtze valley, and France is endeavoring to cross China with a railway line from French Indo-China to connect with the Trans-Siberian Railway in Russian or Japanese territory.

In 1900 occurred the Boxer outbreak against foreigners, which was designed to preserve China for the Chinese. The promoters of this movement look upon railroad building as particularly favorable to the nations that advocate establishing spheres of influence until all of China is controlled by the commercial nations of Europe and America. No doubt the whole question will turn upon railroad building, and already transcontinental lines have been projected both north and south. When completed these lines will carry a vast trade and furnish the means which will bring Europe into control, as well as open and maintain a wide market for the manufactures produced by modern methods.

**FARGO** (fär'gō), a city of North Dakota, county seat of Cass County, on the Red River of the North, opposite Moorhead, Minnesota. It is on the Great Northern, the Northern Pacific, and the Chicago, Milwaukee and Saint Paul railroads. The surrounding country is a fertile region, producing large quantities of hay, wheat, flax, oats, and other cereals. Among the noteworthy buildings are the post office, the county courthouse, the public library, the public high school, and the Protestant Episcopal and Roman Catholic cathedrals. It is the seat of Fargo College (Congregational) and of the State Agricultural College. Island and Woodland parks are public resorts. The chief manufactures include flour, clothing, brick, and machinery. It has a large retail and jobbing trade in merchandise. Electric lights, sewerage, pavements, and public waterworks are among the improvements. It was settled in 1871 and incorporated in 1875. Population, 1905, 12,512.

**FARIBAULT** (fâr'î-bō), county seat of Rice County, Minnesota, at the confluence of the Cannon and Straight rivers, 52 miles south of Saint Paul. It is on the Rock Island, the Chicago Great Western, the Chicago, Milwaukee and Saint Paul, and other railroads. The surrounding country is fertile and contains many productive farms and dairying establishments. Among the manufactures are woolen goods, clothing, machinery, and cigars. The noteworthy buildings include the county courthouse, the high school, the State institutions for the deaf, dumb, and feeble-minded, the Bethlehem Acad-

emy for girls, the Seabury Divinity College, the Shattuck School for boys, and Saint Mary's School for girls. It has electric lights, pavements, waterworks, and street railways. The principal manufactures are flour, woolen goods, musical instruments, clothing and machinery. It was settled in 1850 and incorporated in 1877. Population, 1905, 8,279.

**FARMERS' INSTITUTE** (în'stî-tût), the organization maintained for the purpose of providing opportunities for discussion and advancement of agriculturists and stock raisers. The plans under which farmers' institutes are organized differ somewhat. In some instances they are conducted under the direction of officials appointed by a board of agriculture, while in others the state or government makes an annual appropriation, by means of which institute meetings may be organized and maintained throughout the agricultural districts. The course of study pursued includes topics relating to improved methods of cultivation, fertilization, care of machinery, stock raising, wool, mutton, and pork productions, transportation to market, beautifying of farm life, and many other kindred subjects. It is usually customary to have experienced professors of agriculture and mechanic arts give a series of lectures in order to bring the practical experience of the central stations in direct contact with the practical cultivators of the soil, the rearers of domestic animals, the workers in dairy establishments, horticulturists, etc. In some instances the institutes are in session for several weeks consecutively, while in others local meetings are held at various points in the county or district, thereby facilitating the attendance of a larger per cent. of the industrial classes.

In some instances, as in Michigan and several other states, the institutes are under the control of a board of agriculture. The state appropriation to defray the expenses of the institutes in New York aggregates annually about \$15,000, while in Iowa the appropriation to each county may not exceed \$50 per annum. Other states have plans whereby the same object may be attained, though the methods are very much diversified. Similar provisions have been made in Canada. The institute movement has progressed most successfully in the states of the north and northwest and in Ontario and the western provinces of Canada.

**FARMERS' ORGANIZATIONS** (ôr-gan-î-zā'shŭns), the societies or parties organized by farmers for the purpose of bettering the condition of agriculturists, and influencing legislation favorable to the various lines of agriculture, horticulture, floriculture, stock raising,

and dairying. Among the first organizations of this kind was the Patrons of Husbandry, organized by William Saunders, Aug. 5, 1867. This was formed on the plan of fraternal societies, under which certain degrees were given to members. The subordinate lodges or granges organized under the system were governed by the National Grange and numbered about 26,000 in 1890. Later other organizations were formed, having a more or less political significance, among them the National Agricultural Wheel, the National Farmers' Alliance, and the National Farmers' Political League. In 1892 a convention of delegates from the various farmers' organizations, together with delegates of the Knights of Labor and the People's party, was held in Omaha, Neb. A platform declaring their principles was adopted on the Fourth of July. Among the tenets declared were those of a graduated income tax, free coinage of gold and silver, government ownership of telephones and telegraph lines, reclamation of lands from aliens, and the eight-hour labor law. Gen. J. B. Weaver, of Iowa, was nominated for President and Gen. James Field, of Virginia, for Vice President. The party organized in this way received 1,055,424 of the popular and 22 of the electoral votes.

**FARNE ISLANDS** (färn), or **Fern Isles**, a group of islands in the North Sea, off the east coast of England, opposite Northumberland. The group includes seventeen islets of rocky formation. Navigation in the vicinity is very dangerous. They were the scene of the heroic deeds of Grace Darling in 1838, when the *Forfarshire* was lost. A tower built to the memory of Saint Cuthbert is on one of the islands. They belong to Great Britain.

**FAROE ISLANDS** (färö), a group of 25 islands situated in the North Atlantic, between Iceland and the Shetland Islands. The coast lines are largely rugged cliffs, rising abruptly to a height of 500 to 2,000 feet, while the mountains of the interior contain extensive tablelands, none of which exceeds 3,000 feet above the sea level. These islands belong to Denmark. They are governed by resident representatives appointed under the direction of the king. The inhabitants are descendants of Scandinavian people who settled here largely in the 9th century. Strömö is the largest island and contains the capital, Thorshavn, which has a population of about 1,000. The islands are treeless, but have valuable deposits of peat and coal. Building material and machinery are imported largely from Norway. The chief industries of the people consist of fishing, hunting, and sheep culture. Only seventeen of the islands are inhabited. The religion is exclusively Lutheran.

Numerous schools are supported by government grants. Population, 1906, 15,821.

**FARTHING** (fär'thĭng), a coin of Great Britain, the fourth part of a penny. It was first coined by the Saxons, but the copper farthing did not come into use until 1665. A farthing is equal to about one-half a cent in the money of Canada and the United States.

**FASCINATION** (fäs-sĭ-nā'shŭn), any irresistible influence which captures or controls the will or intellect. That human beings are fascinated more or less easily by certain natural influences is admitted on every hand, but some go so far as to seek to revive widespread belief in the evil eye, an influence that the superstitious thought existed, and by which individuals could be compelled to act contrary to their wishes. Some naturalists think that certain snakes and other animals have this power over mice, squirrels, and birds, but it has been neither satisfactorily explained nor demonstrated. However, some think that serpents emit narcotic fluids whereby the weaker animals become stupefied, while others regard the force or influence analogous to hypnotism.

**FASHION** (fäsh'ŭn), the prevailing style of usages, ornaments, and dress which is adopted by society and accepted by its members in accord with a general law of interest. The fashions change from time to time. They are supposed to take form in line with the most serviceable in practice and the most elegant and decorous in design. When the various fashions of past ages are examined, it is found that the changes were rapid and marked, and that caprice was more often the cause than utilitarian motives. However, the desire to dress *in fashion*, to have every part of the apparel agree with the accepted style, is noticeable throughout the period of history.

**FASHODA** (fä-shō'dä), a town of the Egyptian Sudan, on the White Nile. It was occupied by the French under Captain Marchand in 1898. The British demanded its evacuation, but the French refused to comply with this demand until they themselves received commercial concessions in the region of the upper Nile and an approval to the extension of their possessions in the Central Sudan. Fashoda was founded by the government of Egypt in 1867 and is situated in an unhealthy region. It has considerable trade in produce and merchandise.

**FAST** (fäst), the voluntary abstention from food, a practice which originated as a religious discipline. It may be either a total abstinence for a brief time from all food, or only from certain kinds, as meat or leavened bread. The origin of the practice is very obscure, but it

probably did not at first occupy nearly so prominent a place in Christian rituals as that to which it afterward attained. Among the ancient Egyptians fasting seems to have been associated with many religious festivals, notably that of Isis, but it was not compulsory. Among the Jews fasts were numerous, but the day of atonement was the only fasting day enjoined by the law of Moses. Mishna speaks of four others commemorating, respectively, the storming of Jerusalem by Nebuchadnezzar, the burning of the temple by Titus, the sacking of Jerusalem by Nebuchadnezzar, and the reception of the news of the destruction of Jerusalem by Ezekiel and other captives. Other fasts were proclaimed by royal or other authority on special occasions.

The New Testament enjoins no stated fasts, but several came into vogue subsequently, the fast of Lent taking the lead. In the 3rd century the Latins fasted on the seventh day. The Council of Mentz, in 813 A. D., ordered a fast the first week in March, the second week in June, the third week in September, and the last full week preceding Christmas. In the Roman Catholic Church there is a distinction between the days of fasting and of abstinence. The principal fast days of that church are the forty days of Lent, All Saints, the Immaculate Conception, Rogation Days, Assumption of the Virgin, Whitsuntide, and the eves or vigils before certain festivals, as before Christmas day. To these are to be added the Ember Days, these being the Wednesday, Friday, and Saturday after the first Sunday in Lent, Whitsuntide, the 14th of September, and the 13th of December. Abstinence is practiced on every Friday.

The Greek Church observes as fast days Wednesdays and Fridays; Easter, 48 days; Christmas, 39 days; and several others. The Episcopal and Anglican churches recognize the fast as being praiseworthy, but give no directions concerning it. Their fasting days are every Friday, except Christmas day; the 40 days of Lent; the three rogation days before Holy Thursday; and the Ember Days at four seasons. The Protestant churches in general do not observe fast days, but uniformly require moderation in eating and drinking wholesome food. However, some denominations, as the Adventists, abstain from certain foods, such as the flesh of swine.

**FAT**, an animal substance of a more or less oily character deposited in vesicles in the adipose tissue. It is a compound of oxygen, hydrogen, and carbon, and occurs mainly under the skin and on the surface of muscles, but also collects in considerable quantities around cer-

tain organs, as the heart and kidneys. Fat surrounds the joints and is found in large quantities in the marrow of the bones. Being light, soft and elastic, it forms an excellent packing material in the body, giving a rounded contour and smooth surface to the frame. Its chief use is for the purpose of nutrition, but, not being a good conductor of heat, it enables the body to retain a reasonable uniformity in temperature. In extremely cold climates fat is the principal food of man; for instance, the Eskimos subsist almost wholly on the fat of bears, seals, and whales during the season of extreme cold. *Fatty degeneration* is an abnormal condition brought on by defective nutrition or excessive use of alcohol, on account of which fatty granules take the place of healthy protoplasm in the heart, kidneys, muscles, and arteries. The sufferer retains the appearance of health, but is impaired by want of energy and muscular weakness.

**FATALISM** (fā'tal-iz'm), the doctrine of an unchangeable destiny, according to which all things are preëstablished by the Creator, or by the fixed laws of nature. It has given rise in theory to doctrines or predestination, and, in moral science, to such systems as those of Hegel and Spencer. The ancient Greeks held to the belief in fate so strongly that they regarded it the controlling power of even the gods, while in modern times the Mohammedans regard all things predestined or decreed by fate, and consider the occurrence of an accident an impossibility.

**FATA MORGANA** (fä'tä môr-gä'nä), a peculiar kind of mirage seen in Italy, especially between the coasts of Calabria and Sicily. It occurs in still mornings, when the waters are unruffled by breezes or currents, and the rising sun shines down upon the smooth surface at an angle of 45°. Objects upon the opposite shore of Sicily, upon the dark background of the mountains of Messina, are seen refracted and reflected upon the water in mid-channel, representing large and duplicated images. Gigantic figures of men and horses move over the picture, interspersed with trees, castles, and palaces. Anciently it was supposed that the phenomenon is due to the fairy Morgana, hence the name.

**FATIGUE**, the weariness which follows a long sustained application of the body or mind. It is a lassitude or exhaustion of strength which is due to continued bodily labor or mental exertion. A reasonable amount of fatigue is beneficial to both the body and mind, since it operates to increase the power of the muscular and nervous tissues, thus giving a larger measure of strength and providing for greater future

capability. However, the young and those who have a weak constitution need to exercise care in practicing sustained exertion, since it may have the effect of overtaxing certain muscles or nerves. Excessive muscular fatigue is followed by a loss of the contractile power of the muscle. In the nerves and brain it causes shrinkage of the nerves and a loss of sensibility and mental power.

The term *fatigue of materials* is applied to the injury which results from stresses that exceed the elastic limit of materials. If a bar of wrought iron has an ultimate strength of 55,000 pounds per square inch, in which the elastic limit is 25,000 pounds, a single application of a load will not cause a rupture until the ultimate limit of strength is reached. However, when the application exceeds 25,000 pounds per square inch, the molecular structure is altered, causing the iron to become brittle, and a rupture may occur under a stress much less than its ultimate strength, perhaps at 35,000 pounds per square inch. Engineers have formulated elaborate rules governing the fatigue of materials and make allowance for repeated stresses by means of definite formulas. See **Strength of Materials**.

**FATIMITES** (făt'ī-mīts), the descendants of Fatima, the daughter of Mohammed. They constituted a powerful dynasty which ruled Egypt and Syria for more than two centuries, at the time the Abbasside caliphs reigned at Bagdad. They claimed as their founder Ismael, one of the imams who descended from Ali and Fatima, and attained the throne under Adu Mohammed Obeidallah, who became the ruler in 909 A. D. The dynasty was extinguished in 1171, on the death of Adhed, the fourteenth caliph. It was succeeded by a new dynasty established by Saladin the Great.

**FATTY DEGENERATION** (dê-jěn-ēr-ā'-shūn), in pathology, a term which signifies a gradual displacement of the healthy protoplasm by fat globules. These globules have no element essential in life, hence are destructive to the living tissues. They are liable to affect any of the tissues, especially the cellular and muscular, and are a frequent cause of diseases of the heart and liver. Fatty degeneration of the kidneys occurs in many cases of Bright's disease. It is more common in old age, likely due to defective nutrition, and requires careful medical treatment.

**FAUBOURG** (fō-bōor'), the name applied in France to the suburb of a city, or to a district recently annexed to the municipality. Saint Germaine, a fashionable quarter of Paris, is a faubourg of that city.

**FAULT**, in geology, a displacement of strata of rocks along a plane of fracture. Faults are frequently met with in working beds of coal, the miner coming unexpectedly against an abrupt wall of other strata. The angle this makes in a plane of the bed he is working indicates whether he must look up or down for

FAULTS IN STRATA OF ROCKS.

its continuation on the other side of the dislocation. Beds are thus heaved from a few feet to several hundred or even a thousand feet.

**FAYAL** (fī-āl'), an island of the Azores, belonging to Portugal. It has an area of seventy square miles. A part of the surface is mountainous, rising to a height of 3,290 feet. The soil is fertile and the climate is favorable to Europeans. Among the chief products are live stock, cereals, fruits, and miscellaneous manufactures. Horta, situated on an eminence 3,000 feet above sea level, is the principal town. Population, 1908, 27,045.

**FAYETTEVILLE** (fā'ēt-vil), county seat of Cumberland County, North Carolina, at the head of navigation on the Cape Fear River. It is on the Atlantic Coast Line Railroad and has communication by steamship lines. The noteworthy buildings include the county courthouse, the Donaldson-Davidson Academy, and the State normal school for colored students. Among the manufactures are cotton goods, vehicles, ice, woodenware, and tobacco products. It has a large trade in lumber, cotton, flour, and naval stores. The municipal facilities include waterworks, sewerage, and electric lights. It was settled in 1762 and incorporated as a city in 1893. It suffered severe losses during the Civil War, especially in 1865, when it was occupied by General Sherman. Population, 1900, 4,670.

**FEATHER GRASS** (fěth'ēr), a genus of grasses distinguished by their elegant and featherlike awns. The common feather grass is native to the southern part of Europe, where it is found on the dry hills. It grows in closely

matted tufts, having numerous tall flower stalks with small florets, and the leaves have a dark green color. The tufts, if gathered before the seeds are ripe, retain their beauty throughout the winter. The esparto grass somewhat resembles feather grass. A species known as rush-leaved feather grass is native to the western part of North America.

**FEATHERS**, the dermal growths forming the external covering or plumage of birds. Though chemically similar to the hair on the skin of mammals, they differ widely from it in form and color. As a general rule, feathers consist of a central shaft, which is tubular at the base, and is imbedded in the skin like a plant in the earth. On either side of the *shaft* is a web, beard, or wane consisting of barbs and barbules. Feathers are of two kinds—*quills* and *plumes*. The quills grow mainly on the wings and tail, while the plumes are generally diffused. Being poor conductors of heat, they

FEATHERS.

Marabou Pheasant Toucon Bird of Paradise Ostrich

are useful in preserving the temperature of the bird. They are renewed once or twice a year, which renewal is called *molting*. Some feathers are known as *down* and are the first feathers of the birds. Most birds are provided with an oil gland at the base of the tail, whose secretion the animal distributes at various times over the feathers by means of the bill. Feathers form an extensive article of commerce and are used for ornaments, plumes, bedding, pens, and many other useful purposes.

**FEBRUARY** (fěb'ru-ā-rŷ), the second month in our present calendar. It has 28 days, except in a leap year, when it has 29 days. It was first placed after January by the decemvirs of Rome in 252 B. C. Originally it had 29 days, but, when the seventh month was named after Augustus, a day was taken from it and added to August, making the latter month the same length as July.

**FEDERAL HALL** (fěd'ēr-əl), the name of the building used as the capitol in New York

City, in which Congress met when that city was the seat of government. It was originally erected as a city hall, located on Wall and Nassau streets, and was rebuilt and placed at the disposal of Congress. However, New York retained the national capitol only a short time, as it was removed to Philadelphia in 1790, whence it was removed to the District of Columbia in 1801. Federal Hall was torn down in 1836 and its site is now occupied by a subtreasury.

**FEDERALIST, The**, a series of essays published in favor of adopting the Federal Constitution of the United States. They were written by John Jay, Alexander Hamilton, and James Madison, in 1787 and 1788, and appeared in the newspapers over the signature *Junius*. *The Federalist* had a wide influence and is counted among the political classics of the United States. Many editions with comments and indexes have been published.

