1904

THE BUILDER

AN : ILLUSTRATED : WEEKLY
MAGAZINE : FOR : THE
ARCHITECT : ENGINEER : ARCHÆ-
OLOGIST : CONSTRUCTOR : SANI-
TARY-REFORMER : & : ART-LOVER

CONDUCTED BY

H. H. STATHAM,

FELLOW OF THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

“EVERY man's proper mansion-house, and home, being the theater of his hospitality, the seat of self-fruition, the comfortabest part of his own life, the noblest of his sonne's inheritance, a kind of private prince dome, nay, to the possessors thereof, an epitome of the whole world, may well deserve, by these attributes, according to the degree of the master, to be decently and delightfully adorned.”

“Architecture can want no commendation, where there are noble men, or noble mindes.”—SIR HENRY WOTTON.

“OUR English word To BUILD is the Anglo-Saxon Bylsan, to confirm, to establish, to make firm and sure and fast, to consolidate, to strengthen; and is applicable to all other things as well as to dwelling-places.”—DIVERSIONS OF PURLEY.

“ALWAYS be ready to speak your mind, and a base man will avoid you.”—WILLIAM BLAKE.

The Old Church of Chingford, Essex.

HERE were two manors in the parish of Chingford, the chief of which was given by Edward the Confessor to the cathedral church of St. Paul's, and thence became known as Chingford St. Paul's. The church stood on the other manor, which was always in secular hands. Among the holders of this manor, at different periods of its descent or purchase, were several earls, such as the Earl of Gloucester, *temp.* Edward III.; the Earl of Essex, *temp.* Edward IV.; and the Earl of Rutland, *temp.* Henry VIII. Hence it was usually termed Chingford Comitis or Earl's Chingford. The history of the church and rectory, so far as

documentary annals are concerned, is uneventful. The London episcopal registers yield a list of successive rectors and patrons from 1325 downwards. The rectors do not appear to have been men of any special mark.

The old church, which is dedicated to All Saints, and not to Saints Peter and Paul, as usually stated, stands close to the high road leading to Waltham Abbey, eight miles north of London. It is situated on high ground, and the churchyard commands an extensive view over the valley of the Lea into Hertfordshire and Middlesex.

One hundred and ten years ago a careful contributor to the *Gentleman's Magazine*, before the ivy had begun its pernicious work, described this church as in an exceptionally good state of "very sound repair," so that it struck him as appearing "almost unalterable even to time itself." But it had not entered into

the head of "Indagator Londinensis," the contributor in question, to imagine that it would be left to the wisdom of the XIXth century to hand over this admirably built fabric to the stifling cruelties of the freely roaming ivy. Had it not been for the idiotic policy of abandoning this finely constructed example of our forefathers' energy and skill to the tender mercies of this rampant, coarse-growing weed, Chingford Old Church would today, with a trifling occasional expenditure, have been as well-wrought a piece of architecture as it was in 1794. The north-east view of this church, given in the *Gentleman's Magazine* (vol. lxiv., p. 1106), is a singularly poor one, even for that date; but it supplies a fairly accurate notion of the church on its least attractive side, and shows a single root of ivy at the junction of chancel and nave, which was, however, even then beginning to climb on to the roof.

Fig. 1. Chingford Church (1903).

In a quarto publication issued in 1811, entitled "Ecclesiastical Topography: a Collection of One Hundred Views of Churches in the Euvirons of London," Chingford is the last church delineated. The view in this case is south-east. The ivy, even at that time, is depicted as singularly luxuriant on chancel, nave, and porch. The letterpress describes the building as "most remarkable for the beauty of its appearance," but adds that it "is almost entirely overgrown with ivy."

Wright's "History of Essex," which was published between 1831 and 1835, supplies a good steel engraving of this church, which is also taken from the south-east, showing how much it was then shrouded in ivy, which rose in two places to the top of the tower.

In 1844-5 a new church of white brick, and singularly feeble design, was built at Chingford Green, about a mile to the north of the parish church, when, by a most unhappy decision, it was arranged to abandon the main body of the old church so far as any use of it was concerned, the chancel being walled off for occasional services. These fitful services in the chancel were held from time to time until about ten years ago, when they altogether ceased. Meanwhile the ivy was allowed to wanton at free will over the south porch, south aisle, and nave; vast entanglements rising from the great snake-like stems, clutching the roofs in deadly embrace. If any ventured to remonstrate, of late years, pointing out that the fabric was being stifled to death, "the extraordinary picturesqueness" of the ivy and masses of decayed vegetation were held to justify its continuance. The parish as a whole seemed enthralled by the supposed beauty of this heap of rampant greenery, and allowed

the ivy to continue its deadly work outside, whilst they foolishly attempted to prop up the building from within by a variety of timber supports.

At length the long-expected crash came, and in the bleak, windy weather of last February the roofs of nave and south aisle gave way, dragging with them in their downfall no small amount of masonry and shaking the rest, so that this ancient, well-huilt church is now a sad and deplorable ruin, save for the chancel and tower. It is altogether beyond ordinary repair, and an expenditure of thousands would be required to effect a decent restoration. Unless the ivy and the mass of decayed matter on the roof are speedily removed from the chancel, that, too, will ere long be prostrate.

The church consists of chancel, nave, south aisle, south porch, and west tower. Rough measurements give the size of the chancel as about 18 ft. long and 21 ft. wide. The nave, of three bays, is the same width and 51 ft. in length. The south aisle is about 12 ft. in width; the west tower has a square of 15 ft. Contrary to what is usual with the old churches of this district, where flint so largely prevails, most of the fabric of Chingford church is of good stone. A careful examination of the squared stones shows that a considerable proportion bear distinct traces of Norman axeing, proving that there was a well-huilt church here as early as the XIIth century. When the new church was built in 1844-5, the font was moved from the old fabric. It is a good example of late Norman or Transitional work. The font itself is a squared block of Purbeck marble, standing on four small angle shafts with moulded bases and a

larger central shaft. Each side is arched into five divisions. Unfortunately, when it was removed the top 3 in. were renewed; it may possibly have been necessary to renew some decayed portion, but it surely would have been simple to obtain some harmonising or like material, instead of employing for the new work a marble which is embellished with pink streaks.

There does not seem to be anything left in the fabric that tells of either Norman or Early English work; but the doorway of the south aisle, under the porch, and other details show that this aisle was either built or rebuilt towards the close of the XIIIth century, *temp.* Edward I. This doorway has a single stone shaft nearly detached in each jamb, and some good characteristic mouldings. Of the arcade that divided the south aisle from the nave only a single pier, with corresponding respond, is now standing—namely, that at the east end. The pier is circular, and of the same date as the doorway.

Probably a Norman nave and chancel sufficed for worship on this site until the reign of Edward I. John, Earl of Athol, who then held the manor of Earls Chingford and the advowson of the rectory, forfeited his lands to the Crown by espousing the cause of Robert Bruce, when Edward I. gave the manor to the Earl of Gloucester. It was at this juncture of affairs in local history that the south aisle was built and the church otherwise improved. There are signs about the tower that point to this being the period when a west tower, in place of a mere bell-gable, was first erected.

In the latter half of the XVth century this church underwent a thorough rebuilding. The chancel appears to be

irely new work of that date. In each wall are two two-light windows, with pressed arches. The three-light east window has been renewed, but the jambs are original. There is a well-moulded west doorway on the north side, with a nearly circular head. The north wall of the nave was about the same date built; the two three-light windows have the same character as the chancel, and so has the north doorway of the north bay. The buttresses of both nave and chancel have been remarkably well built; in fact, the whole work of that date, though not enriched, was exceptionally good. The west tower, of like date, is of two stages, unbuttressed, and with an embattled parapet. There is a large angle light, with cinque-foiled head, in the west wall of the basement; the north and south walls are unperforated. The belfry stage has a two-light window on each face. The guide-book to the county bids us to be much Roman brick in the tower masonry. But there is no Roman brick to be noticed; here and there pieces of Roman mediæval tiles have been utilised in the building. The only place where we detected possible Roman brick or tile was in the south-east buttress of the aisle, where two large fragments, apparently Roman, were obtruding. If it was not for documentary evidence, we should have been inclined to put this considerable rebuilding in the last quarter of the XVth century. The will, however, of one Benet Harlewyn, of this parish, proved in the year 1460, shows that the building of the chancel was then in progress. The exact wording is:—*Lego versus fabricam novi cancelli sive chori ecclesie parochialis de Shingilford iijjs ijd.* Probably the nave was taken in hand when the chancel was finished, and then the tower.

The windows of the south aisle seem to have been renewed at a later date, probably circa 1500.

To the reign of Henry VII., or possibly Henry VIII., the really admirable red brick porch must be assigned, with its beautifully moulded doorway and good three-light windows on each side. We believe it to be about the best brick church porch of pre-Reformation date left in East Anglia, if not in all England. Now it has been possible for rectors, churchwardens, and other inhabitants of Chingford—to say nothing of extra-parochial rural deans and archdeacons and other diocesan authorities who are supposed to look after church fabrics—to go on year after year suffering, nay, encouraging, these vast stems of ivy to be grinding through and over this remarkable porch, almost passes the wit of human understanding. One of the ivy stems shown in the photographic plate exceeds 2 ft. in circumference, and another is exactly that measurement. In the west side of this porch a great gnarled elder-bush, of long-standing growth, springs out of the foundation. The roof and walls of this porch are now so rent about that its salvation is well-nigh impossible. As if any miserable outhouse or commonplace modern barn could not be equally effective to display what ivy can do, if the Chingford folk were determined to have this desolating sight of greenery. Ivy can grow and will grow anywhere; but the ancient

time-worn masonry and brickwork of our forefathers—apart from all sacred associations—can never be replaced.

Of the few remnants of old-time worship that the crumbling inner walls of this church still retain, a plain piscina drain may be mentioned at the east end of the south aisle, and the niche for a holy water stoup to the east of the north entrance.

That distinguished Essex ecclesiologist, the late Mr. H. W. King, told a sad story, in the second volume of the Essex Archaeological Society's *Proceedings* (1863), of the depredations made on this unhappily deserted church. In the chancel were the Elizabethan effigies in brass, with an inscription plate, of Robert Rampston (1585) and Margaret, his wife (1590). Robert Rampston was in plate armour and his wife in the elaborate costume of that date. These brasses were not only valuable as excellent examples of the armour and dress of the times, but had a special historical and local value. Robert Rampston, who had served as Yeoman of the Guard to Edward VI., Queen Mary, and Queen Elizabeth, was a great benefactor to the poor of the whole district, and a mural plate recorded his benefactions to Chingford and ten other parishes. A thief made away with the benefaction plate in 1857; encouraged by his success, he soon afterwards paid a second visit, and carried off the two effigies and the inscription. When Chingford church

was dismantled these brasses had been removed from the east end of the south aisle and placed in the chancel.

The old chancel still retains a variety of XIXth and XVIIIth century mural tablets and floor slabs, as well as some ragged batchments. They are chiefly to the families of Boothby and Leigh. Three of Jacobean date have lately been removed to the south wall of the church at Chingford Green. The most remarkable of these is that to Mary, wife of Robert Leigh; and daughter of Henry Josselin, of Torrells Hall, Essex, who died in 1602, apparently in child-birth. The lady is represented lying in bed, with curtains, suspended from a tester, half drawn back; on the coverlet, outside, lies the small figure of a child wrapped round with the chrisom cloth. The inscription, now nearly illegible, has an epitaph assigning to this lady every possible virtue—

Marye the wyfe of Robert Leigh Esquier
Payes here the debt that Nature doth requier
Whoe lived a mirror, for a godly life,
And dyed a wonder, for a loving wyfe,
A boddye chaste, a vertuous mynde:
A temperate tongue, an humble harte:
Secret and wyse, faythfull and kinde:
Trew, without guile, mild without arte,
A frende to peace, a foe to strife.
A spotless dame, a matchlesse wyfe,
Loe heere her trewe anatomye:
And for her birth of gentlerie;
Shew Josyphs height, of Torrells race:
Each tribe did give her equal grace.

The views of the church before and after the collapse are from photographs by C. A. Samuels, of Angel Road, Edmonton.

NOTES.

The Architect of the Government Offices.

THE honour of knighthood bestowed on Mr. H. Tanner of the Office of Works seems to have started the daily press with their usual blunders about architects, the *Daily Telegraph* having given out that Sir H. Tanner was architect of the Government Offices in Great George-street. The editor of this journal wrote a note to the paper in question pointing out the mistake and the injustice to the memory of the deceased architect, the late J. M. Brydon; a letter which the *Daily Telegraph* did not publish. In the daily papers it seems to be supposed that mistakes about architects and architecture may be safely made, since the public care nothing about these subjects, and do not mind whether the papers are right or wrong. The honour paid to the chief official architect of the Office of Works would be more in place if one did not think of the number of far more eminent architects who are yearly passed over by the Government without any recognition of their existence.

The Exit from the Royal Academy.

A FEW days ago an architect, Mr. W. A. Forsyth, wrote to the *Times* drawing attention to the danger to the visitors to the Royal Academy, in case of any sudden alarm of fire, from there being only one exit, and that barred by turnstiles, and suggested the substitution of "several exit doors."

It is hardly fair to charge this danger against the Royal Academy rooms only, as it applies equally to the National Gallery and to the New Gallery, with the exception that the latter is smaller and holds fewer people. But admitting the wisdom of the suggestion in the abstract, how is it to be done now? In the case of the Royal Academy rooms, it would mean remodelling the whole building, or else breaking through the front walls on the first floor and putting exterior staircases on the courtyard front, which would be a terrible architectural blemish to the front as now existing. Such arrangements can only be carried out properly when a building is planned for them *ab initio*. As it is, all that could be done now is to see that the barriers and turnstiles are easily removable. They are not permanent, as they are removed for the Private Views and the Soirée; how long it takes to remove them we do not know. If they are fixed so that they can be removed in a minute or two, that is all that can be done now; though Mr. Forsyth's letter may have done good in calling attention to the point.

Charges on Property for Street Improvements.

ON February 21, 1903, we had occasion to call our readers' attention to a decision of the Court of Appeal in the case of *Surtees v. Woodhouse* as to the time at which expenses incurred by local authorities under the Private Street Works Act,

1892, become a charge on the premises, and it was then decided that they became so charged at the time the works were completed and before the final apportionment under section 13. In the recent case of *in re Allen and Driscoll's contract* a similar question has had to be decided under the Public Health Act, 1875. Specific performance was being enforced of a contract to purchase certain property, and under the contract the vendors were liable to pay outgoings up to September 29th. The District Council, having called on the owners, under section 150, to pave and make up the road, in default of this being done had themselves contracted to have the work done, and the work had been partially performed and partially paid for by the Council before September 29. The question arose as to whether the purchaser or the vendor was liable for these expenses, and the Court decided they fell on the purchaser, since he was the owner "when the work was completed"—the words used in section 257 of the Public Health Act, 1875.

Trees and Houses.

A CASE (*Smith v. Giddy*) which is of special importance to those who live in villas was decided by the King's Bench Division last week. Mr. Jones (as we will call him) allowed his trees to overhang his neighbour Mr. Brown's premises, and the latter claimed in the County Court damages and injunction to prevent the continuance of the alleged nuisance. The County Court judge, however, decided that Jones's proper remedy was to "abate" the nuisance, in other words, to cut back the overhanging trees. This, of course, is a good old mediaeval remedy, and one which has a tendency to cause personal conflicts. The Divisional Court, when the matter came before them on appeal, decided, however, that, though there was no direct precedent for such an action as this, yet that on principle it could be maintained. This is obviously common sense. The right to "abate" the nuisance implies a right to stop it, and the right to do so by legal means is the modern and civilised means of so doing. But the knowledge that trees in villa gardens must not be allowed to overhang adjoining grounds, and that a County Court may now prevent it, is a fact of considerable importance.

Motors and the Roads.

THIS being the first dry season since the motor came into such vogue, the attention of dwellers in the country is being most seriously called to the dust nuisance. This question is not one solely of convenience—ladies, children, and dogs are beginning to learn that the public roads can no longer be used by them either with safety or with any enjoyment—but all house property abutting on main thoroughfares is seriously depreciated in value. Such houses can no longer be let during the summer months, and it also follows that their market value is depreciated to such an extent that many of them are unsaleable. The fact that our roads are entirely unsuited to such high-paced traffic, is recognised even by the motorists themselves, but the only

remedies suggested have been reconstruction of the roads, which is impracticable, or a treatment with oil, which would only make the country roads more unbearable than they are at present. On thoroughfares frequented by motor traffic it is no longer safe for a lady to drive herself unaccompanied by a groom; this is in itself a deprivation to many people of small income, but in dry seasons it is further impossible for her to be driven out in an open carriage at all, and the only cure at present seems to be for her to go to garden parties in a close carriage, or to take refuge in the extraordinary garments adopted by the motorists themselves. It is to be hoped this dry weather may continue until our legislators are released from their labours at Westminster and betake themselves to their country seats, when they will have practical ocular demonstration that much dust was thrown in their eyes in connection with the recent enactments legalising such high speeds.

The Twisting Effect of Lightning. SOME interesting particulars stated in a recent letter to the *Standard*, relative to the action of lightning at Earl's Fee, Essex—have called forth reminiscences of similar effects from several correspondents to the same paper. Most of the occurrences in question exemplified the phenomena exhibited by what is termed "globular lightning," but in the opinion of Mr. Killingworth Hedges, who has this week written a letter on the subject, the incident at Earl's Fee was not due to this cause. Mr. Hedges takes the opportunity of reminding his readers that a lightning flash often divides into several distinct flashes, which, in the case of a building, accounts for its being struck in more than one place at the same time. The twisting effect of lightning is often shown by the displacement of masonry, and Mr. Hedges records an instance in which the spire of a church was rotated bodily through a small angle without being overturned. The most important point suggested by the letters describing the bursting of globular lightning into zig-zag flashes, as well as by the letter of Mr. Hedges, is the absolute necessity of protecting buildings by a connected series of conductors so that every part of the structure may be properly safeguarded.

A Great Indian Dam. We learn that an irrigation dam of most imposing proportions is about to be built across the Tungabhadra River, in the western part of Madras. Rising in the Western Ghats, the Tungabhadra follows an eastward course of some 400 miles from its source to the sea, and, according to the scheme now formulated, will be barred near Hospett by a dam nearly a mile in length and about 150 ft. high. This stupendous work, although not quite so long as the Aswan dam in Egypt, will be considerably higher, and will form a reservoir covering an area of about 150 square miles. The volume of water so held up is calculated at 200 milliard cubic feet, or between five and six times the capacity of the Aswan reservoir. The cost of the undertaking is estimated at about 3,500,000*l.*, an expenditure that it is confidently believed will be amply

justified by the increased value of land in the surrounding regions of the Presidency.

The Subsidence of Boston, U.S.A. ACCORDING to Mr. J. R. Freeman, a well-known American engineer, the city of Boston is slowly sinking. It is stated that the present datum, locally known as the "Boston base," so far as can be ascertained, was in the year 1830 at the same level as mean low water at Charleston. In the present day the same datum, as defined by various bench marks on solid ground, is 0.79 ft. below mean low water level. Granting the accuracy of these measurements, it is evident that the ground in the neighbourhood has been sinking at the rate of more than 1 ft. per hundred years. Although not a matter of immediate importance to the inhabitants and land-owners of the city and metropolitan district of Boston, the question is one of much interest, and may have to be taken into account by those who are concerned in the design of constructional works that are intended to endure for centuries to come.

St. George's Hospital and its Rebuilding. At a Special Court, held on Tuesday in last week, of the governors of the hospital, to consider the reports of a committee appointed in March last year, a resolution was passed by a large majority in favour of non-removal from the present site. In the course of discussion it was stated, upon the basis of reports supplied by Mr. H. Percy Adams, architect to the governing body, that the estimated cost of a new hospital amounts to 325,000*l.*, a total which includes 225,000*l.* for buildings to contain 350 beds, with medical school and nurses' quarters, 50,000*l.* for ten acres of land, and 50,000*l.* for contingencies, legal expenses, etc. It was resolved, further, to utilise the recently acquired property in St. George's-place, Knightsbridge, for buildings to form portion of a complete scheme of a new hospital, and to enter into negotiations with the Duke of Westminster for the purchase of adjoining leaseholds, at a price of 23,700*l.* The question of building ground is somewhat intricate. Briefly stated, it stands thus:—The governing body own the freehold of 26,145 sq. ft. of the existing entire site of 61,645 sq. ft.; they hold 17,600 sq. ft. opposite Green Park at a nominal rent under a lease from the Duke renewable in perpetuity so long as that site is used for hospital purposes; and a similar provision will obtain in respect of the third portion, being 17,905 sq. ft., which they hold from the Duke at a peppercorn rent under a lease until Michaelmas, 1906, with an option to purchase it after that date for 23,700*l.* The hospital was built in 1828-9, from plans and designs by W. Wilkins; Arthur P. Mee added an upper story and a new wing in 1859-68; eight years ago Mr. H. Percy Adams added the southern block, embracing the nurses' rooms, offices, etc., built the small (west) operating theatre, and remodelled the large (east) operating theatre. In the Foundling Hospital is a painting by Wilson, 1746, depicting the original hospital, formerly the house of

Lord Lanesborough, facing Hyde Park, which a committee leased for an infirmary in 1733-4, and enlarged by the addition of two wings after Isaac Ware's designs, as shown in his own print of 1733, and in the coloured print, after a drawing by Dagaty, published in 1797 by Ackermann.

Mr. Neville Lytton's Exhibition. At the Carfax Gallery, 17, Ryder-street, is a collection of works by the Hon. Neville Lytton, which, as the productions of a new artist, are of no little interest and promise. There are a considerable number of small sketches of landscape and buildings in water-colour on toned paper, which show a very broad and free style and a great feeling for composition. There is perhaps a little suspicion of the imitation of an old style about them; "Eashing Bridge" (32), for instance, might almost be labelled "Girtin"; but there is real artistic power in them; "Trees at Rake Mill" (14), for instance, is a beautiful sketch. The buildings which form the subjects of some of the sketches are very well treated. Then there are drapery and figure studies; some fine studies of draped figures and some good nude studies; but why does an artist who can draw so well as in some of these figure studies, allow himself to put in such carelessly drawn hands as in Nos. 21 and 46? A tempera painting called "Patience," of a lady seated with cards before her, is a remarkable and most original piece of decorative painting, executed on a dark gesso ground covered with a diaper design in slight relief. There are several small-scale portraits and one or two life-size ones. Mr. Lytton is evidently at present in an experimental and tentative stage as an artist, and has not quite found his style yet; but he has talent enough to accomplish much when he has settled what to aim at.

The Modern Gallery. At the Modern Gallery is a collection of pastel and water-colour drawings by Mr. Laurence G. Linnell, and water-colour drawings by Miss Elizabeth M. Chettle. Mr. Linnell's are chiefly about the region of Davos, St. Moritz, and Locarno. One of the larger ones, "Winter from the Rhoetian Alps" (19), with the snow mountains rising behind the nearer pine-covered hills, is a fine picture, and he is successful in a good many snow scenes, which seem to be rather a special class of subject with him. But, after all, the best things in his collection are the few English scenes, which are exceptions, such as "Hayfield on the Suffolk Marshes" (37), "A Suffolk Hayfield" (84), "The Wet West Wind" (64), and one or two others. In "Olney in Flood" (105) the spire (as one often finds with landscape painters) is not upright. Miss Chettle's small water-colours, much less ambitious in subject, are undoubtedly the best part of the exhibition, and are of quite unusual excellence of their kind. They are little corners of English landscape in which there is much detail of foreground foliage, painted as by one who loves it. Among these "A Wild Rose Hedge" (109), "A Grey Day in the Woods," "A Spring Moon" (114), "Thistledown and

Butterfly" (117) (the property of Sir L. Alma-Tadema), and "Sallows" (125) are beautiful; and still more so, in another way, is "Sheep on the Sussex Downs" (121), a more extended landscape of a different type from most of the others. Miss Chettle is a true artist, both in poetic feeling and in the conscientious execution of her small pictures.

Mr. E. G. CRAIG'S exhibition of designs for scenes and costumes for the theatre and other drawings in Trafalgar Studios, Manresa-road, is representative of the best class of theatrical art. To successfully cope with the technicalities of staging such scenes is a task much more difficult to overcome in this country than in some of the continental theatres, [where mechanical aid is so much more advanced. It is to be hoped that the effects which Mr. Craig has so well conceived on paper may be possible of actual production. The delightful grey in which he so revels is used perhaps most strikingly in the designs for "The Vikings"; and some of the Masque designs, and the low-toned, rich simplicity of the Shakesperian scenes, show an admirable repose of effect. The illustrations of Dumas—"Porthos," "Aramis," and "D'Artagnan"—are good character studies, expressing the spirit of their lives and time. Of the country subjects, all of which are exceedingly clever drawings in black ink and colour, we may mention "Pontingford," a simple study of trees and distance; bits from Hampton Court, etc. There are also a few woodcuts of characteristic merit. The simple charm and rest of Mr. Craig's work is, we think, sometimes marred by evidence of what one may call an Aubrey Beardsley influence, which is occasionally somewhat marked, and seems foreign to the spirit of his natural expression.

The Society of Arts, this year as last, held its annual Soirée in the Botanic Gardens, which were most beautifully and effectively lighted for the occasion, and fortunately the weather was suitable for a garden party. The guests were received by Sir W. Abney and the members of the Council. The entertainments consisted of the performances of the Royal Artillery Band in the conservatory and of the Irish Guards Band in the garden, and a concert of singing and handbell ringing in the club-room. Mr. Tipper's handbell solos, with a pianoforte accompaniment, constituted what in its way was a most finished artistic performance—just the kind of thing, too, for an occasion of this kind, when one wants the fanciful rather than the serious element in music.

This annual evening reception at the rooms of the Royal Academy came off with its usual success on Wednesday evening. The early arrivals were received by Mr. Yeames and Mr. Frampton, the President not having been able to attend till later. There was the usual crowd and the usual meetings of friends in the artistic and social world (for the Academy soirée is a great opportunity for agreeable surprises

and unexpected recognitions), and the usual band of the Royal Artillery, whose playing, by the way, seemed even better than usual.

LETTER FROM PARIS.

The Society of the "Autumn Salon," which in October last obtained the use of the ground floor galleries of the Petit Palais for an exhibition which was not very successful, intends to organise a second exhibition this year in the Grand Palais. The Société Nationale des Beaux-Arts (New Salon), several members of which had taken part in the "Autumn Salon," regards the latter exhibition, authorised by the State, in the light of a rival, and has forbidden its members to take part in any other exhibitions which may be organised in either the Grand or Petit Palais. This measure will place further difficulties in the way of the "Autumn Salon," which was in fact but a very poor attempt at an exhibition. It will, on the other hand, be likely to injure the "Société des Artistes Decorateurs," which held in December last a very interesting exhibition of industrial art, especially in regard to the decoration of rooms, and which the municipality intends to encourage by giving it, at the close of this year, the use of part of the galleries of the Petit Palais.

A Committee has been formed to purchase the statue of "Le Penseur," by Rodin, exhibited this year at the New Salon, and to offer it to the municipality, which however has not in any way solicited this rather doubtful gift. Outside of the circle of the extravagant admirers of Rodin, there are a good many people who do not see the suitability of this work as a public statue erected in the streets. They think it might do very well in a museum—the Luxembourg or the Petit Palais, but what æsthetic or philosophical purpose would it serve in such positions as the Place de la Trinité, or, as its admirers demand, behind the Opera-House and in the neighbourhood of the Garnier monument? This ill-regulated enthusiasm of the ultra-Rodinites reminds one of the celebrated speech—"I can look out for my enemies, if only Heaven will preserve me from my friends."

On the occasion of the race for the Grand Prix de Paris, the new tribune of Longchamps, from the design of M. Girault, was inaugurated by the President. The general effect of this structure, flanked by the new public tribunes also designed by M. Girault, is exceedingly good. A central vestibule leads to a large and richly-furnished salon, opening on the tribune itself, separated from the race-course by a verandah. Above the salon is an upper story, with its tribune entered from a salon oval on plan; and above all is a second story with a terrace from which a view can be obtained of the whole race-course, with extensive views also over the woods and hills of Meudon and St. Cloud.

The new north and south metropolitan railway, from Montmartre to Mont-Parnasse, is at last on the eve of being commenced. Parliament, before it rises, will pass the vote for the construction, the joint work of the engineers, M. Berber and M. Jametot. The works for the construction, the joint work of the engineers, M. Berber and M. Jametot, can therefore be soon taken in hand, and the *chantiers* will open at the beginning of the coming winter. It will ensure employment, during its construction, for an army of labourers, and will be of real advantage to the population of Paris when completed.

The Curator of the Cluny Museum, M. Edmond Harancourt, is undertaking some useful re-arrangement of the collection. The ground floor rooms adjoining the entrance will be devoted to the exhibition of new objects either given, lent, or purchased. The sculpture is to be methodically classed in its chronological order. The examples of Gallo-Roman, Romanesque, and Early Gothic art, will occupy the galleries called the Thermes de Julien. Late Gothic work will be arranged in the lower chapel; and Renaissance work in the arcades of the courtyard and in a loggia. The new arrangement will allow of the exhibition, in a well-lighted hall, of a fine set of gold-thread tapestries of the XVIIth century, hitherto kept rolled up and inaccessible to the public. The gallery called "Salle de la Licorne" is to be given up to church plate and enamels. In the smaller galleries are to be collected, in a systematic manner, a number of objects now scattered about in the museum, which will be brought

together so as to convey an idea of the total effect of interiors of different epochs. The Service des Beaux-Arts of the municipality would gladly undertake a similar treatment of the Hôtel de Lauzun, so as to restore, with its original furniture, and with hangings, etc., of the same date, the abode of a French "grand seigneur" of the XVIIIth century; but unfortunately there are no funds available for the purpose at present.

The Vieux Paris Committee, the meetings of which have been interrupted for some time by the municipal elections, is to occupy itself shortly with the subject of the celebrated château d'Issy, built by Bullet, and burned in 1871, and of its large park designed by Le Nôtre. It is desired that the remains of the château should be turned to some account to adorn a square in Paris, as fragments of the old Hôtel de Ville and Tuileries are now erected in the Parc Monceau and at the Trocadero. Among the things which might be thus preserved are the fine principal gable or *fronton* (somewhat injured by the German bullets), a fine iron gate wrought iron grille. The Committee is also taking up the case of the curious old building at the angle of the Rue de Poissy and the Rue des Ecoles, once part of the convent of the Bernardines, founded in 1245 by the Abbé Etienne of Lexington. The church was partly destroyed in the Revolution. The Refectory became a warehouse, and the Dormitory a repository of municipal archives. The last transformation of this ancient monument was to become a Fire Brigade barracks. It is now proposed to make of it a museum of Parisian antiquities, and it is hoped that the Municipal Council, to whom a memorandum on the subject is to be presented, will approve and enter into a scheme to treat this ancient building in a manner more worthy of its historical associations.

M. Henry Marcel has commissioned a certain number of sculptors, among whom are MM. Dubois, Peynot, Gasq and Verlet, to produce models for statues to decorate the Park of St. Cloud. These statues, which are to symbolise the Hours, the Days, and the Seasons, are to replace the allegorical statues partly destroyed by shell-fire in the Franco-German war. Now that the last vestiges of the burned château have been removed, it is thought indispensable to give the park some sculptural decoration.

M. Tournaire, the architect to the Department of the Seine, is engaged in elaborating a programme for important additions to the Palais de Justice, at an estimated cost of nine million francs. The scheme will necessitate the erection of new buildings between the Rue de la Sainte Chapelle and Quai des Orfèvres. These will permit of the formation of five new "Chambres Correctionnelles," and a better organisation of the judicial service generally. We shall have occasion to return to the consideration of M. Tournaire's scheme when it is in a more advanced stage. It is at present the only public architectural scheme under consideration by the State or the Municipality which is of any special interest.

LIVERPOOL COTTON EXCHANGE COMPETITION.

LIVERPOOL has of late years added many fine buildings to its street architecture, and is now about to augment the list with a design which will rank as one of the best of the more important recent commercial buildings in the country.

The new Cotton Exchange and offices will be erected on an "island" site, having narrow surrounding streets, and although the position is not a prominent one in the city, the main front will face Old Hall-street, a thoroughfare which is undergoing improvement year by year. The adjoining rights of light have considerably affected the scheme, necessitating the recessing of the upper parts of the main and south-east side fronts.

The accommodation will comprise—on the ground floor, a large exchange, with which are arranged rooms for telephones, cables, and post-office, and members are to have a committee-room, smoking and reading rooms. On the first floor the board-room and secretary will be located, whilst the top floor will accommodate the clearing-house, bank, arbitration and appeal rooms and lavatories. A *café* is to be included, and the remainder of the site is to be occupied by offices and sample rooms to be let for cotton business. No limit

was stated as to cost, but the financial aspect in the letting of offices was, to a certain extent, a governing factor.

In the competition for designs, for which local architects only were eligible to compete, twenty-four sets of plans were submitted, all of which possess remarkable similarity in the main lines of the scheme, which is not altogether due to the restrictions imposed by the conditions. The standard of design is good, bearing in mind that it is drawn from a restricted area, but the general tendency displayed is to produce a building suited to a more spacious site.

In the award recently made public, the assessor, Mr. E. G. Briggs (Messrs. Briggs and Wolstenholme), of Liverpool, recommends the adoption of the design No. 22, by Messrs. Matar and Simon. We understand that the Association has confirmed this selection, with which, we may add, we are in entire agreement.

Dignity is essential in a building of such importance, and the authors of the chosen design have secured this element by clever and at the same time bold strokes in planning what is without doubt a complex problem. The feature of the main front, as shown in the perspective view, is a large open colonnade, behind which is a blank wall, serving no other purpose than that of screening the roof of the Exchange; pavilions, containing staircases and lifts, are placed at either end of the front, and rise as small towers above the parapets crowned with large globes supported by groups of figures. The balustrade, although regulated by the segmental pediments of the pavilions, is barely high enough, and we should have preferred a straight in preference to broken skyline; in other respects we have nothing but commendation to bestow. The low front building, which is seen in all the designs, is here indicated as a loggia with enclosed ends, giving approach to the vestibule, beyond which is the Exchange proper. The point of view taken for the perspective drawing, although fixed on plan by the conditions, is considerably above street level, and has the advantage of displaying the full contrast of the plain rusticated wall and the super-imposed colonnade; the actual value of this will not be appreciated from the street level owing to the foreshortening due to the low building. The authors have wisely kept all the small scale parts of the plan away from the main front to avoid disturbance in the breadth of treatment, and here lies the key to this excellent design.

Again, no attempt is made to produce an elevation fronting the narrow Ormond-street, and the upper floors of the offices are grouped laterally across the site, which secures the maximum light and air both to the new building and to the adjoining property. It, moreover, obtains the north and east aspects specially required for the tenants. The plan of the Exchange, which is the best of those submitted, has the members' telephones and cable rooms opening directly from it, and arranged on the side street so that light and air are obtainable from sources other than overhead. Members' smoking and reading rooms are placed behind the Exchange, but the position and aspect are not altogether desirable.

Of the weak points of the plan, we should say that the corridors and offices on the second and third floors, lighted and ventilated from the space between the ceiling and roof of the Exchange, facts carefully omitted from the plans, are of no great value; that the double roof referred to is unnecessary; that the members' lavatories are quite inadequate; and that the *café*, as well as other parts of the basement, have insufficient light and height. These, however, are blemishes which can be removed in the working out of this good scheme. The Sixth and Edmund-street fronts consist chiefly of offices, and are designed in an up-to-date cast-iron manner, upon a stone base, and placed between stone masses rising at the angles and other intervals, and the result promises to be successful. The $\frac{1}{16}$ th scale details, the tinted $\frac{1}{2}$ in. and $\frac{1}{4}$ in. scale details, and the general view are all delicately drawn.

The second place is given to the design by Mr. Richard Holt, with a premium of £250. The exterior shows a strong influence of the work of Mr. John Belcher, A.R.A., and in particular of his design for the Royal Assurance Buildings in Liverpool, which we published on March 21, 1896, and April 4, 1896. The low front building contains two floors of offices, and has angle entrances provided for the use of the ordinary office accommodation.

A central entrance hall is entered from the street, and to the left and right on entering are placed the committee-room, telephones, and post-office. Beyond the Exchange is a large room, of very small height, filled with telephone enclosures and cable compartments, the lighting of which is impossible. Light in the Exchange is to be derived from a series of small skylights and a central dome light. The author appears to realise, as we do, that the air and light in this, the important space, will be inadequate, and he therefore indicates borrowed lights in the section as external windows, but the plan shows the futility of such a proceeding. No fireplaces are provided in the smoking and reading rooms, which is an omission that cotton brokers would resent. The *café* has practically no daylight. The lateral blocks of offices are placed so closely together as to rob each other of light; the author feels this, for he has contrived a combined window and skylight, which is a costly arrangement necessitating the setting back of each floor.

The board and secretary's rooms are well placed on the main front, and the separate staircase ascending from the Exchange with which a balcony is contrived is a good feature. A free use of classic detail is employed in the fronts, from which the usual dominant order is welcome by its absence. The grouping and details are excellent, but the scheme is sadly deficient in the plan and hardly merits second place.

Messrs. Grayson and Ould secure the second premium of 150*l.* with design No. 20. This scheme follows No. 15 in essentials, but is inferior in style. The principal front has two open domes terminating the main angle projections, whilst the central interest consists of a flat convex break in the building line. The business and members staircases also occupy prominent positions on this front; these are lighted by ranges of small windows, and are further expressed on the exterior by raking stone strings. Various other details suggest the use of stock classic features introduced in a design which lacks cohesion. The width of Ormond-street is much exaggerated in the perspective drawing to give a full view of a side elevation which would otherwise never be seen. An interesting point of the plan is a top-lighted loggia between the hall and the exchange. Two very important departments, however (board and secretary's rooms), receive little consideration, but the scheme generally is well worked out and the fireplaces throughout suitably arranged—a provision not made by all the other competitors. The planning could be made simpler, but the design is disappointing taken as a whole.

Mr. Henry Hartley (No. 19) and Messrs. Gilling and Moorhouse (No. 2) divide the third premium of 100*l.* The latter shows a "piazza" (?) with enclosed ends, put to no other purpose than for shelter and giving access to an entrance-hall, thence to an inner hall and a long, narrow exchange. The parts in use by the members of the Association are well arranged, but the post office is surely larger than necessary. The board-room looks like an imposing chamber on the plan but a height of 12 ft. indicated on the section destroys all hopes of this. The main front is not unlike the selected design, and, indeed, the whole scheme has considerable merit.

By a coincidence No. 19 shows his intentions on nineteen strainers, representing a great amount of labour. The outward effects are decidedly heavy, in spite of the numerous planes and other disturbing elements. The front would gain much by the fact of the main cornice having but one-third of the returns shown; the side elevation is much more effective. The author has arranged a central tower. The plans do not suggest that the upper part of the front is set back, but in other respects they possess merit.

Messrs. Willink and Thicknesse (No. 8) send eighteen strainers to illustrate their ideas, which consist chiefly of an ambitious treatment of the Exchange, entrance-hall and approaches which extend to the full length of the site. This arrangement produces a very dignified interior, but its wastefulness is a factor precluding this design from serious consideration. The upper floors consist of four lateral blocks of offices connected by a central corridor; this and other points in the scheme are fresh and original.

In No. 17 Mr. Milligan provides a kind of quadrant in the low building from which three entrances are obtained, and although passages

and doorways are cramped the ground floor arrangements are good. The author places the *café* on the first floor, and the board and secretary's rooms on the second floor. The Exchange is unnecessarily high; side light is obtained at the second floor level, but what is shown is quite insufficient. The perspective sketch rendered in outline suggests dignity.

A heavy Corinthian order dominates the principal front of design No. 7 by Mr. R. Wynn Owen. The massing of parts is good, but the plan leaves much to be desired.

A very ornate scheme (No. 12) is submitted by Messrs. F. S. Hulme, Anderson and Crawford, such as the promoters of the Competition expressly wished to avoid. The ground plan resembles a cathedral, whilst the heating-chamber and fuel store are enormous. The attempt at blending mediaeval features, such as the "crowns" on the towers, with classic forms and details, is not to be commended.

The exterior of No. 23 is in some respects admirable, but the author, Mr. A. Gilbertson, has obtained too much small detail in the front, a south-west aspect and one not desired for the pursuit of cotton business. The plan does not possess dignity, nor, indeed, the whole design any great imagination.

Mr. W. S. Ellison's design (No. 21) suggests the river front of the Hotel Cecil; he is the only competitor making use of a large central pediment. In some respects the simplicity of the plan is good, although the entrances to the exchange lack importance. The board-room is poorly treated.

By congesting his offices Mr. W. W. Kenworthy (No. 14) has produced the lowest elevation of the whole series. The design of the fronts is worthy of better draughtsmanship.

No. 9 is by Messrs. Stones, Stones and Sproat, who show a divided Exchange with a poor entrance. The design is much over-wrought; the sculpture and carvings generally make the design commonplace. The dormers in the main parapet rob the scheme of its saving clause.

In No. 13 Mr. T. T. Rees provides an open porch in place of a low building. The grouping is good and the general effect quite dignified. The planning is not good, however, particularly so where so many floors of offices overhang the Exchange.

Messrs. Morter, Dobie and G. Fraser are the authors of design No. 16, the view of which suggests a large open site. The grouping is happy and the plain walling welcome after going through seas of detail. The side-entrance through the low front building lacks importance, and the defect is even more noticeable on plan. The office blocks are too closely placed.

No. 8 is by Messrs. Haigh and Thompson, and is much too original, both in plan and elevation, to receive serious consideration in an award of this nature. There is a good feeling of space in the Exchange, but the *café* is much too extensive.

THE LAMP-STANDARDS ON WATERLOO-BRIDGE.

We have before referred to the extraordinary and ignorant action of the London County Council in destroying the fine lamp-standards on Waterloo-bridge, and substituting the commonplace things now seen there. The following letter on the subject appeared in last Monday's *Times*:—

"THE DISFIGUREMENT OF WATERLOO-BRIDGE.

TO THE EDITOR OF THE "TIMES."

Sir,—We wish to make public the following correspondence between this Society and the London County Council in respect to Waterloo-bridge:—

WATERLOO-BRIDGE.

9, Conduit-street, March 21, 1904.

Dear Sir,—This society has seen, with feelings rather stronger than those of mere regret, the alteration which has been made on Waterloo-bridge by the removal of the old lamp-standards, which were specially designed for their position and to suit the character of the bridge, and the placing of new ones which are not only of poor and commonplace design in themselves, but are in any case entirely unsuited to the style of architecture of the bridge.

We think that the County Council can hardly be aware of the solemnity that has been committed in their name. Waterloo-bridge has long been regarded as one of the finest structures of its kind in the world. Canova, the celebrated Italian sculptor, when visiting England, declared that it was worth while to have come to London if only to see Waterloo-bridge. The lamp-standards which have been destroyed were remarkable specimens of the application of art to cast-iron design; they were destined to suit the bridge both in their massive character and simplicity and in their Greek style of treatment; and there can hardly be a doubt that they were designed by Professor Cockerell, R.A., the most distinguished student

of Greek architecture of his day, and who was the brother-in-law of Rennie, the engineer of the bridge.

By the removal of these really artistic lamp-standards, and the erection of the commonplace cast-iron ones now placed there, Waterloo-bridge has for the time been entirely spoiled. The original standards were part of the design of the bridge; those which have been substituted are entirely out of keeping with it.

That the County Council did not intend such a result, and that they supposed they were acting for the best, we, of course, assume; but we do think that in dealing with a structure of such historic and architectural importance as Waterloo-bridge adequate architectural advice ought to have been taken before interfering with its design in this way; and the opinion of this society is that, at whatever cost, the original lamp-standards, or new ones on a similar design, ought to be replaced.

As we intend to send to the *Times* for publication this letter and whatever reply the Council will favour us with, we should like to ask, on behalf of the public, the following questions—

1. Did the London County Council consult any artistic authority before ordering the removal of the lamp-standards?

2. Who designed the new lamp-standards?

3. What has become of the old ones which have been removed?

I am, sir, yours faithfully,

H. H. STATHAM, Esq., F. R. I. B. A., Hon. Sec. Architectural Vigilance Committee.

To the Clerk of the London County Council.

County-hall, Spring-gardens, S.W., April 19, 1904.

Dear Sir,—The Council has had under consideration your letters of the 21st ult. and the 16th inst. with regard to the lamp-standards on Waterloo-bridge, and I am to state that the Council is very pleased to receive the views of the Architectural Vigilance Society upon this subject, as the Council observes with much satisfaction that the society is taking an interest in this and similar matters to which the Council, in the interests of London, has thought it right to devote considerable attention.

With reference to the lamp-standards on Waterloo-bridge, I may state that in 1897, when it was decided to light alternate lamps on the bridge by electricity, the question of using the existing standards was considered. These, although suitable for gas, were too low to properly diffuse the rays of electric light, and it was feared that

danger to the public might be caused through horses becoming frightened by the glare unless the standards were raised. As this could not be done satisfactorily in the case of the then existing standards the provision of new ones seemed inevitable. The choice of a design was a matter of considerable difficulty, as it was limited by the fact that only a narrow base could be fixed on the parapet of the bridge, and finally the present design was approved by the Council in 1898. When the Council at a later date approved of the proposal to substitute electric light for the alternate gas lamps which were retained in 1897, standards of the same design as those which had been already fixed for the electric light were obtained, and these have just been placed in position.

In the course of removal the old standards were unfortunately much broken, and the Council has to state its regret that the old standards have not been preserved.

The Council trusts that the facts above stated give the information desired by the Architectural Vigilance Society.

I am, dear Sir, yours faithfully,

G. L. GOMME, Clerk of the Council.

H. H. Statham, Esq., F. R. I. B. A., Honorary Secretary, The Architectural Vigilance Society, 9, Conduit-street, W.

It will be seen that our first and most important question remains unanswered, and we may therefore conclude that no artistic authority was consulted in the matter. That is to say, that the County Council have destroyed lamp-standards which were remarkable examples of artistic iron-work, designed especially to suit the character of the bridge, and have replaced them with commonplace lamp-standards of no artistic character, and by which one of the finest structures in London is disfigured.

If such a thing were done in Paris there would be a public outcry on the subject, and it certainly ought not to pass without protest in London.

Admitting that there is something in the practical objection to the old lamp-standards for electric lighting, the proper course would have been to have had new ones designed by a competent artist, in a similar style, but of higher

proportions. We ask that this should now be done, and that the lamp-standards which now disfigure Waterloo-bridge should be removed. The cost is hardly worth consideration in comparison with the object of preserving intact the architectural character of such a structure.

The design of the lamp-standards that have been destroyed can be found in Shaw's "Examples of Ornamental Metal Work."

We are, Sir, yours faithfully,

WINDSOR (Chairman)

BALCARRES

H. H. STATHAM (Hon. Secretary)

The Architectural Vigilance Society, 9, Conduit-street, June 25."

We reprint the letter mainly because we are able here to give illustrations of the two lamp-standards, the old and the new. The two comparative perspective sketches were made specially by Mr. W. Curtis Green, that of the new lamp taken on the spot, that of the original one put into perspective from the geometrical drawings in Shaw's "Examples of Ornamental Metal Work." We also give an illustration photographed from one of the new lamp-standards, from which it will be seen that it is really rather dattered in the drawing, and looks considerably worse in the photograph.

It is to be hoped that something will now be done about it, and also that the criticism of the County Council's action in this matter may induce them to consider these things a little more seriously in future, and not to meddle with ancient artistic work without taking

Lamp-standards recently erected by the London County Council.

Original lamp-standards, now removed.

The New and the Old Lamp-standards, Waterloo-bridge.

New Lamp-standard, Waterloo bridge. From a Photograph.

proper advice. We may add that the County Council agreed on Tuesday to a motion by Sir William Richmond to consider the possibility of reinstating the original lamp-standards.

INTERNATIONAL COLLIERY EXHIBITION, ROYAL AGRICULTURAL HALL, ISLINGTON.

In this exhibition, which remains open until Saturday this week, there is comparatively little of interest to the architect and building contractor, most of the exhibits being specially arranged for the benefit of those concerned in coal mining. Nevertheless, a considerable number of the exhibitors show materials, appliances, and machinery such as are in everyday use by our readers. We give in the following notes some account of the objects which more particularly struck our attention during the course of a recent visit to the Agricultural Hall.

As might be expected, materials of construction are very little represented. Beyond a few samples of rolled steel sections, the only exhibit of this class is to be found in a tank, 70 ft. long by 18 ft. wide by 2 ft. 6 in. deep, lined with Callender's bitumen sheeting, and exemplifying the suitability of this material for lining brick or concrete storage tanks and reservoirs. This tank also shows a useful method of securing an inside brick reservoir lining to the main wall, by means of specially designed wall ties. Drawing, surveying, and kindred instruments of various types are shown by two firms. On the stand of Messrs. Joseph Casartelli and Son, of Manchester, we observed an excellent collection, including levels, clinometers, theodolites, prismatic compasses, mining dials, anemometers, and drawing instruments. Similar appliances are exhibited by Messrs. John Davis and Sons, of Derby, together with a device, apparently of American origin, termed a "universal drafting machine," and intended to facilitate the operation of producing mechanical drawings. Rock drills are exhibited by several firms, and among the more prominent

of such tools may be mentioned the Rand rock drill, of Messrs. Fraser and Chalmers, specially designed for shaft sinking and quarry work; five types of the Ingersoll-Sergeant drill suitable for drilling holes from 5 ft. to 20 ft.; examples of the "Champion" rock drill, by the Champion Rock Borer and Air Compressor Co.; and a selection of hand and power rock drills, made by the Hardy Patent Pick Co. One of these drills, driven by air, and termed the "Daw," is capable of boring with ease the hardest known rocks. It will start in any position of stroke, and speed can be regulated from a few blows per minute up to the maximum number without reducing the force of the blow or interfering with the air supply cock. The stand of the last-mentioned firm also includes a variety of picks, shovels, and screens.

Conveyors of several types are to be found in various parts of the exhibition. At the stand of Ropeways, Ltd., is shown apparatus in connexion with Roe's system of aerial transport, for conveying coal, clay, lime stone, bricks, and ores, in quantities ranging from 20 tons to 1,000 tons daily. Messrs. Fraser and Chalmers have a Robins belt exhibit containing samples of the helting used in their conveyors; Messrs. Gibbons Bros., of Manchester, show examples of various forms of conveyor; and Mr. G. F. Zimmer has at work one of his patent swinging conveyors, also made with a perforated bottom for screening. The construction of this apparatus is very simple, the small number of bearings and the absence of travelling gear being special features. The maker states that a conveyor of this type, which has been at work for four years in a Welsh road metal quarry, has conveyed and screened 150,000 tons of rock, and that the cost of repairs has not exceeded 15s.

Some admirable weighing machines are exhibited by Messrs. W. and T. Avery, of Birmingham, a very convenient machine being one with a capacity of 10 cwt., having Avery's patent recording steelyard for printing the weight on tickets, thus obviating the possibility of errors in reading. Similar recording

apparatus is applied to the larger examples of weighbridges made by this firm. Messrs. Wallach Bros., of London, show their "ever-trusty" machines for lime and whitewashing, distemping or cleaning wall surfaces. These are also suitable for fire extinguishing purposes or for applying antiseptic solutions to timber partitions and walls.

Steam-propelled vans, suitable for contractors and others, are represented by a 4-ton wagon, shown by the Thornycroft Steam Wagon Co., of London, and a 5-ton wagon by Messrs. Savage Bros., of King's Lynn, both of these being strong and serviceable vehicles.

Turning now to steam generating plant and auxiliary appliances, we find a number of old friends among the exhibits. Makers of water-tube boilers are represented by Messrs. Babcock and Wilcox, and the Stirling Boiler Co., the former firm exhibiting the model of a water-tube boiler, fitted with steam superheater, and the latter three working models, one with glass tubes showing the circulation of water during the generation of steam, as well as a boiler supplying steam for the requirements of the exhibition. Messrs. Cochran and Co., of Annan, exhibit one of their patent vertical multitubular boilers, the special feature of which is that it is easily accessible for internal cleaning. At the stand of "Circulators, Ltd.," may be seen a model of the "Schofield" patent water circulator for application to Lancashire and Cornish boilers. This model is shown fitted in a model boiler heated by a gas jet, and is clearly calculated to improve longitudinal circulation, and thereby to equalise expansion and assist the operation of steam raising. Mechanical stokers are exhibited by Messrs. Babcock and Wilcox, Eith's Engineering Co., Meldrum Bros., James Proctor, and "Triumph Stoker, Ltd." Most of these stokers are so well-known as to need no description, but it may be remarked that the last-mentioned is fitted with an ingenious device for throwing the coal in small quantities at intervals of a few seconds over the surface of the fire, each deposit being

on an area different from the preceding one. This feature is distinctly worthy of consideration, as its effect should be increased efficiency and diminution of black smoke. Fuel economisers are not much in evidence, the only exhibit being a model of the Green economiser with which our readers are already sufficiently familiar.

Messrs. James Simpson and Co. have on view a useful series of samples, including a Webster vacuum feed-water heater and purifier, with oil filter and separator, a superheater section, and Webster steam and oil separators. Messrs. Joseph Wright and Co. exhibit a model of the improved Berryman feed-water heater, and Mr. William Boby an example of the Chevalet-Boby heater-detartariser for heating and softening water for boiler feeding and other purposes.

Several types of water softener will be found at the exhibition, among which we may mention the Brunn Loewener softener, by Messrs. Lassen and Hjort, of Greenwich, the Koppel softener by Mr. Arthur Koppel, of London, and the Oscar Guttman softener (model only), by Messrs. Babcock and Wilcox. A very fine collection of boiler mountings, steam valves, safety valves, and other steam specialties, has been got together by Messrs. J. Hopkinson and Co., of Huddersfield. This exhibit occupies a central position in the hall and thoroughly deserves careful inspection by all steam users.

At a colliery exhibition it is only natural that pumps should be strongly in evidence, and in the present instance, although no pumping plant of any great capacity is shown, the exhibits are distinctly interesting. Messrs. Ernest Scott and Mountain, of Newcastle, show a three-throw motor-driven pump, capable of delivering 50 gallons per minute against a head of 800 ft. The Worthington Pump Co. have on view some small boiler feed pumps, a three-stage centrifugal turbine high lift pump connected to a Westinghouse motor, and a small triplex power pump. Messrs. Gwynnes have a series of eight small centrifugal pumps, two being direct coupled to oil motors, one to a steam engine, and another to an electric motor.

The Pulsometer Engineering Co., of Reading, have a varied exhibition of their specialties, including a small pulsometer fixed in a section of a wall, showing the method of slinging and working; a "Deane" vertical sinking pump, 1904 pattern; a centrifugal pump, which swivels to any required angle; and a model air-lift pump for tube wells. Messrs. Joseph Evans and Sons, of Wolverhampton, offer visitors the opportunity of inspecting a large

assortment of steam and other pumps for various services. Among the types shown on this space are "Cornish" steam pumps of the bucket type, for general and sinking purposes, single and double ram pumps for boiler feeding, as well as treble ram, siphon, and centrifugal pumps of different types and sizes.

Perhaps the most remarkable feature of the exhibition is the evidence presented in the stands of several well-known firms of the great advances made in the electrical driving of machinery. Space will not permit us to deal in detail with the numerous examples of electrical apparatus which we had an opportunity of inspecting on the occasion of our visit, and we must content ourselves with a brief mention of the most noteworthy exhibits. Messrs. Bruce, Peebles and Co., of Edinburgh, show a 240 h.p. three-phase 3,000 volt induction motor, and electrical machinery of various kinds; the British Westinghouse Co. have a large space, in which are exhibited numerous examples from the complete range of electrical apparatus they have worked out for driving, winding, hauling, pumping, coal-cutting, hoisting, and other machinery; Messrs. Ernest Scott and Mountain exhibit a comprehensive selection of electrical apparatus, including generators, motors, starting and reversing switches, and other machinery; the General Electric Co. devote a considerable amount of space to the display of generating and hauling machinery, and of lamps, telephones, and electrical accessories. Among other exhibitors in this department of work are Messrs. Witting, Eboral and Co., F. A. Glover and Co., Mavor and Conson, Reavell and Co., T. Rowbottom and Co., while electrical cables are exhibited in great variety by Messrs. W. T. Glover and Co., Callender's Cable and Construction Co., and the St. Helen's Cable Co.

The present exhibition is not so extensive as some others that are held annually in the Agricultural Hall, and, appealing to a somewhat restricted section of the community, it is not crowded with members of the general public. We have shown in the foregoing notes that the exhibition contains ample material to interest many of our readers, and the absence of mere sightseers is an advantageous feature from the point of view of those who desire to obtain useful information in peace and comfort.

RESTORATION OF PARISH CHURCH, BURTON.—The restoration of Burton Parish Church has now been completed. The work has been carried out, at a cost of 14,000*l.*, under the superintendence of the architect, Mr. Beck.

MONUMENT TO THE LATE DEAN OF PETERBOROUGH.

A MONUMENT to the memory of the late Dr. William Clavell Ingram, Dean of Peterborough, was on Saturday, May 28, dedicated by the Bishop of Peterborough in the presence of a large congregation. It is an altar tomb with a recumbent figure in white Carrara marble of the late Dean. The base is from a design by Mr. Bodley, executed by Messrs. Thompson and Sons, of Peterborough. The figure is by Mr. Walter Rowland Ingram, the Dean's brother, who unhappily did not live to complete it, and it was finished by two of his former assistants, who had worked under him for many years.

The monument is set up in the Eastern Chapel or Ambulatory of the cathedral. The repair of the West Front of the cathedral, which had been carried on during his life, and which was an object to him of the deepest interest, was completed after his death as a memorial to the late Dean. The monument now dedicated is a personal tribute to his memory by many of his intimate friends.

NEW CLOCK, NELSON, LANCS.—A large tower clock, with four 7-ft. dials, chiming the "Westminster" quarters on four bells, and striking the hours upon a ton bell, has been placed on the Market Hall, Nelson, and was formally started on the 18th ult. The work was carried out by Messrs. John Smith and Sons, Midland Clock Works, Derby; the clock being generally to the designs of Lord Grimthorpe, and fitted with all the latest improvements.

CARPENTERS' COMPANY.—At the examination in carpentry, held at Carpenters' Hall from the 15th to the 18th ult., fifty-seven candidates presented themselves, the largest number hitherto recorded. The proportion of candidates who came up from the provinces was larger than in previous years. The following is the list of successful candidates:—Silver medal—J. H. McCurdy. Bronze medal—J. G. Foxcraft. First-class Certificates—W. A. Scott, W. Birrell, J. T. Pridmore, F. Lambert, J. G. Hurst, W. F. Grove, E. Sudds, W. E. Barnes, W. F. Lombard, O. Gentle, J. Finch, W. Cox. Second-class Certificates—W. T. Brown, F. Boxall, A. L. Carter, G. R. Shrimpton, W. T. W. Smith, J. W. H. Chubb, C. S. Hill, W. E. Sheppard, J. B. Sherbrooke, J. D. McLeod, W. J. Wheeler, G. F. Goodwin, E. Keridge, E. Prieckett, W. Ambrose, P. J. Luxton, E. Elms, C. H. Hancock, G. Swinerton, F. G. Shott, E. Dymock, A. H. Ridd, J. G. Harris, H. Cottingham, C. Stanton.

Monument to the late Dean Ingram, Peterborough Cathedral. The late Mr. Walter R. Ingram, Sculptor: Mr. G. F. Bodley, R.A., Architect.

TRAFALGAR-SQUARE; WEST STRAND (NORTH SIDE) AND AROUND ST. MARTIN'S CHURCH; LEICESTER-SQUARE; AND LOCAL IMPROVEMENTS IN ST. MARTIN-IN-THE-FIELDS, ST. ANNE, SOHO, AND ST. GILES-IN-THE-FIELDS PARISHES: 1801-1900.

On January 2 last we described the making of Regent-street, Waterloo-place, and Pall Mall East in pursuance of the Act of 1813 (53 Geo. III, c. 121). The preamble, moreover, sets forth that:—

"It would be of great Accommodation to the Public . . . if Provisions were made for widening the East End of Pall Mall, and for continuing the same Eastwards by a new Street into Saint Martin's Lane, terminating at the Portico of Saint Martin's Church; and for widening Cockspur Street from the South End of the Haymarket to Charing Cross; and for forming an open Square in the King's Mews opposite Charing Cross. . . ."

The powers thereby granted to the Commissioners of H.M.'s Woods, Forests, and Land Revenues were resumed and enlarged by an

Act of 1826 (7 Geo. IV., c. 77), which recites that:—

"It would be a great Accommodation to the Public . . . if the Commissioners . . . were authorised to make . . . a new Street, so as to continue Pall Mall East from the King's Mews to Saint Martin's Church and from thence in a South-easterly Direction on the South side of the said Church to the North side of the Strand, and to form an open Place or Square opposite Charing Cross, by widening the Communication between Cockspur Street and Craven Street, and to widen the Strand on the North side thereof as far as Castle Court, and also Saint Martin's Lane South of Hemming's Row and Chandos Street, and to improve and widen the South side of Chandos Street. . . ."

The later Act provides for the taking of what might be required of the south part of St. Martin-in-the-Fields churchyard; the removal of the workhouse, parochial School, the Tenison Library, and the Free School in St. Martin's-lane and Hemming's-row, the watch-house, vestry-room, etc. The watch-house and parish stocks stood opposite the

middle of the church portico, the vestry-room on the south of the church (Fig. 1).

The Mews.—After the destruction by fire in 1534 of the King's Mews at Bloomsbury, the Mews at Charing-cross, where the King's hawks and falcons had been kept, were rebuilt in the reigns of Edward VI. and Mary I. for the royal stud and equipages, which were transferred to the Royal Mews at Piccadilly in 1824. The entire group comprised the Earl of Leicester's Green Mews to the north; the Crown or King's, also called Upper, Mews in the middle—where is the west wing of the National Gallery (Fig. 2)—the Great Mews to the south facing Charing Cross; and the Back Mews to the west. The last-named are plotted as Dughill Mews in Thomas Chawner's large-scale survey of July 15, 1796, as lying next south of Monmouth-court, and used by the Duke of Clarence. The group (Fig. 1) occupied the area bounded by Orange-street, Hedge-lane (Whitcomb-street), Cockspur-street, Charing Cross, and the lower portion of St. Martin's-lane; the "colours" of the several stables gave names to Blue Cross, Green, and Orange

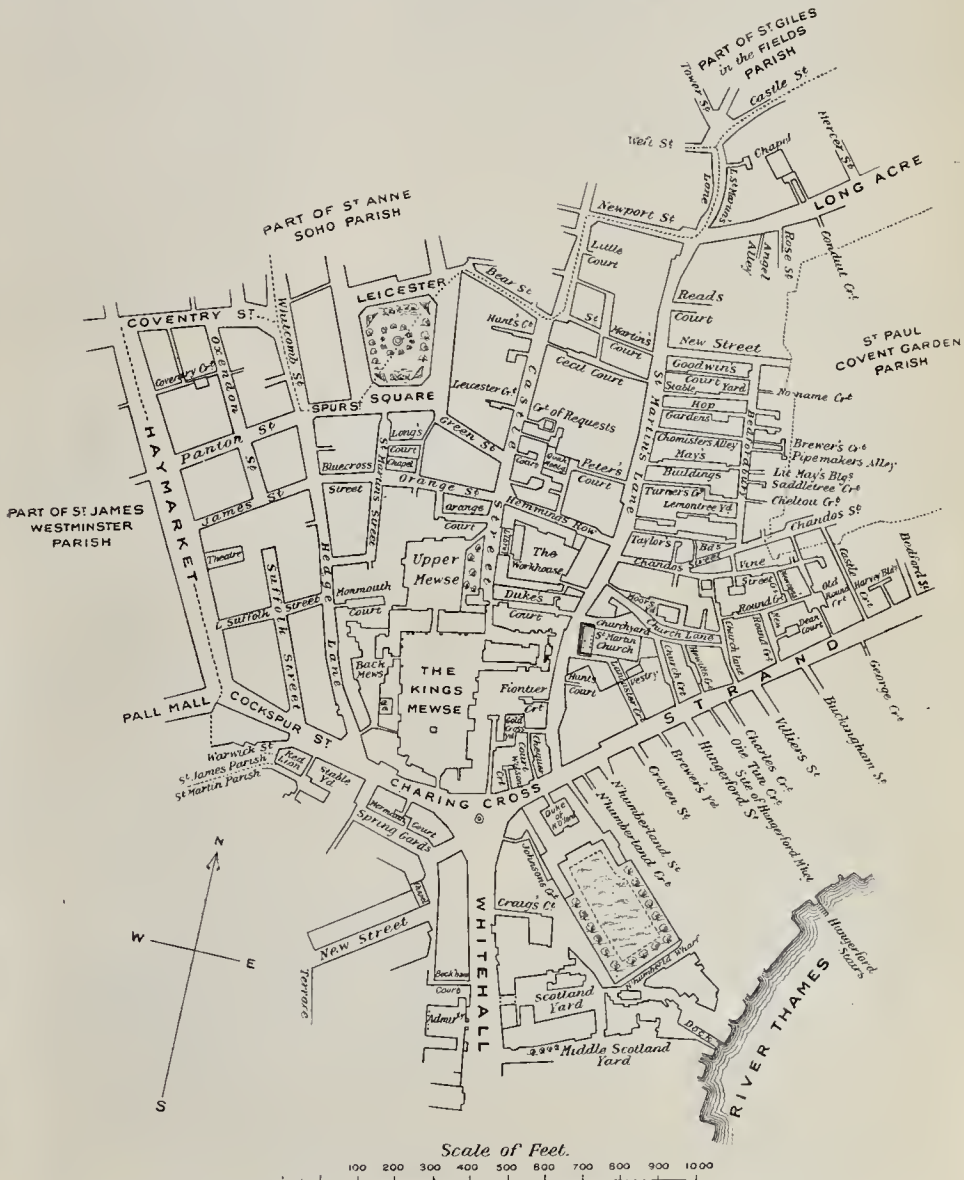

Fig. 1. Plan of the Parish of St. Martin-in-the-Fields, from a Survey made by E. Waters in 1799.

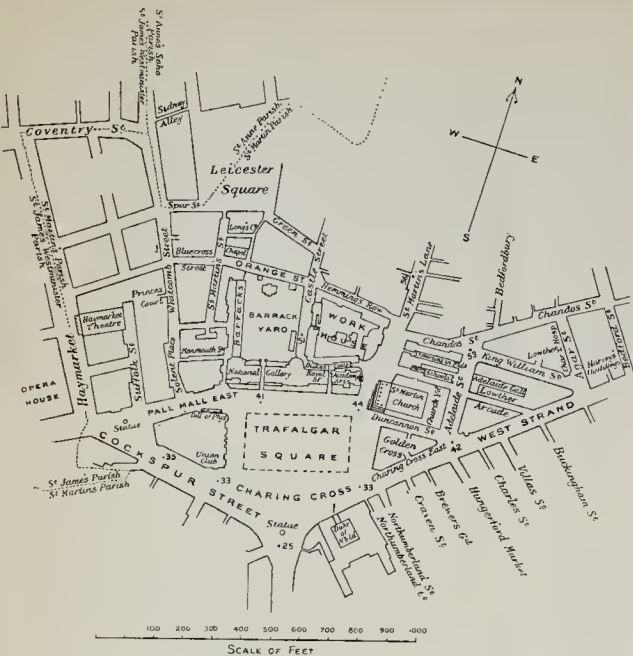

Fig. 2. Waters's Survey of 1799 corrected to 1840 by James Wyld.

streets. One block consisted of a building of red brick with stone dressings, after the Tudor style, having buttresses and crenelles, which, until its demolition in 1830-1, served for soldiers' barracks. The transverse block, standing east and west, sometimes misnamed the riding-school, measured 271 ft. by 53 ft., and had a middle gateway opening into the Green Mews. It formed the stabling of the state horses; the adjacent block, south-east, was the riding-school. That range of stabling was subsequently used as a storehouse for public records and, after the demolition in 1829 of (Old) Exeter Change, Strand, for Cross's Menagerie. At the clearance of the site the National Repository, somewhat similar to the Conservatoire des Arts et Métiers at Paris, was taken from the King's Mews to No. 28, Leicester-square, T. Hosmer Shepherd's drawing, in St. Martin's-lane Free Library, shows the south front inscribed "Menagerie" and "National Repository Exhibition." Whilst some credit the work to Kent it is generally understood that Lord Burlington re-arranged the King's Mews in 1732 for George II., and designed the south front of the state horses' stables cited above, which is depicted in *Wale's* print of about 1750 [January 17, 1903, "stables on the National Gallery site" *], and in *T. Malton's* print of December 30, 1794. Duke's-court lay east and west between the Crown Mews and St. Martin's-lane, opening out of the latter nearly opposite the church. Chawner's plan of 1796 plots the many taverns, houses, and other tenements scattered about the Mews, with the courts, etc.; the Golden Cross coaching inn, No. 10, lay 71 ft. due north from Charles I.'s statue; opposite the opening into Spring-gardens stood the classic front of the Phoenix Fire Office's engine-houses, 1787, by Thomas Leverton (*obit* 1824), of which there is a print in *Malton's* "London," 1792; confer also in the Craze Collection C. Ingre's plans of the properties sold on March 1 and June 25, 1830.

Trafalgar-square.—A map printed by order of the House of Commons of May 12, 1826, shows that during the erection in 1822-8 of the block on the west side of the square it was proposed to take the Mews site for a "Parthenon" to receive the Royal Academy, the Royal Society, and the Society of Antiquaries, and an "Athenaeum" (*sic*) on the ground where is now Morley's Hotel. In the result Sir Charles Barry laid out the square,

* Dates in squared brackets relate to illustrations in the *Builder*.

albeit upon a scale less grandiose than that of his initial conception. The *Gentleman's Magazine* records that the work was begun on August 14, 1837, with the making of the wide footpath along the north side. Barry adjusted the level of the inner space to the incline of the ground with a retaining wall, 255 ft. long, and two flights of steps. He designed the lamp-standards for Bude-lights, the granite posts, basins, and fountains (1844). For the fountains, constructed of Peterhead granite by McDonald and Leslie, of Aberdeen, he obtained a supply from two artesian wells sunk in Orange-street (300 ft. deep) and in front of the National Gallery (395 ft. deep), joined at the depth of 170 ft. by a tunnel to contain 70,000 gallons of water—the wells and tunnels holding when at rest about 120,000 gallons; Easton and Amos made the two engines for the works in Orange-street, the supply being also forced to the public offices in Whitehall and to the Houses of Parliament. The east side of the square, comprising Morley's Hotel, was designed and built upon his own land by George Ledwall Taylor, who died aged 93, in April, 1873. Along the north retaining wall are standards of lineal measures at 62° F., ranging from 1 in. to 100 ft., including the pole or perch, and the surveyor's land-chain, which perhaps may become historical before many years elapse. They were made of gun-metal by Troughton and Simms in 1876, for the Board of Trade, under the superintendence of the late Sir George B. Airy, Astronomer Royal, and are periodically verified by the Standards Department.

The National Gallery, begun in 1832, was opened on April 9, 1838. The pictures, about 150 in all, were hung in five upper rooms in the west wing, the east wing being allotted to the Royal Academy; the ground-floor, at first intended for a public-record depository, was taken for official apartments. Wilkins was hampered by a limited space; he was required moreover to preserve the view of the church and to leave a passage-way (since closed) into Duke's-court, with two entrances to the ground at the rear where are now the remaining portions of St. George's Barracks. He used stones from the King's Mews and the columns, but not the architrave, of the carriage-porico of Carlton House. The cost, 96,000*l.*, amounted to nearly twice the estimated expenditure. Wilkins's building [October 24, 1891, elevation] contains the rooms numbered xvii.—xxii. in the west wing, and xii.—xiv., xvi., and xviii., in the east wing. Pennethorne's altera-

tions of 1890-9 involved the destruction of the noble staircase, an original and impressive piece of design, having a spacious dignity and mystery akin to what we see in some of the staircases of the Louvre, but very rarely in our own public edifices. Though the judges did not select any of the designs submitted for a new building, they named as the best those of E. M. Barry [May 25, 1867, with plan of the principal floor], at an estimated cost of 480,000*l.* The work, but in a much modified form, was entrusted in 1868 to Barry (*obit* 1880), because, it is understood, he and Street could not cooperate in building the Royal Courts of Justice, for which his plans and Street's designs respectively were considered to be the best. Barry's additions on the north and east [July 29, 1876, two plans, and the octagonal hall with its four vestibules] comprise rooms Nos. ix., x., vii. (the long gallery), and around the Octagon, iv., viii., xi., and xv. G. W. Booth was the contractor; Messrs. Craze executed the decorative work; Wyon modelled the sculptured reliefs in the semi-circular panels of the end wall of each of the four vestibules. In 1860 the Royal Academy migrated to Burlington House. The rooms i., ii., iii., v., and vi., and the north, east, and west vestibules, were added in 1885-7 by Sir John Taylor, of the Office of Works, who replaced Pennethorne's double-staircase with the present one, decorated by Messrs. Craze and Son, who used various coloured marbles from Algeria, Modena, Prato, and Tuni.

In 1880 Mr. W. H. Alexander gave 80,000*l.* for a National Portrait Gallery. The Government voted 16,000*l.* for the east building, and paid the London County Council 7,000*l.* for some land abutting on Hemming's-row, throwing 900 sq. ft. into Charing Cross-road, and added 575 sq. ft. of Crown land to that road in 1889. Ewan Christian died in February, 1895, a few months before the completion of the building. [January 4, 1896, Mr. W. Monk's drawing; with plan, section, and twelve of the busts.] Messrs. Shillitoe and Son were the general contractors; the portrait busts over the first-floor windows and elsewhere are by Mr. F. Thomas.

West Strand.—For the re-building of Charing Cross East and West Strand on the north side were pulled down all the houses Nos. 431-487, between Castle-court (Agar-street) and (old) St. Martin's-lane, together with the courts and alleys plotted on the two plans (Figs. 1 and 2), and C. Ingre's plans already cited. At the corner of Agar-street is No. 429, built in 1832 for the Westminster Insurance Company, after C. R. Cockerell's design, and since tenanted by the notorious (old) Royal British Bank. In 1886-7 Messrs. Arding, Bond, and Buzzard re-constructed the whole interior for the British Medical Association and the *British Medical Journal*. In 1890-2 the Lowther Arcade, which the younger generation will remember for its toy-show, was built across the triangular block by Witherden Young, the architect also, for Jacob Perkins, of the adjoining Adelaide Gallery. The Arcade, recently displaced by Coutts and Co.'s new bank, had a passage 245 ft. by 20 ft., and 35 ft. high, and, lighted by small domes on pendentives, presented a very pleasing effect—see W. Herbert's drawings of 1830. The Adelaide Gallery, converted in 1852 to the Marionette Theatre, was again altered in 1894 by Mr. W. B. Pinhey, and added to A. and S. Gatti's restaurant. In 1848 the Fathers of the London Oratory of St. Philip Neri rented two houses on the northern side of King William-street, and adapted the Lowther Rooms (Wyld's map, Fig. 2) for their chapel. After their removal in 1851 to Brompton the Polygraphic Hall, No. 24, was built on the site for Woodin's "Olio of Oddities," by James Thomson (*obit* 1883) whose son, John J. Thomson, rebuilt the Hall in 1883 for Mr. J. L. Toole, as the Charing Cross Theatre, since the Folly, and Toole's, 1890-5, where the revived Society of Beefeaters had their domicile. The theatre, having been pulled down in September, 1896, the governors of Charing Cross Hospital bought from the Commissioners the freehold of the site, with Nos. 23-7 in the street, and Nos. 15-16, Chandos-street, for extensive additions to the hospital. Mr. A. Saxon Snell's designs were chosen in a limited competition in March, 1899, and the ground was finally cleared in the following autumn [June 21, 1893]. Dr. B. Golding established the hospital and a dispensary as an extension of the local West London Infirmary, founded in 1818; when built in 1831-3 by Burton it was only the

eight institution after that kind in London (see illustration). The governors acquired the freehold in 1850; twenty years afterwards James Thomson added a story, and re-modelled the interior; his son carried out similar alterations of the now adjoining Royal Westminster Ophthalmic Hospital, founded in 1817 by G. F. Guthrie, in Warwick-street, Golden-square. In West Strand the Golden Cross Hotel (1832) is by Sir Wm. Tite (*obit* 1873), the ground floor front is changed; No. 457 was the shop of James Wylde, geographer and map-seller; Jeffrey, geographer to George III., kept his shop at No. 487; Nos. 453-6 was the oil and lamp shop (1752) of the late Mr. Gardner, who gathered so remarkable a collection of views, prints, maps, etc., of London in the past.