**FEDERAL PARTY**, the first political party which had control of the government in the United States after the adoption of the Constitution. When the Constitution had been framed and sent by Congress to the states, in 1787, for ratification or rejection, those favoring acceptance were called Federalists and those opposing it were known as Anti-federalists. The Federal party was led by Washington, Pickering, Adams, Ames, Jay, Hamilton, and Morris. By it the machinery of the new government was established, but in this enterprise the prominent leaders of the Anti-federalists were consulted. The district, circuit,

and supreme courts were organized by the Federalists; the departments of State, Attorney-General, Treasury, and War were established; the debt created by the Continental Congress was funded; the debts of the states caused by the Revolution were assumed and funded; plans to repay money borrowed from Holland, France, and Spain were made, and, in 1791, the first national bank of the United States was chartered. A strong opposition to some of these measures was conducted by the Anti-federal party under the leadership of Jefferson, Monroe, Randolph, Madison, Gallatin, Gerry, and others, who afterward became leaders of the Democratic-Republican party. In order to secure the consent of the southern and agricultural states, it was necessary for the Federalists to consent that the national capital be located on the banks of the Potomac River.

The second measure of importance was the founding of the Bank of the United States under the leadership of Hamilton. In 1789 the

system of levying duties on imports was commenced. Each of these measures was carried out by a strict sectional vote, and the agricultural sections of the north and the south began to oppose the tariff system, which gave Jefferson and Madison a source of strength in organizing the new party. Later the Federalists endeavored to bring the country into war with France, this being prevented only by the policy of Adams, but it tended to divide the party. In 1798 the passage of the alien and sedition laws forever destroyed its popularity. The party succeeded in the election of Washington and Adams, the latter being defeated by Jefferson, in 1800, for reelection by a decisive vote. As an opposition party the Federalists took a strict-constructionist ground, while some of its leaders engaged in projects for the disruption of the Union. The policy pursued by the party during the War of 1812, and its general distrust of the people, caused its strength to wane and ultimately destroyed all hopes of permanent success.

**FEEBLE-MINDED** (fē'b'l mīnd'ēd), the state of being weak in intellectual power, or being mentally infirm, vacillating, or irresolute. It is a form of imbecility and differs from insanity in that it is less violent, being a form of feebleness rather than mental derangement or unsoundness. Little was done to build up a system of education which would aim at a suitable treatment of those subject to feeble-mindedness until 1848, when Samuel G. Howe, superintendent of the Perkins Institute for the Blind at Boston, Mass., elaborated a plan of education for the feeble-minded. Formerly they were looked upon as idiotic and either treated in hospitals for the insane, or given such care as was possible in public schools or private institutions.

Massachusetts established a State institution for the feeble-minded in 1851, the first State institution in America founded exclusively for these unfortunates, and subsequently many of the states established such schools. The education of the feeble-minded is now considered a necessary and important part of the system of public schools, since it provides training for those unfitted to take up the regular work of instruction, and who are not sufficiently infirm to be taken to hospitals for the insane, since their training must be of a kind which will strengthen them mentally and tend to develop them to the highest degree of efficiency under a system of training which must begin at an early period in life.

Institutions for the feeble-minded are generally located on a large tract of land within

easy reach of some town or city. In this way the inmates are removed from harmful influences common to a populous section, and they are brought in contact with the things of nature and the influence of their teachers under more wholesome environments than those associated with the city. These institutions are in fact a home for the idiotic and the imbecile, who remain there permanently or until such a time as their mental condition will permit them to return home, or to fill some function in life safely and independently. The purpose is to keep the inmates occupied in pleasant and agreeable work, and at the same time teach them the rudiments of an education. The educational work is largely in the form of kindergarten exercises, but those capable of mental progress learn to read, write, and sing. The male adults are taught to do work in the garden or orchard, while the females learn to knit, crochet, mend, and embroider. Much patience and diligence is required on the part of the teacher, who has charge of a small number of inmates, and the latter are graded as nearly as possible according to their age and state of mental development.

**FEELING**, in psychology, the power of the mind by which it is capable of experiencing or perceiving a mental act connected with some need or activity arising through the physical or the psychological nature. *Psychical feelings* have a purely mental source and arise from some conception or mental state. They are connected with some desire or activity, are accompanied by pleasure or pain, and ordinarily are preceded by knowledge, leading to volition. The feelings are the source of all joy and sorrow, and furnish the motives in view of which we choose to act or do. At first thought it may appear that knowledge alone leads to volition, but the influence exercised by desire and aversion is too apparent to be left out of account. Feelings are classified as *emotions*, *affections*, and *desires*. The simple feelings, as of joy and comfort, are emotions; those that go out toward an object, as of love, are affections; and those in which a wish to possess is manifested, as to possess food or clothing, are desires. See **Touch**.

**FELDSPAR** (fēld'spär). See **Felspar**.

**FÉLEGYHÁZA** (fā'lēd-y'-hā-sō), a city of Hungary, 65 miles southeast of Budapest, with which it is connected by railway. It is surrounded by a fertile farming country and has a considerable market in fruit, wine, grain, and cattle. The manufactures include pottery, clothing, cigars, and machinery. It has electric and gas lighting, waterworks, and paved

and macadamized streets. Population, 1906, 35,403.

**FELLAH** (fě'l'la), an Arabic word meaning peasant or farmer, applied to a laboring and agricultural class in Egypt. They form the bulk of the population and are descendants of the ancient Egyptians, intermingled with Arabs, Syrians, and other races of Africa and Eurasia. In social position they are inferior to the Bedouins. The men are of medium height, have a dark color, a large head with a facial angle of about 90°, thick lips, and small hands and feet. The women tattoo themselves and marry at an early age. Fellahs exhibit the moral qualities of the ancient Egyptians, being intelligent, grave, and sober on the one hand; but idle, jealous, licentious, and of unbending obstinacy on the other. A few are Copts, but Mohammedanism is the chief religion.

**FELLOWSHIP** (fě'l'lo-shĭp), the name of a position provided in many of the institutions of higher learning, both in America and Europe. The holder of such a position is called a *fellow*, who is appointed to the place for eminent scholarship, the object being to make it possible for him to pursue advanced studies. In some institutions the appointment is for a year only, while in others the period ranges from five to seven years, and the holder of a fellowship receives an annual stipend and other valuable perquisites. The ranks of the faculties are frequently recruited from the fellows. In England many fellowships are tenable for life, though in some institutions, such as Cambridge, they are for a definite term of years. However, the income in England is larger than in America, since the fellows receive from \$500 to \$2,500 annually. The trustees in some institutions of the United States are called fellows.

**FELSPAR** (fě'l'spär), or **Feldspar**, a group of minerals which embraces many species. In some form, it is the principal constituent of granite, gneiss, greenstone, and many other rocks, while clays seem to have resulted very generally from its decomposition. The minerals of this group occur in crystals and crystalline masses, are vitreous in luster, and break rather easily in two directions at right angles to each other. The colors are usually white, flesh-red, bluish, or greenish. All kinds of feldspar are so hard that they cannot easily be scratched with a knife. They are fused with difficulty, but are quite soluble in acids. Several species are of a fine grade, including those known as potash feldspar, lime feldspar, and soda feldspar. A nearly colorless variety, known as *moonstone*, is often cut into ornaments and

is prized almost as a gem. Another species with golden-yellow specks, called *sunstone*, is very rare and beautiful and commands high prices. *Labradorite*, obtained chiefly in Labrador, and *Amazon stone*, found in the Ural Mountains, are esteemed as precious stones. In decomposition feldspar not only yields clay, but also the mineral *kaolin*, both of which are essential elements in the manufacture of fine pottery and porcelain. Feldspar of commercial value is obtained in Greenland, in the Adirondack region of New York, in the Rocky Mountains of British Columbia and Colorado, and in other sections.

**FELT**, a kind of cloth made without weaving by taking advantage of the natural tendency of the fibers of hair and wool to interlace with and cling to each other. The materials are carded more or less perfectly, steamed or moistened with hot water, and passed between beaters and rollers which press them into compact cloth or felt. This class of material is used extensively for carpeting and in padding coats, caps, cloaks, and other garments. It is valuable in making table covers, carriage-linings, upholstery work, and piano hammers, and for sheathing boilers and hot-water reservoirs. When saturated with pitch, coal tar, or asphalt, it is used for covering sheds and similar buildings. Beaver hats are made in the same manner of the fur of beavers, rabbits, raccoons, and other animals.

**FEMUR** (fě'mür). See **Skeleton**.

**FEN** (fě'n), a tract of low land which is subject to overflow, or is partially or wholly covered with water. The name is used extensively in England, where it has reference to the Fens, or Fen District, which consists of a moor or boggy land that produces coarse grasses. These regions have a peculiarly rich soil and are frequently redeemed by drainage and the construction of dykes.

**FENCE**, an inclosure constructed of posts set in the ground, having fastened to them wire, rails, or boards. The posts are usually of wood, though iron is used for that purpose to some extent, and in regions having a large supply of rocks some fences are constructed of stone. Fences that inclose a yard are commonly made of boards or woven wire, while the larger fields and ranches are fenced with barbed wires. In some sections many fences are made by planting shrubs together closely in rows, such as willow or osage orange, but these are not as common now as formerly, since they require considerable care and to some extent interfere with the growth of crops near the fence line. Barbed wire used for fencing is usually twisted

of two strands, and the main wire has barbs from three to four inches apart. It is the chief material in constructing fences, though its use is not permitted in the cities and along the roads in some states, where smooth wire is used instead. See **Wire**.

**FENCING**, the art or practice of attack and defense with the sword or rapier. The instrument used chiefly is a small sword made to taper gradually from the hilt to the point, and the size depends upon the rules governing the practice. The rapier is a straight sword with a narrow and finely pointed blade, and is used only for thrusting. A blunt weapon called a *foil* is used chiefly in gymnasiums. It resembles a small sword in the main, but is usually lighter and has a button at the point to prevent accidents in practice. Fencing became popular among the noble and knightly class at the close of the 15th century, when it consisted chiefly of rapier and dagger play, and those engaged in the practice were covered with armor or carried a shield. It took first rank as a favorite form of exercise in the schools and gymnasiums of European countries, where it is still practiced quite extensively, but in America it never rose to a place of considerable importance as a school practice. The Amateur Fencers' League of America, which is associated with the Amateur Athletic Union, is the most important fencing organization in the United States. It has four competitive contests each year, the most important being with dueling swords and sabers, while the others are with foils. Fencing teams are maintained by the principal colleges and universities and these hold intercollegiate contests. New York, Philadelphia, Boston, and Montreal are classed as the leading fencing centers of America.

**FENIANS** (fē'nī-āns), the name derived from a class of ancient Irish warriors, the *Fianna* or *Fionna*, founded as home guards in the 3d century. In modern times it was made the name of a political association that has for its aim the forcible liberation of Ireland from British sovereignty. The Fenian movement of the last century dates from 1857, when John O'Mahoney, James Stephen, O'Donovan Rossa, and other prominent leaders established a brotherhood in America. The object was to make the United States the base for operations in Ireland and Canada against the English, the central headquarters being in New York City.

In 1863 large sums of money were collected to organize for aggressive hostilities, and a convention was held at Chicago for the purpose of formulating plans. An attempt to invade Canada was made in 1866, but the object was

frustrated by a capture of the stores of arms and provisions by United States authorities. About the same time an uprising in Ireland was suppressed by seizing the *Irish People*, a Fenian publication at Dublin, and arresting a number of leaders. Another effort was made to invade Canada in 1871, which likewise proved unsuccessful. An attempt to destroy British ships and prevent shipbuilding by the use of dynamite was designed in 1883, though the enterprise met with little success, the principal promoters being apprehended and sentenced to penal servitude for a term of years. Within recent years the brotherhood, although having many sympathizers in Europe and America, has not pursued active operations, but organizations are still maintained.

**FENNEC** (fě'nĕk), a small animal of Africa, resembling a small fox. The tail is nearly as long as the body, which has a length of a foot, and the ears are three inches in length. It has a yellowish color, except the tip of the tail, which is black and bushy. The fennec is native to the Sahara Desert and is called Sahara fox by some writers. It burrows in the ground, where it spends most of the day, and at night comes out in search of food. It subsists on insects, birds, mice, lizards, and the tender parts of plants.

**FENNEL** (fě'nĕl), a fragrant umbelliferous plant cultivated in gardens to a considerable extent for its aromatic qualities. The flowers are small and yellow or white, and the leaves, sometimes used in cookery, are finely divided. Among the common species are the giant fennel, common fennel, sweet fennel, and Indian fennel. The seeds are carminative and are used in medicine.

**FERGUS FALLS** (fēr'gūs fāls), a city in Minnesota, county seat of Ottertail County, on the Otter Tail River, 186 miles northwest of Minneapolis. It is on the Northern Pacific and the Great Northern railroads. The noteworthy buildings include the county courthouse, the high school, the public library, the Park Region Lutheran College, and a State hospital for the insane. It has manufactures of flour, ironware, clothing, cigars, and machinery. The Otter Tail River supplies an abundance of water power, by which various manufactories, an electric light plant, and several mills are operated. It was settled about 1861 and incorporated as a city in 1863. Population, 1905, 6,692.

**FERMENTATION** (fēr-mĕn-tā'shŭn), a change which takes place in most animal and vegetable substances when they are exposed to air and moisture at ordinary temperatures. It is a chemical decomposition of an organic com-

pound induced by chemical agents or by living organisms. In the former, called *unorganized* or *chemical* ferments, the enzyme causes a structural change without losing its identity, as in digestion; while in the latter, called *organized* ferments, the action is due to the growth of the ferment, as in the formation of acetic acid from alcohol by the action of the vinegar plant. The various organisms which produce fermentation apparently derive their nourishment from the original compound, and yield products that are poisonous to the ferment. It is for this reason that chemical decomposition ceases when fermentation products are in excess, or the nutrient is exhausted. It is arrested by certain substances, such as salt and alcohol, called *antiseptics*, as well as by heat and cold.

Several kinds of fermentation are recognized, the name depending upon the specific product obtained. In *alcoholic* fermentation the sugar contained in liquids is converted into carbonic acid, alcohol, and glycerin; in *acetic*, the spirituous liquors become acid and produce acetic acid; and in *putrid* fermentation, organic substances are altered in various ways, the alteration depending upon the nature of the substance, and poisonous gases are generally set free. Besides these are *ammoniacal*, yielding ammonia; *benzoic*, yielding benzoic acid; *amylic*, yielding amylic alcohol; *viscous*, yielding a gummy mass; *lactic*, yielding lactic acid; and *butyric*, yielding butyric acid.

The various kinds of fermentation may be effected at different degrees of temperature, varying from about 24° to 104° Fahr. In digestion the ferments of the pancreas act on fibrin at 90°. Viscous fermentation, in which wine is made thick and viscous so it forms threads when poured, occurs at a temperature of from 60° to 104°. Alcoholic fermentation under certain condition takes place readily at 24° to 30°. The ferments employed to excite fermentation are mostly organic, though there are many of an inorganic nature. Among the most common fermented liquors containing alcohol and used as beverages are wine, made from the juice of grapes; mead, from honey; cider, from apples; ale or beer, from an infusion of malt; and chicha, from maize. The last mentioned is made in large quantities in South America. See **Beer**.

**FERNANDINA** (fēr-nān-dē'nā), a city of Florida, county seat of Nassau County, on Amelia Island, 35 miles northeast of Jacksonville. It is on the Florida Central and Peninsular Railroad and has a good harbor on the Amelia River, which separates the island from the continent. The city has a large trade, both

inland and foreign, in lumber, cotton, phosphates, and merchandise. A fine shell road extends to Amelia Beach. Cumberland Island, located near the city, was the home of Gen. Nathaniel Greene and is the burial place of Light Horse Harry Lee. Fernandina was settled by the Spaniards in 1632, and was incorporated in 1859. Population, 1900, 3,245.

**FERNANDO PO** (fēr-nān'dō pō'), an island belonging to Spain, located in the Bight of Biafra, about 20 miles off the west coast of Africa. It is 42 miles long and 20 miles wide, and has an area of 768 square miles. The surface is mountainous, but the soil is fertile and well watered. Clarence Peak, the highest summit, has an altitude of 11,025 feet. The climate is hot and unhealthful. Among the chief products are rice, bananas, corn, yams, and live stock. The Portuguese discovered the island in 1471, but it became a part of Spain in 1787. Santa Isabel, the chief town, has a population of 1,500. The island is inhabited chiefly by native Negroes and Portuguese. Population, 1908, 21,346.

**FERNS**, a class of leafy but flowerless plants, springing from a rhizome, which creeps on the surface of the ground, or rises in the air like the trunk of a tree. This trunk does not taper, but is of equal diameter at both ends. The reproductive organs consist of spore cases and are attached to the veins at the under surface of the leaves, or at their margins. Most ferns are comparatively small, while some tree ferns

FERN-TREE. a. SPORE CASES.

reach sixty feet in height. Seventy-five genera and about 4,000 species are known. Some ferns yield products useful for food, while other species contain properties which are of value in medicine for expelling tapeworms. The fronds of ferns, or their impressions, are frequently

met with in a good state of preservation as early as the middle of the Silurian period.

**FERRARA** (fĕr-ră'rá), a city in Italy, capital of a province of the same name, situated on the Po River, about 26 miles northeast of Bologna. The site is low and unhealthful, but the streets are broad and well paved. It is an ancient city and has many towers and bastions. Among the most beautiful of ancient buildings are the old ducal palace and several cathedrals. A number of fine monuments are in the public places, one being dedicated to Savonarola, who was born here. The public library contains 100,000 volumes. It has modern municipal facilities, while railroad and telephone connections are well established. Among the manufactures are pottery, clothing, utensils, and machinery. Ferrara was an important city in ancient times, when it had 100,000 inhabitants, and its university dates from 1264. It was long held as a fief of the popes, came under the rule of the house of Este, and in 1797 was united with the Cisalpine Republic. In 1814 it was restored to the popes, but has been a part of Italy since 1859. Population, 1906, 88,064.

**FERRET** (fĕr'rĕt), a carnivorous animal of the weasel family, but closely allied to the polecat. In form and size it approaches the common mink. It is native to Africa and cannot

FERRET.

endure excessive cold. The representative species are about fourteen inches long and of a yellowish color. Ferrets are much used, both in America and Europe, for destroying rats and

for driving rabbits out of their places of seclusion. Several species are carefully bred in captivity, in which state they subsist on bread, raw meat, and milk. The *black-footed ferret*, found in the western plains of North America, is a species of the weasel. It is about two feet long, has a pale brown color, and the feet and tip of the tail are black. This animal is seen in the towns of prairie dogs, upon which it feeds.

**FERRIS WHEEL**, an immense structure designed and invented by G. W. G. Ferris, and constructed in Chicago in 1893 as a popular feature in the Midway Plaisance at the Columbian Exposition. This great wheel, the largest ever built, contained two wheels of the same size that were securely connected by struts and rods. An axle thirty-one inches in diameter and forty-five feet long was at the center, while the spokes were iron rods two and a half inches in diameter, placed in pairs thirteen feet apart at the crown connection. Thirty-six cars were hung on the periphery, each having a convenient seating capacity for forty passengers. The weight of the wheel and passengers was 1,200 tons, this immense burden being supported by substantial mechanical devices and a solid concrete foundation. The circumference of the wheel was 825 feet; diameter, 250 feet; and elevation above the ground, fifteen feet, making a total height of 265 feet. It was lighted throughout the exposition season by 3,000 electric lights. The total cost of construction aggregated \$300,000, while the number of passengers carried during the period of operation was 1,454,013. It was taken down at the close of the exposition and erected near Lincoln Park, Chicago, and in 1904 was removed to the exposition in Saint Louis.

**FÉROL** (fĕr-ról'), a city of Spain, in the province of Coruña, on the Bay of Betanzos, twelve miles northeast of Coruña. It has a fine harbor and is strongly fortified. The manufactures include hardware, leather, chocolate, cutlery, and firearms. Among the chief buildings are those of the government, a number of churches, and several schools. The streets are wide and regular and are beautified by several squares and promenades. Electric lights and street railways are among the public utilities. Ferrol was made a naval station by Charles III., and still has the largest shipbuilding interests in Spain. The French captured it in 1809 and in 1823. Population, 1907, 26,875.

**FERRY** (fĕr'rĭ), a passage by boat across a small body or stream of water. Ferryboats ply back and forth across water to carry passengers, horses, vehicles, or any other form of traffic.

Any mode of power may be used to propel the boat, which is usually fastened to a cable stretched from bank to bank. Sometimes a pulley is placed over the cable and the action of the water in a running stream carries it across. Large ferries are propelled by steam and furnish transportation for several thousand passengers, as those operated in New York City across the Hudson and the East rivers. In some cases entire trains are transported by steam ferry, as across Hampton Roads, the Columbia River, and the Straits of Mackinac.

**FERTILIZERS** (fēr'tī-lī-zērz), the general name of substances that are used to enrich the soil and promote the growth of plants. It is common to distinguish between homemade and commercial fertilizers, the former being known as *manure* and the latter as *fertilizers*. In a restricted sense the latter applies only to the materials that pass through some process of manufacture before being utilized in farming or gardening. They include such inorganic materials as nitrate of soda, sulphate and chloride of potash, and variously prepared forms of sulphatic rock. Another class embraces such organic substances as guano, bone dust, and the refuse from slaughterhouses. Desiccated and ground sheep manure is a kind of commercial fertilizer.

Stable manures are usually spread on the ground and plowed under, while commercial fertilizers are drilled into the soil in connection with wheat, corn, rye, and other grains, and in this way the plant food comes in direct contact with the roots of the growing plants. The manufacture of commercial fertilizers is regulated by law in many states and provinces, requiring in most countries supervision under the state or government, and the different classes are tested and graduated on the basis of their utility as plant food. This is quite necessary, since the agricultural classes otherwise would be unprotected against the use of worthless or harmful materials. See **Manure**.

**FESTIVALS** (fēs'tī-vālz), or **Feasts**, a period of one or more days consecrated to commemorate some important event or the observance of some religious rite. Festivals were held by most ancient nations and have continued to be observed throughout the modern centuries, though in a modified form. At the time Homer wrote the "Iliad" it was customary among the Greeks to keep two principal festivals—those of the harvest and the vintage—in which the deities were borne through the assemblages, animals were sacrificed, and the sounds of music rent the air. The six sacred festivals of the Jews are enumerated in Leviticus xxiii. The ancient

Greeks celebrated the festivals of Dionysia and Eleusinia and the Pythian, Olympic, Nemean, and Isthmian games, the four last mentioned constituting their great national games. Many festivals were celebrated in ancient Rome, but the Cerealia, Lupercalia, and Saturnalia constituted the more important. Many of the civil festivals of the Romans and Greeks were similar in that they constituted warlike games and exercises.

The festivals kept by the Christians give distinct reference to Christ and other personages held important in the history of the church. Formerly each festival was known as a *holy day*, hence the name *holiday*. The observance of Sunday is of most frequent occurrence. Other festivals designated in the Christian calendar have reference to events in the life of Christ, such as Christmas, Annunciation, Purification, Easter, Ascension, Corpus Christi, Epiphany, Transfiguration, and Trinity. Numerous festivals are set apart to commemorate saints, apostles, and angels, though in most of the churches every day of the year is dedicated to some personage or event. The term *holiday* at present has particular reference to the days set apart by the government to commemorate some important personage or event. See **Holiday**.

**FETICH** (fē'tīsh), or **Fetish**, a word introduced by Charles de Brosses (1709-1777) in 1760 in his publication, "Du Culte des Dieux Fetiches." It was derived from the Portuguese word *feitiço*, meaning *magic*, a term which expresses the idea held by the Portuguese concerning the religion of the natives found in Western Africa. The name was applied by Comte in a general way to the primitive theories of religion, but Sir John Lubbock assigns it as the second stage in the evolution of religious thought, rather than as a form of religion. He takes this view for the reason that the idea of worship is not necessarily involved, since the Negro believes that his deities can be compelled to comply with his desires by means of his fetich. Fetichism is a form of superstition which supposes the earth, feathers, trees, mountains, plants, serpents, and other animate or inanimate objects to have a spirit, and that the person having possession of the object can utilize that spirit as a servant. If the spirit does not attend to all the possessor requests, he beats the object as if to inflict pain as punishment. The most extensive forms of fetich worship prevail in Guinea and other portions of Western Africa.

**FEUDAL SYSTEM** (fū'dəl), an economic system or condition in force throughout Europe

for many centuries. It was distinguished by the political and social ranks which were based on the tenure of feuds and fiefs, given as compensation for military service rendered by chiefs. Under these owners the land was sublet by allotment to their subordinates and vassals in consideration of like service to be rendered. According to the feudal system, the king was the owner of all the land in his dominion, while noblemen held certain tracts under grants from him at his pleasure, but usually on condition of military service. When the Teutonic conquerors of the Roman Empire acquired paramount power, the feudal system made it possible for them to hold possession under the influence of noblemen, who were personally benefited. It had spread over all of France and Germany by the time William the Conqueror led his expedition into England, and soon after all the land was seized and a feudal system was established. It prevailed in England in a widespread form until the restoration of Charles II. However, traces of it are still abundant, but the conditions are greatly modified.

The people of England, who had acquired absolute possession under the Angles and Saxons, universally opposed the establishment of feudal ownership. Here the lands were said to be *allodial* to distinguish them from the *feudal* lands. Later both classes of ownership were recognized, the allodial estates being held by the noble and ordinary freemen and the feudal by those who were bound to serve some superior lord. The latter system possessed some advantage in that it furnished greater security of life and property, hence it came to predominate as a matter of necessity. Even the minor nobles who owned estates voluntarily placed themselves for protection under some more powerful earl or duke, which gradually gave rise to the powerful principalities of Germany and the whole continent.

The feudal system began to crumble with the rise of learning. Other causes of its decline include the spread of civilization, a wider knowledge of the rights of citizens, the rise of cities, and a change in the modes of warfare. Traces more or less prominent are still found in some countries, such as landowners holding title only as tenants from lords or titled nobles. On the banks of the Rhine and in many regions of Germanic and Romanic countries are remains of the system, such as castles formerly occupied by feudal barons and numerous villages in which dependents were grouped for religious worship and educational instruction.

**FEVER** (fē'vēr), a disease or group of diseases characterized by an accelerated pulse and

increased heat of the skin. Fevers usually commence with chills, loss of appetite, feeling of lassitude, pains in the back and limbs and nausea. They are classified into *continued* fevers, such as typhus or typhoid; *intermittent*, occurring at regular periods; *remittent*, such as yellow fever; and *eruptive* fevers, as smallpox, measles, and scarlet fever. Fevers are commonly named from the ailments with which they are associated, as *lung fever*, which is connected with inflammation of the lungs. The temperature in a low fever usually ranges from 100° to 102°, which is not considered much above the normal, but in high fevers it frequently reaches 103° or even 105°. When the temperature excels 105°, it is considered dangerous and may prove fatal.

**FEVERFEW**, the common name of a perennial plant native to America and Europe, found near hedges and in waste places. It is allied to the wild chamomile, but has flat leaves and smaller flowers. The stem has many branches, is about two feet high, and has a strong aromatic smell. It was so named from its use as a medicine in treating ague and fever and is still used as a tonic and stimulant. A double flowering species is cultivated in gardens, and a related plant yields the Persian insect powder.

**FEZ**, the largest city in Morocco, capital of the province of Fez and the principal seat of government in Morocco. It is situated in a valley of the Atlas Mountains about 100 miles east of the Atlantic and 85 south of the Mediterranean. The valley is fertile and is drained by the Fez River, on which the city is located. Ancient walls surround the principal part and the city consists largely of inconvenient houses. It has angular streets and extremely poor sanitary regulations. Among the public buildings are numerous mosques, one of which is the largest in Northern Africa. The palace of the Sultan is an ancient structure, but it is in a state of good preservation. Many of the edifices have fine porticos and are beautified by trees and gardens. The university, founded in 1859, is important as a seat of Moorish learning. It has a large library, botanical gardens, and about 850 students. Among the municipal utilities are a number of public parks and some modern facilities, such as telephones, sewerage, and tramways.

The commercial importance of Fez dates from times far remote, although domestic commerce is still carried on largely by caravans from and to the interior. The trade with Europe is extensive, the exports consisting largely of grain, live stock, fruit, and local manufactures. Among the manufactured products are leather,

silk, woolen cloaks, fez caps, handkerchiefs, pottery, and utensils. Fez was founded in 793 A. D., by Edris II. It was the capital of an independent state from 1202 until 1548, during which period it attained widespread prosperity, and was long famous as a seat of Arabian learning. The inhabitants consist mostly of Moors, Arabs, Jews, Berbers, and Negroes. Population, 1908, 141,385.

**FEZ**, a kind of brimless hat made of fine red wool, so named from Fez, Morocco, where it was first manufactured. It fits the head closely, has a blue or black tassel upon the crown, and is worn extensively by the Turks. The name *tarbush* is applied to it in Africa.

**FEZZAN** (fěz-zän'), a state in Northern Africa, situated south of Tripoli and attached to it for governmental purposes. The length from east to west is 380 miles; width, 300 miles; and area, 110,000 square miles. The surface is hilly and is traversed by the Jebel-es-Soda or Black Mountains, which trend east and west 170 miles and are not elevated above 3,000 feet. Much of the interior is made up of small oases, but the northwestern part is a waterless plateau and the southern section is a desert. It is largely unproductive, owing to an excessively hot climate and the absence of sufficient rainfall. The domestic animals consist largely of goats, sheep, camels, and cattle. Among the chief agricultural products are cotton, barley, wheat, millet, tobacco, vegetables, and fruits. The government is administered by a lieutenant governor under the pashalic of Tripoli, hence it is a dependency of Turkey. Murzuk is the principal town, having a population of 7,250. The inhabitants consist chiefly of Tuaregs, Moors, Arabs, Berbers, and Negroes. Little advancement has been made in the industries and arts, many of the people being unable to read and write. Arabic is the chief language and Mohammedanism of the Sunnite sect is the prevailing religion. The Romans conquered the region in 19 B. C., when it was known as Phazania, and the people became Christians in the 6th century. In the 7th century it was conquered by the Arabs. Population, 1906, 72,380.

**FIBER** (fī'bēr), or **Fibre**, a small thread, string, or filament of which the tissues of animals and plants are constituted. Asbestos is the only mineral fiber known. The utility of fibers in the arts and manufactures depends upon the length, structure, strength, and ability

to retain colors in dyeing. Among the more common animal fibers in use are wool, silk, and furs (q. v.). Vegetable fibers are employed extensively in the arts and are obtained from different parts of a large number of useful plants. Cotton fibers surround the seed of the cotton plant. Jute, hemp, and flax fibers are obtained from the bark of plants. The husk of the coconut and the leaves of various palms are used for making rope and matting. In recent years the fiber of the sisal hemp has come into ex-

FIBER OF HEMP.

The light part shows the fibers after the pulp has been scraped off by a knife or stripping machine.

tensive use for binding twine and rope. Ramie, or China grass, corn husks, Esparto grass, broom corn, Spanish moss, and vegetable sponge furnish fibers for manufacturing purposes. A majority of the finer textile fibers are obtained in the Temperate zones, but the larger number of fibers come from the warmer countries. See **Cotton, Linen, Paper**.

**FIBRIN** (fī'brīn), a white proteid compound obtained when blood is coagulated, as by stirring fresh blood with a bundle of twigs. The fibrin, adhering in fibrous layers, is washed with water to remove the coloring matter. It is insoluble in water, but dissolves in an aqueous solution of nitrate of potassium, when heated to 40° Fahr. Normal human blood contains 2.55 per cent. of fibrin. Vegetable fibrin is a nitrogenous substance resembling animal fibrin, and is separated from the seeds of cereals and other plants.

**FICHTELGEBIRGE** (fik'tel-gē-bēr-gē), a mountain range of Germany, on the northern frontier of Bavaria, about midway between the Bohmer Wald and the Erzgebirge. It has a general elevation of 3,000 feet, but Schneeberg, the highest peak, is 3,415 feet above the sea. This range of mountains separates the affluents of the German Ocean and the Black Sea, being the source of the Naab, the Main, the Saale, and the Eger. Much of the surface is covered with firs and pine. Copper, lead, and iron ores are mined extensively.

**FIELD GLASS**, a small binocular, portable, terrestrial telescope for determining the exact

distance of an object from the observer. It is used largely in armies to ascertain the distance of the enemy, and to range the guns on the basis of observations made by means of it. The common field glass resembles the telescope made by Galileo, having a large object glass to secure a brilliant image and a negative, or concave, eyeglass. An achromatic telescope, having from three to eight joints, being from fifteen to thirty inches long, is designated by the same name.

**FIELD OF THE CLOTH OF GOLD**, the name of the place where Francis I. of France and Henry VIII. of England met from June 7 until 20, 1520, for an interview. The locality of the meeting is on a plain between Arde and Guisnes in the département of Pas-de-Calais. It was so named from the splendor of the banquets and the gorgeous trappings and apparel used by the participants. The meeting occurred because Francis I. sought the friendship of Henry VIII. against Charles V. of Germany, but in this he was not successful. Interviews took place shortly after at Calais and Gravelines between Henry VIII. and Charles V. Shakespeare gives a graphic description of the meeting on the Field of the Cloth of Gold in his "Henry VIII."

**FIERY CROSS** (fī'ēr-ŷ), a cross made by the Highlanders of Scotland, who called it the *Crantara*. It was constructed of light, dry wood and the extremities were burned to a char, after which the fire was extinguished by dipping in the blood of a goat. The Fiery Cross was carried from place to place as a signal for men to hasten to arms in defense of their country.

**FIFE** (fif), a small, shrill-toned, martial instrument, either of wood or metal, in the form of a tube, having fingerholes and a blow-hole or mouthpiece. It is variously pitched, usually from D on the fourth line of the treble staff upward, and the compass is two octaves. The notes are shrill and somewhat harsh. Fifes and drums have been a source of much inspiration in the army during long marches and are still held in high esteem.

**FIFTEEN DECISIVE BATTLES.** See **Battle**.

**FIG**, a small fruit tree native to Asia Minor, but now cultivated in all the countries adjacent to the Mediterranean. About 300 known species are recognized, most of which are characterized by large leaves. Some are trailing vines and others are great trees. The average height of the fig tree grown for its fruit is about twenty feet. In favorable climates it produces two crops of figs yearly, in the spring and autumn.

The fruit is a fleshy receptacle of a conical form. It is attached to the twig by the narrow end. At the larger end is a small opening as in a pear, the flower and seeds lining the interior. The fig is used as food and is employed in medicine as a demulcent and laxative. In a fresh state for table use it can be transported only a short distance, hence it is dried extensively

FIG.

A, Female Flower; B, Section of Fruit.

and packed in boxes for the market. Dried figs form an important article of commerce, the best grade being imported from Turkey and the Levant. However, the culture of the fig has been extended very largely the past few decades, especially in Australia and California, where the quality of the fruit is thought to be equal to that of Smyrna.

**FIGARO** (fê-gâ-rô'), the name of a journal issued in Paris, France, celebrated for publishing contributions from Jules Janin, Jules Sandeau, George Sand, and a number of other able writers. It was so named from the comedies of Beaumarchais entitled "The Marriage of Figaro" and "The Barber of Seville." The name was afterward adapted by Mozart and Rosini, by the former in his "Marriage of Figaro" and by the latter in his "Barber of Seville."

**FIGHTING FISH**, a small fish allied to the perch family, so named because it is used in captivity for fighting purposes. It is a small fish and is kept in glass globes. The color is dull, when the fish is quiet, but assumes a metallic luster when it becomes excited. Fight-

ing fishes are native to the southeastern part of Asia, where they are used for gambling purposes. They attack each other immediately on coming in contact, hence much money is spent in betting on the result of the contest.

**FIGURES OF SPEECH**, the variations of the literal or ordinary form of expression, the intention being to make the thought more attractive or more striking. The principal figures of speech include the simile, metaphor, allegory, personification, antithesis, synecdoche, apostrophe, hyperbole, climax, and irony. They are usually divided into figures of rhetoric, figures of etymology, and figures of syntax. Figures of *rhetoric* are used extensively in poetical composition, being figures of thought rather than of grammatical form. Figures of *etymology* refer to the forms of words, as in the use of *o'er* instead of *over*, while figures of *syntax* have reference to variations in the construction of sentences.

*Simile* is an expression of resemblance between two different things, as in the sentence, "Religion is to the soul what life is to nature." *Metaphor* is another figure which is founded upon the resemblance of one thing to another, but it differs from simile in that the expression is implied instead of being formally expressed. "Life is like an isthmus between two eternities" is a simile, while "Life is an isthmus between two eternities" is a metaphor. *Allegory* is founded upon resemblance, but the comparison is more extended than in simile and metaphor. It is designed to teach some abstract truth by the use of symbolic language, hence is in the nature of a short fable or parable. *Personification* consists in attributing life to inanimate things, as in the sentence, "The hungry flames swept onward." *Antithesis* is founded upon unlikeness, in which things are contrasted or opposed to each other. The expression "Science is deep as eternity; speech is shallow as time," is antithetical. *Apostrophe* is direct address to the dead as if they were living, or to the absent as if they were present. A figure of *synecdoche* consists in putting a part for the whole, or the whole for a part, as in the example, "Give us this day our daily bread." *Hyperbole* is an exaggeration, as in saying "I am tired to death." *Climax* is an ascending series of thoughts or statements which gradually increase in importance, as in "Liberty was lost,—all was lost!" *Irony* is disguised satire. We make use of this figure when we praise a thing and really mean to ridicule it.