St. Martin's Church and around.—Under the Act of 1826 the churchyard was enlarged on the north and east sides, the south part, known as the (Thames) Watermen's burial-ground, being taken for Duncannon-court. Around the church were many courts, passages, and alleys, together with the purlieu known as Porridge Island, famed for its cook-shops, the Straits of the Strand, the Bermudas, and the Carrihee, corrupted by the inhabitants into Cribbee, Islands (Fig. 1). W. C. Mylne acted as valuer on behalf of the Woods and Forests; the new names commemorate three Chief Commissioners—Viscount Lowther, G. J. Welbore Agar Ellis, and Viscount Duncannon. The lower portion of St. Martin's-lane was added to Trafalgar-square. Burton widened and rebuilt the middle portion as St. Martin's-place, and laid out the triangular hock bounded by the Strand, Adelaide-street and King William-street. Nos. 4 and 5, St. Martin's-place were required under the National Gallery Improvement Act. George IV. had given the site of No. 4, built in 1830-1, to the Royal Society of Literature; the Provident Institute and Savings' Bank (1816) removed in 1830 from Leicester-place, Leicester-square, to No. 5, and thence to the premises—now Parr's Bank—erected on the site of Palmer's glass-house after David Brandon's designs [May 22, 1875],

where they remained until the transfer in January, 1896, of the accounts to the Post Office Savings' Bank (Fig. 2).

St. Martin's Church.—The spire, struck by lightning in July, 1842, was reinstated to an extent of 45 ft. In 1858 T. Hayter Lewis decorated the interior and lowered the pews, which had been designed to range with the pedestals of the columns. [October 23, 1858; interior, showing the alterations.] In 1893-7 Sir Arthur Blomfield and Sons repaired all the external masonry, dressing it with "quartz," and redecorated the interior. Prints by West and Toms, and others, of 1726-38 show the graveyard as an open space, with posts, on the south side of the church. The graveyard and the vaults were reconstructed within a retaining wall on the south and east in 1828-9 (the railings being by Cottam and Co.), and for a while the vaults were open for visitors; confer the *Mirror* of December 26, 1831. Either at that time for a readjustment of the new levels, or previously,* a lower course of steps was added on the west side, merging into the higher ground northwards, with a horizontal landing or platform between the two flights, so as to preserve the effect of the portico as standing upon a horizontal base. In 1887 the late Metropolitan Board of Works proposed to alter the steps for a widening of the footpath, and made a model of their scheme; Butterfield proposed to mutilate the portico itself by removing the front row of columns. After a lapse of ten years the Vestry unsuccessfully asked the London County Council to undertake the work as a county improvement. Despite the expressed opinion of the Institute whom the London County Council consulted, the City of Westminster began the work in the autumn of 1900. They added about 3 ft. to the footpath by cutting away the steps, and increased the gradient-rate of the new thirteen s.s.p. on the west by oblitterating the platform

after considerable pains, we had to determine this point; of the very numerous drawings and views for the period 1726-1819, the more authoritative give conflicting evidence.

on that side; for a compromise they retained, but reduced, the platform on the south side. Thus they dispelled a skilfully-gained effect, and destroyed the symmetrical range of seven unbroken steps rising from a horizontal landing to the colonnade of the portico, with the platform itself on the west side, which had separated from the design the lower flight meeting the incline. The recent isolation of the National Gallery on the west side and the gradual demolition of the barracks, suggest that it might have been better in the beginning to make an approach from the north, into the square, on that side by an avenue or boulevard incorporating Leicester-square.

In 1886-91 the Board of Works cleared away Hemming's-row, Peter's-court and the parish-room, formerly the Quakers' Meeting House, in the court, the parish workhouse and the Admiralty pattern-rooms on the south side of the row, and the lower end of Castle-street, for the south end of Charing Cross-road. In 1890-5 they widened Green-street, on the north side, and pulled down Nos. 31, 33, and 34, Leicester-square (Figs. 1, 2, and 5). The clearance in Castle-street involved the schools, with library and common-room, which Archbishop Tenison, after consulting Evelyn and Wren, established in 1684-5 for the clergy and parishioners of St. Martin, St. Anne, Soho, St. James, Westminster, and St. George, Hanover-square parishes. Wren designed the library and schools erected in 1685-97 on the east side (near Duke's-court) of the lower end of Castle-street (Fig. 1). The Charity Commissioners had made an order for the sale at auction of the Tenison Library, about 4,000 volumes, in 1864; the school remained there until 1871, when the new buildings were ready in Leicester-square (*q.v.*). On the northern side of Chandos-street (1637) are the buildings of Charing Cross Hospital Medical School (1881), by the late John J. Thomson, and enlarged by him in 1889 over the site of the old Black Prince tavern on the east side of Bedford-court; a tunnel from the basement communicates with the hospital on the south side of the

Fig. 3. Parts of St. Giles-in-the-Fields, St. Martin-in-the-Fields, and St. Anne, Soho, Parishes: from Horwood's Survey of 1795-9, and Chawner and Pennethorne's Revised Plans of 1840, to show the Improvements for New Oxford-street, Endell street, etc.

street. In Bedfordbury are a Mission church and schools [November 23, 1861] by the late Sir Arthur Blomfield.

Leicester-square (1640-71) and around.—Until the extension in 1845 of Coventry-street across Princes-street (incorporated with Wardour-street in 1881), and the widening in 1844-5 of the footway, now Cranbourne-street, with an extension across Castle-street to Long-acre (Fig. 4), Leicester-square proved as well-nigh inaccessible as Lincoln's-Inn-Fields are still, the only direct approaches from the south being through Spur-street, and the narrow Green-street and Hemmings-row, formerly Dirty-lane. For that improvement, by Chawner and Pennethorne, see *infra*. In 1880-1 the late Metropolitan Board of Works widened Coventry-street, south side, from 40 ft. to 60 ft., at a gross cost of 186,326*l.*, and a net cost of 100,448*l.*, Nowell and Robson being the contractors, and widened Princes-street, renamed, 1881, Whitcomb-street, west side, between Coventry and Panton streets. Amongst the houses demolished in Coventry-street was No. 21, Wishart's snuff and tobacco shop, which David Wishart opened at the sign of the Highlander, Thistle, and Crown, on December 31, 1720, the day of Prince Charles Edward's birth; the shop was a favourite trying-place of Jacobites. A gradual rebuilding of Leicester-square, begun fifty years ago, leaves but three or four of the old houses. Messrs. Puttick and Simpson removed in or about 1840 from Piccadilly to No. 47. We have ascertained that Sir Joshua's painting-room, octagonal on plan, 16 ft. high by 20 ft. across, and lighted by one square window having its sill 9 ft. 4 in. above the floor, was taken down for a large apartment built sixty-three years ago by the Western Literary and Scientific Institution, and since adapted as an auction room. Messrs. Wimperis and East designed the new sale-room (1899), on the site of Sir Joshua's stables in the rear, and were architects for Messrs. Thurston's, of the adjoining premises, erected in 1900, on the sites of Nos. 45-6, in the square, and No. 62, Whitcomb-street [November 21, 1903]; No. 48 is by Messrs. Treadwell and Martin. Nos. 34-5, with No. 23, Green-street, and Nos. 4-5, Long's-court, were acquired at a cost of 42,000*l.* for the Dental Hospital, begun in 1900, and built by Messrs. Trollope and Sons from Messrs. Young and Hall's plans and designs, in lieu of the adjacent Nos. 39-42, whither the hospital migrated in 1874 from Soho-square. In St. Martin's-street was pulled down in 1898, Bertolini's coffee-house, No. 34, a haunt of men of letters, musicians, and actors during the earlier half of the century; in October, 1897, Macmillan's quitted Bedford-street for their new premises [December 12, 1896, and September 25, 1897] by Mr. John Cash. The Baths and Washhouses in Orange-street, by Priehard and Baly, 1848, are, we believe, the first established under the Acts of 1846-7 in that behalf, and were altered and improved by Mr. C. Mason in 1892. In Green-street the eight houses on the north side, west end, are by Mr. G. D. Martin (1896), the Star and Garter, No. 13, and the Garrick hotels by Messrs. Saville and Martin; and the Beefsteaks' Club-room at No. 9 by Mr. F. T. Verity [July 19, 1902].

In 1783 John Hunter leased No. 12, Leicester-fields (since No. 28 in the square), and No. 13, Castle-street. On the intervening space he built his museum, a large apartment lighted by three cupolas, and lecture and dissection-rooms, which, until seven years ago, had formed the workshops of a firm of musical instrument makers. The premises were pulled down in December, 1900, for a block of shops and chambers—by Mr. J. P. Crosby. No. 30, where Hogarth lived at the sign of the Golden Head, a bust of Van Dyck he made of cork (see Parr's bird's-eye view, after Maurer, 1753), and latterly the (old) Sablonière Hotel, gave way to Tenison's Grammar School, 1871, by Murrable. The inscription of the Society of Arts' tablet is somewhat misleading, for it says Hogarth "lived here." The Alhambra was built for a polytechnical exhibition as the Panopticon of Science and Art in 1850-1 [December 20, 1851], plan and drawing; March 18, 1854, interior] after designs by Professor T. Hayter Lewis (obit 1898), to whom his partner, Finden, committed the entire work; the details and decorative scheme were taken chiefly from remains at Cairo. Our drawing shows a vast dome rising to 140 ft. from the ground, as at first intended to be constructed of iron and glass on the ridge-and-furrow principle, with the

pair of minarets nearly 100 ft. high. In the altered design a dome 72 ft. in diameter, with a circular top-light 32 ft. across, and sixteen other lights, was raised above the round hall 98 ft. in diameter, resting on the top of iron columns in three rows. The *Builder* of May 7, 1853, contains Hayter Lewis's account of how he constructed the main ribs, on the ground, and arranged for their equilibrium when in position. John Willson was the builder; Grissell supplied the iron work. The organ, by W. Hill and Co., second in size, but not in power, to only that in York Minster, was removed to the south transept of St. Paul's for the services under the dome, and thence to Clifton. W. T. Best was the first organist. In 1837 the Panopticon became a circus, and then a music-hall and theatre. Twelve months after an extensive alteration of the dome, a fire destroyed the house in the night of December 6-7, 1882. In the re-building, after the late firm of Pery and Reed's designs [June 16, 1883, two interior views], only the front wall was retained, and the ground floor of the front was removed for door-ways, the superstructure being carried upon a continuous compound girder. The architects re-arranged the entire interior, replaced the rotunda with a flattened dome, and used very little wood; Professor A. B. Kennedy supplied drawings for the iron work. The additional buildings, after the Moorish style, having three entrances from Charing Cross-road (1896-7), are by Mr. W. M. Brutton. In 1634-5 Robert, second Earl of Leicester, built upon some open lammas-land a house, for a long period included in Little Newport-street, to which are due both the situation and irregular shape of the square, just as in the laying out of Russell-square its east side was set in alignment with Baltimore (1759), since Bolton, House. The Tulk family bought Leicester-fields for 90,000*l.* Of Leicester House a small portion, being then the (old) Hotel de l'Europe, survived until 1806. The hotel, rebuilt, and two shops were taken down in 1896 for the Hotel de Paris, re-named the Queen's, by Messrs. Saville and Martin. Sutton Nicholls's bird's-eye views of 1751 and 1754 depict next to the forecourt and left wing of Leicester House, a mansion of the Earls of Ailesbury, of whom Charles, succeeding as third earl in 1741, married Lady Anne Saville, daughter and co-heir of William, Marquis of Halifax. The house, afterwards occupied by Sir George Savile, Bart., was subdivided; the west portion became a linen-draper's shop; in the east portion Miss Linwood exhibited, 1804-45, her pictures in needle-work and crewel embroideries. In 1849 the premises were hired for a series of panoramas, followed by certain shows, *tableaux vivants*, and *poses plastiques*, which contributed to the reputation then enjoyed by that locality. We witnessed the fire which consumed that part of Savile House to the ground level on February 28, 1865. The basement became the Shades; the upper portion, left vacant some years was taken for the projected Denmark theatre and the equally abortive Alcazar theatre. In 1882-3 it gave place to the Pandora theatre, by T. Verity (obit 1891), which, never having been opened, was re-constructed by him and opened as the Empire Theatre on April 17, 1884. Three years afterwards Messrs. Romaine-Walker and Tanner altered the house for a "variety" theatre, opened on December 22, 1887. The later Hotel and Café de l'Europe [November 11, 1899, café and brasserie interiors], by Mr. W. Emden, at the corner of Leicester-place, covers the site of Dibdin's first Sans Souci theatre (1796) in Leicester-place. No. 16 is the Girls' School of Notre Dame de France, which should not be confused with the Boys' School at Leicester House in Lisle-street. The church of Notre Dame, entered from Nos. 5 and 6, Leicester-place, is a conversion of the interior of the Rotunda, built by Robert Mitchell, architect, for Robert Barker, inventor of a once highly popular kind of exhibition. In his patent of June 19, 1787, he describes his invention as "an entirely new contrivance or apparatus which I call La Nature à Coup d'Œil." Barker opened the Rotunda in 1794 with a picture of London, painted by Thomas Girtin from the Albion Mills, Blackfriars Bridge, and displayed on a spherical frame 85 ft. in internal diameter. Mitchell's sectional view, 1801, shows side-staircases rising to the top platform. Barker died in 1806; to his son Henry succeeded John Burford, followed in 1823, until about fifty years ago, by his son Robert, who painted many of the pictures

in oil and mostly from his own sketches; G. C. Selous was his principal artist for a period of thirty-five years. Having obtained a ten years' lease of the enclosure from the Tulk family for 3,000*l.*, James Wyld, M.P., the map-seller, erected in 1851 his Great Globe [April 5, 1851, view and plan], after designs by H. R. Abrahams, the ground floor measuring 165 ft. across. From the middle rose a shallow drum 85 ft. in diameter, carrying a dome covered with lead, and admitting daylight through the top. The model, to a scale of 0-1 in. to a mile horizontal by 1 in. to a mile vertical, was viewed from galleries gained by winding stairs. After the demolition of the Globe, in October, 1862, was exhumed the gilded equestrian statue of George I., cast in lead by, reputedly, Van Nost, and modelled by C. Büchard for the Duke of Chandos, which the residents in the square had bought in the sale at Canons in 1747. The local authorities allowed the ground to return to its pristine state of squalor and neglect, that again rendered it a standing reproach, and, as in the case of Landseer's lions at Trafalgar-square, a fruitful theme for bunter in *Punch* and other papers. The chief object of attack was the mutilated statue which at length appeared one morning painted like a toy-horse. A judgment of the Master of the Rolls in December, 1873, inhibited the freeholders from their project of building over the ground. In the following year Albert Grant, M.P., who had made a similar endeavour in respect of Soho-square on the Duke of Portland's estate, acquired the land for, it is said, 30,000*l.*, and employed Mr. (now Sir) James Knowles as his architect, and John Gibson as gardener, to lay it out as an open space, which on July 2, 1874, he conveyed in trust to the Board of Works. The busts in the garden are of Hogarth, by J. Durham, A.R.A., Sir Isaac Newton, by W. C. Marshall, R.A., John Hunter, by T. Woolner, R.A., and Sir Joshua Reynolds, by H. Weekes, R.A. Signor Fontana executed the statue of Shakespear, after that by Scheemakers from a design by Kent, in Westminster Abbey.

New Oxford, Endell, Coventry, and Cranbourne Streets.—Sir James Pennethorne submitted several projects to a Committee of the House of Commons upon Metropolitan Improvements. After the issue of four Reports in 1836-40, an Act (3 & 4 Vict. c. 87) was passed for four improvements, entrusted to Pennethorne (obit 1870) and Thomas Chawner (obit 1851), joint Architects and Surveyors to the Woods, Forests, and Land Revenues. The four schemes; a meagre result of the inquiry, and in themselves greatly reduced through a mistaken spirit of economy; related to (a) an extension of Oxford-street to (High) Holborn; (b) an extension of Bow-street to Charlotte-street, Bloomsbury; (c) a widening and extension from Coventry-street to Long-acre; and (d) a new road from the London Docks to Spitalfields Church. The committee had been influenced by testimony in favour of curved connexions instead of straight routes, and the retention of existing streets instead of making new ones. The "dog's leg line" theory had warm advocates; the firm of R. Lambert Jones and Higgins, surveyors, and other witnesses, strongly maintained the advantages of diagonal or crooked crossings as contrasted with crossings at right angles. We mention those facts in passing to indicate what opinions prevailed when a general improvement of London streets was under consideration in the former half of the century. Pennethorne's original plans for the first scheme would have quite cleared away the most notorious quarter of St. Giles; to effect a small saving one half of the Rookery was left in the hope that the owners would pull it down. The second scheme preserved the west side of the old streets; the property on both sides of Endell-street remained many years but little improved, whilst an awkward crossing was made at Long-acre. Our plan (Fig. 3) embodies the two architects' revised plans, signed by them for the Report of 1840, for a road 1,950 ft. long and 60 ft. wide from Stevenson's, since Meux and Co.'s, brewery to Newton-street, through property appertaining for the most part to the Maynard and Bedford estates—the former lying on the north-eastern side of High-street, where is still the *cul-de-sac*, Maynard-street. The Duke of Bedford obtained 113,963*l.* for his freehold interests; the laying-out of Arthur-street completed the work, which cost 290,277*l.* 4*s.* 10*d.* Church-lane and Phoenix-street have lately been renamed

Bucknall-street: the curious can still follow the lines of the old Rookery in Lawrence (for a while renamed Green) street, and Maynard and Carrier streets between Dyott (for a while renamed George) street and High-street. New Oxford-street was opened to foot-passengers on June 9, 1845, and on March 5, 1847, to vehicles.

The houses on both sides were designed with continuous façades. The block between Meux and Co.'s brewery and Dyott-street had a ground floor constructed as an arcade with a mezzanine floor, and a row of squared reveals alternating with the windows of the third floor and containing the Royal arms carved in stone.* Nos. 10-8, built of red brick with strap and jewel enrichments in stone and cement, after the Jacobean style infrequent in London, are, by, we believe, Wigg and Pownall. Venetian windows distinguish the first floor of Nos. 9-19 in the opposite block. Two other revised plans, signed by Chawner and Pennington in June, 1840, relate to Endell and Cranborne streets. For the former street (Fig. 3) they pulled down the east sides of Hanover, Old Belton, and New Belton streets; Bowl-yard, so-called after the public-house where felons stopped to drink on their way to Tyburn; Salutation-court; and Middle-row, a group of twelve back-to-back houses in Broad-street nearly opposite Bowl-yard (1843); they opened out Bow-court into Bow-street, Covent-garden. In the new street, named after the Rev. James Endell Tyler, rector of St. Giles, is Christ Church [March 8, 1845], by B. Perrey (*obit* 1880), after the XVIIth century style, built of Kentish rag with Bath stone dressings; the spire, shattered by lightning on August 17, 1887, was rebuilt by Mr. R. E. Tyler, who superintended the general repair of the church. At the north-west corner are the St. Giles's National Schools [December 22, 1860, with two plans], by E. M. Barry. G. J. Vulliamy (*obit* 1886) was architect of the adjacent Swiss Protestant Church, 1853-4; the Baths and Washhouses opposite, by Baly and Pownall, 1852, were improved and enlarged in 1900 by Messrs. Clarkson. The later parish Round-house, or Lock-up, in Coal-yard (since Goldsmith-street), gave place in 1884 to the new almshouses on the east side of Barley-court: the inscribed stone tablet is preserved in a cellar there. The Board schools in Coal-yard were erected about thirty years ago on the site of the "Galleries," another typical Rookery.

(To be concluded in our next.)

LONDON COUNTY COUNCIL AND TECHNICAL EDUCATION.

THERE was last week on view a collection of examples of work done by the students of the London County Council's Shoreditch Technical Institute, which, as illustrating the latest developments in Local Government, and as offering practical evidence of the growth of the modern reaction against the mechanical ideal in the handicrafts, is worthy of some attention.

The exhibition, if the unassuming display of the work of the Institute's classes may be so termed, was at the Institute, which lies in Pitfield-street, opposite Mr. Hare's Shoreditch Free Library and Baths, a building which is itself in every sense a monument to education in its best aspects. The Institute Building was formerly known as Aske's School, Hoxton—the old school of the Haberdashers' Company, from whom it was acquired six years ago by the London County Council, which has dedicated the old playing ground to the purposes of a public garden, and has built certain workshops at the back, remote from Pitfield-street.

No consideration of the exhibits can have much point without reference to the scope and purpose of the Institution. The school is organised on solely practical principles, and all teaching is designed to be directly applicable to the needs of the artisan. The Trade Classes are strictly confined to those who are actually engaged in the various trades, either as a means of livelihood, or with a view to making the trade a means of livelihood. The term, "Trade Classes," excludes Domestic Classes for women. The trades include carpentry, joinery, upholstery, plumbing, electric-wiring, French polishing, plasterer's work, and some few others, but "cabinet making and the allied trades" are those to which chief attention is given, and to which we will here confine ourselves.

The course consists in classes and workshop

* The arms formed the subject of legal proceedings recorded in our columns of April 11 and May 23, 1903.

training. The class work deals exclusively with Applied Science and Applied Art, and the work done in the shops by any student, has been the subject of his previous lectures. The student himself makes complete drawings of each subject, and takes off quantities and prepares shop lists of materials before setting out his work.

In the Art Classes copying is discouraged. Lessons in design take the form of studies from natural objects; the application of those studies of natural form to a conventional arrangement or pattern which is indicated to the student by dots or by other means; and by studies made at South Kensington Museum, which are set up as "motives" for design, and so forth.

The visitor to the school readily perceives that here at least there is no indolent dilettantism, none of that self-congratulation of the "artist" which has made the valuable Arts and Crafts movement sometimes so tiresome to its well-wishers, and so slow to commend itself to a public not wholly undiscerning. In these classes and class lectures we may rest assured there is no delay about aesthetic theories, for there is here the serious business of life to hand. And this consideration takes us from the principles of the teaching, to the conditions under which they have to be applied, and it is here that the difficulties of the directors of the school lie.

Shoreditch is a centre of the furniture trade, good, bad, and indifferent. The school teachers have to contend with the prejudices and traditions of that trade and with the appalling ideals derived from the fascination of the marvelously accurate achievements of machinery. The journeyman, the improver, the advanced apprentice, who for a small fee are able to attend the evening classes to the average number, this last season, of one hundred, are receptive at all points except at that precise point where the school is most ambitious to instruct. There the student is stoical. His attitude is respectful, and is perfectly logical and sound. If pressed he speaks somewhat as follows:—"You may be right in what you say, but I have been carving an acanthus scroll on Chippendale armchairs for the past five months, and this is the way my master will have acanthus done, and if I do not do it so, I shall lose my place."

Accordingly there are exhibited at Shoreditch certain carvings of great mechanical skill, copies, sand-papered, stained, and wonderfully polished, such as you may see in the panel of a thoroughgoing Victorian rosewood piano-case, at any musical warehouse. With regard to the evening classes, therefore, which are attended by journeymen and others, the Directors and others can only hope for better things: but with regard to the Day Classes, which are confined to boys of from thirteen to seventeen years old, they can recognise clear indications of the good results borne already by their Art teaching.

Among the exhibits of work done by students who have been trained in the Day school, there are examples which it is difficult to realise as the design and workmanship of boys of sixteen and seventeen. The variety in the treatment of a class subject shows the initiative encouraged in the individual student. The whole of the exhibits generally show appreciation of the material used, reserve in decoration and refinement of line and proportion; and many of the designs have distinction. The whole of the exhibits are free from affectation, and while it may be said that nearly every article of furniture exhibited is by its quality of design associateable with no other epoch than the present, "L'Art nouveau" is entirely absent in every and all its variegated eccentricities. Healthy, practical, under good auspices, and with the promise of high attainment before it, the Shoreditch Technical Institute should have universal good wishes. The importance of the Institute may be indicated by the fact that 750 students were attending its classes last session.

PUBLIC HALL, BENTHAM, YORKSHIRE.—The foundation-stones were recently laid, at Bentham, of a new public hall and institute. The plans for the proposed work, which have been drawn by Mr. T. A. Foxcroft, of Settle, provide for a stone structure, comprising a room which can be used for lectures and meetings of parishioners, a recreation room, billiard-room, news-room, library, and kitchen. The total cost is estimated to be 800*l*.

THE BRITISH ASSOCIATION OF WATERWORKS ENGINEERS.*

Mr. C. C. SMITH, Assoc. M.Inst.C.E., read a paper on the treatment of moorland water to prevent action upon lead pipes, written by himself and Dr. E. M. Chaplin. He said the catchment area from which the Wakefield Corporation obtained its supply formed a portion of the Rishworth Moors, situated on the borders of the West Riding of Yorkshire, about half-way between Halifax and Oldham; its elevation varied between 1,000 ft. and 1,500 ft. above sea-level, and it consisted chiefly of moorland. Peat covered the surface, varying from 6 in. to over 20 ft. in thickness. Underlying the deeper peat in many places were deposits of clay and outcrops of shale. In other places where the peat was thin, the millstone grits were close to the surface. In many parts of the moor where the peat was deep and rested on clay, the ground was soft and marshy, and the water running from it had a peaty colour and taste. Dr. Houston had proved beyond doubt that it was by contact with the peat that the water acquired its acidity and power to attack lead. The works at Rishworth consisted of the Green Withens Reservoir, capacity 242 million gallons, which in addition to being fed by its natural gathering ground, had two catchwaters each over a mile in length, having a flat bottom and sloping sides pitched with stone.

The Ringstone Reservoir had a capacity of 245 million gallons. This had practically no natural gathering ground, but was fed by the Moss Moor Catchwater, 4½ miles long, which had a circular brick bottom, and sloping sides constructed in brickwork and masonry. From the Ringstone Reservoir a pipe-line carried the water to the Ardsley Reservoir—a distance of 17 miles. Ardsley Reservoir was about four miles from Wakefield, and had a capacity of 334 million gallons.

A portion of these works was completed and the water supplied to the city and out-districts in 1888. During the following three years complaints as to lead-poisoning gradually increased until early in the year 1892, when they became so numerous that the Corporation called in Dr. Percy Frankland to investigate the whole matter, and report as to the steps to be taken to counteract the action of the water upon the lead pipes. After a detailed examination of samples of water from the various feeders and streams from the several reservoirs, and from various draw-off taps in the area supplied, and after many laboratory experiments as to the best method of counteracting the solvent action of the water, Dr. Frankland presented a complete report to the Corporation. He found that whilst the gathering ground yielded a water of "Exceptional organic purity admirably adapted both for kitchen and industrial purposes, yet it had a very marked action upon lead, but one which it is quite possible to remove by several distinct methods of treatment, namely—(a) treatment with carbonate of soda; (b) treatment with finely-divided carbonate of lime or chalk; and (c) filtration through finely-granulated limestone."

The authors described very fully the different methods which had been adopted for counteracting the plumbo solvency in the water, and thus summarised the conclusions arrived at:

1. Treatment with carbonate of soda is easily carried out, and is effective, but at the same time it is a very expensive method of treating acid waters.
2. Filtration through sand may be effective whilst the beds are new, but the sand rapidly loses its power of preventing plumbo-solvency.
3. Only a limited quantity of lime or chalk can be usefully added to the water prior to filtration, for if the water is rendered strongly alkaline at this stage, it loses a portion of its alkalinity in passing through filter-beds.
4. With the water experimented upon, it was found best to add one grain of chalk prior to filtration, and from one to two grains of lime after filtration, the lime being added in the form of clear lime-water.
5. The prevention of plumbo-solvency by utilising the dry-weather flow only for domestic consumption is not practicable in the majority of moorland water schemes, it being necessary to store the flood-water for all purposes, especially when such water forms a large percentage of the flow.
6. The use of pipes of other metals than lead has not been found to give entire satisfaction, and even if a perfect pipe were available, the

* Concluded from last week.

large number of lead service-pipes now in use would render treatment of the water necessary.

7. Limestone and chalk as foundations for filter-beds are not of permanent value, owing to the surface of the stone becoming covered with deposit, and so preventing the water from coming in contact with it.

Dr. Chaplin said this question was a very important one to them in the West Riding of Yorkshire, and during the last few days the question had been raised as affecting Leeds. They found they could reduce the action of the water upon lead to an inappreciable extent, and it was very inexpensive and easy to work.

Mr. Jones, Leyton, remarked that the damage done by lead-poisoning was very great. Mr. Simpson said he would like to know if enamelled wrought-iron pipes had ever been used, because he remembered some twenty years ago his grandfather's house in the country was entirely fitted up with such pipes.

Mr. Smith said many wrought-iron pipes had been taken out, but he had never seen any enamelled.

This concluded the technical business of the meeting. A visit was made to the pumping-stations of the Hull Waterworks, and a visit was made to various Belgian waterworks—Antwerp, Brussels, the inter-communal works for supplying the suburbs of Brussels, and the Verviers Works at Gilleppe.

Illustrations.

PROPOSAL FOR REMODELLING THE FRONT BLOCK OF THE NATIONAL GALLERY.

SOME ten years ago I exhibited at the Royal Academy a perspective drawing with a plan nearly similar to this one, for re-modelling the front block of the National Gallery. The drawing, though on a large scale, was really rather a sketch than a serious study, and the central group was carried too high and in other respects did not satisfy me.

The present elevation represents the same general idea more carefully worked out. The centre dome is considerably lower and is treated as a dome in solid masonry (as also the smaller cupolas at the ends); for in these days of Portland cement it seems absurd to assume that a masonry dome cannot be built so as to be weather-proof, and the gain in monumental effect is incalculable.

A main factor in the idea was to get rid of the extraordinary jumble of staircases having no architectural connexion with each other, which at present exist in the interior. Had there been a large-minded First Commissioner of Works in office at the time, or had the then First Commissioner consulted an architect of genius, something better would surely have been done than putting in that timidly-designed central staircase, so arranged that one cannot get from the central to the side galleries without going down one flight of steps and up another!

It is assumed that all the land included in the re-modelled plan will eventually come into the National Gallery site, and therefore should be treated as a symmetrical plan, and given some effect of centralisation and vista. The arrangement here shown gives one central hall and staircase with a large dome over it, a fountain in the centre of it, and a long colonnaded vista each way, closed by the apse with a sculptured group. A similar apse forms a termination of the vista along the wings from back to front. The colonnaded would form a space for the exhibition of works of decorative art, which at present find no place in the National Gallery.

As to the suggested alterations in the external architecture, some people will no doubt object to interfering with a well-known building; but while the refinement of Wilkins's Greek detail is fully admitted, it surely must also be admitted that the existing cupola is an exceedingly timid and weak feature, quite unworthy of its position; and the little cupolas at the ends have of course become almost bywords. Something of the kind and on the scale here suggested, at all events, would surely be preferable; nor could any adequate central hall and staircase be carried out without it. Wilkins's porticoes and lower wall are retained unaltered, except that a new inner column is inserted at each end of the central portico to

give greater depth of effect. The upper blank window-spaces (a very poor device) are filled up and replaced by a frieze of carved ornament. The quadrant line of the pavement at the south-east angle suggested the semicircular bay following its line. It would have been better, as a matter of appearance, to have placed the two pilasters at the extreme ends of the façade close together, to strengthen the angle; but that would involve more cutting down and rebuilding; the two pilasters as shown are left as they now stand. The angle turrets which flank the central dome are finished with cupolas which are intentionally a reminiscence of the finish of the present little cupolas which have been derisively termed the "peppercots."

There is an odd little history as to the treatment of this design by the Royal Academy. The first and rather crude coloured perspective was crossed on the back and sent back to me with the usual curt intimation that the Academy "cannot accept" it—i.e., that it is too bad to hang. I did not at once remove it, and to my surprise received a "varnishing day" ticket and found the condemned drawing hung in a central position. An architectural critic in the *Art Journal* said it was the most notable contribution of the year in the Architectural Room. I dare say he was wrong, but that such a remark should be made of a drawing which the powers of the Architectural Room had in the first instance condemned as not good enough to exhibit, is at all events amusing. The present drawing was accepted at the Academy, but crowded out at the last moment with the usual polite assurance of regret that they could not "find space." Perhaps it is only fitting that executed buildings should take precedence of what the French call *projets*; yet it is possible that some readers of the *Builder* may be disposed to admit that this is of more interest than some of the drawings for which the Academy were able to "find space" in the Architectural Room this year.

H. H. S.

ALTERNATIVE DESIGN BY WILKINS FOR UNIVERSITY COLLEGE.

UNIVERSITY College was founded in 1827, as London University, by the efforts of Lord Brougham, Campbell the poet, James Mill, Grote, Mackintosh, Joseph Hume, Bentham, Dr. Birkbeck, and others, for affording "literary and scientific education at a moderate expense," and the scheme included a hospital and a boys' school. Isaac Lyon Goldsmid acquired the site of about seven acres for 30,000*l.*, and conveyed it at cost price to the proprietors. The roll of professors includes Augustus de Morgan, Lindley, who may be called the father of modern botany, John Austin the jurist, Andrew Amos, and Sir Charles Bell, one of the greatest of physiologists. Under a charter of incorporation the title of the institution was changed to that of University College, a style that was retained at the re-incorporation in 1865; the college now forms a constituent part of the University of London.

The Report of the Council of Proprietors, dated September 30, 1828, contains a drawing (with plans of the three floors of the main block), entitled, "Design adopted by the Council for the University of London." With the drawing and plans should be compared the plan and drawing preserved in a portfolio of Wilkins's designs in the library of the Institute of Architects. We purposely cite the two drawings because they clearly show that Wilkins intended the quadrangle to remain open on the west side except for a low colonnaded screen and a middle raised gateway, and because the elevations of the two wings added since differ from those of the wings as they appear in the "adopted design." In the latter their western ends are finished with a projecting stylobate and a tetrastyle portico of disengaged columns carrying a pediment. The centre of the façade of each wing is surmounted by a small cupola rising from a low podium, quite different from the tower shown in the design here published. When the report of 1828 was made the two wings had not been begun, and the middle block, of which the Duke of Sussex laid the first stone on April 30, 1827, was still in the hands of Henry Lee and Sons, the contractors.

Wilkins died in 1839. In 1845 Professor T. L. Donaldson completed the laboratories. Three years afterwards the vestibule of the main block was remodelled as the Flaxman Hall by Professors C. R. Cockerell and T. L. Donaldson. In 1848-51 the hall at the rear of the vestibule

was replaced, after a fire, with the library and its staircase by Professor Donaldson. In or about 1867 Professor T. Hayter Lewis added the eastern part of the south wing, which was extended westwards in 1878. At the middle point of that wing on the inner side is a rounded bay surmounted with a cupola, instead of the square podium and small cupola of the "adopted design." The corresponding north wing, by Lewis, was begun in July, 1878, and opened in February, 1881. The extension westwards to the footpath of Gower-street of the south wing, with a portion of the return front, to be four stories high including the basement, along the street, are by the late Professor T. Roger Smith. (See the plan in the *Builder* of June 3, 1903.) The west end of the south wing, thus extended, has an order of pilasters only, and is in that and other respects a manifest departure from the "adopted design." Our readers will remember that we pointed out at the time how the new engineering and electrical laboratories have deformed and spoiled one of the most remarkable buildings of its period and style in London. Now that the school is to be transferred to another site, it is to be hoped that this return building will be removed. We believe that some at least of the Council are quite convinced that it was an architectural blunder.

Though the arrangements have been altered since, we may mention that Wilkins planned the basement and ground and upper floors of the main block symmetrically on the north and south sides of the vestibules. He appropriated the basement for vaults, the students' common rooms (to the east of the vestibule), a refreshment room (south), rooms for the anatomical school, and the housekeeper's and steward's rooms. On the ground floor he planned, to the north and south, respectively, two lecture rooms (46 ft. by 24 ft.), a paved cloister for exercise (107 ft. by 23 ft.), a lower theatre (65 ft. by 50 ft.), a museum, and rooms for the professors; at the rear, projecting from the lower vestibule, he laid out two lecture rooms beneath the great hall (each 44 ft. by 38 ft.). On the upper floor he planned the middle vestibule beneath the dome; to the north a museum of natural history (120 ft. by 50 ft.), a museum of anatomy (49 ft. by 41 ft., and 23 ft. 6 in. high), and an upper theatre (65 ft. by 50 ft.); to the south the great library (120 ft. by 50 ft.), the small library (41 ft. by 22 ft.), an upper theatre (65 ft. by 50 ft.), etc. To the east of the vestibule he built the great hall (90 ft. by 45 ft., and 25 ft. 6 in. high) between the two courts; and the hall was replaced as we mention above, by the later library. In the south portion of the south range on the ground floor he planned the University office, the Council-room, and the clerk's room. The south wing is now occupied for the most part by the boys' school; the north wing is occupied by some of the science "sides," and by the Slade School of Fine Art.

We have no history as to the design here published. The engraving from which it is taken bore at the foot an old title and imprint stating that it was the design of Wilkins for London University; which imprint has been obliterated by a wise employee of the lithographer's, who appears to have assumed, on his own responsibility, that as we had put our own title in the usual form under the plate, the facsimile of the original title could be of no use! Our impression is that it is probably the design Wilkins himself preferred; the semi-circular colonnades at the ends of the wings would have had a charming effect, but they were perhaps considered by the Board not to be sufficiently utilitarian. On the other hand, the towers in the centre of the wings are not so good in effect as the cupolas shown in the "adopted design"; and these latter again are not so good as the centre features now there and designed by Hayter Lewis, who in this respect may be said to have improved on both of Wilkins's designs.

TWO STAINED GLASS WINDOWS.

THESE two windows are from the design of Mr. R. J. Stegless (London), who has exhibited several designs for stained glass at different times in the Royal Academy architectural room.

The left-hand drawing of these two was one exhibited at the Academy in 1900, and, as will be seen, represents the Nativity, with the Annunciation as a predella. The other design symbolises "Evening Prayer."

3101, 3103, 3105, 3107, 3109, 3111, 3113, 3115, 3117, 3119, 3121, 3123, 3125, 3127, 3129, 3131, 3133, 3135, 3137, 3139, 3141, 3143, 3145, 3147, 3149, 3151, 3153, 3155, 3157, 3159, 3161, 3163, 3165, 3167, 3169, 3171, 3173, 3175, 3177, 3179, 3181, 3183, 3185, 3187, 3189, 3191, 3193, 3195, 3197, 3199, 3201, 3203, 3205, 3207, 3209, 3211, 3213, 3215, 3217, 3219, 3221, 3223, 3225, 3227, 3229, 3231, 3233, 3235, 3237, 3239, 3241, 3243, 3245, 3247, 3249, 3251, 3253, 3255, 3257, 3259, 3261, 3263, 3265, 3267, 3269, 3271, 3273, 3275, 3277, 3279, 3281, 3283, 3285, 3287, 3289, 3291, 3293, 3295, 3297, 3299, 3301, 3303, 3305, 3307, 3309, 3311, 3313, 3315, 3317, 3319, 3321, 3323, 3325, 3327, 3329, 3331, 3333, 3335, 3337, 3339, 3341, 3343, 3345, 3347, 3349, 3351, 3353, 3355, 3357, 3359, 3361, 3363, 3365, 3367, 3369, 3371, 3373, 3375, 3377, 3379, 3381, 3383, 3385, 3387, 3389, 3391, 3393, 3395, 3397, 3399, 3401, 3403, 3405, 3407, 3409, 3411, 3413, 3415, 3417, 3419, 3421, 3423, 3425, 3427, 3429, 3431, 3433, 3435, 3437, 3439, 3441, 3443, 3445, 3447, 3449, 3451, 3453, 3455, 3457, 3459, 3461, 3463, 3465, 3467, 3469, 3471, 3473, 3475, 3477, 3479, 3481, 3483, 3485, 3487, 3489, 3491, 3493, 3495, 3497, 3499, 3501, 3503, 3505, 3507, 3509, 3511, 3513, 3515, 3517, 3519, 3521, 3523, 3525, 3527, 3529, 3531, 3533, 3535, 3537, 3539, 3541, 3543, 3545, 3547, 3549, 3551, 3553, 3555, 3557, 3559, 3561, 3563, 3565, 3567, 3569, 3571, 3573, 3575, 3577, 3579, 3581, 3583, 3585, 3587, 3589, 3591, 3593, 3595, 3597, 3599, 3601, 3603, 3605, 3607, 3609, 3611, 3613, 3615, 3617, 3619, 3621, 3623, 3625, 3627, 3629, 3631, 3633, 3635, 3637, 3639, 3641, 3643, 3645, 3647, 3649, 3651, 3653, 3655, 3657, 3659, 3661, 3663, 3665, 3667, 3669, 3671, 3673, 3675, 3677, 3679, 3681, 3683, 3685, 3687, 3689, 3691, 3693, 3695, 3697, 3699, 3701, 3703, 3705, 3707, 3709, 3711, 3713, 3715, 3717, 3719, 3721, 3723, 3725, 3727, 3729, 3731, 3733, 3735, 3737, 3739, 3741, 3743, 3745, 3747, 3749, 3751, 3753, 3755, 3757, 3759, 3761, 3763, 3765, 3767, 3769, 3771, 3773, 3775, 3777, 3779, 3781, 3783, 3785, 3787, 3789, 3791, 3793, 3795, 3797, 3799, 3801, 3803, 3805, 3807, 3809, 3811, 3813, 3815, 3817, 3819, 3821, 3823, 3825, 3827, 3829, 3831, 3833, 3835, 3837, 3839, 3841, 3843, 3845, 3847, 3849, 3851, 3853, 3855, 3857, 3859, 3861, 3863, 3865, 3867, 3869, 3871, 3873, 3875, 3877, 3879, 3881, 3883, 3885, 3887, 3889, 3891, 3893, 3895, 3897, 3899, 3901, 3903, 3905, 3907, 3909, 3911, 3913, 3915, 3917, 3919, 3921, 3923, 3925, 3927, 3929, 3931, 3933, 3935, 3937, 3939, 3941, 3943, 3945, 3947, 3949, 3951, 3953, 3955, 3957, 3959, 3961, 3963, 3965, 3967, 3969, 3971, 3973, 3975, 3977, 3979, 3981, 3983, 3985, 3987, 3989, 3991, 3993, 3995, 3997, 3999, 4001, 4003, 4005, 4007, 4009, 4011, 4013, 4015, 4017, 4019, 4021, 4023, 4025, 4027, 4029, 4031, 4033, 4035, 4037, 4039, 4041, 4043, 4045, 4047, 4049, 4051, 4053, 4055, 4057, 4059, 4061, 4063, 4065, 4067, 4069, 407

DE BURY MONUMENT, DURHAM CATHEDRAL.

This is a monumental slab in memory of Richard de Bury, Bishop of Durham from 1333 to 1345, which was presented to the Cathedral a short time since by the members of the Grolier Society, of New York. It is placed over the spot where the remains of the shop lie, in the chapel of the Nine Altars Durham.

The slab is executed in Sicilian marble. The idea of it was taken from the fine specimen of Bishop Bury's seal which is among the best treasures of the Cathedral. From this the original figure was worked, in face, attitude, and vestments. The only change is in the work which the figure now carries under the right arm, a representation of the Philibiblou; for, more than the pastoral crozier, is the characteristic feature of the prelate's life: the canopy under which he stands is simplified on that on the seal; and the two figures, each under his own canopy, represent letters and devotion. The inscriptions under these figures are from the fifteenth chapter of the Philobolion, chosen for the purpose by the Grolier Society:—

"On the Bishop's right we have
 Ilectant libri prosperitate felicitate ardentem,
 insolantur mibi fortuna terrentem.
 Books are a joy in good times, a consolation in bad."

On the left side we have
 ce pro libri adit beatitudinis nostras mercedem
 attingimus, dum adhuc existimus viatores;
 Helped by Books, while still pilgrims here, we view
 the garden of our blessedness."

The inscription round the slab runs thus:—
 HOC SVB MARMORE OSSA RICARDI D'AYNGERLE
 DICII DE BURY, D.G. EPISC. DVYNELM:
 A OBIT AD. MCCCLV. REINVENTVNT IN PACE:
 The memorial is designed by Mr. G. H. Kitchin, architect, of Winchester, the son of Mr. Kitchin, the Dean of Durham.

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, S.W., Mr. J. Williams Benn, M.P., Chairman, presiding.

Loans.—On the recommendation of the Finance Committee it was agreed to lend £100,000 to the London Borough Council 10,414. for the erection of lodging-houses; Camberwell Borough Council 1,000. for contribution to the cost of reconstruction of canal bridge; Deptford Borough Council 10,000. for erection of town hall and offices; Fulham Borough Council 1,000. for electric light installation; and Hampstead Borough Council 4,300. for electric light meters.

Tramways.—On the recommendation of the Tramways Committee it was again agreed to make application to Parliament next session for power to construct tramways from the present terminus in Westminster-bridge-road across Westminster Bridge and along the Victoria-embankment, and by means of the authorised subway to the North side of the Strand.

A sum of 95,000. on capital account was authorised for the purchase of the undertaking of the London, Deptford, and Greenwich Tramways Company.

The Works Committee.—The Works Committee submitted a statement of works completed during the half-year ended March 31, showing the certified value and actual cost of works completed during the half-year. In Statement I. included the accounts for works, completed during the half-year, in respect of which complete specifications and bills of quantities have been prepared. On a few of these works some small expenditure has been incurred after March 31, but all such expenditure has been brought to account. The committee reported as follows: "We are glad to be in a position to bring present to the Council a statement which must be regarded as satisfactory, the result of execution of the works included in a balance of cost below final certificate 5,760. 18s. 6d., or nearly six per cent on the total of the final certificates. Twelve out of the thirteen works have been carried out at a cost below final certificate. . . . In one case only, viz., that of work No. 10, is there an excess of cost over final certificate, and in this case a very wet season greatly retarded the work and tended to increase the cost, and the sinking of the sewer in tunnel through private property proved more expensive than was anticipated. . . . We recommend that the excess, amounting to 1,573. 0s. 6d., of actual

cost over final certificate in respect of the construction of the southern high level relief sewer, Balham-high-road, be approved."

The recommendation was agreed to. The report included the following general observations: "The total cost of the works included in the statements now presented does not represent the turn-over of the department, because much of the expenditure on these works occurred previous to the half-year in question, while on the other hand much of the expenditure during the six months was upon works which are still unfinished. The approximate expenditure on works executed by the department during the half-year was 232,000. The number of works in respect of which full specifications, bills of quantities, etc., have been prepared, and which have been referred to us for execution and not yet included in the half-yearly statements of completed works submitted to the Council, is thirty-three, representing an estimated expenditure of approximately 1,416,000. At present we are aware of no reason why the works in progress should not be carried out for the amount voted in each case. We reported on November 17, 1903, that we had adopted percentages of 2 and 4 1/2 per cent. to be added to the expenditure on wages and materials charged to each estimated work completed during the half-year ending March 31, 1904, to cover general and establishment charges respectively. As, however, the total expenditure during the year 1903-4 proved to be larger than was anticipated when the above percentages were adopted, we have reduced the percentages to be added to the cost of works completed during the half-year to 1 1/2 and 3 1/2 respectively. We have fixed at 1 1/2 and 3 1/2 respectively the percentages to be added, to cover general and establishment charges, to the cost of estimated works completed subsequent to March 31, 1904."

Seepage-polluted Watercess.—The Public Health Committee recommended and it was agreed that expenditure not exceeding £200. be authorised for the purposes of an inquiry as to beds from which watercess is supplied to London, subject to the concurrence of the General Purposes Committee, under standing orders.

Sanitary Officers.—The same committee reported that since 1893 the number of sanitary inspectors in London had increased by some 66 per cent., from 188 in 1893, to 313 in 1904. Of the 313, 28 are women.

Iron and Glass Shelters.—Mr. H. Jephson moved, and Mr. Horniman seconded, that the Council is not prepared to sanction the construction of any iron and glass shelters over the pavement in Piccadilly, and that it be an instruction to the Building Act Committee accordingly.

Mr. White said the matter was under the consideration of the Building Act Committee, and that it would come before the Council at the next meeting.

The motion was then withdrawn by Mr. Jephson.

Charing-cross Station.—Mr. Greenwood withdrew the motion that has stood in his name for some weeks that the question of acquiring Charing-cross Station and Hungerford Bridge be considered, with a view to providing the railway company with a site on the Waterloo side of the river, and the using Hungerford Bridge for tramways, so that the Council's Northern and Southern tramways from Aldwych to Waterloo could be linked together.

Lamp-standards, Waterloo Bridge.—On the motion of Sir William Richmond, the following motion was agreed to without discussion: "That it be referred to the Bridges Committee to report immediately as to the removal of the original bronze lamp-standards on Waterloo Bridge and the substitution therefore of lamp-standards wholly out of character with the bridge, and of particularly feeble design, and as to the possibility of the reinstatement of the original lamp-standards."

The Council then adjourned.

NEW PUBLIC HALL, SOUTH BRENT, DEVON.—Plans have been prepared by Mr. Latham, architect, Kingsbridge, for a new public and market hall at South Brent. The building will be about 80 ft. long by 30 ft. wide.

ASSEMBLY BUILDINGS, BELFAST.—A new hall for the General Assembly of the Presbyterian Church in Ireland is now being erected in Belfast. The work is being erected from the designs of Messrs. Young and Mackenzie, architects.

APPLICATIONS UNDER THE 1894 BUILDING ACT.

The London County Council at their meeting on Tuesday dealt with the following applications under the London Building Act, 1894. The names of applicants are given between parentheses:—

Line of Frontage and Projections.

Hackney, Central.—Retention of projecting steps in front of No. 232, Mare-street, Hackney (Mr. J. B. Westcott for Messrs. Hellis and Son).—Consent.

Hackney, North.—Balconies to proposed buildings on the north and south side of Holmleigh-road, Stamford-hill, Hackney (Mrs. F. A. Cave).—Consent.

Lewisham.—Stone hoods to porches in front of Nos. 42, 44, 46, 48, and 50, Algiers-road, Lewisham (Messrs. Tompkins and Connew).—Consent.

Lewisham.—Retention of a one-story addition to a house on the north side of Ewhurst-road, Lewisham, abutting upon the west side of Salehurst-road (Messrs. J. G. Nicolls and Sons).—Consent.

Wilmington, West.—Three houses, Nos. 41, 42, and 43, De Laune-street, Kennington (Messrs. E. Briant and Son for Mr. A. F. De Laune).—Consent.

Norwood.—Buildings upon a site abutting upon the south side of Rothschild-street and west side of High-street, West Norwood (Mr. T. Martin).—Consent.

Paddington, South.—An oriel window at No. 5, Cleveland-gardens, Hyde-park (Messrs. C. J. Mann and Son).—Consent.

St. George, Hanover-square.—A portico at No. 31, Wilton-place, St. George, Hanover-square (Messrs. Davis and Emanuel for Lady Jones Parry).—Consent.

Wandsworth.—Houses with shops on the west side of Mitcham-road, Tooting, northward of the "Foresters' Arms" public-house (Mr. W. C. Poole for Messrs. Swain and Selley).—Consent.

Westminster.—Mouldings upon oriel windows at "Parliament Chambers," Great Smith-street, Westminster (Messrs. Falgrave and Co. for Mr. E. J. Read).—Consent.

St. Pancras, West.—One-story shops upon a site abutting upon the eastern side of Stanhope-terrace, Regent's-park, St. Pancras, and southern side of Delancey-street (Mr. A. Whitelaw for the London and North-Western Railway Company).—Refused.

Width of Way.

Brixton.—Buildings upon the site of Nos. 8, 10, and 12, Clark's-row, Rohsart-street, Brixton (Messrs. H. Bragg and Sons for Mrs. R. Slade).—Consent.

Whitechapel.—Working class dwelling-house on a site abutting upon the north side of Montague-street and west side of Bell-lane, Whitechapel (Messrs. D. Cubitt, Nichols, Sons, and Claxet for Mr. H. Friedlander).—Consent.

Rotherhithe.—Buildings upon the site of Nos. 16 and 17, Magdalen-street, Bermondsey, with external walls at less than the prescribed distance from the centre of the roadway of the street (Messrs. F. Chambers and Son for Messrs. R. Dickeson and Co.).—Consent.

Wandsworth.—A one-story building at the rear of No. 251, Upper Richmond-road, Putney, with external walls at less than the prescribed distance from the centre of a roadway leading out of the east side of Lower Park-fields (Mr. C. L. Banks for the trustees of Mrs. E. Gerhold and Mr. A. Gerhold).—Consent.

Lines of Frontage and Construction.

Hampstead.—Retention of a wood and iron building on the north side of Sandwell-crescent, West End-lane, Hampstead (Mr. W. Sandeford).—Refused.

Hampstead.—The retention of a wood and iron fire station building on part of the forecourt of No. 138, Maids-valle, Kilburn (Mr. O. Fleming for the Fire Brigade Committee of the Council).—Consent.

Lines of Frontage and Width of Way.

Lewisham.—A block of residential flats, with bay windows and a one-story addition in front, at No. 155, High-street, Lewisham (Mr. C. A. Geen).—Consent.

Clapham.—The rebuilding of the "Wirtemberg Arms" public-house, abutting upon Wirtemberg-street and Cross-street, Clapham (Mr. W. Husband for Mr. J. E. Manktelow).—Consent.

Hampstead.—Mission buildings on the site of Nos. 8 and 10, Broomsleigh-road, West Hampstead, abutting also upon Dornfield-street, with projecting porch, oriel window, and buttresses (Messrs. Whitfield and Thomas for the Rev. E. N. Sharpe).—Consent.

St. George, Hanover-square.—An addition to No. 19, Minerva-mews, Chester-terrace, St. George, Hanover-square (Mr. W. E. Mills for Mr. C. H. B. Wentworth).—Refused.

Width of Way and Construction.

Battersea.—Retention of wood and iron enclosures to the belting on the third floor of premises on the north-west side of Church-road, Battersea, the iron framing supporting the water-tank on the roof, and the retention of a forecourt wall at less than the prescribed distance from the centre of the roadway of Church-road (Mr. H. Branch for Messrs. Mayhew, Ltd.).—Consent.

Formation of Streets.

Islington, North.—That an order be issued to Mr. C. J. Bentley, sanctioning the formation or laying out of two new streets for carriage traffic to lead from Hornsey-lane to Whitehall-park, Islington, and in connexion therewith the widening of a portion of Hornsey-lane (for Mr. G. Wills).—Consent.

Woolwich.—A deviation from the plans approved on October 1, for the formation of new streets to lead out of the east side of Shrewsbury-lane, Plumstead, so far as relates to the widening of Shrewsbury-lane at the southern end of the estate (Mr. W. Parish).—Agreed.

Woolwich.—A deviation from the plans approved for the formation of Bereta-street, Footscray-road, New Eltham (Mr. G. Bush).—Refused.

Space at Rear.

Strand.—An addition at the rear of No. 17, Chartes-street, Haymarket, upon part of the space at the rear of that building (Messrs. Treadwell and Martin for Messrs. W. Dunstan and W. J. Styles).—Consent.

St. George, Hanover-square.—Alterations and additions to No. 34, Wilton-road, St. George's, Hanover-square (Mr. A. J. Wood for Mrs. R. Morris).—Refused.

Buildings for the Supply of Electricity.

Kensington, South.—Retention of an addition and erection of a further addition at No. 11, Chapel-place, Kensington (Mr. J. Slater for the Kensington and Knightsbridge Electric Lighting Company, Ltd.).—Consent.

Deviations from Certified Plans.

Finsbury, East.—Deviations from the plans certified by the District Surveyor, so far as relates to the proposed rebuilding of "The Royal Oak" public-house, abutting upon Waterloo-street and Galway-street, St. Luke's (Messrs. Willis and Leslie).—Consent.

Alterations to Buildings.

Paddington, South.—Raising of the back addition of No. 16, Bayswater-terrace, Paddington, and the construction of an additional story in the roof of the main building (Messrs. Trant, Brown, and Humphreys for the Misses Johnston).—Consent.

The recommendations marked † are contrary to the views of the local authority.

ENGINEERING SOCIETIES.

INSTITUTION OF ELECTRICAL ENGINEERS.—The annual conversation of the Institution of Electrical Engineers took place in the Natural History Museum, South Kensington, on Tuesday evening. The guests were received by Mr. Gray and Mr. Alex. Siemens, and spent a most enjoyable evening. As usual, there were no technical exhibits, but a carefully chosen programme of instrumental and vocal music was given with excellent effect.

COMPETITIONS.

NEW COTTON EXCHANGE, LIVERPOOL.—The award of Mr. F. G. Briggs, F.R.I.B.A., the assessor on the designs for the New Cotton Exchange sent in by competing architects, and which has been confirmed by the directors, is as follows:—The design No. 22, by Messrs. Matear and Simon, is recommended for adoption. No. 15, by Mr. Richard Holt, for the first premium of 250*l.*; No. 20, by Messrs. Grayson and Ould, for the second premium of 150*l.*; and the third premium of 100*l.*, divided between No. 2, by Messrs. Gilling and Moorhouse, and No. 19, by Mr. Henry Hartley.

SCHOOL AT SOUTHALL.—At the meeting on Thursday of last week of the Middlesex County Council it was announced that Mr. Paul Waterhouse, the assessor appointed by the President house, the assessor appointed by the President house, the assessor appointed by the President house, in respect to the erection of a new public elementary school at Southall, to provide accommodation for 800 children, had made his award as follows:—(1) Mr. C. E. T. Laurence, 22, Buckingham-street, Strand, W.C.; (2) Mr. J. Mann, Hayes; (3) Mr. W. L. Eves, Usbridge. A motion was passed appointing Mr. Laurence architect at a commission of 5 per cent., subject to tenders being obtained for

the work showing the total cost of the buildings not to exceed 12½ per cent. above £11 per head on the accommodation provided, and on the understanding that the working drawings are to become the property of the County Council.

Correspondence.**"THE PLENUM SYSTEM OF VENTILATION."**

SIR,—As your issue for last week contains a reply by Messrs. Henman, Cooper, and Lea, to the statements contained in my paper published in the "Journal of the Royal Institute of British Architects," perhaps you may kindly permit me to correct certain inaccuracies in their figures (and to give my authorities), which show that they have seriously misrepresented the facts.

According to the annual report of the Royal Victoria Hospital, Belfast, for 1902, the number of beds in the old hospital was 196; these were for patients only, and *exclusive* of those required for a large staff of doctors, nurses, servants, and others. But Messrs. Henman, Cooper, and Lea state that there were only 130 "residents."

In the new hospital there are only 293 beds for patients, and at the present time only about two-thirds of these are occupied; many of the wards were quite empty, or very nearly, last month at the time of my inspection, and probably there were not more than 200 patients in residence, or possibly a few more than in the old hospital. But Messrs. Henman, Cooper, and Lea state that the new hospital will contain 400 "residents," but admitting that at present there are only 300.

It will therefore be seen that the authority from whom I obtained the information as to the number of patients in the old hospital and new one being about equal, was fairly correct; indeed, it would be surprising to me to find an error, inasmuch as the statement came through the chairman of the Board of Management of the hospital to the writer of a letter before me. And this is a reasonable conclusion to draw, for it is not probable that the number of Belfast patients would very greatly increase during one or two years.

But, as I do not know the *exact* numbers, I will give the numbers of patients in both the old and new hospitals as being about equal, although admitting the possibility of a slight increase, which could not, however, materially affect the comparison I am about to make, and I will accept, as correct, the estimate quoted by Messrs. Henman, Cooper, and Lea, that the coal consumption for the new hospital will be 1,800 tons for this year, against the 516 tons used in the old hospital, according to the report for 1902.

Old hospital for 200 patients—coal used, per patient, 24 tons.

New hospital for 200 patients—coal used, per patient, 9 tons.

New hospital for 300 "residents" (as at present)—coal used, per resident, 6 tons (according to Messrs. Henman, Cooper, and Lea).

It remains to be proved that the enormous increase in the consumption of coal to six or nine tons per patient per annum is to be satisfactorily accounted for by an increased hot-water supply, additional laundry work, or the results attained for other purposes; in any case, it cannot be claimed that Plenum ventilation can compare favourably with scientific natural methods as to cost of fuel.

I have given the above figures for the purpose of correcting any impression that the new hospital is occupied by so many as 300

patients; that the old hospital contained many less patients than the new one, and in support of the statements contained in my paper also to remove possible mistakes with regard to the use of the words, "patients" and "residents."

Messrs. Henman, Cooper, and Lea have quite omitted to reply to the most serious point raised in my paper, in reference to the failure of the Plenum system of ventilation at Belfast to remove the vitiated air and smell from the operating rooms, by way of the exhaust provided for the purpose.

I have stated that the foul air and odour from these rooms (in which anaesthetics, or other chemicals, were being used at the time of my inspection) were being expelled through the joints of the doors when closed, and in volumes through the opened doorways; the smells were perceptible through the corridors, and to the interior of the large wards near the entrances to the same; I pointed out the failure to the official who conducted me through the premises, and he will be able to give any confirmation that may be asked for.

If vitiated air can be forced through doorways in this manner from one ward to another by this Plenum system, it cannot be said that the apartments are being properly ventilated; but it is clear that there was a very serious breakdown at these points, either from neglect or ignorance of the officials, failure of the mechanical appliances, or other disadvantages of unnatural methods of ventilation.

I think that I have advanced sufficient to show that Messrs. Henman, Cooper, and Lea were not at all justified in making their very injurious remark, to the effect that they hoped that "Mr. Bibby may be more accurate in the information he is collecting for his new work on 'The Planning of Hospitals,'" or it will be of no practical value to it is idle to write that my deductions are "obviously unreliable" without the slightest attempt to indicate the alleged error and supply corrections; it would have been better to have given some explanation, or excuse for the failure of the ventilation at the operating rooms, for instance.

From the reply of Messrs. Henman, Cooper, and Lea, it might be supposed that I had remarked adversely on the health of the medical staff of this hospital. I did not, and am not at all surprised to be told that the officials all enjoy good health, inasmuch as the portions of the hospital occupied by them are *not* heated and ventilated on the Plenum system, neither are they compelled to live like the patients in the institution, under glass roofs, and without the cheerful advantage of windows in the walls; staring at blank walls from week to week, or month to month, breathing air at one monotonous temperature, and writhing under the appalling uniformity of the conditions thrust upon them.

I do not know if the doctor connected with the Royal Victoria Hospital, at Belfast, who has complained of the health of his staff, entered the Plenum ventilated wards, is a visiting or a resident official; I had no such sensation myself, but was very glad to leave the wards, for the external air was fresh and wholesome after being for some time in an unnatural atmosphere. GEORGE H. BIRBY.

THE WAR OFFICE AND PATENT RIGHTS.

SIR,—It is to be hoped that among the many improvements the public are being led to anticipate from the recent clean sweep at the War Office something will be done to improve the position of patentees whose inventions the War Office may desire to use—all events, if the treatment a friend of mine received is a fair sample of what a patentee may expect from some Government officials.

Some years ago my friend invented a certain article which he patented, and the patent for which is still being kept in force by him by the payment of Government fees. Of this patented article my friend sold many thousands in the ordinary way of business. During the late war in South Africa some 125,000 of these articles were required by the War Office, and one would naturally expect that the officials would ask the patentee to tender for what was required.

Nothing of the kind. The authorities invited several firms to tender for these goods or a sample of my friend's invention, made and supplied by him in the usual way of trade, and bearing his name, and distinctive patent number punched thereon. Certain officials who were invited to tender directed the attention of the War Office officials to the fact that the articles they were asked to tender for were recognised as patented, but their apprehensions were allayed by official assurances that under the powers of the Secretary of State they were absolutely protected as contractors to the Crown.

As soon as my friend heard what was going

on—which he only did by chance through his own maker having been invited to tender—he pointed out to the War Office the unfairness of these proceedings, but to no purpose. They ignored him altogether, obtained the goods where they thought best, and even refused to give him—the patentee—the option of executing the order at the price at which it was placed elsewhere.

Now, the Patent Act says that it shall have the same effect against the Crown as it has against anyone else, and yet we have here a Government department refusing to recognise the grant by the Crown itself to my friend of certain exclusive rights. How, therefore, does my friend obtain—in the words of the grant—"the whole profit and advantage from time to time accruing by reason of the invention," if he is not even asked to tender for the supply of goods to be made under the patent, while others who have paid no patent fees are permitted to profit at the expense of the patentee, who is denied even the opportunity of accepting or rejecting the order?

The position of the Crown is not on all fours with that of the general public, inasmuch as, unlike that public, it is the grantor of the patent, and, therefore, should not attack its own grant by claiming to do gratuitously what it has forbidden all and sundry to do except on terms.

The War Office stated that it had been advised they need not pay any royalty for the use of my friend's patented invention. Who advised them? My friend has the written opinion of the very highest authority on patent law in the country that his patent is one that could be upheld in a court of law.

A patent must be assumed to be good and valid and the patentee entitled to all its benefits until a court of law decides otherwise, and it ought not to be possible for a Government department and its advisers to constitute itself a court of law and sit in judgment on a grant of patent made by that Crown, of which it is a department. But how can a poor inventor hope to fight against a Government department which has the State purse behind it?

My friend's loss has been a double one; first, he loses the profit someone made on the order, and secondly, as the articles were eventually not wanted owing to the war coming to an end, these articles were sold by the War Office for a mere song, and were at once thrown on the market and come into unfair competition with my friend's goods, as they were purchased at a price which enabled the buyers to undersell him, and a business of thousands has been reduced to one of hundreds.

I trust you will be able to find space for this in your journal, and that it may induce others to bring forward any similar cause of complaint.

SYMPATHISER.

[** The correspondence sent to us with this letter, and the eminent legal opinion referred to, entirely bear out the writer's statement.—Ed.]

The Student's Column.

NOTES ON PORTLAND CEMENT: CHAPTER I.—THE CONSTITUTION OF PORTLAND CEMENT.

WITH increasing demand for Portland cement of improved quality, experimenters on the subject are many, but its constitution still remains very uncertain and variable. The first to make advance in this direction was Le Chatelier, who, in 1887, published a paper on his research. His methods were a microscopical examination of the clinker and set cement and the synthetic preparation of the bodies supposed to exist therein.

Le Chatelier found that cement clinker in microscopical sections appears to be made up of constituents some of which are active and others inactive to polarised light. It seemed impossible to separate them from one another, hence he tried to construct bodies of like physical and chemical behaviour. Tricalcium-aluminate crystallises in cubes, and hence is optically inactive. He found a body analogous to this in the clinker. The chief constituent he found had weak optical activity, with well-defined crystalline form. This he believed to be a silicate of lime with the formula $SiO_2 \cdot 3 CaO$. Another silicate he found had a deep brown colour, optically inactive and more fusible than the preceding two. This he conjectured was an aluminoferrite of lime having the formula $2 (Al Fe)_2 O_3 \cdot 3 CaO$.

He produced such a body with the required properties. It is slowly acted on by water,

but does not contribute much to the setting properties of cement. Assuming that aluminate and silicate of lime were the chief constituents of Portland cement, Le Chatelier prepared these and examined them for their action on water.

Silicates. :

Monocalcium silicate $CaO \cdot SiO_2$ is not acted on by water, and can play no part in hardening of cement if present.

Dicalcium silicate $2 CaO \cdot SiO_2$ is formed by heating proper proportions of lime and silica in a crucible, falls to pieces on cooling, and Le Chatelier believed this spontaneous pulverisation due to change in crystalline form.

Tricalcium silicate $3 CaO \cdot SiO_2$ cannot be prepared by heating CaO and SiO_2 in proportion, a mixture of lime and lower silicates being always obtained.

Le Chatelier says, however, that this trisilicate may be formed by heating lime and fusible silicates, and concluded that it was the chief active compound in cement.

Aluminates.

Monocalcium aluminate $CaO \cdot Al_2O_3$, nearly infusible, sets rapidly with water.

Dicalcium aluminate $2 CaO \cdot Al_2O_3$, fusible, sets quickly with water, falls to pieces on boiling.

Tricalcium aluminate $3 CaO \cdot Al_2O_3$, very fusible, sets quickly, disintegrated on boiling.

Assuming that magnesia can take the place of lime and form similar compounds to the latter, and that iron oxide can replace alumina, Le Chatelier gives the formulæ:—

$$\frac{CaO + MgO}{SiO_2 + Al_2O_3} = \text{not greater than } 3,$$

$$\text{and } \frac{CaO + MgO}{SiO_2 + Al_2O_3 + Fe_2O_3} = \text{not less than } 3.$$

According to Le Chatelier, the reaction which took place when cement was acted on by water and allowed to set was chiefly the formation of hydrate of lime $[Ca(H_2O)_2]$ embedded in a mass of white crystals of hydrated monocalcium silicate ($CaO \cdot SiO_2 \cdot Aqua$) obtained by decomposition of the trisilicate.

The research of Le Chatelier was repeated and extended by Messrs. Newberry, who published their results in 1897. Their aim was to find:—

(1) What proportion of lime must be used for a given percentage of silica and alumina in clay.

(2) Can a general formula be stated applicable to all clays which will indicate the proportion of lime to give the best results with each.

Messrs. Newberry repeated Le Chatelier's experiments of making and examining silicates and aluminates of lime, with the results as shown in table.

two and a half molecules of CaO to one Al_2O_3 , the product is unsound.

The data thus obtained Messrs. Newberry used to determine the amount of lime that may be safely used with a clay of known composition.

The most highly limed silicate that can exist in a good cement having the formula $3 CaO \cdot SiO_2$, and the most basic aluminate being $2 CaO \cdot Al_2O_3$, the most highly limed cement will have the general formula $(3 CaO \cdot SiO_2)_x \cdot (2 CaO \cdot Al_2O_3)_y$. In $3 CaO \cdot SiO_2$, the ratio of lime to silica is 2.8, in $2 CaO \cdot Al_2O_3$, the ratio of lime to alumina is 1.1. Therefore, for 100 parts of clay proper ($SiO_2 \cdot Al_2O_3 \cdot Fe_2O_3$), the maximum lime required will be:—

$$\% SiO_2 \times 2.8 + \% (Al_2O_3 \cdot Fe_2O_3) \times 1.1.$$

These proportions are, however, only safe in practice with the finest grinding of raw material and finished cement. According to Messrs. Newberry, magnesia does not form hydraulic compounds with silica or alumina, and is incapable of replacing lime in cement.

Messrs. Newberry's research is interesting and of great practical value, but it throws very little light on the constitution proper of cement. The conclusion to be drawn from their work is that certain proportions of lime, silica, and alumina react on burning, giving a sound cement, but it does not tell us in what manner these bodies are combined.

In 1899 Rebuffat gave his views on the structural arrangement of the compounds forming Portland cement. These, he says, are composed of a crystalline compound of lime and orthosilicate of calcium, and aluminate of calcium in varying ratios. In opposition to Le Chatelier's conclusions that it is the tricaluminate $3 CaO \cdot Al_2O_3$, Rebuffat believes it to be the monocaluminate.

Along with the orthosilicate of lime compound there is also present in cement high in silica a quantity of $CaO \cdot SiO_2$. According to Rebuffat, the hardening process consists in the hydration of calcium orthosilicate producing a body having the formula $2 (SiO_2 \cdot 2 CaO \cdot Aqua)$, and the lime is set free forming crystalline hydrate. Hydration of the calcium aluminate also takes place. The metasilicate does not hydrate, but combines with the hydrated calcium aluminate, forming double compounds. Rebuffat ascribes the power of highly silicious cement to resist the action of sea-water to these latter compounds.

Zulkowski has drawn attention to a fact which most experimenters have overlooked. In making slag cement it is necessary to quickly chill the molten slag to give it the necessary hydraulic properties. If allowed to cool slowly, such a slag will frequently fall to pieces. The same phenomenon is noticed when over-burned cement clinker is allowed to cool in the air, such change resulting in different

SILICATES.

Formula.	Ratio of Lime to Silica.	Percentage Lime.	Percentage Silica.	Fresh-Water Test.	Deval's Hot Test.
(1) $2 CaO \cdot SiO_2$	1.86	65.11	34.89	Set hard; hard after six weeks.	Sound and hard.
(2) $2\frac{1}{2} CaO \cdot SiO_2$	2.33	79.0	30.0	Set soft; hard after six weeks.	"
(3) $3 CaO \cdot SiO_2$	2.80	73.66	26.32	Same as (2).	"
(4) $3\frac{1}{2} CaO \cdot SiO_2$	3.27	76.53	23.44	Cracked; soft; hard after six weeks.	"

ALUMINATES.

Formula.	Ratio of Lime to Alumina.	Percentage Lime.	Percentage Alumina.	Fresh-Water Test.	Deval's Hot Test.
(1) $2 CaO \cdot Al_2O_3$	1.1	52.33	47.62	Set quickly; hard; sound after six weeks.	Sound; fairly hard.
(2) $2\frac{1}{2} CaO \cdot Al_2O_3$	1.37	57.85	42.15	Set quickly; curved and cracked.	Curved and cracked; soft.
(3) $3 CaO \cdot Al_2O_3$	1.65	62.23	37.77	Same as (2).	Same as (2).

From these results Messrs. Newberry drew the conclusions:—

(1) Lime may be combined with silica in proportion of 3 CaO to 1 SiO_2 , and give a product of practically constant volume and good hardening properties, though hardening slowly. With three and a half molecules of CaO to one SiO_2 , the product is not sound.

(2) Lime may be combined with alumina in the proportion of 2 CaO to 1 Al_2O_3 , giving a product which sets quickly, showing constant volume and good hardening properties. With

properties of a material whose chemical composition remains the same, may be ascribed to dimorphism. Zulkowski says that this dimorphism is shown by the silicate of calcium of the formula $2 CaO \cdot SiO_2$. When two molecules of lime and one of silica are heated together the orthosilicate is first formed, having the structure $Ca < O > Si < O > Ca$. At a higher

temperature this body rearranges itself to form basic calcium metasilicate $O = Si < OCa > O$.

This basic compound is hydraulic. If when in the pasty condition it be quickly cooled the compound remains, but if allowed to cool gradually it changes once more to the orthosilicate, and the strains resulting from this change causes disintegration and the powder so formed has no setting properties. In opposition to Le Chatelier and Newberrys, Zulkowski holds that 3 CaO SiO₂ cannot exist in Portland cement, but that it is mainly composed of dicalcium orthosilicate, basic metasilicate, and free lime.