**FIJI ISLANDS** (fĕ'jĕ), an island group in the South Pacific Ocean, consisting of about 250 distinct islands, of which one-third are in-

habited. They are situated 7,450 miles from San Francisco, east of the New Hebrides, and have an area of 8,050 square miles. The two largest are Vanua Levu and Viti Levu, the former having an area of 2,600 square miles and the latter, 4,250 square miles. Most of the islands are of volcanic origin, but the group contains many atolls and coral reefs. Volcanic action and earthquakes are not infrequent. The climate is healthful, the soil is productive, and the natives have become largely educated and Christianized. Among the principal products are live stock, maize, cotton, copra, sugar, peanuts, tobacco, pearl shells, and fruits. The government maintains two public schools and an industrial institute, at which about 200 pupils attend. The Wesleyan missionaries direct almost entirely the educational affairs, their schools numbering 2,075, at which 35,500 pupils attend. Besides these, there are 145 schools of the Roman Catholic mission, at which 2,150 pupils are enrolled.

The Fiji Islands present one of the most favorable examples of effective Christianizing, fully 110,000 of the inhabitants being Christians, while not more than 75 years ago the natives ranked as the fiercest of cannibals. Abel J. Tasman (1602-1659), a Dutch navigator, discovered them in 1643, and Captain Cook cruised among them in 1773. An influx of European settlers began in 1866, principally from Australia and New Zealand, and soon after the commercial interests of the Fijis grew to importance. Since 1874 they have been formally governed by Great Britain as the Fiji Colony. Suva, on the south coast of Viti Levu, is the seat of government. The inhabitants consist chiefly of Fijians, Indians, Rotumans, and Europeans, the last mentioned numbering 2,459. Population, 1906, 125,085.

**FILE**, a steel instrument for abrading or smoothing surfaces, having raised cutting surfaces or teeth made by indentations of a chisel. Files are of various shapes, sizes, and fineness of cut. Those in common use are either flat or triangular in form. They are said to *taper* when they are thinner toward the point; to be *parallel*, when they are of the same dimension throughout; and *blunt*, when they grade between a taper and a parallel. Some types are square, round, or half-round. They are either single-cut, having but one row of teeth, or double-cut, having two sets of teeth crossing each other obliquely. A *rasp* is a similar instrument, but has coarser teeth and is used on soft materials, such as wood and the hoofs of horses. The file is one of the most ancient instruments, and is mentioned as early as 109

B. C. Only high grade steel is used in manufacturing files. The cutting and tempering involve much skill and the use of complicated machinery.

**FILEFISH** (fil'fish), a class of small fishes native to the tropical and temperate waters, so named because the stout dorsal spine is armed with two rows of barbs, giving the appearance of a file. Both jaws are furnished with teeth, each having eight teeth in a row, and the body is covered with hard rhomboidal scales. The *barnacle eater*, a species of filefish, occurs in the Atlantic off New England and Newfoundland. It attains a length of eighteen inches, has a tawny color, and is frequently seen in aquariums. A species native to the Mediterranean is about two feet long. The filefish is allied to the trigger fishes.

**FILIBUSTER** (fil'ĩ-büs-tēr), a name applied originally to the pirates of the West Indies. The word is of Spanish origin, in which language it designates a fast-sailing vessel or flyboat. It came to be the name of the adventurers who organized expeditions in the United States to gain control of West Indian and Central American regions with the hope of having them annexed to the United States, and thus to extend the slave territory. Gen. William Walker, who was captured, court-martialed, and shot Sept. 12, 1860, was the most noted of the filibusters. The term *filibuster* has been introduced recently to designate the members of the minority of a legislative body, who seek to delay or defeat the adoption of measures obnoxious to them by raising questions of parliamentary law, making motions to adjourn, or calling for yeas and nays.

**FILTRATION** (fil-trā'shūn), a process by which solid particles are separated from a liquid by causing the latter to pass through porous substances, which retain the solid particles or impurities. In constructing a filter it is necessary to use materials that contain interstices or pores through which the liquid may pass, but they must be sufficiently fine to retain the solid particles. Ordinary plans for filtering may be illustrated in a device utilized in constructing cisterns, in which the water is passed through a porous substance, such as sandstone, brick, charcoal, silicated carbon, wood, gravel, powdered glass, or others by which the solid particles may be retained. The most serviceable plan is to conduct the water through a pipe to the filter, which is commonly made of various layers, such as sand, gravel, charcoal, and other substances alternated, and, after passing through them, it is dropped into the cistern or tank beneath. A partition wall of brick, through which the water

passes, is not an uncommon form, the water being dropped in on one side of the wall and drawn out for use at the other side.

In order to preserve a good sanitary condition it is necessary to have the filter constructed in such a way that it may be removed and cleansed or replaced by other substances at least once or twice a year, otherwise the pores become clogged, or the mass solidifies by the particles retained, and thereby it becomes inoperative or impure. In filtering oils, syrups, ale, beer, and other similar substances it is customary to use horsehair, cloth, felt, skins, cane, clay, wool, capillary threads etc., this depending upon the character of the liquid to be purified. Charcoal made of bones is much more serviceable than wood charcoal, since it removes both the solid matter and many gases, and is utilized to reduce the color of alcoholic beverages and to whiten sugar. Mechanical devices are now used extensively to clean the water in tanks and cisterns. They are placed in the water and, by manipulating a valve, the entire body is forced through a small filtering cylinder, by means of which the particles become separated and are thrown out. However, it must be borne in mind that filtration removes only substances suspended mechanically in the liquid, while impurities or foreign substances existing in a dissolved state can be removed only by distillation. See **Distillation**.

**FINCH**, the popular name of various small birds, many of them having fine plumage and a beautiful song. They are usually called *hard-billed* song birds to distinguish them from the warblers or *soft-billed* songsters. Not less than 550 species have been described, of which 135 are found in Canada and the United States. Various species of the finches inhabit nearly all parts of the globe, except Australia, but they are most abundant in the Northern Hemisphere. They are variously known as bullfinch, chaffinch, hawfinch, and pinefinch. These birds may be distinguished by their strongly formed bill, suitable for crushing seed, which is their favorite food.

**FINDLAY** (find'lā), a city in Ohio; county seat of Hancock County, on the Blanchard River, about 42 miles south of Toledo. It is on the Big Four, the Cincinnati, Hamilton and Dayton, the Lake Erie and Western, and other railroads. The surrounding country has extensive deposits of petroleum, natural gas, and fire and potter's clay. Among the noteworthy buildings are the county courthouse, the city hall, the public library, and the high school. It is the seat of Findlay College (Church of God) and has a hospital and an orphans' home. Among the manufactures are vehicles, machin-

ery, ironware, earthenware, clothing, glass, baskets, flour, pottery, and stoves. It is the focus of several electric interurban railways. The city has waterworks, pavements, sewerage, and a public park. It was incorporated in 1837. Population, 1900, 17,613.

**FINE ARTS.** See **Art; Architecture; Sculpture**, etc.

**FINGAL'S CAVE** (fīn'gals kāv), a celebrated natural cavern on the island of Staffa, off the western shore of Scotland. The basaltic columns consist of immense dikes with diversified though symmetrical forms, and are joined to the rocks with much beauty. At the entrance it is 42 feet wide and at the end it has a width of 22 feet. It is 227 feet long. The height of the arched roof is 65 feet. The cave can be entered by small boats, since the low-water mark in the cave is about 20 feet. This cavern presents one of the most picturesque of the many nonvolcanic igneous eruptions found in the earth's crust.

**FINLAND** (fīn'land), a grand duchy of Russia, in the northwestern part of Europe, with an area of 144,550 square miles. It is bounded on the north by Norway, east by the governments of Archangel and Olonetz, south by the Gulf of Finland, and west by Sweden and the Gulf of Bothnia. The region includes many lakes and marshes, the largest of the lakes being Kalla, Enare, Tornea, Saima, Päjänne, and Ladoga. Many of these lakes are connected by canals, whereby commercial enterprise has been greatly facilitated. The railroads, with a total of 2,090 miles, are under government control and furnish connection with all the important commercial centers. The rivers are unimportant, and no great mountain elevations exist. It has vast forests of conifers and oaks, which cover about one-third of the land surface, though coal and extensive fossils do not abound. Granite, copper, and iron ore are the chief minerals. Among the chief agricultural products are wheat, oats, rye, and barley. The climate is affected by the adjacent water surface, rendering it suitable for the production of pears, apples, cherries, and small fruits, but the larger species thrive only in the southern portions. Many of the lakes and streams abound with salmon, trout, perch, pike, and other food fish. All the domestic animals common to Europe are reared with profit, especially cattle, horses, sheep, and swine. The principal exports are fish, meat, leather, textile fabrics, lumber, and grains. Coal, raw cotton, and foodstuffs are imported. The largest share of trade is with Sweden, Russia, and Germany.

**GOVERNMENT.** The executive authority is vested in the Czar of Russia, who is the Grand Duke of Finland. A new constitution went into force in 1907, under which the legislative function is exercised by a diet of 200 members, who are elected by universal suffrage without distinction of sex. The state of education, like that of the Scandinavian countries, is on a high plane of efficiency, and greatly excels that of any other portion of Russia. Nearly the entire population is able to read and write, the result of compulsory attendance laws and a free school system for both sexes. Helsingfors is the seat of literary life and impulse. A university supported by government grants is maintained at Helsingfors, which has an attendance of 2,350 students.

**INHABITANTS.** The people consist mostly of Finns, whose language, the Finnish, is generally spoken, but the higher classes generally speak Swedish. Lutheran, the established religion, is the faith of practically the entire population; only 48,500 belong to the Greek Church. Only a small per cent. of the inhabitants are Russians, but the country has a considerable number of Swedes, Lapps, and Germans. Helsingfors is the capital and chief city. Other cities include Abo, Tammerfors, and Wiborg. Population, 1905, 2,982,088.

**LANGUAGE.** The Finns are allied to the Magyars of Hungary and the Laplanders, and differ in language and habits from the Russians and Swedes. The language is classed with the northern division of the Turanian or Uralo-Altaic family, which is spoken by the people of Lapland, Olonetz, and Archangel. Their literature is valuable on account of the richness and beauty of its poetry, and the language is not only agreeable, but has a wealth of vowels and diphthongs, and is uncommonly flexible. Within recent years several lexicons and treatises on their history, language, and literature have been published, while their tongue is taught in many of the higher educational institutions.

**HISTORY.** The Finns had independent chiefs up to the 12th century and were a warlike people. They were conquered by the Swedes about 1150 and their conversion to Christianity followed soon after. Peter the Great of Russia secured a portion of their territory by treaty in 1721, and Russia conquered the remainder from the Swedes in 1809; since which time it has belonged to that country. In 1903 the privilege of autonomy was removed, but it was restored in 1905, at the time of the general strike in Russia. At the same time woman suffrage was established and social and financial reforms were inaugurated.

**FINLAND, Gulf of**, an extensive arm of the Baltic Sea, extending to the east between Finland on the north and the Russian governments of Saint Petersburg and Esthonia on the south. The width is from 10 to 75 miles and the length is 250 miles. It receives the outflow from Lakes Ladoga and Onega. Within the gulf are numerous islands, sandbanks, and shoals. The Russian government maintains several forts on the gulf. The shores are rocky and precipitous and the waters only slightly salty. It has a number of fine harbors, including those of Wiborg, Kronstadt, Reval, and Helsingfors.

**FINS**, the organs of fish which serve to propel, balance, or steer them in the water. They

FISH, SHOWING FINS.

usually consist of rays of bones covered with an elastic membrane. The *pectoral* or breast fins, a short distance behind the gills, are modifications of the anterior limbs in other vertebrate animals, and the *anal* fins, near the anus, correspond to the hind limbs. The *dorsal* or back fins are from one to four in number, depending upon the species, and the *ventral* or belly fin usually is a modification of the skin. The tail is known as the *caudal* fin. Fins are usually divided into *paired* and *unpaired*, the former including the pectoral and sometimes the anal and the dorsal. The term *fin* is often applied to the paddles of a whale, but never to the hind feet of seals or the webbed feet of birds.

**FIORD** (fyôrd), or **Fjord**, a name first used by the Scandinavians in describing a narrow bay that penetrates inland, and which is characterized by steep, rocky walls. Inlets of this kind are very common in Norway, and are thought to have originated from the combined action of glaciers and waves. Sogne Fiord, the most notable fiord of Norway, extends inland about 100 miles, and for this entire distance has very high and precipitous walls of rock. Similar inlets occur on the coasts of Nova Scotia and New England, and they prevail more or less in British Columbia, Greenland, Patagonia, and New Zealand. The lochs and firths of Great Britain are in many respects similar to fiords.

**FIR** (fēr), a name once used coextensively with the widest sense of the word *pine*, but

now restricted by botanists to the one genus *Abies*, which includes the spruce fir, silver fir, Norway spruce, and other species. The trees of this genus belong to the family *Coniferae*. They are distinguished from the pines by the flat, rounded apex of the scales of their cones, and by leaves not in clusters of definite number. Fir trees are found in many parts of Eurasia and America, where they occur in fine forests, and the lumber and other products derived from them are important articles of commerce. From the *Norway spruce* is obtained lamp-black, tar, turpentine, resin, and Burgundy pitch. The bark is used in tanning and for making baskets, the roots yield fibers for cordage, and the wood is employed for fuel, house-building, and making masts and spars of ships. In the market the wood of the Norway spruce is known as Christiania deal and Dantzic deal. The *white spruce*, or *white fir*, which ranges from Lower California to British Columbia, is one of the finest trees of that region and attains a height of 300 feet. *Hemlock* forms dense forests in the northern part of the United States and Canada, extending as far as Hudson Bay. The bark is valued for tanning, while the wood is used for construction purposes. In the northwestern part of North America is found the *Douglas fir*, often growing 250 feet high. Spruce beer is made from

BALSAM FIR.

small branches of the *black spruce*, and Canada balsam is obtained from the *balm of Gilead fir*.

**FIRE** (fīr), the evolved heat and light produced by ignition or combustion. The vividly perceptible ascending stream or current exhibited in the combustion of gases is called a *flame*. In ancient times it was regarded one of the

four primary elements of which all things were thought to be composed, the other three being earth, air, and water. Among the ancients and even within comparatively recent times many superstitions regarding fire were common, such as led to fervid and devoted fire worship. Many uses of fire were known very early, though some of the common methods of producing and controlling it are quite recent. The newer methods include its production by inflammable matches and its extinction by chemical compounds, as by a mixture of dried ferrocyanide of potassium, chlorate of potassa, and sugar set in action by sulphuric acid, or by mechanical agencies.

**FIRE ALARM** (ä-lärm'), an apparatus for communicating warning of a fire, either electrical or mechanical. An automatic arrangement is now in use which depends for its action upon the increased temperature of the air in the vicinity of the fire, or of the burning away of certain connecting cords which are stretched in exposed situations. In large cities there are stations where any person discovering a fire may turn in an alarm by touching an electric button, which immediately gives the street and number of the house on fire, at the central station, whence relief may be speedily despatched.

**FIREARMS.** See **Cannon**; **Gun**; **Rifle**, etc.

**FIREBALL.** See **Meteors**.

**FIRE CLAY**, a variety of clay found in a stratum below the coal formations and sometimes elsewhere. It is used in the manufacture of brick, tile, gas retorts, and other vessels suitable to withstand high temperatures. The principal constituents of fire clay are silica and alumina, accompanied by small proportions of iron, lime, magnesia, water, and organic matter. Fire clay is found extensively in Canada and the United States and occurs in all the continents.

**FIRECRACKERS.** See **Fireworks**.

**FIRE DAMP**, an explosive coal-gas generated in coal mines, consisting chiefly of light carburetted hydrogen. When fire damp is mixed with from five to fourteen per cent. its volume of atmospheric air, it is explosive. It is very dangerous to miners, the principal protection being the safety lamp, though in most cases danger can be avoided by a good system of ventilation. Edison invented an electrical safety lamp which gives a strong light for several hours at a very trivial expense and, when any accident occurs to break the globe, the light instantly becomes extinguished.

**FIRE DEPARTMENT** (dê-pärt'ment), an organization maintained in towns and cities as a means of protection against fires. This de-

partment of a municipal government is supported by general taxation and may be either paid or voluntary. A *paid fire department* is one in which the chief and his assistants are employed regularly on a salary, while a *volunteer department* is made up of members who serve only when called by a fire alarm, and they are paid only for the time they actually attend fires. Some cities maintain both classes of organizations, as a means of security during large conflagrations, and the volunteers are paid only for the actual time of service.

Paid fire departments are maintained in practically all towns and cities that have a population of more than 9,000, and those in charge as employees of the city give their entire time, both day and night, to the duties incumbent upon them. The smaller cities have a single fire station, while the more populous places have a central and several branch stations, where the fire engines, ladders, chemical engines, hose carts, and other supplies are kept ready for use. One or more teams of well-trained horses are kept ready for call in the stalls at the station. When an alarm is given by electrical devices, they take their places under the harnesses which are suspended in position before the engine or fire wagon, and the men, who promptly slide down poles from the room above, clasp the harnesses and are ready to start for the scene of the fire without delay. Hose are attached to the hydrant of the waterworks, which supplies the necessary pressure, or, where an engine is used, the pressure is obtained through it, and the water is pumped direct from the hydrant. In many instances chemical engines are used and in some cases the work is supplemented by a hook and ladder company.

**FIRE ENGINE** (ěn'jĭn), a machine designed to throw water for the purpose of extinguishing fires. Mechanical devices for saving buildings and cities from destruction by fire were used more or less for many centuries, though it is only within recent years that they have been brought to a high state of efficiency. They are mentioned in Roman history by Pliny, and appear to have formed a part of the municipal facilities of Athens, Carthage, and Alexandria. Several mechanical devices for throwing water to considerable heights were used extensively in Europe in the 16th century, the most successful of which were built in Augsburg, Germany. Similar machines were constructed at Nuremberg in 1657 and at London in 1730. They came into use in the cities of Canada and the United States about 1731. At present some form of fire engine is a part of

the necessary equipment for municipal protection, not only in every city, but in all the towns and hamlets.

Fire engines are a class of force pumps by which the water is subjected to a pressure sufficient to raise it to the necessary height, and are now generally worked by steam. In the smaller engines a cistern holds the supply of water, though in the larger a direct connection with the city water supply furnishes the necessary quantity to be rapidly thrown to great heights on burning structures. Steam fire engines have either rotary or piston pumps constructed on a single or double plan, with either tubular flue or coil boilers. The larger weigh about five tons, though engines weighing about three tons are preferred on account of greater facility in moving them hastily to the point of danger. The capacity of these engines is from 200 to 900 gallons per minute, the flow of water being controlled by an automatic relief valve.

Fire engines are commonly drawn by horse power, though steam is employed in the larger cities, with good results. The first fire engine to be propelled by steam was used successfully in New York City in 1873. Many seaports have fire engines that are mounted on fire boats. In smaller cities and villages chemical fire engines are used with good results. By these a stream of water from one fourth to three fourths of an inch may be thrown 200 feet by means of a chemical mixture with water, which produces carbonic acid gas and supplies the pressure necessary. A hose cart is used in connection with fire engines. It consists of a four-wheeled vehicle, supplied with about 1,000 feet of hose, and is moved along with the fire engine to the place of danger, but in many of the newer chemical engines the hose is carried on the engine itself. The hose is made of cotton fabric. It is usually lined within and covered without by rubber, though there are several varieties manufactured for the trade.

**FIRE ESCAPE** (ēs-kāp'), a device for enabling persons to escape from the upper parts of high buildings. Most tall, modern constructions are provided with iron ladders extending from the top of the building to the ground on the outside of the brick or stone work. They are put up as the masonry is built. Ladders capable of being drawn out like a telescope are preferred in some classes of buildings. Rope ladders with hooks at one end are a part of the equipment of many of the more important hotels and of some travelers. In many cases large nets of stout sailcloth or slender ropes are utilized for lowering persons to the ground,

or for them to jump into while held from the ground by the firemen. Persons weighing 200 pounds can safely jump one hundred feet into these nets. Some cities are provided with a cannon that shoots a projectile with a cable or rope attached over the building in which the danger occurs, and it is then fastened to form a means of escape. The construction and use of fire escapes are regulated by law in most countries.

**FIRE EXTINGUISHERS** (ěks-tīn'gwīsh-ērz); the chemical agents utilized in extinguishing fires. Various compounds are recommended for the purpose, the most common being a mixture of chlorate of potassa, sugar, dried ferrocyanide of potassium, and water, and, when sulphuric acid is brought in contact with it, gases are liberated and the whole is directed to quench the flame. All rooms in first-class hotels, passenger cars, and passenger compartments in steamboats are supplied with bottles of chemical fire extinguishers, by means of which conflagrations may be averted by prompt action.

**FIREFLY**, the name commonly applied to all winged luminous insects. They abound in all the warmer latitudes, especially near wet and marshy grounds. Some have a steady

GLOW WORMS.

Male winged.

Female wingless.

glow, but most species, as they fly, emit and conceal their light with much regularity at intervals of three or four seconds. In most of these insects the light proceeds from the last three segments of the abdomen. An adult firefly is shown in the accompanying figure, together with a larva and a glow worm (q. v.). In most species of elaters the larva is more or less luminous. The common firefly or lightning bug is not much over half an inch long. Some species found in the West Indies are larger and emit light so powerful that small print may be read by means of it, while a fair light may be secured by confining a number in a glass

vessel. Several species native to the West Indies emit light from two eyelike tubercles on the thorax.

**FIREPROOFING**, a term used to describe the construction of buildings, treatment of portions of buildings, or apparatus by which they become partly or wholly invulnerable to damage by fire. The safeguards adopted early in the history of constructive building consisted of using brick or stone, and later iron entered into doors, lintels, and stairways. These and other methods are now in common use, while in large cities every building must be constructed according to certain specified conditions provided by the city authorities. Wood treated with silicate of soda is made largely proof against fire, since the application of strong heat fuses it into a kind of glass that forms a shield of protection. Cloth or wood does not blaze, if impregnated with certain saline substances, such as phosphate of soda or ammonia, borax, alum, and many other chemicals. Cloth may be treated with graphite in a bath and then placed in an electro-metallic bath apparatus by which the cloth is coated with metal. Woolen and ordinary fabrics are rendered fireproof by being treated with borax, alum, or soluble glass.

Papers and valuable documents are preserved in fireproof safes, which are constructed with double walls, having the intervening space filled with a nonconductor of heat. In the tall buildings of cities marked precaution is taken in the construction of all portions exposed to view, and, as a further safeguard, metal shutters are used to protect the outside windows against the entrance of fire from a neighboring building while burning. Besides, water pipes extend from the basement to the upper story, these being connected with pumps below, and there are water buckets, hand grenades, and mechanical extinguishers for protection against incipient damage by fire. In many structures are stairways and openings by which entrance and passage of firemen to all parts of the building are facilitated. By these and similar means it is possible to protect and guard the larger centers of commerce against widespread fires, such as have destroyed portions of London, New York, Philadelphia, Chicago, and other cities at different times.

**FIREWORKS**, the common name of preparations containing combustibles and explosives, such as charcoal, niter, and sulphur, with chemicals producing colored lights or scintillations in burning, and used to make displays at festivals, expositions, or at times of public rejoicing. Many forms are made, according to the effects desired, such as crackers, rockets,

squibs, Roman candles, torpedoes, balloons, wheels, and other arranged pieces. Some are contrived with ingenuity and skill, and, when ignited, represent various pictures and devices. The powder utilized in fireworks is made according to the same principle as gunpowder, but with it are used charcoal, niter, sulphur, and other substances to influence the explosive properties and give tint or coloring. Filings of zinc impart a bluish color, iron or steel filings increase brightness, while a greenish tint is secured by copper filings. Besides this class, such chemicals as salt, lampblack, amber, and resin are used.

The Chinese and Hindus manufactured fireworks many centuries before they became known to the Europeans, largely for the reason that they knew of gunpowder much earlier than western peoples. They utilized them at festivals and celebrations. Many of the different devices employed in producing noise and illuminations at night are of Chinese manufacture, though within recent years large establishments have been built in Europe and America at which all classes of fireworks are manufactured. The largest establishment of this character is located in New Jersey. Firecrackers are among the most popular devices used at celebrations. They consist of a tube made of strawboard, are from two to fifteen inches in length, and have a diameter equal to about one-tenth of the length. The newer process of manufacture has made it possible for one person to make about 2,500 tubes per day. These tubes are plugged with pasteboard wad, cord, or pith at one end and at the other with clay or wood pulp, and in the latter a fuse is placed. The explosive is on the interior and with it the fuse articulates. When finished, the firecrackers are covered with an artistic red paper, dried, and packed ready for the market.

**FIRE WORSHIP.** See Parsees.

**FISH**, a group of vertebrate animals which live in water and breathe by gills. They are

SKELETON OF FISH.

distinguished by having paired fins and by not breathing by lungs in any stage of life. Their form is well adapted to permit them to move

easily and rapidly through the water, tapering toward the extremities, but exceptions are numerous. The typical character of the skeleton is evidently homologous with those of quadrupeds and man. The four limbs belonging to the usual structure of vertebrate animals assume the forms of fins. Fins, gills, and, most generally, scales are distinguishing features of fish. The heart contains only one auricle and one ventricle, receiving venous blood only, and sending it to the gills, where it is oxygenated and passed by the dorsal vessel into the greater and only circulation. Fish, with few exceptions, are cold-blooded animals; that is, they have a temperature little above that of the water in which they live. When taken from the water, they die in consequence of the drying up of the fine fringes of the gills.

In most fish the gills are situated at the back part of the sides of the head, usually four on each side, and consist of folds of membrane attached to the surface of the gill cavities, or a multitude of vascular membranous plates, generally in double fringelike rows fixed by the base. The gill orifices are covered by a bony plate whose motion expels the water, which is taken in by the mouth to supply the gills with air. Fishes possess nerves and organs of all the senses, although the senses of touch and taste are dull compared with those of many other animals. Some fish are destitute of sight, while most species have large eyes and a very acute vision. Others have no teeth, but many species have a large number. The air bladder, an organ aiding them to maintain an equilibrium in the water, is found in many kinds.

Fishes reproduce by means of *spawn*, or *eggs*, which, in some species, are fertilized in the body of the female and in others fecundation takes place at the time or after they have been extruded. The eggs are usually deposited in sand or gravel where the water is shallow. Many species leave the depths of the ocean and pass into fresh water for this purpose. A single codfish is said to lay nine million eggs. As a rule, they show no parental care either for their eggs or young, but some species build nests and watch over them. Fish, being cold-blooded, need no covering for warmth; hence, the scales serve for protection or as a defensive armor. While the skin of cartilaginous fish yields shagreen and the bladder of some fishes isinglass, by far their most important use consists in supplying man with food.

Many species known as *deep-sea fish* are very peculiar and formerly were not known to exist. Many of them have no eyes, for the reason

that sunlight is absent from the depths at which they thrive. Their peculiar structure enables them to withstand the low temperature and enormous pressure that are common at great depths. They live almost, if not entirely, upon animal life, as plants do not grow without the influence of sunlight. Many of the species have extended mouths and dilatable stomachs, which enable them to swallow and digest bodies much larger than themselves, or strain out material from sediment that settles down from above. The fins and tail are long and delicate, because of the perfect calm at such depths. See **Fins**.

**FISH CULTURE** (kŭl'tŭr), the industry embracing the education and labor devoted to the growth and propagation of fish. The ancient Egyptians and Chinese were highly skilled in pisciculture and gave it marked attention, for the reason that the subsistence of large masses depended to a vast extent upon the food-producing qualities of their interior and adjacent waters. Since then the art may be traced through successive centuries. It is not difficult to realize the vast benefit that the industry yields to the people of Western Europe, and its wholesome influence upon the commercial aspects of America. Since the large fish feed upon the smaller, and the latter upon the eggs, it is apparent that these influences, in connection with the fishing industry, tend to greatly limit and ultimately depopulate the waters of the finny tribe.

The discoveries made by Stephen Ludwig Jacobi, of Westphalia, Germany, in 1748, led to the art of increasing fish by stripping the females of their eggs and fertilizing them by the milt taken from the male fish. From this discovery and those made later by L. J. R. Agassiz it became possible to breed and rear fish more extensively than had been possible previously, and by skillful application and care preserve, feed, and fatten them. We find as a result that waters before unproductive have been populated with various species, such as the California salmon, California brook trout, char, whitefish, shad, and German carp. Many streams and lakes have been populated with fish, as the shad, which has been planted in the rivers of Georgia, and the whitefish fry has been introduced in Lake Erie. Besides, the waters of California, Canada, and many European countries have been restocked, and the more valuable kinds have been greatly increased in numbers.

Much advancement has been made in fish culture in the United States, where it is now pursued more extensively than in any other country.

The industry is under the jurisdiction of the United States Fish Commission, a bureau established by act of Congress, Feb. 9, 1871. The primary object originally was to investigate the food fish of the seacoast and inland waters of the United States. Since then the duties of the bureau have been widely extended, and the whole now constitutes one of the most important functions in the service of the government. Many valuable reports and bulletins have been distributed annually, these relating to various branches in the different phases of the industry. They have been instrumental in disseminating accurate and scientific knowledge of the art. The several states have been supplied with various kinds of fish, the annual distribution often aggregating 200,000,000 eggs and fish, of which three-fourths are infant and adult fish and about one-fourth are eggs. At colleges of agriculture and other institutions under State and Federal control, such as are now quite common, the industry has been carefully studied. Along with fish culture proper, the artificial culture of lobsters, oysters, mussels, and other crustacea is growing in importance.

**FISHERY** (fish'ēr-ȳ), the business of catching fish or other aquatic animals, but relating also to the locality where marine life and fish are found in paying quantities. The objects for which fishing is conducted include pearls, corals, sponges, whales, turtles, shellfish, seals, and many others, besides the various species of fin fish. Among the chief methods of fishing are those employing drawnets, spears, lines, and dredges. The most important of the fresh-water fisheries include those of the salmon, in which sportsmen employ fly hooks, while fishers generally use stakenets and drawnets. Other important fresh-water fish embrace the perch, eel, trout, pike, and catfish. Measured from the standpoint of profit, the oyster, cod, herring, and haddock are the most productive sea fisheries. Countries bordering on the sea naturally possess the most valuable fisheries, among which Canada and the United States take very high rank.

Disputes regarding fishery rights have taken on the form of international questions, and have occupied the attention of diplomats, especially those involving the United States and Great Britain at different times. The Bering Sea question, which occupied the attention of both governments for some time and attracted particular attention in 1896, is one of the most important. Under the fishery laws the owner of the soil and streams, or bodies of water, is entitled to the exclusive right to fish in such water. Where the owner has land adjacent to both sides of the stream, he enjoys the sole right to fish in

the entire stream lying between his property, and, where his possessions are only on one side, his right extends to the center of the stream. In streams and bodies of water belonging to the State or Federal government the right to fish is abridged or authorized by general laws. In many of the states fishing is strictly prohibited, except at certain periods of the year, even in the bodies of water belonging to private owners, while in some it is made unlawful to fish with drawnets and to use more than two or three hooks on a line. Such legislation is deemed necessary in order to protect the waters from being totally depopulated, and to preserve a fair aggregate of the different kinds of fish at all times. Besides, damaging influences, such as dams, the discharged sewage, and other unwholesome and obstructive agencies, are prohibited under suitable penalty, and it is made the duty of officers to prosecute investigation for proper protection.

Newfoundland has some of the most valuable fisheries in the world, especially in cod, herring, and haddock. The Great Lakes yield whitefish, sturgeon and Michigan herring. Salmon are caught in large numbers on the Pacific coast, especially at the mouths of the Fraser and Columbia rivers. Manitoba and Minnesota are especially noted for the fisheries in hundreds of lakes. Rapid transportation by railways has made it possible to supply many sections of the country with fresh fish, even in the summer season.

**FISH HAWK**, an eagle or other rapacious bird which preys upon fish, as the bald eagle or the osprey. This genus of birds is widely diffused, being found both in warm and cold climates, and is grouped with the family Falconidae. It is singular among the falcons in preying exclusively upon fish, and to this end its whole structure and habits are adapted. The fish hawk is about 22 inches long, and has a dark brown color variegated with gray and white. It has a short, broad, rounded bill, a long tail, expansive wings, and remarkably rough scaly, pointed toes, suitable for grasping its slippery prey. The feathers are destitute of supplementary plumes and very oily. These birds are found near the sea, lakes, or rivers, and are everywhere birds of passage, going toward the warmer zones soon after the appearance of frost. They catch their prey by diving into the water and grasping it with the talons. See illustration on following page.

**FISK UNIVERSITY**, an institution of higher education for colored persons, organized by Clinton Bowen Fisk at Nashville, Tenn., in 1865. The institution is coeducational under

the nominal jurisdiction of the Congregational Church, and maintains courses of study in medicine, theology, normal teaching, industrial arts, and advanced sciences. It has about 30 instructors, 550 students, a fine line of apparatus, and a library containing about 10,000 volumes. The annual income is about \$7,500.

OSPREY.

**FITCHBURG**, a city and one of the county seats of Worcester County, Massachusetts, on the Nookagee River, fifty miles northwest of Boston. It is on the Boston and Maine and the New York, New Haven and Hartford railroads. The public buildings include numerous churches, several high schools, a public library and art gallery, and a public hospital. Educational advancement is facilitated by a number of scientific societies. It is the seat of the Fitchburg State Normal School. Among the manufacturing establishments are iron foundries, machine shops, cotton, woolen, and flour mills, paper mills, shoe and shirt factories, and wood-turning establishments. The streets are finely paved, well lighted, and connected with suburban districts by electric car lines. It has a growing trade in merchandising and farm produce. Fitchburg was settled in 1719, was a part of Lunenburg until 1764, and was incorporated as a city in 1872. Population, 1905, 33,017; in 1910, 37,826.

**FIUME** (fê-oo'mă), a seaport city of Hungary, on the Adriatic Sea, at the mouth of the

Fiumara River. It has a fine harbor on the Gulf of Quarnero and has convenient railroad facilities. The manufactures include paper, tobacco, machinery, soap and clothing. Among the principal buildings are a municipal theater, a naval academy, the town hall, and the Church of Saint Vitus. It has a large interior and foreign trade. Fiume was a town of the Byzantine Empire. It became a possession of Austria in 1471, and since 1779 has been an imperial city of Hungary. Population, 1905, 39,603.

**FIVE FORKS**, the site of a battle fought in Dinwiddie County, Virginia, April 1, 1865. It was Grant's intention to cut General Lee off from Petersburg, and he accordingly dispatched Sheridan with cavalry and Warren with infantry to the extreme left, where Lee had stationed Pickett. Sheridan attacked the intrenchments at Five Forks held by Pickett's corps, but was driven back. On the next day he was reinforced by Warren's corps and carried the fortifications, taking 5,000 prisoners. The Union loss was 1,000 men. As a result Petersburg evacuated on April 2, and Richmond fell soon after.

**FIVE NATIONS**. See Iroquois.

**FIXED STARS**. See Stars.

**FLAG**, a banner used as a mark of distinction by a company, party, sovereign, or nation. It consists of a piece of cloth, usually square, oblong, or triangular. The material is commonly of bunting, either plain or bearing a device, and is displayed as a standard, symbol, or signal by being attached by one edge to a staff, or to a halyard, by which it may be hoisted on a pole. The Egyptians originated the idea of standards early in their history, which is verified by inscriptions on very ancient sculptures and temples. That the Greeks and Romans followed by the adoption of standards and ensigns is clearly borne out by the *gonfalon*, which was borne in the Roman army near the commander in chief during an engagement. In the Middle Ages the *pennon* was used by a knight, while the *standard* served the purpose of distinguished persons. The cross appeared in the banners of the Crusaders during their historic upheavals in mediaeval European history.

The flag of Denmark is the oldest among European standards. It is red with a white cross and dates from the 13th century. The union of the three crosses of Saint George, Saint Andrew, and Saint Patrick first designated the union of Scotland with the kingdom of Great Britain, and later it symbolized the union of this kingdom with Ireland. It is known as the *union jack*, which at present con-

stitutes the naval flag. In the British flag is a quartered field, one quarter blue, one quarter yellow, and two quarters red, which bears the insignia of Ireland, Scotland, and England.

The imperial flag of the German Empire is yellow, containing in the center the imperial arms and a gold shield. It is divided into quarters by the iron cross, three black eagles and the crown appearing on each of them. The Turkish Empire has a red flag, with eight pointed stars and a crescent moon; the latter became historic in distinction from the cross of the Crusaders. Russia has a yellow flag, on which the Russian arms are conspicuously displayed, but its naval flag is white with diagonal bars of blue. All nations and many sovereigns, states, principalities, and provinces have flags appropriate to their purpose, usually bearing a more or less decorative field in commemoration of some historic event.

Flags are borne on the masts of ships to designate the country to which they belong and to indicate the rank of the commanding officer. The regiments of an army are distinguished from each other by the flags they bear. A yellow flag borne on a vessel denotes quarantine and a red flag, that powder has been taken on board. A white flag is by the consent of all nations a flag of truce, and a vessel bearing such a flag is met by a vessel or boat under charge of a commissioned officer bearing a white flag. When a flag is lowered or hoisted to half the height of the staff on land or to half the mast of a ship, it indicates mourning. A flag is lowered or is pulled down as a mark of respect for a superior officer. To indicate distress, it is reversed. Aside from their use as emblems and to designate certain officers, flags serve an important purpose in mercantile and national navies as signals by which to communicate. They are used extensively for weather, railway, survey, and other signals.

In America the Colonies used the British flag prior to the separation from England, though several others had been proposed early in the agitation for separation. The first was one bearing the inscription "Join, or die," and, when the purposes of resistance to the British began to assert themselves more forcibly, a flag bearing a rattlesnake was designed. It bore the motto "Don't tread on me." However, Canada continues to use the imperial flag of Great Britain, but it also has a banner of its own, the Federal flag of Canada. See **Canada**.