In support of his theories Zulkowski experimented on a sample of cement, from the analysis of which he assumed the following composition:—

Sodium and potassium silicates	3.43	per cent.
Sulphate of lime	2.45	"
SiO ₂ , 2 CaO	61.89	"
Al ₂ O ₃ , 2 CaO	12.14	"
Fe ₂ O ₃ , 2 CaO	4.95	"
Magnesia	.97	"
Lime	14.22	"

According to Zulkowski, such a cement ought to take up 14.67 per cent. water of hydration. The results actually obtained were 14.44 per cent. in twenty-one days, not increasing after this.

Dr. Loebell considers that Portland cement consists of from 11 to 26.6 per cent. free lime; 14 per cent. CaO SiO₂; 43 per cent. 2 CaO SiO₂; 23 per cent. 2 CaO (Al₂O₃ Fe₂O₃). According to Jex, the hardening of cement is caused by the formation of orthosilicate of lime from metasilicate and free lime. Steur, Wormser, and Spanjer consider that part of the free lime is dissolved in the cement, which accounts for large quantities not being objectionable. Hart and Meyer say they have detected free dissolved lime in cement clinker.

The results obtained from the experiments all indicate that lime is present in excess of that required to form CaO SiO₂. Le Chatelier and Newberrys believe this excess as being in combination as 3 CaO SiO₂. Rebuffat looks on it as forming a loose compound with 2 CaO SiO₂ = 2 CaO SiO₂, n CaO. Zulkowski regards the excess as free lime in variable proportions. In support of this there is also the opinion of Loebell, Steur, Wormser, Spanjer, Hart, and Meyer.

It is the author's opinion that Zulkowski's views are nearest correct, and that essentially Portland cement consists of ortho and meta dicalcium silicates, complex and variable aluminates and ferrites, and free dissolved lime. The free lime proper or that which comes from the coarse grains of chalk in the raw material will vary in a carefully-prepared cement from 1.5 per cent. to 4.5 per cent. in a cement made from coarsely-ground raw material.

Until some reliable method is devised for differentiating between free lime and loosely-combined lime, the constitution of Portland cement will remain uncertain.

METROPOLITAN ASYLUMS BOARD.

The usual fortnightly meeting of the Managers of the Metropolitan Asylum District was held at the offices of the Board, Victoria Embankment, on Saturday last week, Mr. Scovell presiding.

Correspondence was received from the Local Government Board in regard to various works proposed to be carried out at hospitals under the control of the Managers. Among the works sanctioned were the following:—Fire-resisting works to ten temporary wards and the temporary chapel of the North-Western Hospital, at an estimated cost of 4,500l., and alterations at the laundry of the Eastern Hospital, including rearrangement of machinery and plant, at a cost not exceeding 475l. The plans showing the proposed drainage works in connexion with the reconstruction of the South-Eastern Hospital were approved by the Local Government Board subject to the disconnection from the main system of all the drains from the infected blocks.

South-Western and Eastern Hospitals.—On the recommendation of the Finance Committee, it was agreed to apply to the Local Government Board for sanction to incur an additional expenditure of 169l. on the erection of fire-escape staircases at these hospitals. The amount previously sanctioned by the Local Government Board was 1,449l. for the execution of the work at both hospitals.

Loans.—The action of the Finance Committee in applying to the London County Council for loans amounting to 126,280l. was approved. Included in the loans is the esti-

mated cost of the erection of the Southern Hospital, 75,000l.

Leavesden Asylum.—Consideration of a long report of the Asylums Committee on the proposed purchase of additional land for the extension of the sewage disposal works at this asylum was postponed.

High Wood School.—The Children's Committee recommended, and it was agreed, that workshops, etc., should be erected at this school, at a cost of 360l. The matter was referred to the Works Committee.

Northern Hospital.—On the recommendation of the Hospitals Committee the Works Committee were instructed to take the necessary steps for the making good of the roads at this hospital. The Engineer-in-Chief's estimate of the cost of the work is 450l.

Darenth Asylum.—A plan prepared by the Engineer-in-Chief for the rearrangement of accommodation for the principal officers at this asylum was approved and forwarded to the Local Government Board for their sanction. The work is estimated to cost 250l.

Grove Park and Northern Hospitals.—The Works Committee, in their report, stated that they had been requested by the Hospitals Committee to arrange for the installation of mechanical stokers at those hospitals where they are not already in use. In April last the Committee submitted a report in which they pointed out that at the Brook Hospital, where the Meldrum type of mechanical stoker is in use, the result showed a saving of 955l. in the cost of coal consumed during the twelve months in which the stokers had been in use; the initial cost of installation having been only 786l. It was agreed, on the recommendation of the Committee, to accept the tender of Messrs. Meldrum Bros., Ltd., for the installation of four stokers at the Grove Hospital, at the sum of 925l.; four at the Park Hospital, at 935l.; and two at the Northern Hospital, at 415l.

Western Hospital.—A plan prepared by the Engineer-in-Chief for the enlargement of the engineers' and carpenters' shops at this hospital was approved and forwarded to the Local Government Board for their sanction. The estimated cost is 250l.

TRIBUNAL OF APPEAL CASE.

DISPUTE AS TO THE GENERAL BUILDING LINE.—The Tribunal of Appeal under the London Building Act, 1894, sat at the Surveyors' Institution, Great George-street, Westminster, on Tuesday, to hear an appeal by Messrs. Knapp, Fisher, and Sons, on behalf of the Incorporated Hospital and Home for Incurable Children against the certificate of the superintending architect of metropolitan buildings, under sections 22 and 29 of the Act, defining the general line of buildings on the north-east side of Finchley-road, Hampstead, between Netherhall-gardens and Adelaide-road, in which part of Finchley-road he further certified the building site in question to be situated; and further, certifying, under section 29 of the Act, that the said building site is situate in the road or street called Finchley-road, Hampstead.

The members of the Tribunal present were Messrs. J. W. Penfold, A. A. Hudson, and E. A. Grüning.

Mr. Cunningham Glen, barrister, appeared for the appellant, and Mr. Bailhache (instructed by Mr. Andrews, from the solicitors' department of the London County Council) for the respondents; Mr. Courthorn Munro represented the Hampstead Borough Council, and Mr. Skelton watched the proceedings on behalf of owners of houses in College Villas-road.

For the appellant it was submitted that the certificate ought to have been confined to that portion of Hampstead-road between College Villas-road and College Crescent-road; that, taking that portion of the road, the certificate which declared the building line to be more than 50 ft. back from the road was wrong, and ought to be upset; and that the building line was, as a matter of fact, up to the pavement.

On behalf of the London County Council it was contended that there was a well-defined line in the nature of a crescent formed by the houses, College Villas, 3 to 7, and the front of New College, and, therefore, that the superintending architect's certificate was correct.

Some discussion ensued as to whether the parties could not agree on the line to which buildings, proposed to be put up on part of the grounds of North-court adjoining New College, should be erected.

Eventually, it was agreed on behalf of the appellant that he should put a fresh proposition before the County Council for its consideration.

The Tribunal intimated that they had heard only one part of the case, and they were not, at present, in a position to say whether the line

was, in fact, more than 50 ft. back from the road, or whether the alternative might not be that there was no general line at all in that part of the road.

On this, the case was adjourned generally.

OBITUARY.

Mr. J. BOWER.—Mr. James Bower M.Inst.C.E., Borough Engineer of Gateshead, died recently at his residence, 8, Vernon parade. He had held the position of Borough Engineer for thirty-five years. In his earlier life he was associated with the Great Northern Railway, and, after setting out a part of the line near Peterborough, became chief assistant engineer to the Company in 1856. In 1861 he superintended the laying of a line into Liverpool, and was afterwards resident engineer on the line between Grantham and Lincoln. He was, in 1868, an inspecting engineer on the Irish Railway Commission, and afterwards went to Gateshead where his chief work was the designing and laying out of the sewerage scheme of the town.

GENERAL BUILDING NEWS.

CLERGY HOUSE, SMALL HEATH, BIRMINGHAM.—The new clergy house, which has been erected adjoining St. Aidan's Church, Herbert-road, Small Heath, for the accommodation of the clergy engaged in the work of the parish, was formally blessed on the 12th inst. by the Bishop of Worcester. The building is three stories high, and is built of red brick with freestone dressings. Mr. Arthur Dixon is the architect, and the total cost will be about 1,600l.

ST. PETER'S CHURCH, MANEY, SUTTON COLDFIELD.—The foundation-stone of St. Peter's Church, Maney, has just been laid. The new church is being erected to the designs of Messrs. Cossins, Peacock, and Bewlay, by Mr. T. Elvins, of Soho-hill. The site is at the corner of Maney Hill-road. The complete designs provide for a tower at the west end, but for the present the erection of this will be postponed. The nave will consist of five bays, 34 ft. long, but at present only four are to be built. The church will have a total seating capacity of 570, exclusive of choir, but the portion to be now built provides for only 402. The site has been purchased at a cost of 850l., and the building contract amounts to 5,252l. 10s., including all internal fittings, heating, and lighting, but excluding the tower and one bay of nave and aisles. The total cost of that portion of the church now in course of erection, it is estimated, will reach 6,500l.

EXTENSION OF THE PUBLIC LIBRARY, STOKES NEWINGTON.—The reopening of the Stokes Newington Public Library, after having undergone alterations and additions, took place recently. In the extended building, the public rooms are on the main floor, and comprise the reading-room, having an area of 2,352 ft.; reference library, with an area of 1,460 ft.; lending library (including borrowers' lobby), 2,500 ft.; children's library (with separate entrance), 850 ft.; lecture hall (exclusive of platform and retiring-rooms), 1,800 ft.; the directory lobby, and also librarians' office. The committee-room and staff-room are on the first floor. The work was carried out from the plans of Mr. S. G. Goss, architect.

PRIMITIVE METHODIST CHURCH, MORPETH.—The memorial stones of the new Primitive Methodist church, which is being erected in Howard-terrace, Morpeth, were laid a short time ago. The new church will be built on a site of about 900 sq. yds. The formation of the ground being below the street level advantage has been taken to obtain a school room to seat 250 on the lower floor, which is practically level with the surface of ground. The church will be approached from the street by a flight of steps, and at the entrance to the church there is a lobby with double swing doors. The church will have accommodation for 350 persons. At the rear will be minister's and stewards' vestries, connected with the school by a separate flight of stairs. The frontage to Howard-terrace is to be built of rock-faced blockers, and the sides and back with roughly-scraped rubble, sneek-walced. The interior woodwork for seats, rostrum, dado cladding, etc., is to be carried out in pitch-pine and the remainder in selected redwood. The heating is to be by hot water on the low-pressure system, with radiators placed at the entrances and other portions of the building where extra warmth is required. The foul air will be extracted by galvanised sheet-iron tubes fixed in openings above the ceiling, and carried off by an automatic rock-wood fixed on the ridge. Fresh air will be admitted through Tobin's tubes fixed in the exterior walls, assisted by hoppers

ventilators in the windows. The premises are designed in the Perpendicular style, and the architect for the building is Mr. F. Walton Taylor, of Newcastle, whose designs were selected in competition. The architects are Mr. Thos. A. Turnbull, of Rowlands Hill, the following firms being responsible for the sub-contracts.—Mr. John Hewitson, later; Mr. E. Byles, plumber; and Messrs. Jackson Bros., painters and glaziers.

NEW WESLEYAN CHAPEL, LOW MOOR, YORKSHIRE.—The memorial stones of a new Wesleyan Methodist chapel, which is being erected at Low Moor, near Bradford, were laid recently. The building has been designed by Messrs. W. J. Morley and Son, architects, of Bradford, with a tower rising to a height of 30 ft., and surmounted by an octagonal dome. The structure will consist of nave, transepts, choir-stalls, and communion table. Accommodation will be provided for 776 worshippers, 439 of the seats being on the ground floor, and 304 in the gallery, which occupies three sides of the chapel. The choir seats are placed in front of the organ, and are raised above the rostrum. There are vestries for the minister and choir, and two class-rooms. The gallery is reached by four staircases. The vestibule will be tiled with marble mosaic. The woodwork of the interior will be pitch-pine, and the ceiling of fibrous plaster with ornamental panelled work, and the windows will be filled with tinted ornamental leaded lights. Alterations and additions to the school premises have also been undertaken, and these include an infants' room and four new class-rooms, three of which may be thrown into the large school-room on the first floor. A communicating corridor is to be made between the chapel and the school on both floors. The various contracts have been let for £3,925.

SCHOOL BUILDINGS AT BRENTFORD.—The Middlesex County Council on Thursday of last week appointed Mr. Nowell Parr architect for a proposed manual training and cookery centre at the Ealing-road Council School, Brentford, and for the erection of two additional class-rooms, each to accommodate sixty children.

THE JEWS' FREE SCHOOL, SPITALFIELDS.—The Jews' Free School, Bell-lane, Spitalfields, founded on modest lines originally in 1817, has gradually risen till it forms certainly the largest public elementary school in the Kingdom, and probably in the whole world. No fee is admitted, but the accommodation is 2,200 boys, and 1,300 girls, requiring a staff, formed of the headmaster, vice-master, head-mistress, vice-mistress, seventy-five certificated teachers, nineteen pupil teachers and probationers, three assistant teachers for needle-work, and special instructors for Hebrew, science and art, drawing, military drill, gymnastics, instrumental music and cookery. Teachers' salaries alone absorb 12,144. The design for the present building was abandoned because two portions of the school are of comparatively recent date, and the scheme could not be carried out without the whole of the children being removed during the rebuilding. The present scheme, therefore, follows very much the lines of the existing buildings, giving greater space, more suitable sizes for class-rooms, more convenience generally, and an additional wing on the southern side. It will thus be seen that from the architectural point of view, the peculiarity is that two-thirds of the school will be entirely rebuilt without the education being interrupted for a day. The contractor is Mr. J. Carmichael; the clerk of works, Mr. Murrell; and the architect, Mr. Robson. Surrounded as the building is by warehouses or other high buildings, there is little attempt at architectural display. The treatment is of red brick, with stone-coloured terra-cotta for dressings; tall-glazed bricks are used for dados, and white glazed bricks very extensively in the staircases, latrines, and covered playgrounds. Practically the whole building is raised in the air so as to give the greatest possible playground space. The foundation-stone was laid by Lord Rothschild on Wednesday last.

SUNDAY SCHOOL, STEETON, YORKSHIRE.—On the 20th ult. the memorial stones were laid of the new Primitive Methodist Sunday school, at Steeton. The school is being built to the plans of Messrs. Moore and Crabtree, architects, Keighley, and will include an assembly-room, capable of holding 230 scholars, and also class-room accommodation. The estimated cost is 650*l*.

NEW CHURCH ROOMS, LLANBRADACH, WALES.—The opening of All Saints' rooms at Llanbradach, took place recently. The new building consists of a hall providing accommodation for 500 people on the ground floor, with a concert hall on the upper floor. Mr. E. M. Bruce Vaughan, of Cardiff, was the architect for the work.

NEW THEATRES IN LONDON.—The directors of the Palace Theatre, in Cambridge-circus, have secured a site in Tottenham Court-road for the erection of a new theatre and music-hall to accommodate an audience of about 4,000 persons. The ground lies at the corner of Great Russell-street, and the plans and designs will be prepared by Mr. W. G. R. Sprague.—For the new Jewish theatre in the East End of the town, Mr. Bertie Crewe has been appointed architect, and building operations will be begun in August next by Mr. A. Davis, who is also chairman of the company of promoters. The site is in Commercial-road, at the corner of Myrtle-street, and the theatre—to be called the Orient—is intended for the performance of dramas in the Yiddish tongue. The house will contain room for 2,000 persons, and the cost is estimated at 45,000*l*.

TOWN HALL, JARROW.—The new Municipal buildings and county court, at Jarrow, have just been opened. The premises occupy a central site in Grange-road and Wylam-street, and where the small Corporation offices formerly stood. The principal entrance is in Grange-road, and through an oak-panelled vestibule, in which the foundation-stone is exposed, the main hall and staircase are reached. The latter is of marble, with oak paneling and pilasters, and a central corridor on both ground and first floors traverses the entire building. There are terrazzo floors, and the walls have enamelled tiled dados. The Council chamber and committee-rooms are on the first floor front, and adjacent are the Mayor's parlour and the councillors' cloak-room. At the west end of the chamber is the Mayor's dais; the councillors' seats are arranged in horse-shoe form, and in the centre is accommodation for the town clerk and officials. The fittings of the chamber are in fumed oak and red morocco. At the opposite end to the mayoral dais is a gallery for the public. The fittings of the chamber are at present filled with leaded glass. The Corporation officials are all housed on the ground floor. The county court is on the first floor, and is reached by a separate entrance and staircase in Wylam-street. The Registrar's offices are on the ground floor, and of easy access to the public. In round figures the cost of erecting the structure was 10,000*l*., and the furnishings amounted to 2,000*l*.. Mr. J. C. Nichol, of South Shields, was the contractor, and the whole of the work has been carried out from designs prepared by Mr. Fred Renoldson, architect, of South Shields. Mr. Jas. Grieve was clerk of works. Messrs. Dinning and Cooke, Newcastle, supplied the heating apparatus; Messrs. Emley and Sons, the marble and mosaic decoration; Messrs. Brown and Hughes, the wood mantelpieces; Mr. W. Scott, the telephones; Mr. W. Cowper, the office fittings; Messrs. Gillow and Co., Lancaster, the Council chamber furniture; and the painting and decorating was done by Mr. John Dixon.

LAMBETH TOWN HALL.—The Borough Council of Lambeth has rejected a recommendation by the General Purposes Committee that they should visit provincial town halls so that they might, when drawing up the specification and list of requirements, be in possession of the latest arrangements for such buildings. The loan of 25,025*l*. for the purchase of the site has been completed with the Prudential Assurance Company.

MUNICIPAL BUILDINGS, BOSTON.—The municipal buildings, which have been erected in West-street, Boston, have been opened by the Mayor (Alderman Joseph Cooke). On the ground floor are the rooms and offices of the town clerk, medical officer, sanitary inspector, and rate collectors. On the same floor, but reached by another entrance, are the police offices, the fire station, and police court and magistrates' room. The library and public reading-room and the School of Art are on the first floor. The steps of the staircase leading up are of artificial stone. The staircases are daisied with old gold tiles. They have windows of stained glass, displaying the triple crowns and ram on a woolpack. The supporting arches on the ground and first floor have enriched architraves, with impost mouldings to the piers. The public library is about 50 ft. square, lighted by eight windows overlooking West-street, whilst at the back there is another window. The School of Art comprises three rooms. The first and largest one is lighted by six windows. The second apartment is the painting-room, and further on is the art master's private room. Altogether the School of Art is 56 ft. by 20 ft. The residence of the Chief Constable is on this floor, over the police offices and cells. Entrance to the residence is obtained by a private staircase from the west end of the buildings. The dining-room is 20 ft. by 14 ft., drawing-room, 14 ft. by 16 ft. There is a kitchen, 14 ft.

square, scullery, and other offices. The Council Chamber occupies the south-east angle of the buildings. The dimensions of the room are 35 ft. by 25 ft. There are seven stained and painted windows. Adjoining the Council Chamber is the committee-room, and here are also councillors' cloakroom, lavatory, and other offices. The total cost of the building is about 20,000*l*. The architect was Mr. James Rowell, and the contractors were Messrs. S. Sherwin and Son, Boston.

IMPROVEMENTS TO THE WORKHOUSE AND INFIRMARY, CROYDON.—At a recent meeting of the Croydon Board of Guardians, the report of the Special Committee, appointed by the Board to consider the subject of additional accommodation required at the workhouse and infirmary, was submitted. The report recommends that Mr. J. Hatchard Smith, architect, be instructed to prepare an amended design, and the present estimated cost of 6,627*l*. to be modified. The report was adopted.

BLACKHEATH AND CHARLTON COTTAGE HOSPITAL.—The opening of the new wing erected for the benefit of the out-patients of the Blackheath and Charlton Cottage Hospital, in Shooters' Hill-road, took place recently. The new building, which consists of a waiting-room for the patients, two consulting-rooms, a dressing-room, and a dispensary, has been erected at a cost of over 1,000*l*. from plans prepared by Mr. E. R. Robson, architect, of Blackheath, the contractors being Messrs. Garrett and Co.

TUNBRIDGE WELLS HOSPITAL.—A bazaar has just been held in aid of the building fund for the new wings by which Tunbridge Wells General Hospital has been extended. The new wings, of red brick, with white stone facings, are situated partly in Grosvenor-road, and round the corner a considerable distance along Goods Station-road. From the old General Hospital, close by, the premises are semi-detached. The estimated total cost of the extension is 22,000*l*. Mr. Percy Adams is the architect, and Messrs. Jarvis and Son, of Tunbridge Wells, the builders. The main entrance to the hospital will still be in the Grosvenor-road, nearly opposite St. Augustine's Roman Catholic Church. The male ward holds twenty-four beds, and over this is the female ward of the same size, while there are corridors 30 ft. long. The wards are 100 ft. long by 27 ft. wide, and there are twelve windows on either side, with a verandah on the Goods Station-road side. The floors, covered with linoleum, are concrete. The bath-rooms and lavatories at the end of the wards have glazed walls and terrazzo paving. There is a special ward for convalescents. The staircases are fireproof, and there are single bed wards on both floors. The operating theatre is on the ground floor, and there are large waiting-rooms. The out-patients' department is entered from Goods Station-road, where close by is the house surgeon's consulting-room, beyond the porter's lodge. The large waiting-room is 44 ft. by 26 ft., and on either side are consulting and examination rooms, further on being the large dispensary section. There is also a children's ward, 44 ft. long by 26 ft. wide, and above is the isolation ward. There are also other rooms and offices for the Secretary, Governors, etc., and a casualty-room beyond the courtyard and gardens, the entrance to which is on the Goods Station-road side. The hospital will be heated with hot-water pipes, and lighted with electricity throughout.

FIRE STATION, MILE END.—Mr. Edward Smith, Chairman of the Fire Brigade Committee of the London County Council, laid the memorial stone recently of a new fire station, in course of erection, in Burdett-road. The station, which is being built by the Works Department of the Council, and the estimated cost of which is 7,674*l*., was commenced in February last. It will supersede the street station in Baggally-street, and consist of an appliance-room, 13 ft. wide at front, with an average depth of 40 ft., a watch-room, 14 ft. by 9 ft. 6 in., a stable, a recreation-room, 24 ft. by 19 ft. 4 in., and store. In the upper rooms will be accommodation for six married men and their families, and the basement will contain a laundry, stokers, workshop, stores, etc. The station is being erected under the supervision of Mr. W. E. Riley, the Council's superintendent architect.

ROYAL VICTORIA HOSPITAL, DUNDEE.—At a meeting of the Works Committee of the Dundee Royal Victoria Hospital held recently, the meeting considered the propriety of extending the buildings, and plans, by which the required accommodation would be provided, were submitted by Mr. James Finlay, architect, at an estimated cost of 6,000*l*. The architect was instructed to proceed with the introduction of an electric fan for the thorough ventilation of the present cancer ward.

STAINED GLASS AND DECORATION.

MEMORIAL WINDOW, PETERBOROUGH CATHEDRAL.—A painted glass window, erected to the memory of Canon Twells, was unveiled on Saturday last in Peterborough Cathedral. It is intended to record his characteristics as a preacher, and a writer of well-known hymns. For the latter purpose David is taken as a typical personage; for the former, St. John the Baptist and St. Paul. Each of these saints, as represented in the window, is accompanied by subjects (pictures) illustrating events in his life. Thus, under King David is his playing and singing before Saul and Christ. Under St. John the Baptist is the Baptism of our Lord and the Visitation to St. Elizabeth. Beneath St. Paul is his preaching at Athens and the miracle at Miletus. In the tracery are the four Doctors of the Church—emblems of Christian teaching. The whole window is designed in the style of the architectural stonework. The inscription is engraved on a brass plate. The work was designed and executed by Messrs. Lavers and Westlake, of London.

APPOINTMENTS.

KING'S COLLEGE.—Mr. Arthur Stratton, A.R.I.B.A., has been appointed Lecturer in the Architectural Division of King's College, London, in succession to Mr. C. H. Reilly, who now occupies the Chair of Architecture in the Liverpool University. Mr. Ronald P. Jones, M.A., has been appointed Assistant Lecturer with Mr. Stratton at King's College. The Department, which was formerly included in the Faculty of Science, has recently been reorganised and transferred to the Faculty of Arts.

RIPON.—At a special meeting of the Ripon City Council on the 27th ult. Mr. William Mitchell, of Longridge, was appointed City Surveyor and Sanitary Inspector. Mr. Mitchell has, for six years, been City Surveyor and Sanitary Inspector at Longridge. There were 130 applicants for the post, six of whom had been selected to appear before the Council—viz., Messrs. D. Hinchcliffe, Northallerton; W. Mitchell, Longridge; T. Collins, Bishop Auckland; J. F. Day, Kettering; J. R. Lupton, Lancaster; and J. W. Constantine, Rochdale.

BODMIN.—Bodmin Town Council received eighteen applications for the combined appointments of Borough Surveyor and Inspector of Nuisances. Mr. Buscombe was elected by nine votes to Mr. R. Crosbie's four.

SANITARY AND ENGINEERING NEWS.

Huddersfield Sewerage Disposal.—At the Huddersfield Town Hall, on the 23rd ult., Mr. H. P. Bulnois and Mr. H. T. Bulstrode, Inspectors of the Local Government Board, inquired into an application made by the Corporation for sanction to borrow 135,000*l.* in connexion with proposed additional works of sewerage disposal. Among those present were the Town Clerk (Mr. J. H. Field), and Mr. K. F. Campbell (the Borough Engineer, who has prepared the scheme). The Town Clerk said that the present sewerage works at Deighton, begun in 1839 and finished in 1853, cost 101,000*l.*, and of this amount about 5,000*l.* had been repaid. About fifty-six acres of land on the south side of the river Colne had been purchased for this scheme. Mr. K. F. Campbell stated that, shortly after completion, the existing works, having filtration tanks with a total capacity of 1,250,000 gallons, were found altogether inadequate to deal with the total flow of sewage. The small results arising from chemical precipitation by ferrous and filtration through polarite led to a thorough investigation of the sewerage disposal question in relation to the particular conditions prevailing at Huddersfield. Owing to the billy nature of the district, and the fact that suitable land could not be obtained for the purposes of the Corporation, artificial filtration was the only method that could be adopted. The scheme provides for the purification of the sewage by sedimentation and distribution over filtering areas. The area of the borough is 11,854 acres, and the population about 100,000. The drainage of the whole borough, excepting the small district of Outlane, will be dealt with at the existing and proposed works. On the average the volume of sewage is estimated at 7,500,000 gallons, or seventy-five gallons per head; the dry weather flow, 5,500,000 gallons, or fifty-five gallons per head. This excessive flow arises from the admission of trade waste from 104 factories. The area of the land of the existing works is 64 acres, and there are about 28 acres available for further extension. The tank effluent will be conveyed from the septic tanks at Deighton to beds at Cooper Bridge by means of a culvert a mile and one-eighth long, with a maximum carrying capacity of

44,000,000 gallons a day. Here there will be sixteen circular trickling beds, constructed upon a layer of concrete or asphalt, with a total area of 115 acres, and an average depth of 7 ft. Electrically-driven distributors will convey the sewage on to the trickling beds evenly in all conditions of weather, and the flow can be regulated from three-quarters to one and a quarter million gallons per acre. The distributing apparatus will be controlled automatically from a main building. Sufficient land will remain for other beds to deal with 4,000,000 gallons of sewage, and 26 acres to utilise for under drainage in case of flood. By the suggested method, and abandoning chemical precipitation, a saving of 1,800*l.* per annum will be effected, and, in addition, several annual charges. A new sewer in connexion with this scheme will, it is estimated, at current prices, cost 11,763*l.*, new precipitation tanks, 10,673*l.*, storm beds, 10,319*l.*, filter beds, effluent channels, distributors, and outfall sewer, 52,114*l.*, land, including minerals, surveyors' and law expenses, 20,500*l.*, making, with several four-figure items, 135,000*l.*

SEWAGE WORKS, DRIGHLINGTON, YORKSHIRE.—The new sewage works at Drighlington were opened on the 23rd ult. The construction of the main outfall sewer, and of the works at the sewage disposal field, etc., is being carried out by Messrs. Ward and Teley, of Bradford, and the contract for the sewerage of the higher districts is in the hands of Messrs. Greaves and Wheaton, of Calverley. The whole works have been designed by Messrs. John Waugh and Sons, engineers, of Bradford, and Mr. G. B. Waugh has superintended the construction as works engineer, assisted by Mr. H. S. Rusforth.

NEW WATERWORKS, STREET, SOMERSET.—The new waterworks, which have been erected at Street, were recently completed and opened. Messrs. Wright and Son, of Taunton, were the contractors for the whole work, with the exception of the high-level reservoir, which was carried out by Mr. F. Huish, Street. Mr. A. P. I. Cotterell, M.Inst.C.E., was the engineer of the scheme, and the cost was 26,000*l.*

FOREIGN.

GERMANY.—Herr Hans Griesbach, architect, died at Berlin on May 11th.—A new theatre is to be built at Berlin, from the plans of Herr Hentschel.—MM. Fellner and Helmer have undertaken the reconstruction of the theatre at Bielitz. A new church is to be built at Königshütte, from the plans of Professor Schmitz.—A new bridge is to be built near Munich, consisting of two arches, each 70 metres wide.—The asylum at Bremen by Messrs. Weber, Ohnesorge, and Wagner has been completed.—The Evangelical Institution, for the training of nurses at Lichterfelde, near Berlin, is completed; the building was designed by Herr Kleine.

AUSTRIA.—The architect, Herr Hermann Wehrenfennig, died at Vienna on May 23, in his fifty-third year.—A new Infantry Cadet School is to be built at Enns.—A fountain is in course of construction at Innsbruck, designed by the sculptor, Herr Baumgarten.

SWITZERLAND.—The Society of Swiss Artists, Sculptors, and Architects held its annual general meeting, on June 12, at Neuenburg, when Herr Gustav Jeanneret took the chair. Herr Max Girardet, of Bern, was elected secretary to the National Exhibition of Arts at Lausanne, and expressed the hope that the Swiss people would support the Society in its efforts to preserve the characteristic features of their national art.

THE RAPID TRANSIT SUBWAY, NEW YORK.—Although the promise made that the New York subway would be open for traffic on January 1 this year has not been fulfilled, it seems likely that the works will be completed in the course of two or three months. In Manhattan Island all the tracks and electric cables are laid, the greater part of the signalling plant has been installed, and many of the passenger stations are quite ready for use. The contractors are making strenuous efforts to complete the equipment of the power-house, of which the building measures 690 ft. by 200 ft., and the maximum capacity of the engines will be 132,000 h.p. This will be the largest power-station in the world, and the complete subway system will be an inestimable boon to the inhabitants and trading classes of New York.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—The title of the "Non-Flammable Wood and Fabrics Company, Ltd.," of Townmead-road, Fulham, has been changed to "The Fire-Resisting Corporation, Ltd."

METROPOLITAN WATER BOARD.—The ordinary meeting of the Metropolitan Water Board was held at the offices of the Metropolitan

Asylums Board on the 24th ult. under the chairmanship of Mr. B. M. Bouchard. The chairman drew the attention of the Board to the fact that that was the appointed day under the Act, that, with one exception, the water undertakings had that day been vested in the Board, and that they had assumed the responsibility for supplying six and a quarter millions of people with water. The exception was that of the New River Company, who had applied to the Local Government Board for a postponement. The Local Government Board had, on consideration of the application, and in view of the appeal now pending in the House of Lords, postponed the vesting in the New River case until July 25.—The Works Committee reported that they had received thirty-seven applications for the position of chief engineer to the Board, at a salary of 2,500*l.* a year, and they selected three candidates for submission to the Board—namely, Mr. William B. Bryan, Chief Engineer to the East London Water Works Company; Mr. Ernest Collins, the Distributing Engineer of the New River Company; and Mr. E. E. Tuttle, Chief Engineer of West Middlesex Water Works Company. The committee recommended that Mr. W. B. Bryan be appointed at a salary of 2,500*l.*, and that he should also receive, while in the Board's employ, in addition to his salary, such further sum in lieu of pension during the term of his service with the Board as would, with the 2,500*l.*, make an annual sum payable of not less than 3,750*l.* It appeared that under his old appointment Mr. Bryan had been allowed to engage in private practice, but this he proposed to wind up at the end of the year, and only to retain a consulting engineership to the City of Nottingham during the construction of an undertaking there. Ultimately, Mr. Bryan was appointed on a division by thirty-three votes to fourteen, an amendment to give the appointment to Mr. Collins having been defeated.

THE SURVEYORS' INSTITUTION: SPECIAL CERTIFICATE EXAMINATION.—The following candidates have passed the recent Special Certificate Examinations, now held triennially, in Forestry:—Forsyth, T. Maw, F. H. G. Osmond, Smith, Henry Pritchard, J. Ashton Sawyer, J. Clulow Thompson, Martin L. Wheldon. The first "Daniel Watney" Prize, to the value of 10*l.*, was awarded to Henry Pritchard, and the second "Daniel Watney" Prize, value 5*l.*, to J. Ashton Sawyer. The examiners on this occasion were Mr. Daniel Watney, Dr. W. Somerville, Mr. G. Marshall, and Professor C. E. Curtis. The following have passed the Special Certificate Examination in Sanitary Science:—Hubert C. Sands, Henry P. Ward. The examiners were Professor H. Robinson, Mr. H. P. Boulnois, Mr. C. John Mann, and Mr. R. C. Gleib.

DISBURSEMENT BY ADVERTISEMENTS.—In addition to the Metropolitan Borough Councils which have already been reported in the *Builder* as having taken action upon the circular-letter from the Royal Institute of British Architects on the abuse of buildings by advertisement hoardings, the following have considered the matter:—Lambeth Borough Council are of opinion that it would be well if local authorities had some power to deal with the nature and extent of advertisements which are now exhibited in increasing size and number, and have adopted this motion:—"That the London County Council be requested to include in a General Powers Bill a clause giving the Metropolitan Borough Councils power to deal with poster advertisements." Greenwich Borough Council have agreed:—"That the London County Council be asked to take such steps as may be proper for obtaining Parliamentary powers in the direction indicated by the Institute." Southwark Borough Council passed the following motion:—"That representation be made to the London County Council to embody a clause in their next General Powers Bill to give effect to the suggestion that the public authorities should have power to regulate the display of advertisements contained in the letter from the Royal Institute of British Architects." Marylebone Borough Council, while sympathising with the views of the Institute, are not at present prepared to take any action. The Metropolitan Borough Council considered that the matter is one more for the London County Council to deal with. Hammersmith Borough Council has decided to take no action, and Shoreditch Borough Council has, upon the recommendation of the committee to which the letter was referred, simply marked the communication "Received."

PROFESSORSHIP.—Mr. Charles Waldstein, Litt.D., Fellow of King's College, Cambridge, has been appointed to succeed Sir W. Martin Conway as Slade Professor of Fine Art. Dr. Waldstein, who occupied the chair during the previous periods of three years in 1895-1901, is University Reader in Classical Archaeology. He is a native of New York.

and a prominent member of the American Archaeological School at Athens; he has carried out excavations on the site of the ancient Plataea, together with other important work in connexion with that school.

THE SANITARY INSTITUTE CONGRESS.—The Sanitary Institute preliminary programme of the Twenty-second Congress, to be held in Glasgow, from July 25 to 30, has now been issued. The President of the Congress is the Right. Hon. Lord Blythswood, Lord Lieutenant of Renfrewshire. Sir Richard Douglas Powell will deliver the lecture to the Congress on "The Prevention of Consumption." Excursions to places of interest in connexion with Sanitation, Conversation, afternoon and evening cruises, and other entertainments will be arranged for those attending the Congress. Two hundred and fifty authorities, including several County Councils and County Boroughs, have already appointed delegates to the Congress, and as there are also over 3,300 members and associates in the Institute, there will probably be a large attendance, in addition to the local members of the Congress. In connexion with the Congress, a Health Exhibition of Apparatus and Appliances, relating to health and domestic use, will be held as a practical illustration of the application and carrying out of the principles and methods discussed at the meetings. Among the popular lectures to be given in the exhibition will be one on "Healthy Houses," by Professor H. R. Kenwood, M.D. The Congress will include three Section meetings for two days each, dealing with (1) Sanitary Science and Preventive Medicine, presided over by Professor J. Glaister; (2) Engineering and Architecture, presided over by Professor Henry Robinson; (3) Physics, Chemistry, and Biology, presided over by Professor Frank Clowes. Among the subjects to be brought forward for discussion are included:—"Domestic Sanitary Engineering in West of Scotland"; "Planning and Construction of Parochial Institutions"; "Ventilation"; "The Construction of Hospitals"; "Sanitary Fittings"; "The Construction of House Drains"; "Purification of Trade Effluents"; "Sewage Disposal"; "Standards of Purity for Sewage Effluents"; "The Abatement of the Smoke Nuisance"; "The Municipality and the Housing of the Poor"; "The Municipality and the Plumber"; "Sanitary Local Authorities and Administration of Public Health"; "Trade Diseases and their Prevention"; "The Conditions of Home Work in Various Trades"; "Ventilation in Factories and Workshops"; "The Mortality of Occupations"; "Certification of Houses by Sanitary Authorities"; "Pig Styes"; "Road Maintenance"; "Amendment and Consolidation of the Public Health Acts"; "Rural Inspection"; "School Hygiene and Ventilation," etc., etc.

STEVENSON MEMORIAL, EDINBURGH.—The memorial tablet, erected in St. Giles' Cathedral, Edinburgh, to the memory of Robert Louis Stevenson, was unveiled on the 27th ult. by Lord Rosebery. The tablet, which is the work of Mr. Augustus Saint-Gaudens, an American sculptor, has been placed on the west wall of the Moray aisle.

EGYPT EXPLORATION FUND.—The latest set of antiquities found at Deir el Bahri and Ebnasya, together with the Papyri and antiquities found at Oxyrhynchus, will be on view at University College, Gower-street, from July 4 to 30.

Legal.

THE LONDON COUNTY COUNCIL AND THE TRIBUNAL OF APPEAL.

THE case of *in re* the London Building Act, 1894, and in the matter of the London County Council, came before a Divisional Court of King's Bench, composed of Justices Wills and Kennedy, on June 23, on a special case stated by the Tribunal of Appeal at the instance of the London County Council.

Mr. Bailhache appeared for the appellants (the London County Council), and Mr. Bartley Dennis for the respondent, Mr. Robert Roy.

In the temporary absence of Mr. Bailhache, Mr. Dennis stated that this was an appeal by the London County Council against a decision of a new body, called the Tribunal of Appeal, under the London Building Act. It was the first case which had ever been brought in this court on this matter. The learned counsel said he might tell the court how the Tribunal of Appeal came to be constituted. Under the Act of 1855 there was no building line fixed by anybody in London, but if, in the opinion of anybody, a man built a house beyond the general building line, it was a question for a jury. Then, under the Metropolitan Management Act, 1862, an official appointed, called the superintending architect, and it

gave him power to fix the building line, and the House of Lords held that his decision was absolutely final and binding on everybody. This was considered very hard lines, as the superintending architect was the official of the London County Council, and if that body wanted to widen streets it could bring pressure to bear on him. Now the appellate Tribunal was an independent body, one member being nominated by the Board of Trade, one by the Institute of British Architects, and one by the Surveyors' Institution, and these gentlemen sat on appeal on the line fixed by the superintending architect. In the present case the superintending architect fixed a certain building line, and his client, being dissatisfied, appealed from his decision to the Tribunal of Appeal, and that body varied the line, and the County Council, not being satisfied, now appealed on two points of law.

At this stage Mr. Bailhache came into court, and read the special case, which stated that, on September 5, 1903, Mr. Chas. Botterill, as agent for Robert Roy, the owner of houses, Nos. 689 to 697, Fulham-road, inclusive, desiring to build upon a building site partly occupied by these houses, by notice in writing of that date, applied to the superintending architect of Metropolitan buildings, under section 22 of the London Building Act, 1894, to define the general line of buildings in respect of the land occupied by the said houses. The superintending architect gave notice to all persons mentioned in section 24 of the Act, and, having heard all the persons who attended before him, issued his certificate on October 3, 1903, with the plan annexed. From such plan it appeared that he did not confine himself to defining the general line of buildings in respect of the land occupied by the said houses, but, by his certificate, he defined the general line of buildings on the southern side of Fulham-road, between Munster-road and Landridge-road. Mr. Chas. Botterill appealed from the said certificate to the Tribunal of Appeal, and the Tribunal of Appeal on November 10, 1903, having viewed the building site in question, and the locality, and having heard all the parties referred to in the order of the Tribunal of Appeal, issued their order, dated November 10, 1903.

Paragraph 5 of the special case stated that Fulham-road was a public highway, the buildings, Nos. 907 to 921, Fulham-road, inclusive, being built up to the highway. The shops shown on the plan in the Fulham-road, between the corner of Munster-road and No. 651, Fulham-road, were, at the time the Tribunal of Appeal made their order, built to an advanced line on the site formerly occupied by No. 47, Munster-road, with the consent of the London County Council, dated March 24, 1903, and subject to the conditions of such consent. The case further stated that the County Council contended that the Tribunal of Appeal had no power to make their order on the following grounds:—

(a) The line so defined, both from Landridge-road to the point marked *b*, on the plan marked "B," purported to define the general line of buildings for a portion of Fulham-road, in respect whereof the superintending architect had not defined any general line of buildings.

(b) The line defined by the Tribunal of Appeal which varied the said certificate of the superintending architect, as appeared by the plan marked "B" was not a general line of buildings within the meaning of the London Building Act, 1894.

The case further stated that the Council also contended that there was no power in the Tribunal of Appeal to order (in the absence of consent) a lump sum for costs. Appended is the full text of the award of the Tribunal of Appeal (Messrs. Penfold, Hudson and Gruning):—

"Whereas, on the 5th day of October, 1903, the superintending architect of Metropolitan buildings made his certificate under the provisions of section 22 of the London Building Act, 1894, by which he certified that the main fronts of the buildings, tinted pink on the plan annexed to his certificate, and signed by him, form the general line of buildings on the southern side of Fulham-road, Fulham, between Munster and Landridge-roads, in which part of Fulham he further certified the building site in question, coloured blue on the said plan, thereto annexed, to be situate, and by which he further certified, in pursuance of the provisions of the 25th section of the said Act, that the said building site in question is situate in the road or street called Fulham-road, Fulham, and that such building site is also situate in the road or street called Landridge-road, as shown on the said plan, and whereas it appears to us, the above-named members of the Tribunal, that notice of the certificate, dated October 3, 1903, was duly given to all persons to whom, by the 24th section of the aforesaid Act, it is directed to be given. And whereas Mr.

Robert Roy, being the owner of the building site in reference to which the general line of buildings has been certified, deeming himself aggrieved by the said certificate, has appealed to us (by his agent, Mr. Chas. Botterill) as the Tribunal to which the said appeal is referred under the 25th section of the aforesaid Act. And whereas the said Mr. Robert Roy appeared before us by his agent on November 10, 1903, to prosecute the appeal. Now, we therefore, the said Tribunal, having viewed the building site in question, and the locality, and considered the said certificate, and having duly heard Mr. Chas. Botterill, surveyor, on behalf of the appellant, Mr. D. P. Andrews (of the Solicitors' Department of the London County Council), in support of the certificate of the superintending architect of Metropolitan buildings, Mr. R. M. Prescott, Town Clerk, on behalf of the Metropolitan Borough of Fulham, and all other persons interested who, deeming themselves aggrieved, have desired to be heard on the said appeal, and having also heard and considered the evidence adduced before us, do make and publish our decision herein as follows:—We do hereby allow the appeal and vary the certificate of the superintending architect of Metropolitan buildings, dated October 3, 1903, and decide and determine that the general line of buildings on the southern side of Fulham-road, Fulham, between the point marked *a* and the point marked *b* on the plan annexed to this order, is as defined on such plan by a strong green line. And, further, we order and direct that the respondents pay the sum of 10*l.* 10*s.* to the appellant as the costs of his appeal. In witness whereof the seal of the Tribunal is hereto affixed, in accordance with the resolution of the Tribunal of the 10th day of November, 1903. (Signed) J. W. Penfold, Chairman of the Tribunal, Chas. H. Love, Clerk of the Tribunal."

Mr. Bailhache said that their lordships would see that the superintending architect had himself only fixed the general line of buildings between Munster-road and Landridge-road, in which part of the Fulham-road he certified the building site in question to be situate. The Tribunal of Appeal had fixed a line for a much longer distance along the Fulham-road, extending considerably further to the right. He must satisfy their lordships that the Tribunal had gone wrong in point of law. It was no good for him to suggest that they had gone wrong on a question of fact. The general effect of sections 22 and 24 of the Act of 1894 was that the superintending architect defined on request—and was bound to do so—the general line of buildings. He might, if he liked, define a general line of buildings for the whole of the street. He might also, if he liked, define the line of buildings for part of a street, block, or row of houses. When he had made his certificate, notice of that certificate had to be given to all persons affected by it, including persons within 50 yds. on either side of the length of the two termini at the end of this line. Before 1890 the certificate of the superintending architect was final, and from it there was no appeal. When the County Council came into being the Tribunal of Appeal was constituted, and the Act of 1894 provided that there should be a right of appeal by all persons aggrieved by the architect's decision to the Tribunal of Appeal. The learned counsel then read section 27 of the Act of 1894, which provides, in effect, that the consent by the London County Council to the erection of a building or structure beyond the general line of buildings shall not be deemed to alter or affect in that, or in any other part of the street, the general line of buildings as existing at the time of the consent. Continuing, the learned counsel said that he challenged the line drawn by the Tribunal of Appeal in two respects. He challenged the line drawn to the right of Landridge-road to point "B" on the plan, on the ground that, in respect of that portion of the Fulham-road, the superintending architect had not defined any general line of building. It might be that it was a good line from "A" to Landridge-road, and bad from Landridge-road to "B." If he showed that it was bad from Landridge-road to "B," it was only bad to that extent. If the line were held to be a good line, the Tribunal of Appeal would have the power to be the original defining authority for the building line of a street or part of a street which had not been considered by the superintending architect. The Tribunal of Appeal were not the original defining authority at all.

Mr. Justice Kennedy said he thought, on this appeal, the court had nothing at all to do with the line beyond the Landridge-road.

Mr. Bailhache said he would leave that point, and then proceeded to argue that the Tribunal of Appeal had no right to alter, in

the way they did, the line fixed by the architect between Munster-road and Landridge-road. The learned counsel also submitted that the Tribunal of Appeal had no power to make the order as to costs they did make.

Mr. Bartley Dennis supported the decision of the Tribunal of Appeal. He said the superintending architect had only taken into consideration in defining the line one side of the street. The Tribunal of Appeal were not bound to any part of the street the superintending architect chose to select.

Mr. Justice Wills: The applicant did not ask for a building line to be settled between Munster-road and Landridge-road, but he only asked for it to be settled as for his own buildings?

Mr. Bartley Dennis said that was so. He submitted that the appeal on all points failed, and should be dismissed.

Mr. Justice Wills, in giving judgment, said that the case raised a question of considerable importance, and had given the court a certain amount of difficulty. The question to be decided was, whether the order of the Tribunal of Appeal varying that of the superintending architect was erroneous, and founded on some mistake in point of law, because, on a question of fact, there was no appeal. His lordship, having gone through the material sections of the Act of 1894, said that the question of where the general line of buildings ought to be drawn, was a question of fact which ought to be decided by taking into consideration the physical aspect of the street, the buildings in it, and its physical peculiarities. The appellant Tribunal had very wide powers to affirm, reverse, or vary any decision, and to make such order as might seem fit. The Tribunal of Appeal had a perfect right to say, in fixing the building line, it was a faire and better thing to take a greater length of the road than the superintending architect had done. He could see nothing which the Tribunal of Appeal had done which could possibly make him say that they had made any mistake in point of law. Such a matter as this was entrusted to a tribunal entirely qualified to decide it. So far as he could see there was nothing extravagant in what the Tribunal of Appeal had done. But whether it was so or not he did not hesitate to say that, so far as the Tribunal's consideration was concerned, it was a question of pure fact with which this court had no right to interfere. His lordship said that the only other point he had to deal with was whether the Tribunal of Appeal had power to make the order as to costs they did make. He considered they had power to order the unsuccessful party to pay to the successful party a lump sum for costs instead of leaving the costs to be taxed in the ordinary way. He thought the appeal should be dismissed with costs.

Mr. Justice Kennedy concurred.

Leave to appeal was granted.

DISPUTE UNDER A THEATRE BUILDING CONTRACT.

THE case of *in re the Arbitration Act, 1899*, and in the matter of an arbitration between Kirk and Randall and Sir Charles Wyndham, came before a Divisional Court of King's Bench, on June 27.

In this case the action of "Kirk and Randall v. Wyndham," and all other matters in dispute between the parties, were referred to the arbitration of an arbitrator, and the court appointed as arbitrator Mr. H. T. Steward, of 45, Parliament-street, Westminster. In the course of the reference a question of law arose, and the arbitrator, for his own guidance, in order to get the opinion of the High Court on the subject, stated the special case which now came on for argument.

The special case stated that plans and drawings, and a specification of works to be done, and materials to be used in the erection of a theatre at the corner of St. Martin's-court, in St. Martin's-lane, W.C., were prepared for and on behalf of Sir Charles Wyndham by Mr. W. G. R. Sprague, architect, of Fitzalan House, Arundel-street, Strand, and bills of quantities therefore were prepared by Mr. A. R. Henderson, surveyor, of 47, Pall Mall. Messrs. Kirk and Randall tendering for the works on June 21, 1901, the amount of their tender being 25,814*l.*, but such tender was not accepted by Sir Charles Wyndham. In August, 1901, Messrs. George Trollope and Sons commenced the works upon the site, and executed a large quantity of excavation. In October, 1901, Messrs. George Trollope and Sons were desirous of discontinuing the work, and Messrs. Kirk and Randall were invited by Mr. Sprague to undertake the completion of the work. In October and November, 1901, negotiations took place, and Messrs. Kirk and Randall offered to take over the work and

complete the building for the sum of 25,500*l.*, but ultimately agreed to reduce the price to 24,800*l.*, with the condition that no deduction be made for the work already done by Messrs. George Trollope and Sons. Articles of agreement were signed by Messrs. Kirk and Randall and Sir Charles Wyndham on November 26, 1901, whereby Messrs. Kirk and Randall agreed for the sum of 24,800*l.*, to execute, subject to the conditions on which in the schedule of the said agreement, the works shown on the drawings and described in the specification. On the same date Messrs. Kirk and Randall signed the specification referred to. The specification provided that the conditions of the contract would be those of the Royal Institute of British Architects.

The articles of agreement were those of the Royal Institute of British Architects. In the articles of agreement it was agreed, *inter alia*, as follows:—"Any reference in the said conditions to the bills of quantities shall not have the effect of constituting them part of this contract." The bills of quantities were referred to in the said conditions—viz. in conditions 3, 13, and 14. It was contended by counsel for Sir Charles Wyndham, and denied by counsel for Messrs. Kirk and Randall, that, upon the true construction of the documents, the bills of quantities formed part of the contract made between the parties. The question for the determination of the court was, whether such bills of quantities did or did not form part of the said contract.

On behalf of Sir Charles Wyndham it was now contended that, for the purpose of ascertaining the final sum due to the plaintiffs, after allowing for the omission of certain towers from the original designs, and for extras, it was necessary to incorporate these documents. If the bills of quantities were not to be part of the contract, it was urged that it would mean a difference of several thousands of pounds.

On behalf of the contractors it was said that the bills of quantities were not part of the contract for the purpose of effecting the basis of the lump sum agreed upon, but it was admitted that they might be referred to in order to price extras and omissions.

At the conclusion of the arguments of counsel, the Lord Chief Justice, in giving judgment, said he could not help thinking that the contention really raised on behalf of Sir Charles Wyndham before the arbitrator went to the extent that the lump sum could be opened up, and that in that way the bills of quantities were to form part of the contract, not for their proper purpose, but for the purpose of saying that it was not a contract for a lump sum at all. He was clear that this was a lump sum contract, however, and that the documents in question were wholly inadmissible for the purpose of turning the 24,800*l.* into some other figure. He expressed no opinion, however, as to what was a proper omission of a proper extra—that was a question for the arbitrator—and while he said that the bills of quantities formed no part of the contract in regard to the lump sum, when the clauses of the contract which contained the usual provision for extras and omissions came to be worked out, he said the documents therein referred to were these bills of quantities, and had to be taken into the contract directed. For the purposes of omissions and extras, therefore, the bills of quantities might be looked at, but not for the purpose of saying that the contract was for measure and value of the work.

Mr. Justice Kennedy agreed, and the case was accordingly remitted to the arbitrator with this direction.

Mr. W. English Harrison, K.C., and Mr. Clavell Salter, K.C., appeared for Messrs. Kirk and Randall, and Mr. Spencer-Bower, K.C., and Mr. Rose-Innes for Sir Charles Wyndham.

LIABILITY FOR PAVING, ETC., EXPENSES.

THE case of *in re Allen and Driscoll's contract*, dated July 22, 1903, and *in re the Vendor and Purchaser Act, 1874*, came before the Court of Appeal, composed of Lords Justices Vaughan Williams, Romer, and Cozens Hardy, on June 23, on the appeal of E. and F. Driscoll from the judgment of the late Mr. Justice Byrne in the Chancery Division.

In this case an order had been made in an action by the vendor for specific performance that the purchasers were, on or before September 29, 1903, to pay to the vendors 4,440*l.* in settlement of the purchase-money and interest due in respect of eleven leasehold houses at Acton, the vendors to recover the rents and pay all outgoings in respect thereof up to September 29, 1903. In February, 1903, the vendors received notice under the Public Health Act, 1875, to pave and make up the roadway in front of the

houses, and as the vendors did not comply with the notice, the District Council, on July 7, 1903, entered into an agreement with a contractor to execute the said works. The whole of the work was not completed until after September 23, but the Council made from time to time payments on account to the contractor. The question in the case was, whether the expenses of the works were to be paid by the vendors or the purchasers. The purchasers contended that the charge in favour of the Council upon the property for the expenses under the Act of 1875 took effect when the Council entered into the contract of July 7, which rendered them liable to the contractor. Mr. Justice Byrne held that the charge did not take effect until the completion of the works, and that the purchasers were liable to pay the amount. Hence the present appeal of the purchasers.

At the conclusion of the arguments of counsel for the appellants their lordships affirmed the decision of Mr. Justice Byrne, and dismissed the appeal with costs.

Mr. Cozens Hardy appeared for the appellants, and Mr. Norton, K.C., and Mr. Ashton Cross for the respondents.

PATENTS OF THE WEEK.

APPLICATIONS PUBLISHED.*

12,450 of 1903—G. SPENCER: *Folding Partitions for Dividing Rooms.*

The partition consists of parts or leaves which are hinged edgewise together, and on the bottom of the parts or leaves pulleys or castors are fixed for working on in opening or closing. On the top of some of the leaves is fixed a pin, with a roller working between plates or grooves, attached to a beam on the ceiling above.

15,138 of 1903.—EVERED and Co., LTD., and S. EVERED: *Hinged Casement and Fanlight Openers.*

In a fanlight or casement opener, consisting essentially of a screwed rod or arm pivoted to the fanlight, operated by a screw-box pulley, carried by a bracket on the fanlight frame or the reverse, the pivoting of the screw-box pulley carrying bracket directly to an angle or fixing plate, and arranging the opener at such a position with respect to the pivot or angled edge of the fanlight or casement, that a screwed rod or arm of short length only is necessary to effect the required opening and closing of the said fanlight or casement.

16,793 of 1903.—T. W. TWYFORD: *Water-Supply Fittings for Institution and other Baths, and the like.*

In hot and cold water-supply fittings for baths or the like, the employment, in conjunction with a single spindle operating both valves, and actuated by a loose or removable key, of a safety device for preventing the turning on of the hot water before the cold supply has been opened, the said device consisting of a spring or equivalent bolt or slide having a limited yielding movement, and arranged in the path of a lug or projection on the key, which is adapted to act upon the said bolt and force the same into a position in which it will constitute a positive stop for blocking the said key against further rotation, but will, nevertheless, admit of its withdrawal from the spindle.

6,562 of 1904.—W. B. PITT and R. PITT: *Doors, Gates, and like Structures.*

A swinging door, pivotally suspended at a point between its vertical edges to a suspension device depending from the door frame or other elevated structure, a wheeled carriage supporting the suspension device, an elevated track for said carriage extending transverse the doorway, and spring mechanism acting upon said carriage and tending to draw it back to the position which it normally occupies when the door is closed, in combination with a horizontally reciprocating device, suitably mounted, and engaging with a carrier pivoted to the inner edge of the door, and spring mechanism acting upon said reciprocating device, and tending to restore it to a position which normally holds the door closed.

7,068 of 1904.—G. MAHEUX: *Non-inflammable Composition for Use as a Protective Coating.*

A non-inflammable composition, distinguished by the incorporation with a selected vegetable, mineral, or animal tar of substances or products capable of rendering materials non-inflammable, these substances including especially boric acid, borax, and alum, with or without an addition of asbestos.

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

790 of 1904.—H. FASEL: *Window Fastener*.
A window fastener, comprising in combination an arm of band iron or other suitable material, provided with a longitudinal slot at its free end, hinged fixed with the other end to the sash of the window, a clamp-screw fixed in the lower bar of the window frame passing through said longitudinal slot of the arm of the fastener, and a clamp-nut on said screw.

1,102 of 1904.—SUTCLIFFE, SPEAKMAN, and CO., LTD., and T. DAWBER: *Brick-making Machinery*.

In a self-rolling push board for the cutting-apparatus of a brick machine, the combination of a member having vertical hollow pockets therein, containing a textile fabric soaked in oil, a layer of textile fabric such as jutean closing the front of the pockets, and an outer covering of perforated sheet metal.

713 of 1904.—M. ULLMANN: *Self-closing Hinges*.

According to this invention the hinge consists of a lower part fixed to the wall, and an upper part attached to the door or window, and movable on the lower part, the upper part turning on a bolt fixed to the lower part, the upper part having a collar movable on it, and the lower edge of the collar and the upper edge of the lower part of the hinge are screw-shaped or inclined, the collar having a projection falling into a corresponding recess of the lower part of the hinge. The recess is larger than the projection, so that when the door is closed and the projection lies in the recess, there will be a small space on each side of the projection. The collar has an arm, through which passes a screw or bolt, which serves for adjusting the collar on the lower part of the hinge, and is also provided with a recess through which extends the lug of the upper part of the hinge and constitutes a stop for the bolt.

27,100 of 1903.—H. C. BAKER: *Construction of Manholes for Conduits*.

A manhole for electrical and other conduits, the enclosing or body wall of which is composed of separate layers of bricks or blocks of two different styles, said bricks or blocks being curved in such a manner that they form a manhole substantially elliptical in horizontal section, said manhole being also provided with a cover, comprising parallel bars and bricks or blocks of two different shapes, and in which is a central opening, provided with a removable cover.

7,001 of 1904.—E. MITCHELL and F. GUNN: *Tie for the Walls of Buildings, and the like*.
A tie for walls, consisting of two longitudinal strips of suitable material turned over at their ends to form angular or transverse arms, projections formed at the extreme ends of said arms, a web or webs at the centre of the longitudinal strips, said strips being engaged with each other at the angles.

7,904 of 1904.—A. SILLER: *Iron and Stone-work Flooring, and the like*.

An iron and stone flooring, the distinguishing feature being that trussed or framework cross girders or supports are laid on the under-supports or main girders, such, for example, as I-girders or masonry between two parallel rows of stonework, or in the material binding the same, these trussed girders being surrounded by filling, and, after the latter has been hardened, capable of taking up the whole of the strain.

9,139 of 1904.—G. F. FISHER: *Building Constructions, and Blocks therefor*.

A structure, comprising a suitable foundation, and building or facing blocks having each a securing iron embedded therein, said securing irons having their ends projecting from the upper and lower edges of said block, the projecting end or ends of each securing iron having its rear face flush with the rear face of the block in which it is embedded, and each block having the upper, lower, or both marginal portions thereof provided with a cut-away portion to receive the projecting lower ends of the securing iron in the block directly above, said cut-away portions being wider than the securing irons to permit of adjusting the blocks laterally with respect to the blocks beneath.

9,269 of 1904.—B. H. BORDER: *Manholes, Inspection Chambers, and Interceptors for Drains*.

In an inspection chamber, the combination of a solid floor, high benchings, and separate manhole sections, the floor and sections having wide flanges and grooves whereby a watertight joint may be made between the same. The combination with an interceptor having a pivoted valve for the clearing eye and a catch to receive the loose side of said valve, of a flange to make a watertight joint with the manhole section above it, the front portion of

said interceptor being formed to fit a recess in the floor of an inspection chamber.

9,640 of 1904.—J. P. DOUGLAS: *Siphon Flushing Cisterns*.

A method of starting the action of a siphon flushing cistern, having an inverted bell serving to cover a trap inlet to the siphon, and to imprison air as the cistern is charged with water so as to prevent water from overflowing through an opening the bell interior to the atmosphere when the cistern is charged with water, so as to enable the imprisoned air to discharge and allow the water to rise in the bell until it overflows said inlet.

9,444 of 1904.—C. JACOBS: *Compound for Coating Bricks, Plastering, and the like*.

This invention relates to compounds for coating bricks, plastering, and the like, and has for its object to produce an inexpensive compound of this character which will render the objects upon which it is applied water and moisture proof, and whereby, in particular, the saltpetre contained in bricks and plaster commonly used, which sooner or later, to a greater or lesser extent, permeates to the surface thereof, through the action of the atmosphere, will no longer appear after this compound is applied thereto. The compound is formed by mixing caustic soda with nitric acid, muriatic acid, tartaric acid, and sugar of lead, mixed either with varnish or with oil.

9,765 of 1904.—A. DENAYER: *Cements and Limes*.

This invention relates to a process for increasing the resistance of Portland cement, and of other cements in general. The invention consists in mixing an alkaline silicate with a cement or lime before, or during, or after the burning operation.

The Orthodox Cathedral of Famagusta, Cyprus.

FAMAGUSTA came into existence as a great medieval city of the Levant at the close of the XIIIth century.

In its beginning the town seems to have been a mere fishing village for long after the disappearance of ancient Salamis, two miles away to the north, or old Famagusta, as it was called in the Middle Ages. But in the early days of the Frank occupation of Cyprus this village became important on account of its natural harbour, and a fort was built to protect it. An Orthodox bishopric was established at an early date, and in its cathedral (which in all probability is the small Byzantine church at the side of the immense Gothic building, the subject of the present article) the remains of S. Epiphanius, Bishop of Salamis, were enshrined. This relic was venerated here until the close of the XVIIth century—that is to say, until the Turkish invasion. Hamendorf saw it here in 1564. (*Itinerarium*, 1621.)

In 1291 the loss to Christendom of S. Jean d'Acre occasioned an immense impetus in the development of Famagusta as a stronghold and a centre for European commercial enterprise in the near East, and to the early XIVth century belong the extensive fortifications and the citadel which we see at present, as it were, through the earthwork

ramparts added by the Venetian engineers of 200 years later. The magnificent fosse hewn in the sandstone rock, a remarkable work of its kind and dating from the same period, would form the quarry whence the stone for the walls was obtained. As a means for contributing towards the prosperity of the city several pilgrimages were instituted about the beginning of the XIIIth century. Already the monastery of S. Barnabas was a recognised resort, and in addition the name of S. Epiphanius was associated with the new city by the shrine within the Byzantine cathedral already mentioned, and by a mysterious cave where miraculous water dropped from the rock, according to Stephen Lusignan, who mentions having witnessed the miracle.

The south-east quarter of the city appears to have been almost entirely occupied by the Orthodox or "Greek" section of the community during the Middle Ages. The northern and western portions appertained equally exclusively to the Latin, Nestorian, and Armenian population, whose churches remain in ruins, a melancholy evidence of once flourishing colonisation, whilst all traces of domestic or commercial occupation have entirely disappeared. In the "Greek" quarter several small Byzantine churches still survive. They are buildings of a small, unimportant character, their only claim to notice being in certain fragments of fresco still clinging to their walls. Towards the middle of the mediæval city, and probably marking the centre of the primitive fishing village, stands the

Orthodox cathedral. As already remarked, this small, insignificant Byzantine building may be of great antiquity, but, as in all Byzantine churches, evidences of age unsupported by historical or documentary proof are very deceptive. In the present case no details of architecture or sculpture present themselves for identification, and the general forms of the pointed arch construction afford very little clue. The building would appear to have been much repaired and added to at subsequent periods. At the present time this building is very ruinous, its tottering walls threaten to fall at any moment, and, considering its general faulty construction, it seems to stand as it is by a miracle.

The great Gothic cathedral or "Metropolis" of the Orthodox church in Famagusta is a very remarkable building from every point of view. Built on to the side of the little primitive Byzantine church above described, it completely overshadows and practically effaces its parent building. In addition to its immense size—unprecedented in Cyprus building of a native kind—several remarkable differences from the usual Byzantine arrangements are noticeable in the plan. In adopting the Gothic style of the XIVth century the Orthodox clergy seem to have waived several well-known prejudices of their church and allowed an unusual resemblance to the Latin peculiarities of plan and detail. As will be noticed in the accompanying drawings, the primitive cathedral consisted merely of two aisles, each terminated by a semicircular apse. These

The Cathedral, Famagusta. Plans.

would appear to have been a customary plan for an Orthodox church in Cyprus at an early medieval period. The two apses are arranged one for the altar proper, the other for the "altar of prothesis." Both altars are necessarily concealed behind the gorgeously decorated iconostasis. At a still earlier time churches were often covered by a large dome, like the early church in the castle of S. Hilarion, or at least a cruciform plan was adopted with a dome at the crossing.

The two-aisled plan is singularly characteristic of Cyprus churches, but during the XIVth century a change was probably brought about in ecclesiastical taste by the building of so many splendid cathedrals in the Latin or European style by the French and Italian master masons settled in the nearer East during that period. The Orthodox community, seized with a spirit of emulation, attempted to rival the superb cathedral of Famagusta, built in 1311 by Archbishop Bandoïn Lambert for the crowning of the putative kings of Jerusalem. The more usual two-aisled plan was abandoned for the imposing triple division of the mediæval church as imported from Europe by the Crusaders.

Another great church in Famagusta, known to the Turks as "S. Nicholas," was also built about the same time as the Orthodox cathedral. Although much smaller in scale, it resembles the Orthodox cathedral in such a remarkable manner as to seem merely a replica. Thanks to a rather more robust construction, smaller proportions, and a situation farther removed from the Turkish

batteries of 1571, this church remains at the present day in a remarkable state of preservation. The well-preserved interior affords to an experienced eye an excellent idea of what the now completely ruined Orthodox cathedral must have been like; but in the latter case, however, the fresco decorations still form a remarkable feature, which is completely wanting in the "S. Nicholas" since its conversion into a mosque. In most buildings of this type it is difficult to judge of the original intention of the designer owing to the removal of the fixed furniture, and particularly of the iconostasis. No Latin church was built during the Middle Ages without its high "jubé," or rood-screen, and no Orthodox church then or now could be constructed without its iconostasis completely covering up the east wall, which in no case was ever intended to be visible. As a consequence the eastern walls of Byzantine churches always appear singularly mean and uninteresting when laid bare and naked by the removal of the screen. On the other hand, the lantern-like apse of a Latin church, with its choir enclosure forming almost a church within a church, remains architecturally interesting even when denuded of its screens in the taste of modern days.*

The Orthodox cathedral was built of

* Attempts have been made to identify "S. Nicholas" (now used as a grain store) with the church of SS. Peter and Paul, which, according to Stephen Lusignan, was built by one Simon, a merchant of Famagusta, out of the proceeds of one successful trading voyage. This story is somewhat suggestive of the popular mediæval romance of "Whittington and his Cat" type, and the assumption that the "S. Nicholas" of the Turks is SS. Peter and Paul of the legend is too hypothetical, and rests on practically no evidence. The dedications of the ruined mediæval churches of Famagusta can only be identified in a very few instances.

regular coursed masonry neatly cut in the best style of Latin building, and singular contrast with the wretched workmanship of the average villa church of Cyprus. Mouldings and carv details are the same precisely as those of the Latin cathedral and churches of the XIVth century, and it is evident that mason-craft of all these monuments is identical. European masons and sculptors were certainly employed on the Latin cathedral of 1311; if European workers were not engaged for the Orthodox building, we must suppose that native artisans had assimilated western ideas of work and craft in a very remarkable manner. Such neatly-jointed stonework, carefully-executed vaultings, elaborate mouldings to arch or window are hardly to be found elsewhere in buildings of the native Cyprus church.

It may be concluded from the plan that in all probability a donical lantern was constructed in the middle of the nave vaulting. This feature, so beloved of Byzantine architects, probably added the unsubstantial constructive character of the church, and assisted in the general downfall of the vaulting at the time of the bombardment in 1571. Only at the north-east corner of the ruin does a fragment of the original vault remain at the present day in a most precarious condition.

Two very remarkable resemblances in the plans of the two cathedrals—"Latins" and "Greeks" remain to be noticed. In spite of the well-known aversion of the Orthodox to interment within their churches, the "Greek" cathedral has been originally planned for building by means of the peculiar western mode of "founders' tombs." That is to say, the means for the purpose were provided by persons who claim the right of sepulture within the church. The walls of the cathedral were occupied with doorways are constructed to receive "founders' tombs," and the method of construction has unfortunately tended towards the destruction of the building, as in so many other churches in Cyprus. In the Latin cathedral there are also "founders' tombs," but they have a comparatively small influence on the stability of the edifice. In the "Greek" cathedral and in the Latin churches these tombs are introduced in such a manner as to completely cut away the main strength of the church walls. As a sign of date, the "founders' tombs" may be taken to represent the last years of the XIVth century. The system was of Italian origin, and rapidly spread over Christendom as an easy way of erecting churches in the days before "bazaars" and other modern means for the purpose. The second peculiar resemblance between an Orthodox cathedral and the Latin type of plan is the presence of small sacristies or treasuries leading out of the eastern apses. In the Orthodox ritual there is no necessity for a distinct external sacristy: the space of the "prothesis" occupies the place. Why should these unusual features have been introduced? Perhaps we may be allowed to see in these resemblances the adoption of the Gothic style so evident of that *rapprochement* between the two branches of Christianity which

is considered within practical politics the beginning of the XVth century. Identification of date in mediæval building in Cyprus is a very difficult and certain study. The methods of work of mason-craft seem to have been full archaisms at all periods. Naturally it arises from local workers being employed in copying a foreign style for which they had no natural affinity. For instance, the singular chevron or zig-zag decoration to doorways, which in Europe is a distinctive feature of the earliest transitional style from Romanesque to Gothic, is in Cyprus continued in use through the mouldings of the XVth century period. It seems possible for various reasons to suppose the Orthodox cathedral a building of the XVth century and much later replica of "S. Nicholas," as a sculpture on the latter seems to be of XIVth century style.

Although in the last stage of ruin, its steeple gone and a great part of its walls, the Orthodox cathedral still possesses a remarkable series of frescoes on such portions of the interior as still stand erect. The three eastern apses are intact, and their semicircular walls are decorated with a series of paintings in rows one above another. These paintings are of very inferior character, and have a great resemblance to the common XVth century frescoes executed by itinerant artists for village shrines in Italy. The lowest row of figures represent apostles and doctors of the Orthodox church. This series is carried around all three apses. At a higher level a series of New Testament subjects, scenes from the Passion, etc., treated as figures within a decorative framework in the common Italian manner, are painted. The semi-dome over each of the apses is of course filled with dim traces of the usual colossal figures representing a "Majesty" or "Paradise." More interesting paintings are, however, to be found on the side walls of the church over the "founders' tombs." In one or two cases these are remarkably well preserved. They form panels continued upwards from the arched recess in the style of the tombs in the "Frari" church of Venice. These "founders' paintings, being doubtless commissioned by individuals, are of a very much superior type compared with those which cover the eastern wall of the church. The solid, well-built walls of the cathedral have retained their plaster and these frescoes in a most remarkable manner, in spite of the vandalism of the past three centuries and the overwhelming destruction always resulting from the fall of a vaulted ceiling. Perhaps their preservation may be partly due to the way in which the walls were first covered with a very slight coating of plaster, which naturally has a better chance of surviving than a heavy layer of "intonaco," as was often used in the Middle Ages in Italy.

This church must have presented a very remarkable and magnificent appearance when it stood complete with its elaborate carved and gilded furniture of the later mediæval style. It apparently possessed a wood iconostasis, the traces of a stone base for which remain at the pavement level of the sanctuary. The Bishop's throne would

also be a wooden erection, and would be on the outside of the iconostasis, in a position similar to that of the patriarchal throne in the "Catholicon" of the Holy Sepulchre at Jerusalem. In endeavouring to realise the former appearance of this interior, a problem is presented by the space which in an ordinary Orthodox church is occupied by the stalls or seats ranged around the church for the convenience of aged members of the congregation being in this case devoted to wall-tombs. We must suppose these very usual and, indeed, necessary adjuncts to a church were arranged in the form of a choir in an English cathedral.

The church is a most interesting example—perhaps almost unique as a positive design—of the mixture of Eastern and Western ideas in plan and detail. Not the least curious thing to observe in its hybrid character is the fact that in spite of a certain incongruity, perhaps inseparable from such attempts to adapt the details of one style to the

plan and proportions of another, in the present case the result, as far as can be judged from the ruins, was imposing and satisfactory. The still perfect church of "S. Nicholas" has a remarkably fine internal effect, even in its present mutilated condition. We can judge by comparison that its larger neighbour was proportionately finer. The central lantern added to the Orthodox cathedral would perhaps have had a somewhat mean appearance in the interior view. It appears small in proportion to the general scale of the church, much in the way that the lanterns over the crossing of Milan Cathedral and many other Gothic churches of large size appear small since our eyes have been accustomed to the more liberal proportions of the domical churches of the Renaissance. And in addition this Gothic-Byzantine lantern in Famagusta had not apparently the satisfactory position of crowning a crossing of nave and transepts.

Few, if any, records remain of the history of the Orthodox cathedral of

CROSS-SECTION ON LINE A-A.

WEST END ELEVATION.

The Cathedral, Famagusta: Elevation and Section.

Famagusta. Stephen Lusignan ("Corografia," p. 31) states that in 1212 the Pope Innocent III. sanctioned the formation of a Greek Archbishopric in Nicosia (translated from Famagusta) and of three Bishoprics of Famagusta, Paffo, and Limassol. A few years later, however, Pope Alexander IV. made an ordinance, called the "Alexandrine," by which the three Bishops were not to reside within their titular cities, and the Greek Bishop of Famagusta was directed to reside in Riso Carpasso. By a strange anomaly the Greek Bishop seems to have been enthroned in the "Chiesa Cattédrale de' Greci" by the Latin Bishop of Famagusta, and took on this occasion the oaths of fealty to the Pope of Rome. This curious ceremony is fully described by Stephen Lusignan, who seems to have acted on occasion as Latin Vicar-General for the purpose.

After the destruction of Famagusta by the Turks, the "Greek" cathedral is mentioned as being confirmed together with the Chapel of S. Symeon to the Orthodox community, which had permission to remain within the ruined city. This could not, of course, be the church which has now been described, as there is every reason to suppose it must have been reduced to the condition in which we see it at the present day by the Turkish bombardment. The marks of iron cannon-balls on the ruin and the close vicinity of the site to the side of the city most exposed to the Turkish batteries suggest this. Perhaps the church of "S. Nicholas" sometimes confused with the cathedral may have been constituted the "Metropolis" of the city at this period, but this church seems to have been taken away from the Orthodox after the year 1600 and converted into a mosque. It is now a granary.

In 1901 M. Enlart, the author of "L'Art Gothique et de la Renaissance en Chypre," attempted some small excavations of the Orthodox cathedral, and discovered the two rows of steps in the central apse. This peculiar feature is unusual in buildings of the last few centuries, and of course reminds the student of the primitive Byzantine arrangement. There does not appear to have been any episcopal throne provided for in this form of presbytery such as we are familiar with in examples of churches of the XIth century in Europe. It was perhaps a mere surviving ritual feature, like the similar arrangement of comparatively modern Coptic churches in Egypt, and indeed the two steps are almost too narrow to allow of their having been used by the priests. M. Enlart also discovered some interesting traces of the method of glazing employed in this church during his excavation. Amongst the debris were immense quantities of broken window glass of various colours. On investigation these proved to be remains of roundels which had been set in a peculiar framework of plaster of Paris, a system which is represented to some extent at the present day by the mosaic-like windows of Turkish mosques, which are also worked in the same way with a coarse setting of plaster. These roundels were about 8 in. in diameter, of a very poor quality of glass—imperfect white, deep blue, green, and purple in colour. A few fragments of

marble mosaic from the flooring were also turned up. Most of these remains are now in the little museum at Famagusta.

The Orthodox Metropolis stands in a most interesting condition for study and exploration. With the exception of M. Enlart's researches nothing seems to have been touched within the ruins for centuries. Much of the stone on the outside next the road has probably been removed, but speculators in secondhand building stone have not yet penetrated very far into the mass of fallen vaulting which fills the interior. This mass looks as if it lay as it fell in at the time of the Turkish siege, and under such debris much of interest may still be buried.

Sketches of this building were made by Mr. Vacher in 1883 for a paper on "Medieval Buildings in the Island of Cyprus," published in the *Transactions* of the R.I.B.A. These sketches are somewhat inadequate to give an idea of the scale of the building, but the plan is a carefully-measured one; unfortunately the communication between the two churches is not shown. M. Enlart gives some excellent sketches and photos in his great book on the architecture of Cyprus, but his plan also requires correction in one or two particulars. A really complete and exhaustive set of drawings of the cathedral cannot of course be made until the whole of the interior is freed from the mounds of fallen masonry, which at present reach a height in places of 6 ft. to 8 ft. This would be an interesting enterprise on the part of any archaeologist with time to spare for superintending the always slow and tedious operations of Levantine labourers.

THE HELLENIC SOCIETY.

It was a happy thought to celebrate the twenty-fifth year of the foundation of the Hellenic Society by a special commemorative meeting. It was an occasion both for bringing to the notice of the outside public some idea of the manner in which the Society has progressed since its small and tentative commencement in 1879, and of the work which it has accomplished in promoting the intelligent study of Greek archaeology, literary and artistic; or more especially, one may say, of the fruitful combination of literary with archaeological study.

For in this respect the foundation of the Hellenic Society came at what one may call the psychological moment, when students of things Greek were just beginning to perceive that the study of Greek literature apart from the actual remains of Greek architecture and art was only a one-sided method; that the literary and the artistic remains should be taken together and studied in combination if we were to arrive at the best and most comprehensive understanding of Greek culture and of the lesson that it has for mankind. It might be difficult indeed to say whether the formation of the Hellenic Society was the consequence or the cause of this wider view of Hellenic study; perhaps it may be said to have been both. Its formation was due to this wider perception on the part of a few persons, but it has been the means of promoting the adoption

of the same view in the minds of many persons. It commenced with 112 members; it now numbers 850. Its *Journal*, commenced also in a tentative manner and with some doubt as to its future, has now become a recognised storehouse of papers valuable for critical learning.

Sir Richard Jebb, who occupied the chair at a meeting which entirely filled the Society of Antiquaries' meeting-room, naturally paid a high tribute to the late Sir Charles Newton, to whose exceptional learning in everything connected with Greek archaeology the Society was so much indebted during its earlier years, as well as to his enthusiasm in the cause, not less genuine because it was not popularly demonstrative; in fact, Newton was not one who cared or endeavoured to appeal to the popular mind at all; he addressed himself to those who already had some knowledge of and interest in his special subjects. Sir R. Jebb quoted Ruskin's remark, in his characteristic language, as to Newton's "intense and curious way of looking at things," a phraseology which exactly described his attitude of mind. And it was to Newton that the Hellenic Society was indebted for starting with the broadest view of what Hellenic study was to include—everything that was Greek, of any age and in any country where the restless Greek spirit had demonstrated its existence by either literary, or architectural, or sculptural remains. To have confined its investigations to the great period and the great shrines of Greek art might have been to lose discoveries of the greatest historical interest.

One point which was brought out by Sir R. Jebb was the manner in which the Society had brought the Universities more in touch with the British Museum. Previous to its formation, as he truly observed, work was being unostentatiously done by students connected with the British Museum, in comparison with which the study of the same class of subjects at Oxford and Cambridge could only be regarded as elementary; and of these students in the recesses of the great museum the Universities knew little or nothing. The Hellenic Society, of which the most accomplished of the British Museum men became members, brought them and their work into the light of day; they became known authorities on their respective subjects; and most of them being also University men, a new perception arose in the University world as to what thorough archaeological study really implied. The papers published in the *Journal* of the Hellenic Society fully illustrate this high standard of archaeological investigation; there is hardly one of them which is not an example of special investigation, in which nothing is taken for granted, and in which in most cases some new point is brought out.

The presence of two eminent American scholars, Professor Gildersleeve, of the Johns Hopkins University, and Professor J. Williams White, the President of the Archaeological Institute of America, was an agreeable incident at the meeting, and we have no doubt that the two learned visitors were personally quite sincere in their appreciation of the labours of the Hellenic Society and in

their wish that the bonds of amity and union between English and American archaeologists should be drawn closer. Nevertheless, we cannot shut our eyes to the fact that American archaeologists, as a class, seem decidedly anxious to work for their own hand, and produce the impression, whether correctly or not, of being in general exceedingly jealous of English archaeologists; we have noted more than one case lately of refusal, in American hooks, to recognise or give credit to English archaeologists; even cases where, though an English archaeologist's work could not but be recognised, his name was suppressed. This is not a pleasant feature in the attitude of American archaeologists, and complimentary speeches at meetings will not quite atone for it.

But the address of the afternoon was unquestionably that of Mr. Gennadius, the former Greek Minister in London, in whose official rooms the idea of the Hellenic Society was first, we believe, started. He rose quite above the platitudes of the occasion, into the region of philosophic thought. If any outsiders ask—as they do sometimes—why there should be this machinery for the study and elucidation of things Hellenic, Mr. Gennadius supplied them with the answer. In language of great eloquence and beauty he dwelt on the value of Greek literature and Greek art as a means of supplying the highest form of culture to the modern mind; he reminded his hearers how many great English statesmen had owed their breadth of mind to the influence of Greek literature; how sane and wholesome was its influence; how important its recognition of beauty in life as opposed to mere material progress; and how much a recently deceased great philosopher might have gained in breadth of sympathy and in calmness of judgment had his mind been steeped in the influence of Greek language, literature, and art, instead of merely having what might be called a scoffing acquaintance with Homer through the medium of a hastily examined English translation. That is the true view to take of the value of Greek culture to us; it holds up a higher and saner standard than that of our hurried modern life. One can fancy how the Greeks would have abhorred the kind of thing which is called "art nouveau."

NOTES.

By the death of G. F. Watts we have lost the last of a great trio of English painters who have left no one to succeed them on the same artistic level; for whatever differences of opinion there might have been as to the art of Millais, Leighton, and Watts, and as to their relative greatness, there can be no doubt that they represented, each in his own way, a power in painting in which they have at present no successors. Burne-Jones could not be grouped with them, for his genius, beautiful as it was, moved in a more limited area. By many persons Watts will at present be regarded as the greatest of the three, on account of the poetic and moral aim which he kept before him, in his later works especially. But it

was this moral aim which constituted his weak side as an artist. When once you begin to give a predominant importance to the moral of a work of art, the art is likely to suffer in proportion, and in many of Watts's later works did suffer to a painful extent. In his "Love and Death," perhaps his greatest work, he still preserved the balance; it was a painting with a great intellectual meaning, but not with a moral in the ordinary sense of the word. "Love and Life" was a painting with a distinct and pronounced moral, and was proportionately weaker as a picture. His works of this class will hardly retain in future the same interest which for many they now have. Watts's future greatness will rest on the works in which beauty, of colour and form, was predominant, not excluding poetic meaning; on his "Daphne," "Love and Death," "Hope," "Endymion," "The Infancy of Jupiter," and other such works. As a master of the mystery of colour he was hardly surpassed, in his best works, by any painter, ancient or modern; while his power of original conception was shown in such dramatic figures as his "Jonah" and "The man who had great possessions"; and his few landscapes seemed each to illustrate a new "note" in landscape painting. He produced many interesting and some great portraits—among the latter his "Tenyson" and "Herr Joachim" especially; but his portraits tended to become, in a good many cases, not so much likenesses of his sitters as his conception of what they ought to look like. Of his grand simplicity of character and total absence of covetousness in regard to either honour or gain too much cannot be said. He regarded himself always as one striving after an ideal rather than as having attained. "Well, here you find me," he said to a lady visitor at his studio, "still trying to paint a little." The modest sentence was an epitome of his whole life and character.

At the annual meeting of the Palestine Exploration Fund, held on Wednesday at the Royal Institution, Sir Charles Wilson gave an account of the work that had recently been done and which was immediately in prospect, followed by the exhibition of an interesting series of lantern slides illustrating recent and present work, more especially at Gezer, where Mr. Macalister is engaged in explorations from which much of interest has been obtained and more is expected. But the *firman* permitting excavation expires in fourteen months from now, and both Sir Charles Wilson and the chairman (the Duke of Northumberland) impressed on the members and friends of the Fund the importance of raising sufficient money to make the best of the opportunity while it lasts. Other countries, Germany and Austria especially, are now actively engaged in the field of Palestine exploration; and it is almost needless to add that these explorers receive substantial assistance from their respective Governments, while from ours none can be expected; all such expenditure being evidently, in the eyes of the English Treasury, "waste of public money." Among the discoveries

recently made are a considerable number of remains of children evidently sacrificed from some superstition at the erection of a building—hurled at or under the base of a wall. The evidence of this kind of ruthless practice among the Canaanites of the early time throws a new light on the fierceness of the denunciations of the heathen in the Old Testament chronicle.

Training Colleges. THE executive council of the County Councils' Association have adopted a Report, prepared by a committee, which may have some bearing upon the building and planning of training colleges in the future. The committee framed the outline of a scheme for a one year's course in a training college where the students should, as the committee recommended, be supplied with facilities for acquiring, with other things, the practice as well as the theory of education, and instruction in physical exercises, wood-working, cookery, black-board drawing, and elementary experimental and natural philosophy. The committee also recommended that all local educational authorities should provide facilities for the training of selected teachers who have not passed through a training college course in educational methods.

Inhabited House Duty. WHAT renders a house "an inhabited dwelling house" within the meaning of the House Tax Act, 1851, has just been the subject of a decision, *Smith v. Dawney*. A dwelling house fully furnished, and with the furniture in place, remained unoccupied for a whole year. It was occasionally aired by an agent, and the garden was kept in order, but nobody had slept there, and the question was whether in such circumstances the lessee was liable to be assessed for inhabited house duty. An impression has prevailed that the test to be applied is whether the house has or has not been slept in, and in some cases the words of the section "inhabited dwelling house" have been construed with reference to this test, but in the present decision a much wider construction has prevailed. This statute took the place of the statutes which imposed the window tax, and it contains a reference to the former Acts. In these Acts the words used were occupation as distinguished from habitation, and the Court has now construed the word "inhabited" as though the word "occupied" had been used in the section, and as a consequence the house being kept in a state fit for occupation, ready to be slept in, has been held to render it "inhabited" as distinguished from buildings not capable of being occupied as dwelling houses, such, for instance, as those used for classrooms or as gymnasiums. This furnishes one more example of the unsatisfactory results attending legislation by reference. Every Englishman is presumed to know the law, but he might as well be presumed to be able to fly as to understand the Statute law. In the present case the word "inhabited" has a well-understood meaning, and the puzzled householder may be excused if he asks why, if the law meant to convey "occupied" as it had said in former statutes, the same word

was not used in the statute dealing with the same subject matter. We can only refer him to Shakespear.

**Covenants
on Sale
of Freehold.**

THE Court of Appeal in the case of *In re Poole and Clark's Contract* were recently consulted as to the proper form of covenant to be entered into by the purchaser of freehold property with the vendor when the latter held the property subject to restrictive covenants, and the Court laid it down that the covenant should be prefaced by the words "with the object and intent of affording to the vendor a full and sufficient indemnity, but not further or otherwise." The object of such a covenant is only to secure the vendor from any action brought against him by persons alleging that they have suffered damage by a breach of covenant, and the insertion of these words prevents him from obtaining an injunction against the vendee except when he has been so sued, as otherwise no interest in the property remains in him.

**The Municipal
Electrical
Association.**

MR. T. P. WILMSHURST delivered an interesting presidential address to the Incorporated Municipal Electrical Association last week. His remarks on the companies which are prepared to supply power in bulk to corporations show that municipal engineers regard the sphere of these companies as being confined to the supplying of factories, country mansions, etc., which are outside the reach of local municipal or company supply. They strongly resent the attempts that are being made in Parliament to obtain terms and exemptions for these companies which are denied to municipalities under the Electric Lighting Acts and their provisional orders. For instance, under the Electric Lighting Act of 1882, the undertaker, subject only to certain very limited safeguards, must supply anyone who makes a demand for the electric light. The power companies, however, are seeking to be relieved of this obligation. The President congratulated municipal engineers on the rapid growth of municipal electric supply undertakings during the last eight years. The total capital expended in these undertakings has increased during these years from four millions to forty millions. A considerable portion of this increased capital is due to the numerous municipal electric tramway schemes. The importance of enabling the consumer to enjoy the maximum possible light with the electric current supplied him was rightly insisted on. Mr. Wilmshurst was not of opinion that the duties of a supply company stopped at the meter. He said that companies ought to test glow lamps free of expense. They ought also to have inspectors who could advise consumers how to obtain the maximum light for the units they consumed. The company would be well repaid for the slightly-increased expense. Parliament has recognised that the providing of lamps of good efficiency is within the domain of "electricity supply." In some recent Local Acts a clause has been inserted authorising municipalities to "sell, let on hire, and otherwise deal with electric lamps." Glow lamp testing is very much simpler than gas lamp testing, and at a central station it could

easily be carried out during the night shift. The importance of the offer of cheap electric power in inducing manufacturers to settle in towns was also pointed out, and this phase of municipal rivalry is worthy of the consideration of municipalities.

**Thames
Steamboats.**

A CIRCUMSTANCE which particularly attracts the attention of visitors to London, but which now escapes the attention of most inhabitants of the Metropolis, is the absence of river steamers on the Thames. Those who live in the great city are a singularly patient and docile race. They know there used to be, and ought now to be, a regular service on the great highway provided by nature, but there is no public agitation on the subject. The omnibus or underground railway is cheerfully accepted as a substitute. At the present time the steamboat company, owning or leasing certain piers and possessing a fleet of peculiarly antiquated craft, cannot afford to maintain their service because it is not likely to pay, and the County Council has not yet authority to establish a modern service. This reproach to London will, it is to be hoped, shortly be removed, for the County Council Bill has already been passed by the House of Commons, and is now under the consideration of a Select Committee of the House of Lords. When this measure has been finally sanctioned, Londoners will have at their disposal, without unnecessary delay, a fleet of thirty specially-designed steamers giving a regular and punctual service all the year round between Hammersmith and Greenwich; and although ratepayers may suffer somewhat at the outset, there is no doubt that the gain to the community will be very great.

**The
United Service
Club,
Pall Mall.**

It is announced that the members of this Club have obtained the consent of the Commissioners of Woods and Forests to a renewal of their lease for a further period of sixty years, and that they are resolved to carry out some structural alterations of the premises. The clubhouse was erected in 1826-8 after Nash's plans and designs as part of the improvements he effected in Pall Mall and Waterloo-place; the enlargement on the east side was made by Burton. Whilst, in the matter of its design, the building scarcely does justice to its position, the outward appearance of the structure by no means belies its general reputation as being one of the most commodious and comfortable club-houses in that quarter of the town; it possesses moreover the uncommon advantage of a long return frontage to a wide open space which is comparatively but little used for vehicular traffic.

**Changes at
St. George's
Circus,
Southwark.**

It is stated that the Obelisk is about to be removed from the centre of the Circus to a fresh site in Waterloo Bridge-road, and that it will be replaced by an illuminated clock-tower given by a firm who have traded as tobacco merchants during a long period in the Borough. The Obelisk, a block of limestone, stands at the junction of five main roads on a spot which is distant one mile from

Westminster Hall, 1 mile 40 ft. from London Bridge, and 1 mile 350 ft. from Fleet-street. It was set up in the reign of St. George's Fields in 1771 in honour of Alderman Brass Crosby, who when Lord Mayor in 1770-1 achieved some celebrity by his confinement in the Tower for having released a printer whom the House of Commons had illegally arrested, and for sending a messenger of the House to prison. In the Circus stood until some months ago the buildings of the School for the Indigent Blind (since rebuilt at Leatherhead), which was first established at the former Dog and Duck tavern in St. George's Fields in 1799. When those premises were taken thirteen years afterwards for Bethlehem Hospital the governors of the charity acquired a site at the Circus, whereon, and on some adjoining land, they built a school for 220 inmates in 1834-8, after designs in the domestic Tudor style by John Newman (see the wood-cut, with the obelisk, in the *Mirror* of February 21, 1835). The school and its site were purchased for 140,000*l.* for purposes of an electricity generating station by the Baker-street and Waterloo Railway Company, who obtained additional powers for an extension of their line from Waterloo Station to the Elephant and Castle, Newington Batts.

**Pictures by
Giovanni
Costa.**

Two or three fine landscapes by the late Professor Costa have been exhibited at the Royal Academy, but perhaps few people in London were aware what a remarkable painter he was until the exhibition of a collection of his works at the Gallery of the Society of Painters in Water-Colours. His works previously exhibited in London had rather a sameness of manner and subject, and at the Society's Gallery one was surprised by an unexpected versatility in subject and style. The first one in the catalogue, "Celi narrant Gloriam Dei," is a small landscape with a very powerful and broadly-treated sky, much more English than Italian in manner. No. 5 is a replica of or a study for, on a small scale, one of the finest of his Academy pictures, of which there is another and still smaller edition (No. 81). In these and other works we recognise a fondness for a particular type of foreground—broken-up hillocks with growths of rushes. This meets us again in one of the largest and most important pictures here, "On the shore near Ostia" (10). "The Carrara Mountains above Lercici" (66) is an exceedingly fine landscape, and illustrates also the artist's success in the introduction of foreground figures; the two here are quite a study in themselves, while keeping their place in the picture. He was fond also of introducing into his foregrounds a single figure carefully composed so that its lines should harmonise with the composition of the whole picture; there are several instances of this. "The Cork Wood by the Sea" (65) is in a quite different key from most of the others. Among others of remarkable power and originality are "A Roman Road in the Woods" (36); "Study from Natrre, Porto d'Anzio" (44); "The Mainland from Monte Circeo" (49), with a long row of admirably painted old buildings, and the star-like

flowers in the foreground; "The Ancient Port of Nero" (68); and the "Early Study" (153), with its beautifully painted masses of dark trees and the light in the sky beyond them. Costa's influence on Mason we are not surprised to hear of when we see such a work as "Landscape near Perugia" (61), which might almost be taken for a picture of Mason's; while the delicate "Tree Study" in pencil (134) recalls Leighton's "Lemon Tree." A small picture called "Study in the Roman Campagna" (113) is interesting for another reason—it so remarkably recalls some of the landscape backgrounds in early Italian art. "The Nymph" (94), a life-size nude study, shows another side of the artist's powers. Altogether it is a most remarkable exhibition, and enables Londoners for the first time to form an adequate idea of Costa's artistic importance.

The Leicester Galleries.

At the Leicester Galleries is a collection of water-colour drawings by Mr. W.

Lee Hankey, a good many of which illustrate a method of treating landscape which has become rather prevalent of late, in which outline and detail are rather evaded, and the effect is got by contrasted masses of warm colour. It is not altogether an effect after nature; it is the translation of nature into an artistic scheme; but a good deal of it is very interesting. Some of the figure subjects have much heauty or character, such as the mother and child in "When I began to love" (22), and the half-humorous half-pathetic one of the young cottage girl under the title "If I were loved as I desire to be" (64). The large picture, "It's the Child's Turn now" (30) is pathetic, and fine in composition, but might have been equally so on a smaller scale: the picture is too large for the subject and treatment. Among things that may be specially mentioned are "The Dinner Hour" (44), "Touring" (48), and "Go not, happy day" (49), a small picture of calm water, distant white cottages, and floating clouds. In an adjoining room is a collection of Mr. Raven Hill's clever drawings for *Punch*, excellent specimens of work in black and white; but it is a kind of art the interest of which depends as much on the humour of the descriptions or titles as on the drawing; the two have to be taken together.

The Montague Fordham Gallery.

MR. SPENCER'S collection of iron work at the Montague Fordham Gallery is interesting

for its excellent workmanship as well as for the originality of its design. One section of the altar rail for the Roman Catholic Cathedral at Leeds is shown, a design for a steel casket for the Cartwright Memorial, a shield for the Cambridgeshire County Council, and a collection of attractive household accessories, such as fire-irons, electric light fittings, lamps, and candlesticks. The workmanship throughout is substantial and sound. The sympathy of the workman for the material is such that will delight architects, who nowadays often find it hard to get a simple piece of smith's work done showing any combination of hand and eye. In this respect, however, Mr. Spencer's more ornate pieces of work

are open to adverse criticism. Rough tool marks are well enough on simple smith's work, but elaborately designed work should not depend on this kind of effect. In Florentine metal work, for instance, the most beautiful effects depend on the great imagination in the design—based on the severest constructive lines—and on great delicacy of execution; the result of the finished article is satisfying in all respects; it is evidently hand-made, but that is only one of its charms. At the same gallery Mr. Adams shows some fine water-colour drawings, delightful in decorative quality, colour, and imagination.

ARCHITECTURE AT THE ROYAL ACADEMY.—V.

THE examples of ecclesiastical architecture at the Academy do not reflect any great activity in important church building, and although the exhibits are numerous, and many of them excellent, they represent almost entirely, works on a small scale.

The Liverpool Cathedral Competition accounted for much wall space in the architectural room in 1903 and is echoed in the present exhibition in No. 1600, an interior view of Mr. W. J. Tapper's design. We commented favourably upon this scheme in reviewing the competition drawings in our issue of May 30, and we published Mr. Tapper's design on June 13, 1903, but the present illustration, which is one of the best in the room, gives a more lucid idea of the author's aim at obtaining his principal effect from a mighty expanse of clearstory window. It also conveys a clear impression of the appearance of the eanted ends of the nave leading up to the narrow choir, which was the bold stroke in a very good plan. In contrast with this gigantic conception, Mr. Tapper also exhibits the "Interior of Memorial Church at Malvern Link" (1591), a very quiet treatment of a simple subject in which an arcaded clearstory is pleasingly introduced.

Mr. W. H. Seth-Smith sends an interior of a "School Chapel in Oxfordshire," which, although designed in good taste, appears to want greater provision for light and air—an important element where present-day youth is concerned.

"St. Matthews' Church, Auckland, N.Z." is an interior with a good stone treatment designed by Mr. F. L. Pearson (1417). The stone arches spanning the nave at short intervals are carried up to the underside of the tiebeams, above which rises an open timber roof. The abruptness of the finish to the stonework is not satisfying, and indeed it is not clear why these walls should be employed unless for acoustic reasons. The four lancets at the west end are not happy. No. 1452 is a design for a town church by Mr. C. Wontner Smith in which much good Gothic detail is seen, particularly in the tower. The smaller parts of the ground story will, however, improve under a more heavy treatment. "The Church of St. Chad, Longson, Stafford" (1506), is an edifice of no great interest shown by a dull drawing wherein the tower and broached spire appear to overwhelm the parts reserved for worship. There is a lack of design in mass, detail, and proportion, and the windows are very poorly managed. We are accustomed to more thoughtful work from the author, Mr. G. C. Horsley. The "Congregational Church, Dover" (1510), by Mr. F. Newman, is unassuming and is blessed with an end window of a present-day popular type. This consists of a large arched opening containing two heavy mullions or buttresses, around which ordinary stone tracery is grouped; it is neither constructive nor graceful in the presence of the arch. "Interior of the Church of St. Crispin, Poonah" (1515), is interesting, although no plan is given by the author, Mr. J. N. Conper, in that there is an attempt to blend Eastern detail with Western medieval forms. Mr. Geoffrey Lucas, who is responsible for many of the excellent line drawings shown in recent exhibitions at Burlington House, contributes a charming design for a "Hillside Chapel" (1527, wrongly described in the catalogue). The plan indicates that a small vestry, covered with a pent roof, is placed below the east window, and that at the end of the nave space is allowed for a porch and font. The eaves of the roof is brought down as low as possible and is only broken by a small twin gable containing two south windows;

a panel with a figure subject occupies the central space, continuing the lines of the windows, and the whole feature constitutes a delightful part of the scheme. At the west end stands a small tower with battered sides, a battlemented parapet, and a neat spire. The tower rises in the plane of the west wall, which we think is a mistake; it is more satisfactory to find the lines of such features continued to the ground, and not disappearing in the surrounding walls or behind roofs. This is, however, a minor point in what is a charming design, simple yet thoughtful.

Another successful little church, "St. Michael and All Angels, Woolmer Green, Welwyn" (1528), hangs immediately below the subject to which reference has just been made. The tower placed on the north side gains in importance by standing well away from the body of the church and bears out our previous remarks. Brick is the general material employed, whilst a sparing use of stone is made in some of the dressings to doors and windows. There is an air of restraint in the detail and in the large wall surfaces; but perhaps the most attractive element in the design, of which Mr. R. W. Schultz is the author, is the excellent proportions. No. 1554 is "Proposed Church at Wolverhampton," by Mr. P. L. James, which seems to occupy an island site, but the extreme thinness of the tower and certain other points occasioning adverse criticism do not render the design worthy the position. The "Holy Trinity Mission Church, Tulsa Hill" (1544), designed by Messrs. Treadwell and Martin, is a small brick and stone edifice in which the generous masses of the roof are effective. "West Front" (1566) is a terse title of a very indifferent design which has no claim, in our opinion, to a place on the walls of the architectural room. A very ambitious attempt is made in a design for "A National Crematorium and Hall of Deposition" in No. 1556, for which Mr. W. G. Mitchell is responsible. The diagram plan is too minute to be read, but the effort to apply classic detail to Gothic forms, which is clearly shown, is illogical. Take, for instance, the long, narrow buttresses of the tower, which are converted into tremendous pilasters by the use of Ionic caps. Observe also the introduction of stone tracery in semicircular window-heads. This tinted scale drawing has, however, an air of dignity; but surely in a structure peculiar to present-day requirements the mongrel application of traditional forms is incongruous.

The development of British possessions in Africa is naturally expected to produce important works in architecture. We have already reviewed some good buildings to be erected in Johannesburg, and we now proceed to a comparison of two churches intended for distant parts of the "dark continent." No. 1542 is an interior view of the "New Cathedral, St. John's, Umtata, S.A.," designed by Mr. C. H. Fellows Prynne, which at once strikes us as being substantially similar to other works in the home country by the same architect. Here is a stone-built church, having arcades, windows, and other parts bearing a strong impress of English medievalism, together with Mr. Prynne's favourite feature, a large pierced stone chancel screen rising towards the roof, and which becomes the dominant note in the conception. The detail is of a very ordinary description, and whatever influences were at work, it is possible to translate symbols and structural details into honest terms befitting the climatic and other conditions of the occasion. We cannot help thinking that, in spite of the raw state of the country and of the claims of ritual, this experiment is utterly wrong. Now the "English Church, Entebbe, Uganda" (1655), although very much smaller in its aspirations, is truthful in that it aims primarily at being a product of the country, and in the fact of its suitability to the needs of the climate. Professor Beresford Pitts illustrates his design by plans, elevations, and sections drawn to a good scale in a very clear manner. The church comprises nave with aisles, an apsidal chancel, organ chamber, vestry, a bell tower, and two porches, whilst the entrance end is approached from a garden enclosure having a simple cloister around three sides. To moderate the effects of a strong sun, a verandah, or stoop, surrounds the outer walls of the church, and the upper windows, which are circular, are shaded by wide overhanging eaves and verges. The construction shows itself clearly both on the exterior and in the interior of the church, and consists of brick piers and arches

with intervening plastered or rendered spaces; the king-post roof is covered with tiles, and the verandah and cloister are of the plainest post and pent order. This is one of the most interesting exhibits; the simplicity in design arises from necessity, not from affectation, and is a good object-lesson to all who study this part of the Royal Academy exhibition.

The work of Mr. Temple Moore is represented in two drawings. No. 1592 is an interior of a new church at Bradford, which, although hardly pleasing in the windows of the end wall, is thoughtful and restrained. The south-west view of "St. Margaret's Church, Leeds" (1596), shows a very large square tower, having five stages, in overpowering relation to the body of the fabric. What appears to be the incumbent's house (there is no plan) is a nicely-designed dwelling built against the two-storied south porch of the church. The dwarfed effect of the house is to be regretted; we also are inclined to anticipate, amongst other disadvantages from such proximity, that the chimneys will smoke. In general respects, however, the design is a valuable addition to the architecture of this enterprising city.

One of the most attractive drawings in the room is No. 1593, a view of the Church for Christian Scientists, Manchester. Mr. Edgar Wood, whose work we are pleased to find has not escaped recognition, has produced a picturesque composition with an originality and absence of tradition befitting the comparatively recent growth of this new sect. The church proper, which has a very high pitched roof, is flanked by low wings, set obliquely to the front. The small diagram in the corner of the drawing suggests a very interesting plan, but the nature of the respective parts is not clear. The church has arcades forming passage aisles, and the wings appear to contain meeting and school rooms. Three large chimneys occupy a prominent position in the scheme, the boldness of which is cleverly masked by the introduction of the tall stems of trees. It is to be inferred from the draughtsmanship that the low buildings will be faced in brick and the roofs covered with tiles, giving contrast with the rough cast gable of the church, which contains a window arranged in the form of a cross and a canopy with figure in the apex. The character of the detail leans more toward a domestic than an ecclesiastical type. Mr. Wood also exhibits "Middleton Wesleyan Church and Schools," No. 1595, an excellent group of buildings arranged round a courtyard, within which is a small sunk garden. The plan adds to the interest of a study of the scheme; we are curious, however, to know the purposes for which most of the tiny class-rooms are to be used. The design has a late Gothic influence, although the detail is quite original in its application and the whole scheme refined. "The Church of St. Christopher, Haslemere" (1608), by Mr. Charles Spooner, is a small fabric in which a good village feeling is maintained. It is in acute contrast with the "West Front of a new church at Peckham" (1617), designed by Mr. Burke Downing, which is a heavy Renaissance elevation overburdened with "features." Messrs. Runtz and Ford contribute a view of the "St. Giles' Christian Mission Church, Great Wild Street" (1626), a distinctly good street church built in brick; there is no plan, however, to enable us to speak as to its other qualities.

In "St. John's Church, Palmer's Green" (1634), shown by a view of the east end, Mr. J. Oldrid Scott is responsible for an important work in which a large tower above the crossing is dominant. Too great a variety of materials, however, is used, and they are themselves put into a multitude of forms and patterns producing confusion. The two circular turrets with spirelets at the east end, and the staircase turret rising up the centre of the south transept are unsatisfactory. The clock dial is too small, the tower buttresses too slight to perform a work of support, either in reality or effect, and the whole design would gain dignity by a simpler and broader handling. The "Presbyterian Church, Frognaal" (1648) is, in this last respect, a great improvement. Messrs. Pite and Balfour have produced a good stone-built church with a nicely-designed tower.

We could hope for a larger representation of the works of Scottish architects than is usually the case; the few examples submitted in the present exhibition are not of any great interest. A set of scale drawings is given of the "New Organ and Chancel for the King's Welsh-House Church, Grosvenor-square" (1582), the author

of which is Mr. J. J. Burnet, A.R.S.A. The organ is divided so that each half terminates one of the side galleries. There are minimal advantages and disadvantages in this arrangement, but the fact of a gallery, which is substantially a structural object, ending abruptly in an organ case, which is a fitment, is a very weak point in this rearrangement. The octagonal parts of the cases into which many pipes are contrived are extremely heavy features. The marble paving, the choir stalls, pulpit, and other fittings are very good. A scheme of colour decoration, by Mr. R. Anning Bell, is incorporated in the design, including a large tapestry panel representing The Last Supper, some painted wall enrichments, and three stained glass windows. "New Building, Marischal College, Aberdeen" (1602), looks a very important work in the small drawing. Messrs. A. M. Mackenzie and Son, the architects, do not append a plan, which alone makes such a sketch intelligible; but we observe that a delicate treatment is resorted to where we should have anticipated an element of sturdiness and solidity which always characterised Scottish mediæval building.

Quite a large number of designs for church fittings and furniture are to be seen in the exhibition. Mr. F. L. Pearson sends "Reredos, All Saints' Church, Maidstone" (1446), a heavily-canopied and figured design in which the low side wings are not quite satisfactory. Mr. J. H. Eastwood has two altars, one for the Cathedral of St. Anne, Leeds (1520) and the other for the Cathedral of St. Barnabas, Nottingham (1611). These are both charming pieces of canopied work, well arranged for their relative positions. The altars, tabernacles, and retables are executed in marbles delicately insaid and suitably designed for the particular materials.

The same author submits drawings of the "Shrine for the Relics of St. Urban" (1648), which is full of excellent detail. All three exhibits are beautifully drawn by Mr. S. K. Greenslade. Nos. 1592 and 1597 are interior views of old churches having new furniture. The former is a screen at Dymock Church, Gloucester, and the latter consists of a new lectern and reredos at Abbey Dore Church, Herefordshire, in neither of which is any great originality displayed; but we have every belief that the author, Mr. R. W. Paul, has considered what is fittest for the positions. "New Organ, etc., Congregational Church, Leeds" (1618), is an excellent design by Mr. F. W. Bedford. A plan would have been useful, but it is seen that good effects are obtained from a large recess on the floor level and from an overhanging loft. No. 1650 is one of the anomalies of this year's selection. The pencil sketch illustrates the performance of a ceremony. The catalogue, however, directs observation to the design of the altar screen for the "Church of St. Catharine," by Mr. J. E. D. Spain. There is remarkable poverty in the design, wherein a hideous distortion of a classic order is the only element to be considered.

Of the designs for schools, "St. Helen's School, Abingdon" (1442), by Mr. F. Pearson, is perhaps the most important. This is a group of brick and stone-dressed buildings of some interest, but quite unintelligible as a composition owing to the absence of a plan. In the "Hull School of Art" (1481), a competitive design by Mr. H. R. Gardner, we have a successful attempt at making full use of an opportunity for securing breadth, which a building of this class presents. Mr. Edwin Gunn is also happy in this respect in his "Design for a Parish Institute" (1503), which is a vigorous piece of design, likely to favourably impress the minds of its habitués. No. 1559 is a view of some important additions to Radley College, by Mr. A. H. Ryan Temson. Mr. H. O. Crosswell sends "Hall and Class-rooms, Commercial Travellers' Schools, Pinner" (1502), and "Schools, Spring Grove, Isleworth" (1614), both of which are somewhat ordinary in design, and not calculated to make lasting impressions upon the scholars. In the "Pickering Grammar School" (1653), by Mr. John Bilson, a low, quiet design is obtained. The plan shows that the building is well adapted to the limited needs of a small population. No. 1615 is a view of the "Higher Grade School, Hackney," by the official architect, Mr. T. J. Bailey. This is a somewhat important addition to the London public school buildings, but in the matter of external design it is no advance upon previous examples in a collection of buildings which is, in some respects, unique.

Several groups of almshouses are hung on the

walls, but only one, No. 1569, by Mr. Septimus Warwick, has much merit.

"Ingram House, Stockwell" (1531), by Mr. A. T. Bolton, is a building intended to house bachelor clerks and other business men. The planning, although not here exhibited, is exceedingly skilful. The basis of the external design is the introduction of a large Doric pilastered order upon a rusticated base, built in brick; a deep frieze an important part in the scheme. We are inclined to doubt the expediency of the employment of a classic order for sheer elaboration in a modern institution of this kind.

TRAFALGAR-SQUARE; WEST STRAND (NORTH SIDE) AND AROUND ST. MARTIN'S CHURCH; LEICESTER-SQUARE; AND LOCAL IMPROVEMENTS IN ST. MARTIN-IN-THE-FIELDS, ST. ANNE, SOHO, AND ST. GILES-IN-THE-FIELDS PARISHES; 1851-1900.

(Continued from p. 15.)

Coventry and Cranbourne Streets.—In 1844 Coventry-street was extended from Princes, now Wardour, street across the site of houses on that side of Leicester-square, and in the winter of 1843-4 was pulled down the south side of a footway from the square to Castle-street for a road 32 ft. wide extended to St. Martin's-lane and Long-acre (Fig. 4, revised plan of June, 1840). The improvement, effected in 1844-5, yielded nearly 79,000, to Lord Salisbury for his interest in the Cranbourne-street area. On the site of the original Ryder's-court, a quaint corner of old Soho, is Daly's Theatre [November 14, 1891, with section and plan], by the late Spencer Chadwick, C. J. Phipps (obit 1897) being consulting architect; the main front is of Ham Hill stone; the house, opened on June 27, 1893, has been enlarged at the rear by Mr. P. E. Pilditch. Cranbourne-mausoleum, on the sites of Earl's-court and Cranbourne-passage, and the Hippodrome and Crown hotel, 1899-1900, are by Mr. Frank Matcham.

Shaftesbury-avenue.—In "London and Westminster Improved," 1766, Gwynn points out the convenience of a direct street from the Haymarket northwards through Soho and St. Giles-in-the-Fields. Under their Act of 1877 (40-1 Vict. c. 225) the Board of Works began the thoroughfare in the winter of 1884-5, by levelling the block between Piccadilly, Tisbury-street, and Regent-circus (Fig. 5). With the south side of Richmond-street they demolished No. 53, Wardour-street—formerly No. 38, Princess-street—the last remaining home in London of Nell Gwynne.* Entering St. Giles parish at Five Dials (Moor-street), the Board pulled down the southern side and most of the northern side of Dudley (until June 9, 1845, Monmouth) street, and crossing Broad-street, laid out two openings into New Oxford-street. For the western opening they incorporated nearly all the south portion, formerly Plum Tree-court, of Bloomsbury, formerly Charlotte, street (Fig. 3), leaving only the two chapels, the Westminster French Protestant Girls' School (1847), and the French Protestant Episcopal Church of St. John the Evangelist, established by Charles II. in Savoy Palace in 1661, and, as the carved inscription testifies, rebuilt in 1845 by descendants of the refugees; the architect was Ambrose Poynter (obit 1886); R. L. Roumieu (obit 1877) repaired and improved the edifice in 1869. Bloomsbury Baptist Chapel [April 13, 1848], built for Sir Morton Peto by John Gibson (obit 1892), after the Lombardic manner, has outer walls of white brick with Caen stone dressings and two spires 117 ft. high. Bedford Proprietary Chapel, erected by Samuel Mecke in 1770, and reconstructed in 1846, was pulled down in the spring of 1896; Oxford-mansion, by Mr. G. D. Martin, occupies the site. For the eastern opening were demolished Thorney-street and part of Vine-street (Fig. 3). The new road, constructed by Turner and Son, T. Turner, and J. J. Griffiths, at a gross cost of 1,136,450*l.*, and a net cost of 758,887*l.*, was opened in January, 1886, three months after the death of Lord Shaftesbury, much of whose philanthropical labours were expended on behalf of the poor in St. Giles. It has a subway along its course of 1,170 yds., and has a minimum width of 60 ft. During the progress of the works for Shaftesbury-avenue

* In the interval 1667-70: in 1667 she lodged in Drury-lane; in 1670 she took a house on the north side of Pall Mall.

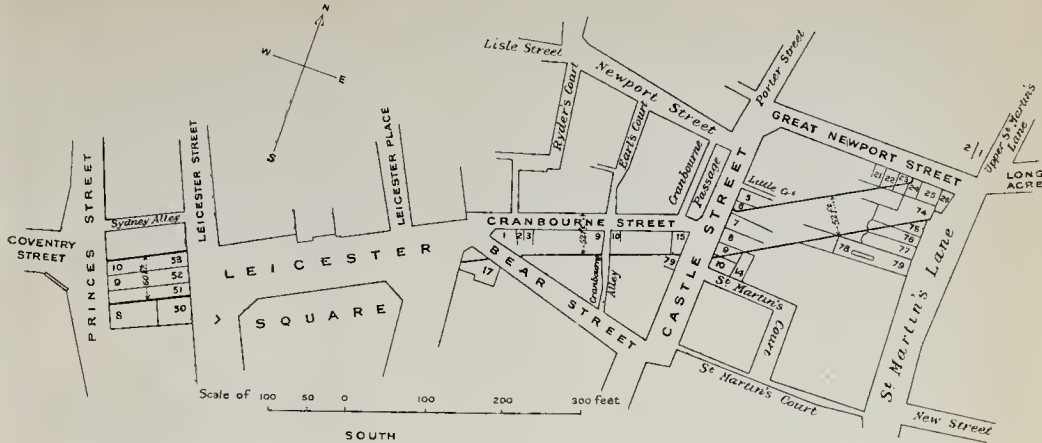

Fig. 4. From Chawner and Pennethorne's Plan for "New Street from Coventry-street to Long-acre" (1840).

and Charing Cross-road, 3,044 persons were dispossessed; in neither instance did the Board take initial steps to ensure that the new façades should present in some measure a continuity or harmony of design. No. 172, the French Hospital and Dispensary, providing for sixty beds, and built in 1888-90 after plans and designs by T. Verity, as honorary architect, supplants the house in Leicester-place, Leicester-square, where the charity was established in 1861. The Shaftesbury Theatre, having eighteen doorways on its four open sides, was built in 1888 by C. J. Phipps, for the late Mr. John Lancaster, whom, on the opening night of October 20, 1888, the audience greeted with "Best pit in London!" The Lyric, erected for Mr. Henry J. Leslie by Messrs. Stephens and Bastow, who tendered for 26,777*l.*, is also by Phipps, and accommodates nearly 1,600 persons. The façade, 148 ft. in length, of red brick and Portland stone, is after the Renaissance style; the upper floors, having a separate staircase, were arranged as residential flats, and the building covers an area of some 14,200 ft. superficial. The buildings absorbed the rear portion of the Café de l'Etoile in Great Windmill-street, where William Hunter formed his anatomical museum; his nephew, Dr. Matthew Baillie, succeeded him in that house, and then James Wilson, another celebrated anatomist; the portico and steps are removed and a window fills the doorway. The Trocadero, built for a music-hall but converted into a restaurant in 1896, displaced the Argyll dancing-rooms, closed on November 30, 1875, and originally the tennis-court of Piccadilly Hall. The tennis-court had been the home of Duburg's wax-work exhibition; it became, in turn, a theatre, and Laurent's casino. Messrs. J. Lyons and Co. acted as "their own general contractors," Messrs. H. Young and Co. supplying the steel and iron work. The structure has nine floors, and a façade of Dumfries stone, with marble work. The plans, and "modern" French Renaissance designs, were made by Mr. J. Hatchard Smith, assisted by Mr. W. J. Ancell; the former carried out the work until May, 1896, when the latter completed it in October, 1896. Scott's Restaurant, by Messrs. Treadwell and Martin, 1893-4, at the corner of Coventry-street, occupies the site of Piccadilly Hall; between the two stands St. Peter's Church in Great Windmill-street, by R. Brandon, 1860-1. Nos. 128-32, London Salvage Corps (1887), is by W. Wimble (*obit* 1903); E. P. Loftus Brook (*obit* 1895) designed No. 164, the National Refuges for Children; No. 231, Ashley Hall [April 19, 1890], is by Charles Bell (*obit* 1899). At Cambridge-circus is the building renamed the Palace of Varieties in December, 1892, which the late Mr. D'Oyley Carte erected in 1888-9 as the Royal English Opera House. He was "his own builder," employing no general contractor. Mr. T. E. Collcutt designed the very striking and, for a London theatre, picturesque façades [January 3, 1891], as well as all the interior decoration. The constructive work was planned and superintended by Mr. G. H. Holloway, who directed the whole of the works. For the interior decoration, executed by Collinson and

Lock, beautifully-coloured Italian and Algerian marbles, Mexican onyx, and Derbyshire alabaster were lavishly used.

Charing Cross-road.—When a Commissioner for Reforming the Buildings, etc., Evelyn proposed to make a road through the Cock-and-Pye fields—built over as Seven Dials by Neale in 1694—and to open out St. Martin's-lane along the side of Covent Garden. In 1826 the Woods and Forests revived the project; in 1846-8 all the east side of Upper St. Martin's-lane, and some houses northwards, were demolished for a contemplated wider road from King-street, Covent Garden, through St. Giles and Soho, to the east end of Oxford-street. The Board of Works accomplished a part of that scheme by laying out Garrick-street, constructed by E. Thirk, at a net outlay of 34,140*l.*; the street, 405 ft. long and 50 ft. wide, was completed in March, 1861. But under their Act of 1877 the Board altered the plans by shifting the line of route to Castle-street, a short distance to the west of St. Martin's-lane and Seven Dials. Delayed by reason of the obligation to supply house-room for the evicted working-classes, they did not begin active operations until the summer of 1885, when they pulled down part of the east side of Crown-street, Soho, at the north end. Continuing southwards along Crown-street (Fig. 5) they absorbed Grafton-street, Newport Market (see *infra*), Princes-court, and, in Little Newport-street, Grafton House and an adjoining mansion on the site of the residence of Mountjoy Blount, whom Charles I. elevated Earl of Newport. Grafton House formed a fashionable resort and lounge when Soho was an aristocratic quarter of the town. The road, which cost 583,084*l.* net, and was opened on February 26, 1887, is 966 yards long with a width of 60 ft., increasing to 130 ft. at the south end; the subway, 12 ft. by 7 ft. 9 in., has its arch rounded in brick. For a cause already mentioned the elevations along the frontages present more variety than excellence, and but few call for particular notice. In August, 1888, the trustees of the settled estates of the late Marquis of Salisbury, tenant for life, sold Nos. 113-4-5, St. Martin's-lane as the site in part of a Parish Hall in lieu of that on the north side of the church (Fig. 2). Robert Walker (*obit* 1896), designed the St. Martin's Free Library for the Library Commissioners on the east portion of that site (1890). He was architect also of the Town Hall, erected by Messrs. Mowlem and Co., for 23,206*l.*, and opened on July 16, 1891. Mr. J. Murray altered and enlarged the latter as the Westminster City Hall in 1901-2, on Messrs. Patman and Fotheringham's tender for 24,593*l.* The Garrick Theatre [June 30, 1888], by Mr. W. Emden, had the then unusual advantage of situation affording side-passages for the since organised queues, without obstruction of passing traffic. A subway under one passage connects the detached dressing-rooms and the stage, which is in the south part of the building; the auditorium is sunk half-way below the street level, and the tiers were hung without columns or other visible support. The entire designs are after the Italian Renaissance; Messrs. Peto Brothers were the contractors.

Sir Charles Wyndham's Theatre, by Mr. W. G. R. Sprague, 1898-9, is similarly isolated on three sides by the widened St. Martin's-court; the plans provided for an audience of nearly 1,200, and a roof-garden. No. 28, Camera Club, and the block on the site of the old Clock House, at the opening into Cecil-court, as re-built, are by Mr. F. T. Pilkington, 1892; just opposite at the corner of Bear-street is No. 39, built as Newbery House, after Mr. Carritt's designs in 1889, for Messrs. Griffith, Farran, Okeden, and Welsh, successors of John Newbery, "the philanthropic publisher" of St. Paul's church-yard. Messrs. Crosse and Blackwell's stables, etc. [April 15, 1876], on the site of the old Plough Inn, are by R. L. Roumieu, who made the drawings for the raising and extension of their other premises, carried out by Messrs. Roumieu and Aitchison. The Welsh Presbyterian Church, on the west side, formerly in Nassau-street, Soho, is by Mr. James Cullitt, "Les Grecques," the first Greek church established in England, and built by Joseph Georgeirenes, ex-archbishop of Samos, in 1677, in Hog-lane, since Crown-street, in the then parish of St. Martin, belonged to the French Huguenots from 1682 until its sale in 1822, by the trustees to some Calvinistic Nonconformists. In 1849 the rector of St. Anne, Soho, averted its conversion into a dancing-saloon, and P. C. Hardwick (*obit* 1892) re-arranged the interior. On June 29, 1850, the church was dedicated to St. Mary the Virgin. At that time it was surrounded by twenty-two almshouses in four blocks, whereof those in Chapel-place, to the south and west, have been ascribed to Nell Gwynne; we know not on what authority, nor is her name cited in the inscriptions with founders' names, 1680-6, given by Hatton in his "New View of London," 1708. In 1869 a clergy-house and vicarage were built on the north side of the church; in 1872-4 were added a chancel, vestries, and a north aisle [October 2, 1875, with plan], and schools for 600 children, on the site of the east and north almshouses and the former clergy and church houses, from designs by R. Herbert Carpenter and W. Slater, the former (*obit* 1893) being architect of the chancel, west end, and north aisle. The sextapartite and domical groining, in red brick and stone ribs, of the chancel, which rises 60 ft. to the crown of the vault, is supported by massive buttresses having thin walls between them. The south and west walls having been condemned, a final service was held on Sunday, August 7, 1898, in the church which is depicted—but as reversed—in Hogarth's "Noon." The vaults were cleared, the floor was underlaid with concrete; the foundation stone of the new nave was laid on June 11, 1890, Mr. A. R. G. Fenning being the architect. In the autumn of that year the south and west almshouses were pulled down, a Board cookery and laundry centre, by Mr. T. J. Bailey, replacing the south group (see illustration) in 1892.

Newport Market and the Refuge.—The area of the market (Fig. 5), about 40,000 sq. ft., was cleared in July, 1882, having been reserved by Clause 33 of the Board's above cited Act of 1877, for working-class dwellings, erected as Sandringham-buildings by the Improved

Industrial Dwellings Company, on the east side of Charing Cross-road, in 1884-5. The buildings (see illustrations) included the market-house, an octagonal structure having a glazed upper story, and one of the last of the slaughter-houses which, with that in Bear-yard, Clare Market, had survived the Public Health Act of 1849. To the south of the market-house stood an old barn-like structure, which, erroneously described as the slaughter-house, had been in fact the place wherein the beasts were stabled, the dealers meeting in the "chaffering floor" above the stalls. That building, whereof the large-framed timber work and the stalls yet remained, became in 1863, by the care of the late Mrs. W. E. Gladstone, in association with the House of Charity in Greek-street, a refuge for the homeless poor, combined with

an Industrial School. The efforts made by Mrs. Gladstone and her co-adjutors were one cause of the introduction of the Houseless Poor Act, which required the London Boards of Guardians to provide more accommodation for casuals at the charges of a common fund.

SOME NOTABILIA.

Metropolitan Board of Works established under 18-9 Vict. c. 120 (1855); abolished by Local Government Act, 51-2 Vict. c. 41 (1888).
 St. Martin; St. Anne, Soho (1778); St. James, Westminster (1855), and other parishes included in the City of Westminster by London Government Act, 1899, and royal charter of October 29, 1900; the vestries abolished. City Hall, on site of Swan Close, and parish pound.
The Mews.—Aggas's map (January 17, 1903). Nelson column, 1840-9, W. Railton (May 28,

1898, sections); the lions unveiled January 31, 1867—Sir Edwin Landseer. Gordon statue [December 1, 1888]—H. Thornycroft, pedestal—A. Waterhouse.
 St. Martin's.—Mr. Boore gives, 1885, a bust of J. Gibbs, by Rysbrach, 1726, to the parish. F. Buckland finds John Hunter's coffin in the vaults; interment in Westminster Abbey, 1859. Electrical lamp standards—Singer and Sons, 1900.

Leicester-square.—Leicester House; Waller's "Sacharissa," the patriot Algernon Sidney, and Henry the beau Sidney of the De Gramont Memoirs. Long's-court; J. Gibbs built a house c. 1730, for Sir Phillip Parker Long. Green-street; 11, Woollett, engraver; (old) Soc. of Beefsteaks, 1735-1869. "Cranbourne-street," v. Gamble's rare shop-bill engraved by Hogarth, 35, St. Martin's-street, Sir Isaac Newton (1710-27), and the Burneys. Mrs. Threl's "dear

Fig. 5. Plan based on the Ordnance Map of 1870-3, to show the Widening of Coventry-street, the Alteration of Regent-circus, and the Laying-out of Shaftesbury-avenue over the Old Street Lines.

Newtonians"; front altered, 1849, and the so-called "observatory" removed; but Newton did very little astronomical work, by way of observation, in London.

St. Martin's-lane.—Cecil-court, rebuilt 1889-90, first London building, April, 1764, of L. Mozart and his two children. 75. Old Slaughter's (1892), pulled down for Cranbourne-street. Young, of New, Slaughter's, 82, County Court. Duke of York's Theatre, by W. Emden, 1891-2, on site of 104, Sir J. Reynolds, and of a house at the rear in Peter's-court, Sir J. Thornhill. 60 (rebuilt), and in 1803 opposite the church, T. Chippendale. 100 (Burlingame-mansions), Fuseli. New Theatre—W. G. R. Sprague, 1900-1. Aldridge's Mart, 1753, enlarged—P. E. Filditch. County Court replaces the Court of Requests in an old Baptist Chapel at the rear, in Castle-street (Fig. 1). Confer Smith's "Nollekens and His Times," 1828, for famous residents, and for Rubilliac's studio, rebuilt as the Meeting House in Peter's-court.

Soho.—St. Anne's church, the Danish tower rebuilt with vestry rooms and watch and engine houses, 1802-3, by S. P. Cockerell; restoration by Sir A. Blomfield; graveyard opened 1892, new W. wall for widening of Vardour-street, 1900.

Dean-street.—Soho, since Royalty, Theatre, 1834—S. Beazley; rebuilt 1882-3.

Frith-street.—87, the Novellos, 1829-34; Alf. Novello to Dean-street, 1834. Apollo Theatre, Shaftesbury-avenue, 1900-1—Lewin Sharp.

Gerard-street.—34-5, Macclesfield House: Charles Gerard, Earl of Macclesfield, 1680-93; his son; we find in the rate-book, 1700, "Earle Maxfield" is rated 11. 6s. for that house; Lord Mohun, died after the duel with the Duke of Hamilton, November 15, 1712; Lord Lyttelton; burned August 10, 1887, rebuilt for the Pelican Club—Martin and Purchase, 43 (rebuilt), Dryden, 1686-1700; we find he was rated at 11s. 3d., and his widow, "Madam Dryden," at 12s. **Soho-square.**—Carlisle House, Mrs. Cornelly's assembly rooms pulled down, 1804, the saloon converted for St. Patrick's R.C. Church, rebuilt 1891-2—Kelly and Bireball. French Protestant Church of London [June 27, 1891, and June 10, 1893] and schools in Noel-street [May 15, 1897]—Aston Webb. No. 16 [October 31, 1896]—J. T. Wimperis and Arber. Charles II.'s statue, with fountains, removed to Graeme's Dyke, Harrow Weald, July, 1886. Soho bazaar, 1815-1900.

Greek-street.—31, Jonathan Buttall, Gainsborough's "Blue Boy," succeeded to his father's ironmongery business. I. Alderman Beckford; Metropolitan Commissioners of Sewers, 1847-56; Metropolitan Board of Works until 1861, when bought for the House of Charity, the chapel—Jos. Clarke, windows—O'Connor. Five Dials; the French Change, Moor-street, site of entrance to the Swiss Chapel.

St. Giles. For the Irish and other populace, cookeries, ragged schools, etc., v. "Rookeries of London," 1850, a report of 1848, and John Leech's "Children of the Mobility." The churchyard, opened July 8, 1891; Lord Derwent-water's remains removed to Thorndon, Essex; W. Leverton's "resurrection" gate, of bricks, replaced with one of stone, 1804, shifted from N. to W. side, 1865. Public Library, High Holborn, 1893-4—W. Rusworth. Seven Dials column, having six faces, to Weybridge-green, 1822. Charing Cross-road, Shaftesbury-avenue, and High-street follow the line of the wall of St. Giles Hospital, the orchard to N.E. of Cambridge-circus.

Streets re-named; Betterton (vice Brownlow); Goldsmith (Coal-yard); Macklin (Charles, formerly Lewknor's-lane); Sbelton (King); Dyott (George, but formerly Dyott); Coptic (Duke); Soho (Charles); Ganton (Cross); Whitcomb (lower end was Dorset-place until 1882, upper end was Princess-street until 1881). Museum-street absorbed Queen, Peter, and Bow streets, Bloomsbury.

THE ARCHITECTURAL ASSOCIATION.

THE ordinary meetings of the Architectural Association will in future, as in the past, be held on Fridays. The Committee have taken pains to consult the views of the whole body of members by voting papers, and are satisfied that, though Friday may be inconvenient to some, there is not sufficient evidence that departure from long tradition is generally desired. It is, however, decided to hold the meetings in the new premises, in which there is ample accommodation, and in the July issue of the *Notes* the hope is expressed—a hope in which we share—that the enthusiasm of the past will not only be maintained, but enhanced, and that the admirable and varied series of papers and discussions promised for next session will secure the attendance and participation both of junior and senior members.

The following is the prize-list for session 1903-1904:—

A.A. Travelling Studentship, value 25/.,

and silver medal, George Drysdale; second prize, value 5/., Alick Horsnell; A.A. Medal, value 10/., J. A. Hallam; A.A. Essay Prize, value 10/., 10s., and silver medal, not awarded; Banister Fletcher Bursary, value 26/., 5s., and medal, F. J. Watson Hart; Architectural Union Company's Prize, value 10/., C. R. Pinsent. School of Design.—Elementary Class—1. D. G. Round, prize value 3/., 3s. and bronze medal; 2. C. K. Roe, certificate. Advanced Class—1. Maurice E. Webb, prize value 5/., 5s., bronze medal, and pass for modelling class; 2. Alick Horsnell, certificate and pass for modelling class.

The Andrew Oliver and Class Prizes will be announced next month.

Mr. Leonard Stokes has given a donation to the New Premises Fund of 100/., and the total amount of the fund is now 6,266/., 8s. 4d.

THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring Gardens, S.W., Mr. J. Williams Benn, M.P., Chairman, presiding.

Loans.—On the recommendation of the Finance Committee it was agreed to lend Bermondsey Borough Council 31,000/., for electric lighting and dust destructor purposes; Bethnal Green Borough Council 8,400/., for paving works; Shoreditch Borough Council 7,000/., for electric light installation, and Metropolitan Asylum District Managers 126,280/., for various purposes.

Park Side Widening.—Mr. Greenwood presented a petition, signed by the Duke of Westminster, Earl Cadogan, Lord Howard de Walden, and about 300 of the principal residents in Belgravia and Knightsbridge, praying the Council to consider the desirability of acquiring the leases of the houses known as Park Side, Knightsbridge, which are about to fall in, with a view to the widening of the road.

The petition was referred to the Improvements Committee.

Rejected War Trophies.—On the recommendation of the General Purposes Committee that the Council was not prepared to select a site for the two guns allotted to London as war trophies,

Captain Swinton moved, as an amendment, that the report be received with the exception of this paragraph, which he regarded as a slur on the whole British Army.

Mr. Sidney Low seconded the amendment, which, after a short discussion, was rejected on a division by 72 votes to 32.

Goldsmiths' Institute.—Sir William Collins (Chairman of the Education Committee) stated that, as a result of interviews with the Clerk of the Goldsmiths' Company and the London University authorities, it was made clear that the company had no intention of maintaining the institute at New-cross in perpetuity. He was, however, able to read a letter from the company to the effect that as it was too late for the company to include the whole cost of maintaining the classes during the coming winter in this year's budget, the company would grant an additional 5,000/., to be spent in consultation with the Council. If the Council saw fit to accept that offer the classes would be continued in the coming session as in the past. That was in addition to the 5,000/., a year which the company had undertaken to provide for three years.

Mr. Piggott thought the offer of the company was anything but generous.

The Council then approved of the continuation of the institute in its present form for at least one year.

Vauxhall Bridge.—The Bridges Committee, reporting upon the progress of the construction of Vauxhall Bridge, stated that under the terms of the contract the bridge should be completed by December 31, 1905. One quarter of the contract time had elapsed and about 5 1/2 per cent. of the work on the site of the bridge had been completed. In addition, about 720 tons of steel for manufacture, out of a total of 3,720 tons, had been delivered at the contractor's yard at Grays. Although the amount of work executed was not large, the contractor (Mr. C. Wall) had assured the committee that he was taking such steps as were necessary to complete the work by the time specified in the contract.

Erection of a Sign at No. 86a, Brick-lane, Spitalfields.—The Building Act Committee reported as follows:—"Our attention having been drawn to the erection of a sign at No.

86a, Brick-lane, Spitalfields, without the consent of the Council having been first obtained, we gave instructions for proceedings to be taken to obtain its removal. The summonses taken out on behalf of the Council were dismissed by the magistrate who refused to state a case for the opinion of the High Court. The principle involved is of considerable importance, having regard to the fact that the Divisional Court of the High Court recently expressed some doubt whether the case of *Hull v. the London County Council*, which decided that such signs were not projections within the meaning of section 73 of the London Building Act, 1894, was rightly decided, and we therefore think that application should be made for a mandamus to the magistrate to state a case for the opinion of the High Court in the matter of the Council *v. Mr. Schewzik re the erection of a projecting illuminated sign at No. 86a, Brick-lane, Spitalfields*, and that, in the event of the application being successful, all necessary steps be taken to obtain the opinion of the High Court upon the case."

The recommendation was agreed to.

Restaurant Shelters.—On a recommendation of the Building Act Committee to authorise Messrs. Lyons and Co. to erect an iron and glass shelter to a restaurant building on the South side of Piccadilly, a discussion on the general question of allowing such shelters took place.

Mr. J. Burns, M.P., while admitting that there was something to be said for allowing a shelter for theatres, strongly protested against the growing tendency to allow these shelters to restaurants. If this continued the streets of London would be spoiled.

The Council rejected the recommendation.

Waterloo Bridge Lamps.—Mr. Burns, M.P., asked the Chairman of the Bridges Committee whether, in the event of there being further alterations in the lighting of their bridges or other structures, care would be taken that the officers did not push interesting artistic fittings into the background, as was the case with the lamps on Waterloo Bridge.

Mr. Strauss said that, as in the past, the Council would be responsible for the doing away of lamps. A full report on the Waterloo Bridge lamps would be made on the reference of Sir Wm. Richmond, passed last week. The old Council was responsible for the taking away of the old lamps and for the new design, which he admitted was not an artistic design.

Foundations for Engines, Greenwich Generating Station.—The following recommendation of the Highways Committee was agreed to:—"(a) That expenditure on capital account, of sums not exceeding 9,900/., in all be sanctioned, in connexion with the construction of the foundations for the engines and dynamos for the first portion of the electricity generating station now being established by the Council at Greenwich for the electrical working of portions of its tramways. (b) That the offer of Messrs. H. Lovatt, Limited, to execute, at the schedule rates under their existing contract with the Council for the erection of the superstructure of the first portion of the Greenwich generating station, the construction of the foundations for the engines and dynamos for that portion of the generating station referred to in the foregoing resolution, be accepted."

Labouring-class Accommodation Demolished and built during the year 1903.—The Housing of the Working Classes Committee submitted the following report:—"We present for the information of the Council a return which has been prepared under our instructions by the statistical officer showing the net addition to labouring-class accommodation provided in the County of London and in the adjacent districts in the year 1903. The return also shows the number of rooms and tenements contained in the houses as well as the average weekly rents charged per tenement and per room. The information relating to the county areas has been obtained in the first place from the provisional valuation lists of each parish and subsequently checked by local investigation. As regards the extra London districts, the town clerks of Croydon and West Ham, and the clerks of the 22 urban and three rural districts, all supplied statistics and gave every facility for obtaining the necessary information.

The several parishes and metropolitan boroughs in London and the parishes and urban districts outside have for the purposes of the return been grouped into five sections, but the figures are given separately for each unit. The sections

are—(a) Western section—From the river northwards to the Edgware-road and the adjacent districts in Middlesex. This district includes the City of Westminster. (b) Northern section—From the Edgware-road to the Kingsland-road and the adjacent districts in Middlesex. This district includes the City of London. (c) Eastern section—From the Kingsland-road southwards to the river and all the adjacent parishes in Essex. (d) South-Eastern section—From the river to the eastern boundary of the Metropolitan Borough of Lambeth and the adjacent parishes in Kent; and (e) South-Western section—From the eastern boundary of the Metropolitan Borough of Lambeth westwards to the river and the adjacent parishes in Surrey. Each section is sub-divided into three zones, which are shown on a map which accompanies the return. The central area comprises the City of London, the City of Westminster, the Metropolitan Boroughs of Holborn, Finsbury, Bethnal-green, St. Marylebone, Stepney, Bermondsey, and Southwark, and the northern part of Lambeth and southern part of St. Pancras. The rest of London comprises the remainder of the County of London; while extra London comprises the urban districts and parishes in the immediate neighbourhood of the County of London. Taking the three zones together, the number of rooms provided and demolished in the course of the year may be summarised as follows—

	Central area.	Rest of London.	Extra London.	Total area.
Number of rooms provided . . .	3,632	22,274	38,006	63,912
Number of rooms demolished . .	3,192	1,239	472	4,903
Net addition . .	440	21,035	37,534	59,009

It is not possible to say exactly to what extent the new labouring class accommodation has exceeded that required to meet the increase in the labouring class population. Taking into account, however, the last census figures as well as the number of persons occupying the Council's dwellings, we find that an average of 1½ persons per room is a reasonable figure to take for accommodation provided within the county area, and an average of 1½ persons per room in the extra London area. If this basis be adopted, it may be stated that accommodation for 79,130 persons has been added in the course of the year. If the population increased in the same ratio as in the decennial 1891-1901, the increase would be 94,920 persons of all classes, although it is believed that an estimate on this basis shows a larger increase than has actually taken place. On the assumption that the increase in the labouring class population amounted to two-thirds of the total, such increase would be 63,280 persons on the basis of the decennial period for the whole area, or 56,318 persons on the basis of the last quinquennial period for London and the decennial period for extra London, whereas accommodation for 79,130 persons has been provided. The Council adjourned at 7.30 o'clock.

ANDERSON'S DUODECIMAL SLIDE RULE.—This invention, patented in February, 1904, by Major Anderson, R.E., promises to overcome in some measure the limitations which hitherto have militated against the adoption of the slide rule by engineers and quantity surveyors. One of the most important of the limitations in question is that the slide rule is a purely decimal instrument, involving the use of conversion tables in countries where the metric system is not commonly employed. Another disadvantage is found in the impossibility of obtaining sufficiently accurate readings on a rule of reasonable length. A feature which is somewhat perplexing to the novice is that the values of the graduations are decimally variable, in the sense, for example, that the figure 2 may be read as 0.02, 0.02, 0.2, 2, 20, 200, and so forth. In Major Anderson's rule, the numbering is made absolute, rendering subdivision possible other than decimally; but instead of the scales repeating longitudinally, they repeat in a series of parallel lines, the number of which may be increased as far as the breadth of the rule will permit. It would be impossible to explain the construction of the instrument in a short paragraph such as the present, especially without a diagram; but those of our readers who are interested in the subject will be able to obtain particulars from Mr. Casella, of Holborn Bars, by whom the instrument is being manufactured.

Illustrations.

THE DOME, ST. PETER'S.

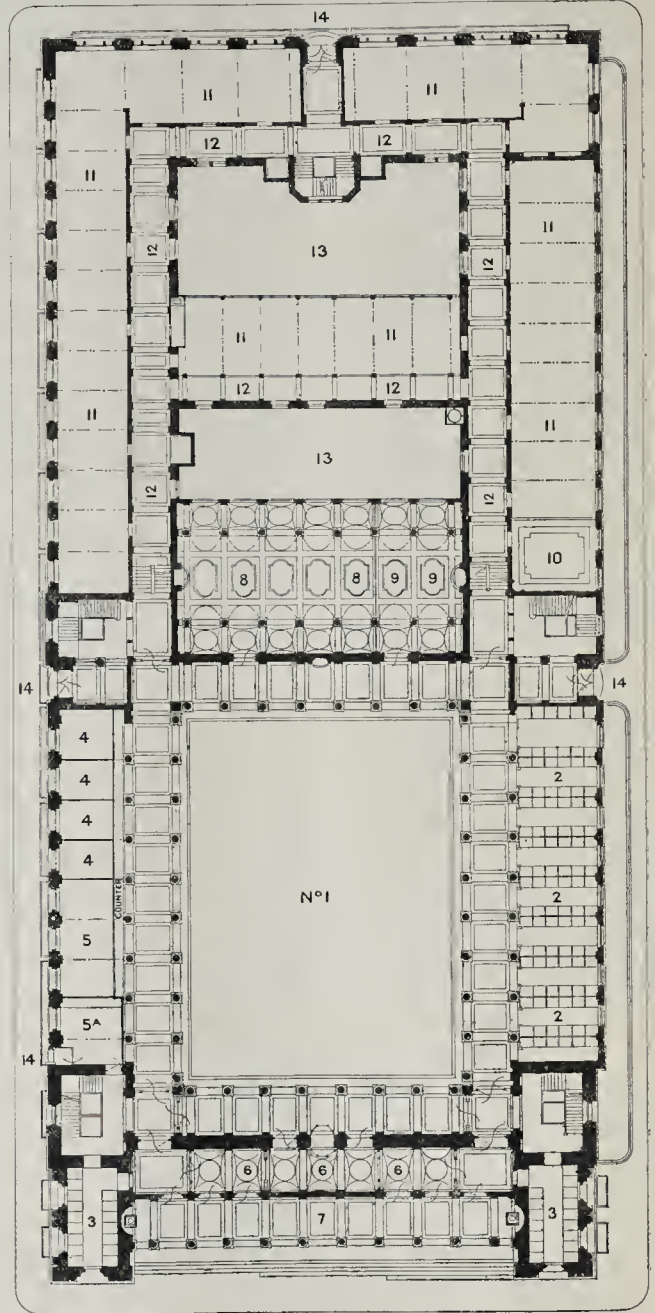

PHOTOGRAPHIC view of Michelangelo's great dome from a near and unusual point of view may not be without interest.

It gives an idea of the massiveness of construction of the dome and its substructure,

though hardly of its scale, for there is nothing in the foreground objects to furnish a definite scale. The coupled columns round the drum are about 42 ft. in height, and each of the swags in the frieze is 20 ft. long. The architecture of the drum, however, is better in respect of scale than that of the body of the church.

The drum alone, it will be remembered, was actually built under Michelangelo's inspection, though the dome and lantern were carried out from his design.

OLD HALL STREET

Liverpool Cotton Exchange. Ground Floor.

**TOMB OF POPE INNOCENT VIII.,
ST. PETER'S.**

The illustration shows the tomb of Pope Innocent VIII., which stands at the back of the second pier on the left side of the nave. It was executed, in 1492, by Pietro and Antonio Pollajuolo, the latter celebrated for his work in bronze relief.

On a projecting bracket is the seated figure of the Pope holding a spearhead, to recall the present made to him by Bajazet II., who sent him what purported to be the original spearhead with which Christ was pierced by the Roman soldier. The recumbent figure below is also that of the same Pope.

LIVERPOOL COTTON EXCHANGE.

We give this week the perspective view and plans of two of the floors of the selected design for the new Liverpool Cotton Exchange, by Messrs. Matar and Simon.

The design was described in our article on the competition designs last week. It is only necessary to add the references to the numbers figured on the plans.

MANCHESTER STOCK EXCHANGE.

This block of buildings is designed for a Stock Exchange and offices to let, the details of the arrangement being fully described in our issue of May 28 last, when a review was given of the various sets of drawings submitted in the competition, in which Messrs. Bradshaw and Gass, of Bolton, were successful, and their design is here illustrated.

The ancient lights which surround the site on all sides made it necessary to keep the new buildings within the height of the old ones, and the design had to be adjusted thereto. The main entrance to the Stock Exchange is on the street level in Norfolk-street, the "house" and its accessory offices being placed in the rear, with a secondary entrance from Pall Mall. The "run" of the business in the Manchester Stock Exchange was carefully studied and is fully provided for, so as to give the greatest convenience for the members. A large clear floor space is given to the house, which is domed and has side-lights, with the members' reading and smoke rooms near the members' entrance and overlooking the house. At the clerks' end and near their entrance the forty telephone boxes are placed, the quotation boards being in a central position. The clerks' rooms and clearing house are on the lower ground floor, with the secretary's rooms over the members' entrance, convenient for the board room, and accessible also from the office staircases. Offices to let are arranged along the Norfolk-street and Pall Mall fronts, with entrances from both streets. It is intended to erect the building in Portland stone and use marble lining in much of the interior.

**HOUSE AT WINTERSLOW, NEAR
SALISBURY.**

This house is situated on the Downs and commands a good view of the surrounding country.

The walls are of red brickwork, and the roof is tiled.

It is intended as an occasional residence by the owner, who resides in London; the village in which the house is situated being very rural and retired.

The builders are Messrs. Clarke and Son, of Winterslow; and the architects Mr. A. H. Hart and Mr. P. L. Waterhouse.

**Nos. 10 AND 11, PARK-PLACE,
ST. JAMES', S.W.**

The illustration shows two freehold houses to be erected on this site. It is intended to use Portland stone with red brickwork, and the ornament is strictly confined to positions where it will prove of most value.

Mr. A. H. Hart and Mr. P. L. Waterhouse are the architects.

CHURCH OF ST. SAVIOUR, FITZROY-SQUARE.—The Ecclesiastical Commissioners have approved of a scheme propounded by the Bishop of London, for the demolition of the Church of St. Saviour, in St. Pancras parish, and the union of the benefice with that of St. John the Evangelist Church in Charlotte-street, Fitzroy-square. The proceeds of the sale of the site and materials are to be devoted towards the endowment of a new church at Enfield. St. Saviour's Church was built as Fitzroy Chapel after, it appears, the designs of the brothers Adam, who laid out the square, of which the east and south sides were erected after their designs in 1793-5; the chapel, having been altered and improved, for 1,050 sittings, by J. Peacock, was consecrated on July 19, 1864. The organ, by Lincoln, was rebuilt by Walker.

APPLICATIONS UNDER THE 1894 BUILDING ACT.

The London County Council at their meeting on Tuesday dealt with the following applications under the London Building Act, 1894. The names of applicants are given between parentheses:—

Lines of Frontage and Projections.