The present national flag of the United States, called the *stars and stripes*, originated June 14, 1777, when the Continental Congress resolved that "the flag of the United States be thirteen

stripes, alternate red and white, and that the union be thirteen white stars on a blue field." Congress changed the flag to fifteen red and white stripes and fifteen stars in 1794, but in 1818 an act was passed by which the original thirteen stripes and fifteen stars were restored, as the addition of a new stripe for each additional State would make the flag unwieldy. At that time it was provided that the thirteen horizontal stripes, which represent the thirteen original states, should be continued, while a new star should be added to the number with the admission of a new State into the Union, the addition to take effect on the Fourth of July next succeeding the admission. The first flag under this law was hoisted over the Capitol of the United States in 1818. It remains unchanged, except as to the number of stars. The last addition of a star was made in 1907 after Oklahoma was admitted to the Union.

**FLAGELLANTS** (flāj'ĕl-lants), a class of Christians which originated about the year 900, who thought that flagellation is a reasonable penance. It was recommended by the abbot of Prüm, in Rhenish Prussia, about that time, but did not become popular until 1260, when it came into prominence in connection with the struggle between the Guelphs and the Ghibelines. The second outbreak occurred in 1349, when the black plague was raging in Europe, and a third movement took place in 1414, at which time many became dissatisfied with the rule of the popes. The Flagellants enrolled for a period of 34 days; that is, one day for each year Christ lived on earth. They were stripped to the waist and scourged themselves with knotted whips as they marched from place to place, carrying banners and singing songs of praise. When blood was drawn as the result of flagellation, it was thought to atone for their own and others' sins. Since they belonged to the party of the Guelphs, they were permitted to continue their practices by the Pope, but in 1349 Clement VI. issued a bull against them. Gregory VI. designated them as heretics in 1372, because they were said to consider flagellation more important than the sacraments. This sect had adherents throughout Western Europe, extending from Italy to Denmark and England.

**FLAGEOLET** (flāj'ō-lĕt), a wind instrument with a mouthpiece like a common whistle. It resembles the flute and is usually made of boxwood or ivory. Most instruments of this class are provided with a large aperture near the mouthpiece and six or more finger holes. The range is two octaves and the tone resembles that of the piccolo, but is softer in

quality. *Flageolet tones* is the name given to the harmonic notes of the violin, violoncello, and other stringed instruments, which notes are produced by lightly touching the strings with the finger, thus producing a node, the string vibrating on both sides of the finger. See **Harmonics**.

**FLAG OFFICER**, a term used to designate a naval officer of rank high enough to command a fleet, or a subdivision of a fleet. Such an officer carries at the masthead a flag instead of a pennant, and is the naval equivalent of the general officer in the military. The vessel of the flag officer is called the *flagship*.

**FLAG OF TRUCE**, a signal that one of two contending naval or military forces desires to suspend hostilities. The flag used for such a purpose is white, and indicates that the party displaying it wishes to communicate or surrender. Firing upon a flag of truce is a breach of the naval or military code, and such an offense subjects the guilty party to severe retaliation and punishment. A flag of truce is sent by the senior officer to one of like rank, but the party who is to receive it may refuse acceptance, and the party bearing it may be warned not to proceed farther by a shot fired across the bow. A failure to stop when thus warned renders the party liable to be fired upon. A flag of truce is not permitted to be used to obtain private information, but serves only as a signal that the party displaying it desires to communicate.

**FLAGSTONE**, or **Flag**, the name of any rock that splits into tubular masses or flags, suitable for curbing, sidewalks, or doorsteps. Flagstones may be obtained from a variety of rocks, such as sandstone, limestone, and brownstone. A class of sandstone of the Devonian age yields bluestone which is well adapted for paving purposes.

**FLAMBOYANT** (flām-boi'ant), in architecture, a showy style of decoration used extensively in the 15th century. It originated in France and is a form of Gothic architecture. Its realistic and pictorial treatment of decorative sculpture corresponds to the Penpendicular style used in England about the same time. The windows and panels are distinguished by flamelike tracery. The masterpieces of this style include the choir of Saint Severin in Paris and the façades of the cathedral in Rouen.

**FLAME**, **Temperature of**, the condition, with respect to heat, of a blaze rising from a burning body. A flame usually consists of sev-

eral parts which differ from each other in temperature as well as in color and illuminating power. The flame of a lighting device, such as a lamp or a gas jet, consists of an inner dark cone and a brilliant white envelope. In the center there is no combustion, hence the dark part of the flame, and the heat and the illuminating power are greatest where the combustion is most complete. The temperature of flames is a subject to which Rossetti gave much thought in 1878. After conducting careful investigations with his calorimeter, he announced the following table of results:

Locatelli lamp .....	1,688°	Fahr.
Stearin candle .....	1,724°	Fahr.
Petroleum lamp, with chimney .....	1,886°	Fahr.
Petroleum lamp, without chimney—		
Illuminating part .....	1,688°	Fahr.
Sooty envelope .....	1,436°	Fahr.
Alcohol lamp .....	2,147°	Fahr.
Bunsen burner .....	2,480°	Fahr.

The temperature of an electric arc, as determined by Violle, is about 6,332° Fahr.

**FLAMINGO** (flā-mīn'gō), a genus of migratory birds which until recently were placed among the waders, but they are now generally classed among the swimmers. However, they very seldom use their webbed feet for swimming, the web formation being designed rather for support on the soft, muddy bottoms. The body is not large, but the long neck and legs permit them to stand from three and a

FLAMINGO.

half to four feet high. In many respects the bill resembles that of a duck, but it turns suddenly downward near the middle, the mandible being furnished with small toothlike edges,

which serve to prevent the escape of crustaceans, mollusks, worms, fish, or seeds, the common food. Flamingoes are birds of powerful wings and fly either in single file or in wedge-shaped flocks like geese, a single bird leading the way for the flock. The prevailing color is pinkish or reddish. The nest is made of mud scraped into a mound with the feet and hollowed out on top, in which two or three white eggs are laid and hatched, the young reaching maturity in about a year. Flamingoes inhabit Eurasia, Africa, and America. When feeding, they keep their feet continually going to stir up the mud. Some of the older birds act as sentinels for security to the rest.

**FLAMINIAN WAY** (flā-mīn'ī-an), the chief road leading from ancient Rome to the northern provinces, so named from Caius Flaminius the Elder. It was platted to Arminium by Flaminius in 220 B. C., at the time he was censor, and subsequently branches were laid out to all the important towns in the northern part of Italy. The length of the main road was 222 miles, which distance included many large grades and substantial bridges, remains of which are still found at some places.

**FLANDERS** (flān'dērz), the former name of a region of Europe, extending along the German Ocean. It is now included in Belgium, Holland, and France, forming the provinces of East and West Flanders, in Belgium; the southern part of Zealand, in Holland; and all of Le Nord, in France. The original inhabitants were Belgic tribes, who were subdued by Caesar, and the region was added to Roman Gaul. Later it came into the possession of the Franks and was added to Neustria by the Treaty of Verdun. Philip the Bold erected the territory into a government district in the 9th century and assigned it to his son-in-law, Count Baldwin I. In 1016 the town of Valenciennes was added and Ghent and the Zealand Islands became a part of the district about the same time. Hainaut, Alost, and Tournai were added in the reign of Baldwin V., after whose death the region was divided and passed consecutively to various countries.

In the 12th century the manufactures and commerce of Flanders rose to vast importance, and in the former part of the 14th century the Flemings were able to contest successfully with France. The latter country resigned its claims to Flanders in 1526. Afterward it passed to the united houses of Austria and Spain, though Charles V. of Germany ultimately secured control of the larger portion. A part was united with the Nether-

lands by the Treaty of Westphalia, and other portions to France by the Treaty of the Pyrenees in 1659, the Treaty of Nimeguen in 1678, and the Treaty of Utrecht in 1713. The other portions then remaining independent now form the provinces of East and West Flanders in Belgium.

East Flanders has an area of 1,158 square miles and, in 1906, had a population of 1,052,970. The area of West Flanders is 1,249 square miles and the population, in 1906, was 812,962. Ghent is the capital of the former and Bruges of the latter. The soil is productive and carefully cultivated, while the manufactures of the various products, such as laces, linens, and damasks, excel in quality. Both provinces have extensive communication by canals, electric railways, and steam railroads.

**FLANNEL** (flān'nēl), a woolen fabric differing from broadcloth and cashmere in being woven of yarn which is twisted more loosely. It varies in degree of fineness, and is used very extensively for shirts and undergarments. By allowing the perspiration easy passage and not appearing cold to the body, if damp, it is cooler in summer and warmer in winter than other fabrics. A class of loosely woven fabrics made of cotton are known as *outing flannels*. They have a napped face and many of the designs are colored attractively. Another class, the *domett flannels*, are made with cotton warp and woolen filling.

**FLATFISH**, the common name of all fishes that swim on their side, such as the sole, flounder, turbot, plaice, and halibut. The body is much compressed. The side which is turned toward the bottom is generally colorless. It is called the blind side, from the absence of an eye, since both eyes are on the upper side of the head. Some flatfishes have the right and others the left side turned toward the bottom.

**FLATHEAD**, the name applied to various Indian tribes, owing to their custom of flattening the skulls of infants by pressure. This practice was common to the fish-eating Chinook Indians on the Pacific coast; to the ancient natives of Peru, both previous and subsequent to occupation by the Incas; among the Caribs of Florida and Central America; and, it is thought, among the mound builders of the Mississippi valley. The civilized Selish Indians are improperly called Flatheads, as they do not flatten the skulls of their children. They originally inhabited the valley of the Saint Mary's River, but conveyed their lands to the United States, and were removed to Idaho in 1871, where they occupied the Jocko

reservation. They always were peaceable and are now advanced in education and the industries.

**FLAX**, an annual plant with alternate linear-lanceolate leaves, many-flowered broad

FLAX.

a, Flower; b, Seed Pod.

cymes, usually yellow, blue, or white, and crenulate petals. It embraces about a hundred species, which grow more or less widely distributed in all warm and temperate climates. A large yield is reported in the United States, where, in 1907, the product was 25,862,000 bushels. More than one-half of the crop was grown in North Dakota. The States which ranked next are Minnesota and South Dakota. Other regions which produce large quantities of flax are Manitoba, Saskatchewan, Argentina, Russia, India, and Austria. However, Argentina generally takes the first rank in the production of flaxseed, while Russia is the leading flax fiber producing country in the world. Flax is grown very extensively, on account of the commercial value of the seed as well as for its fiber. In most countries the virgin soil, when first broken, produces the best yield of flax. The ground is plowed in autumn or in the spring, depending upon the locality, and the seed is sown either in drills

or broadcast, usually in April. When the crop is ripe, generally in August, it is cut with a harvester and is afterward thrashed with a machine to obtain the seed.

A large amount of labor is required to secure the fibers in the best condition. For this purpose the crop is usually pulled up by hand, roots and all, and the seeds are removed by a process called *rippling*. To obtain the *lint*, or flaxen fiber, from the *boon*, or core, of the stem, the bundles are steeped in water until the boon begins to rot, when it can be separated readily from the fiber by means of a *scutching blade* or a machine. It is next *hackled*, or combed, after which it is spun into threads and woven into cloth. Linseed oil is pressed from the seed, and the residue is a highly fattening food for hogs and cattle. Flax was cultivated extensively in ancient times, both in Egypt and Asia, and linen is spoken of in the Book of Joshua. See **Linen**, **Linseed Oil**.

**FLEA** (flē), a wingless insect, belonging to the hopping Diptera. It has two lancetlike mandibles, a sucker, and a slender, bristle-like tongue, the whole incased between two three-jointed plates. The entire body is covered with a tough integument. It is very active and can leap two hundred times its length in a single bound. The common flea thrives particularly in the nests of poultry and on the fowls themselves. Some species infest the furs of animals and often prey upon man. In favorable weather fleas hatch in five or six days, in about twelve days they inclose themselves in a cocoon, and after eleven days more come out perfect insects. They are

DOG FLEA. COMMON FLEA. a, proboscis.

most numerous in dry climates and in filthy and uncouth places.

**FLEABANE** (flē'bān), the name of several species of plants, widely distributed in all the continents. The common fleabane of England grows to a height of fifteen inches, has panicle flowers, and is used in treating diarrhoea and dysentery. A species native to California yields ingredients useful in manufacturing the Persian insect powder and is recommended

for its medicinal properties. Horsetweed, butterweed, and sweet scabious are names applied to species found in the Mississippi Valley, especially in the northeastern section.

**FLEMISH** (flēm'ish), the language spoken in a number of Belgian provinces, portions of Holland and France, and several countries adjacent to these. It is a form of Low German, or *Platt-Deutsch*, and differs but slightly from the German in pronunciation and orthography. In East and West Flanders, Limburg, Antwerp, and Brabant it is the universal tongue and gives evidence of but little change in dialect since the 8th century. The language spoken is very similar to the form of speech used by the Council of Liptines in 742, while preparing a creed in which pagans renounced idolatry when they embraced the Christian faith.

The Flemish literature is comparatively modern, and before the 19th century it was identical with the Dutch. However, some of the early writers of the literature which belongs to the Netherlands may be said to have laid a distinct foundation for the Flemish of modern times. Jakob Van Maerlant is regarded the father of Flemish poetry. He wrote several romances in which he treats the "Holy Grail," while "Reynard the Fox" and the "Mirror of History" were produced in the same period. In 1618 a translation of the Bible was made into the Flemish. It contains such elegance of expression that it is regarded the standard authority in orthography and construction. French ascendancy tended to limit the language and literature, but after the revolution of 1830 it began to revive and take on its present form. Among the noted leaders in the revival of Flemish may be named Blommaert, Conscience, Van Duyse, Snieders, DeVries, Willems, Van Rijswijk, David Bormans, Willem Bilderdijk (1756-1831), and Snellaert.

**FLENSBURG** (flēns'böörg), a city of Germany, in the province of Schleswig-Holstein, about forty miles northwest of Kiel. It is located on the Flensburg Fiord of the Baltic Sea and has railroad and electric railway facilities. The chief buildings include a courthouse, a theater, a public library, and the Marienkirche. Among the manufactures are carpets, oil, machinery, clothing, and sailing vessels. It has a large trade in coffee, grain, and live stock. Flensburg was founded in the 12th century. Population, 1905, 53,771.

**FLEUR-DE-LIS** (flēr-dē-lē'). See **Iris**.

**FLICKER** (flik'ēr), the popular name for the golden-winged woodpecker, a beautiful

bird common to the eastern part of Canada and the United States. It is about a foot in length, has an olive-brown color, with black and white markings, and the head and neck are ash-colored. It winters in the southern part of the United States, moving northward on the early approach of spring. The food consists of worms and insects, which it extracts from the trees, but it also feeds on berries and the tender parts of plants. A large number of species of the flicker have been listed, including about 35. The *red-shafted flicker* is common to the region west of the Rocky Mountains, from Mexico to Alaska. *Yellow-hammer*, *sap-sucker*, and *high-holder* are other names locally applied to birds of this class.

**FLINT**, a mineral regarded as a species of quartz, or as intermediate between quartz and opal, consisting almost entirely of silica. It has slight traces of oxide of iron, lime, and carbon, and contains some organic matter. Flint is usually gray, smoke-brown, or brownish-black, but is sometimes spotted or mottled. Dark-colored varieties are usually found imbedded in chalk and are abundant wherever chalk formations prevail. Flint, when struck with steel, produces a spark of fire, which property was formerly made use of in fire-arms and for starting fires. Knives, axes, arrowheads, and various sharp weapons and cutting instruments are among the most interesting relics of antiquity.

**FLINT**, a river of Georgia, rises in Clayton County, and flows by an irregular course to the southwest corner of the State, where it joins the Chattahoochee to form the Apalachicola River. The entire course of 300 miles is through a rich agricultural and mineral country. Light-draft steamers navigate it as far as Albany, a distance of about 140 miles from its mouth. Larger steamers reach Bainbridge, a distance of 50 miles.

**FLINT**, a city of Michigan, county seat of Genesee County, on the Flint River, about sixty miles northwest of Detroit. It is on the Père Marquette and the Grand Trunk railroads. Electric car lines, waterworks telephones, pavements, and electric lighting are among the municipal facilities. It has a fine courthouse, a public library, and a commodious high school building. It is the seat of Oak Grove Home, an institution for the feeble-minded, and of the State institution for the deaf and dumb. The principal manufactures include clothing, woolen goods, flour, machinery, cigars, vehicles, and utensils. The sur-

rounding country produces large quantities of cereals and fruits. Flint was settled in 1820 and incorporated as a city in 1855. Population, 1904, 14,884; in 1910, 38,550.

**FLINT GLASS.** See **Glass.**

**FLINT IMPLEMENTS**, the utensils formerly used in performing manual labor and as instruments of war. Specimens are found frequently in the places which were occupied by settlements in prehistoric ages. While they occur in all regions where settlements were maintained in early times, they are met with most numerous in European countries, particularly in Denmark, the Netherlands, and other regions of the northern and western parts of Europe. These implements consist of chisels, knives, daggers, saws, scrapers, arrowheads, axes, and borers, and served a useful purpose, though modern savages do not employ such tools. The American Indians made arrowheads and other instruments of flint, many specimens occurring in different sections of America, but they are more abundant in the Mississippi valley than elsewhere.

**FLINTLOCK**, a small gun originated by the Spaniards in the 17th century. It has a small piece of flint in the jaw of the hammer, which, when released, strikes a piece of steel, and the sparks ignite and explode the charge. William III. introduced flintlock muskets into England, where various forms of this class of firearms continued in use until about 1840. Arms of this kind formerly were used both in war and in sporting, but they have been superseded by modern weapons, such as breech-loading guns and rifles.

**FLOATING ISLANDS**, the formations caused in lakes and other inland waters by the aggregation of driftwood carried down by rivers, and by deposits of soil and vegetable matter, or by detachments of elevations adjacent to the banks of rivers or on shores of lakes. These islands occur more numerous in tropical countries and receive their early consistency by interlacing roots of plants, and later by the growth of shrubs and even trees. Some of the islands are large enough to furnish pasturage and are met with from fifty to a hundred miles from the mouths of the large rivers of Asia, Africa, and America.

**FLODDEN** (flōd'den), **Battle of**, a severe military contest that occurred on Flodden Hill, Scotland, Sept. 9, 1513, between the English army commanded by the Earl of Surrey and the forces of James IV. of Scotland, in which the latter were defeated. The English army

consisted of 32,000 men and the Scottish of 30,000. Both sides lost heavily. The English army lost 4,000, while the loss of the Scots was much heavier and included several earls and other officers of high rank. A description of the battle is given in Sir Walter Scott's "Marmion."