Walworth.—Buildings upon the site of Nos. 347 to 351 (odd numbers) inclusive, Walworth-road, Walworth, to abut also upon Liverpool-street (Messrs. Cluttons for the Ecclesiastical Commissioners).—Consent.

Hampstead.—A motor-house at the rear of No. 156, Fordwych-road, to abut upon Rondurad, Hampstead (Messrs. Done, Hunter, and Co., for Mr. W. Jones).—Consent.

Strand.—The rebuilding of Nos. 1 and 1a, Cockspur-street, and Nos. 18 and 19, Pall-mall East, Strand, with porches and projections (Mr. H. Tanner, jun., for the International Navigation Company, Ltd.).—Consent.

Hackney North.—Buildings on the west side of Wordsworth-road, Stoke Newington, southward of the Baptist chapel (Mr. C. M. Cobb for Mr. A. J. Weibking).—Consent.

Lewisham.—Buildings with one-story shops upon a site abutting upon the south side of Ewhurst-road and west side of Salehurst-road, Lewisham (Mr. H. L. Upham for Mr. H. Lillywhite).—Consent.

Islington, North.—Retention of a showcase on the forecourt of 147, Seven Sisters-road, Islington (Mr. H. Hoek).—Consent.

Wandsworth.—Additions to the Union Church, Upper Richmond-road, Putney (Mr. C. De Gruchy for Messrs. C. W. Jones and H. Rofey).—Consent.

Battersea.—An addition to the Southlands Training College, High-street, Battersea (Messrs. C. Bell, Withers, and Meredith for the Wesleyan Education Committee).—Consent.

St. Pancras, West.—A bay window at No. 1, Albert-terrace, Regent's-park (Mr. S. C. Castleman for Sir William Collins).—Consent.

Hackney, Central.—A building at the rear of No. 44, Mortimer-road, Kingsland, to abut upon Downham-road (Mr. J. M. Lester for Mr. J. B. Watts).—Refused.

Chelsea.—A one-story building on the forecourt of "Elgin studio," on the east side of Trafalgar-square, Chelsea (Mr. W. S. Frith).—Refused.

Width of Way.

Mile End.—A dwelling-house upon the site of No. 44, West-street, Mile-end Old Town, with external walls at less than the prescribed distance from the centre of the roadway of Williams-buildings (Mr. R. Button, jun., for Mrs. A. Louissan).—Consent.

Woolwich.—A one-story addition at the rear of Nos. 57 and 58, Baresford-street, Woolwich, with the external walls at less than the prescribed distance from the centre of the roadway of Ropeyard-rails (Messrs. W. Marriage and Co. for the Committee of the Woolwich Labour Institute).—Consent.

Line of Frontage and Construction.

Southwark, West.—An open iron and concrete gangway to connect the fourth floor of "Clink Wharf," Clink-street, Southwark, with the roof level of "Soho Works," on the south side of the street (Mr. R. H. Kerr for Messrs. Noel and Sons, Ltd.).—Consent.

Formation of Streets.

Lewisham.—That an order be issued to Mr. J. W. Webb, sanctioning the formation or laying out of two new streets for carriage traffic, to lead from Salehurst-road to Bexhill-road and Stinness-road, Lewisham).—Consent.

Space at Rear.

Greenwich.—An addition at the rear of No. 119, Humber-road, Westcombe-park, Greenwich (Mr. A. Roberts for Mr. W. Ballard).—Consent.

Deviation from Certified Plans.

Chelsea.—Deviations from the plan certified by the District Surveyor, under section 43 of the Act, so far as relates to the proposed rebuilding of the hack division of No. 14, Cheyne-walk, Chelsea (Messrs. Smith and Brewer for Mr. O. Fleming).—Consent.

Strand.—Deviation from the plans approved in respect of the erection of a block of buildings on the site of Nos. 70, and 71, Jermyn-street, and 25, Bury-street, St. James's, so far as relates to an extension of the southernmost shop in Bury-street (Mr. R. Morphew for Mr. G. F. Harrington).—Consent.

Westminster.—A deviation from the plans approved in connexion with the rebuilding of the "Feathers" public-house on the site of Nos. 32 and 33, Great Chapel-street, Westminster, so far as relates to an increase in the height of the extension, over the roof of such

building, of a portion of Queen Anne's-chambers adjoining (Messrs. Rolfe and Matthews).—Consent.

The recommendations marked * are contrary to the views of the local authority.

COURT OF COMMON COUNCIL.

A MEETING of the Court of Common Council was held on Thursday of last week. On the recommendation of the Streets Committee, the following tenders were accepted:—Messrs. J. Mowlem and Co., for paving the carriage-ways of West Smithfield, with granite sets, laid with bitumen joints, 1,987*l.*; for paving the footways of West Smithfield in a similar manner, 52*l.*; and 1,969*l.* for similar work in Long-lane. Tenders were also accepted from the French Asphalt Company for paving the carriage-ways of the following streets with Asphalt:—Oat-lane, 77*l.*; Whitecross-street,

1,145*l.*; and White Hart-street, 55*l.* A tender was also accepted for 324*l.* from the Acme Flooring and Paving Company for paving the carriage-way of Cloak-lane with wood. Consent was given to the General Post Office authorities to the laying of nine 3/4-in. pipes from the Central London Railway subway (Bank Station), to the City and South London Railway Station at King William-street, and three additional 3/4-in. pipes from the Bank Station of the Central London Railway to the existing manhole at Wallbrook, and thence to the Queen Victoria-street subway.

Mr. Alderman Alliston, on behalf of the special committee appointed to consider the scheme for the construction of a barrage in the River Thames, reported the result of the interview which the committee had had with Mr. Balfour, with the purpose of pressing upon the right hon. gentleman the undesirability of proceeding further with the scheme until there

COMPETITIONS.

STAMFORD FREE LIBRARY.—The outstanding questions between the Stamford Library Committee and Mr. Carnegie have been settled, and the time for sending in designs has been extended to July 30. Mr. H. T. Hare will act as assessor.

MORTUARY AND CORONER'S COURT FOR DEPTFORD.—Deptford Borough Council on Tuesday resolved to invite architects willing to submit designs for a proposed new mortuary and coroner's court to forward their names to the Town Clerk with particulars of any similar buildings erected under their supervision. The Public Health Committee will select twelve of these names, out of which the Council will choose three, the successful one of whom will be paid an inclusive commission of five per cent., and the two others ten guineas each. The cost of the buildings is approximately estimated by the Borough Surveyor at 4,000l.

SCHOOL, ACCRINGTON.—At a meeting on the 27th ult. the Accrington Education Committee considered competitive designs for the Hyndburn Park School. This school is to be erected to meet the needs of the north-west and part of the south-west wards of the borough. The site, which is about 5,000 square yards in extent, is on Steiner's Park, adjoining Hyndburn-road and Park-road. The school has to provide accommodation for about 1,050 scholars—750 in the mixed department and 300 in the infants' department. Besides provision for ordinary subjects, accommodation is to be made for instruction in science, woodwork, cookery, and laundry work. The plans had to be for a school on the central-hall principle. The competition was restricted to architects within ten miles of the borough. Mr. T. Mellard-Read was appointed the assessor. The first premium, amounting to 50l., was awarded to Messrs. Shaw and Vowles, of Burnley. They also obtained the second premium, whilst the third, amounting to 10l., went to Messrs. Fairbairn and Holt, of Blackburn. The committee also resolved that, subject to the printed conditions, Messrs. Shaw and Vowles, architects, Burnley, be entrusted with the erection of the school on the terms named therein.

BALSALL HEATH BATHS.—The Baths and Parks Committee, at its meeting on the 27th ult., considered the competitive designs sent in, and decided to recommend the City Council to approve of those submitted by Messrs. W. Hale and Son, Colmore Row, Birmingham. The estimated cost of the baths, including the necessary engineering works, is 30,000l. The baths will adjoin the Free Library in the Moseley-road, and it was specified by the committee that the design for the new building should harmonise, or, at least, not clash, with that of the library. Consequently the elevation designed by Messrs. Hale and Son provides for a building of red brick, relieved with buff terracotta, after the Renaissance style. The plans show a two-story elevation to Moseley-road, with three entrances, all of which will be under the control of one ticket office. The suites of private baths are provided on the Moseley-road side, the swimming baths being at the back, with the boiler stands between them. The first-class swimming bath will be 150 ft. long and 56 ft. wide, with a water area of 81 ft. by 32 ft. There will be 63 dressing-boxes, and a gallery will be provided for the accommodation of spectators on the occasion of sports and aquatic entertainments. The size of the second-class swimming bath is given as 85 ft. by 48 ft. 6 in., with a water area of 72 ft. by 32 ft. Here 95 dressing-places will be provided and also a soap bath. The plans also show a suite of 16 first-class private baths for men, and 6 for women. The second-class private baths are practically duplicates of the first class. Over the entrance to the men's department in Moseley road are two turrets, specially carried up for the purpose of ventilating the private baths.—*Birmingham Mail.*

had been a Board of Trade inquiry into its merits. He said it was to be regretted that the President of the Board of Trade had not been able to see his way to meet the request of the Corporation and the Conservators of the Thames as to holding a public inquiry. The report was adopted, and the committee were empowered to continue to oppose the Port of London Bill in every way possible.

WESTMINSTER CITY COUNCIL.

The usual fortnightly meeting of the Westminster City Council was held on Thursday last week at the City Hall, Charing Cross-road.

Trafalgar-square Sewer.—On the recommendation of the Works Committee, it was agreed to construct a 12-in. pipe sewer for draining the north side of Trafalgar-square, at an estimated cost of 400l.

Rutland-street Sewer.—It was agreed also, on the recommendation of the same committee, to construct a sewer in this street, at an estimated cost of 2,500l.

Victoria Station Enticement.—An application for the closing of Ecclestone Bridge, in connexion with this work, was, on the recommendation of the Committee, refused, until

Elizabeth Bridge should again be opened to the public.

Subway for Imperial Institute to Royal College of Science.—The Works Committee reported that, after negotiations, an arrangement had been arrived at with the Office of Works in regard to the construction of this subway. The arrangement was approved of by the Council.

Whitehall Paving.—The Committee submitted a lengthy report on the "failure of the contractor to repair" the red gum-wood paving in Whitehall, by the New War Office, and recommended that the work be carried out by the Council. This was agreed to.

Piccadilly Widening.—The improvements Committee submitted a report on this matter, but, after some discussion, the question was adjourned.

PRESBYTERIAN HALL, WALSALL.—The foundation-stone of a new Presbyterian hall has just been laid in Darwall-street, Walsall. The hall will be 57 ft. long and 24 ft. wide, and will accommodate about 300. The contract price is 900l. The builders are Messrs. Hall and Sons, Walsall, and the architects are Messrs. Bailey and McConnal, Walsall.

Correspondence.

PLENUM VENTILATION AND THE ROYAL VICTORIA HOSPITAL, BELFAST.

SIR,—We regret the necessity for taking up more of your valuable space, but, although many readers will estimate at their true value the statements of Mr. Bihy in your last issue, some may, without explanation, be misled, for his calculations are based on wrong data.

Through lack of space only a limited staff could be accommodated in the old hospital, nurses residing outside. In the new hospital ample provision is made for 300 patients and 100 resident staff, and, although the full complement is not yet made up, the heating, hot-water supply, and ventilating appliances are for the whole number, and, for very good reasons, have been kept going since the buildings were completed; hence the comparison should properly be made between the total accommodation in the old and that in the new hospital.

However, we have on no occasion claimed that efficient ventilation by mechanical means, with adequate heating, can be maintained at the same rate of expenditure as haphazard ventilation and inadequate heating, because it is a well-ascertained fact that change of air within a building during cold weather implies proportionate expenditure of heat, whether mechanism be employed or not to effect that change.

What has been proved at Belfast is that a complete hospital can be erected and equipped with ventilating appliances by which definite change of air is secured from seven to ten times an hour, with adequate heating, at a cost quite one-third less than has been expended on hospitals in which no provision has been made for ventilation on any definite principle. Such a saving in initial outlay leaves a large margin for necessary annual expenditure on efficient heating and ventilation.

We regard Mr. Bihy's other statements equally as unreliable as on this question or coal consumption, and are therefore content to leave to impartial judgment the actual comfort, convenience, or cheerfulness of this in comparison with any other hospital.

WM. HENMAN and THOS. COOPER,
Architects.
HENRY LEA and SON,
Consulting Engineers.

OBITUARY.

MR. FREEMAN.—We regret to hear of the death, on June 23, in his sixty-sixth year, of Mr. Richard Knill Freeman, of Diocesan-chambers, No. 51, South King-street, Manchester, and of No. 17, Wood-street, and No. 114, Radcliffe-road, Bolton. Mr. Freeman, who was Surveyor for the Diocese of Manchester, was elected a Fellow of the Royal Institute of British Architects in 1882; he was a Fellow of the Manchester Society of Architects, and twice served as President of that society. Having begun his professional career at Derby, he removed thence to Bolton, where he established a leading and extensive practice in Lancashire and the adjoining counties. Of some of his principal architectural works, the following have been illustrated, and with plans, in the *Builder*:—Church of the Holy Trinity, South Shore, Blackpool (August 21, 1886; and April 6, 1889, interior); Graythwaite Hall, Windermere, for Lieut.-Colonel Myles-Sandys, M.P. (June 11, 1887; and the stables, December 7, 1895); "Bryerswood," Windermere, for Mr. J. R. Bridson (January 23, 1888); Ribbleson Church, near Preston, Lancs. (March 10, 1888); a house at San Remo, for Dr. Freeman (April 6, 1889); West Hartlepool Municipal Buildings, 1888-9 (May 11, 1889—interior of the Council Chamber); St. Augustine's Church, Tonge Moor, Bolton-le-Moors (May 2, 1891); the Free Library and Museum, Derby (July 17, 1897; No. VIII. of our series "The Architecture of our Large Provincial Towns"); and St. John the Baptist Church, at San Remo, after the fire in 1899, for which Signor Gastaldi, of San Remo, acted as local superintendent of the work (November 3, 1900). On January 28, 1888, we published an illustration of Moreton Old Hall, Cheshire, after a water-colour drawing by him, and on March 7, 1896, we illustrated his plans and designs for the Central Higher Grade School for 1,080 children in Great Moor-street, for the Bolton School Board, in respect of which he won the first premium. Twenty years ago, Mr. Freeman restored the interior of the Church of St. Mark, Worsley, built after Sir G. G. Scott's designs in 1846; he was the architect of the churches of St. Luke, Deepdish, Rochdale, 1887-97; All Saints, Moses Gate, Farnworth, near Bolton (1887); St. Paul, Marton, Lancs., as rebuilt and greatly

enlarged (1899-1900); St. Jude, Preston (1893); SS. Simon and Jude in Rishton-lane, Great Lever, Bolton, with the parsonage and schools (1899); and St. Katharine, near Chorley New-road, Horwich, of which the nave, side aisles, vestries, and temporary chancel were completed, for 600 sittings, in May, 1902. He prepared the plans and designs for the Infirmary near the public park in Spa Fields (opened in October, 1883); the Chadwick Natural History Museum buildings in Queen's-park (opened in June, 1884); the Corporation's Public Baths (1896); and the Church Army Labour and Settlement Home—Bolton; St. Margaret's Church, Hollinwood, near Oldham; the enlargement of the parish church at St. Anne's-by-the-Sea; the Wesleyan Church and schools at Pendleton; and for houses, local improvements, and so on, at South Shore, Blackpool; the schools of the Church of St. Stephen and All Martyrs, at Lever Bridge, Stone; and the pavilion, to hold 2,000 persons, on the pier at Stockport. He made the designs for the sedilia and paneling with credence in St. Luke's Church, at Deepdish, Rochdale. Amongst Mr. Freeman's more recent work we may instance the enlargement and improvement of the Nurses' Home in St. George's-road, Bolton; the St. Job's Church schools, for 800 pupils, at Farnworth-with-Kersley, Lancs.; the lych-gate, West Houghton Church, erected as a memorial of the reign of Queen Victoria, and the Coronation of King Edward VII.; the chancel, organ-chamber, etc., at Horwich Church, in memory of the late Rev. H. S. Pigot; the organ-chamber, Ringley Parish Church; and, at Christ Church, Heaton, the organ-chamber, screens, and traceried canopy of the ornamental screens in the west end of the church. In January, 1902, he acted as assessor, on behalf of the Manchester City Council, in the competition for the buildings at the Withington Cemetery, on which occasion his awards were confirmed. Messrs. Cunliffe and Freeman were architects of the Church of St. Mark, Bolton, 1871. During the past two or three years, Messrs. R. Knill Freeman and Frank Freeman have been employed as architects for the reconstruction and extension of the shore end of the central pier at Blackpool with a widening of the main frontage and deck, and new entrance buildings, pavilion, arcade, and pier promenade, for which Mr. R. Knill Freeman's

designs were chosen by the Blackpool Jetty Company in a limited competition in 1897, the new works forming portion of a scheme for the improvement of the shore promenade, etc.; the alteration and enlargement of the parish church at Ashton-on-Ribble; Crooke Hall, for Mr. Carlton Cross; Read Church, near Blackburn; and Croston Church, near Preston; new churches at Ashton, and Bickershaw near Hindley; a tower at the parish church, Hillwood; the rebuilding of the schools at Kirkham; and the carrying out of an extensive project for improving the shore end of the pier at Southport, which includes various new buildings and the setting back of the frontage of the promenade along the shore.

MR. WATTS.—Mr. George Frederik Watts, who died last Saturday at Little Holland House, which he built for himself twenty years ago in Melbury-road, Kensington, was born on February 23, 1817, his father being of Welsh descent. In his boyhood he painted some illustrations for the novels, and made a composition for the fight for the body of Patroclus. Having studied during a short while in the Royal Academy Schools, he entered the studio of William Behnes; but he often avowed that his real teachers were the Elgin marbles. After the dissolution of his marriage with Miss Ellen Terry, he married, in 1836, Miss Mary Fraser-Tytler, of Alderley, co. Inverness. He declined, in 1835 and 1834 offers of a baronetcy; he was elected A.R.A. and R.A. in the same year (1837); he received the honorary degrees of LL.D. and D.C.L. from the Universities of Cambridge and Oxford, Knighthood of the Legion of Honour and the Order of San Luigi, Lucca, and was amongst the first twelve upon whom the King bestowed the Order of Merit. Mr. Watts's first exhibits at the Royal Academy consisted of two portraits of ladies, and "The Wounded Heron," 1837. When twenty-five years old he won a prize of 300*l.* for a cartoon design of a fresco for the Houses of Parliament, of Caractacus led in triumph through the streets of Rome. He thereupon went to Italy, settling in Florence. On his return in 1846 he gained a premium of 500*l.* in the competition for decorating the House of Lords, and was commissioned to paint the frescoes of "St. George and the Dragon," and "Alfred inciting the Saxons to resist the landing of the Danes," for which he won a first prize. He exhibited in 1849 a cartoon "The people who sat in darkness have seen a great light"; his offer of a fresco for the hall of Euston terminus was declined. In other public buildings of London his work may be seen: at St. Paul's; Lincoln's Inn hall (to which he presented the large fresco of "The School of Legislation"); at Aldersgate, where he built, in the churchyard of St. Botolph, a cloister to commemorate deeds of self-sacrificing heroism in everyday life—he termed it an "open book of worth"; and at St. Jude's, Whitechapel, a mosaic replica of his picture of "Time, Death, and Judgment." Of Mr. Watts's pictures there are examples in the National Gallery, the Burlington House Diploma Gallery, and the Luxembourg, and at Munich. The twenty-nine in the National Portrait Gallery include portraits, painted at his own instance, of Panizzi, Mr. George Meredith, Carlyle, Dr. Martineau, J. S. Mill, Matthew Arnold, Sir Henry Taylor, Wm. Morris, Mr. Swinburne, and Lords Lawrence, Lyndhurst, and Stratford de Redcliffe. Lady Henry Somerset owns his portrait of Lord Tennyson, painted some forty-five years ago; and the list under this head includes those of Mrs. Ionides, Lady Holland, Lord and Lady de Vesci (a recent work in chalk), Browning, W. E. Gladstone, Joachim Rossetti, and Cardinal Manning. To the Tate Gallery he presented as many as twenty-six examples in the everyday part of his life's work; we can but cite his ideal and didactic pictures of "Love and Life"; "Love and Death"; the trilogy of Eve, with "Eve Repentant"; "Jonah"; the "Young Man who had great Possessions"; "Time, Death, and Judgment"; "Death Crowning Innocence"; "Faith"; "Hope"; "Charity"; "The Court of Death"; "Life's Illusions"; "Mammon"; and "The Minotaur." Amongst his legendary and mythological subjects we may mention the "Story from Boccaccio"; "Orpheus and Eurydice"; "Goddesses Three"; "Birth of Jupiter"; and "Endymion and Diana," of which the larger-sized version is at present in the New Gallery. His sculptured works include the "Clytie," "Hugh Lupus," an equestrian group, executed for the late Duke of Westminster, "Physical Energy," in the current year's R.A. exhibition, and the monumental figures of Bishop and Lichfield in Lichfield Cathedral, and Lord Lothian in the parish church of Bickling. The gallery of his country seat, "Limmerslease," at Compton, in

Surrey will, it is understood, become the property of the country. A notable exhibition of his own works was held, 1832, in the Grosvenor Gallery, New Bond-street. Some time ago Mr. Watts gave a version of his "Love and Death" to the Whitworth Institute, Manchester.

GENERAL BUILDING NEWS.

CHURCH, WOODHALL SPA.—In 1893 the foundation-stone of the new church of St. Peter was laid by the Right Hon. Edward Stanhope. At that time only a nave and north aisle were built, and the church has now been completed by the addition of a chancel, organ chamber, and vestry, the whole fabric costing about 3,700*l.* The architect is Mr. C. Hodgson Fowler, of Durham, and the contractors, Messrs. Dowman and Son, of Stamford. The building is of red brick.

CHURCH, BRONDESHURY.—Princess Henry of Battenberg recently laid the memorial stone of St. Anne's Church, Brondeishury, which is being built from the designs of Mr. Cutts. It will take the place of a temporary iron building which was erected four years ago. The seating accommodation to be 500.

ABERGWILLI PALACE.—The work of restoration of Abergwili Palace, the residence of the Bishop of St. David's, is to be undertaken immediately. Mr. V. D. Caroe, architect to the ecclesiastical Commissioners, has prepared the plans.

SCHOOLS, MIDDLESBROUGH.—The design of Messrs. Forrester and Wylie, architects, of Middlesbrough, and Hartlepool, for schools proposed to be erected in Marsh-road have been accepted.

PRIMITIVE METHODIST CHAPEL, SCARBOROUGH.—The new Primitive Methodist chapel, in Seamer-road, Scarborough, was recently opened. The new building is of red brick, with stone facings. The ground floor will accommodate 275 persons, and there are two aisles, with pews on either side and in the middle. The gallery has accommodation for 180 persons. The choir and organ are placed immediately behind the rostrum, and there is accommodation for a choir of over fifty. The transepts and other seats provide seating for sixty persons, making a total accommodation of 553. There is also provided a minister's vestry, etc. The architect was Mr. J. Caleb Petch, whose plans were selected in competition, and the contractors, Messrs. Hunter and Smith, brick, masonry, and plastering; Mr. T. Wilcox, joinery; Mr. W. Wodpon, slating; Mr. J. C. Gill, plumbing; Messrs. Appleby and Brogden, iron work; and Mr. Jas. Carr, painting. The cost of the whole building is 1,600*l.*

SCHOOLS, UPPER RHYMNEY.—A new school, under the auspices of the Bedwelly School Board, on the Monmouthshire side of the Rhydney Valley, was opened recently at Upper Rhydney as an infants' department. The new school provides accommodation for 260 infants, with provision for future extension for forty. There are five class-rooms opening on to a central hall. The contractor was Mr. David Davies, of Trade-street, Cardiff, and the total cost a little over 4,000*l.* Messrs. James and Morgan, of Cardiff, were the architects.

NEW INDUSTRIAL SCHOOLS, LANCASTER.—The new industrial schools, which have been erected in connexion with the Royal Albert Asylum, Lancaster, were recently opened. Mr. T. E. Eccles, architect, of Liverpool, prepared the plans for the work, and the cost has been about 7,000*l.*

MUNICIPAL BUILDINGS, INCE.—The new municipal buildings, which have been erected at Ince, have just been opened. The building is of pressed brick and Rushton red terracotta, and roof covered with blue slates. The main entrance, which is in Ince Green-lanes, has circular pillars on each side, and carved frieze above. The building is two stories in height, besides basement with open area, and has the following accommodation:—In the basement—caretaker's quarters, living-room, scullery, pantry, and two bedrooms, also stores, heating cell, hoist, etc. On the ground floor—entrance hall, separate offices for the following officials:—Clerk, assistant clerk, overseer, collector, secretary to Education Committee, and committee-room for the latter, school attendance officer, waiting-rooms, lavatory, etc., and large spare room to be used as required for any special public functions. Behind the main building is the large public hall, 67 ft. long and 35 ft. wide, with retiring-rooms on each side. The large hall is 23 ft. to the ceiling, with open timber principals and ornamental plaster ceiling. Seating accommodation has been provided for about 500 people, and a platform. At the platform on the first floor is the Council chamber, 35 ft. long by 20 ft. wide, and 16 ft. 6 in. from floor to ceiling. There is also a committee-room,

23 ft. long by 16 ft. wide, chairman's parlour, surveyor's office, drawing office, plan-room, waiting-room, medical officer, nuisance inspector's office, two spare rooms, lavatories, etc. The staircase from the hall to the first floor is of stone, with wrought-iron balusters and polished oak handrail. The floors in corridors on each floor are in granolithic mosaic with ornamental tile dados. The work has been carried out by Mr. A. Wigan, builder, Ince, with the exception of plumbing and decorating and plastering, the former being done by Messrs. Gaskell and Sons, Millgate (who have also done the heating apparatus throughout the building), and the latter by Messrs. Livesey and Parkinson. All the work has been in accordance with plans and details made by and under the supervision of the architects, Messrs. Heaton, Ralph, and Heaton, Wigan.

MASONIC HALL, AVONMOUTH.—A new masonic hall is in course of erection on a site in Port-view-road, Avonmouth. The new building will be two stories in height; the temple being on the first floor. The robing-room and dining-room will be separated by a movable partition, which, when folded back, will enable a company of about 100 to be accommodated on the ground floor. There will be lavatory appliances on the same floor, and leading from the vestibule will be a flight of stairs to the tyler's hall, retiring-room, and temple above. The building is to be in the Renaissance style, and will be of bricks, with freestone dressing, and a tiled roof. Provision is made for future extension in the shape of a kitchen on the ground floor, communicating with the dining-room. Messrs. W. and J. Bennett, of Bristol, are the contractors, and the architect is Mr. J. A. Wright, also of Bristol. The cost of the hall is estimated at about 2,000*l.*

NEW MARINE LABORATORY, CULLERCOATS, NORTHUMBERLAND.—It is proposed to erect new marine laboratory at Cullercoats, in place of that destroyed by fire. The plans for the work have been prepared by Messrs. Oliver, Leeson and Wood, architects, Newcastle, and the estimated cost is 5,000*l.*

CLUB PREMISES, GOLDWICK, OLDHAM.—The foundation-stone of the new premises of the Marlboro' Conservative Club, at Goldwick, was laid recently. The building, now in course of erection, occupies a corner plot facing Abbey Hills-road and Mustard-street, and has a frontage to the main road of 16 yds. The club comprises a billiard-room, with smoke-room, conversation-room, bar, lavatory, etc., on the ground floor; and on the first floor will be the assembly hall for public meetings, dances, etc., with retiring-rooms opening off the staircase landing. The entrances are from Abbey Hills-road, the club entrance and the entrance to the assembly hall being apart. The assembly-room floor will be boarded with maple floor boards, tongued and grooved, and specially nailed. The contractors for the whole of the works are Messrs. F. Spencer and Co., Moorhey-street, while the following are the sub-contractors:—Brickwork, Mr. Jarvis Bewley; masons, Messrs. Bebbington; slater, Mr. R. Wood; plasterer, Mr. J. Glynn; plumber and glazier, Mr. Stanley Bates. The architect for the building is Mr. Arthur Turner, Oldham.

RENFREWSHIRE COMBINATION POORHOUSE.—The memorial stone of the new combination poorhouse for the County of Renfrew was laid recently. The poorhouse, which was designed by Messrs. M'Whannell and Rogerson, architects, Glasgow and Barbead, is being built on the pavilion system, and the material used is Bothwell Park bricks, faced with Ciegghorn terra-cotta bricks, and red-stone dressings. The following beds are provided:—Female ward, 110; male ward, 117; children's ward, 36; and probationary ward, 22; total, 285. There is an administrative block and other offices, and provision has been made for future extension, including an hospital. The total cost of the buildings is estimated at 42,750*l.*

INFECTIOUS DISEASES HOSPITAL, RATRAY.—On the 23rd ult. the Infectious Diseases Hospital, which has been erected at Ratray for the burghs of Blairgowrie, Alyth, Coupar-Angus, and Ratray, was formally opened. The hospital was erected from the plans of Mr. Luke Falconer, architect, Blairgowrie, at a cost of about 5,000*l.*

CREMATORIUM, SHEFFIELD.—The new Crematorium, at Sheffield, is being erected by the Corporation at the City Road Cemetery, and takes the form of an "annexe" to the existing chapel on the Nonconformist side. This chapel was built, along with the one for the Church of England on the other side of the cemetery, and the entrance gateway and the crematorium, in 1880, for the late Sheffield Burial Board, from the designs of Messrs. M. E. and C. Hadfield, architects, and the present building is the joint work of Mr. C. Hadfield and

Mr. C. M. Hadfield. The new building is designed so as to harmonise with the chapel to which it is attached, and takes the form of a square chamber, 36 ft. by 36 ft. inside, large enough to accommodate two cremating furnaces. One only is being installed at present. The building is fireproof, being roofed with an octagonal dome of stone ribs and concrete, covered with roofing slabs of artificial stone in place of slates. It terminates in a stone lantern. Through the centre of this lantern the main furnace shaft is carried up. Light is also derived from four large windows on each face of the cremating chamber. Beneath the cremating chamber is a basement, which is required to contain the lower portions of the furnaces, flues, etc. The building is being erected by Messrs. D. O'Neill and Son, contractors; the furnace and working arrangements being provided by Messrs. H. Simon, Ltd., of Manchester.

EXTENSION OF THE VICTORIA INFIRMARY, GLASGOW.—Progress is being made with the additions to the Victoria Infirmary at Langside. The new ward pavilion consists of four stories, and has a southern exposure. On each floor there will be a ward containing about eighteen beds, and, in addition, branching off are two small wards, while to the back provision is made for all the necessary offices. The day-room at the end faces Battlefield-road, and is built on the half-circle plan, with doors on each flat opening out on to the outside balcony, which follows the contour of the outer wall. The extensions also include a nurses' home, which will provide accommodation for about thirty bedrooms and parlours. The additions, which are of white sandstone, are similar in style to the original design for the infirmary, and Mr. H. E. Clifford, architect, Glasgow, prepared the plans for the work.

FOREIGN.

FRANCE.—The statue of George Sand, by M. Sicard, has just been unveiled in the Luxembourg Gardens.—The Académie des Beaux-Arts has awarded the prize founded by the late Antoine Bailly to M. Cordouan, the President of the Société Royale des Architectes du Nord, for his fine *Hôtel de Ville* at Dankeque.—Among the "Envois de Rome," the exhibition of which has just been opened at the Ecole des Beaux-Arts, may be specially mentioned a set of plans for a "Cité Industrielle," by M. Tony Garnier, who last year sent the plans for a "Cité Ouvrière" which were refused as being too modern to find place among the classical studies which form the bulk of the students' work.—A monument to Garibaldi is to be erected at Paris.—The bust of Victor Hugo, by Dalou, has been placed in the Palais Bourbon, in the gallery called "Des Quatre Colonnes."—M. Soldi, the sculptor, has completed a model to be distributed among the members of the Société des Gens de Lettres. It bears two figures symbolising "L'Ecrivain" and "La Pensée," with a panorama of Paris as background.—The bell-tower of the Cathedral of Chartres is undergoing important repairs.—The ancient fortifications of the town of Aigues-Mortes, which were the property of the War Department, have now passed into the custody of the Fine Arts Department and have been classed among the "Monuments Historiques."—The sculptor Dubois has been commissioned to execute a monument to Eugène Fromentin, the painter, which is to be erected at la Rochelle. It will consist of a portrait bust on a column, in front of which is to be a figure of an Arab horseman.—The new Casino at Cannes, of which the cost is estimated at a million and a half of francs, is to be built on the beach, eastward of the Albert-Edward jetty. The Casino will be entirely surrounded by a garden.—The death is announced, at the age of eighty-three, of the Marquis de Barthélemy, member of the Académie des Inscriptions et Belles Lettres, and well known for his learned studies in numismatics and in the religious and feudal archeology of the Loire district, of Burgundy, and of Brittany. He was also author of some important papers on heraldry.—The death is also announced, at the age of thirty-one, of M. Charles Carpeaux, son of the eminent sculptor, who died at Saigon mainly from the effects of overwork in carrying out the various archeological missions entrusted to him by the Department of Public Instruction.

GERMANY.—The memorial to Bismarck, at Bremen, is being carried out by Adolf Hildebrand.—Professor Johannes Otzen has been elected President of the Royal Academy of Arts, at Berlin.—A new synagogue is to be built at Frankfurt, for which designs are being sent in, and for which a first premium of 4,000 marks, a second of 2,500 marks, and a third of 1,500 marks are being offered.

AUSTRIA.—The sculptor, Herr Hans Boursstaler, of Vienna, has undertaken to model and execute a monument to the Emperor Francis Joseph, in Carrara marble; the monument is to be unveiled on October 4.—A number of Viennese sculptors have been invited by the Minister of Education to send in plaster models of a memorial to Stelzhamer, the Austrian poet.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—Mr. H. T. Fowler, architect, Ramsdensquare, Barrow-in-Furness, has taken over the practice of Mr. J. X. McIntosh, of 6, Cornwallis-street, Barrow, and is removing his offices to that address.

SOCIETY OF MINIATURE PAINTERS.—The King has given his consent that this Society, which exhibits periodically at the Modern Gallery in Bond-street, should for the future assume the title of "The Royal Society of Miniature Painters."

THE LABOUR MARKET IN THE COLONIES.—The July circular of the Emigrants' Information Office states that in *Canada* the building, metal, engineering, shipbuilding, and manufacturing trades generally have been busy, and skilled mechanics have had no difficulty in procuring work at good wages; but the Minister of the Interior telegraphed from Ottawa on May 31, "Only persons wishing to engage in farming or farm labour, for whom there are abundant openings, should go to Canada at present." Experienced coal miners can get employment in Nova Scotia and British Columbia. In *Australia* there has been an excellent harvest everywhere, which has improved prospects generally, but there is little demand for more labour, and the supply of mechanics and miners is quite sufficient. The last reports from *New Zealand* show that the local supply of labour is for the most part sufficient. No persons are now allowed to land in *Cape Colony* unless they have secured definite employment in the Colony, and possess 20*l.* on arrival, or have permits to enter the Transvaal or Orange River Colony. The labour market is overstocked, and a great many mechanics and labourers are unable to obtain work. Labour in *Natal* is plentiful, and large numbers of unskilled workers and indifferent tradesmen are unable to obtain employment. Over 100 men have been discharged from the railways, and forty-four hours a week are now being worked instead of forty-eight. Emigrants, therefore, other than those obtaining nominated passages, are warned against going to Natal at the present time on the chance of work. No one can enter the *Transvaal* without a permit, and persons are warned against going there at the present time in search of work. Trade is depressed, and many workmen are leaving the country. In the *Orange River Colony* there is very little demand for skilled mechanics, and none at all for second-class hands or general labourers.

VICTORIA AND ALBERT MUSEUM.—The loan exhibition of paintings by George Morland now on view will be closed after Sunday, July 10.

THE DEANERY, MANCHESTER.—A scheme has been approved by His Majesty in Council whereby the house at present occupied by Dean Maclure in Bury New-road, Higher Broughton, Manchester, will, together with certain additional garden ground, be purchased as a residence for the Deans of the Cathedral Church. The price of the house and garden ground amounts to 5,500*l.*, and the cost of certain improvements, alterations, and incidental expenses amounts to about 750*l.* These charges will be defrayed out of moneys now held by the Ecclesiastical Commissioners on behalf of the Dean and his successors, complemented by a sum of 2,500*l.* (being not more than two years' net income of the deanery) to be raised, upon the security of a mortgage of the revenues of the deanery, by a loan at 4 per cent. from the Governors of Queen Anne's Bounty.

BRISTOL MASTER BUILDERS' ASSOCIATION.—The annual outing of the Bristol Master Builders' Association and friends recently took place to Chepstow and Raglan. The party, numbering about seventy-five, left the Joint station in saloon carriages. When they arrived at Chepstow they were conveyed to Raglan, a distance of sixteen miles. At the Beaufort Arms Hotel, Raglan, luncheon was partaken of, and then the ruins of the castle were inspected. Upon the return to Chepstow there was dinner at the Beaufort Arms Hotel, Mr. E. I. Neale (President of the Association) in the chair. The President, having submitted the loyal toast, said that members of the Association would remember that soon after entering on his year of office he mentioned that it was becoming usual with such organisations to

have a chain of office for the President to wear at public functions. He then proposed to the Association a gift of a medallion on the condition that the Association provided a suitable chain for it, which the Association accepted. He then instructed a well-known London company of goldsmiths to make a gold medallion representing the Bristol coat of arms, and it now gave him great pleasure to ask their esteemed member, Mr. Geo. Wilkins, to receive the medallion on behalf of the Association. Mr. G. Wilkins, on behalf of the members of the Association, tendered hearty thanks to the President for his gift. He then placed the chain, to which the medallion was attached, around the President's neck. Mr. R. F. Ridd submitted the health of the ladies and visitors, and Messrs. Cotterell and Brown, whose names were associated with the toast, briefly responded. The health of the President, proposed by Mr. W. Morgan (Cardiff), and acknowledged by Mr. Neale, brought the proceedings to a termination.

CAPITAL AND LABOUR.

GLASGOW MASONS.—A strike is threatened in the building trade in Glasgow and district. Recently the operative masons, of whom there are over 3,000 in the district, made a demand for an eight hours' day. This the employers refused to grant, and accompanied their refusal with an intimation of a reduction of a halfpenny per hour, bringing the wages down to 3*d.* per hour. At a meeting on the 23rd ult., attended by about 2,000, the operatives agreed to withdraw their demand for shorter hours, and by more than a two-thirds majority resolved to strike if the employers do not withdraw their intimation of reduced wages. For the last eighteen years wages and hours in the trade have been adjusted by an annual conference and agreement.

Legal.

CITY ANCIENT LIGHT DISPUTE.

The case of Savill and others v. the City Offices Company, Ltd., came before Mr. Justice Buckley in the Chancery Division on June 29 and 30, an action by the plaintiffs to restrain the defendants from erecting certain buildings in the City in such a way as to substantially interfere with the plaintiffs' ancient lights.

Mr. Buckmaster, K.C., and Mr. Lawrence appeared for the plaintiffs, and Mr. Ralph Neville, K.C., Mr. Astbury, K.C., and Mr. Whinney for the defendants.

Mr. Buckmaster said the plaintiffs were the freeholders and leaseholders of premises known as No. 34, Leadenball-street, E.C., and defendants were the owners of No. 27, Leadenball-street, which immediately adjoined No. 34 upon the western side. Plaintiffs built their premises as they now were in 1872, and in order to obtain the largest possible amount of space and light, they erected their buildings so that they had three areas, which cut into the buildings and ran east and west. The rooms that looked into these areas were very valuable in the city, and the rents were very high. But the direct light they got was entirely the light they received coming in a south-west direction over the defendants' buildings. There was a party wall between the buildings which ran to a height of 38 ft. and this, by agreement, had been demolished. This party wall was an important factor in the case. The defendants had now taken down their old buildings and had proceeded to build the present buildings, and, so far as his instructions went, they would be 30 ft. higher than the old buildings. The result of this would be that these new buildings would materially interfere with the light of the plaintiffs' windows. It was the plaintiffs' case that the most important part of their light came over the roofs of the old houses of the defendants. Then as to the party wall.—The defendants said that, if that had remained in position, the light to their windows would have been diminished to a greater extent than by the new buildings, which were further off. But the plaintiffs' evidence would show that such was not the case. The defence set up was that the defendants' buildings would not diminish the light of the ground floor of the plaintiffs' buildings; but it would slightly as regarded the first floor, but not at all in regard to the other floors. His contention, on behalf of the plaintiffs, was that defendants' buildings would interfere with their lights on the ground and first and second floors.

Mr. H. T. Smith, an architect and surveyor, gave oral evidence that the defendants' proposed buildings would materially affect and injure the light of the plaintiffs' premises.

Cross-examined by Mr. Neville, Witness said that forty windows in the plaintiffs' premises would be injured by the defendants' proposed buildings. Not every one of the rooms lighted by those windows would be so injured as to be less fit for occupation as city offices. His calculations had been based on the assumption that the wall was still standing up to the height of 33 ft.

Which are the windows which you say are injured to the greatest extent?—Undoubtedly the windows on the first and second floors of the block between areas "C1" and "C2."

Cross-examination continued, They were the windows in the central block. The rooms lighted by the windows were used as commercial offices. He considered that the rooms as City offices were not well lighted under existing conditions. They were fairly well lighted. The tests which he had made were taken at various times from July of last year. The ground floor was badly lighted, and worse than the first floor. The second floor had a much better light. He noticed a difference in the light when the defendants' buildings were down. Then there was a much greater amount of diffused light. The reduction of light would materially affect the letting and selling value of the plaintiffs' premises as City offices.

Mr. Charles Riley, cross-examined by Mr. Buckmaster, said he was an architect, and had had considerable experience in questions of light in the City of London. He had seen the plans prepared by the previous witness, and had checked the measurements and the angles of obstruction that the plans showed, and they were correct. It was fair, for the purpose of determining the obstruction that would be caused by the defendants' new buildings to the windows shown as "A" in area "C1," to take the section along the line which Mr. Smith had drawn. He had inspected the premises and gone into the rooms in areas "C1," "C2," and "C3." If defendants' new buildings were put up the light received in the windows in the first floor of "C1" would be considerably diminished. The windows in "C2" would be affected. "C3" did not stand in the same position as either "C1" or "C2." If the defendants' buildings were put up to the height they proposed, it would seriously affect the value of the plaintiffs' premises. The damage would be substantial.

Cross-examined by Mr. Neville, The light coming to the south side of "C1" was not so effective as the light coming to the north side of "C1," because, on the north side of "C1" there was a higher building of their own. He had only been in the plaintiffs' offices once, and that was a few days ago. It was at about two o'clock in the afternoon. That was on Friday, June 24. He went into the whole of the rooms on the first and second floors, but not on the ground floor. Those offices were fairly well lighted considering they looked into a well. "C3" had a good light undoubtedly.

Mr. Henry Dawson, an architect and surveyor, examined by Mr. Buckmaster, said that he had been informed of the fact that there was a party wall between the area "C1" and the defendants' premises, and the area "C2" and the defendants' premises, which originally stood at the height of 33 ft. He had formed his opinion on the question of the light on the assumption that that wall was still up.

Mr. Buckmaster: Let me take the area "C1." Assuming the party wall up, are there any windows that look into "C1" that will not be materially affected by the defendants' buildings?—None, nor in "C2" either. In answer to his lordship, the witness said that all the windows would be materially affected.

Examination continued, The letting value of the plaintiffs' premises on the ground and first floors would be materially and substantially affected by the defendants' proposed buildings. The second floor not so much. The windows "1" and "3" on the ground floor in "C3" would be materially affected by the defendants' buildings, but not the windows in the other floors of "C3."

Cross-examined by Mr. Neville, Do you say that the injury to the plaintiffs' buildings by the defendants' proposed buildings in "C1" would be greater on the ground floor than on the first floor of "A" and "B"?—Certainly not. It is greater on the first floor.

Further cross-examined, The second floor was affected less than the first floor. The deprivation of light to the ground and first floor windows of "C1" and "C2" by the defendants' new buildings would substantially affect their letting value. For all practical purposes the existence or non-existence of 23 ft. to the top of the wall might be disregarded.

Mr. John Alexander Potter, examined, said he was general manager of Shaw and Co.,

shipowners, who had offices in No. 34, Leadenhall-street. There principal offices were on the first floor, and they had also two rooms on the second floor, and another room on the third floor. Their offices looked into areas "C1" and "C2." The rooms on the first floor had been in the occupation of the Company for twenty years. During that time he had observed the light coming to the windows of the rooms on the first floor. He thought that if the defendants' buildings were put up, the light to their rooms would be very materially decreased. The defendants' building, as far as it had already gone, had diminished the light of their offices.

Cross-examined by Mr. Neville, His attention was first called to the question of light when the old building was taken down—about last September.

When was your attention first directed to any alteration of the light coming to your premises?—This spring.

Cross-examination continued, He considered that the obstruction that would be caused to the light of the window "A" by the defendants' new buildings would be appreciable. The obstruction might not be material in summer, but it would be material in winter. Before the defendants' buildings were pulled down the light they received through their windows was sufficient for the business they carried on.

Mr. W. M. Marshall, secretary of a ship-building company having offices on the first floor of No. 34, Leadenhall-street, examined, said that if the light of their offices was further diminished, the value of them would be decidedly affected. He was present when the defendants made experiments with tarpaulin, showing the height their building was intended to go. He noticed that the tarpaulin materially obstructed the light coming into the window "J." The tarpaulin was up for some weeks.

This being the plaintiffs' case, his lordship asked Mr. Buckmaster what relief the plaintiffs asked for.

Mr. Buckmaster replied that plaintiffs asked for an injunction to restrain further building by the defendants, and damages for the loss of light already suffered.

His lordship: Is that what you are going to ask now?

Mr. Buckmaster: Does your lordship mean, ask for an injunction to restrain further building?

His lordship: Quite. Mr. Buckmaster, after consulting with his clients, said that they would be prepared to let the case be dealt with on the footing that they asked only for damages for the wrongful act which was done by the defendants' buildings.

His lordship: Then the question is whether I ought to refer the case to a surveyor to ascertain the damages for the wrongful act, if there is any wrongful act.

Mr. Astbury, K.C., in the absence of Mr. Neville, said he should like to call a few witnesses to show that the defendants' building caused no interference with the light of plaintiffs' building at all. According to the view of defendants, they did not intend to put up a building which would cause any damage at all.

His lordship: You have to satisfy me that the plaintiffs make out no case of interference with light in the sense we use the term.

Mr. Astbury: We say we are not causing any obstruction which is calculable at all.

Professor Elsey Smith, examined by Mr. Astbury, said he was an architect, and was Professor of Architecture at King's College. He had devoted a considerable amount of attention in the past to questions of light. In the present case he had made a careful examination of the premises, and had considered the effect of the defendants' new buildings, if raised to the full height, on the plaintiffs' windows, with the partition wall both up and in its present condition. In "C1" and "C2," supposing the partition wall was up to the full height of 33 ft., the defendants' new building could not have any possible appreciable effect on the ground floor windows in those areas. He had been in the rooms on the first floor. Having regard to City offices in general, the rooms on the first floor of plaintiffs' premises enjoyed a particularly good light. If the defendants' building was put up to the full height, the effect on the plaintiffs' premises would be so small that it could not be put into money. Having regard to the place where the premises were situate, he had no doubt at all that defendants' new building would not cause any appreciable nuisance or render any of the plaintiffs' rooms less fitted for business.

Cross-examined by Mr. Buckmaster, Would the defendants' building not materially interfere with the light which "A" had

hitherto received from the south-west?—It would not materially interfere with the lighting of the room generally. It would not be material for the purposes for which the rooms are used.

Cross-examination continued, The windows "a," "h," "c," "d," and "e" in the plaintiffs' premises were so lighted that the defendants' new building would not materially interfere with the lighting of the rooms. There was no doubt that there would be a slight interference with the light of the windows on the ground, first, and second floors in the areas "C1" and "C2," with regard to the area "C3," the interference was very slight indeed.

Mr. H. H. Collins, an architect, and one of the District Surveyors for the City of London, generally corroborated the evidence of the last witness.

Mr. Douglas Young, surveyor, examined, said he had had a large experience in light and air cases. His opinion was that the depreciation in the light to the plaintiffs' buildings by reason of the defendants' proposed buildings would be so small that it would be impossible to find a money value for it.

Cross-examined, There would be an interference with the lateral light coming from the south-west, but it would not be substantial.

Counsel having addressed the court on behalf of their respective clients, Mr. Justice Buckley, in giving judgment, after stating the facts, said that the discussion before him had proceeded on the footing that defendants might require the party wall to be replaced to the full height, and that, therefore, the plaintiffs could not have any better right to complain of any interference than they would have had if that wall were replaced. The plaintiffs said that they had a right of action to restrain the defendants from erecting their building so as to obscure, darken, injure, or obstruct the ancient lights or windows of the premises looking over the areas "C1," "C2," and "C3." That the plaintiffs' lights were ancient was not denied. At the Bar the plaintiffs, at the close of their case, had intimated that they did not ask for an injunction but only for damages. The question on which he had to express an opinion was whether, on the evidence before him, he was satisfied that the plaintiffs had made out a case of damage such as could be complained of in a court of law to their ancient lights. If he thought they had not made out such a case, he must dismiss the action with costs, but if he came to the conclusion that they had made out a *prima facie* case, he would have to direct that there should be an inquiry as to damages.

The question of fact he had to decide, having regard to the recent decision of the House of Lords in the case of the Home and Colonial Stores v. Colls, was, whether the defendants' operations would deprive the plaintiffs of sufficient light which, according to the ordinary notions of mankind, taking into consideration the neighbourhood in which the plaintiffs' premises were situate, would render them less suitable as City offices? Assuming that the party wall was replaced at "C1" and "C2," it was obvious that all the plaintiffs' lights would lie in a well. The ground floor windows would be at a very considerable depth, and the first floor windows as well. In that state of things the plaintiffs said that the windows most interfered with were the windows on the first floor. The result of the evidence was that these windows, being in offices in a very congested part of the City, in which, of course, a very high amount of light was very frequently not enjoyed, were exceptionally well lighted. It was true that there was a considerable amount of light which found its way into the wells from the east. From the south to such of the windows as looked south there was an excellent light as a City light. The windows looking north enjoyed excellent light from diffused and reflected light. They also enjoyed light from the west. These rooms enjoyed, as City offices, an excellent amount of light. He thought that the obstruction complained of would not so interfere with the light of the plaintiffs' rooms as that they could not be occupied as City Offices. That being so, there was cause of action. He negatived the suggestion that there was an actionable nuisance shown. He thought it was quite plain that there was no pecuniary damage at all which would result from that which the defendants proposed to do. The deprivation of a small amount of light was no nuisance to the plaintiffs. A little less light would do the plaintiffs no harm. That being so, there was no nuisance. The plaintiffs, having failed to prove some ground of damage, the action failed, and he dismissed it with costs.

Order accordingly.

DOVER ANCIENT LIGHT CASE.

In the Court of Appeal, composed of Lords Justices Vaughan Williams, Romer, and Cozens-Hardy on the 4th inst., the bearing was concluded of the case of Thompson and Son, Ltd., v. Lloyd's Bank, Ltd., on the defendants' appeal from the judgment of Mr. Justice Joyce in the Chancery Division. (The case was reported in the issue of the *Builder* of November 14, 1903.)

In this case the plaintiffs, the owners of the Garrick's Head, Market-square, Dover, claimed an injunction to restrain the defendants, the owners of Nos. 6 and 7, Market-square, from erecting, or permitting to remain erected, any building on the site of their premises in such a manner as to interrupt the free access of light to plaintiffs' windows as the same had been hitherto enjoyed, and for damages. It appeared that the premises of the plaintiffs and defendants adjoin, and part of the plaintiffs' premises consist of an open passage, and a tap-room alongside it, which are on the ground floor, and of rooms above. The rooms were used for the purpose of the plaintiffs' business. The windows of these rooms abut on an open yard, which is part of the defendants' premises. The highest part of the old buildings of defendants did not exceed 34 ft. from the ground level. The plaintiffs alleged that their lights were ancient, and they had enjoyed the free access of lateral light to the windows of these rooms over the defendants' buildings. The plaintiffs alleged that defendants intended to pull down these buildings and erect on the site new buildings to a height of 60 ft., which would materially obstruct their light.

Defendants, in their defence, said that no part of their proposed new buildings, which could in any way affect the access of light to the plaintiffs' windows, was to be as high as 60 ft. The proposed main back wall was to be only 31 ft. 6 in. high above the ground level, and was to be 3 ft. further south and away from the plaintiffs' windows than the old back wall. Defendants also said that the ridge of the roof was to rise to a height of 49 ft., but would be so sloped and set back from the main wall at the eaves so as not to interfere with the access of light to plaintiffs' windows. They also said that the only part of the buildings which was to approach a height of 60 ft. was a small turret at the south-eastern corner, which could not have any effect on the access of light to the windows. Defendants further said that, if there was any obstruction, it would be lateral obstruction of an insignificant and immaterial character, and not such as to cause any appreciable damage to the plaintiffs. Mr. Justice Joyce held that the defendants' building would obstruct some of the plaintiffs' ancient lights, and that the interference would not be trivial. He accordingly granted an injunction in the Yates and Jack form, and awarded the plaintiffs the costs of the action. Hence the present appeal of the defendants.

Mr. Younger, K.C., and Mr. Sargent appeared for the appellants, and Mr. Hughes, K.C., and Mr. McSwiney for the respondents. Mr. Younger, on behalf of the appellants, having stated the facts, said the question the court had to determine was, would the light from the defendants' new building amount to a nuisance to the plaintiffs? His submission was that, having regard to the decision of the House of Lords in the case of the "Home and Colonial Stores v. Colls," it did not amount to a nuisance. He argued, first, that the plaintiffs had not shown a good cause of action. If, however, the court should hold that the plaintiffs had a good cause of action, his submission was that they had no right to an injunction, but only the right to recover damages if the building were erected.

Mr. Hughes, on behalf of the respondents, submitted that the judgment of Mr. Justice Joyce should not be disturbed. He contended that the decision of the House of Lords in the case of the "Home and Colonial Stores v. Colls" did not apply to the present case. The decision of the House of Lords in that case was, in effect, that a plaintiff, though losing a substantial part of his light, had no right of action if he had a sufficiency of light for the purposes of business or occupancy. He did not think that the decision in that case went further than that. If he was right in suggesting in that case that decision could have no application to a case where you started with an insufficiency of light. In the present case it was the fact, and it was really conceded that the plaintiffs had an insufficiency of light. The tenant and all the plaintiffs' witnesses said that the light was insufficient, and that, on a dark day, artificial light had to be used. He submitted that the plaintiffs had the right to keep the little light they had. Plaintiffs were bound to get their light from the narrow yard which was now the property

of the defendants. The only possibility that the plaintiffs had of getting light was from that narrow yard. He contended that the plaintiffs had shown that they would suffer substantial damage to their light if the defendants' building were erected, and that they were entitled to the injunction granted by Mr. Justice Joyce. The learned counsel argued that, at any rate, the plaintiffs would be entitled to damages.

Lord Justice Romer pointed out that the plaintiffs could not get an order for damages as the defendants' building had not yet been erected, and might never be erected.

Mr. McSwiney followed on the same side.

In the result, Lord Justice Vaughan Williams, in giving judgment, said he should have liked to have disposed of this case on proper materials on which to work; but as neither party had accepted the suggestion for an independent surveyor to make a report to the court on the matter in dispute, all that he and his learned brothers could do was to decide the case on such materials as were placed before them. Mr. Justice Joyce had tried the case before the decision of the House of Lords in the case of the "Home and Colonial Stores v. Colls" was heard in the House of Lords, and, at that time, the learned judge had regard to the law as it was declared by the Court of Appeal in the case of the "Home and Colonial Stores v. Colls." The decision of the Court of Appeal in that case was really given on the basis that a right to light was a right of property, which, if substantially violated, entitled the person whose right had been thus violated to an injunction. That being, as Mr. Justice Joyce understood, the proper question to be inquired into at the time, the present case was tried on that basis. But they now knew that, according to the decision of the House of Lords, that the real question to be asked was, whether the effect of the defendants' building was to diminish the light and air so as to sensibly affect the occupation of the plaintiffs' premises and make them unfit for occupation. At the time the Court of Appeal gave its decision in the case of the "Home and Colonial Stores v. Colls," it was thought that anything beyond a mere trifling interference with the right to light entitled the plaintiff to succeed in an action, and to get an injunction. Mr. Justice Joyce had come to the conclusion that the sort of well from which the plaintiffs' windows got their light would be very much darker after the defendants' buildings were erected than it was now, and that there would be obstruction to the direct sunlight to the plaintiffs' windows during a part of the day. Mr. Justice Joyce went on to say that the damage would not be trivial, and would be of such a character as to justify the court in granting an injunction. He (the Lord Justice) would have thought that the most convenient course, as far as that court was concerned, was to have got an independent surveyor to have given them his views on the question, because, upon the general finding of Mr. Justice Joyce, it was impossible to say that there was such a diminution of light and air as sensibly to affect the occupation of the plaintiffs' premises, and make them less fit for occupation. For that reason he should have preferred to have the assistance of a report from an independent surveyor upon that very question. With such material as this court had, he was not satisfied that the plaintiffs had made out such a case as to entitle them to an injunction. Having regard to the conditions under which the inquiry was held, it was difficult to arrive at any conclusion at all. But, being invited by the parties to look at such parts of the case as were relevant to the issue, he was not prepared to say that the plaintiffs had made out their case. He was anxious that it should be known that he did not intend anything he had said to affect this *quia timet* kind of action, or which would entitle the defendants to say that the Court of Appeal sanctioned their building being erected. If the defendants went on with their building they went on at their own risk. In these circumstances the action must be dismissed, and the appeal succeed, with the usual consequences.

Lord Justice Romer also thought that the appeal should be allowed. He could not help thinking that the expert witnesses in the court below, and the learned judge in his findings of fact were almost of necessity influenced by the judgment of the Court of Appeal on the question of light in the case of the "Home and Colonial Stores v. Colls" before that case went to the House of Lords, and was decided there. The action was a *quia timet* action, and the onus was on the plaintiffs to prove that the proposed new buildings of the defendants would be a wrongful act on the part of the defendants such as to justify this court in granting them an injunction.

Lord Justice Cozens-Hardy also concurred.

He wished, however, to point out that the fact that the appeal had been allowed, would not prevent the plaintiffs bringing a fresh action, if they were so minded, for any damage caused by the defendants' proposed buildings.

The appeal was accordingly allowed with costs, the plaintiffs' action being dismissed with costs.

PATENTS OF THE WEEK.

APPLICATIONS PUBLISHED.*

4,819 of 1903.—J. BLANC: *Reinforced Concrete Construction.*

A system of construction for transoms, flags, slabs, floors, ceilings, joists, beams, columns, etc., in reinforced concrete, characterised by the construction of a skeleton or frame, formed of metallic trellis work of longitudinal rods or bars, connected by rods or bars which before and after having entwined the said rods or bars pass into the floor, ceiling, etc., thus establishing an intimate connexion.

13,453 of 1903.—J. SALT: *Window Sashes and Stiles, and a Device for Fixing and Hanging same.*

Window sashes and stiles, and means for hanging said sashes, consisting in the combination of grooves within the pulley stiles, conductors bearing in said grooves, and pivots bearing in said conductors, and carried in the sash stiles.

17,216 of 1903.—C. PHILIP and H. MAURER: *Rising Door Hinges and Door Checks.*

An automatically closing rising door hinge and check, comprising helically threaded pin, having at its lower end a brake piston extending into an oil receptacle or air chamber, and provided with a valve which enlarges the passage for the brake fluid during the upward movement of the pin, and reduces the said passage during the downward movement of the pin, in order to allow of rapid opening of the door and to cause the latter to close slowly.

21,322 of 1903.—T. B. HARRISON: *A Lifting or Hoisting Apparatus.*

A lifting apparatus, in which is employed a device consisting of a pulley block suspended by the hoisting rope of the lifting or hoisting apparatus, a carrying block with pulleys respectively on fixed and movable pins or axles, a rope having its two ends attached to a fixed part of the lifting or hoisting apparatus, and passed round pulleys of the said pulley block and carrying block, gripping pieces carried from said movable axles or pins, and fulcrumed to a common centre or to different centres on a distance bar.

1,742 of 1904.—J. PILKINGTON, L. PILKINGTON, and H. PILKINGTON: *Ventilating Appliances for Windows.*

The invention consists of a folding flap fixed to the bottom sash of the window, so that when the latter is raised the space can be closed, and the window fixed or locked in this position, and the fresh air can enter only between the upper and lower windows or sashes.

8,656 of 1904.—J. EBRINGHAM: *Construction of Flues and of Bricks therefor.*

This invention relates to the construction of flues for smoke, air, gas, and the like, and consists in forming said flues of specially-shaped bricks, constructed to firmly bind or bond the back and front of the flues together, and is particularly adapted to the bends in flues. The bricks are usually made of the thickness of two ordinary bricks, but may be made of the thickness of one ordinary brick if preferred.

9,200 of 1904.—A. WYSS-BAUMGARTNER: *Chimney Tops.*

A chimney top, comprising a spiral, decreasing in the sense of the height, and whose different spirals form, with the increasing height, acute angles with the centre line of greater and greater magnitude, with the object of obtaining a brisker suction action on the chimney.

10,296 of 1904.—J. D. BENNET: *Folding Desks for School and other use.*

A folding desk in which brackets carrying the swinging desk top are pivoted to the end standards, and their swinging movement is limited by stops on such brackets entered into segmental guide ways in the standards.

10,321 of 1904.—J. A. TAYLOR: *Sash Fastenings.*

The object of this invention is to combine convenience with security, by providing means whereby window sashes may be partially open and yet remain securely locked together. To

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

effect this, one end of the top rail of the bottom sash is fitted with a sash fastener, having a spring arm furnished with a projecting stud that takes into, and works up and down in a slotted check-plate, which is counter sunk in one side of the upper sash in any convenient position.

16,859 of 1903.—W. MARCH: An Appliance for Breaking up Macadam and other Roads.

A road-lifting machine, the wedges of which horizontally pierce and lift up the road surface, whether through the medium of screws or gearing, or whether constructed with lever, sliding bars, links, fixed or detached blades, steel rope, and winding gear.

17,269 of 1903.—J. W. SUTTON: Non-Conducting Walls, suitable for Ice Safes, and the like.

According to this invention the wood or other material of which the wall is formed has cemented to it a layer of compressed cork, which is preferably comparatively thick, say half an inch, and this in turn has cemented to it a sheet of mineralite. The surface of the mineralite is enamelled with any suitable enamel, which, however, should not contain any lead or other poisonous material.

17,619 of 1903.—J. SHANKS and R. BURNSIDE: Ball Taps or Float Valves.

A ball tap or float valve, comprising a barrel having a part shaped to take the connexion with the supply pipe, the inner end of which part forms the seating for a valve on a piston working in the barrel, the piston having in it a ball head on the end of a float lever, fulcrumed on a rocking ball pin projecting through the barrel.

18,583 of 1903.—A. COLLIS: Flushing Cisterns. This consists in the combination with a flushing cistern of a perforated inlet pipe, and a closed discharge chamber divided into two compartments communicating with each other, and fitted with a flap valve, discharge pipe, and air pipe, and with a plunger and pull.

6,828 of 1904.—D. D. McBEAN: A Method and Means for Constructing Subaqueous Tunnels, or the like.

A subaqueous building construction, consisting in the combination of a submerged working chamber, comprising sheeting walls driven into the earth beneath, and a roof seated upon the same, and means for supplying air under pressure to said chamber, to transmit the pressure of the superincumbent water to the side walls and bottom of said chamber.

9,945 of 1904.—F. J. M. M. DUCASTEL: A Method of Making Foundations in Compressible Loose, or Water-logged Ground.

A method of making foundations in wet ground (muddy, peaty, marshy, compressible, immersed, or water-logged), consisting in the first place, if found necessary, in the formation of a platform or artificial island, and then in the insertion and compression in this platform of impervious sheaths built up of hardened clay intended to completely surround the foundations or piles, enabling them to be mainly supported on the solid ground and anchored therein, the materials constituting these foundations being rammed, or pile driven in the interior of the said projecting sheaths with or without an armature or strengthening piece of metal.

10,556 of 1904.—J. AHNOLD JUN.: Sewers.

The construction of sewers, consisting in the combination of slabs, blocks, or plates suitably curved or shaped to form, when fitted together, the sides or body of the sewer, an invert upon which the said body is built or rests, and an outer lining of brickwork surrounding the body thus formed.

TERMS OF SUBSCRIPTION.

"THE BUILDER" (Published Weekly) is supplied DIRECT from the Office to residents in any part of the United Kingdom at the rate of 6s. per annum (24 numbers). FRANKLIN & CO., 10, Abchurch Lane, London, E.C. 4, are the sole agents for parts of Europe, America, Australia, New Zealand, India, China, and Japan. For all other parts of the world, the Publishers (FRANKLIN & CO.) should be addressed to the Publisher of "THE BUILDER," Catherine-street, W.C.

SUBSCRIBERS IN LONDON and the SUBURBS, by prepaying at the Publishing Office 18s. per annum (24 numbers) or 4s. 9d. per quarter (13 numbers), can ensure receiving "The Builder" by Friday Morning's Post.

TENDERS.

Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Thursday. [N.B.—We cannot publish tenders unless authenticated either by the architect or the building-owner; and we cannot publish announcements of tenders accepted unless the amount of the tender is given, nor any list in which the lowest tender is under 100l. unless in some exceptional cases and for special reasons.]

* Denotes accepted. † Denotes provisionally accepted.

The Planning and Construction of Gas Works.

THE planning and construction of gas works calls for engineering rather than for architectural ability, but there is nevertheless ample scope for architectural skill to be brought into action in the design and erection of the extensive buildings required for the housing of machinery and plant on all modern gas works of importance. The prosperity of the gas industry in this country, which is to a considerable extent due to the general use of gas for fuel and power purposes, is responsible for the growing dimensions of the various buildings and structures required in connexion with the manufacture, distribution, and sale of gas. With their increasing magnitude, these structures are becoming more and more conspicuous features of all our large towns, and it is, therefore, a matter of public concern that, as far as is practicable, they should be of architectural or artistic merit.

Smoke, dust, and stink are concomitants of the carbonisation of coal and the treatment of residuals which cannot, perhaps, be altogether avoided, but a gas works need not be an eyesore even in a rural district. Contrary to general belief, the atmosphere of a gas works is not prejudicial to plant life; and trees, shrubs, and flowering plants may be

seen growing luxuriantly within the walls of many gas works both in town and country. With good engineering, reputable architecture, and a little attention to horticulture and arboriculture, a gas works may become almost as inoffensive as a well-kept water works. In justice to the gas engineering profession, it must be admitted that constructions formed of a miscellaneous collection of old boiler-plates, corroded sheets of corrugated iron, and dilapidated window frames obtained by hargaining with house-breakers, which do duty as factory buildings in many industries, are seldom seen on a gas works, and that in many instances everything that can reasonably be looked for in the way of good building has been accomplished.

The issue of a ninth edition of Hughes's small handbook on gas works* calls to memory the many changes which have occurred in gas engineering practices during the fifty years which have elapsed since the first edition was published. The adoption of stoking machinery operated by compressed air, hydraulic power, or electricity, has only become general within the last fifteen years; and plant for the generation of carburetted water-gas was not erected in this country until the year 1891; whereas more than one hundred British gas works are now provided with manufacturing plant of this description. Gas-holders have largely increased in dimensions, and notable changes in the methods of con-

structing them have been witnessed. The erection of plant for the manufacture of sulphate of ammonia has become general, and gas is commonly distributed under higher pressures than formerly. The erection of special buildings for the cleaning and repairing of gas fires and cookers, and the provision of one or more show-rooms in the business quarter of the town supplied with gas, may also be regarded as comparatively modern developments of the industry.

In the preface to this ninth edition it is stated that all out-of-date references have been eliminated, but several paragraphs which reveal the antiquity of previous editions of the book have escaped Mr. O'Connor's revision. For example, turning to the description of Sir George Livesey's gas-holder of 12,000,000 cubic ft. capacity, which was erected at East Greenwich more than ten years ago, we read that "the tank of this holder, which is now in the course of construction, is 304 ft. in diameter and 31 ft. 6 in. deep, and projects 17 ft. above the level of the ground, for, on account of the abundance of water in the site (as it adjoins the Thames) the excavation could not be sunk deeper without extraordinary expense in pumping." Again, on page 80, it is stated that "gas lighting was first introduced about eighty years ago"; as a matter of fact, Professor Lewes delivered the Murdoch memorial lecture, entitled "A Century of Work on the Development of Light from Coal Gas," before the Gas Institute twelve years ago; and on

* "Gas Works: Their Construction and Arrangement and the Manufacture and Distribution of Coal Gas." Originally written by Samuel Hughes. Ninth edition, revised by Henry O'Connor. London: Crosby Lockwood and Son., 1904.

page 81 of the book itself reference is made to Creighton's attempt to introduce mechanical stoking for gas manufacture in the year 1808.

The book discusses in a general manner most of those subjects which ought to be studied in detail by every gas engineer. This cursory treatment renders it interesting to those who are not professionally associated with gas manufacture, but who nevertheless take an intelligent interest in industrial operations. It also makes the book valuable to the young gas student, since it places before him in readable form much accurate and useful information, and is likely to induce him to turn for further information to those larger treatises on gas engineering which deal with the same subjects in fuller detail. The principal fault of the present edition is that, although many new and useful paragraphs have been added, the book has not been brought quite abreast of the times. We find no mention, for instance, of the Dellwik process of water-gas manufacture, although Dellwik plant has been working at Ilford, Tipton, West Bromwich, and elsewhere for a considerable period. The electrical charging machines now in use at Derby, Paris, and other places have also escaped mention. On the other hand, the references to brick retorts might with advantage have been deleted.

The most seriously defective chapter is that on "Burners and Glasses." Incandescent lighting under normal pressures is dismissed in a short, but very much out-of-date and misleading paragraph; while, in a subsequent paragraph, the reference to a home-made lamp using hot gas and hot air, and having an efficiency of eighty-six candles per cubic ft. of gas consumed, should, in our opinion, have been omitted.

A detailed description of the planning and construction of a large modern gas works would fill a volume of considerable dimensions, and could hardly be attempted in these columns; but much of the constructive work which has to be carried out on such a works is of general interest to all concerned with building, and we may take the present opportunity of referring to the principal noteworthy features associated therewith. Before proceeding, however, it may be well to briefly refer to the order of procedure in gas manufacture as commonly carried on in the larger British factories.

The coal has to be unloaded from ships or barges and conveyed to the coal stores, or, if the coal has to be imported by rail, the trucks are shunted on to a siding, and thence direct to the coal stores. From the stores the coal is transferred to the hoppers of machines which place the coal in red-hot retorts. Each retort receives a charge of 6 cwt. of coal. The number of retorts varies, of course, with the quantity of gas to be produced, but a retort-house of fairly large dimensions will contain, say, 150 retorts; and on a large works four or five of these retort houses will be provided. The Beckton works are built on a much larger scale, but these are exceptional. The retorts are heated in furnaces maintained at a bright red heat by the combustion of producer gas generated in

producers situated beneath the furnaces, the producers being fed with hot coke. The gas evolved when the coal is placed in the retorts passes up ascension pipes to the hydraulic main, and thence through the condensers, washers, scrubbers, purifiers, and station meters to the gas-holders. Tar and ammoniacal liquor are collected from the hydraulic main, condensers, and washing apparatus, and are stored in large tanks or watertight wells. Five or six hours after the coal has been placed in the retorts gas ceases to be evolved, and the residual coke is then withdrawn and quenched with water. The retorts are immediately recharged with coal. It is important that the gas should not be allowed to accumulate under pressure in the retorts, and, as the washers, scrubbers, purifiers, and gas-holders throw considerable "back pressure," a description of pump termed an "exhauster" is connected to the inlet of the washers or condensers. The exhauster draws the gas from the retorts as rapidly as it is evolved from the coal, and forces it through the purifying apparatus into the gas-holder.

Site and General Design.—In many instances gas works established more than fifty years ago on the outskirts of a small town have gradually been hemmed in on all sides by dwelling-houses, until at length they have become more or less centrally situated in a thickly-populated district. The ground adjoining the works has meanwhile become too valuable to permit of its purchase for extensions, and the site occupied by the works has also increased in value. Consequently, a new and larger site more remote from the residential portion of the town has been secured for the manufacturing department; while the large blocks of offices and show-rooms which have become necessary, owing to the increase in the number of gas consumers, the development of the business of supplying fires and cookers on the rental system, and the increased office work entailed by the popularity of the penny-in-the-slot meter, have been erected on a portion of the old site or on some other site conveniently situated in the business quarter of the town. The central offices are, of course, in telephonic communication with the works. In London, more than a quarter of a century ago, the Gas Light and Coke Company found it expedient to close their city manufacturing stations and erect new works at Beckton, some seven miles distant, on a site of over 300 acres in extent. The most recent important removal is that of the Hastings and St. Leonards Gas Company, who will shortly commence manufacturing on their new works, now nearing completion, which have been erected at Glynne Gap, on the waste land between St. Leonards and Bexhill. Similarly new works to supply Edinburgh with gas were last year opened at Granton.

The site selected for a gas works should be one of the lowest levels in the district, and should be one on which coal can be readily and economically delivered. Water carriage is, as a rule, the cheapest, and a waterside site is therefore usually selected if available. Failing this, a site adjoining a railway is chosen. The soil should by preference be one in which a

brick or concrete gas-holder tank, say 40 ft. in depth, can be readily constructed. The water met with excavating is often a source of great expense and inconvenience to the gas engineer. In colliery districts the soil should be one to which the coal can most economically be conveyed direct from the mine to the retort houses.

In the case of waterside works it is common practice to raise the coal from the ships or barges in buckets or grabs by means of steam or hydraulic cranes, the coal being discharged into trucks on a high-level railway. The trucks are propelled along overhead trestle-work lines into the upper part of the coal stores, which adjoin, or form a portion of, the retort houses. From the trucks the coal is allowed to fall into its allotted place. On large works small locomotives running on a ground level track are used for the transport of material and from different parts of the works. The relative positions of the various buildings required for plant and machinery must differ in accordance with differences in local conditions.

In planning a works only one entrance should be provided; and close to this entrance should be the gate-keeper's lodge, the weighbridge, the store-keeper's offices, and any offices to which the general public must have access. In many cases a house is provided on adjoining the works for a resident foreman or manager, and in such cases the residence should be close to the entrance, or else have a front entrance opening upon the public street, and a back side entrance in direct communication with the works. It is desirable that unauthorised persons should not be able to gain access to, nor employees to leave, the works without passing the gate-keeper.

Coal Stores.—The coal stores are frequently situated within the retort houses. In other cases they are merely covered spaces without walls situated in close proximity to the retort houses. The proportionate storage space required is dependent upon the facility with which fresh supplies can be obtained. A works adjoining a colliery need not stock a large supply, but where the supply has to be brought from a distance, and the delivery is liable to interruption, a large stock must be maintained. Generally speaking, provision should be made for the storage of at least as much coal as will be required during two winter months.

Retort Houses.—These should be substantially built of brick, and have, in preference, slate roofs. There are two stages in most modern houses—a lower upper stage from which the retorts are charged and the residual coke with drawn, and a lower stage from which the furnaces are clinkered. The red-hot coke, as it is raked out from the retorts is allowed to fall through an opening in the upper stage to the lower stage, where it is quenched with water. The upper stage is usually about 10 ft. above the lower, and is commonly formed of cast-iron plates supported on iron columns. The dimensions of retort houses vary, of course, very greatly. They are frequently made about 75 ft. in width and about 40 ft. in height from the lowest floor to

springing roof. The length will according to the number of retorts, a house is sometimes constructed with few to its being lengthened when the output has to be increased. A fairly large works will probably possess four or five houses, each containing, say, 150 retorts. The rules to be observed in the construction of the outer walls of a retort house are merely those to be observed in the construction of any other building of similar dimensions. Light and air is admitted through the upper part of the walls, and attention must be given to ventilation. Outside the retort house space must be left for the storage of coke.

Purifying Houses.—Gas is commonly purified by passing it through oxide of iron and lime after it has been well washed with water. The houses are usually constructed with three stages, the top stage, for storage of new lime oxide; the second stage, on which the retorts are supported; and the bottom stage, or ground floor, which receives the gas line or oxide discharged from the retorts. By the use of chutes, the purifying material is readily transferred from one floor to another. Purifiers were formerly housed in large brick buildings, but it is now a common practice to merely provide a roof and pillars supported on metal girders and columns, the sides of the house being entirely open.

Gas and Liquor Wells.—For the storage of gas and ammoniacal liquor, large tanks are required. These are commonly underground tanks or wells constructed with cement concrete or with brick laid in cement. Sometimes, however, the tanks are constructed of riveted iron plates and lined above ground. The choice of material must depend upon local circumstances.

Oil Storage Tanks.—Where carburetted water-gas is manufactured, provision must be made for the storage of many thousands of gallons of oil. The tanks to contain this oil are usually formed of riveted iron or steel plates, and are lined above ground.

Gas-holder Tanks.—The choice of material for the construction of gas-holder tanks must depend upon locality. In London concrete is perhaps to be preferred, but in some other districts brick-and-puddle tanks may be cheaper. Ground unsuitable for excavation steel tanks placed above ground on artificial foundations are now frequently used. H. E. Jones, in a paper communicated to the Institution of Civil Engineers in 1901, gave the following figures as representative of the cost of gas-holder tanks constructed with different kinds of material, presumably in the neighbourhood of London:—

- (1) A concrete tank, in 1900, for a three-lift gas-holder containing $1\frac{1}{2}$ million cubic ft., cost 5,790*l.*, or 3*l.* 5*s.* 10*d.* per 1,000 cubic ft.
- (2) A brick-and-puddle tank, for a three-lift gas-holder for $2\frac{1}{2}$ million cubic ft., would cost at the present date, in clay 1 (the most favourable), 14,700*l.*, or 5*s.* per 1,000 cubic ft.
- (3) A steel tank, for a four-lift holder for $\frac{1}{2}$ million cubic ft., constructed in 1899, cost 5,220*l.*, or 6*l.* 18*s.* per 1,000 cubic ft.

(4) A cast-iron tank, designed in 1897, for a three-lift holder for $\frac{1}{2}$ million cubic ft., was estimated to cost 8,975*l.*, or 14*l.* 5*s.* per 1,000 cubic ft., and was not carried out.

Gas-holders.—The same authority advocates the use of steel holders with untrussed crowns. When the holder grounds the crown and roof rest upon a timber stage permanently fixed in the tank. Guide framing for the upper lifts is now frequently dispensed with, while the framing for the lower lifts is of much lighter construction than formerly. Mr. Jones recommends "vertical members of rolled-joist section, strutted at short intervals by horizontal joists or girders, and braced by flat bars of steel. Thus the entire framing resembles a single lattice column large enough to enclose the holder." The heavy cast-iron columns which were formerly universally used for gas-holder guide-framing are now quite out of date.

THE NATIONAL TRUST.

THE National Trust, which held its annual general meeting on Wednesday afternoon at the Royal Society's rooms, is developing into an important power, and seems likely, if it receives adequate support in the way of funds, to realise a very great work for the nation, and more especially for future generations, in securing in perpetuity places of beauty which otherwise would almost infallibly be spoiled or destroyed for all purposes of public enjoyment. The Bishop of Southwark, who described his interest in the movement as being that of a "slum bishop," made a point in this respect in recurring to the condition of the surroundings of St. Saviour's sixty years ago, when there was a quiet oasis shaded with trees all about the neighbourhood of the church, under which his present parishioners might be now sitting had there been a National Trust existing at that time to secure the trees and the open space for them. Another question which comes into the purview of the National Trust is that of the destruction of the beauty of natural sites by the very means which are taken to bring people within easy reach of them. As Mr. Sidney Colvin said, in a speech which was admirable both in matter and manner (the speeches generally, we may observe, were quite above the usual level of oratory at public meetings), the consecration of certain scenes in the poetry of Wordsworth resulted eventually in a kind of rush to see them, which had the effect of entirely destroying the very quality for which the poet loved them; and the chairman, Sir Robert Hunter, in his opening remarks, while pointing out that the Trust took up no general position of hostility to railways, touring, and tourists, put the very crucial question in reference to the Snowdon light railway—what was the use of providing what were called easy and cheap means of transit for the public to places of natural beauty, in a manner which robbed those places of that very atmosphere of quiet and seclusion which gave them the greater part of their charm?

The National Trust, though its pro-

gramme includes places "of historic interest" as well as "of natural beauty," has so far directed the greater part of its efforts towards the purchase and preservation of natural beauty, and this partly for a practical reason. Though the Trust has been successful in getting a good deal of money subscribed for special purposes, it is not at present a wealthy body; and it appears that the places of natural beauty which they have acquired bring in a sufficient amount of return, by rents for uses not interfering with their attractions, to make the Trust in this respect self-supporting; while ancient remains, on the contrary, require a certain expenditure in keeping them from further decay. A larger revenue may make a difference in this respect, but in our opinion the Trust is doing better for the country in securing sites of unspoiled country and preserving them than in any other possible expenditure of its energies.

This question came up in a concrete form in the third and the only really important resolution submitted to the meeting. On Wednesday, as usual, three out of the four resolutions were little more than formal, giving speakers the opportunity of saying anything they wished to say in regard to the policy and objects of the Trust; but the third one proposed a larger scheme than the Trust has yet taken in hand. The resolution ran—

"That this meeting warmly approves of the proposal for the acquisition of Aira Force and Gowbarrow Fell on Ullswater by the National Trust, and pledges itself to use every endeavour to secure the required purchase-money."

This is a larger purchase than any which the Trust has hitherto attempted, and consists of some 750 acres of park and wild fell rising to a height of 1,578 ft. above sea level, together with a ravine through which the Aira Beck flows, and with a frontage of a mile to Ullswater shore. The owner wishes to sell, but has given the Trust for the present the first claim. Were the land to be sold publicly, there can hardly be a doubt that it would be utilised for building "attractive residences," and thus lose its wild character and be the occasion of intruding houses on to the banks of Ullswater. It is not so much from the desire to possess this estate, as the desire to prevent others possessing it who would put it to a utilitarian use, that the Trust urges the raising of funds to acquire it. The price is 12,000*l.*, of which only a small proportion is as yet promised, but the Trust has been so successful in other cases in procuring money for the objects it has at heart, that we have every expectation of its success in this effort also, and that we shall hear of the completed purchase at the next annual meeting.

The preservation of the beautiful waterfall, Aira Force, is another important object. Seeing that we have arrived at a time when every engineer regards a waterfall not as an object of beauty, but as an instance of power running to waste, it is necessary to look jealously after our waterfalls, or none of them will be left to us. The fate of Foyers is a warning not to be lightly forgotten; let us do what we can to preserve those that still remain from destruction.

NOTES.

The Post Office and Open Spaces. By means of a Government Bill now before Parliament, the Post Office seeks to obtain powers which will enable the department to disfigure open spaces without reference to the rights of the owners or guardians. The conservators of such areas have hitherto been able to prevent the Post Office from carrying telegraph wires across the commons, woods, and forests under their charge to the lasting injury of their charm and the destruction of their natural appearance. If the present Bill should become law, it is highly probable that such spaces as Wimbledon Common, Epping Forest, and other heritages of the people will be hopelessly disfigured by telegraph posts and wires. There is nothing to be gained by the passing of the measure in question beyond a slight reduction in the length of wire used, and we hope that all who are interested in the preservation of open spaces will unite in resisting the act of vandalism proposed by the present Government at the instance of the Postmaster-General.

Actions against Public Authorities. In these days, when municipal trading is on the increase, the case of *Sharpington v. Fulham Board of Guardians* is one of general interest. The defendants had entered into a contract with the plaintiff, a builder, to make certain structural alterations in a house with a view to converting it into a home for pauper children. The contract price was £599l., and the contract contained an arbitration clause. The plaintiff alleged that he had been delayed in the work for thirty-six weeks over the contract time owing to the action of the defendants, and to alterations and changes made in the contract by them, and he claimed 1,357l. in addition to the contract price. The work was completed in May, 1901, arbitration was applied for in April, 1902, and the matter was referred to arbitration November 25, 1902. The defendants raised a preliminary objection in law that they were public authorities within the meaning of the Public Authorities Protection Act, 1893, and that the proceedings had not been commenced within six months next after the acts, negligence, or default complained of as prescribed by section 1. The Court held that the Act had no application to an action for breach of contract brought by a contractor, a private individual, on a contract made with him and having no connexion with the public duty to be performed by the public authority. This decision is very important, since it is obvious that the Public Authorities Protection Act was framed only to protect such authorities in their executive duties, and not when they were contracting in their new commercial capacity, and, apart from the time limit, the Act contains provisions giving public authorities great advantages as to costs if they are sued unsuccessfully, which would be most unfair were the Act to apply to their contractual relations with private persons. The defendants raised a second technical defence under the Board of Guardians (Payment of Debts) Act, 1859, in which they were also unsuccessful.

Assignees of Leasehold. THE principle of limiting covenants on sale of freehold to an indemnity has had an important application to leaseholds in the case of *Harris v. Boots*. The plaintiffs were lessees of certain premises in Brighton under a lease for thirty years, which contained a clause restraining them from making any alteration or addition to the premises without leave in writing. The plaintiffs assigned their interest in the said premises to the defendants, who were also in possession of the adjoining premises, and with the leave of the lessor all the premises were thrown into one. The assigned premises proving insanitary, certain alterations were made by the defendants, amongst other things a window was knocked through. The plaintiffs therefore proceeded against the defendants for a breach of the lease and for a mandatory injunction to restore the premises. The lessor, it is to be observed, who had an interest in the property, had taken no proceedings. In these circumstances the Court held that the covenant amounted only to a covenant to indemnify—that is to say, a covenant on the part of the assignees to indemnify the assignors against any claim for damages which might be made against them by the original lessor, and the action was dismissed. This decision is satisfactory, for it stands to reason that lessees who have parted with their interest in the premises (as was the case with the plaintiffs in this case) have no wish to enter upon litigation, but may feel compelled to do so to protect the property for the original lessor. Now, unless complaint is made by the person really interested in the property, the intervening lessee who has parted with his interest need take no proceedings, at any rate in the case of breach of negative covenants.

Steam Traffic on Roads. WITH the increasing use of steam traction for heavy traffic on the roads the case of the *Attorney-General v. Scott* will be read with interest. The defendant was the owner of a quarry in Monmouthshire, and also a hauler of stone from other quarries, and pending the trial of the action now decided he had been prohibited by an interim injunction, confirmed by the Court of Appeal, from using steam traffic on the roads at all. He was indicted for nuisance, in that it was said he rendered the roads dangerous and impassable for vehicular or other traffic. His defence was that the roads were improperly maintained with a view to the character of the ordinary traffic to be expected in that district, and he alleged that since the road had been put into a proper state the remedy of perpetual injunction was inapplicable and unreasonable. There was no allegation that any provision of the Locomotive Acts had been infringed or the traffic improperly conducted, and the case rested solely on the frequency and weight of the traffic. The Court, in a considered judgment, found that the bad condition of the road was not primarily caused by the defendant, but arose from neglect on the part of the county council in maintaining it in a fit condition for the traffic to be expected, and that after the road was properly constructed the traffic would cause little or

no damage, and the injunction was refused and the interim injunction dissolved, on the defendants giving an undertaking not to resume the traffic until the reconstruction was completed. It should be noted that this question of nuisance is quite independent of the question of damages for excessive traffic, as is shown in the case of an action for damages by the Tavistock Rural District Council, in which, although a similar defence was raised, damages for extraordinary traffic were awarded.

Street Accidents. In response to a question asked in the House of Commons the Home Office have published a table of street accidents in the Metropolitan Police District known to the police. The total number of accidents attributable to motor-cars and cycles for the year ending May 31, 1904, is 1,817, those attributable to horses and horse-drawn vehicles 22,558. In these accidents the number of persons respectively injured was 640 by motors, 7,921 by horses, the fatal accidents being respectively 17 and 198. Some of the Press organs in the motor interest are making much capital out of the above figures, quite omitting the consideration of the difference in the numbers of horses as compared with motors in use in the Metropolis. Any comparison between the two classes of traction is almost childish, but during the period covered by this return we believe there were only 5,000 to 7,000 cars in all England, and to assume that there were 100 times as many horses as cars in use in the Metropolitan Area is probably to under-estimate the real number very considerably; but even on this assumption the proportion of the total number of accidents—7·4—attributable to motors, as compared with 92·6 attributable to horses, gives a very high average to motors in view of the small number in use.

Dangers from Electric Shocks. THE embellished accounts of the fatal accidents due to shocks to trespassers and employees on electric railways, which have recently appeared in the daily Press, have given many people erroneous ideas of the dangers arising from electric shocks. It may be of use therefore to consider some of the dangers arising from this cause, as unreasoning panic may often be as dangerous as foolhardiness. Suppose, for example, that the trolley wire were to break and fall on the roof of a crowded car. In the event of the safety devices not acting, there will be a wire about a third of an inch in diameter on the car at a pressure of 550 volts from the earth. If the wire is pressing against the clothes of anyone it is exceedingly unlikely that he will feel anything, and even if it touches his skin the shock will only be appreciable if his boots are damp and the car roof wet. Even then it is not necessarily fatal. In the worst case, if anyone has grasped the wire and cannot let go, it will be perfectly safe for a fellow passenger to pull him away by grasping his clothes and putting a foot on the wire to prevent it striking others. To push the wire away or keep it down with a walking-stick is a perfectly safe proceeding. On a railway with an electrified conductor between the rails an ordinarily-

clothed person falling on the conductor would feel no shock unless his skin made contact both with the conductor and the rail. In the event of it ever being necessary, it would be fairly safe to walk beside the electrified conductor or even on it, provided that your boots were not soaking wet and that their soles were sound. In this case it would be advisable to keep your hands in your pockets. The only danger consists in stumbling, and making contact with your skiu between the conductor and damp earth or a rail. It is always safe to pull at a victim's clothes. It must be remembered that a current from the high-pressure conductor will only flow through your body when your body forms a path to another conductor at a lower pressure, as, for example, a water pipe, a gas pipe, a damp wall, or damp earth. Walking beside the electrified conductor of a railway in a rainstorm without a mackintosh is as dangerous as walking on the edge of a precipice—you must not stumble, and you must not put your foot on the rail.

Dover Harbour. ALTHOUGH the east pier of the commercial harbour at Dover will not be formally opened until September, it has already been used for Transatlantic traffic. This pier, commencing opposite a point between the Wellington and Grauville Docks, is now called the Prince of Wales Pier, and extends considerably beyond the end of the old Admiralty Pier. It is worthy of note that the landing-stage on the new pier will accommodate ocean liners at any state of the tide, and that the pier itself will ultimately have a width of 245 ft. to provide still further for the requirements of the port. Railway lines have already been laid connecting the end of the pier with the shore, but we learn that a proposal is on foot to carry a viaduct direct from the South-Eastern Railway Station, next to the Lord Warden Hotel, to a point about halfway along the Prince of Wales Pier. This will leave a triangular area, between the new viaduct, the pier, and the tidal harbour, and it is probable that the area in question will ultimately be filled in to provide a site for the erection of quay sheds and other buildings.

Contamination of Water by Lead. WE have received a small pamphlet of three pages dealing with lead in drinking water, by Dr. Aspinall Marsden, lately a medical officer of health in the North of England, in which he suggests that lead, undetected or unheeded, in water, is the cause of much illness and physical degeneration, and that the matter is of national importance. The author inveighs chiefly against moorland water supplies, but he does not state his case at all clearly. We gather that his experiences lie largely in an area whence water may be drawn from lead-bearing strata. The ordinary ore of lead, galena, is quite insoluble in water, but secondary minerals, such as cerussite, produced from it, are soluble in certain waters, e.g., those highly charged with carbon dioxide. The upland lead-bearing districts in England are, however, not numerous; Alston Moor, North Derbyshire, and the North Wales coast hardly

serve as a basis for a general indictment on these grounds. If, on the other hand, Dr. Marsden's suggestion is that nitrates, often plentiful in moorland waters, exercise a solvent action on lead pipes, his strictures cover a much wider field. Reference is made to the presence of nitrates, and it is well known that waters so contaminated, especially with ammonium nitrate, have a great solvent action upon lead. No impurity (in the absence of copper) is so easily detected and estimated in water as lead, and we should have thought that the writer's experiences would have provided figures which could answer at least some of the questions he raises. One-tenth of a grain of lead per gallon can be detected directly, and this is the amount taken by most analysts as sufficient to condemn a potable water. Smaller amounts may be found by a proportionate boiling down of the sample before testing. Fortunately hot water is not usually conveyed far in lead pipes for mechanical reasons, but it is difficult to provide a substitute for lead at a reasonable cost for a whole water system. Lead pipes could be drawn with a lining of tin, but perhaps some alloy of lead might increase our immunity from the danger of poisoning. A series of experiments on this subject with waters of various compositions would be of great value, and when, after a few more decades, we have come to realise the need for a National Chemical Laboratory, perhaps such investigations may be carried out. In the meantime we might appeal to such authorities as Professor Bedson and Dr. Oliver, of Newcastle, for some popular statement as to the effect of continued very small doses of lead upon animals.

The Parish Church, St. Giles-in-the-Fields. A FACULTY will shortly be issued by the Consistory Court for carrying out some improvements and alterations in the fabric of the church. The rector and churchwardens propose to remove the monument to Chapman, the poet, and first translator of Homer into English verse, from against the outer side of the south wall of the church into one of the vestibules. Thomas Habington, in his poem "Castara," published in the year (1635) after Chapman's death, refers to Chapman's grave outside the (old) church. The monument bears two Latin inscriptions, whereof one is a copy of the original—the date has recently been corrected—that seems to have been cut upon a fresh slab inserted into the monument as erected by Imigo Jouis to his friend—

GEORGII CHAPMAN POETA
MDCXXXIV. IGNATIUS JONES ARCHITECTUS REGIUS OB HONOREM BONARUM LITERARUM FAMILIARI SUO HOC MON: D.S.P.F.C.

The concluding letters we take to signify *de sua pecunia faciendum curavit*. The lower inscription records the restoration of the monument (in 1827), when it was protected with a hood formed of two stones placed at an angle. The faculty will authorise the separation of a part of the south aisle as a side-chapel, with a screen and a second holy table, and an exchange of the positions of the Bishop

Patteson memorial window in the north gallery, and the present east window, which forms a memorial to Dr. J. Endell Tyler, rector, who, with the churchwardens, restored Chapman's monument. The monument is in the form of a stele, rising to a total height of 5 ft. 5 in. from the ground; the base, 29 in. wide, stands 25 in. from the wall, and the top portion consists of a carved finial now much weather-worn.

The Soane Museum. WE are glad to announce that Mr. Walter L. Spiers has been appointed Curator of the Soane Museum as successor to the late Mr. Birch. Mr. Spiers assisted in the work during Mr. Birch's illness, and found it of so much interest that on the lamented death of the late Curator he determined to apply for the appointment, undertaking to give up any other professional work if appointed. Mr. W. Spiers was educated in the Engineering Department at King's College, London, and subsequently in the office of his brother, Mr. R. Phené Spiers. In the Architectural Association, which he joined in 1866, he gained the first prize in the Class of Design, and Sir W. Tite's prize for a design for a town church. He passed the voluntary examination for membership of the Institute of Architects in 1870, and obtained a silver medal for measured drawings of Eastbury Manor House in 1873. He subsequently qualified and was appointed as a district surveyor, but has given a great deal of time to the kind of research which is specially desirable in a curator of a museum. The appointment is a very good one, on which we may congratulate both Mr. Spiers and the Soane Museum Trustees.

ARCHITECTURE AT THE ROYAL ACADEMY.—VI.

THE decorative works in the architectural room, although not so numerous as in recent exhibitions, partake largely of the nature of memorials. Contrary to anticipation, the designs for sculptured monuments are few and of no great public interest, except the Queen Victoria memorial, which we have already noticed. Of the remaining exhibits, Mr. Reginald Blomfield's "South African War Memorial, at Halleybury College" (1,558), is the most prominent. The design consists of a large obelisk rising from an ornate base, the four sides of which are convex, and terminate in large carved consoles, whilst the whole stands upon a flight of circular steps. The names of battles are placed upon small metal shields on the lower part of the obelisk, and an inscription is cut in a large carved trophy in each of the sides of the base. The drawing, which is made by the author, is excellent, in spite of the tall tree behind the subject, having an angry movement; the design has merit in its XVIIIth century aspirations, but the base is perhaps over-wrought with carvings, the simplification of which would have added to the dignity of the composition.

No. 1,490 is a "Competitive Design for Memorial Tower, Allahabad," by Mr. M. S. Hack, a very ordinary conception of no value to this exhibition. Plans are wanting, but we see sufficient to convince us that this tower will not construct as shown.

We are inclined to the opinion that a XXth century war memorial should primarily indicate the period of the incident intended to be immortalised. This is not the direct purpose of No. 1,524, "War Memorial to Old Cliffonians," designed by Messrs. Paul and James, with whom is associated Mr. A. Drury, A.R.A.; for it is seen that a heavy base with much XVth century Gothic detail, upon which stands a small armoured figure, presumably St. George, is obviously an attempt to harmonise the

monument with its earlier surroundings. A very good design for a mural monument is given in No. 1,632, by Mr. J. J. Shaw, to be executed in green and black marbles. A large central recess contains a white marble sarcophagus, embellished by a chain of metal wreaths and festoons, whilst figures of youths in the act of watching, are placed in smaller side niches. The idea suggests dignity and solemnity.

The majority of the designs for commemorative works, however, take the form of stained-glass windows, all very small in size, and not one of the drawings bears a scale or any other information to direct the imagination in studying these coloured reproductions. No. 1,479 is a square-headed window with a transome, in which the subject of St. George is introduced with an heraldic panel in the lower part, and the whole is enclosed within a foliated border. Mr. J. W. Lisle's colouring and composition are the two chief factors in this excellent design.

"Sketch for an East Window, Church of St. Ignatius" (1,516), by Mr. P. Woodroffe, is a distinctly clever handling of an early geometric style of glass, such as is found at Chartres. The *motif* of the design is seen in the series of elaborated quatrefoils set in an interlacing vine grisaille. The principal panel contains a figure of Christ in Ascension, and a connected arrangement of lines and colours appearing in all the central spaces, each of which has a subject, gives cohesion to the design, an element invariably absent in this kind of work. This is a good drawing of a most interesting window. "St. George" is the popular subject of decorative artists and re-appears in No. 1,518, which is a "scrap" of glass design, by Mr. H. Arnold. Here the colour is confined to the figure exclusively, which stands out as a large spot; a slight use of colour in the ground would carry off the hardness of such an arrangement to the benefit of the whole lancet, of which this drawing forms a part. No. 1,604, by Mr. J. D. Forsyth, is a six-panel, three-light traciced window; each of the three upper spaces contains single allegorical figures surmounted by canopies, while the lower spaces have groups of figures representing arts and sciences. The colours are somewhat crude, although the work is carefully drawn; but no window can stand two distinct scales in its figure treatment. A Renaissance feeling is given in No. 1,606, a square-headed window, by Mr. J. Pfelan, in which a figure of St. John is standing upon a kind of pedestal, surrounded by an arch-and-pilastered border. The natural attitude of the subject is unsuited to the conventionality of its setting, and the scale of the respective parts is unhappy. In No. 1,635, the same author reverts to tradition in canopied design, and is more successful.

Mr. W. Aikman sends a drawing of a window for "All Saints' Church, Blackrock" (1,636), in which the principal figure is clad in a rich, red robe. A dark green background is introduced, from which rises a "tree-stem" design, terminating with angels in the apex; the general effect should be very satisfactory.

No. 1,644, by Mr. G. Parlyb, is one of the most beautiful drawings which have been hung in the Academy in recent years. It is a two-light traciced window, in which the subject of "The Annunciation" is most carefully and minutely indicated in a pre-Raphaelite manner. The colour scheme is excellent, and there are innumerable interesting and delicate accessories. The drawing, however, suggests a decorative painting more than conveying the impression of a work executed in leaded glass; the slight confusion of the design, therefore, would be accentuated by the constructional lines of the glazing. A contrast is seen in the roughness of the sketch for a single light window, No. 1,643, by Mr. O. E. Prest. Here is a figure of a bishop contained within a border consisting of an intertwining tree growth, twisted into various forms of cusped tracery. This kind of thing is not to be desired.

The decoration of interiors does not find a large place on the walls, and there is not one example of the complete treatment of a building. Although "The Salon of an Orient Liner" (1,463), by Messrs. Stevenson and Reelfern, is shown in an indifferent ink drawing, there are indications that colour is intended, as well as an extensive use of wood fittings. There is room for improvement in the design of most ship interiors, and this is quite an advance, worthy of a better drawing. No. 1,605 is "Hall Ingle in a Riverside House,"

the title given to a highly-coloured interior, designed by Mr. L. Wyburd. The scale of the furniture is very small in proportion to that of the apartment; or the hall is very high, and the timbers terrific. Resolved into present day terms in furnishing, this design is "a quaint note." The preliminary sketch for the decoration of the central hall at "St. Paul's (Girls' School," by Mr. E. J. Lambert (1,641), is the kind of subject of which we could wish many more examples. The drawing shows the colour treatment of the barrel-vaulted ceiling of the most important part of the institution, and a very good scheme is indicated. By way of criticism we should say that, whereas most of the coloured designs are subordinated to the spaces occupied, the composition in the main tympanum and indeed the architecture of this end of the hall would gain considerably if the large painted subject received a more formal arrangement. This drawing probably loses value by its perspective view; elevations, and perhaps a key-view, would be more satisfactory.

There are two exhibits which, in view of the conservative character of these annual exhibitions, appear to be out of place, or is it possibly a sign of better things? No. 1,493 is a decora-

tive coloured panel, by Mr. Alexander Fisher, representing St. Veronica. Groups of figures in flat relief are arranged about a Byzantine colonnade, making an interesting design, but it is placed much too high up to appreciate, and is more suitable for the Sculpture Galleries. In Gallery No. V. Mr. E. A. Abbey, R.A., shows a design for a Crucifixion, already mentioned, in which the coloured figures are conventionally treated and placed upon a gilt background. The panel is intended for a retdos in the Church of the Holy Trinity in Paris (361), and is instructive as indicating the sound ideas of decorative work of this great painter. But its right place is with the works in architecture, and not mixed with the pictorial reproductions of things natural. The size of the work, however, appears to have shown the hanging committee that the small chamber at disposal would not conveniently contain it.

This concludes our reviews of the drawings, etc., which illustrate architecture at Burlington House, and we are forced to summarise in the same strain as on past occasions. The practice of the architect is a wide-reaching process, and it is only necessary, in order to realise this,

Fig. 1. Doorway, S. Agostino, Ancona.

Fig 2. S. Ciriaco, Ancona.

to glance at the variety of subjects submitted in the architectural room. There is no encouragement for *grands projets* or works in any degree comprehensive, which are proportional to our national greatness; on the contrary, we find a limited selection in scraps of churches and cottages, in stained-glass and street fronts, banging haphazard, as if by a kind of gracious indulgence from the painting authority in whom is vested the destiny of a living British art.

NOTES AND SKETCHES IN SOUTHERN ITALY.—I.

ANCONA.

ANCONA is the capital of a province and has a fine harbour. Its population is considerable, containing a large proportion of Jews; according to Biedeker, 6,000 out of 28,000, but Amati gives the figures as 2,000 and 32,000 respectively. It lies on the lowest slopes of Monte Conero, the Comerus or Cumerus of Pliny, between the promontories of Monte Astagno and Monte Guasco. From the summit of the latter the Cathedral S. Ciriaco overlooks the town and the harbour, standing on the site of a temple of Venus, which is mentioned by Catullus and Juvenal, while the other horn of the semicircle is occupied by the citadel. Below this is the lazaretto, built in 1732, a pentagonal fort with a drawbridge, now utilised as a bonded warehouse. The northern pier is fortified with two batteries, and is of Roman construction. At the beginning of it rises the triumphal arch erected in honour of Trajan in 115 A.D. by the Roman senate, said to have been designed by Apollodorus. It is Corinthian, narrow and lofty, built of Parian marble without mortar. It was once adorned with trophies, inscriptions, an equestrian statue of Trajan, and statues of Plotina and Marciana, his wife and sister; all these were removed by invaders in the Vth and Xth centuries. It is approached by steps and railed round. Beyond is another arch by Vanvitelli, which faces towards the sea. It stands on the continuation of the Roman pier, which was made by Clement XII.

The streets of the city are narrow and winding (except in the new part, which is more interesting to the inhabitants than to the traveller), and every now and then steps are made use of to conquer the steep more rapidly. The Palazzo Comunale was built about 1270. Margheritone of Arezzo made the design, and from the street below a good deal of the hack part may be seen such as he left it. The facade and interior were altered in the XVth century by Francesco di Giorgio, and modernised in 1647. On the facade is a quaint relief of Adam and Eve of the original period,

and others remain at the hack. Within is a XIVth century statue of Marco de' Rossi, the legist. A little lower down a piazza has at one side an interesting facade of the same period. The Prefettura has a fine court with Gothic arcades, through which the street passes. The pointed arched gateways (which still have the chains used to block the street hanging by them) have been recast in Renaissance times with fluted attached columns, and other pointed arched openings have been disguised by additions in the same manner. The windows on the first and second floors have graceful arabesques on their friezes, and the machicolations beneath the cornice have been adapted as a decoration. The church of S. Francesco (now a barrack) has a very fine Gothic portal attributed to Giorgio da Sebenico, and so much resembling the Gothic work of Istria as to make the attribution probable. The church of S. Agostino (now also a barrack) has a striking doorway of similar style with a curious mixture of Renaissance detail (Fig. 1). Another building of the same character is the Borsa, called the Loggia de' Mercanti, built in 1459. The XVth century Palazzo Benincasa adjoins it. There are several late Renaissance churches, among which is one with a rococo spire, which is oval in plan, and has a spirally ascending arcading as decoration, giving it the strangest and most unstable appearance. An early Renaissance door of the church of S. Maria della Misericordia is rather over-rich, but pretty.

The most interesting buildings in Ancona, however, are the Cathedral (Fig. 2) and the church of S. Maria della Piazza. The facade of the former is ascribed to Margheritone, but there are many fragments of an earlier period worked up into the structure, without counting in the ten antique columns of the interior (the dedication was to S. Lorenzo until the Xth century). The dodecagonal cupola is believed to be the earliest and one of the finest in Italy. It was filled with scaffolding and undergoing restoration, so the writer has no opinion on the point. The plan is a Greek cross, each of the arms being flanked with aisles. The nave arcade is round arched, with buttress slips above each column. A dentilled cornice crowns the whole wall, and a string separates a blank clerestory space from the arcaded portion. The wooden roof is like that of S. Zeno, Verona, in shape, and is painted blue and white with yellow rosettes in each square. In the right transept there are three queer flat and shallow Ionic caps, with a heavy ornamented block above, and a cushion ahaeus above that which is moulded at the top and bottom, but otherwise plain. These appear to be of the IXth century, and much resemble some figured by Cattaneo.

There is a crypt below each transept, and on the right is a fine parapet wall with panels bearing incised designs, relief being given by the ground being tooled hack for a space. There are four slabs on one side, with storks, an eagle, peacocks, and griffins respectively, the first facing each other on each side of a pomegranate tree, the second clutching a rabbit in its claws, the third with a poplar-leaved tree between them, and the fourth with branching conventional lilies and a central stem. The design is striking, though the execution is rough, and is probably copied by local carvers from Byzantine originals. On the other side figures stand in couples beneath arches—three couples and one single figure, the background being inlaid with reddish marble. Apparently this parapet wall was remade in the XIVth century, to which period the framing and the figures appear to belong. In the crypt below are many interesting sculptured fragments of various dates—a XIIth century relief of Christ between symbols of the Evangelists, signed Phibippus; three XIIth century statuette, probably from the left transept, the sarcophagus of Titus. F. Gorgonius, praetor of Ancona; a IVth century work with reliefs of Old and New Testament subjects; the sarcophagus of S. Marcellinus, a statue of S. Primitianus and other fragments, both of architectural and figure sculpture. The crypt of the left transept has been modernised in the baroque style. Here are the tombs of SS. Cyriacus, Marcellinus, and Lihorius.

The facade has a beautiful porch with griffins, one holding a ram and the other a serpent. The drawing gives a general idea of the design of the church. The south door is largely made of earlier fragments, and probably a good deal of work was done in the XIVth century, using up material of an earlier period. Many flat reliefs are incrustated in the facade, and pieces of grey cipollino applied for decoration without constructional value. Close by is the campanile, and at the other side the archbishop's palace, where Pius II. closed his weary life in the consciousness of failure in 1464. He provided his blessing and indulgences in plenty for the crusade against the Turks which he had preached, but neither money nor arms.

The church of S. Maria della Piazza has a facade of 1210 with much carving by Philipppus; a central round arched doorway with elaborate archivolt (Fig. 3) and rows of arches across the whole facade. At the side is a pointed arched doorway and a round arched corbelled cornice, which also occurs at the summit of the nave wall. The proportions have been altered by Renaissance additions. In the wall of the facade, behind the arcading, are some pieces of interlacing inlaid work with gilded tesserae still

adhering, which seem to show an earlier use of them in this connexion than is generally allowed. The springings of arches in the main piers show that there was once a porch. The *scodelle* under the first row of arches are coarsely painted majolica of late date. This façade now so much blackened by age was built of white and pink marble.

The origin of the town is lost in the mists of antiquity. Pliny says it was founded by the Siculi fifteen centuries before Christ, Strabo that it was founded by Syracusans flying from the tyranny of Dionysius about 400 B.C. The name is derived from the Greek *αγκων*, an angle, referring to the shape of the coast. It became the capital of Picenum, and fell under the power of Rome in 268 B.C., when it was made a colony and an important maritime station. Besieged by the Goths under Totila, it was succoured by Belisarius (551), and became the principal city of the Pentapolis under the Greek Exarchs, but was afterwards conquered by the Lombards. It was given to the Pope by Charlemagne on the destruction of their kingdom. In 839 the Saracens burnt it. In 1068, remembering that damage, it joined the Normans. Nicholas II., therefore, anathematised it, but removed the curse at the intercession of S. Peter Damian. It was attacked in turn by the troops of the Church and of the Emperor, and in despair put itself under Emanuel Comnenus for forty years, from 1143. It was twice besieged by Frederick II. during this period (1167 and 1174). In the latter siege a widow named Stamura showed great bravery, setting light to the war engines under a shower of darts and stones, and apparently escaping unhurt. Ancona ceased to have relations with Constantinople after the signing of the peace of Constance between Pope and Emperor. It was the capital of the March and the residence of the Marquis. In the defeat of Ostino (1245) it lost the carroccio and its conductor, Marcellino Peto, and, remembering this, it took up the Angevin cause when the opportunity came. Sometimes Guelph, and sometimes Ghibelline, it flourished until 1532, when it finally became part of the States of the Church under Clement VII. At this time the governor, Bernardino della Barba repressed a slight rising with a large force, entered the public palace, and threw from the windows all the documents, ordering them to be burnt, an act of barbarism paralleled by that committed at Messina by the Spanish viceroy, Don Francesco Bonavides in 1678. The next governor founded the fortress, beheaded five principal citizens and exiled sixty-four, after which quiet reigned, and the city was described as *civitas fidei*! The French Revolution brought another siege, and, though it returned to the Pope and was made a free port, it suffered yet two others, one in 1849, when Zambecari defended it for eighteen days against the Austrian General Wimpffen, and

the other in 1860, when Lamoriciera and the pontifical guards were assailed by the Italians under Fanti and Persano. F. H. J.

MAGAZINES AND REVIEWS.

In the *Art Journal*, in an article on "The Art Annals of Liverpool," we are glad to see tardy justice done to that remarkable animal painter William Huggins, who went through life hardly known or appreciated in his native city or elsewhere. As the writer of the article (Mr. E. Rimbault Dibdin) truly says, he was incomparable as a draughtsman; his colour at his best was exquisite, and Landseer never drew a lion as he did." We remember one picture, a coloured crayon study of a lion walking away, his great head and mane turned round to the left, which in action and drawing was a perfect masterpiece. But Huggins seldom painted large and important oil-pictures, and that was probably one reason why he remained comparatively unknown, while such a far inferior and comparatively commonplace animal painter as Ansdell imposed himself on public notice by the large size of his canvases. An article signed "E," on the work of Mr. Lionel Smythe, we are in entire sympathy with, and the selection of illustrations is good and very representative of the work of this poetic and suggestive artist.

The *Magazine of Art* contains an article on a Belgian artist unknown to us, Herr Leempoels, who appears to be a painter with a certain original walk in art, in the creation of what may be called symbolic pictures—groups representing abstract ideas, such as "Hymn to a Family," "Friendship," etc. An article on "The present school of decoration in Germany" is very favourable in tone, but then the examples selected are also far too favourable to be regarded as really representative, by those who are acquainted with the eccentricities of furniture design constantly to be seen in German illustrated art publications. In an article on "Sculpture at the Royal Academy," the Editor observes quite truly, while doing justice to the great ability displayed in this year's sculpture, that the Academy has no space in which to illustrate adequately the real merit of contemporary British sculpture. Why Mr. Gilbert's grotesque head called "The Mother of the Ninth Symphony" should be singled out for special praise along with Watts's "Physical Energy," we do not understand. The odd and grotesque are out of place in sculpture, and the "Ninth Symphony" should have suggested something noble rather than grotesque.

The *Berliner-Architekturwelt* is largely occupied with illustrations of the architectural designs in the Berlin Art Exhibition of this year. Among these there are the usual designs for mysterious conceptions only destined to be carried out on paper—a "National Hall"

and two "Grab-Mäler"; but there are also designs of a more reasonable character. Among these Herr Kühn's "Ladies Seminary for Honnef," a domestic Gothic building with a stone ground story and white rough-cast over, is very pleasing; so, in another and rather ostentatiously simple style, is MM. Jansen and Müller's "Girls' School at Essen," but we should imagine that it was inadequately lighted. Herr Schwegken's design for the tower approach to a steel bridge fails, as so many structures of this kind do, for lack of simplicity, though it is not so weak and florid as our Tower Bridge structures. The new architectural gallery of the exhibition, designed by Herr Schweitzer, of which an interior view is given, is a really artistic piece of work, founded on Greek forms, but with some novel treatment in detail. The number is preface by a critical article on the art exhibition, written by Herr Swarzenski, of which the following is a summary. He commences by remarking that in a collection of 2,171 exhibits there can be but a small percentage of important or interesting works. In this case there is a predominance of the class of work that displays real talent and earnest endeavour, but has not sufficient greatness to rise above mediocrity. The exhibits are representative of all branches of creative art, although paintings predominate. Among these the most important are undoubtedly those by the late Franz von Lenbach, and by Ludwig Dill, whose works are classed together; the former is represented by several of his finest portraits, and the latter exhibits characteristic landscapes in soft brown, green, and grey tones. Oscar Frenzel too is distinguished by his understanding of German landscape, which he interprets best under the warm golden light of sunset. Of subject pictures there are several worthy of note, such as those of E. Dettmann, O. H. Engel, Müller, Schoenefeld, and a small pastel entitled "Adam" by Stassen. Among the sculptors Berlin is most widely represented, and besides well-known artists, such as Manz, Schauss, Hosaeus, several younger sculptors are noteworthy. Such are Jaekle and Schmarze, Ernst Müller, Helene Quittman, and C. Starck. The selection of pictures exhibited by foreigners seems a strange one. Belgium is represented by Courtaens; three Dutch artists have gained admittance, Gari Melchers, H. M. Mesdag, and Mesdag van Honten, and there is also a collection of Spanish works by Sorolla y Bastida. Besides these there is a variety of Hungarian paintings, mostly of small interest or merit. The pencil studies and illustrations in black and white show much that is good and praiseworthy, but the most satisfactory exhibits are to be found in the new architectural gallery. In general, the tendency of the architectural exhibits is towards the ideal, or merely the external aspects, and the fuller details of ground-plans, elevations, or models have been somewhat overlooked. This, however, thinks Herr Swarzenski, is in keeping with the character of the exhibition, and is therefore to be commended; a conclusion, in which, however, we can hardly concur.

The *Architectural Record* (New York) contains the continuation of Mr. de Kay's illustrated article on "Bronze and Iron Decorations," commenced in the June number. The illustrations are of very varied merit. Some of them, such as the doors of the Maryland State Building, the railing for the Newport Exchange bank, and the two playfully-designed fire-dogs by Mr. Linder, with little nude boys grouped with them, are very original and effective. Other designs show a total want of feeling for the material; the metallic window frames on pages 42-43 look exactly like wood carving, and would be taken for it but for the title, and the spray of "hammered iron work" by the Rempis Co. (page 41) is a piece of naturalism in iron of the worst type. No criticism on the illustrations seems to be attempted in the article. A paper on "What is Civic Art," by Mr. Herbert Croly, is partly a reply to one Mr. C. Mulford Robinson, who seems to have published a book or pamphlet on the subject, and to have maintained the very erroneous idea that civic art is something produced for the glorifying of the city or State and not for the sake of art. In that case, it will be likely to be more civic than artistic. Mr. Croly's remarks on the present state of American public art are judicious and interesting:

"Whether an American New York can be obtained only at the price of good looks remains to be seen; but at least we should not fall into

Fig. 3. West Door, S. Maria della Piazza, Ancona.

the naïve error of seeking to make either a consummately beautiful or a consummately American city merely by the magic of intelligent effort. A great city cannot be forced to bloom beautiful. Its comeliness must wait on the concurrence of a number of rare and happy conditions. The art which is capable of making a consummately beautiful city must possess more than intelligence, good taste, and complete information. It must be a mature art, guided by authentic conventions, fertile in great designers, possessed for a passion for propriety and beauty of form, and confirmed by genuine popular appreciation, in every respect the master of its resources. We have plenty of clever and well-informed architects, painters, and sculptors in this country and some few great ones, but it must be recognised that American art is mature only in spots, and that it should be in no hurry about attempting to rear a series of great municipal and national monuments. American art is not as yet guided by authentic conventions. Its methods are experimental."

It will be seen that Mr. Croly is a saner critic on American art than some of his countrymen. The *Architektonische Rundschau* gives for its first illustration a really charming design, the *Ratbaus* for Ober-Scheneweide, by MM. Altgelt and Schweitzer. It shows a façade in a free classic style, but with a good deal of mediæval feeling about it, part of the charm of which consists in the unexpected manner in which a generally symmetrical treatment is slightly varied in detail; the towers at each extremity of the front, for instance, are identical up to the balustrade, but the lanterns on them are of different height and design. The graceful arcaded loggia in the centre of the upper story contrasts admirably with the plain treatment of the rest of the openings. Altogether a piece of architecture at once refined and picturesque. There is nothing else of special interest in the illustrations, but the text includes an article on the public fountains of Constantinople ("Die Brunnen Konstantinopels") by Herr Freiber von Tettau.

In the July issue of *Technics* several articles will be found which are of interest to our readers. Mr. Joseph Horner deals with "Modern Methods of Steel Casting," illustrating some strong and weak forms of commonly recurring castings, pointing out the differences necessary in the design of a frame for cast-iron and steel respectively, and giving other hints that should be of service to the draughtsman. Mr. Harold Busbridge, in a short contribution on "The Shrinkage and Warping of Timber," presents some very practical notes with eleven drawings, making clear the characteristics of different varieties of timber and the effects following different methods of cutting logs into planks. "A New Process for the Protection of Iron and Steel from Corrosion" is described by Mr. Sherard Cowper-Coles. One point of particular interest about the new process is that the metal can be coated with a thin even deposit of zinc at a temperature many hundred degrees below the melting point of zinc. The first step is to free the iron from scale and oxide by dipping in an acid solution or by the use of a sand blast; the next is to place the objects in a chamber charged with zinc dust, which is heated for a few hours and allowed to cool. On opening the chamber the articles are found to be coated with a fine homogeneous covering of zinc, the thickness depending on the temperature and the length of exposure. Mr. E. Flander Etchells, in Part VII. of the "Theory of Structural Design," considers moments and the nature of units in a manner that should be helpful to those desiring a thorough grasp of the inner meaning and true import of constants employed by the structural engineer. In addition to the foregoing, mention should be made of the following articles—"The Radiation and Emanation of Radium," by Professor Rutherford; "Limitations to the Use of Storage Batteries," by Mr. H. M. Hobart and "Electric Traction," by Mr. R. Borlase Matthews. The useful character of this magazine is well maintained in the present number.

In *Public Works*, Sir W. Willcocks contributes an article on the interesting subject of "Egyptian Weirs or Regulators," including both the old and the new Nile barrages, with numerous sections. An article by Mr. J. F. J. Reynolds on "The Improvement of Traffic facilities in London," fills us with dread lest any municipal government should be tempted to carry out these suggestions. We are shown sections of "a new Thames Embankment," double-decked, with an upper roadway for motor omnibuses and other traffic carried on walls and steel supports above the present roadway, and a "typical crossing of an existing

street," with two stories of ugly girder bridges one over the other. The effect of such a system would be to choke all our street views and to render all fine architectural effect in London impossible. Does it ever occur to those who suggest this horrible disfigurement of our cities that there may be even more important considerations in a capital city than getting across a street in the easiest and quickest manner, and that a little crowding and delay may be a lesser evil than disfiguring the whole architectural aspect of a city?

This month's issue of the *Century* is worth getting by architects, for the sake of this description and illustrations of "The New West Point," the great reconstruction of the United States military Academy which is to be carried out from the designs of Messrs. Cram, Goodhue, and Ferguson, of Boston, the architects whose plans were selected in competition. This is really a fine and a very novel architectural conception; the treatment of a military school as a kind of great fortress, with something of mediæval reminiscence about it, though not a mere imitation. The competitors were instructed to keep their designs in sympathy with the existing buildings of the Academy, the most important and distinctive of which had been designed in the Gothic style; the point is exceedingly well put in the following quotation from the official Report on the subject:

"It is not desirable that any scheme should attempt to sweep the field clean and destroy architectural associations made honourable by generations of great men, while it is of the highest importance to preserve intact the structural sentiment which gives character and individuality to the Academy. It would be a great pity to make such a competition the subject of an architectural thesis in which the heritage of the past plays no part."

In the *National Review* Mrs. Ady writes a short memorial article on Giovanni Costa, bringing out very well his character both as man and artist. It is a great pity that this kind of appreciation of so remarkable an artist should have only have become general in this country after his death. Mrs. Ady dwells with emphasis on Costa's close and devoted study of nature and natural fact. "The Italy that he paints is not the conventional Italy of Claude and Poussin." Quite true. But, on the other hand, can it be said that Costa achieved as broad and elevated a style as that of Claude and Poussin at their best? There are more ways than one of looking at this question of natural fact in painting.

In *Longman's Magazine* Mr. C. L. Eastlake writes an article on what he characterises as "The Misrule of Imperial London," in which he draws attention to a great many inconveniences which are tolerated in London through mere want of efficient policing. As he says, "one of the most aggravating sources of offence to law-abiding citizens is ineffective legislation"; and he gives a good many examples of this, the truth of which will be but too readily recognised by every Londoner. Other inconveniences arise from a total want of common-sense in providing for obvious duties which are left to chance and charity. The sweeping of the crossings is a flagrant example:

"Whose business is it to keep them swept? The duty is at present undertaken by an army of irresponsible men and boys who, picketed at innumerable corners all over the town, stand holding their brooms and touching their hats to any pedestrian who is likely to spare a 'copper.' In wet and muddy weather they certainly render some service, and no conscientious foot-passenger likes to ignore it if he has a penny at hand. Now, supposing such a person in the course of a stroll goes over fifteen crossings and comes the same way back, his walk, if he is a liberal man, will have cost him half a crown! Of course no one actually incurs this expense. But as a matter of principle one crossing-sweeper deserves his fee as well as another. If they are paid at all, they ought to be paid uniformly. Sometimes an unsophisticated ratepayer asks why the parochial or metropolitan borough authorities who are supposed to keep our roadways clean do not extend that duty to street-crossings. The taxes levied for these and kindred purposes have increased enormously of late years, but if they do not suffice for their object, few householders would object to an additional charge of a few shillings if it would relieve them from an irregular and troublesome demand for daily gratuities."

This absurdity of the begging crossing-sweeper is a perfect disgrace to London. For our own part, we steadily refuse ever to give anything to a crossing-sweeper, because it is fostering a

ridiculous system. We recommend Mr. Eastlake's article to the attention of the London County Council and the City authorities.

The *Gentleman's Magazine* contains the rather surprising incident of a long and detailed architectural criticism of the Westminster Cathedral, signed "F"; from internal evidence presumably not the work of an architect, or the Byzantine capitals of the chapels would not have been described as "barbaric"; nor would the tower have been criticised as "chimney-like" without any reference to the refining effect of its entasis. It is odd that, in describing the columns of the chapels, the writer is enthusiastic about entasis, and the life it gives to "the inert and almost dead column"; yet he never notices the same effect in the tower. There is, however, reason in some of "F's" criticisms, especially in his remark as to the effect of brickwork on a great scale lying very largely in large and unbroken masses; and he does full justice to the interior of the building. It is something to find that an editor of a general magazine will admit such an article at all.

Knowledge contains an article by Mr. Walter Mander on the interesting subject of "The Solar atmosphere at different levels."

CEMENT BRICKS.

On Monday last a demonstration was given, at the works of Messrs. J. Hebblethwaite and Sons, Stanhope-street, N.W., of a machine for the manufacture of bricks from cement mortar. Both the apparatus and the method are particularly simple. The machine consists of an iron frame provided at one end with a rectangular box, divided into two compartments, the bottom of each being formed by a loose board, supported by a frame attached to the upper end of a mechanical movement, through which vertical motion is imparted to the board. Thus the bottom of each compartment can be raised to the level of the top edge. One side of the rectangular box, as well as the diaphragm parallel thereto, is slotted vertically in such manner as to permit the entrance of parallel knives, which are moved horizontally by means of a lever, and in their final position they divide the two compartments of the rectangular box into ten compartments, each of the size of an ordinary brick. The process of brickmaking may be thus briefly described:—

(1) A supply of mortar, in the proportion of one part Portland cement to three parts sand, is mixed near the machine; (2) the compartments of the rectangular box are filled with mortar, which is well rammed in so that the corners may be thoroughly filled; (3) the horizontally moving knives are drawn into their final position, cutting the mass of mortar into the form of ten bricks; (4) the knives are drawn back to their original position; and (5) the lever raising the movable bottoms of the compartments is operated, and the bricks are thereby brought out of the mould and can be carried away to await setting. As the result of our examinations, we are in a position to say that any ordinary labourer could make a large number of bricks daily after very little practice, and at a cost per thousand that would compare favourably with good stocks. It is not quite clear, however, what advantage is to be derived from the application of cement in the form of bricks. If the object be to build walls, it would be far more economical to use concrete, which is much cheaper than cement mortar, and can be filled into moulds with far less labour than that involved in the laying of separate bricks in courses. In some special classes of work, bricks may be preferable, and if our readers think them essential, they will probably find the apparatus here described to be both practicable and serviceable.

THE POWELL WOOD-PROCESS SYNDICATE.—This company, who are the patentees of the method of treating timber known as the Powell or Sugar Process, have taken premises at Carpenter's-road, Stratford, E., where they are laying down the necessary plant to work the system. The plant consists of tanks to contain the solutions, a cylinder in which the timber is treated, and drying-rooms to which the timber is taken after treatment. The plan of drying adopted is the hot-air system, with circulating fans. Among the advantages claimed by the patentees for their process are that it enables timber to be seasoned rapidly without splitting or cracking it, and affords resistance to dry rot, and other forms of decay.

THE ARCHITECTURAL ASSOCIATION
SUMMER VISITS:
IV.—WINCHESTER.

No place is more closely associated with the history of England of all ages, or more instructive in the evolution of British building styles, than the city of Winchester. Little wonder is it, therefore, that the visit of the Architectural Association to this ancient borough on Saturday, the 9th inst., should have provided endless sources of interest to students in architecture.

Under the direction of Mr. N. C. H. Nisbett, who had carefully prepared notes on a long programme, a tour of the principal buildings was made. Sites of early British camps, evidences of the Roman occupation, and various incidents of pre-conquest times were pointed out.

The West gate, probably built by Henry III. stands at about the site of the entrance to the Roman city. The building is now utilised as a small museum and showplace, containing relics of civic interest. The County Hall, which was next visited, is a large XIIIth century building with two arcades, and appears to be a later part of the Norman Castle, of which little evidence remains. The piers of the arcades have clustered Purbeck marble shafts, and are specially interesting in rising from circular bases, and terminating in the circular abacuses of the caps. Remains of the dais are still to be seen, and behind it, an unusual detail is the small window in the end wall ensuring supervision and attendance. It is a matter of regret that certain structural alterations were made in the XIXth century, chiefly in the transposing of a door and window for the supposed convenience of the assizes, which are held at long intervals. The stone vaulted subterranean sally port is perhaps unique. It is in fine preservation, and although approached from private ground, it is renowned that an opportunity will be taken of acquiring it for public service.

The Guildhall, with its overhanging clock-case and supports, together with the city cross, built about 1430, were pointed out. The prebendal brick houses and other dwellings in the close were much admired, and the new borough museum was brought to the attention of the party of twenty-eight members. This building is a stone and flint built structure in a medieval design quite unsuited to a XXth century museum, but it transpired that the corporation desired that the building should harmonise with the Cathedral. Such a suggestion reflects a blind ignorance of the lessons of archaeology.

The famous cathedral (which we illustrated and described in our Cathedral series on October 1, 1892) needs no description here. Mr. Colson, the architect to the fabric, gave an interesting account of the history of the building, and of the re-roofing of the nave in recent years. It is remarkable that a huge cathedral as large as the present church should have existed in Norman times. The choir screen is an oak fitting inserted by Sir Gilbert Scott in place of a screen designed by Imigo Jones. The latter is said to be still preserved, and it is to be hoped that great care will be taken of it, and the question of re-erection kept in mind.

Wolvesley Castle is one of the principal historic ruins of Winchester, standing upon the site of an important Roman house, and becoming later the residence of Saxon kings. Here is supposed to be the apartment in which Egbert held council in the IXth century, and declared that this country should be called England. The old walls show a careful and general re-use of old materials. A large Renaissance house, dating from 1607, now stands upon part of the site.

The ancient and well-known college was keenly inspected and appreciated. The development of the institution was explained by plans and prints. The two courts with gate towers are splendid examples of medieval educational establishments, and the chapel is unusually high for its length; the latter has suffered very considerably in the matter of fittings and decoration inserted in the XIXth century. The large schoolroom, built in 1683, is almost certainly the work of Wren, although no documentary evidence exists. The cloisters are simple yet interesting, but the most unusual feature is the Fromond's chantry, placed in the middle of the cloister-garth. Of modern works, Mr. Champneys' "Memorial Buildings" are the best, although leaving much to be desired. A South African War memorial is seen in a new gateway designed by Mr. F. L.

Pearson. The new science school, however, is a most unfortunate piece of design, from all points of view. The façades have many features which are utterly meaningless; perhaps the worst of these is the carved stone tympanum in the wooden pediment and cornice, stained and varnished!

The historic Hospital of St. Cross was finally visited. No description is here needed, but it may be of interest to recall that the institution was founded in 1136 for thirteen poor brethren. The present lodgings were built in the XVth century, and it is supposed that the original dwellings were located on the south side of the church. The latter is a large edifice, and very interesting as a "transition" Norman work. It is to be deplored that the interior of the chancel should have been so ruthlessly spoiled by virulent colour decoration designed by the late Mr. Butterfield. The scheme consists of a variety of coarse patterns having no relation to the unique architecture of the chancel, and the result is nothing short of barbaric. An inspection of the kitchen, with its ancient utensils, and of the hall, terminated a splendid day's instructive sight-seeing.

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, S.W. Mr. J. Williams Benn, M.P., Chairman, presiding.

Loans.—On the recommendation of the Finance Committee, it was agreed to lend Camberwell Borough Council 1,394, for housing purposes, and 1,750, for purchase of land for an open space; Poplar Borough Council 20,000, for electric light installation, and 740, for erection of a wall, etc.; Wandsworth Borough Council 5,500, for street works, etc. Sanctioned also given to the borrowing by Shoreditch Borough Council of 9,958, for electric light installation and meters, and Westminster City Council of 6,953, for sewer reconstruction works.

Schools.—The Education Committee recommended and it was agreed that application be made to the Board of Education for approval to the finished plans of the undermentioned new schools, enlargements, etc.:

Electoral Division.	School.	Contractor and amount of Tender.	Work included in plans.
<i>New Schools:</i>			
Wandsworth	Dunt's-hill	Messrs. Holliday & Greenwood, Limited, £23,837.	Two-story building for senior mixed and junior mixed, with drawing class-room and science room, and separate one-story building for infants. Total accommodation, 1,140.
Woolwich	Timbercroft-road	Messrs. G. E. Wallis & Sons, Limited, £19,556.	Three separate one-story buildings for senior mixed, junior mixed, and infants. Total accommodation, 980. (Planned for future enlargement by an additional class-room for each department).
<i>Enlargements:</i>			
Woolwich	Elizabeth-street..	Messrs. E. P. Bulled & Co., £3,299.	Enlarging the school by 150 places; also erecting combined cookery and laundry centre, drawing class-room, and science room.
Central Hackney ..	Signon-road ...	Messrs. J. Chessum & Sons, £1,686 15s. 8d.	Enlarging the school by 130 places, and extending boys' covered play-ground on roof.
<i>Centres, etc.:</i>			
Wandsworth	Rosendale-road..	Messrs. J. & C. Bowyer, £3,297.	School for 60 mentally defective children.
East Islington	Ambler-road ...	Messrs. J. Willmott & Sons, £3,095.	School for 60 mentally defective children.
Wandsworth	Oak-lodge	Mr. E. Triggs, £4,700 and £500 for further works.	Alterations to premises to adapt building for thirty resident and 10 non-resident elder deaf girls; and two new buildings in rear of site.

Avery-hill Mansion.—Sir William Collins, the Chairman of the Education Committee, stated, with reference to a proposal that the Avery-hill Mansion should be utilised as a day training college, that communications had taken place between his committee and the Parks Committee as to the practicability of the suggestion, and he understood that the Parks Committee regarded the proposal favourably. The matter was, however, still under consideration.

Fleet-street Widening.—Upon the recommendation of the Improvements Committee it was agreed to contribute 1,107, one-half of the net cost of the widening of Fleet-street at No. 71, to 60 ft., proposed to be carried out by the City Corporation.

The Lamp Standards on Waterloo-bridge.—In answer to Mr. Horniman, Mr. Straus (Chair-

man of the Bridges Committee) said that his committee were considering the reference made to them with regard to the removal of the lamp standards from Waterloo-bridge and had decided to consult Mr. Frampton as to whether these standards were still fit to be used for electric lighting purposes. He was glad to be able to contradict the statement that any of these standards were broken. Out of the eighteen, sixteen were perfectly sound, and the others were only slightly damaged, and could be easily repaired. The standards were not of bronze, but were cast-iron, and a very good example of old cast-iron. They were placed on the bridge in 1817.

Tramways.—The report of the Highways Committee, giving the account of receipts and expenditure on the Council's tramways for the year ending March 31, 1904, was submitted.

Mr. Gaskell called attention to the difference between the estimates a year ago and the actual facts now before them. A year ago it was estimated that the net receipts would be 128,770, on the electric system, and 20,000, on the horse system, a total of 148,939. The actual net receipts, however, were 94,452, or a deficiency of 52,487. Seeing that some time ago the chairman of the Committees told them that receipts from the electric system would soon be 1,000,000, a year, this was very disappointing.

Mr. Percy Harris considered there was justification for calling attention to the great discrepancies in the estimates.

Mr. A. Baker (Chairman of the Highways Committee) claimed that the Council had every reason to be satisfied with the results of the tramways so far, seeing the delays and disadvantages which had been experienced in connexion with the reconstruction work. As a matter of fact, they anticipated a loss of 15,000, on the Southern system, but they had reduced the loss to 8,000. They had to pay interest charges and sinking fund for eighteen months before a tramcar was run, and had a private company been operating the lines they would, on the results of the year, have declared a dividend of 5 per cent. When they generated their own electricity they would save half the present cost. With regard to the conduit system, he believed that it was the best system

and the cheapest in the end for them to adopt. The report was adopted.

Motor-car Registrations.—The Highways Committee reported that, in accordance with the provisions of the Motor-car Acts, the Clerk of the Council had, from June 18 to July 2, registered 149 motor-cars and 91 motor-cycles, thus making the total number of cars and cycles registered up to the last-named date 3,768 and 2,697 respectively.

Working Class Dwellings.—Mr. Bruce submitted a return from the Housing of the Working Classes Committee, from which it appears that the total gross income for the year from all the dwellings amounted to 89,873, or 1s. 7d., and of this a sum of 40,269, or 3s. 10d., or 41.81 per cent., was required for outgoings during the year, as compared with 32,948, or 5s. 5d., or 44.45 per cent. during the preceding year. In addition

to this the sum of 46,832l. 2s. 8d., or 52.11 per cent., was required for interest and sinking fund charges, as against 35,269l. 6s. 7d., or 47.58 per cent., during the year 1902-3. Upon reviewing the operations of the Council as a whole since the opening of the first block of dwellings in April, 1894, it is found that there is a balance in hand amounting to 12,050l. 18s. 7d. after taking into account a net contribution from rates of 22,000l. 18s. 10d. The net charge on the rates is entirely due to the debt charges in respect of undeveloped estates, for although amounts have been raised in the rate in respect of dwellings, there is no deficiency on the income account of the dwellings as a whole, as a result of the Council deciding itself to erect and manage them. Such a result may, the committee think, be regarded as satisfactory. The total expenditure on capital account on all the dwellings and estates up to March 31, 1904, amounted to 1,731,904l. 3s. 3d., which sum represents the actual payments made up to that date, and does not include liabilities under contracts for buildings in course of erection. The dwellings mentioned in the accounts comprise 3,996 tenements, 658 cottages, and 1,147 cubicles containing accommodation for 24,467 persons.

The return was received.

The Criterion Theatre.—Sir Algernon West asked the chairman of the Theatres Committee whether his attention had been drawn to a statement by the chairman of Spiers and Pond (Ltd.), to the effect that his company were unable to pay a larger dividend in consequence of the requirements made upon them by the County Council.

Mr. Yates, the Chairman of the Committee, said it was true that in 1899 certain requirements were made on the managers of the Criterion Theatre, and these were carried out in 1903. They were made on the authority of the Lord Chamberlain, and were the minimum that could be asked for, in order to secure that this theatre should be rendered safe for the public. The whole of the negotiations in connexion with this matter took place with Sir Charles Wyndham, and the committee had had nothing to do with Spiers and Pond (Limited).

London Traffic.—Mr. Greenwood moved, in pursuance of notice of motion: "That, having regard to the necessity for providing additional traffic facilities in London and to the importance of linking up the Council's northern and Southern tramway systems, it be referred to the Improvements Committee to consult the Highways and Bridges Committees and to report at an early date—(1) whether the South-Eastern and Chatham and Dover Railway Company are contemplating the rebuilding of Charing-cross Station and the widening of Hungerford-bridge; (2) whether the Council can be advised to take the opportunity of submitting to Parliament a scheme for the acquisition by the Council of Charing-cross Station and Hungerford-bridge, providing the railway company with a site for a new terminus station on the Waterloo side of the river in place of the present terminus at Charing-cross, and erecting for general traffic a new road-bridge of sufficient width and capacity to take a double line of tramway in the centre of the roadways, so that the Council's northern and southern tramways from Aldwych to Waterloo could be linked together; (3) what saving of capital moneys might be anticipated in carrying out such a scheme by the avoidance of the rebuilding of Lambeth-bridge and of the widening of Waterloo-bridge, and in other ways, and what would be the general result to London of throwing open such an exceptionally fine access between the northern and southern part of the county; (4) what would be the estimated gross cost of each principal portion of the scheme, the estimated recoupment by disposal of the surplus land, and the estimated net cost."

Mr. Cornwall seconded the motion, which was supported by Mr. Straus and others and adopted.

The Council soon after adjourned.

THE BRITISH MUSEUM LIONS.—In the House of Commons recently, replying to Mr. MacNeill, who asked what had become of the bronze lions which formerly were along the line of railings in front of the British Museum, and which were removed to widen the footway, Lord Balcarras said:—Twelve lions were removed to St. Paul's Cathedral, with the concurrence of the Trustees of the British Museum; the remainder are at the Museum, in charge of the Trustees.

APPLICATIONS UNDER THE 1894 BUILDING ACT.

The London County Council at their meeting on Tuesday dealt with the following applications under the London Building Act, 1894. The names of applicants are given between parentheses:—

Lines of Frontage and Projections.
Paddington, South.—Buildings on the south side of Moscow-road, Bayswater, eastward of Bark-place (Messrs. Metcalf and Greig).—Consent.

Camberwell, North.—Houses for the working class on the north and south sides of Beckett-street and east side of Toulon-street, Wyndham-road, Camberwell (Mr. W. Oxtoby for the Metropolitan Borough of Camberwell).—Consent.

Width of Way, Lines of Frontage and Construction.

St. Pancras, South.—Two iron gangways at the third and fourth floors, and alterations to an existing gangway at the second floor of premises on the north and south sides of Beaumont-place, St. Pancras (Messrs. Maple and Co., Ltd.).—Consent.

Battersea.—Coal-conveying plant across Lombard-road, York-road, Battersea (Mr. W. M. Wilkins for the Council of the Metropolitan Borough of Battersea).—Consent.

Formation of Streets.

Lewisham.—That an order be issued to Mr. A. H. Kersey, sanctioning the formation or laying out of a new street for carriage traffic to lead from Gabriel-street to Grierson-road, Lewisham.—Agreed.

Wandsworth.—That an order be issued to Mr. J. C. Radford refusing to sanction the formation or laying out for carriage traffic of new streets on a site abutting upon the west side of Gwendolen-avenue and the south side of Hazlewell-road, Putney (for Lord Westbury).—Agreed.

Islington, West.—A deviation from the plans sanctioned for the formation or laying out of a new street to lead out of the east side of Caledonian-road, Islington, to the north-eastern side of Stock Orchard-crescent, so far as relates to an alteration in the gradient of such street (the Loraine Property Company, Ltd.).—Refused.

Space at Rear.

Chelsea.—A modification of the provisions of section 41 with regard to open spaces about buildings, so far as relates to the proposed erection of a building upon a site abutting upon the western side of Sloane-street and northern side of Basil-street, Chelsea (Mr. F. S. Chesterton for Mr. Cobb).—Consent.

Buildings for the Supply of Electricity.
Marylebone, West.—A generating-station on a site abutting upon Richmond-street and Salisbury-street, St. Marylebone (Mr. J. Wilson for Metropolitan Borough Council).—Consent.

The recommendation marked + is contrary to the views of the local authority.

ARCHITECTURAL SOCIETIES.

MANCHESTER SOCIETY OF ARCHITECTS.—Last Saturday this Society visited Wakefield, and spent some time in going through Messrs. Gibson and Russell's council offices for the West Riding County Council. The entrance hall, with its marble floor and walls and plaster domical ceiling, the council chamber (seating 120 members), and all the principal rooms were found to be of great interest, and worthy of more thorough study than time permitted. Afterwards the XIVth century chantry on the bridge was visited. Externally this must have been of wonderful richness and beauty. Unfortunately the stone has weathered so badly that little remains but a suggestion of the original effect in the part which escaped the restorer's hand early in the last century. Internally there is still some most interesting detail in a very rich canopy and niche, showing most delicate workmanship. The roof is also of interest.

NEW STAND, GOODWOOD.—The erection of the new grand stand at Goodwood racetrack is now in progress. The structure will be 258 ft. long and 50 ft. high. Under one roof will be arranged the royal box, the house stand, and accommodation for members. Tattersall's, and general visitors. Below a subterranean passage, 10 ft. in width, leads from the paddock to the lawn, and both these enclosures have been enlarged. The stand and lawn together will afford accommodation for 10,000 visitors, and a separate building has been erected for the Press, telegraphists, and officials. The work has been carried out from the designs of Mr. A. J. Henderson, architect, by Mr. Wallis, contractor.

ENGINEERING SOCIETIES.

SOCIETY OF ENGINEERS.—A highly interesting visit was made by the President—Mr. D. B. Butler—and members of the Society of Engineers on the 29th ult. to the Portland Cement Works of Messrs. Martin, Earle, and Co., at Wickham, Rochester, where they witnessed the manufacture and testing of cement made by the ordinary method and by the new Rotary Kiln System. The works, which are now about a mile in length, are situate on the River Medway, and are said to be the largest Portland cement works in Europe. They were acquired by the present company in 1891, when the plant only consisted of a few kilns of the chamber type, and a pair of mills for grinding the clinker, power being supplied by a 250-h.p. beam engine. The works were enlarged from time to time until in 1899 they were equal to an output of 3,000 tons per week. About that date, becoming aware of the remarkable results obtained in the United States with rotary cement kilns, the firm investigated the question and erected a full-size experimental kiln on the American system, with which they made a long series of exhaustive experiments. Numerous modifications, alterations, and improvements were introduced, until, after about two years of uninterrupted experiment, Messrs. Martin, Earle, and Co. succeeded in evolving a perfect rotary kiln, capable of dealing successfully with the Medway raw materials—chalk and clay—for the manufacture of Portland cement. The rotary continuous kiln was found to offer peculiar facilities for regulating the burning during the process of clinkering, whereas with the intermittent chamber kiln no such correction is possible. The new system also showed itself superior to the old, both as regards the quality of the product and the cost of production. The rotary kiln house is a large brick building in which the sixteen kilns are arranged in line. The kilns are provided with slurry agitators and coal-firing apparatus. Some are also fitted with apparatus for drying sufficient fuel—which is finely powdered coal—for the entire battery. The body of each kiln is 90 ft. in length, constructed of mild steel, and lined with basic fire-brick. The kilns are set on the incline, and rotate at such a speed as ensures a well-burned clinker. The remarkably large output of 200 tons of clinker per week can be obtained from each kiln, maintaining an average of 25 cwt. per actual running hour of the kiln. The clinker discharged from the kilns is transferred to horizontal revolving coolers, from whence it is transmitted by conveyors to the crushers, and is afterwards elevated to cooling towers. The dry-mill house is situate behind the cooling towers, and the milling is there done by "Griffin" mills arranged in separate batteries of six mills each, which receive the clinker from overhead hoppers through shutes. The finished cement is conveyed from the dry-mill house by ordinary screw conveyors to the warehouses, where a number of customers have stores specially reserved for their own use. The men employed in connexion with the rotary kilns are approximately two-thirds fewer than required to obtain the same output from the old-fashioned kilns. Three sets of engines are employed to drive the wet plant, the dry-mill and the coal-mill plants respectively, all of which are identical in size and type. Each engine is of the triple expansion marine type, designed for mill work, with rope drives, and working with surface condensers and centrifugal circulating pumps. High-pressure steam is supplied to the wet plant from a battery of three Lancashire boilers, and to the other plants from a battery of five similar boilers, all fitted with Galloway tubes. The rotary kilns are driven by two horizontal engines with rope-drives, and take steam from three marine boilers. The principal buildings on the works, as well as the chalk quarries, are lighted by electricity. Powerful arc lamps are employed, and the current is supplied from a generating station on the works. A well-appointed laboratory is attached to the works, being equipped with every known scientific device for testing not only the raw materials and the finished cement, but also the exact proportion of mixtures of the raw materials at the various stages of manufacture. It is also fitted up for general research work.

THE JUNIOR INSTITUTION OF ENGINEERS.—Visits of this Institution were recently paid to the Chelsea Generating Station of the Under-

ground Electric Railways Company of London, Lots-road, Chelsea, and to the adjoining London County Council's Pumping Station. At the former the General Manager, Mr. J. R. Chapman, and the Resident Engineer, Mr. J. W. Towle, were present, and the visitors were enabled to make a complete examination of the work so far as it had advanced. The station will supply current for working the trains of the District Railway from White-chapel to the various western and southern termini, Richmond, Wimbledon, Hounslow, Ealing, etc.; also the tube trains of the Baker-street and Waterloo Railway, the Great Northern, Piccadilly, and Brompton Railway, and the Charing-cross, Euston, and Hampstead Railway. The initial equipment of these lines will be about 150 trains. The station is designed for ten units of 5,500 kilowatts each, and one unit of 2,500 kilowatts. The output of the station will be three-phase, 33½ cycles, 11,000 volts, and will be distributed at this potential to twenty-three sub-stations. The site comprises 3.67 acres, and has a water frontage of 1,100 ft. The building is 453 ft. 6 in. long by 175 ft. wide, with an office annex 25 ft. by 81 ft. The steel frame of this building is entirely self-supporting, and contains 6,000 tons. The foundations extend from 30 ft. to 36 ft. below the ground level, and the loading of the clay does not exceed 4 tons per sq. ft. Attention may be called to the group system which has been followed throughout in both the mechanical and electrical installation—i.e., eight boilers are grouped to one turbo-generator; these boilers have their own feed-pump, and the generator supplies its own section of bus-bar. No attempt is made to cross-connect the steam piping of the different groups, except at the east end of the building, where three groups are brought together in one small auxiliary header for supplying exciters, air compressors, bouse pump, etc. The station is designed for turbine engines, and illustrates the reduction in floor area which can be secured with this type of engine as against the reciprocating type.

At the L.C.C. pumping station Mr. H. M. Routhwaite, Mechanical Engineer, Hon. Mem. J.I.E., received the members. There are here four horizontal gas engines, having each two 18½-in. cylinders, with 2-ft. stroke, both coupled to one crank (cylinders at opposite ends). On each crank shaft is a 7-ft. 6-in. rope pulley, grooved for eight 1½-in. ropes, and these ropes lead down to similar pulleys of 6 ft. 5 in. diameter on the four centrifugal pumps. The pumps have suction and delivery pipes 23 in. diameter, and impellers of 66 in. diameter. These engines each indicate about 200 horse-power, at about 150 revolutions per minute, and the pumps each throw about 44 tons per minute. There are also four similar engines, with 18½-in. cylinders, 2-ft. 6-in. stroke, 7-ft. 6-in. rope pulleys on crank shafts, grooved for ten 1½-in. ropes, and 10-ft. 4-in. similar pulleys on pumps. The pumps have 32-in. pipes and 72-in. impellers. These engines each indicate about 240 horse-power, at about 160 revolutions per minute, and the pumps each throw about 85 tons per minute. The 200-horse-power engines pump from the low-level sewer, and the other engines from the higher level Counties Creek Sewer. The whole plant works only during rainy weather, and pumps storm-water only into the Thames. The average number of hours per annum during which it will be required to run is estimated at sixty or seventy, though, of course, in exceptionally wet years it may be that the machinery will run as long as 100 hours.