**FLOOD PLAIN**, a level tract of land on the border of a river, formed by sand and silt deposited during overflows. In many places the surface is highest near the margin of the river bank, where the greater amount of silt is deposited during an overflow, and some distance back are marshes and swamps, which are sometimes fed by springs or remain wet for want of sufficient drainage. The flood plains in the lower course of the Mississippi are very fertile. Formerly they were covered by meadows or swampy forests, but now they yield large quantities of agricultural products. Other tracts of this kind are located on the middle course of the Rhine and Danube and on the lower course of the Nile, Po, and Ganges. See **Delta.**

**FLORA** (flō'rā), the goddess of flowers, who was held in the highest esteem by the Romans. Her festival, the Floralia, was celebrated from April 28 to the first of May. The festival was one of universal merriment, in which houses, streets, and vehicles were profusely decorated with flowers. Two temples were built at Rome to this deity. She typified the season of spring, and was the reputed guardian and protectress of every blossom.

**FLORENCE** (flōr'ens), county seat of Lauderdale County, Alabama, on the Tennessee River, 126 miles southwest of Nashville, Tenn. It is on the Southern and the Louisville and Nashville railroads, at the foot of the Muscle Shoals Canal, and is surrounded by a fertile agricultural and fruit-growing country. The noteworthy buildings include the county courthouse, the public high school, a State normal school, an academy, the Synodical Female College, and the Southern University for Women. Wildwood Park is a fine public resort. Among the manufactured products are cotton goods, cigars, machinery, vehicles, and building material. Near the city is one of the largest Indian mounds in the State. Coal deposits abound in the vicinity. Florence was settled in 1819 and incorporated in 1889. Population, 1900, 6,478; in 1910, 6,689.

**FLORENCE**, a city of Italy, capital of a province of the same name, on the Arno River, about 140 miles northwest of Rome. The site

is in a beautiful valley surrounded by hills, while a number of bridges cross the Arno and join both portions. Several important railroad lines connect it with the commercial emporiums of Italy, and electric street railways, telephones, and other municipal facilities add to the convenience and comfort. Besides its commercial importance, it takes high rank in the manufacture of woolen and silk goods, porcelain, mosaic, hats, musical instruments, toys, and numerous objects in the fine arts.

The public buildings include several beautiful palaces and impressive structures, and many piazzas or squares give the city a reputation for elegance and convenience. Among the principal buildings is the cathedral founded in 1298, and dedicated with much display and impressive ceremonies in 1887. Michael Angelo found the dome of this historic structure a convenient model for Saint Peter's. In the cathedral are numerous sculptures by master artists, among them Michael Angelo. Other churches contain almost an equal wealth of master productions in sculpture and painting. The celebrated buildings include the Uffizi, Vecchio, Signoria, Pitti, Strozzi, Il Bargello, and Riccardi palaces. The cathedral of Santa Maria del Fiore is the most remarkable building in the city. Many eminent Tuscans were buried in the church of Santa Croce, which has many fine decorations and celebrated tombs, among them those of Galileo, Michael Angelo, Alfieri, and Machiavelli. Dante's monument by Piazzini is situated in the Piazzini Santa Croce. A national library of more than 200,000 volumes and 12,000 manuscripts is located in the Pitti Palace, which also contains the celebrated Florentine gallery of art. Florence has numerous literary and educational establishments, a public school system, and institutions devoted to the arts, sciences, and higher educational interests. The Florence school of art is the most important in Italy.

Florence was founded by the Romans in the 1st century B. C., and probably named from Fiesole, a beautiful mountain near its site. It came under the dominion of Pope Gregory VII. in the 11th century, and by the middle of the 13th century it rose to commercial importance, ranking for many years as one of the first cities of Italy. An independent republic was established at Florence in 1283, and about fifteen years later great strife arose between rival parties under the names of Blacks (Ghibellines) and Whites (Guelphs), which resulted in the defeat of the latter and the banishment of the

leading members, among them the poet Dante. The republic fell in the 16th century and it was placed under Charles V. of Germany, who became known as the Duke of Florence, and was a member of the Medici. This dynasty ruled until 1737, when it was succeeded by Francis of Lorraine, who afterward became Emperor of Germany. The history of Florence is merged into that of Tuscany from that time until it became united with the kingdom of Italy. From 1864 to 1871 it was the provisional capital of the kingdom, whence dates its recent prosperity. Among the great men produced by Florence are Amerigo Vespucci, Galileo, Dante, Boccaccio, Michael Angelo, Vinci, Cellini, Andrea del Sarto, Medici, Machiavelli, and Petrarch. Population, 1906, 212,308.

**FLORICULTURE** (flō'ri-kŭl-tŭr), the cultivation of flowers or ornamental plants. While this branch of the industries has been carried on in Eurasia from remote ages, it is of comparatively recent date in America, and has been pursued as a business only about a century. In 1890 the government census detailed the first general information in regard to floriculture in the United States, but much of material value was added by the census investigations of 1900. The number of floral establishments in 1908 was about 9,125, of which 580 were operated by women. Establishments of this kind are operated in all the states, over 1,000 acres of land are utilized for the purpose, and the value of the annual output is \$35,250,000. Employment is given to about 22,500 men and women. The states of New Jersey, New York, and Pennsylvania take the leading rank in floriculture. Ontario and Quebec are the leading provinces in the floriculture of Canada. Among the products are cut flowers, rose bushes, plants, and shrubs. Roses, carnations, violets, chrysanthemums, and lilies are the leading flowers sold on the market, in the order named.

**FLORIDA** (flōr'ī-dā), a southern State of the United States, popularly called the Everglade State. It is bounded on the north by Alabama and Georgia, east by the Atlantic Ocean, and south and west by the Gulf of Mexico, and west by Alabama. The larger part of the State is a peninsula, extending about 400 miles south from Georgia, the remainder being a narrow strip of land, the western point of which lies 350 miles west from the Atlantic Ocean. The western boundary is formed by the Perdido River, which enters the Gulf of Mexico at Perdido Point. About four-fifths of

the State is contained in the peninsula. The area is 58,680 square miles, including a water surface of 4,440 square miles.

**DESCRIPTION.** The southern portion is generally low and marshy, while the northern part is more elevated and somewhat broken, though no part of it rises to a greater altitude than 300 feet above the sea. At Key Biscayne is the northern extremity of the Florida Keys, which stretch toward the southwest in a curved line about 200 miles. They consist of coral reefs and include a number of habitable islands, the surface of which is about ten feet above sea level. The Dry Tortugas, Key Large, and Key West are the larger of these islands. Among the larger coast indentations are Apalachee Bay, Tampa Bay, Biscayne Bay, Charlotte Harbor, Choctawhatchee Bay, and Pensacola Bay. The Atlantic coast line is about 470 miles and the coast of the Gulf of Mexico is 675 miles long.

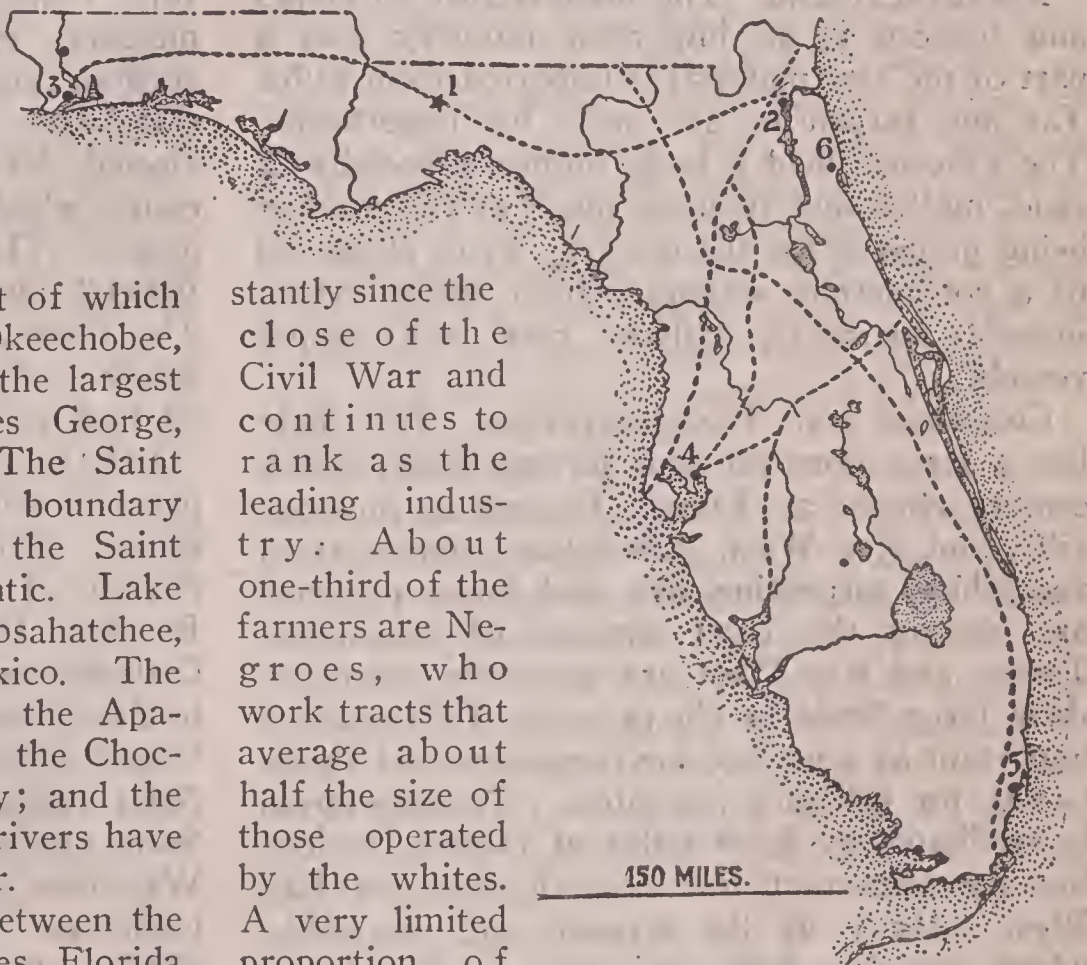

Florida has about 1,200 lakes, most of which are located in the peninsula. Lake Okeechobee, with an area of 650 square miles, is the largest of the lakes. Others include lakes George, Apopka, Harris, and Kissimmee. The Saint Mary's River forms a part of the boundary between Florida and Georgia, and the Saint John's has its outlet into the Atlantic. Lake Okeechobee is drained by the Caloosahatchee, which flows into the Gulf of Mexico. The Peace flows into Charlotte Harbor; the Apalachicola and Suwanee, into the Gulf; the Choctawhatchee, into Choctawhatchee Bay; and the Escambia, into Pensacola Bay. The rivers have about 1,000 miles of navigable water.

**CLIMATE.** Its favorable situation between the temperate and tropical regions gives Florida an equable and agreeable climate. The freezing point is rarely reached, while the wholesome influences of the gulf and oceanic waters modify the climate agreeably during the warmer parts of the year. About 43° to 90° include the limits, though the temperature sometimes falls below 32° for brief periods in the northern part. The average annual temperature at Jacksonville is 69°; at Key West, 78°; and at Pensacola, 68°. In the swamp region the climate is unhealthy, but statistics accord the other parts of the State a very high position in the record of favorable climate, which fact is utilized by many invalids of the north, who seek a genial and healthful region during the winter season. Saint Augustine, Key West, and Jacksonville are among the popular winter resorts. Copious rains fall during the winter, while the

summers are characterized by moderately dry, but agreeable and favorable, conditions. In some places the rainfall is 60 inches and at Jacksonville it is 54 inches.

**MINERALS.** Metallic mines are not worked in the State. Phosphate rock is the most important mineral product and is mined extensively for the manufacture of fertilizers. Deposits of this mineral occur most extensively between Tallahassee and Lake Okeechobee. Limited quantities of lignite coal and petroleum are obtained. Deposits of fuller's earth are worked in the vicinity of Quincy. Agate, chalcedon, and carnelian are among the precious stones.

**AGRICULTURE.** Farming has increased con-

stantly since the close of the Civil War and continues to rank as the leading industry. About one-third of the farmers are Negroes, who work tracts that average about half the size of those operated by the whites. A very limited proportion of the land in the Everglades has been brought

into a state of cultivation, but large districts are subject to reclamation and here the soil is exceeding fertile. The crops vary somewhat with location north and south. Orange culture has taken rank as an important industry and the State has about half the orange acreage of California. Corn is grown extensively in the northern part, and the last decade shows a considerable increase in the acreage of that cereal. Other crops include rice, oats, potatoes, tobacco, arrowroot, cassava, and many varieties of fruit. Several species of cotton thrive, including the sea-island cotton. Sugar cane, hay, sweet potatoes, peanuts, pepper, ginger, cloves, and pimento are other products of importance.

1, Tallahassee; 2, Jacksonville; 3, Pensacola; 4, Tampa; 5, Miami; 6, Saint Augustine. Chief railroads are shown by dotted lines.

Stock raising receives considerable attention. Cattle are grown chiefly for meat, but the dairying interests are well established. Horses, mules, swine, and sheep are grown profitably. The favorable climate causes plants to grow with vigor and rapidity, and flowers bloom in all seasons of the year. Grassy and marshy plains characterize the northern part, which has an abundance of timber, including the pine, live oak, and palmetto. Other species more or less distributed are the magnolia, persimmon, and pitch pine. Wild turkeys, ducks, geese, and partridges are abundant in the newer sections of the State.

**MANUFACTURING.** The manufacture of cigars and tobacco is an important industry, and a part of the raw material is imported from Cuba. Tar and turpentine are made for exportation. The fisheries yield a large output, especially of shad, mullet, and sponges, much of the product being prepared for the market. Fruit is canned to a considerable extent. Other manufactures include fertilizers, railway cars, and sailing vessels.

**COMMERCE AND TRANSPORTATION.** The State has a large domestic and foreign trade, which centers chiefly at Tampa, Pensacola, Jacksonville, and Key West. Phosphate, cigars, fruit, vegetables, turpentine, fish, and forest products are among the chief articles of commerce. Tampa and Key West are especially noted for their large trade in cigars, while Carrabelle is important as a market for turpentine and Punta Gorda for fish and vegetables. Transportation is facilitated by 3,500 miles of railway, including the important line recently built to Key West. Many of the streams are navigable, which, together with navigation on the Atlantic and the Gulf, afford first-class facilities.

**EDUCATION.** Educationally, Florida is making material progress, its educational institutions being well established and liberally patronized. The common schools, high schools, and State institutions maintain well-articulated courses of study. A college of agriculture is located at Lake City. The East Florida Seminary and Military Institute is at Gainesville; the South Florida Military and Educational Institute, at Bartow; the West Florida Seminary, at Tallahassee; a State normal school for whites, at De Funiak; and a State normal school for colored teachers, at Tallahassee. A number of benevolent and reformatory institutions are maintained. The leading religious and civic organizations are represented by State and local institutions. Saint Augustine has a State

institution for the blind and dumb and the State reformatory is at Marianna. School attendance has been increased materially by a process of transportation of the pupils, but the number of schools decreased somewhat.

**GOVERNMENT.** The present constitution was ratified in 1886. It vests the chief executive power in the Governor, who is elected for four years and is not eligible to succeed himself. Other State officials, including the secretary, treasurer, attorney-general, comptroller, commissioner of agriculture, and superintendent of schools, are likewise elected for four years. The senate consists of 32 members elected for four years, and the general assembly has 68 members elected for two years. Legislative sessions are held biennially and are limited to sixty days. A chief justice and two associates, elected for six years, comprise the supreme court, which is the tribunal of highest judicial power. The State is divided into circuits for judicial purposes, each having circuit judges. The towns, cities, and counties elect their respective officers, most of whom serve for terms of four years.

**INHABITANTS.** About eighty per cent. of the people reside in the country and in small towns. Fully one-half belong to the Methodist church. The remainder are divided among the Baptists, Presbyterians, Protestant Episcopal, Catholic, and other denominations. Tallahassee, in the northern part of the State, is the capital. Other cities include Jacksonville, Key West, Saint Augustine, Tampa, and Pensacola. The State has had a steady growth since the Civil War, both in wealth and in the number of inhabitants. The total population, in 1900, was 528,542; in 1910, 752,619.

**HISTORY.** The history of Florida begins with its discovery by Ponce de Leon in 1512, while he was in search of a mythical fountain whose waters would confer perpetual youth. It was discovered on Easter Sunday, the *Pascua Florida* of the Spaniards, hence the name Florida. De Soto explored it in 1539. In 1560 the French Calvinists founded a settlement, but they were shortly after massacred by the Spaniards. The region remained in possession of Spain until 1763, when it was ceded to England in exchange for Cuba, though the Spaniards regained the country in 1781. The United States purchased Florida in 1819, but the treaty was not finally ratified until 1821, when it was organized as a Territory, and it was admitted as a State in 1845. This treaty relinquished all Spanish authority over the region west of the

Rocky Mountains, claimed as belonging to the Louisiana Purchase, but not previously acknowledged by Spain. Many of the settlements were disturbed by the Seminole Indian wars in 1835-42, though these Indians were removed to Indian Territory, now Oklahoma, shortly after. In 1861 Florida seceded from the Union, but was readmitted under the reconstruction policy of President Johnson. The State played an important part in the national election of 1876, when the contest for President was decided by the Electoral Commission (q. v.).

**FLORIDA, Bay of**, the name of the narrow channel between Florida and Cuba, lying west of the Bahama Islands. It is separated from Florida Bay by the Florida Keys, and is traversed by the Gulf Stream. It is about 60 miles long at the northern extremity and 130 miles at the southern, and has a length of 225 miles.

**FLORIDA KEYS**, a group or chain of islands at the southern extremity of Florida, belonging for the purpose of government to Monroe County. It stretches in a curved line fully 200 miles from Biscayne Bay toward the southwest into the Gulf of Mexico. The group includes thousands of islands, some of coral formation, and many are low, marshy, and uninhabitable. Key Largo is the largest, but Key West is the most important. The latter contains the city of Key West and a naval station.

FLORIDA KEYS, BAY OF FLORIDA, AND KEY WEST RAILROAD.

A railroad extends from the mainland across the principal chain of islets, connecting them by massive iron and concrete bridges.

**FLORIN** (flōr'ín), a coin so named from Florence, Italy, where it was first issued in 1254. Coins of the same name and of different values have been issued in many countries. The *gulden*, originally issued in Germany, was until a comparatively recent time the monetary unit of Austria, and the *guilder* is still used in the Netherlands. A silver piece with a value of two shillings is in circulation in Great Britain, and bears the official name of *florin*, but the gold florin of England has not been issued since the Middle Ages. The English florin is worth here about 50 cents; the Dutch guilder, about 40 cents; and the German gulden about 35 cents.

**FLOTSAM** (flōt'sam), the name applied in the English law upon the goods that float upon the surface of the water after a shipwreck, or such as are thrown overboard to lighten the cargo. They belong to the crown if they are not claimed by their owner after recovery. Goods that are cast from a ship in peril are sometimes called *jetsam*, and those that are tied to wood or a cask before being cast out are designated as *ligan*. These words are now seldom used, but the term *jettison* is employed in connection with insurance.