BUILDERS' BENEVOLENT INSTITUTION.

The fifty-seventh annual general meeting of this charity was held at the offices, 31 and 32, Bedford-street, Strand, W.C., on Wednesday.

In the absence of the President (Sir Weetman Pearson) through illness, the chair was taken by Mr. John T. Bolding.

The notice convening the meeting was taken as read, and the minutes of the last annual general meeting were read and confirmed. The following report was read and adopted:—

"The Committee has the pleasure to present its fifty-seventh annual report, and is glad to be able to state that, notwithstanding the continued depression in all branches of the building trade, the funds of the Institution, by careful and economical management, have been adequate for the present requirements. It is very desirable that the benefits of this charity should be extended, but this can only be done judiciously with an increased income. The Committee, therefore, appeals to subscribers, donors, and their friends for a continuance of their generous support.

"Since the last report two elections of pensioners have taken place—in November 1903 and May 1904—when ten men were added to the list. The Committee was fortunate enough on both occasions to be able to elect all the really eligible pensioners, without having recourse to the costly and troublesome procedure of contested elections. Each application was minutely inquired into and reported upon before the final elections were made.

"There are now 33 men and 27 women enjoying pensions of 42l. and 30l. per annum respectively. Six pensioners (three men and three women) died during the course of the past year, burial allowances of 5l. being granted in cases where the relatives of the deceased needed assistance.

"The Committee acknowledges with the warmest gratitude all the President (Sir Weetman Pearson) has done for this charity. His personal generosity and wide influence have enabled the Committee to strengthen the financial position of the Institution and to anticipate a continuance of its good work.

"Death has dealt hardly by the Committee during the past twelve months, in taking away such valuable and respected members as the late Mr. E. Cassell, Mr. John Greenwood, Mr. B. E. Nightingale, and Mr. G. Nelson Watts.

"The Committee takes this opportunity to again thank the Trustees (Sir Arthur Charles Lucas, Bart., Mr. F. J. Dove, Mr. T. E. Rider, Mr. J. Howard Colls, Mr. T. Stirling, and Mr. J. T. Bolding); the Honorary Auditors (Mr. J. T. Bolding and Mr. R. J. Ward); and the dinner stewards for their kind and valuable services to the Institution.

"The Committee is glad to announce that Mr. William Downs has accepted the Presidency in succession to Sir Weetman Pearson.

"The annual dinner will be held in the Whitehall Rooms, Hotel Metropole, Charing Cross, on Thursday, the 24th November."

The audited accounts for the past year were received and adopted. The income was 1244l. less than in the previous year, but 427l. more was spent on the pensioners, whilst the management expenses were under a sovereign different. Sixty-six and a half per cent. of total income was paid to pensioners in 1902-3; 88 per cent. of total income was paid to pensioners in 1903-4; 10 per cent. of total income was paid for management in 1902-3; 11 per cent. of total income was paid for management in 1903-4.

The following elections were made:—As President, Mr. William Downs; as Hon. Treasurer, Mr. J. Howard Colls (re-elected); as Trustees, Sir Arthur C. Lucas, Bart., and Messrs. F. J. Dove, T. F. Rider, J. Howard Colls, T. Stirling, and J. T. Bolding (all re-elected); as Committee, Messrs. J. T. Bolding, F. J. Dove, C. Russell, G. J. Lough, Basil P. Ellis, and A. Ritchie (all of whom retired by rota but were re-elected); as Hon. Auditors, Mr. Robert J. Ward, F.S.I., and Mr. J. T. Bolding.

Votes of thanks were voted to the past President, Sir Weetman D. Pearson, Bart., M.P.; Vice-Presidents, Hon. Treasurer, Trustees, Executive Committee, and Hon. Auditors.

LIBRARY AND MUSEUM, MANSFIELD, NOTTINGHAMSHIRE.—The memorial stone has just been laid at Mansfield of a library, and the opening subsequently took place of the museum. Both institutions will occupy the same site, situated in a central position opposite the Victoria Hall, in Leeming-street, the library fronting the main road, whilst the museum is at the rear. Several months ago competitive designs for the new library were invited, and Mr. Sutton, of Messrs. Sutton and Gregory, Nottingham, was the successful architect. Mr. S. B. Frisby, of Mansfield, has secured the contract for the building. The Renaissance style is to be adopted, and the front elevation will be in Leeming-street. Mansfield stone will be entirely used for the front, and the side elevation will be of red-sand bricks, with stone dressings. The entrance will be in Leeming-street, and will lead into a hall, around which will be grouped the public rooms. Accommodation is provided on the ground floor for a leading library, 50 ft. by 18 ft. 3 in.; reading-room, with magazine and reference room screened off, 60 ft. by 25 ft. 5 in.; ladies' room, 25 ft. 6 in. by 15 ft. 3 in.; and librarian's room and packing-room. The lighting will be by electricity, and the heating by hot water. The lending library will be immediately opposite the entrance. An iron staircase will give access to a store-room on the first floor, and there will be a small hoist for books. The total cost of the building will be about 3,000l. The museum structure is of wood, with a galvanised iron roof. The foundations are of concrete, with wood floors above, the lighting is by electricity, and the heating by hot-water pipes. The museum consists of the following rooms:—Main hall, 56 ft. by 35 ft.; lecture-room, 25 ft. square; insect-room (over lecture-room), 25 ft. by 25 ft.; six side rooms on the ground floor, each 30 ft. by 10 ft.; curator's room, 25 ft. by 12 ft. There is also in the main hall a small annex, approached by stairs.

Illustrations.

JUMIEGES ABBEY.

JUMIEGES is a Benedictine abbey in the department of Seine Inférieure, near Rouen, which has been much visited and little studied; no precise account of it having been published till that of M.M. Guédy and Viatte, presented to the Salon of 1899 with plans and drawings. Yet it is the earliest of all the abbeys of Normandy, except Bernay, and must have had considerable influence on the two great churches on whose design the Norman architecture of England is mainly based, viz., Cécily-la-Forêt and St. Etienne, Caen. It was founded in 638 or 654, was burnt by the Normans in 841, and it was not completely restored till about 941. Three years later it was again destroyed by Raoul Tourbe, Count of Rouen. The present church was commenced in 1040, and was consecrated in 1067 in the presence of William the Conqueror, who presented it with many English manors. It is possible that not only the choir, but the nave as we see it now and some part of the two fine western towers, which we illustrate, were complete in 1067; for the design is more archaic than that of St. Stephen, Caen, which is variously said to have been dedicated in 1073, 1077, 1081, or 1086. In 1358, during the Hundred Years' War, the abbey was pillaged, and it was at this time that the Romanesque choir was destroyed. The XIVth century choir was but three bays long, ending in an apse of seven bays; this apse was surrounded by an ambulatory, and from the ambulatory radiated seven chapels, two of which in part survive. The abbey was again sacked in 1415 after the battle of Agincourt. In the XVth century was demolished the wooden spire, of prodigious height, of the central tower. The conventual buildings are mainly XVth century work. The two western towers are 170 ft. high. They differ slightly in design. It is asserted that in the Middle Ages only metropolitan cathedrals, certain collegiate churches, and the royal abbeys were allowed western towers precisely alike.

The upper stage of each is hexagonal. The nave has what is called the Lombard plan, though it is yet to be proved that it originated in Lombardy—i.e., compound piers and cylinders alternate, as at Durham and elsewhere. In front of the compound pier a massive roof-ridge shaft rises to the top of the clearstorey wall. These shafts supported the broad transverse arches spanning the nave. The central span of the nave was not vaulted; but, as at St. George, de Bockerville and Cécily, probably the roof timbers were set longitudinally on gables carried by the transverse arches. The nave consists of eight bays—i.e., of four coupled bays. Internally the elevation of the nave has an archaic look, and is evidently influenced by Bernay. The ground story occupies less than half the elevation; the triforium story is low and is not separated from the clearstorey stage by a string. The clearstorey stage occupies a very large space. Unlike most of our own Norman churches there is no passage in the clearstorey wall, and consequently, no inner arcade to the clearstorey windows, each of which is set in an expanse of blank wall, in the fashion of Fontaines-ave. As in St. Etienne, Caen, and Gloucester choir there is a superposed vaulted aisle; but in these two the vault is a half barrel, whereas at Jumieges it is groined. The piers and cylinder are low and massive; the pier-arches are recessed orders, but are neither carved nor moulded. As in Ely transept, patterns were painted on some of the caps, probably intended to be carved subsequently. The aisle has a lofty; each bay has two superposed windows, not separated by a string; the lower window lights the lower aisle, the upper the superposed aisle; the same arrangement was repeated at St. Etienne, Caen, St. Albans, Ely, and elsewhere. The buttresses are flat plaster strips, neither staged nor ornamented. The paucity of string courses gives a curiously archaic look to Jumieges. The western arch of the central tower survive South of the transept, in the usual position were the sacristy and chapter-house, east of cloister. South of the choir is the little parish church of St. Pierre, part of which is asserted to be work of the XIIth century; its nave, however, appears to be two centuries later. The choir church is said to have been 265 ft. long, and its nave to have had a span of 33 ft.; the choir w

45½ ft. long with a span of 31 ft. In the transepts were return-galleries, as at St. Etienne, Caen, Winchester, and Ely.

STAIRCASE, DEPTFORD TOWN HALL.

THE view is taken from the doorway of the Councillor's Assembly-room on the mezzanine floor, looking downward to the main entrance, and upward to the Council Chamber on first floor. The galleries on each side lead to the suite of committee-rooms. The drawing shows the work as now being carried out, slight modifications having been made from the competition design. The columns are in Breccia, and stairs in Sicilian marble, with wrought-iron balustrade; the walls being finished in Parian and painted.

The architects are Messrs. Lanchester, Stewart, and Rickards.

WITHAM HALL, LINCOLNSHIRE.

THE extensive alterations to this mansion, shown in the illustration, were completed in the autumn of last year. The original house was a rambling old building, built and added to at various periods, most of which has been pulled down, with the exception of the portion comprising the hall and drawing-room. This part of the house dates from about 1750.

The library wing is also part of the old house, but the upper story has been raised, and a new roof and bay added to bring it into harmony with the new dining-room wing. The new billiard-room is a handsome apartment, and has a large brick fireplace and carved wood mantel.

The block containing the kitchen offices is the oldest part of the house, probably dating from the latter end of the XVIIIth century.

At the wish of the owner the roofs were entirely re-slatted with the old stone slates obtained from the pulling down and from other old buildings. The stone work was partly from old materials and partly from new stone found on the estate.

The house is lit by acetylene gas supplied by the St. James Company, of Victoria-street, Westminster.

The general contractors were Messrs. W. Pattinson and Sons, of Ruskington, Seaford, Lincolnshire, and Mr. John Fletcher acted as clerk of works.

The drawing was hung in last year's Academy and is from the hand of the architect, Mr. A. N. Prentice.

HOUSE AT PEEBLES.

THE buildings consist of the house as illustrated, a stable and coachman's house, and an entrance lodge. The walls are built of rough squared rubble with dressed corners, ryzats, etc. The stone used is of a warm cream colour, and was obtained from Black Pasture, Prudhim, and Eastfield Quarries, which provided a slight variation in the colour. The roofs are covered with Edwards's dark blue, brown, and red tiles as they came from the kiln. These tiles are very hard, and do not take on any weathering; but a pleasing effect is obtained by mixing the various shades as they come from the kiln, without having them picked for equal shades. The casement windows are Messrs. Hopes'. The ball, staircase, and part of the study are panelled in Austrian oak. The stable buildings have been fitted up by Messrs. Muggrave, and both the stable and yard are paved with their adamantine clinkers.

The following are the contractors for the various trades:—Mason work, Messrs. Neil M'Leod and Sons, Edinburgh; joiner work, Mr. Peter Barton, Edinburgh; plumber work, Messrs. Morrison and Son, Edinburgh; plaster work, Mr. L. Grandison, Peebles; tiler work, Mr. William Fairbairn, Peebles.

The total cost of the works, including the laying-out of the garden, has been a little over 7,000.

A. HUNTER CRAWFORD.

COMPETITIONS.

PROPOSED CONSERVATIVE AND UNIONIST CLUB, CARLTON, NOTTINGHAM.—The competitive design of Mr. C. J. Whitbread, of Carlton, has been selected, and Mr. Whitbread has been appointed architect for the work, which is to commence shortly.

FREE LIBRARY, LOUGHBOROUGH.—In response to an invitation by the Loughborough Town Council, eight designs were submitted to them for a new Carnegie Library. The Council had arranged with Mr. George Hodson, M.I.C.E., F.G.S., to advise and assist them in making the

GROUND-FLOOR PLAN.

SCALE OF 10 5 0 10 20 30 40 FEET

House at Peebles. Plan.

selection of a design, and, at a recent meeting of the Council, held to consider Mr. Hodson's report, it was decided that the design submitted by Messrs. Barrowcliff and Alcock, of Loughborough, should be adopted. The assessor selected two designs—i.e., the one selected by the Council and the design submitted by Messrs. Sutton and Gregory, of Nottingham. The main entrance to the library in the accepted design is to be from Granby-street, the building being set back a distance of 19 ft. The reading-room, which has been made the main feature of the design, is 40 ft. square. A portion of this reading-room has been set apart for the use of ladies only, and is to be curtained off. The lending library is 35 ft. by 28 ft., and extends through the first floor, a wide balcony over forming the patent library, which is lighted from the top. The bookshelves are arranged in tiers 3 ft. apart and 7 ft. 6 in. high, with a window between each section giving a direct light to the bookshelves. Each section contains 24 ft. of shelving in eight tiers, giving a total accommodation of over 13,000 volumes. The borrowers' lobby is in direct communication with the entrance hall, and a portion of the counter is screened off to provide separate accommodation for children. The patent library is approached by a wide staircase from the entrance hall, and is so arranged that at a small additional cost this room can be extended to a further distance of 35 ft., thereby providing a room 60 ft. by 28 ft. The reference library, 23 ft. by 18 ft., is also arranged in direct communication with the entrance hall, and is situated about the centre of the site. There are also arranged librarians' room, store and packing room, staff mess-room, lavatories, etc. The librarian's house is to be on the Packe-street side of the site, and in direct communication with the library buildings. There is an open space of about 200 sq. yds., with a frontage to Packe-street; this would be available for any future extension, or for the erection of any other public building which may be required. The heating will be by means of low pressure hot water radiators. Externally the library will be faced with red sand stock bricks with tawny terra-cotta dressings.

THE ETON MEMORIAL HALL.

SIR,—I believe that there can be no objection to my calling attention to a significant fact in connexion with the competitive designs for the Eton Memorial Hall now privately being exhibited.

It will be remembered that the site of the

proposed building is opposite the continuous facade formed by Upper School, the Ante Chapel, and the porter's lodge, and flanked by two modern houses, one of considerable height. The new schools, designed by Woodyer in the Tudor style, are also prominent. With the exception of the Manor House (which makes no attempt at architectural design) and the Upper School (in the early classic manner), the whole of this group exhibits the features of Tudor design, and Upper School itself has had a narrow escape, during the last half of the XIXth century, from being "brought into harmony" by the substitution of Gothic features for the original design.

Contrast with this last suggestion the fact that of the sixteen schemes only three exhibit any close approach to this traditional style, the majority being in favour of pure classic. How different the spirit to that in which Pearson ruined Cockerell's lovely fragment at the Cambridge University Library by the addition of "a little thing of his own" in the most uncompromising "Third Pointed" ?

I trust that, by calling attention to this point before the awards are made, I am not infringing any of those mysterious and dangerous laws of architectural "etiquette" which beset the intrepid.

ETONIAN.

WATER-CLOSET PARTITIONS.

SIR,—A case of some interest to builders, sanitary authorities, and owners of property was recently heard by Mr. Cluer, one of the Magistrates at Worship-street Police Court, in which the owners of premises in Wilson-street, Finsbury, were summoned by the Finsbury Borough Council for that a water-closet, newly constructed by their builders, was "in bad order, out of condition," and "required alteration and amendment." The proceedings were taken under section 41 of the Public Health (London) Act, 1891, and the prosecution alleged that the partition walls of this water-closet, which abuted on a "workplace," situated on the top floor of the building, did not comply with clause 2 of the London County Council's by-laws in reference to the construction of water-closets, which reads as follows:—

"He shall construct such water-closet so that on any side on which it would abut on a room intended for human habitation, or used for the manufacture, preparation, or storage of food for man, or used as a factory, workshop, or workplace, it shall be enclosed by a solid wall or partition of brick or other materials, extending the entire height from the floor to the ceiling."

This partition consisted of 1-in. matchboarded, properly tongued, etc., and the Borough Council's contention was that this was not "other materials" of a solid character. Instead of proceeding against the "person constructing"—i.e., the builders (who invited them to do so)—for any contravention of the by-law, they waited for three months after the completion of the work, and then took proceedings against the owners. The Magistrate, however, was against them on the point of "other materials," and held that it was solid. The builders invited the Superintending Architect of the London County Council to define what "other materials" would, in his opinion, imply, but that gentleman declined to commit himself by so doing. The Borough Council then, finding that the Magistrate was against them on this point, further alleged that the materials had shrunk and the joints opened, when he adjourned the case so that he could see himself whether this was so or not, and in the end dismissed the summons, with 2l. 2s. costs against the Borough Council. G. J. GAVIN.

The Student's Column.

NOTES ON PORTLAND CEMENT:

CHAPTER II.—THE CHEMICAL ANALYSIS AND VALUATION OF THE RAW MATERIAL USED IN CEMENT MANUFACTURE.

ESENTIALLY Portland cement consists of silica, alumina, and lime. The materials from which the lime is obtained are of very different qualities. They are found as soft chalk or hard crystalline limestone and many degrees between these two, but, as a rule, the harder the substance the more carbonate of lime it will contain. The soft chalks, although nearly pure carbonate of lime when dried, in natural state contain much water; while some of the hard limestones in natural state contain as much as 90 per cent. CaCO_3 . Just as the limestones vary, so the other raw material, the clay, is found in different forms. It occurs in all grades, from the plastic clay or river mud to the hard shales. These raw materials are never found quite pure, but containing varying proportions of foreign chemical compounds, such as carbonate of magnesia, water, sulphuric acid, alkalies, coal, etc. Because of this, it is of the greatest importance, if the finished cement has to be a reliable one, for the manufacturer to know their exact composition. This is only determined by chemical analysis. The following methods of analysis are as carried out by Dr. Karl Schosch, of the High School of Charlottenburg:—

Limestone Moisture.—100 grammes of the crushed material is put in a wide glass tube and dry air pumped through it till the weight is constant. The loss in weight is the moisture to air-dryness. The tube is next placed in an air oven and kept at 105°C . for two hours. The loss in weight added to last result gives the total moisture.

Loss on Heating.—Weigh 2 grammes of the dry substance, after grinding into a platinum crucible and heat over a gas blow-lamp till the weight is constant. The loss is combined water, organic matter, and carbonic acid. The carbonic acid is estimated in another portion of the dry substance by any of the well-known methods for carbonates (Mohr's apparatus is recommended). This result deducted from the last gives combined water and organic matter. The combined water may be estimated in another portion of the substance by heating 2 grammes in a hard glass tube, through which a current of dry air is passed, and catching the water expelled in pure dry calcium chloride.

Insoluble Residue.—In most limestones this is present only in small quantities, so it is not necessary to separate the silica, sand, and oxides of iron and alumina. After determination of the loss on heating, transfer the residue in the crucible to a porcelain basin, add a little water, then gradually about 10 ccs. of 20 per cent. hydrochloric acid, and dilute the whole to about 250 ccs.

Heat to boiling, and add ammonia till alkaline (test with litmus paper). The precipitate consists of clay, sand, silica, oxides of iron and alumina. Take the basin from the burner, when the precipitate will quickly settle to the bottom. Filter into a litre flask, and wash till not a trace of chlorine is in the washing water (test with silver nitrate).

In washing do not stir up the precipitate with the water, because the silica might go through the filter paper. After washing, transfer the precipitate, yet wet, to a platinum crucible, and burn for ten minutes after the paper is ashed.

Lime.—When the filtrate in the litre flask is cool make up to the mark with distilled water. Draw off 500 ccs. into a beaker, add a few drops of hydrochloric acid to prevent precipitation of the carbonate of lime, and boil. Next carefully add crystalline oxalic acid, then slight excess of ammonia. Allow the precipitated oxalate of lime to stand—in a warm place if possible—during the night. By this means it is not necessary to reprecipitate the lime. Filter, wash with boiling water till no chlorine is in the washings (test with silver nitrate), dry, ignite in a platinum crucible over a blast-lamp till constant, and weigh as CaO .

Magnesia.—To the filtrate from the lime add a few drops of hydrochloric acid, evaporate to a bulk of 250 ccs., allow to cool, and add 250 ccs. of 10 per cent. ammonia, then sodium phosphate. Stir well till the phosphate of magnesia separates, allow to stand twelve

hours, and filter. Wash with cold water to which 20 per cent. of ammonia has been added till the washings are free from chlorine (test with silver nitrate and nitric acid). Dry the precipitate, and if in small quantity ignite along with the filter paper, if in large proportion separate the phosphate as far as possible from the filter paper, which is burned in a platinum wire loop, adding the ash to the precipitate in a porcelain crucible, and ignite the whole till quite white. If necessary, add a drop of nitric acid. So long as black points are to be seen the ignition is not complete. Weigh the phosphate ($\text{Mg}_2\text{P}_2\text{O}_7$) and calculate to MgO or Mg_2CO_3 .

Sulphuric Acid.—Acidulate the remaining 500 ccs. in the litre flask with hydrochloric acid, heat to boiling, and precipitate the sulphate with barium chloride. Allow to stand overnight, and if only in small quantity wash with cold water, otherwise use hot water. A good paper for filtering barium sulphate is made by Schleicher and Schull (Blue Band No. 589). Ordinary filter paper moistened with a 10 per cent. solution of ammonium acetate will prevent the barium sulphate passing through. After good washing (test with silver nitrate for chlorine, not for barium with sulphuric acid), burn the precipitate in a porcelain crucible. If pyrites is present the following separation is necessary. Put 2 grammes of the original dried substance into a porcelain basin, cover with bromine water, add 25 to 30 ccs. hydrochloric acid, and boil. By this means the sulphide is oxidised into sulphate. The total sulphate is then estimated as above. The difference between this and the last result gives the sulphur present as sulphide.

Alkalies are usually obtained by difference. If required to be estimated, use Laurence Smith's method, which is as follows:—Mix 0.5 gramme of the very finely-powdered substance with 0.5 gramme of sal-ammoniac and enough pure precipitated carbonate of lime to bring the mixture to about 80 per cent. CaCO_3 ; put the mixture into a platinum crucible. Heat, with the lid on, first for half an hour over a Bessler burner, then for another half hour over a blast-lamp. The alkalies assume the form of chloride. Soak the crucible and contents in water; heat, and filter. From the filtrate precipitate the lime by means of carbonate of ammonia at a boiling heat, filter off the carbonate of lime, evaporate to dryness, ignite the residue gently to remove the sal-ammoniac, and weigh what remains. This residue should consist only of fixed alkali chloride, but generally it is contaminated with lime and magnesia; hence it is advisable to redissolve it in the crucible in a little water, add a pinch of pure lime, and treat again as before. The pure alkali chlorides are weighed and the potash determined by chloroplatinic acid.

Analysis of Clays.—The moisture, combined water, carbonic acid, and organic matter are estimated as in limestone.

Gross Analysis.—Mix 2 grammes of the very finely-powdered dry substance with about 10 grammes of a mixture of sodium carbonate 50 parts, potassium carbonate 50 parts, and potash nitrate 5 parts. Place in a platinum crucible and fuse over a blow-pipe flame till all effervescence ceases. While the contents of the crucible are still molten, quickly chill the bottom of the crucible by placing in a shallow basin containing cold water. Now place the crucible and lid in a large porcelain basin and cover with water to which a few drops of hydrochloric acid has been added. When the melted mass is free from the crucible remove the latter from the basin, washing it thoroughly. Evaporate to dryness, take up the residue with water acidulated with hydrochloric acid, heat to boiling, and filter the silica, care being taken not to wash any of it through the paper as explained in limestone analysis. Dry and ignite, taking precautions to prevent any of the silica, which is very light, escaping from the crucible. Heat the filtrate from the silica to boiling and add ammonia in slight excess. Filter the precipitated oxides of iron and alumina, wash thoroughly, transfer while yet wet to a platinum crucible, and ignite. If manganese is present, the following method of separation is employed:—Neutralise the filtrate from the silica in the cold with sodium carbonate; mix with perfectly neutral sodium acetate and heat to boiling.

The alumina and iron are precipitated as basic acetates, but at boiling heat the manganese salt is quite soluble. After two minutes boiling take the beaker from the flame, allow to settle, filter hot and as quickly as possible, and

wash with very hot water. Next dissolve the precipitate in hydrochloric acid and precipitate the second time with ammonia. All the manganese is in the two filtrates, which are mixed and neutralised with sodium carbonate. Add excess of bromine water, boil and filter the separated manganese. Wash with boiling water, transfer while yet wet to a platinum crucible, and ignite sharply. Weigh as Mn_2O_3 , and calculate to MnO .

Lime, magnesia, sulphuric acid, pyrites, and alkalies are separated as explained in limestone analysis.

In valuing his clay the gross analysis alone does not give much information to the cement-maker. A method founded on that of Lunge and Schocher's for marls is used with advantage by the author. The *modus operandi* is as follows:—A gross analysis is done as just explained, only the iron is separated from the alumina by fusing the ignited oxides with acid sulphate of potash, dissolving in sulphuric acid and titrating with standard potassium permanganate. One gramme of the dry clay is then ground to approximately such a fineness as it would be in grinding the raw material for practical working, and mixed with enough pure dry carbonate of lime to bring the total CaCO_3 in the mixture to about 80 per cent. The mixture is strongly ignited in a platinum crucible over a blow-pipe flame, the same heat and time of ignition being maintained each analysis. The mass is transferred to a large porcelain basin, water added, and then about 20 ccs. hydrochloric acid. The liquid is evaporated to dryness, the residue taken up with water and a few ccs. hydrochloric acid, filtered, and washed free from chlorine. The precipitate consists of silicic acid, sand, and undecomposed silicates. This is boiled along with the filter paper in a nickel basin with 20 per cent. solution of sodium carbonate, filtered, and washed, first with hot sodium carbonate solution and then hot distilled water, till all the silicic acid is dissolved and the sodium carbonate washed out. The residue on the filter consists of difficultly fusible silicates and coarse sand, which is ignited in a platinum crucible and weighed. This result varies according to the time of heating and the intensity of heat applied; but, if always carried out in the same manner, comparative results can be obtained which will give the manufacturer an expression of the cement-making value of the clay. The other constituents are determined as explained under gross analysis. Fresenius' modification of Seger's method, by decomposing the clay with hot concentrated sulphuric acid, is not convenient and is tedious, which led the author to adopt the carbonate of lime method; moreover, sulphuric acid does not act on the felspar and fine sand, so that the cement-maker cannot by this method determine if his clay is or is not easily decomposable in the burning of the raw mixture. The results of analysis given below are obtained from a sample of clay by the three methods described.

	Gross Analysis	Fresenius' Method.		CaCO_3 Method.
		Soluble in HCl.	Insol.

THE VILLA MEDICI DRAWINGS.—As usual, the work sent from Rome by the students of the French school at the Villa Medici has been on view at the Ecole des Beaux-Arts. M. Prost, a first-year student, exhibits drawings of the Theatre of Marcellus, and some interesting fragments from Pompeii. M. Hulot has sent studies of the Forum of Nerva, and a fine water-colour of the Palatine Chapel at Palermo. M. Tony Garnier, a fourth-year student, sends drawings of a "Cité Industrielle," the details of which are both architecturally and practically interesting.

METROPOLITAN ASYLUMS BOARD.

The usual fortnightly meeting of this Board was held on Saturday last week at the offices of the Board, Victoria Embankment. Among the correspondence received was a communication from the Local Government Board authorising the execution of certain works at Belmont Asylum at a cost not exceeding 15,000.

Darent Asylum and Western Hospital.—On the recommendation of the Finance Committee, it was agreed to apply to the Local Government Board for authority for the expenditure of 770l. on enlarging the workshops at the Western Hospital, and the rearrangement of the principal officers' accommodation at the Darent Asylum.

Leavesden Asylum.—The Asylums Committee submitted a lengthy report re the purchase of additional land at this asylum for the purpose of an extension of the sewage system. It was agreed, on the recommendation of the Committee, to apply to the Local Government Board for sanction to purchase a piece of land, 57a. 1r. 3p. in extent, adjoining the Asylum estate, at a cost of 6,000l.

High Wood School.—Plans prepared and submitted by the Engineer-in-Chief of proposed workshops at this school were approved and ordered to be forwarded to the Local Government Board.

OBITUARY.

MR. THOMAS BROWNE.—The death has just taken place of Mr. Thomas Browne, builder and joiner, at his residence in Whipcord-lane, Chester. Mr. Browne, who was a native of Liverpool, went to Chester many years ago, and followed his trade as a mason. About thirty years ago he commenced business as a builder and joiner at the Tower Wharf, and executed several large contracts in Chester and North Wales. He was well known in the city and district, and for some years served on the Town Council.

GENERAL BUILDING NEWS.

RESTORATION OF SEIGHFORD PARISH CHURCH.—This church has been reopened after restoration. The church is a very ancient one, the earliest portions—the nave, arcade, and the chancel arch—dating from the XIIth century, and the recent work has revealed several points of interest to archaeologists. One in particular is a small niche which was found contained in the wall on the south side of the chancel. There is around the niche some lettering, which is conjectured to be *Moritura in te Deus*. The church was originally Norman and Cruciform. Of this church there remain the chancel arch, the nave arcade on the north side, portions of the chancel walls, and a piscina, which has probably been built in further eastwards. The short Norman chancel, which probably terminated in an apse, was lengthened in the XIIIth century, and a priest's door was inserted. Other windows were inserted on the south side in the XIVth century, and these had again been subjected to alteration at a later period. There are clear indications at the crossing of the existence of a north transept, and it is probable that there was a central Norman tower, which fell and crushed the south side of the nave. The present south wall and western tower of brick were built in the XVIIIth century. These are of the worst possible architectural character, and it is hoped they may, in the not far distant future, be restored in a manner more in keeping with the original structure. The Bridgeford aisle, running the whole length of the north side of the church, is of late Perpendicular date, and the abolition of the former vestry at its west end has opened out the western bay of the Norman arcade. The present work of restoration has been carried out by Messrs. Collins and Godfrey, builders, of Tewkesbury, under the guidance and supervision of the architect, Mr. W. D. Caröe, of London.

The outside of the church has been repaired and restored where absolutely necessary, but it is upon the internal portion of the building that most attention has been bestowed. The stonework in the walls has been divested of cement and sham pointing. An entirely new roof of oak has been placed over the chancel, the old timbers in the nave have been cased, and bits of tracery introduced into the principal beams, and the roof over the Bridgeford aisle has also been restored. The floors have been lowered to their original level, and laid with wood blocks in place of bricks, and the passages have been laid with red tiles. The old seating has been cut down and adapted to proper dimensions, and a clergy desk has been made out of the oak remaining removed from the seats. The altar rails, originally of Charles II date, have also been slightly lowered. The old Jacobean

pulpit, which has been removed from its old place at the south-east corner of the nave to a central position between the nave and the Bridgeford aisle, has been restored. The wall which enclosed the vestry in the north-west corner of the church has been removed, the space being filled with seats, and a new vestry has been built in the north-east corner of the Bridgeford aisle. A heating vault has been erected, and a hot-water apparatus placed in the church, this work having been accomplished by Messrs. Rudge and Griffith, of Stafford. The priest's door in the chancel has been opened and restored, and the sanctuary has been tiled and enlarged. The work of rebuilding the organ was entrusted to Messrs. H. S. Vincent and Co., of Sunderland. —*Staffordshire Advertiser.*

ST. CLEER CHURCH, NEAR LISKEARD, CORNWALL.—The Church of St. Cleer was reopened, after complete restoration, on Wednesday, June 23, and the new choir stalls and roof screen were dedicated. The church is, in many respects, interesting from an architectural point of view. The original church was built in the XIIth century, and a fine old Norman door still remains in the north aisle, but the main portion of the building and the tower (which is exceptionally fine) are of XVth century work. The north arcade is of roughly-hewn granite, but the columns of the south arcade are of Polyphant stone, with beautifully-carved caps and moulded bases. The carving is exceptionally well preserved, especially considering the deplorable state in which the church was when it came into the present architect's hands. The floors were very damp and uneven, being laid directly in the ground, the steps broken and patched, and the nave and aisle roof just falling into decay. A wretched deal roof had been put on the chancel in place of the old wagon roof, and high deal boxed pews, facing in all directions, formed the seating accommodation. The present restoration has included the removal of whitewash from the stonework, restoring the nave roof and renewing the chancel roof in oak, with carved angels at the feet of the curved ribs, re-flooring the whole church with slate, and wood-block flooring in the nave and black and white marble steps and paving in the chancel and chapel, and a new roof screen right across the nave and aisles, with carved figures complete. The cost of the entire work has been about 2,500l.

The architect is Mr. Geo. H. Fellowes Pryne, of Westminster, and the builder, Mr. S. Trehane, of Liskeard, Mr. S. Pomeroy acting as clerk of works.

ST. OSWALD'S CHURCH, SHIPTON, GLOUCESTERSHIRE.—The Church of St. Oswald, Shipton Oliffe, has just been reopened after restoration. The work has been carried out under the direction of Mr. H. A. Prothero (Messrs. Prothero and Phillott, of Cheltenham), the contractors being Messrs. Collins and Godfrey, of Cheltenham, Gloucestershire.

CHURCH RESTORATION, PITCHLEY, NORTHAMPTONSHIRE.—The restoration of the parish church at Pitchley has now been completed. The work has been carried out by Messrs. Norman and Underwood, contractors, under the supervision of Mr. Holding, architect, at a cost of 1,067l.

SCHOOL, ALNWICK.—A new school has been erected at Alnwick, from the design of Mr. J. Wightman Douglas, architect, Alnwick.

COTTAGE HOSPITAL, COBHAM.—A cottage hospital is to be erected at Cobham. The plans for the work have been prepared by Mr. F. W. Bedford, architect.

NEW DISPENSARY, NOTTINGHAM.—A new dispensary is to be erected on a site in Gregory Boulevard, Nottingham. The building will comprise a waiting-ball, with consulting-room, operating-room, and dressing and dispensing rooms, with a house for the resident surgeon adjoining. The cost is estimated at from 1,500l. to 2,000l. Mr. Ernest R. Sutton, whose plans were accepted in competition, is the architect for the work.

CONVALESCENT HOME, ANCOATS.—The new convalescent home, at Sandebridge, has just been completed in connexion with Ancots hospital. The buildings have been carried out by the contractors, Messrs. Levi, Brown, and Sons, of Wilmslow, under the supervision of the architects, Messrs. Thomas Worthington and Percy S. Worthington.

NEW FACTORY, BELFAST.—A new factory has been erected for Messrs. Mayrs and Co., Ltd., in Royal-avenue, Belfast. The building is of red brick, and is three stories in height, with a flat roof for the storage and seasoning of timber. The foundations are of concrete. Mr. Allen B. Stokes, C.E., prepared the plans for the work.

EXTENSION OF THE CENTRAL STATION, GLASGOW.—The improvements to the Central Station, Glasgow, have now been completed. The whole of the works of the new extension were designed and carried out under the direction

of the Caledonian Railway Company's Engineer-in-Chief, Mr. D. A. Matheson. Mr. G. R. Storrar and Mr. H. Cunningham acted as resident engineers, and Mr. Alexander Grant was superintendent of works. The principal contractors were Sir William Arrol and Co., Glasgow; Morrison and Mason, Glasgow; James Goldie and Son, Glasgow; P. and W. Anderson, Glasgow; the Motherwell Bridge Company; P. and W. MacLellan, Glasgow; William Anderson, Glasgow; John Cochran, Glasgow; and John Orr and Sons.

KNOX MEMORIAL HALL, MONKSTOWN, IRELAND.—His Grace the Archbishop of Dublin performed the opening ceremony of the Knox Memorial Hall, Monkstown on the 28th ult. The architect of the building was Mr. Millar, the contractor being Mr. T. C. Joly, of Newtown Park, Blackrock. The hall cost nearly 4,000l.

DORMAN MEMORIAL MUSEUM, MIDDLESBROUGH.—The Dorman Memorial Museum, Middlesbrough, is situated near the principal entrance to the Albert Park. The building, a square block, is designed upon classic lines, and is placed practically in the centre of a plot of land about an acre in extent. The most important parts of the building are those devoted to the exhibition of the different classes of specimens, the space provided for this object being divided into four rooms or galleries one story in height, opening one into the other; two of these galleries are 60 ft. in length and 25 ft. in width, the other two being about 30 ft. square, each. These galleries are all lighted from the top. The roof of the first gallery is domed and lighted by a large lantern; the roofs of the other three galleries are semi-circular. The whole of the roofs are of steel construction. The front part or façade of the building is two stories in height above the ground line, with a basement floor beneath. The main entrance is in the centre of the front, and has a wide approach leading into the hall, about 20 ft. square; from this a corridor runs to the right and left, part of which will be utilised for museum space. On this level is provided the library, the curator's room, a room for hats and coats, and lavatories and other necessary accommodation, and for approach to the basement and the first floor. On the basement level there is provided a room for the preparing of special specimens, with separate access from outside, as well as other rooms for storage and for the purpose of the warming of the building. The whole of the first floor is reserved for museum space, with the exception of the provision of a room, which is intended to be used as a workshop by the curator and his assistants. The building is fireproof throughout, the floors being constructed of concrete, covered with solid wood blocks. It is warmed by open fires and by hot water, upon the low-pressure system, with radiators, through each of which is passed a current of fresh air, which is warmed before entering the several rooms. The surface of the floor of the entrance-hall and lobby adjoining is formed of Italian mosaic pavement. The building throughout will be lighted by electricity. Red brick and terracotta has been used. There is an octagonal central tower. The architects are Messrs. J. M. Bottomley, Son, and Wellburn, of Middlesbrough and Leeds. Mr. E. A. Jones has acted as clerk of the works, and Messrs. Allison Bros., of Middlesbrough, have been the builders. The cases have been made by Messrs. Marsh, Jones, Cribb, and Co., of Leeds, from the designs of the architects. The total cost of the museum building, with the site and the several fittings, will amount to between 10,000l. and 15,000l.

VICTORIA PAVILION, RAMSGATE.—The Princess Louise, Duchess of Argyll, opened the Royal Victoria Pavilion, Ramsgate, recently. The new building has been erected for the Corporation at a cost of 40,000l., and occupies a site adjoining the Royal Harbour. It has a frontage to the sands, and covers an area of 4,000 yds. The centre of the interior consists of a hall, 130 ft. long by 65 ft. wide, having a balcony on three sides, and a stage at the west end, with dressing-rooms for artists and orchestra. The proscenium has a 30 ft. opening. The architect was Mr. Stanley D. Adshear, of Bloomsbury, and the work has been carried out by Mr. F. G. Minter, of Westminster and Putney. In addition to the great hall, at either end are octagons, comprising a tea-room and buffet. Surrounding the central hall, and extending over and beyond the outbuildings, is an upper promenade, about 300 yds. in extent.

BUSINESS PREMISES, WARDOUR-STREET, W.C.—Mme. Sarah Bernhardt laid the foundation-stone a few days ago of the new premises to be built for Mr. W. Clarkson, the wig-maker, on the west side of Wardour-street, near the corner of Shaftesbury-avenue. The new building, which has been designed by

Mr. Horace M. Wakley, will be completed about the end of the year.

THE LEYSIAN MISSION BUILDINGS.—The Prince and Princess of Wales opened, on Monday, the completed portion of the new buildings of the Leysian Mission, City-road. The new buildings have been erected at a total cost of 112,000*l.* The buildings, which have been designed by Messrs. Bradshaw and Gass, and are of fireproof construction throughout, are situated at the corner of City-road and Old-street. They have a frontage to the City-road 132 ft. long and a total floor area of over two acres. The Queen Victoria hall, which is at present the only completed portion of the buildings, contains seating accommodation for 2,000 persons. In addition to the Queen Victoria hall, there are a small hall and numerous class-rooms for Sunday School work; club-rooms for men, boys, women, and girls, tea and refreshment rooms, and a drill hall and gymnasium. A medical mission is to be conducted in a detached building, and there are other rooms for the administrators of the mission.

BANK, KESWICK.—A new bank has been erected in the High Market-square, Keswick, for the Carlisle and Cumberland Banking Company. The premises have been erected on a site adjoining the old bank, and have a frontage to the street of some 36 ft. The lower part of the elevation is in red stone, and the upper part faced with the green slate stone of the district, with red stone dressings. The roof is covered with red tiles. The building is lighted by electric light throughout. The bronze hinges are from the Keswick School of Industrial Art. The work has been carried out by the following contractors:—Mr. Isaac Hodgson, builder, Keswick; Mr. Chas. Clark, joiner, Keswick; Mr. Thos. Brown, painter, Keswick; Messrs. D. Thomson and Son, plumbers, Carlisle; Mr. C. Greenwood, plumber, Keswick; Mr. J. Armstrong, electrician, Carlisle; Messrs. Cairns and Co., graters, Carlisle. The structure is from the designs and plans, and under the supervision, of Mr. J. H. Martindale, architect, Carlisle, and Mr. W. Wildman acted as clerk of the works.

COUNCIL SCHOOL, LEEDS.—A new school, erected in Argie-road, off Kirkstall-road, Leeds, was opened on the 11th inst. by the Lord Mayor. The school is part of a scheme which will eventually provide accommodation for 1,500 scholars, it being the intention of the committee, at some later date, to erect a mixed school on a portion of the site fronting Kirkstall-road, and to use the present building as an infants' school. For the present, accommodation is provided for 500 children in ten class-rooms, grouped round a central hall, six of which will be used for a mixed school, and four for infants. In addition to the main school a separate building has been erected for manual training, and this will be used as a centre for boys from other schools. The work has been carried out under the superintendence of Mr. W. S. Braithwaite, architect. The total cost of the site was 4,544*l.*, and the cost of the buildings, fence walls, and fittings, 9,122*l.*

SANITARY AND ENGINEERING NEWS.

SANITARY CONDITION OF STABLES.—In the annual report by the Liverpool Medical Officer of Health on the health of the City of Liverpool for 1903, attention is drawn to the unsatisfactory condition of stables. The number of visits of inspection made was 4,724. Conditions prejudicial to health were found in stables on account of defective construction, or of improper situation, or from neglect of lighting, ventilation, and cleansing of the stables. Under existing legal powers, great difficulty is experienced in dealing with stables, and complaints are very frequent of nuisances occasioned by the causes indicated, the most frequent, perhaps, being neglect of cleanliness. A large number of stables, it is added, are either so defective, or so little care is taken of them, that the visits of the inspectors are necessary almost every day, in order that they may be under practically constant observation. The Health Committee of Liverpool have endeavoured to procure adequate powers to enable them to make by-laws to deal with stables (a) for regulating the lighting, ventilation, cleansing, and draining; (b) for regulating the situation and mode of construction of stables to be erected within the city. Such by-laws have now been drafted and approved by the Health Committee.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—Mr. T. Martin Crippon, architect (Dundee), has removed his offices from 30, Reform-street, Dundee, to the offices at 32, Bank-street, formerly occupied by the late Mr. W.

Alexander, City Architect of Dundee, whose practice he has taken over by arrangement with the Trustees.

THE SLATE TRADE.—The make of slates for 1903 shows an increase, as compared with 1902, of 5,000 tons from slate mines (or underground quarries) and 10,000 tons from open quarries. This is, however, 25,000 tons below the average output of the last ten years. The demand for slates of good quality is brisk, and the increased output will displace an equivalent tonnage of foreign slates.

THE OLD BURLINGTON HOUSE COLONNADE.—In the House of Commons recently, in answer to Mr. MacNeill, who asked what had become of the stone colonnade formerly in front of Burlington House, Piccadilly, and removed by the Department of Works, and why it was not re-erected in one of the parks or elsewhere, Lord Balcarras replied as follows:—The colonnade is lying in Battersea Park; the question of re-erecting it is now under the consideration of the First Commissioner.

THE GUILDHALL LIBRARY, MUSEUM, AND ART GALLERY.—Amongst recent additions to the museum, the contents of which have been re-arranged and reclassified, are some remains of the Queen Eleanor cross that stood in West Cheap, opposite Wood-street, and, having been rebuilt in 1441-2 by Lord Mayor John Hatherle, was pulled down on May 2, 1643, by the Long Parliament; relics from the sites of Newgate Prison, Chamberlain's Wharf, and the New Ballic in St. Mary Axe, including a XIVth century stone figure of St. Christopher from the present site, and a sign of the "Black Boy," from a house in Fleet-lane. The Corporation have purchased the painting, "Mowing Bracken," by Mr. H. H. La Thangue, A.R.A.; Mr. Briton Riviere, R.A., has presented "The Temptation in the Wilderness," now lent to the St. Louis Exhibition; and Mr. George Gilbert has bequeathed two oil paintings, and eighty-four drawings in water-colour by his brother, Sir John Gilbert, R.A. A new catalogue of the contents of the museum is now ready, and a large amount of printed books, MSS., and maps and prints has been added to the collections in the library.

NATIONAL HOUSING REFORM CONFERENCE.—A conference, under the auspices of the National Housing Reform Council, was held at Bournville, Birmingham, on Saturday last. Councillor W. Thompson, Richmond, presided. A number of municipalities sent representatives, including, Birmingham, Manchester, Salford, Wigan, Sheffield, Brighton, York, Hull, Leeds, Bradford, and Newcastle-on-Tyne, in addition to the Liverpool Housing Association, the Citizens' Association of Manchester, the Sheffield Health Association, the Local Government Reform League, the Allotments and Small Holdings Association, Durham, the South Staffordshire and Somersetshire Miners' Associations, and other workmen's organisations. The chairman referred to the great death-rate in the large towns which was due to the want of sunshine and fresh air, and said there was an avoidable death-rate of 100,000 every year, and, in addition, they had the chain of disease and suffering which led up to it. Their desire was to lessen this by creating a more healthy public opinion. He advocated the better planning and healthful development of housing areas, remarking that whenever opportunity had been given by the provision of a cheap and frequent system of transit, there had always been a rapid rush of population to districts which had been entirely neglected. The whole of the existing by-laws should be recast and made more elastic and more adaptable to the needs of the different districts. Mr. T. C. Horsfall proposed:—

"That this conference respectfully desires to draw the attention of the President of the Local Government Board to the pressing need for (1) such measures as will effectually enable local authorities to secure that all new housing areas shall be planned to ensure an ample provision of light and air, open spaces, gardens, etc., and rendering impossible the development of new slums; (2) increased and more effective powers for dealing with the housing question in rural districts." Mr. Barlow, secretary of the Bournville Estate, seconded the motion, which was passed. Councillor Thomas Shaw, Sheffield, next proposed:—"That this conference, recognising the evils arising from bad housing conditions, desires to draw the attention of local authorities to the great value of the housing powers already possessed by them under the Housing of the Working Classes Act, 1890, 1900, and 1903, and respectfully urges that these powers should be efficiently and vigorously administered, more especially in regard to Part III. of the Act of 1890, which renders practicable the provision of suitable cottages, without any burden being placed upon the rates." Mr. Kelley, Manchester, seconded the proposition, which was affirmed.

CAPITAL AND LABOUR.

SHEFFIELD BUILDING TRADES DISPUTE.—The dispute in the Sheffield building trade, between the operative stonemasons and the master builders of the city, after lasting for about six weeks, has now been brought to a termination satisfactory to both sides. A conference was held on the 4th inst. at the Building Trades Exchange, Cross Burgess-street, of the executive of the Master Builders' Association, and a deputation from the Operative Masons' Society, augmented by two officials from the parent society in London. At this meeting an amicable settlement was arrived at, and, as the result, work has been resumed. On the two main issues—the question of permitting the introduction of hand-worked or machine-moulded stone in Sheffield, and the binding, as apprentices, of stonemasons whose compromises have been effected between the contending parties. With regard to the former, the original rule governing the trade locally was that "piece-work and sub-contracting shall not be allowed, and no worked stone shall come into the town, except flags, steps, and landings." The master builders wished to amend this, so as to read, "piece-work and sub-contracting shall not be allowed, and no hand-worked or machine-moulded stone shall come into the town, except flags, steps, and landings." The compromise now arrived at decides that no worked or partly-worked stone shall be introduced, beyond stone planed up to the square and chamfered coping, except flags, steps, and landings. With regard to the employment of apprentices, the old regulation insisted on boys being bound at the end of three months' employment, but the sons of members of the Operative Stonemasons' Society were exempt from this rule. The master builders sought to place these on the same level as other lads entering the trade. The difficulty has now been got over by a regulation which provides that sons of stonemasons "may" be bound, thus leaving the matter for individual settlement between the master builder and operative masons whose sons work with them. Of the minor questions of the dispute, the master builders desire that in winter the stonemason shall commence work at 8 a.m., having previously had breakfast. This has been acceded to by the stonemasons. This brings them into line with other branches of the building trade. The extra 4d. per hour paid to stone-setters, or fixers, which the employers objected to, will remain as before.—*Sheffield Telegraph.*

MASON'S STRIKE, GLASGOW.—The masons' strike has now entered upon its third week, and, judging from present indications, there is little hope of the dispute being settled before the conclusion of the Fair holidays. Some time ago the Lord Provost, Sir John Ure Primrose, suggested that both parties should submit the points at issue to arbitration, on the footing that the men return to work at once at the old rate—9*sd.* per hour, pending the arbiter's decision. The Master Committee are not empowered to act upon the suggestion, but in acknowledging the Lord Provost's letter, they thanked him for his kindly interest in the affairs of masters and men, remarking that they quite appreciate his hesitancy in moving in a trade dispute. It so happens that many of the masters are on holiday at present, a circumstance which has delayed the meeting to consider his proposal till July 26. A mass meeting of the men was held in the Albion Hall recently to consider the suggestion. After some discussion, the following resolution was adopted:—"That we, the operative masons of Glasgow and district, beg leave to thank the Lord Provost of Glasgow for the proffered good office but we cannot go further in the matter." It may be added that the executive committee of the operatives have decided to pay strikers money to the men signing the roll through the holidays.—*Glasgow Herald.*

Legal.

PATMAN AND FOTHERINGHAM v. PILDITCH.

In this case, which was not reported, detailed in our columns, the plaintiffs entered into a contract for the erection of a block of flats in Southampton-row, W.C., the contents of which was in accordance with the form authorised by the Institute of Architects, stated that the works were to be done according to the plans, specifications, and bills of quantities. The plaintiffs found discrepancies in the quantities, and sued the defendant for amount of such deficiency, upon the ground that the bills of quantities formed part of the contract, and that, consequently, they were entitled to be paid for the work shown on plans and specification, although not

taken in the quantities. The defendants raised the defence that the bills of quantities did not form part of the contract, but the judge gave a verdict in favour of the plaintiffs (Messrs. Patman and Fotheringham, Ltd.), and upheld their claim. As the point decided is one of importance to building owners and contractors, we think it well to put on record the judgment of Mr. Justice Channell, which was as follows:—This matter is, of course, one of considerable doubt upon the construction of this contract. The bills of quantities are incorporated into this contract in an unusual manner. It has been referred to a statement of the Master of the Rolls, in which he says, dealing, I think, with the ordinary case of a bill of quantities, that it is well understood, and that it had been settled in more than one case, that this document, the bill of quantities, where it was embraced in, and made part of, one of the other documents, whether by being in the specification or by being scheduled to the contract, or as a separate document altogether, was not, and was not intended to be, a representation to be acted on in the sense of being a warranty. Now, as regards all the instances which the Master of the Rolls gives, except as to being introduced into the contract, that, of course, is all perfectly clear. He speaks, in general words, of it being introduced by, amongst other things, a schedule to the contract. He does not say in the contract itself; and if it is introduced into the contract itself, it seems to be perfectly obvious that the operation of it depends upon the mode in which it happens to be introduced into the contract. Because it is perfectly possible, although a thing is a bill of quantities, and has been prepared as a bill of quantities, for the ordinary use of a bill of quantities, still it is possible, if the people like to incorporate that into their contract as a description of what the work is that is contracted to be done, they can do it, and, therefore, if you find it in the contract, you have got to construe the contract simply so, and say what it means; and, in this case, as in almost any other case, if one has got to deal with the way in which the courts have construed other and different contracts from the one in question, it does not afford very much help. I suppose everyone understands by this time what a bill of quantities is, and how it comes into operation. It is prepared, as a rule, by some independent person who, under a special arrangement that is made in such matters, takes the place of the builders' clerk, and if there were no such thing as making out a bill of quantities when the plans were submitted to tender, each builder would have to do it himself and have to pay his own clerk for doing it; but, for general convenience, it is done in a different way, and that man whose services, rendered before the builder knows anything about it, are adopted by the builder in each particular case, stands very much in the same position—in fact, in quite the same position as if he had been employed by the builder. I take out the quantities for him himself, although he has been employed by somebody totally different. In this particular case, the gentleman who is entering into this contract for the building to be built for him, is himself an architect. He was the architect in regard to this building, and the printed form is altered therefore from the architect engaged by the employer to the architect and employer, and, in some respects, the contract was a little bit anomalous. It does happen that he had prepared in his own office these bills of quantities; so that, it being done by him through his clerk, it is the same thing as if it had been done by himself, and I think it applies, for this purpose, to totally different characters. He is a contracting party. Also, he is the quantity surveyor. As a contracting party he has certain liabilities, and as a quantity surveyor he would take other liabilities; and certainly, if, as a quantity surveyor, there was negligence in the preparation of these quantities in that capacity, either in this action, if it is properly planned (I am told there is something to be said in reply to that), or in some other action which should be properly framed; that is if, in his capacity of quantity surveyor, he has been guilty of negligence, he will be liable, of course, for that negligence. There is no difficulty about that cause of action. The real difficulty is the main cause of action, if not the only cause of action, is set up in these pleadings, and that is the cause of action against him as contracting party. Now, as to that, we have got really to see what is the true meaning of this contract so far as regards what is the contract or work which there is a contract to do for the 17,000*l.* As a general rule, of course, the contract work is described in plans and a specification. The bill of quantities is the estimate made by some outside person as to the quantity of work which those plans and

specifications show, and, assuming that it is properly done, the works described in the bills of quantities and the works described in the plans and specification would be identical. In this case the suggestion is, and, for the purposes of argument only, has it been admitted, that they are not identical, and that there were very large discrepancies between the bills of quantities which were, in point of fact, made out, and what ought to have been the true bills of quantities upon the contract plan. Now, those being the facts, the contract is entered into in this shape. The contractor will substantially complete, etc., for the sum of 17,000*l.*, the several works required to be done in the erection of a block of flats on a site.

If it had been kept there it would have been, of course, absolutely and entirely indefinite. The next sentence is, "in a good, sound, lasting, and workmanlike manner." That is the manner, and we have not yet got the particular description turning the indefinite block into some definite amount of contract work. Then it says, "According to the plans, invitation to tender to specification and bills of quantities signed by the contractors." Now, "signed by the contractors" grammatically, and, in fact, in this case no doubt applies to all the things, although I do not suppose the invitation was signed by the contractor. It may have been. But the plans were signed by the contractors. The specification was signed by the contractors. The original bill of quantities was not signed by the contractors; but the priced bill which he gave in was. I think, therefore, that those bills of quantities signed by the contractors mean the priced bills of quantities.

Now, the question is that, following those words, "according to the plans, invitation to tender, and specification, and bills of quantities," that is, following upon an indefinite description of the work to be done, you must find the description of the work that is to be done, the thing that turns a block of flats indefinite into some definite block of flats; you must find that, somewhere or another, in these words that follow, "the plans, invitation to tender, specification, and bills of quantities." But also we have, in these four documents, to find the mode of doing the work, because that has come just before in "a sound, lasting, and workmanlike manner," according to these documents. So that you would expect these four documents would do two things:—(1) Define what the work that has to be done is, and turn the indefinite "a block of flats" into the definite block of flats; and (2) would also contain the instructions as to the mode in which the work is to be done. You would expect to find both of those somewhere or another in the four documents. Now, are you to say that some are to be looked at for some matters, and some for others, or are all of them to be looked at for both purposes? I think if there is anything material in any one of them for either of the two purposes, you must look at it for that purpose as well as for the other; that is to say, you must look at both. So far as they have got anything material to both purposes you must look at them for both purposes to define the work, and also to show the mode in which it is to be done. Now, for which purposes are you to look at the bills of quantities? The bill of quantities is the document which specially says, when you have got it incorporated like this, "what the quantity of the work is to be. Mr. Lawrence's argument is that I must deal with it in the same way as in any contract, or anything else we have to construe; that is to say, you deal with the specific things as over-riding the general ones and governing them, just as even, I think, without a clause to that effect in a contract you would say that figured dimensions over-ride some dimensions arrived at by taking the scale. Now, I think that there is great doubt about the way in which one looks at it, but on the whole, I cannot help feeling that Mr. Lawrence is right in saying that, if it was merely wanted to introduce bills of quantities for the purpose of showing the way in which the extras were to be priced, that had already been sufficiently done by clause 17, and that it was unnecessary to introduce the words, "bills of quantities" in the way in which this was done, unless it was intended to make that as the other documents with which it is coupled are a part of what the contract work was, and turning the indefinite block of flats into some definite amount of work. I confess that it is not the first time one has had experience of these building contracts, and I have always taken the view that, when the bills of quantities were introduced (and I have seen one or two cases of that sort) in this particular way, and made part of the contract, it is for the express purpose of varying the usual effect of those bills of quantities, making them part of the

contract instead of a mere estimate of what it is. My view, therefore, not arrived at by any means without doubt, is that here, so far as the bills of quantities and the plans can be put together and looked at as a thing in accordance generally with the plans, and with the quantity of work shown in the quantities, so far as that thing is possible (and I take it that it is in these matters), my view is that then the quantities provide the amount of the work, and, if in the course of doing the work the contractor is directed to exceed that amount of work for the purpose of making it accord with what it is desired to have in regard to the building, I think that then that is all extra, subject, of course, to the further things in the contract as to the mode in which it is to be done, and so on.

I think, therefore, on the whole, that it is incorporated into this contract as a part of the description of the contract work, and that, therefore, apart from any question of negligence which there might possibly be, and which would have to be dealt with in a different shape, as I have said before, if the facts for that purpose only are admitted, the plaintiff is necessarily entitled to something beyond what he has been allowed.

I say, therefore, that my judgment, subject, of course, to the reference, will be on the construction of the contract for the plaintiff. My view is that the whole of the quantities are introduced into this contract as part of the description of the contract work, and that, therefore, he is required, in order to complete the work, to do more work than is in the quantities, he is entitled to have that as an extra.

POINT UNDER THE LONDON BUILDING ACT, 1894.

THE bearing of the case of the London County Council v. Davis concluded, before a Divisional Court of King's Bench, composed of the Lord Chief Justice and Justices Kennedy and Phillimore, on the 12th inst., on the appeal of the London County Council from a decision of a Metropolitan police magistrate, under section 7 of the London Building Act, 1894.

Mr. Horace Avory, K.C., for the London County Council, said the question in this case was whether the respondent had formed or laid out a street within the meaning of the London Building Act. The magistrate had formed, or expressed an opinion, that the place in question was a market or bazaar, and therefore not a street within the meaning of the Act. Counsel said there was nothing in the Act about a market or bazaar. The point in the case was whether, it being a market or bazaar, prevented it being a street. In 1902 the respondent pulled down some old houses in Morgan-street, Commercial-road, and erected a large block of buildings, in the centre of which was a number of small shops. There were various entrances to them. The magistrate held that it was not a place for foot traffic within the meaning of section 7 of the Act. He was also of opinion that the shops formed a market, and not a street, within the meaning of the Act, and he dismissed the summons. The learned counsel contended that it was a street within the meaning of the Act, just the same as the Burlington Arcade was a street for foot traffic.

Mr. Macmorran, K.C., having supported the decision of the magistrate,

Mr. Avory asked the court to find that the magistrate should have found that the place was a new street, and should have imposed a penalty.

The Lord Chief Justice, in giving judgment, said that the place was commenced to be laid out as a new street about June 22. The place was about 20 ft. wide, and there were fifty-five places of business on one side and thirty-four independent shops on the other side. There were six or seven different modes of access to the buildings. Under all the circumstances, he had come to the conclusion that the magistrate had applied a wrong test. It was not a question whether a market had been established, but whether the respondent had laid out a place where people went in and out to those shops. He thought, on these facts, there was a commencing to lay out a new street in June. The place did not cease to be a street because it was used as a market.

Justices Kennedy and Phillimore concurred, and the appeal was accordingly allowed, the case being sent back to the magistrate.

POINTS OF LAW UNDER A BUILDING CONTRACT.

IN the Chancery Division, on the 6th and 6th insts., Mr. Justice Farwell had before him the case of Sharpington v. the Fulham Board of Guardians on two preliminary points of law raised by the defendants.

In this case the plaintiff, a builder and contractor, entered into a contract to convert a private house at Parson's Green, S.W., into a house for the reception of pauper children under the charge of the defendants. The contract price was £539, but this sum was afterwards increased. The contract contained a clause for the reference of disputes to arbitration. The work was completed on May 3, 1901. The plaintiff's case was that the work was delayed for thirty-six weeks beyond the contract time by reason of the defendants' acts and owing to alterations and changes made by the defendants, and that, in consequence of this, he (plaintiff) had incurred considerable expenses over and above the amount of defendants' architect's certificate. Plaintiff accordingly made an additional claim for 1,357l. Defendants disputed this claim, and the matter was referred to arbitration on November 25, 1902, the demand for arbitration being made in April, 1902. The two points of law raised by the defendants were, first, that the action would not lie under the Public Authorities' Protection Act, 1893, as the plaintiff had not commenced proceedings within six months after the acts or default complained of, nor within six months next after the ceasing thereof. The second point was that if any debt or claim was lawfully incurred by the defendants to the plaintiff in respect of the plaintiff's claim, the same was incurred or became due on or before May 3, 1901, the date of the completion of the contract, and was not paid within the half-year in which the same was incurred or became due, nor within three months after the expiration of such half-year, the commencement of such half-year being reckoned from March 30, 1901, the time when the last half-year's account was, or should have been, closed according to the order of January 14, 1867, of the Poor Law Board, and that the same could not be paid by the defendants under the Boards of Guardians (Payments of Debts) Act, 1859.

After hearing the arguments of counsel, his lordship held that the defendants' contention on both points failed. On the first point he said that the public duty in the present case was to supply a house for the reception of poor children. A breach of duty would be an injury to the poor children of the neighbourhood. The defendants had to alter the house, and they entered into a contract, and the complaint was by the contractor as a private individual of injury to himself. It was not an action in the name of the poor children of Fulham. Therefore, the defendants' contention on that point failed.

On the second point, the defendants' contention also failed, as the amount to be paid by the defendants in the present case could not be ascertained until the arbitrator had given his decision.

Mr. Upjohn, K.C., and Mr. Beddall appeared for the plaintiffs, and Mr. Butcher, K.C., and Mr. A. A. Hudson for the defendants.

CASE UNDER THE PUBLIC HEALTH ACT, 1875.

The case of Harris and others v. Scurfield came before a Divisional Court of King's Bench, composed of the Lord Chief Justice and Justices Kennedy and Phillimore, on the 11th inst., on appeal from a decision of the Justices of Sheffield.

From the special case stated it appeared that the respondent, the Medical Officer of Health of Sheffield, had preferred an information against the appellants alleging that a nuisance arose from defective surface channels at Nos. 7 to 25 in No. 1 Court, Eyre-lane, Sheffield, and that that nuisance was caused by the default of the appellants, and had not been abated after notice given. The short facts were these:—Appellants owned eighteen houses, Nos. 7 to 25, in No. 1 Court, Eyre-lane, Sheffield. The houses were back-to-back houses, and Nos. 7 to 13 formed part of a block, and Nos. 14 to 25 were in one block. Nos. 7 to 13 faced Nos. 14 to 19, and between them was an open space of ground with a pavement on either side. Nos. 20 to 25 of the houses faced the boundary wall on the south-east side of the court, and between them and the boundary wall was also an open space of ground, with a pavement on the side thereof. The main entrance to the court was from a partially-enclosed space of ground, to which an entrance was obtained from one of the main thoroughfares. The court could also be entered by two narrow passages made between Nos. 7 to 13 of the houses. The surface channels were open, and not enclosed or covered in any way, and the slop water from the sinks of each house was carried by a separate channel cut in the pavement at right-angles to each house. There was, therefore, a separate cross-channel for each house, and a number of the cross-channels drained into each side-channel, and the drainages were by these

side-channels into two gullies in the court, and from there into the main sewer outside of the court. The use of the side-channels and cross-channels constituted a nuisance within the meaning of the Public Health Act, 1875. The Medical Officer of Health contended that each of the side-channels and cross-channels was a drain, as defined by the Act of 1875, as all the houses were premises within the same curtilage. He contended, therefore, that appellants were bound to do the work required by the notice. The appellants, however, contended that each of the side-channels was a sewer under the statute, as each was used for the drainage of more than one building, and that the premises were therefore not within the same curtilage. The Justices held that the side-channels were drains, and not sewers, and that the houses drained were premises within the same curtilage. Hence the present appeal.

At the conclusion of the arguments of counsel, the Lord Chief Justice, in giving judgment, said that the decision of the Justices could not be supported. No authority had been cited which showed that a curtilage would include this kind of combination of houses. No definition of a curtilage existed which would cover the case of a number of houses separately occupied by different people, simply because there was a common access and, to a certain extent, accommodation. He was of opinion that these houses were not houses within the same curtilage, and the appeal must be allowed with costs.

Mr. Justice Kennedy and Mr. Justice Phillimore concurred.

Mr. Danvers, K.C., and Mr. Beddall appeared for the appellants, and Mr. Montague Lush, K.C., and Mr. Waddy for the respondent.

LIABILITY FOR PAVING, ETC., CHARGES.

In the Court of Appeal, composed of the Master of the Rolls and Lords Justices Stirling and Mathew, on the 7th inst., judgment was delivered in the case of the Mayor, etc., of Hackney v. the Lea Conservancy Board, on the plaintiffs' appeal from a judgment of Mr. Justice Wright in the King's Bench Division.

The action was brought by the plaintiffs to recover from the defendants 300l. 2s. 6d., the amount apportioned on the defendants in respect of paving and other expenses in making good a new street, known as Maiwand-road, Clapton Park, in the Borough of Hackney, it being alleged that the defendants were liable for this amount as the owners of a strip of land bounding or abutting on that road, and forming part of the Hackney Cut navigation of the river Lea. The only question on the appeal was whether the defendants were the owners of this strip of land within the definition in section 255 of the Metropolitan Management Act, 1855.

Mr. Justice Wright held that the defendants were not the "owners" within the meaning of the section, inasmuch as they held the land "as trustees for public purposes, inconsistent with the land being rack-rented as between landlord and tenant." Therefore, the question was whether the conditions under which the defendants held the land in question were such as to support the learned Judge's conclusion. The Maiwand-road was built upon only on the side furthest from the river Lea. The land in question, which bounded the side of the road opposite to that on which the buildings were, was a retaining bank for the purpose of strengthening the bank of the Hackney Cut, and was about 26 ft. wide at the base. No houses were built upon this land, the trustees (the Lea Conservancy Board), under their powers, having purchased the land in 1849 for the purpose before stated, and it was used for that purpose and for no other purpose.

Their lordships held that there was sufficient evidence to show that the embankment, without impairing its efficiency as a protection to adjoining lands, might be made the site of a building, or might in other ways be turned to profitable account in connexion with the defendants' business. They accordingly held that the defendants were liable for the expenses, allowed the appeal, and entered judgment for the plaintiffs for the amount claimed with costs.

Mr. Macmorran, K.C., and Mr. Bevan appeared for the appellants, and Mr. Horace Avery, K.C., and Mr. E. Morten for the respondents.

NEW MARKET HALL, LEEDS.—The new market hall at Leeds was recently opened. The building has been erected from the designs of Messrs. Leeming and Leeming, architects, of London, at a cost of over 110,000l. Mr. J. T. Wright was the principal contractor for the work, and Mr. James Reid was the clerk of works.

PATENTS OF THE WEEK.

APPLICATIONS PUBLISHED.*
13,315 of 1903.—J. and E. BATES and SONS, LTD., and A. J. BATES: *Joints of Sheet Metal Hinges*.

Hinges are usually made from a flat blank, the joints of which are formed by rolling or turning. This invention has for its main object the strengthening of the joints, which is effected by forming between a pair of dies a corrugation or reed, or a series of corrugations or reeds running along the joints, which are then rolled on and form corrugated or reeded joints which strengthen them in the weakest place, and also enhance their appearance.

14,367 of 1903.—F. L. KEPPLER: *Sash or Glazing Bars*.

A sash or glazing bar for glass roofs, and the like, wherein the bar proper is of approximately A-shape in cross-section, its upper flange being formed with four thin ribs for providing cement and screw grooves, and the lower horizontal flanges with two thin ribs for providing water gutters, said lower flanges being connected with two thin webs.

15,711 of 1903.—W. BERNSEAW, P. UELLEBERG, and A. UELLEBERG: *Door Locks*.

This relates to door locks, and consists in the construction of the locking bolt, so that in its opened position it projects into the staple plate, and the staple plate provided with recesses or openings, so as to allow the bolt to enter its opened position, or be withdrawn therefrom in its opened position, while one or two catches, held in position by spring pressure, hold the bolt fast and the door shut, so that it can be only opened by a certain pressure exerted against it, whereas the bolt and the door can be locked totally by pushing forward the bolt by a key, so that its front end projects beyond said openings or recesses in the staple plate, into an opening provided for this purpose.

16,699 of 1903.—F. H. SHORLAND: *Chimney and Ventilating Cowls*.

A chimney and ventilating cowl, for application to the outlets of ventilating shafts, chimneys, and the like, consisting of an internal shell with radial outlets, radially projecting plates, and radial shield plates, with contracted outlets arranged at each side of the outlet plates to act asaffle plates against the ingress of air.

16,879 of 1903.—J. A. GEE and J. W. BOWLEY: *Plug for Wedging into Walls, and for other purposes*.

A wall or the like plug, provided with a saw cut extending from its rear towards the front end, consisting of a binding ring at the front solid end of the plug, and a wedged-shaped piece of equal or greater length adapted to expand and compress the plug at the rear end, and to cause compression at the front end, so that the latter presents a comparatively solid compressed face.

17,403 of 1903.—C. SMITH, SONS, and CO., LTD., and J. F. MOORE: *Spring Roller Stops for Doors*.

A spring roller stop for doors, consisting in the combination of a bridge piece, adapted to be fixed in a mortise in the bottom of a door, a fork piece carried by said bridge piece, and adapted to slide up and down, a spring which presses the fork piece downwardly, a cross-pin and roller carried by said fork piece, said roller projecting for a certain distance below the base of the bridge-plate to ride over the stop-plate fixed on the floor.

17,658 of 1903.—J. JUDD and J. G. CRAIG: *Domestic Fire Escapes*.

A domestic fire escape, having a rope carriage, consisting of a cross piece, through which a rope is adapted to pass, a hinged front to enable the rope to be readily inserted, and a brake adapted to act on the rope.

17,954 of 1903.—A. J. POLLOCK: *A Toilet Cabinet applicable to Bathrooms, and the like*.

A toilet cabinet, consisting in the combination of an upper ventilated compartment, the door of which is provided with a mirror, said compartment adapted to hold tooth brushes, and other toilet requisites, and a lower compartment provided with drop lid, and adapted to hold brushes and combs.

26,161 of 1903.—G. SCHWARZ: *Construction of Baths to Facilitate the Heating*.

This relates to the construction of baths to facilitate the heating of the water, with the effect that the heating gases act directly through the casing of the bath on the water.

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

The invention consists in the provision of heating channels or flues around the bath for its purpose.

2,245 of 1904.—J. POLLOCK: *The Adjustable Attachment of Handles or Knobs upon their Spindles.*

This consists in the combination or arrangement and use of means for adjustably attaching handles or knobs to spindles, comprising an internally threaded longitudinal hole in the spindle, a bushed and shouldered channel through the knob or handle, and screw threaded to engage the thread of said hole, and provided with a head fitting the larger diameter of said channel, and resting on the shoulder formed therein, and a plug closing said channel and hiding the screw.

6,969 of 1904.—P. BILLARD: *Manufacture of Imitation Ornamental Ceramic Tiles, Slabs, and the like.*

Tiles, slabs, and the like, formed of sheets of celluloid ornamental paper and plaster, cement, or the like, and in which the folded edges of the said sheets of celluloid and ornamental paper are fastened or embedded in the plaster or cement mass.

7343 of 1904.—F. NUSCH (Westentchen Thomas-Pbosphat-Werke G.m.b.H.): *Asphalt Compositions for Floors, and the like.*

A process for the manufacture of an asphalt-like floor covering, characterised by the fact that powdered slag is mixed with the melted asphalt composition in such a way that the fatty substances in the latter will admit of it, and in that proportion which is necessitated by the degree of viscosity required, whereupon such binding materials as tar, resin, oil, and the like, are added in order to enhance the receptability of the powdered slag, the rest of the process then being carried out in the usual manner, the usual filling materials such as sand, gravel, and the like, being also employed if necessary.

8,323 of 1904.—W. EMOND: *Window Holders and Fasteners for Sliding Sashes.*

This consists in the combination with a rack bar, of a housing having a shaft mounted therein, one portion of the shaft being round in cross-section, and the other portion square in cross-section, a pinion mounted upon the round portion of the shaft and adapted to engage the rack bar, a disc mounted upon the square portion of the shaft, the opposing face of the pinion and disc being radially corrugated, and a spring for holding the said corrugated faces in engagement.

9,955 of 1904.—W. SPROWSON: *Safety Gear for Lifts.*

Safety gear for rope-suspended carriages of lifts, which consists in arranging each suspension rope to descend towards the carriage, pass round a pulley or pulleys on the carriage, and ascend again, and attaching two guy ropes to each of the suspending ropes, the other end of these guy ropes being coiled round a shaft in such a manner that, when one of the vertical lengths of the aforesaid suspending rope breaks, the carriage will tend to move downwards relatively to the intact vertical length of the suspending rope, so that one of the guy ropes will be put in tension and will rotate the shaft on which it is wound, and by these means bring cams, pivoted to the carriage, to bear on vertical posts or guides so as to brake or stop the downward motion of the carriage.

10,196 of 1904.—K. RODELSTAB: *Contrivance for the Secure Shutting and Better Cleaning of Skylight Windows.*

A contrivance for the secure shutting and better cleaning of skylight windows, consisting in the combination of a hinge axle having shoulders and rods connected at their inner tie holes with said axle, and rods detachably connected at their upper ends with the window, and at their lower ends joined to fore-going rods at the point of junction with a slide bolt fitting, having a jacket in which a slit is cut with a notch cut in such slit, and a bolt having a beaded handle, and sliding in said jacket.

10,197 of 1904.—K. RODELSTAB: *Adjusting Lever Appliance for Operating Skylight Windows.*

An adjusting lever appliance for opening, fixing, and closing skylight windows, consisting in the combination of an adjusting lever having a fixed pivot whereon a draw-rod is swivelled, and a combined slot with a fixing plate having a fixed pivot, a shoulder at right-angles, and a combined slot.

10,650 of 1904.—F. W. BLAKESLEE: *Building Blocks.*

A building block, having a pair of longitudinal grooves or openings which extend beyond the middle of the block, and thereby overlap one another, one of the grooves or openings intersecting the top of the block,

and terminating short of the bottom, and the other intersecting the bottom, and terminating short of the top of the block.

10,747 of 1904.—R. BAXTER: *Sash Fasteners.*

A sash fastener, comprising a catch, consisting of a horizontal portion provided with a bevelled end, and a second lighter portion at an obtuse angle with the first portion, a base, a pivotal connexion between the catch and the base near the angle between the respective portions, and a wedge hinged to the end of said second portion extending from said end to said base.

10,974 of 1904.—A. FAHRMANN: *Mixing and Sorting Apparatus for use in the Manufacture of Bricks or the like.*

A mixing and sorting apparatus, particularly applicable for brick manufacture, comprising a receiving vessel, an end plate provided with perforations or openings for the discharge of the material treated, and a cam rotated in the interior of the apparatus and mounted in a spindle therein.

11,218 of 1904.—C. WULF: *A Process for the Manufacture of Floor Covering.*

A process for the manufacture of floor covering, according to which strips of thin absorbent paper or other suitable material are first saturated with oil colour, then dried, and afterwards painted on one side with the same colour.

15,653 of 1903.—H. PARKINSON: *Appliances for Drying, Mixing, and Preparing Tar Macadam.*

According to the invention, the appliance comprises concentric cylinders, constituting a steam jacketing, within which is another cylinder, the internal surface of which is provided with spaced vanes or blades, arranged at such distances apart, and at such angles that, when the interior cylinder is, by gear wheels, worm, or like mechanism, caused to revolve, the napping will, by the vanes, be gradually worked towards and out at the opposite end of the cylinder to which they were introduced, and thereby the tar applied to the nappings is equally distributed, and the nappings are equally coated by the tar, and as the vanes or blades do not revolve, save as part of their carrying cylinder, there is no liability of wedging, as is the case when worms or screws are employed for passing the nappings through a cylinder or mixer, and the steam jacketing ensures economical and uniform application of heat to the interior cylinder, and is more convenient than application of heat from a fire direct to the mixing cylinder as heretofore practised.

16,412 of 1903.—T. WINSTANLEY: *Process of, and Machines for, Preparing Lime and Portland Cement.*

According to this invention, the lime in its caustic state is placed upon trays, and a number of such trays are joined together so as to form an endless traveling tray conveyor. At the commencement of operations a suitable quantity of lime is placed on a tray, upon this water is sprinkled, and starts the slaking of the lime, the tray conveyor is then moved a short distance, thus bringing an empty tray to be treated in the same way as the previous one, and so on with successive trays, this process of slaking and conveying thus becoming continuous.

17,706 of 1903.—H. H. LAKE: *Construction of Beams or Girders (H. Ballinger).*

A concrete beam, provided with an iron or steel insertion, characterised by the fact that the insertion presents its greatest cross-section at that part of the beam at which the prevailing strain is greatest.

22,025 of 1903.—H. S. C. GREATORX: *Plaster Slabs or Blocks for Walls, Partitions, Buildings, and the like.*

Building blocks or slabs having one or more openings passing through them. In such openings or passages a short distance from the top of block, the horizontal length of the passages is somewhat greater than for the remainder of their depth, so that a narrow ledge is formed, upon which may be supported the ends of strips of wood or other suitable material in order that grouting or liquid cement, when poured in passages, may not pass further down. The blocks have at each vertical edge half of a similar opening to those just described, so as to form, when placed against the vertical edge of a similar block, a complete opening similar to those already described as passing through the blocks.

1,893 of 1904.—G. H. DUNLOP: *Method and Machinery for Excavating, Dredging and Transporting Earth and other materials.*

A method for excavating, dredging, and transporting earth, and other materials with a scoop, operated by three ropes from a main

power-station, and an outhaul-station, combined in one structure so that earth may be filled into the scoop by hauling it forward, transported in it by hauling it backward and deposited from it by overturning it forward.

3,005 of 1904.—G. C. SAVAGE: *Furnaces, Stoves, and Fireplaces.*

An air-feeding structure for furnaces, consisting of a casing having a partition extending substantially parallel to the front and rear walls of said casing, and dividing the same into air-feeding conduits, one of said conduits having inlet for air for primary combustion, and opening downwardly into the space below the bottom of the other conduit, and the other conduit opening near the top of the casing, a passage for admitting air to the latter conduit, said conduits being so disposed that air for supporting primary combustion is drawn downwardly and discharged into the ash-pit below the grate-bars, and the air for supporting secondary combustion is discharged into the fireplace above the burning mass of fuel.

10,139 of 1904.—E. R. PALMER: *Sanitary Inspection Chambers.*

A sanitary inspection chamber for sanitary purposes, composed of a series of superposed chamber sections of cast metal or earthenware, connected together by watertight joints, the necessary junctions and channels being cast or moulded in the bottom section.

TO CORRESPONDENTS.

A. M. (Below our limit).—A. S. (Amounts should have been stated).

NOTE.—The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, manuscripts, or other documents, sent to or left at this office, unless he has specially asked for them.

Letters or communications (beyond mere news items) which have been duplicated for other journals are NOT DESIRED.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

We are compelled to decline pointing out books and giving addresses.

Any communication to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

PRICES CURRENT OF MATERIALS.

* * Our aim in this list is to give, as far as possible, the average prices of materials, not necessarily the best Quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

"Civics" from an Architectural Point of View.

HE address by Professor Geddes last Monday on the subject which he has defined by a new word in our language—"Civics," may mark an important

step in the progress of ideas as to the formation of both the political and the material city. At all events it is an interesting event to find a man of literary and mental culture like Professor Geddes occupying himself in emphasising publicly the idea that city government, polity, and planning, should not be allowed to develop accidentally, but should represent a reasoned and thought-out system.

The history of great cities, both socially and materially, is one of the most interesting of studies, for which, as Professor Geddes remarked, sources of information exist, in the statistical literature of the cities themselves, which have not been fully drawn upon. Their institutions, like English liberty, have "broadened slowly down from precedent to precedent," and if London could now be planned *de novo*, both in its municipal institutions and in its architectural planning, it would be a very different city from the one which now exists and which we are striving to make the best of, in the face of obstacles left in our way by old-fashioned institutions and old-fashioned street planning and building. Yet these

anomalies, both political and material, have a great and picturesque historical interest; through them we see how the forms of the city life of the present day slowly struggled into being; and in some senses it would be impossible to give to a city planned and politised anew on a given scheme, the same interest which is inherent in the remains of old streets, with their old names derived from trade, family possession, or local circumstance, and their old and often cumbrous institutions, which remain as witnesses of a polity suited to other circumstances, and now picturesquely out of date.

While fully appreciating the importance of the political point of view, it is with the outward and visible city that we are concerned. And one is obliged to admit that a city systematically planned as a new erection, however grandiose, must fail of much of the beauty of circumstance and association which cluster around the ancient city of irregular growth. The Americans have emphasised this in New York and others of their cities by merely calling the streets by number names; thus depriving themselves of that interest of association which the French give by associating new streets with names of eminent men or of remarkable events; a system which we have fortunately to some extent adopted in London of late. A city laid out on gridiron lines and numbered is an unhappy and prosaic affair, quite unworthy of an educated generation. Any opportunity which may occur of founding and planning a modern city from the beginning—and it really seems as if we

may have such happening nowadays—should be regarded as an opportunity for creating a work of art on a great scale, which may appeal to us by its architectural beauty, though it can have none of the picturesque interest belonging to an old city. You cannot make the picturesque; it grows. Hence, as Professor Baldwin Brown urged in his lecture on old Edinburgh, reported on another page, in making improvements in a new city, the most reverent care should be taken of the relics of its past history, so long as their retention does not interfere with sanitary conditions or very materially with public convenience. Sanitary considerations must predominate over historical associations—that is, a mere matter of common sense; but ancient relics should not be swept away merely on the plea of public convenience, unless the inconvenience is a very serious one. There is too much an inclination, among the City Fathers of modern days, to regard every possibility of a shortened street route, for instance, as a reason for pulling down whatever stands in its way, whether new or old; whereas there are often cases in which the increased convenience of transit is hardly worth considering in comparison with the destruction that must be perpetrated to obtain it.

In planning a new city we want not a Utopia but a Eu-topia, as Professor Geddes characteristically put it, contrasting the original grammatical meaning of the word in its Greek form with the acquired meaning which More's fanciful treatise has given to its Latin form

Planners of new cities have a considerable temptation to be Utopian in the More-ish sense—to aim at an ideal perfection which will hardly work, and may defeat its own ends. At the same time, the planners of a new city have a great deal in their power. They can make, *ab initio*, those arrangements for convenient conduits for water and gas mains, electrical power, and sewerage, which we feel the want of so much now, but which it is almost impossible to realise in a city already built. The desirability of arranging things with regard to the future and not merely for present requirements, is almost a new idea; or, if it was at all acted upon a generation or two back, a lack of imagination and of scientific prophecy prevented the city improvers of that day from realising what would be the probable requirements of half a century or so later. But the Utopian is a more dangerous person to an old city than to a new one, or would be if there were any chance of his having his own way. He is the kind of man who would block up all our streets with bridges and crossings, or send us all into tunnels, to get rid of the rather imaginary danger and inconvenience of crossing a street on a level. He would ruin all our city architecture if he had a chance, but fortunately his proposals are usually so preposterous as to defeat themselves.

What should be aimed at in a modern city is fine and effective architectural alignment to begin with, as a foundation for everything else, while avoiding a tame and formal symmetry; wide roadways and foot pavements (just compare the width of pavements in the modern streets in Paris with our cramped strips of flagging); the provision of trees in streets (again compare Paris); and the securing of gardens and open spaces for ever defended from being built on. There is another source of beauty in cities mostly forgotten, but of great charm, viz., the introduction of running streams through cities, or their protection where they exist. The site of London was once intersected by several running brooks, one of them a large and important one. Only think what a charming feature we should have secured in London had these brooks been revivified with built-up retaining walls and maintained as running water, instead of being allowed to be choked and built out of existence. For these it is now too late; they are dead and buried, though the Fleet is said still to run an invisible course underground. What else we can do with old cities, and London especially, is to preserve religiously all the open spaces there are; to make our new streets of ample width (we are still far too narrow and timid in our ideas in this respect); to make every provision for planting trees in them; and to insist on a certain standard of architectural treatment of new streets. But this last is a subject in itself. One or two feeble and half-hearted municipal attempts have been made, resulting in utter failure through want of a decisive plan and a determined intent. It is to be hoped that a more energetic endeavour may yet be made to remove our new streets above mediocrity and commonplace.

LIGHT AND WATER.

THE two words combined stand for a whole crowd of associations of natural and pictorial beauty. Not only is water almost the only surface in natural landscape which brilliantly reflects light, but it owes most of its varying effects to the manner in which light strikes it and is reflected from it, according to the condition of its surface. When water is more or less roughened or rippled it is the appearance of its own surface under reflected and flashing lights which makes the painter's problem. When it is still, the problem takes another form, for the water becomes a mirror, absorbing rather than reflecting light, but on the other hand reflecting the objects on the surrounding landscape; a natural incident the charm of which seems never to tire. This charm of reflecting water is a double one; partly pictorial, arising from the reduplication of colour and hue which it shows, and the softened effect which, even in perfectly still water, gives a new texture to the reflected colours; partly that of mental association, since, knowing as we do that complete or nearly complete reflection can only occur in calm water, we unconsciously associate the incident with ideas of calm and repose:

"The swan on still St. Mary's Lake
Floats double, swan and shadow":

a couplet which gives a sense of repose to the whole passage, in spite of the poet's unscientific use of the word "shadow" for what is not a shadow. There is no effect more seductive to the mediocre artist than this of reflection in water; and it seems so delightfully easy too! Yet this is rather a delusion, for while the reflected light from the surface is much simpler in still than in rippled water, the problem of reflected objects is a complicated one, introducing questions of perspective effect which are often overlooked. It seems, to the superficial amateur, such an easy thing, when regarding water as a mirror, to repeat below its plane, more or less distinctly, what is visible above its plane. Yet in fact this reduplication can never occur except with objects close to the water's edge, and even then only if they present a flat vertical plane at right angles to that of the water. In the reflection of a wall with projecting coping, for instance, it will be the shadowed soffit of the projection that will be seen in the water, which, if the spectator's eye is above the top of the real wall, will be invisible to him. So the reflection of a plant overhanging at the water's edge will show the shadowed side of the leaves, not the sunlit side which the spectator sees in the real object. There is indeed the theoretical case of the eye being on the level of the water, when image and reflection would be identical; but this is too merely theoretical for consideration.

It is the fact that the eye is always more or less above the level of the watery mirror, which produces such often unexpected discrepancies between the appearance of objects in reeding planes in the actual landscape and their reflection in the water. The reflection, if we could reproduce it as a solid entity, is really the precise inversion of the actual

objects, but we see them at a different angle. Consequently foreground objects in the reflection intercept those in their rear in a manner in which they do not intercept them to the eye in their material positions. It is a question of perspective effect. We remember a curious and unforgettable object-lesson in this respect many years ago, when walking in a country lane in twilight, approaching an open space with a pond in the centre. On the further side of the pond passed a team of horses, totally invisible in the fading light in consequence of a dark mass of hedge beyond them. But in the reflection in the pond the whole team was clearly silhouetted against the reflected sky, the hedge being too far back to come into the line of reflection. It was a most curious and unexpected effect, quite puzzling at the moment.

Sir Montagu Pollock has published an interesting and useful book* in which he has summed up the results of much observation both on the perspective of reflections and on the effects of light on water, and in which he explains by very clear and instructive diagrams the reasons for the discrepancy between the material objects and the reflections as seen in calm water. The subject touches both on the scientific and the artistic side of art-study. Experienced artists perhaps hardly need such demonstration of facts which they must often have noticed in painting or sketching from nature; yet some painters who are masters of the representation of colour and aerial effect in landscape are not always very strong in the perception of perspective, and to beginners in landscape sketching it must be most useful to have the scientific reason for these perspective effects of reflection so clearly demonstrated to them by means of diagrams—sections so to speak, of the landscape, the reflection, and the water-plane. Though good many various results are illustrated in detail, the whole principle of the matter is really summed up in his Fig. 4, showing "The difference between the reflection and the direct view depends upon the height of the eye above the water." In this diagram, which we reproduce, the spectator is supposed to be placed on the summit of a hill overlooking a lake with a house and trees and a hill behind them on the other side of it; but he sees nothing reflected by the top of the opposite hill. To explain this the author supposes him to be situated at a position at an equal depth below the water level, vertically under his original position; and it becomes obvious at once that from that position he could not see the top of the opposite (actual) hill, the projection of low land below hiding from him both the houses and trees and the base of the hill. What is true of the inverted standpoint and actual image is true of the actual standpoint and the inverted image. If he took his stand on the low ground nearer the water-level he would see a reflection of a considerable portion of the house and of nearly three-fourths of

* "Light and Water, a study of reflexion and reflection in river, lake, and sea." By Sir Montagu Pollock. London: Geo. Bell and Sons, 1903.
+ The author writes "reflexion," and therefore quoting him we give "spelling," though it is not one we have usually adopted. Philologically, it may be defended.

Diagram Showing Effect of Elevated Standpoint upon Reflections.

opposite hill. It seems so simple as to be self-evident, when drawn out in this way as a section; yet it represents a practical fact often overlooked. A good many other diagrams illustrate various applications of the rule under various circumstances, and these may make it plainer to some readers; but the whole theory is really summed up in this diagram, and any one who has properly grasped the fact as illustrated there can apply it in any other case.

While recognising the clearness of the author's reasoning and demonstration on this point, we confess that we cannot follow him in his note about the rainbow at the end of the chapter. To put the question "Can a rainbow be reflected?"

has perhaps not occurred to everyone; but it is no doubt a curious point, when we consider that a rainbow has no objective existence, and that, as the author puts it, no two men see the same rainbow. But then we have to remember that a reflection has no existence either; and that, in a somewhat similar sense, no two men see the same reflection, since the reflection depends upon the position of the spectator. We have read his note and examined his diagram carefully, but it carries no conviction to our mind. The author seems to suggest that if the spectator on a position some distance above the water level looks down to the water for a reflection of his rainbow, he will see (if he sees any reflection) not the reflection of that rainbow but of another, which is invisible except by reflection. It is possible that in very clear water he might see an apparent rainbow at another angle formed against the reflected cloud in the water, but we are of opinion that he will also see in the water the reflection, in the ordinary sense, of the rainbow that he sees in the air, if it is sufficiently strongly brought out against a dark cloud also (of course) reflected. The cloud, it is true, is a material entity, the rainbow is not; but we only know that by reasoning; to the eye it is an entity, and reflection itself is only an optical effect. It is seldom that there is an opportunity of testing the point by observation; but imagine the case of a brilliant rainbow strongly believed against a dark cloud, and above calm water; does the author mean to assert that the cloud will be reflected and rainbow light will not be? We should certainly be very much surprised to find that it was so. Turner, we think, has

Painted a segmental rainbow with a portion of it reflected at the reverse angle in water; we seem to remember such a point in one of his works; and though Turner cared little about verisimilitude in the details of a scene, he studied general facts of nature carefully. The author admits that he has never had an opportunity of seeing any such break as he imagines there must be between the real (if one may so speak) and the reflected rainbow; on the only occasion when he remembers seeing the reflection of a rainbow in water, "its extremities were hidden by near objects, so that he had no opportunity of observing the break." We should very much doubt if he ever will have one.

The chapter on the reflections in rippled water is very well done, and gives in diagrams the optical reasons for various effects of light on rippled water which are often represented in painting with more or less truth, though not always with evidence of distinct reasoning as to the causes of these effects. There are two interesting points to which the author draws attention. One is, that the reflection from the sun is more vertical in a comparatively light wind, where the ripples follow each other in pretty regular lines, and more spread out in a stronger wind, where the waves are more broken up into different angles and there are more facets to throw off side lights. Accordingly, where the pathway of the moon on the water widens out towards the horizon, this is an indication that out at some distance there is rougher water. Another point mentioned by the author in regard to painting reflections in rippled water is, that those of distant objects tend to lengthen out, or lengthen down, vertically, and are therefore best represented by vertical strokes of the brush, whilst nearer at hand these reflection marks resolve themselves into separate horizontal streaks. He does not in that sentence point out the reason of this, though it is to be inferred from remarks on other pages; but the reason undoubtedly is that in the distance we see only the top and front of the ripples, which present the same reflection, while in the foreground we see over the crests on to the other side, which reflects at a different angle. We noticed an instance of this the other day, in walking by a piece of water ruffled by a fresh breeze, in which there were various posts placed at intervals. As long as these posts were

at a distance, they presented no reflection, for we could only see the top and near side of the ripples, which reflected sky light. As we approached each post, it developed a strong though broken-up reflection, because we could then see over on to the further side of the ripples, which reflected the dark colour of the posts. That seems a very suggestive object-lesson as to the effect of distance in modifying reflections in rough water.

The chapter on colour in rippled water is one that we think painters will find interesting, and many of the remarks in it we can confirm from our own observation. On the subject of sea-colour, which is especially interesting and complicated, a good many suggestions are made in explanation of the varied and sometimes quite unexpected effects of colour in rough seas. One of the practical conclusions from the study of the subject is that rough water is better represented by detached spots of colour than by any pervading colour. Owing to the varied faces presented to the light, it is possible, the author remarks, to make out three or even four distinct colours on each little wave in an ordinary ripple. This however, of course, can only refer to foreground waves; in the middle distance the points of colour would blend into one pervading tone, and could only be so represented in painting.

We recommend the book to the attention of painters; whether they agree or not with all the views expressed, they will find it interesting and suggestive; and to all lovers of nature, whether painters or not, the subject is one full of fascination.

NOTES.

The Hampstead Heath Extension Council are appealing to the public for help to save the beauty of Hampstead Heath from being destroyed by the building which will probably follow the formation of the Tube railway terminal station on the Heath, unless measures can be taken to secure the land for the public. With this view the Hampstead Heath Extension Council (as we have before mentioned) are endeavouring to raise money to purchase from the Eton College Trustees Wylde's Farm and the meadows lying on the north-west boundary of the Heath, and adjacent to the new station. Plans have actually been made for laying out this land, about 80 acres in extent, for streets and houses, making a small town by the terminus, which would completely spoil the view from this portion of the Heath. The Heath Extension Council have the option of purchase till September 1, and unless the land can be acquired before that date it will be sold for building land. About 6,000l. more is still required to make up the purchase-money. It is to be hoped that this will be done, or the opportunity will be gone for ever. Subscriptions can be sent to Mrs. Barnett, Warden's Lodge, Toynbee Hall, Whitechapel; to the London and South-Western Bank, 28, High-street, Hampstead; or to Lloyd's Bank, Rosslyn Hill, Hampstead. Apart from larger subscriptions, if every one who goes on the Heath would send a

shilling to the fund, a good deal would be done.

Highways and the Heat. THE continued dry weather is playing havoc with many highways, either because they are not properly managed or because they are too narrow for the traffic upon them. As regards the first point it is evident, as can be demonstrated to anyone who will inspect a few highways, that steam-rolling is something of a snare. For there is now, with an increased use of steam-rollers, a distinct tendency to break up the stones less, and also to put round stones down with angular stones. After a steam-roller has been over a road, however improper the material may be, it has for a time an appearance of smoothness. But when continued dry weather comes the round stones or those which are too large begin to get loose, and the entire surface gradually breaks up. When stones were carefully broken and worked in by traffic in winter the initial process was amounged at first to the wayfarer, but the result was a road which was stronger in dry weather than a road with improper material only partially bound together by a steam-roller. In the southern counties, notably in Hert and Bucks, miles of roads are now in a very bad state from the above causes.

"Owners" and Street Improvements. IN the case of Mayor, etc., of Hackney v. Lea Conservancy Board (*Builder*, p. 74) the Court of Appeal had to determine the meaning of the word "owner" in section 250 of the Metropolis Management Act, 1855. This question has frequently come before the courts, and the decisions have been noted by us from time to time. The Conservators of the River Lea were called upon to bear their proportion of the expenses of making up a new street in respect of a strip of land which was used by them solely as a retaining bank on the Hackney Cut, but which was 26 ft. wide and capable of other use, and the question was whether they were "the persons for the time being receiving the rack rent of the premises or who would so receive the same if such premises were let at a rack rent" within the meaning of the Act. The Court below had held that the premises were held for purposes inconsistent with the land being rack-rented as between landlord and tenant. The statutes under which the Conservancy held the land contained no power to let, but they did contain a power of sale. The Court of Appeal held that they held the land beneficially, and that it was not *extra commercium*, and that even if they had no power actually to let the land themselves it was nevertheless capable of being let at a rack rent, and the Conservators were therefore liable as owners to contribute to the paving expenses.

Drains or Sewers. IN the case of Harris v. Seurfield (*Builder*, p. 74) the old question of drain or sewer was again litigated. The appellants were the owners of eighteen houses which were built in blocks of six to seven houses and were back to back. The drainage for slop water was by separate channels cut in the pavement of the court between the houses at right angles to

each house into a side channel, and from the side channel into gullies, and thence to the main sewer. The owners were called upon to abate a nuisance arising from these cross and side channels under the Public Health Act, 1875, the contention being that as the premises were in the same curtilage these were separate drains. The magistrates had adopted this view, but the Divisional Court held they were sewers, since houses separately occupied could not be brought within the meaning of the word "curtilage," even though there was a common access and to a certain extent common accommodation. The Lord Chief Justice in almost pathetic terms alluded to the recurring difficulty of deciding these cases and the apparent futility of pointing out the necessity for fresh legislation.

The Welsh Power Scheme.

It is interesting to note that substantial progress has been made with the extensive system of electrical power distribution inaugurated in South Wales. The district assigned to the company comprises over 1,000 square miles, and uses something like 500,000 horse-power, chiefly provided at the present time by steam and gas engines. As the electricity company is already able to supply current for power purposes at 3d. per Board of Trade unit, it is probable that users will find considerable economy to result from the adoption of electricity. The company has so far established three generating stations, one at Pontypridd with a capacity of 6,000 h.p., and others at Cwmbran of 1,320 h.p. and Bridgend of 750 h.p., while a fourth is in course of construction at Neath. One excellent result of the scheme is that the Bridgend Urban District Council, who had proposed very heavy expenditure for the erection and equipment of a generating station, decided to purchase the current required, and were able to show a profit on the first year's working of their electricity department—a result that is somewhat unusual in connexion with municipal enterprises of the kind. We should now like to hear of some electric power schemes involving the utilisation of water power for the generation of current, provided they do not involve the destruction of any picturesque waterfall.

Folkestone Harbour Extension.

On Tuesday last week, when laying the final stone of the new pier and harbour works at Folkestone, M. Cambon appropriately observed that the ceremony had a special significance and marked the *rapprochement* realised between the peoples of England and France. The works, which were commenced in 1896, include the reconstruction of the pier with six new landing-stages, the rebuilding of two railway stations, and the erection of an overhead promenade. The old timber pier is replaced by a granite-faced concrete structure, with a width of 75 ft., which is continued 900 ft. beyond the end of the old pier—300 ft. in a straight line and 600 ft. at an angle of 36 deg. therefrom, so as to form shelter for vessels lying on the eastern side of the pier. The new landing-stages provide adequate accommodation for steamships at high or low tide, and two berths

situated on the western side of the pier will afford protection during the prevalence of east winds. The railway platform now runs the full length of the pier, and the new promenade forms the roof of the station buildings. On shore, the old harbour station is in course of replacement by a new structure, and the whole of the works constitutes a most important improvement which we are sure will be appreciated by travellers on both sides of the Channel.

Magnetic Alloys.

IN a paper read to the Dutch Physical Society last June, Dr. F. Heusler described how he discovered, owing to one of his tools having been accidentally magnetised, that a particular alloy of manganese and tin was strongly magnetic. He has since made a careful research on the magnetic properties of alloys of manganese, and has made one or two further discoveries which may have several commercial applications. He has noted that given alloys become non-magnetic at definite temperatures, and that this temperature, when the manganese is alloyed with lead, is only 140 deg. Fahrenheit. This can obviously be utilised for temperature-indicating devices, and, if it is found that the alloys do not lose their magnetic properties with time, it can also be used in connexion with fire alarm devices. A manganese lead magnet, for example, would lose its magnetic properties at 140 deg. Fahrenheit; its keeper would therefore drop at this temperature, and it could easily be arranged that it should complete an electric-bell circuit, and so give the alarm. Theoretically, also, it seems to us that this discovery of Dr. Heusler's solves the problem of converting heat directly into work. By alternately heating and cooling a magnet made of one of these alloys, the keeper may be kept oscillating by the magnetic attraction continually overcoming its weight, and thus work could be obtained. A generator for electric currents could also be made on this principle. It was found that an alloy of manganese, aluminium and copper rivalled cast iron in its magnetic properties, and although the cost of this alloy makes its commercial application at present out of the question, yet it is highly probable, seeing the important results obtained in this brief research, that further discoveries in the immediate future will make these alloys useful in dynamo construction. From a theoretical point of view many interesting problems have arisen. A new magnetic theory seems to be required to explain why, for example, the addition of aluminium to practically non-magnetic alloy should convert it into a powerful magnet.

The Volcanic Origin of Oil.

AS OBSERVED by geologists at various times, not only are gaseous, liquid, and solid hydrocarbons among the more important products of solfataric volcanic emanations, but also acid vapours, sulphuretted hydrogen, gypsum, and calcareous or siliceous waters. That such volcanic phenomena represent the normal orderly process of petroleum production appears to be a clearly established

geological fact, for reasons which are stated by Mr. Eugene Coste in a paper recently read before the Franklin Institute. It is interesting to note that, as pointed out by the author, the oil, sulphur, salt, natural gas and hydrogen-sulphide products of the Texas Coastal Plain are not indigenous to the strata in which they are found, but are resultant products which have ascended, under volcanic pressure, at points along lines of structural weakness, and have been disseminated through thousands of feet of the shales, sands, and littoral sediments of the same region. After an exhaustive discussion of the subject, Mr. Coste arrives at the important conclusion that as oil and gas have only been supplied along lines of structural weakness, or along fractured zones of the crust of the earth, new oil and gas fields are to be looked for only along such belts or zones. Existing oil and gas fields serve to indicate the position of numerous oil belts, and the author suggests that, so far as practical results are concerned, the important point is to accurately trace the fissured areas on reliable maps, and to drill in the localities thus indicated.

Museum at Famagusta, Cyprus.
A LITTLE museum of the most modest pretensions has been recently constituted in Famagusta, Cyprus, for the purpose of housing the valuable fragments of sculpture which for more than twenty-five years have littered the Zaptieh harrackard, in the middle of the ruined city. It is to be hoped this is the beginning of good things, as far as Cypriote antiquities are concerned. The collection of fragments now rescued from a miserable condition has been to a great extent illustrated in the great work on "L'Art gothique et de la Renaissance en byzpe," published by M. Enlart, at the inst of the French Government, in 1899. It would that we could record the institution of similar "provincial museums" in other parts of the island, for preserving the interesting remains of mediæval art still surviving in private possession, abandoned to the tender mercies of government officials.

The Star Chamber.
ADVERTING to the recent decease of Sir Reginald Palgrave, who until his retirement in 1900 had been during many years Clerk to the House of Commons, we may mention that amongst his investigations in the field of historical ætymology was an inquiry into the exact position of the Star Chamber. Sir Reginald Palgrave succeeded in ascertaining, after much research, that the drawing-room of his own residence—room which has since been given up to the leader of the House of Commons—stands almost precisely over the spot where the Star Chamber, having escaped from a fire in 1834, was destroyed for the hiding of the north wing of that part of the precincts of the new Houses of Parliament. On July 8 were sold at Messrs. Foster's rooms in King-street, ten guineas, eighteen pieces of stained glass, bearing heraldical devices and portraits of Kings of England, which had been removed from the Star Chamber many years ago.

Chartley Castle Estate, Staffordshire.
THIS estate, which extends over some 8,000 acres, lying between Stafford and Uttoxeter, will shortly be offered for sale at auction. Of the ninety-eight lots the principal lot includes the Manor Farm and its early Elizabethan manorial house, Chartley Park, famed for its indigenous herd of wild white cattle—descended from the primeval herds of Needwood Forest—Chartley Hall, a seat of the Shirleys, Earls Ferrers, and the ruins of Chartley Castle. The latter consists of two ivy-covered round towers encompassed with yew trees, being the remains of the castle built by Randolph de Blundeville, fourth Earl of Chester, in 1229, after his return from Palestine. His sister brought the county estates in marriage to William de Ferrers, Earl of Derby, ancestor of John, who was summoned to Parliament as Baron Ferrers of Chartley in 1293, and of Sir Robert Shirley, Baron Ferrers, who in 1711 was advanced Viscount Tamworth and Earl Ferrers. The Castle, having been forfeited by Robert de Ferrers, eighth and last Earl of Derby, on his attainder *temp.* John was subsequently restored to his house. A residence, constructed mostly of timber, that took its place was consumed by fire in 1781. It had been the home of the Devereuxs, Earls of Essex: Sir Henry Shirley married in 1615 Dorothy, daughter of Robert, the favourite of Queen Elizabeth. Chartley Hall, a moated house in the domestic Gothic style, embodies the prison-lodging of Mary Queen of Scots, whence she was taken to Fotheringay Castle, but the greater part of the mansion has been destroyed by fire on two occasions since that time.

Ironmongers' Hall, Fenchurch-street.
ADVERTING to Messrs. Huhard and Moore's designs for rebuilding the Company's Hall, as published in our number of May 28, we may mention that the present hall was built in 1748 after plans and designs by Thomas Holden. The stone front consists of a rusticated ground floor and two floors above, the middle portion of the façade has an order, on the first and second floors, of four Ionic pilasters with an angle-pediment, in the tympanum of which are the arms of the Company between two large cornucopieæ. In the middle of the order, and above the central doorway, is a Venetian window, having four Ionic columns, half-engaged, and over that is an oval-shaped opening, glazed for light; the spaces on the same line between the two pilasters on either side are pierced with similar circular openings. The first-floor windows of the two sides have rounded heads, those of the ground floor are squared. An urn surmounts the pediment, and there are urns upon the open balustrade. From the vestibule, which is divided with Tuscan columns, a large staircase leads to the banquetting hall, measuring 70 ft. by 30 ft. and 30 ft. high, which about sixty years ago Jackson and Son decorated, after the Louis XIV. style, with papier-mâché and carton-pierre imitative oak. The Company, who possess a portrait by Gainshorough of Admiral Viscount Hood, presented by him in 1783, was first incorporated in 1464; their first hall, on the present site,

had a gate-house, refectory, and armoury; in 1565 the Company of Court Letter Scriveners were incorporated with the Ironmongers, who constituted a guild or craft in the early years of the XIVth century.

Barnet Isolation Hospital Competition.
THE Barnet Hospital Committee at their meeting last week again discussed the question of appointing an assessor in the case of the Isolation Hospital competition and finally decided against it, the absurd argument that it would be unjust to the competitors to appoint an assessor now, when they did not advertise it, being again brought up. This looks rather like a convenient argument brought up to give a show of justice to a proceeding which is only influenced by economical considerations; an assessor will have to be paid, and they do not want to pay him. It is noticeable that one of the arguments was that they had on their Board Mr. Hasluck, who was a professional gentleman; and that Mr. Hasluck himself subsequently said that he knew nothing whatever about isolation hospitals, "that it was a question of life and death in deciding the character of the new building, and that if any defects should afterwards he discovered the responsibility resting on the Committee would be a very serious one." Mr. Hasluck is evidently a sensible man, and it is a pity that his advice was not listened to.

Eton War Memorial Competition.
THE Eton War Memorial Competition, about which we published a letter last week from "Etonian," seems to have been conducted in rather an odd manner, from an architect's point of view. The circular sent round to the competitors, announcing the award of the premiums by the assessor, states that the plans have obtained warm approval from the assessor, and that "whatever course be finally adopted, they will be of the greatest service to the committee." Further on it is stated that "the Committee of Taste are not yet in a position to make any further statement in the matter, or to suggest the adoption of any one design, or the combination of any two or more designs" (the italics are our own). The "Committee of Taste" must be in need of a little sound architectural advice if they really suppose that a "combination of two or more designs" is a proceeding either reasonable in itself or likely to be accepted by the architects. If the professional assessor (Mr. Norman Shaw) saw this circular, we cannot understand his letting it go out without a protest. We presume the Committee of Taste is entirely an amateur one; certainly its ideas about architectural design seem to be of a very amateurish description.

PORTLAND-PLACE, WEST KENSINGTON.—Steps are being taken for the affixing of a tablet upon the front wall of No. 7, Portland-place, to commemorate the circumstance that Coleridge occupied the house in 1810. Portland-place forms a row of houses on the west side of a turning which leads, southwards, out of the high road to Hammersmith, into Avonmore-road, and overlooks the railway line at the former Caunter's Bridge, near Addison-road station. A local tradition avers that Coleridge, either before or after his sojourn in Portland-place, lodged for a while in the adjacent Edwardes-square.

RECENT DISCOVERIES IN THE ROMAN FORUM.

The discovery of a group of prehistoric vases in a specially-constructed receptacle in the base of the equestrian statue of Domitian has recently been brought to the notice of the readers of the *Builder* (May 28; p. 574). The character and meaning of the deposit has not yet been certainly determined; but it is worthy of notice that the vases form a group of several varieties, such as is found in the tombs of the VIIIth century B.C., and that they resemble very closely indeed not only the pottery of the inhumation burials* of the necropolis close to the temple of Antoninus and Faustina, but that of other cemeteries of the same period in the neighbourhood of Rome. They cannot, therefore, inasmuch as they are the products of a relatively advanced art, be compared with the primitive vases which the Arval brethren worshipped, and which appear to have been of a rough and undeveloped style. It seems most probable, on the whole, that, as I said before, they are the contents of a tomb which was disturbed by the laying of the enormous concrete foundation for the statue.

Another discovery of far greater historic interest occurred in the latter half of April, quite close by; for, at a distance of about twenty yards to the north-west, Commendatore Giacomo Boni, who has directed the recent excavations since they began in 1898, noticed a line of blocks of travertine, which ran in a direction out of correspondence with the lines of the Imperial Forum, but agreeing with the orientation of the Republican period. The removal of some of the travertine slabs of the pavement of late Imperial times which now covers the area of the Forum showed that these blocks formed the north side of an enclosure of irregular shape, but measuring roughly 30 ft. from north to south, and 20 ft. from east to west. This enclosed space had originally been paved with rectangular slabs of tufa, but the upper surface of these had subsequently been hacked away, and over them travertine slabs had been laid—except in one place near the south end. Here the tufa slabs were left to their original height, and others laid over them, so that this portion is 4 in. or 5 in. higher than the rest of the pavement; it is twelve-sided, about 10 ft. across, and was apparently enclosed by a beltstrade of slabs of stone, which ran in a circle round it.

This area seems to correspond in position with what we know of the site of the Lacus Curtius, which, as Roman writers tell us, was situated in the centre of the Forum. According to the most popular legend, the spot took its name from Marcus Curtius, who, when a chasm opened in the Forum and the gods demanded the sacrifice of the best that Rome contained, leapt, in full armour, mounted on his charger, into the abyss, which at once closed on him. There were, however, other versions, according to one of which the name came from the leader of the Sabines in their attempt to take vengeance on Romulus for the rape of the Sabine women. His name was Metius (or Mettus) Curtius, and it was said that when hard-pressed he had taken refuge in the marsh, and hardly managed to escape from it. The third form of the story merely traces the name to one Caius Curtius, who, during his consulship, made an enclosure round the spot where a thunderbolt had fallen. This might perhaps be an attempt to account for the existence of the twelve-sided space at the south end; but the irregular shape of the main precinct agrees better with the first two versions of the legend, which are those more widely current. And with these, and more especially with the second, agrees the representation on a relief now in the Palazzo dei Conservatori (belonging itself to the late Classical period, but probably a copy of a much older original) of a heavily-armed horseman whose steed is stumbling in a bed of reeds.

The identification of the paved area with the site of the Lacus Curtius (which was, we know, dry land at any rate in the Augustan age) seems thus eminently probable; and it is worth noting that the constructors of the system of underground passages beneath the area of the Forum (*Builder*, January 2, 1904) expressly avoided tunnelling under the place, whether because of its sanctity, or because the ground was known to be marshy, or for both reasons; and that though the galleries themselves are entirely constructed of solid

concrete, owing to the amount of water which percolates through the subsoil of the Forum. Such discoveries as these help greatly in making ancient Rome more of a reality to us. We have not here, it is true, the original Lacus Curtius, but further excavations which will in time be undertaken below the level of the pavement which has recently come to light, and which probably belongs to the later days of the Republic, will, in all probability, throw light upon the origin of the legend.

THOMAS ASHBY, JUN.

THE ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

The annual meeting of the Association of Municipal and County Engineers was held at Shrewsbury on Thursday, Friday, and Saturday, July 14, 15, and 16. The new President, Mr. A. T. Davis, C.E., of Shrewsbury, is County Surveyor of Shropshire, and the first county surveyor to occupy the presidential chair of the Association. Mr. Davis has been an active and respected member of the Association for nearly a quarter of a century, has acted for some years as honorary secretary of the Midland district, and has been an elected member of the Council for a number of years. At the opening of the meeting the retiring President (Mr. W. Weaver, C.E., of Kensington) occupied the chair, and there were present the President-elect, Mr. A. T. Davis, Messrs. T. H. Yabbicom (Bristol), J. T. Eayrs (Birmingham), J. Lobley (Hanley), E. G. Mawhey (Leicester), O. C. Robson (Willesden), O. E. Winter (Hampstead), C. Chambers Smith (Sutton), J. D. Watson (Birmingham), J. P. Barber (Islington), J. S. Pickering (Cheltenham), A. Creer (York), J. Price (Birmingham), H. Richardson (Handsworth), J. E. Wilcox (Birmingham), A. H. Walker (Loughborough), J. Gammage (Dudley), W. C. Edlowes (Shrewsbury), M. Lea (Truro), A. D. Greatorex (West Bromwich), W. Welburn (Middleton), A. J. Price (Lytham), T. Caink (Worcester), J. A. Crowther (Southampton), W. H. Tressider (Falmouth), T. S. Yates (Waterloo), J. Eaton (Plymouth), J. W. Wardle (London), G. W. Lacey (Oswestry), W. H. Grieves (Buxton), R. S. Dorman (Armagh), T. W. A. Haywood (Battersea), R. A. MacBair (Lincoln), F. T. Grant (Gravesend), M. J. Fleming (Waterford), R. F. Vallance (Mansfield), C. F. Wike (Sheffield), J. P. Norrington (London), J. Parker (Hereford), C. Brownridge (Birkenhead), F. W. Nager (Walsall), G. Eaton-Shore (Crewe), and others.

The Mayor (Councillor W. F. Watkins) attended the opening of the meeting, and offered the Association a hearty welcome to the ancient and historic borough. He trusted that during their stay they would find many matters of interest in town and country.

Mr. W. Weaver (the retiring President) thanked the Mayor for his gracious and kindly welcome.

Mr. T. Cole (Secretary) read the Annual Report of the Council, which stated that the Association had now 1,060 members. The Council had awarded premiums of 10*l.* to Mr. A. D. Greatorex, of West Bromwich, for his paper on "Municipal Work at West Bromwich," and 5*l.* to Mr. N. F. Dennis, for his paper on "Some Municipal Works at Aldershot." The Council reported correspondence with the Local Government Board on the professional status of the municipal engineer. The committee still had the question of the model building by-laws under consideration, and a mass of evidence had been collected.

The retiring President moved the adoption of the report.

Mr. Yates (Waterloo) raised the question of the payment by local authorities of the expenses of members attending meetings of the Association.

Mr. T. Henry (Retford) and Mr. W. H. Grieves (Buxton), supported the suggestion.

Mr. J. Patten Barber (Islington) said the Local Government Board were very difficult to move, especially when the moving force was the Association. The position the Local Government Board took up was that they could not move at the suggestion of the Association of Officials; the representation must come from the local authorities.

The President promised that the matter should be carefully considered by the Council of the Association, and the report was then approved.

Mr. W. Weaver (Kensington) then moved an alteration in the by-laws to facilitate the amalgamation of the Scottish Association with the

Association. The alteration was to enable the Scottish members to join without the payment of an entrance fee, and allowing the Council to dispense with the provision of by-law 2, requiring members to hold a chief permanent appointment.

Mr. O. C. Rohson (Willesden) seconded the new by-law, which was carried unanimously.

On the proposition of Mr. T. H. Yabbicom (Bristol), the retiring President (Mr. W. Weaver, of Kensington) was thanked for his services to the Association during the past year.

President's Address.

The newly-elected President (Mr. A. T. Davis), in his inaugural address, having thanked the members for his election, assured them that during his term of office he would endeavour, to the best of his ability, to maintain the high position which the Association now occupied. Having been connected with the Association for close on a quarter of a century, he could not resist looking back to its early days and recalling the progress that had been made. He offered no apology for alluding to its early history, because he held that too much honour could not be given to those far-seeing men—Mr. Lewis Angell, Mr. James Lemon, Mr. Charles Jones, and others—who, recognising the advantages of a common bond of fellowship and professional interests, founded this society thirty-one years ago. It was reported that at the inaugural meeting, held on May 2, 1873, more than 100 engineers and surveyors of various towns had joined the Association. At the close of the last financial year this number had increased more than tenfold, the actual roll of the Association embracing at that date a total of 1,060 of all ranks. This interchange of experiences was of enormous advantage, not only to municipal engineers, but also to the councils they served, and the community in general. Indeed, he had no hesitation in affirming that the municipalities of this country had derived immense benefits from the Association in this respect. During the existence of the Association, while the population of the United Kingdom had increased by upwards of 10,000,000, with its concomitant crowding in the larger cities and towns, the rate of mortality had decreased from 21.3 in 1871 to 15.4 last year; and members might fairly claim, along with their colleagues the medical health officers, no small share in the diminution of human suffering and the prolongation of human life represented by these figures. The Council were doing their best to combat the two evils that militated so much against the professional status of the municipal engineer and surveyor—viz., insecurity of tenure, and the occasional appointment, by urban and rural councils, of unqualified men. The remedy seemed simple enough; it was only necessary to follow the precedent set in the case of the metropolitan medical officers of health, who were protected by the Local Government Board under section 108 (b) of the Public Health (London) Act, which was as follows:—"A medical officer of health shall be removed by the sanitary authority with the consent of the Local Government Board, or by the Board, and not otherwise." The principal reason for the Local Government Board exercising some control over the appointment of the London medical officers of health was that it would be detrimental to the interests of the public that such should be held by men unprotected in some way, seeing that their duties were of such a character as to bring them into conflict with vested interests, and to render them liable to unjust treatment. But surely these arguments were equally applicable to the engineer and surveyor, whether in London or the provinces, who in the conscientious discharge of his duties—e.g. in the administration of the by-laws, to mention only one instance, might incur the hostility of some person or persons placed in authority over him. But, apart altogether from the question of security of tenure, it was quite time that the practice of appointing incompetent men and the payment of disgracefully inadequate salaries should cease. The work of the municipal engineer involved the health of thousands, as well as the expenditure of enormous sums of money, and as both these subjects so intimately concerned the public, it was to be hoped that Members of Parliament might be induced to take the matter up. The proposed union with their Scottish *confères* would, he felt quite sure, prove mutually advantageous, and no man would be wanting on his part during his year of office to make the union a happy one. A ve-

* The inhumation tombs are here, as any rate, later in date than the cremation tombs (*Builder*, January 2, 1904, p. 3).

important work was being performed by the special committee appointed to make recommendations for the improvement of the Model By-laws issued by the Local Government Board, for both urban and rural districts. He sincerely hoped that the recommendations of the committee when submitted would be adopted by that board.

It would be universally admitted that very great advantages and economies must accrue from the standardisation of engineering materials, which was being carried on by the Institution of Civil Engineers with the approval of the Government and the co-operation of other institutions and societies, including their own. Interchangeability within proper limits must cheapen the cost of production, and it was gratifying to hear, on the authority of the chairman of the sub-committee which undertook the work of standardising tram-rail sections (Mr. W. Howard Smith), that since the completion of their labours and the publication of the standard sections and specifications scarcely a tram-rail of any other section had been rolled in this country. The Association was also represented on the Pipe Standardisation Committee now sitting under the chairmanship of Mr. Charles Hawkesley, past-president of the Institution of Civil Engineers. Their representatives were Mr. F. Griffith, of Leicester, and Mr. W. Watts, of Luton. This committee was making exhaustive inquiries with a view to standardising all classes of pipes, from rain-water pipes to the large steel and iron pipes for hydraulic power. For a very long period the troublesome problem of sewerage and sewage disposal had exercised the minds and engaged the serious attention of municipal and sanitary engineers, and for upwards of six years a Royal Commission had been making researches into its hidden mysteries. However, without waiting for the final report of the Royal Commission, one could easily see that the complex problem, if not solved, was approaching solution, and engineers, he thought, had acquired sufficient knowledge of natural and artificial methods of sewage purification to enable them, with adequate funds at their disposal, to produce an effluent of any chemical and bacterial standard value that might be required. That no one method was of universal application was as much an axiom to-day as ever it was. If suitable land in sufficient quantity could be purchased at a reasonable price he felt sure that the simple and natural method of irrigation would, in the majority of cases, prove the most satisfactory and economical, but where land was unavailable, equally good results might be obtained by artificial or biological methods. Be the method natural or artificial, however, he was convinced from practical experience and careful observations, that unless the works were entrusted to the management of experienced and thoroughly reliable men, whose aim was purification and not profit, failure and not success would be the result. If the recommendation contained in the third report of the Royal Commission was carried into effect, viz., "that the law should be altered so as to make it the duty of the local authority to provide such sewers as were necessary to carry trade effluents as well as domestic sewage, and that the manufacturer should be given the right, subject to the observance of certain safeguards, to discharge trade effluents into the sewers of the local authority if he wishes to do so," the difficulties of municipal engineers, in some towns at least, would be greatly increased. The fourth report of the Commission was pregnant with interest to all municipal engineers, but more especially to those whose districts contained tidal waters. The Royal Commissioners said: "The treatment of sewage, according to methods at present in use, cannot be relied on so as to alter its character as to allow of its discharge in the immediate neighbourhood of shellfish layings, without incurring appreciable risk of disease being communicated by the consumption of shellfish taken from such layings. In such cases either the sewage outfall must be removed or the layings closed." These observations had a much wider bearing than at first view appeared, as the whole question of sewage treatment and rivers pollution was involved. They were no doubt within measurable distance of the formation of river boards, composed of joint committees of county and county borough councils, under a central authority, with powers over watershed and drainage areas, to prevent pollution of rivers and other sources of water supply, to check waste, and to guard local interests, by prevent-

ing water being taken for sale outside a given area. When these watershed areas were formed it was to be devoutly hoped that they would eventually supersede the existing absurd administrative Local Government areas of the country. Whether our inland streams would ever be rendered pure enough, after storage and efficient filtration, to adopt as public sources of water supply he could not say, but it would be an enormous gain to the country at large if this desirable result could be achieved. Possibly a rigorous isolation of typhoid and cholera cases, and the sterilisation of their excreta before discharging them into the drains and sewers, might lead to such a consummation. It was notorious that many of our small towns and country villages were unprovided with water fit to drink, and were positively crying out for this necessity of life. It was anything but creditable that this state of things should be possible in these advanced days of sanitation. It proved conclusively that the law on the subject was ineffective, and that a change was absolutely and urgently needed. The county councils were doing their best with the feeble powers which, in this respect, they possessed, to bring about an improvement, but progress was very slow indeed. For some years past the County Council for Shropshire had been trying to induce several urban and rural districts devoid of a proper supply of water, to combine for the purpose of obtaining one, and eventually succeeded in grouping certain districts into a water supply board. This board promoted a Bill in the present session of Parliament, which, however, emerged from the ordeal of Committee curtailed to such an extent as to reduce its value and usefulness very considerably.

With reference to highways, he said, while traction engines and the heavy motor lorries were cutting up the roads, the users of swift-running light motors were demanding smoother and better surfaces which enormously increased the difficulty of the situation. The motor-car had brought in its wake a problem in the form of dust, the solution of which would in itself bring about this change. The clouds of dust raised by the motor-cars were principally caused by the sucker-like action of the wide pneumatic tyres of their small wheels. This action was positively injurious to the macadamised road crust, in that it sucked out the binding material which held the macadam in place, which was naturally followed by disintegration of the crust itself. This dust nuisance had exercised the minds of many people, and patent "dust-layers" were already in the market and were said to be a panacea for the evil, such as "Westrumite," "Pyne Oiline," and other oily liquids for sprinkling on the roads. These, however, were only palliative measures; they might prove very useful in special cases, such as automobile trials, race meetings, and other gatherings of a like character, but he feared they would prove too expensive for general permanent use. The real remedy must be founded on the principle that "prevention is better than cure," and their chief roads, at least, would have to be coated with an impervious material which would resist the sucking action mentioned, and, at the same time, be strong enough, together with the foundation coat, to bear heavy traction traffic. If this change was to be brought about without friction it must be done without adding materially to the present cost of maintenance, and he could not think of any better or more economical material for the purpose than tar-macadam. There was nothing new in the principle of mixing tar with road metal, but many of them must be interested in the experiments of one of their members in the use of selected furnace slag for the purpose, which, while yet warm from the furnace, was made to absorb the tar which it was alleged thoroughly saturated it and rendered it waterproof throughout. If this material was found in actual practice to be sufficiently tough to resist the wear and tear of heavy traffic the fact that it could be produced at a reasonable cost, especially in the neighbourhood of blast furnaces, would lead to its extended use, both in town and country, in the place of ordinary macadam. The gain to the travelling public from roads of this class would be of enormous value. Tractive force would be considerably reduced, especially when compared with that exerted under existing conditions, such as dust in summer and mud in winter, both of which conditions greatly increased resistance to traction; dust would be reduced to a minimum, and automobilists would be enabled to lay aside their unbecoming garments

for something more beautiful; the roads would be kept in a better sanitary condition, as rain, instead of injuring them, as at present, would have a cleansing effect on their impervious surfaces. With roads of good, hard, smooth surfaces—yet not too smooth on the steeper gradients—there would be less necessity for light railways and tramways which rendered the roads less commodious and useful for ordinary traffic. Motor omnibuses would take their place as means of communication between town and country, and would be much more effective, inasmuch as they could go to the very doors of the people. This would probably assist in arresting the migration of the country population to the towns.

It had often occurred to him that it would be much better that building by-laws should be abolished in favour of a general building Act. This would do away with the present anomaly by which builders were able to erect what they liked in one district where there were no by-laws, while perhaps in an adjoining district they were compelled to observe a rigid set of laws. Surely it would be better to fix minimum standards for town and country respectively, and make everybody adhere to them rather than to have rigid regulations in one district and none at all in another. However, so long as the law remained as it was, they must make the best of it. ♦

Mr. Robson (Willesdon) proposed a vote of thanks to Mr. Davis for his address, which was seconded by Mr. E. G. Hawbey (Leicester), and carried by acclamation.

American Sewer Design and Construction.

Mr. S. Hodgson, Assoc. M. Inst. C. E., read a paper on American sewer design and construction. He said the circumstances which led up to the construction of the Boston Main Drainage Works—distinguishing them from the metropolitan works, to be referred to hereafter—were commonplace enough. It was on record that in 1870 an aggregation of old city sewers discharged by about seventy outlets into tide-water, chiefly along the harbour front, with the customary results. In 1875 the problem was submitted to a commission of medical and engineering experts, who were asked to report as to the best means of providing main drainage facilities for the entire area of the city, having at that date a population of about 340,000 and occupying an area of 37½ square miles. A further area of 20½ square miles in the Charles and Neponset river valleys, naturally tributary to any system of this character, was also included in the reference, the entire 58 square miles lying to the south of the Charles river. The more thickly settled portions of the city itself obviously demanded preference in any remedial measures to be undertaken, and the physical features of the territory greatly favoured the claim. In view of these conditions, it was decided to proceed at once with the construction of the low-level system and to postpone the building of the high-level gravity sewer until such time as the increasing density of population and other causes should call for action in that direction. The harbour outfall works, on the other hand, were made of sufficient capacity to receive in addition the sewage of the entire high-level district, and an inlet for this purpose was provided at Squantum. The original works of the low-level system—known as the Boston Improved Sewerage—were constructed between 1877 and 1884 at a cost of 1,000,000. They comprised 25 miles of main and intercepting sewers, ranging from 2½ ft. to 10½ ft. diameter, located generally along the tidal margins of the city and lying mainly below the level of low tide; a pumping station at Old Harbour Point, where the sewage was lifted about 30 ft. through force mains into twin deposit sewers, each 8 ft. wide and 16 ft. high, in which heavy matters settled before the sewage reached a 7½ ft. tunnel, 7,169 ft. in length, crossing under Dorchester Bay; an outfall sewer, 11 ft. high and 12 ft. wide, 5,900 ft. in length, built on an embankment and connecting the tunnel with open reservoirs on Moon Island, where the sewage was stored during the latter half of the ebb tide and the whole of the flood tide; and a discharge conduit leading to the tidal currents in the harbour. The original capacity of the reservoirs was about 20,000,000 gallons, but additions made within the last five years had increased this to 40,000,000 gallons. Similarly the original pumping plant, with a nominal capacity of 42,000,000 gallons per day, had been brought up to a total of 150,000,000 gallons. The system was designed for an ultimate population,

on the 15 square miles, of 600,000, a mean of sixty-three per acre. The water supply was taken at 62 gallons per head per day, with a maximum rate of flow equal to twice that volume, and provision was made for a volume of rainfall, actually reaching the sewers, equal to a depth of $\frac{1}{4}$ in. falling in twenty-four hours. The works were constructed, and were still owned and operated, by the City of Boston. They provided, beyond a doubt, for the most urgent part of the general sewerage problem of the metropolitan district, but left a large and growing population without any satisfactory means of sewage disposal. One result of this was the gradual extension of the city area made tributary to the pumping system, a process of no avail in relieving those outside areas which had been recognised as forming part of any rational drainage district. The problem, as affecting those portions of the Mystic and Charles river valleys, was complicated by the difficulty, in many cases amounting to impossibility, of dealing with the sewage of any given area within the borders of the municipality affected, and it was finally recognised that no authority, other than that of the State of Massachusetts, was sufficiently comprehensive to embrace the entire district to be served. Successive commissions, beginning with the Metropolitan Drainage Commission of 1881, made a study of the situation, but the matter was brought to a head by the State Legislature of 1887 directing the State Board of Health to consider and report on a general system of main drainage for the relief of the two valleys, comprising a metropolitan area of 114 square miles. The report, submitted in 1889, recommended the division of this district into two parts, with an independent harbour outfall for the larger portion (72 square miles) north of the Charles river, containing a population, in fourteen municipalities, estimated at about 280,000 in 1890. The execution of the scheme was begun in May, 1890, the Charles river system being completed two years later. The execution of the north metropolitan system, carried on simultaneously, was a much larger and more difficult undertaking, and it was not until the spring of 1896 that the entire system could be said to be in operation. The total cost of the original works of both systems amounted to about 1,200,000. The author then proceeded to deal with the various additions to the original works up to 1904. The expenditure on metropolitan systems was met by contributions from the various municipalities, devised to cover the repayment of principal and interest in forty years, and the annual cost of maintenance and operation was likewise borne by the respective areas. In order to bring the payments under the first head more nearly into proportion to the increased use of the system by a growing population, it was provided by the Act that, instead of refunding one-fortieth of the entire sum in each year, the payment should be apportioned as follows: 5-fortieths in the first ten years, 6-fortieths in the second ten years, 13-fortieths in the third ten years, and 15-fortieths in the fourth ten years. The bonds bear interest at the rate of 3 per cent. per annum. While he had been enabled to place a concrete example before English municipal engineers, there were some leading features, affecting American sewage works generally, to which it might be well to refer. Among these the most prominent and important was the tendency towards the separation of rainfall from sewage which the late Sir Edwin Chadwick laboured to promote in Great Britain. American ideas on this subject were of a very advanced type, inasmuch as they did not tolerate the exclusion of roof and yard water from the rainfall conduits. It must be said of Americans, in this as in other respects, that they had the courage of their convictions. As exemplifying this characteristic, the author might say that while he had never known in America of a case in which ventilating manhole grids were closed on account of alleged nuisance, this step was becoming increasingly common as a means of preventing the ingress of rain water to "sanitary" sewers. This procedure was greatly facilitated by the growing practice of dispensing with disconnecting traps between houses and the street sewer, but this had not been brought about by an objection to open grid sewer ventilation. The absence of complaints in this respect had, in fact, always impressed him as being one of the most remarkable facts connected with American sewerage works, and he was constrained to attribute this immunity, at least in part, to the more generous use of water demanded by American ideals.

The study of rainfall records, and the application to them of available formulae, had resulted in America in a noteworthy expansion of ideas in regard to the dimensions of rainfall conduits. On the other hand, the rigidity with which it was regarded as possible to adhere to the exclusion of rainfall from "sanitary" sewers had had its effect in reducing the size of the latter to an extent otherwise impossible. In this way, 8-in. pipes might be said to be the standard for ordinary street sewers, a fact exemplified in the system designed by American engineers for the City of Havana in 1900, in which 83 miles, out of a total of 124 miles, were of that dimension. The use of small pipe sewers carried with it the obligation of limiting the ingress of subsoil water, as conforming to that general restriction of volume which was aimed at in "sanitary" sewers. Contrary, however, to English practice, what were known as patent pipe joints were not used, reliance being placed upon the filling of the annular spaces with Portland cement, generally mixed with a small proportion of sand to prevent cracking.

Mr. J. Price (Birmingham) said the paper was interesting in that it dealt with engineering in another country. When they looked at the main features, and saw they were dealing with a population of sixty-three to the acre, and the water supply was taken at 62 gallons per head per day, and that, owing to the increase of the impermeable area, the consumption of water had risen to 100 gallons per head per day, they would see what a different problem they were dealing with in America to what they were in England. If they were going to have 100 gallons of water per head, with only a small quantity of sewage in it, they were getting very near the point at which they could use the storm overflow. With reference to the separation of storm water from the sewage at Birmingham, with a partial separate system they could eliminate about three-eighths of the discharge in storm time. In the future they would probably be able to raise the proportion of storm water to five-eighths. The Boston method of dealing with the financial question was new; at any rate, he knew nothing like it in England.

Mr. E. G. Marbey (Leicester) mentioned that in Leicester the late Mr. Gordon introduced a separate system by which he succeeded in cutting off about one-half of the rain water from the foul water sewers.

Mr. Fryce (Lytham) remarked that if street grids were never closed in America on account of complaints, American sewers must be better ventilated than they could ventilate sewers in this country, or they must flush them more, or the people must be more long-suffering than the English people were, because he did not see how it was possible to avoid some smell if the ventilator was at the ground level.

Mr. S. G. Hodgson, in reply, said the amount of supervision they got on engineering works in America was infinitely greater than anything known in England. They got more money to do the job, and they got more highly-skilled men to do the work. There was a more liberal and generous spirit in regard to the design and supervision of engineering work than he was able to find in England.

"The Sewage Problem Solved."

Mr. W. D. Scott-Moncrieff read a paper entitled, "The Sewage Problem Solved." He said that in the paper which he read to that Association at Kensington last year, he took the opportunity of stating as clearly as he could what the conditions were which might be regarded as essential to the successful application of bacterial processes to the purification of sewage. These conditions were (1) after subjecting the sewage to that amount of anaerobic fermentation which was required for the breaking up of the organic matter into unstable compounds, capable of being fully oxidised to nitrates by the action of aerobic organisms—providing the means by which the zonal changes which take place in downward filtration can be carried on regularly and without any serious alterations in the environment at any stages of the process, such as occur in the "contact" system, in other words uniform distribution. (2) Means by which the aerobic organisms are supplied with no more than the maximum amount of nutriment that they are capable of digesting, in any given time. (3) Means by which a time of rest between each meal is secured so as to avoid the development of gelatinous growths in the filter bed. (4) Means by which the organisms are provided with an air

supply proportionate to the amount of nitrification demanded by different kinds of sewage. If these four conditions were under control, to obtain the best results, it was necessary to know, in exact terms, the measured value of the four following factors:—(a) The quantity of air necessary for the life processes of the organisms. (b) The best rate of flow per unit of filtered surface. (c) The best period of rest between each discharge. (d) The depth of filter required to produce the necessary standard of purity in the effluent. He thought he might claim this as his system, seeing that even now he was the only person who had recognised and advocated that the above factors were the necessary and only conditions demanded by nature in order to obtain complete and final success. The author, on the occasion of the Kensington meeting, described an apparatus which was designed for this purpose, and it was the object of the present paper to show from the actual results, not only that the apparatus had realised all that he expected from it, but that it had even surpassed his most sanguine anticipations. In the able hands of Mr. Dill, manager of the sewage works at Staines, backed up by his surveyor, Mr. Barrett, a new light had been thrown upon the entire subject of sewage disposal and a complete revolution of all our previous ideas on the problem had been inaugurated by the use of this machine. The author's experiments at Ashstead, so long ago as 1898, had prepared him to expect some such result, but even he must confess to something akin to a feeling of wonder when the apparatus showed that in so short a period as ten days, which had hitherto been regarded as wholly insufficient for the ripening of a percolating filter, a strong brewery sewage, taken as it arrived on the works, could be purified to the extent of over 80 per cent. in its aluminoid ammonia through only 4 ft. of gravel, gauged to pass a 1-in. mesh, and rejected by a $\frac{1}{2}$ -in. mesh. This marvelous result was obtained not by any new or by an unknown scheme, but by a process which was quite familiar to every one present, by simply doing what he had all along maintained was essential, viz., following the demands of nature implicitly and in all respects. At Stanwell, where the Staines disposal works were situated, the sewage was conveyed from an extensive district, reaching at some points as much as five miles from the outfall, by means of Shone ejectors. It was a strong domestic sewage heavily charged with brewery refuse, and with the trade waste from large linoleum works. Immediately over the sewer, where it was open within a few feet of the mixing-house, and before it had been treated in any way, a Worthington pump, so small that it was quite portable, and which was driven by compressed air, was arranged so as to draw sewage from a short length of suction-pipe provided with a strainer at its intake about 2 ft. from the pump a relief valve was fixed on the discharge-pipe (which was $\frac{1}{2}$ in. in diameter) for the purpose of avoiding unnecessary strain on the pump, and to give a less jerky discharge. Immediately over the testing-machine itself a small tank was arranged, into which there was a continuous flow of sewage from the Worthington pump, all the sewage beyond that which was being tested passing away through an overflow pipe provided for the purpose. In this way a continuously-changing sample, varying with the sewage as it arrived at the works, was constantly available. In the small tank further straining was provided for, with the result that the apparatus could be absolutely relied upon to work automatically with only a few minutes' attention during the course of the day. It should be noted that, in any case, the liquid, as it was discharged upon the testing apparatus, being crude sewage, was never so free from suspended matter as the effluent coming from a well-arranged hydrolysing tank. The accuracy of the discharge, which took place through an orifice of a fixed diameter, was secured by an arrangement by which a small vertical delivery pipe was made adjustable by a gland and stuffing box that allowed it to be raised or lowered, thus altering the head of liquid so as to obtain any required rate of flow. The rate of discharge was a little over 8 pints per sq. ft. per hour distributed over the upper surface of the filter. The period between each discharge was four and a quarter minutes, and the amount of air being asperated through the filter was at the rate of 4 cubic ft. per hour. If this be taken in gallons, the air supply in terms of that measure was nearly 8 gallons

per ft. of filter surface per hour, or nearly 3 gallons of air per cubic foot of the air space in the filter, allowing about one-half of its cubic contents to be occupied by the filtering material. Taking the air supply in its relation to the flow of sewage, it was nearly at the rate of 8 gallons of air per gallon of sewage per hour. No elaborate analyses were required at these early stages, and only three samples were taken—one of the crude sewage and of the effluent as it came from taps Nos. 4 and 6. The result proved that the filter was already actively at work, the oxygen consumed in the cold in four hours having fallen from 6.15 in the crude sewage to 1.52 at the fourth foot of filter, and gone back to 1.56 at the sixth tap. This showed that everything was going satisfactorily, and so the same conditions were maintained with absolute uniformity until the fifteenth day, when samples of crude sewage, and of the effluent from the fourth tap, were taken in order to estimate the amount of purification that was being obtained in terms of reduction of the oxygen consumed, and of the free and albuminoid ammonia. These proved that the bacterial activity was progressing satisfactorily. On the twenty-ninth day a more elaborate series of analyses were taken, which dealt with the crude sewage and the effluent from the third, fourth, fifth and sixth taps. The results of the improved conditions, together with the greater maturity of the filter, was clearly indicated by the diagram, in which the fourth foot of filtering still showed excellent results, with a curious set-back both in the free ammonia figures between the fourth and fifth tap, and of the oxygen consumed and albuminoid ammonia between the fifth and sixth. There was a trace of nitrite and 4 of nitric nitrogen per 100,000 parts. They next came to a still more elaborate series of analyses which were taken seven days later on June 22, being the thirty-sixth day from starting, the conditions having been kept absolutely uniform since the twenty-ninth day. The nitrite had risen from a trace to 2 parts per 100,000, and the nitrite had exactly doubled. The lines of progressive purification at the various filtering depths had become much more regular, showed that far the greater portion of the work was carried out between the surface of the filter and the third foot of depth, and that the comparatively small amount of purification between the third and sixth foot had been effected without the set backs which were in evidence when the air supply was less. The author wished to point out that all these results had been obtained under conditions that as themselves were very far from being favourable, either in respect of the maturity of the filter as a bacterial medium of oxidation, or the condition of the liquid which was taken as it arrived at the works, or the rate of flow, which was probably excessive for this particular sewage. He was quite satisfied that these results were due as much as anything to the uniformity of conditions which were maintained, as to allow of the organisms taking up their work in zones, where each colony could work with an undisturbed environment. The proofs of the importance of this uniformity was forthcoming at Ashted, where the mere displacement of a tray led to an upsetting of the process, from which it required two or three days to recover. In these investigations the same element was strongly in evidence, because all the samples immediately deteriorated when the air supply was doubled, although the altered condition was of course ultimately favourable to the improvement which supervened as soon as there was time for the organisms to adjust themselves to the new environment. The author had not yet come across a scheme for the disposal of sewage by bacterial oxidising processes which this apparatus was not capable of clearing up by giving results in exact and comparable terms, and it must be capable of doing so if it included all the factors of the problem and enabled them to be measured and compared. The investigation at Staines had been undertaken upon practical lines, with a practical object in view. The first inquiry had been to discover what the most unfavourable conditions, which, in this case, at any rate, might be looked upon as the least expensive, could be made to yield before considering those that were easily provided, which cost money. It was now quite certain that the Ashted results could be repeated, at least in the great majority of cases, and that an effluent giving a percentage of 90 per cent. of oxidised to oxidised nitrogen was within the reach of

every one who provided the conditions revealed by the apparatus described.

Mr. Watson (Birmingham) said, though his views agreed very largely with those of Mr. Moncrieff, he felt they had not yet reached a solution of this question. The sewage at Staines was a comparatively weak sewage, which they could screen, and they were bound to get very different results from it than from a sewage which, after hydrolytic change, had such a quantity of suspended matter that they could not possibly get an apparatus like this to work without a good deal of attention. He would not like them to think they would obtain perfect results from the tester, nor that they would be able to obtain results without some little trouble and expense, because there was nothing obtained in this world without trouble and expense.

Mr. J. E. Wilcox (Birmingham) said the first thing they had to recognise was the requirements of the Local Government Board. They might say they had a tester, and with it they had produced certain results from a filter of a certain depth, but the Local Government Board would say they knew nothing of their tester, they would have to comply with the requirements of the Board, and if they did not comply they would not get a loan. In designing the distributor which was in use at certain works, he ventured to say Mr. Moncrieff went much further in the solution of the sewage problem than in the design of this tester.

Mr. Bush (Sudbury) asked whether the apparatus could be applied to contact beds.

Mr. Hall (Staines) said that, as Mr. Moncrieff had stated, all the factors could be accurately measured. After eight weeks' experiment with the tester, he was more fully convinced than ever that these factors when applied to sewage would be the means of giving them reliable data.

Mr. Caink (Worcester) suggested that the air should flow through the filters in the opposite direction to the sewage. It seemed to him that they would then get better results.

Mr. J. S. Pickering (Cheltenham) thought the author was adopting the right course with this apparatus as a means of testing some of the conditions which take place on a larger scale. But he ventured to suggest that Mr. Moncrieff had too hastily drawn conclusions from his experiments.

Mr. A. Creer (York) said the crux of the whole matter was the disposition of the Local Government Board in dealing with municipalities. The results obtained from experiments had very little weight with the Local Government Board in inducing them to depart from the hard and fast line they had laid down.

Mr. Moncrieff, in reply, said the apparatus would not apply to contact beds, which, in his opinion, were hopelessly unscientific.

FACTORY AND WORKSHOP ACT, 1901.

We have received from the Home Office the following memorandum, endorsed "Form 718, June, 1904," in relation to the provisions of the Factory Act in regard to accidents:—

"MEMORANDUM AS TO BUILDINGS IN COURSE OF CONSTRUCTION OR REPAIR.

Certain provisions of the Factory Act, relating to the reporting of accidents and examination of steam boilers, apply:—

(1) to premises on which machinery worked by mechanical power is temporarily used in the construction of a building or in structural work in connexion with a building, and

(2) to buildings over 30 ft. in height which are being constructed or repaired by means of scaffolding, whether machinery be used or not;

and the person using any such machinery, or employing the persons engaged in the construction or repair, is responsible (under penalty) for seeing that the provisions referred to are duly observed.

Reporting of Accidents.—When there occurs on such premises or buildings any accident which causes to a person employed therein such injury as to prevent him on any one of the three working days next after the occurrence of the accident from being employed for five hours on his ordinary work, written notice (Form 43) must be sent forthwith to H.M. Inspector for the district.* Every such accident should also be entered in a register kept for the purpose on the premises (Form 73). And, further, if the accident is fatal, or is produced by machinery moved by power, or by a vat or pan containing hot liquid, or by explosion, or by escape of gas or steam, a similar written notice (Form 43) must also be

* If the address of the District Inspector is not known the notice may be forwarded under cover to the Chief Inspector of Factories, Home Office, London, S.W.

sent forthwith to the certifying surgeon for the district, whose name and address can be ascertained from the Inspector where necessary.

In the year 1903, 115 fatal and 2,044 non-fatal accidents were reported in connexion with buildings in course of construction or repair. It is, however, believed that these returns are incomplete, and the Inspectors are instructed to take proceedings against the persons responsible, if notice of accident is not sent.

Steam Boilers.—Every steam boiler used in the places and premises in question must be maintained in proper condition, provided with a proper safety valve, steam gauge and water gauge, and thoroughly examined by a competent person every fourteen months. A signed report of the result of the examination must be entered within fourteen days in a register to be kept for the purpose on the premises (Form 73).

If notice of the commencement of a building is given to the Inspector, he will forward an abstract (Form 57), containing a summary of the provisions of the Act relating to buildings.

The official forms can be obtained, directly or through any bookseller, from Eyre and Spottiswoode, East Harding-street, London, E.C.; Oliver and Boyd, Edinburgh; and E. Ponsonby, 116, Grafton-street, Dublin.

Safety Precautions.—The following suggestions, if carried out, would tend to reduce the number of accidents occurring on buildings in course of construction or repair. They are based upon those contained in a Home Office memorandum issued to the building trade in 1902.

(1) Every working platform more than 8 ft. from the ground should, before being used, be provided throughout its entire length on the outside and at the ends:—

(a) with a guard rail fixed at a height of 3½ ft. above the platform. Openings may be left for workmen to land from the ladders and for the landing of material;

(b) with boards fixed on edge, rising at least 7 in. above the platform, and with their lower edges resting or abutting on the scaffold boards. Openings may be left for workmen to land from the ladders.

(2) All "runs" or similar means of communication between different portions of a scaffold or building should be at least 18 in. wide. If made of two or more boards they should be so arranged as to prevent unequal sagging.

(3) Scaffold boards forming part of a working platform should be supported at each end by a putlog, and should not project more than 6 in. beyond it, unless lapped by other boards, which should rest partly on or over the same putlog and partly upon other putlogs.

(4) Ladders should rise some feet above the place they give access to, and should have a level and solid footing, and be securely fixed at the top point of rest.

(5) Loose putlogs or other timber should not be allowed to remain projecting from the face of the scaffold where hoisting or lowering of material or plant is being carried on.

(6) Where the scaffolding has been sublet to a contractor, the employer should satisfy himself, before allowing work to proceed thereon, that it complies with the conditions named above, and that the material used in its construction is sound.

B. A. WHITELEGGE,
Chief Inspector of Factories.
Home Office, June, 1904."

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS:

THE JUNE EXAMINATIONS.

The Preliminary Examination, qualifying for