**FLOUNDER** (floun'dēr), a genus of fishes of the flatfish family, found along the shores of almost all countries. The body is often a foot or more in length, extremely flattened at the sides, and about one-third as wide as it is long. Like other flatfish, they usually swim on the left side, but reversed specimens are common. About 150 species of the flounder have been studied, most of which occur in salt water, but several of the species thrive in lakes and other bodies of fresh water. The color varies according to the ground where the fish live. Flounders are excellent and favorite food fish.

**FLOUR**, the ground and bolted portions of cereals, though specifically applied only to the products made of wheat. When applied to the finely ground substance of any other cereal it is usually specified, as rye flour, buckwheat flour. Among the principal food products flour is of vastly greater importance than any other, and, as an edible substance, enters into manifold convenient forms, such as bread, biscuit, cake, pudding, and crackers. Rice being the favorite food of the Mongolians of Asia and entering quite largely the edible substances of other people, it is the only cereal that rivals flour as food for man. The cultivation of cereal plants is as old as the history of man, which likewise is true of the use of their seed for food.

Various relics of remote antiquity indicate

that crude devices were employed in the manufacture of flour from wheat and rye. The process consisted of crushing the grains in a cavity cut in stone by means of a conical piece of porphyry, crystal, or marble. In the later period of ancient Egypt and the early times of Rome, the pestle and mortar served for crushing grain, which were soon displaced by the ox mill and later by the water mill. In early water mills the process of grinding was effected by an upper and lower millstone. The latter had a slightly convex surface, over which the concave surface of the former fitted. The grain passing between the two in a slow but constant stream was ground to a mixed mass of flour, middlings, and bran, each of which was afterward separated from the others. Modified forms of this class of mills are still used in newly settled countries and among people who do not manufacture vast quantities of flour.

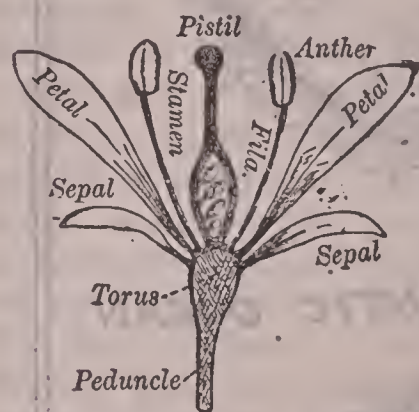

In modern flour milling it is customary to convey the wheat from railway cars, in which it is shipped from the agricultural districts, into bins. From the bins it is carried by means of elevators into storage rooms at the top of the mill building, where it is kept until needed for grinding. The machinery for manufacturing flour is located usually on the first floor, and as the grain is let down all foreign matters are separated from it. In the cleaning process all the oats, chaff, dirt, dust, cockle, and other impurities are taken out by means of blasts of air, sieves, and powerful magnets, the latter removing all particles of iron that may have mixed with the grain in threshing and in transportation. After this process of cleaning, it passes consecutively between rollers or cylinders having spiral corrugations that operate to crush it. The first of these are coarse and serve to break the wheat into particles, but they become finer and are set more closely together until the last of the series effects a very high degree of crushing.

After the wheat is crushed sufficiently, the product is carried to complicated machinery in which the *flour*, *middlings*, and *bran* are separated. This machinery has been perfected to such a high state that remaining impurities can be removed and all portions of the wheat are utilized to the best purpose. Formerly the mills were somewhat unpleasant because of the flying particles of flour. However, this has been overcome by a dust collecting machine, which creates a vacuum through the agency of a fan, causing the suspended particles to be drawn by currents of air into a chamber, from which they are removed at certain intervals. Roller mills are now employed in manufacturing flour both

from spring and winter wheat, and are propelled successfully by water, steam, or electric power, though the first named is far the most inexpensive.

About 18,500 flouring mills are operated in the United States. Those at Saint Anthony Falls, Minneapolis, are propelled by water power and are the largest in the world. Pennsylvania has the largest number of mills, though most of them are small. Canada holds the second rank in the list of North American countries as a producer of flour. The vast wheat fields of the central-western section have made this possible. Winnipeg is one of the great flour-producing cities of the world. Other centers are at Toronto, Ottawa, and Vancouver. A national association of millers is supported in the United States, which has numerous branches in the several states where milling is an important industry. With it are associated a number of mutual insurance companies. About 16,500,000 barrels of flour are exported from the United States annually, while the domestic market requires 75,500,000 barrels.

**FLOWER** (fou'ēr), the bloom or blossom of a plant, the terminal bud inclosing the organs of reproduction. The *stamens* and *pistils* are the essential parts of a flower. These are usually surrounded by floral envelopes, the *calyx* and *corolla*, but in the lily, crocus, and other endogenous plants they are not distinguishable. The leaves of the calyx are called *sepals*, and those of the corolla are known as *petals*. In flowers the stamens, or male organs of reproduction, are composed of the *filament*, *anther*, and *pollen*. The pistils, or female organs, consist of the *style*, *stigma*, *ovary*, and *ovules*. Where both stamens and pistils appear in the same flower, it is said to be

PARTS OF A FLOWER.

hermaphrodite or perfect, but, if only the stamens appear, it is unisexual or imperfect. A flower which has only the pistils is said to be barren or sterile. Sometimes both calyx and corolla are wanting, when it is said to be

naked. If both the stamens and pistils are wanting, the flower is termed neuter or empty. An assemblage of flowers on a plant is called an *inflorescence*. If there is no flower stalk, or peduncle, of which the torus is the upper part, the flower is said to be sessile.

The primary object of the flower is to fur-

nish the necessary elements of reproduction. To accomplish this essential function, the pollen must be transported from the stamen to the pistil, which may be done through the agency of insects, but in most cases is effected by the pollen falling or being blown through the air. The best results come from fertilization by pollen from a different flower of the same plant or from a different plant. Much has been done in floriculture to develop both a high degree of fertilization and showy blossoms.

**FLOWERS, Adoption of,** the selection of flowers as symbols by certain states and nations. Floral symbols came into use in very early times and mention is made of them in the early history of China and in biblical literature. The lotus, or sacred lily, was consecrated to the gods in Egypt, and afterward became the national emblem. Many nations of antiquity used a code of floral symbols in decorating the surfaces of monuments and in making inscriptions in temples, but these are not understood. Throughout history is a line of records that conveys information in regard to the extensive use of flowers in national ceremonies, but the selection of particular flowers came about rather as a matter of sentiment than by legal or national adoption. Edward I. of England wore the red rose, from which circumstance the rose became the national emblem of that country. However, the British coat-of-arms contains the English rose, the Irish shamrock and the Scotch thistle. In Canada the maple leaf has been the national emblem since 1834. It is the leaf of the sugar maple of the forest, which is renowned for the brilliant colors of its foliage in autumn. The following is a partial list of the national emblems:

Canada	Maple Leaf
England	Rose
Egypt	Lotus
France	Fleur-de-lis, or Iris
Germany	Cornflower
Greece	Blue Violet
India	Lotus
Ireland	Shamrock
Italy	White Lily
Japan	Chrysanthemum
Mexico	Prickly Pear
Persia	Rose
Scotland	Thistle
Spain	Scarlet Pomegranate
Switzerland	Rare Edelweiss
United States	Goldenrod

Many of the states of the United States adopted flowers by a vote of the public school children, and in others adoptions were made by acts of the legislatures. The following is a partial list of the State flowers:

Alabama	Sunflower
Arkansas	Apple Blossom
California	Poppy
Colorado	Columbine
Delaware	Peach Blossom
Georgia	Cherokee Rose
Idaho	Syringa
Indiana	Corn
Iowa	Wild Rose
Kansas	Sunflower
Louisiana	Magnolia
Maine	Pine Cone and Tassel
Michigan	Apple Blossom
Minnesota	Moccasin
Mississippi	Magnolia
Missouri	Goldenrod
Montana	Bitterroot
Nebraska	Goldenrod
Nevada	Sage-brush
New York	Rose
North Dakota	Goldenrod
Oklahoma	Mistletoe
Oregon	Grape
Rhode Island	Violet
Texas	Bluebonnet
Utah	Sego Lily
Vermont	Red Clover
Washington	Rhododendron
West Virginia	Rhododendron
Wyoming	Gentian

**FLOWERS, Artificial,** the product of manufacture embracing imitations of real flowers, made of various materials. The Italians were the first to bring the art of making flowers to a high state of perfection, although the early Egyptians and Romans had developed it to a considerable extent. At present the Americans, Germans, and French excel in the output. About \$250,000 worth each are exported from Germany and France annually. They are used chiefly for ornamenting ladies' and children's hats and bonnets. The materials used are various, including wax, shell, horn, whalebone, paper, rubber, ribbons, velvet, cambric, jaconet, calico, muslin, blown glass, crape, gauze, and satin.

**FLOWERS, Language of,** the method of using flowers as types to express thoughts and feelings. The art of using flowers to convey messages originated in ancient times, when the custom was better understood and more generally practiced than at present. An extensive flower language was developed in the western part of Asia at a remote period, but the Greeks and Romans conveyed to us the most authentic record of its use and application. Though nations widely remote from each other cultivated the use of such a language, it is interesting to note that they agreed in applying the same sentiment to many of the flowers. For instance, the amaranth signifies immortality; the oak leaf,

power; the moss rosebud, a confession of love; and the white rose, happy love. The following is a partial list of the more important flowers used in expressing sentiments:

Amaranth	Immortality
Anemone	Anticipation
Apple Blossom	Preference
Aspen Leaf	Fear
Brier	Insult
Buttercup	Riches
Camellia	Illness
Calla	Pride
Candytuft	Indifference
Cornflower	Heaven
Cowslip	Youthful Beauty
Cypress	Death
Daffodil	Unrequited Love
Daisy	Simplicity
Dandelion	Coquetry
Evergreen	Hope
Everlastings	Undying Affection
Fern	Forsaken
Five-leafed Clover	Bad Luck
Forget-Me-Not	True Love
Four-leafed Clover	Good Luck
Foxglove	Insincerity
Geranium	Deceit
Goldenrod	Encouragement
Heather	Loneliness
Heliotrope	Devotion
Hepatica	Anger
Honeysuckle	Fidelity
Hyacinth	Sorrow
Ivy	Trustfulness
Laurel	Fame
Lilac	Fastidiousness
Lily	Majesty, Purity
Lotus	Forgetfulness
Marigold	Contempt
Moss or a dry twig	Old Age
Myrtle	Wedded Bliss
Narcissus	Vanity
Oak Leaf	Power
Orange Blossom	Marriage
Oxalis	Pangs of Regret
Palm Leaf	Conquest
Pansy	Loving Thoughts
Poppy	A Tryst at Evening
Rosemary	Remembrance
Rue	Repentance
Scarlet Geranium	A Kiss
Snowdrop	A Friend in Need
Sting Nettle	Rudeness
Sweet William	Gallantry
Tuberose	Bereavement
Tulip	Boldness
Violet	Modesty
Yellow Rose	Jealousy

**FLUIDS** (flū'ids), the substances whose molecules change places freely by slight pressure. They include liquids and gases, as opposed to solids. Liquids possess no definite shape, but assume that of the vessel in which

they are kept, except at the upper surface, which is level. Gas inclosed in a bottle presses upward against the cork as well as against the sides and base. From this fact liquids are said to be nonelastic fluids and gases are termed elastic fluids.

**FLUKEWORM** (flūk'wôrm), or **Fluke**, the name of several kinds of worms found in the liver and biliary ducts of sheep, in which it causes the disease commonly called *rot*. The eggs, which are laid in the liver, pass to the exterior by means of the gall and the intestines and hatch on the wet grass. After undergoing a complicated process of development, they crawl about on the grass and are eaten by the sheep, and inside of the stomach undergo another form of metamorphosis. Later they bore through the animal tissue and find lodgment in the liver, where they reach sexual maturity. Other species attack birds and fishes, and a kind common to Egypt infests different organs and tissues of man.

**FLUORESCENCE** (flū-ō-rēs'sens), the property possessed by some transparent bodies which causes them to produce at their surface, or within their substance, light of a different color than that of the mass of the material. This may be demonstrated by exposing green crystals of fluor spar to light, when the reflections are blue. This is due to the property which the substance has of modifying the light striking upon it. Glass colored of a yellow tint with oxide of uranium, known as canary glass, produces fluorescence of a brilliant green tint.

**FLUORINE** (flū'ôr-in), a nonmetallic element separated from fluor spar or fluoride of calcium by the action of sulphuric acid. It is not found native and can be isolated only with great difficulty, since it combines very readily with different substances. The stems of grasses, mineral springs, sea water, and many animal substances contain fluorine. Compounds of fluorine are used in preserving food, in etching glass, and for antiseptic purposes. It has the property of corroding objects with which it comes in contact, hence must be preserved in lead or ceresin bottles.

**FLUOROSCOPE** (flū-ôr'ô-skōp), an instrument employed to transfer X-rays into light. This light enables an observer to see through several inches of wood, observe the bones of the living body, or other objects of dense construction in bodies usually opaque. The fluoroscope was invented by Thomas A. Edison, who tried over 800 different salts in experimenting to perfect a suitable instrument. The most satisfactory fluoroscope consists of a rectangular box a foot long, tapering toward the far-

ther end, at which a fluorescent screen is placed. The inside of the box is painted black. The screen is made of pasteboard, covered with white paper and then coated with collodion, on which fine crystals of calcium tungstate are sifted. In passing four amperes through a Crookes tube, and holding an object between it and the fluoroscope, the observer can see through the screen and the object, and thus study visually the phenomena discovered by Röntgen.

**FLUOR SPAR** (flū'ör spär), the fluoride of calcium, which occurs especially in deposits of cobalt, tin, silver, lead, and other beds of metals. It is usually blue, green, yellow, or pink, though it occurs also in colorless and transparent forms. Fluor spar occurs in Norway, England, and Germany. The annual American product is valued at about \$115,000, and is obtained chiefly in Kentucky and Illinois. It is used as a flux in iron smelting, and in the manufacture of opalescent glass and hydrofluoric acid.

**FLUTE** (flüt), one of the oldest wind musical instruments. It has four joints, tapers toward one end, and contains a number of holes to be covered with the fingers or by keys. Some flutes have a mouthpiece, but others are played by placing the lower lip close against the hole of the outside and blowing the air so its passage is broken against the opposite edge of the hole, causing the air inside the hole to vibrate. Its soft, pleasant tone and wide range in compass make it an important instrument in orchestral music.

**FLUX** (flūx), a substance used to promote the fusion of minerals, or to cause their decomposition. Many materials are employed for this purpose, depending upon the nature of the body to be treated and the chemical action desired. Limestone unites with the alumina and silica of iron ores, hence is the usual flux employed in the blast furnace. Borax forms fusible compounds with silica and other bases and is used very generally as a flux. Cyanide of potassium is employed both as a flux and a reducing agent and niter and litharge are good fluxes and oxidizing agents. Many substances, such as litharge, boracic acid, and red lead, are used as flux in making pottery.

**FLY**, an insect characterized by possessing but two wings, the posterior set being reduced to a pair of so-called balancing rods, or legs. The proboscis or underlip ends in two flaps, which are used for lapping. A long list of pests belongs to the order Diptera, or two-winged insects, such as gadflies, bat flies, blowflies, and the common house flies. About

40,000 species have been described, but these are thought to be only about one-eighth of the number which at present are represented by living species. To these may be added a long list of extinct and fossil flies. Not less than

1, MUSCID; 2, SYRPHUS; 1a, FLY'S FOOT.

1,500 species have been described from the fossils found in the shale beds of Florissant, Colo., and many other sources are fully as prolific.

The eggs of a fly hatch into larvae in about a day. They then pass into a quiescent pupa stage for several days more, whence they issue as full-grown insects. In warm climates flies are seen the entire year, but where the winters are cold they disappear on the approach of heavy frosts. A few survive the winter in sheltered places. These, together with some of the eggs and pupae, preserve the species. Flies are enabled to walk on smooth surfaces and ceilings with their backs downward by a hairlike cushion which serves to hold them in place, partly by a glutinous fluid secretion and partly because of their ability to remove the air from below the feet by means of suckers through the hair, the pressure of the air on the outside serving to support the insect. The muscid, or house fly, and the syrphus, or drone fly, are well-known species of these insects.

**FLYCATCHER** (flī'käch-ēr), the common name of many birds native to America, so named from their ability to catch flies and other insects. They have the habit of waiting until the insect comes very near, when they dart suddenly to secure it, after which they return to the same place. Birds of this class are seldom seen on the ground or in the act of chasing insects in the air like swallows. The *Savannah flycatcher* is common to the southern part of the United States. About 350 species are native to North America, and they are widely distributed from Panama to the northern part of Canada, but are best represented where insects are most numerous. Only four species are native to Europe, including the *spotted flycatcher* seen both in Great Britain and on the continent. The kingbird (q. v.) belongs to the family of flycatchers.

**FLYING FISH**, a name applied to all fishes which have large pectoral fins and are able to

sustain themselves in short seeming flights above the water. A large number of species belong to this class, about thirty, and two families, most of which are common to the warm zones. They swim in shoals near the

FLYING FISH.

surface and, leaving the water, often dart through the air for a distance of several hundred feet. Little, if any, force is acquired while the fish are in the air, but, instead, the strong tail seems to be the only source of motive power, the winglike pectoral fins serving rather as parachutes to support the body in the air. It does not seem true that these fishes leave the water merely to escape danger as has been asserted by some writers, but they do so as a means of exercising in the air, of which they appear to be fond. The *flying gurnard*, a spiny fish of the Gulf of Mexico and the Atlantic coast, emits a phosphorescent light in the night. Flying fish rarely rise more than four feet above the water, but when a school is met by a small boat they move in all directions and sometimes a few fall upon the deck. They are about a foot long and are held in high esteem as food.

**FLYING MACHINE**, a mechanical structure designed to navigate the air. It differs from a balloon mainly in that a flying machine is heavier than the air, while a balloon is lighter. Efforts to navigate the air by means of mechanical apparatus have been made for about five centuries and, though some degree of success was made in the last century, the successful solution of the problem has been approached only within the last decade. *Aéronauts* constitute a class who think air navigation possible only by means of balloons, while *aviators* have been multiplying in numbers, be-

lieving it possible to perfect flying machines with which movement in the air will be as safe and rapid as upon the land or the water. They have studied the structure and flight of large birds and from them have drawn lessons so valuable that the perfection of a safety flying machine is fast nearing its culmination.

In the 17th century Bernier, of Sable, France, constructed two pairs of wings, which he fastened to the shoulders and ankles with leather straps. By means of these mechanical devices he was able to guide himself in the air and fly for some distance, especially when starting by running from an elevation and thence moving over the valley beneath. In 1896 the secretary of the Smithsonian Institute, Prof. S. P. Langley, completed his *aërodrome*, a flying machine which he sent up with much success, and perfected it to such a state that it was possible to move, ascend, and return successfully. O. Chanute, of Chicago, in the same year carried on elaborate experiments with his *aëroplane*, which enabled him to fly and soar quite successfully.
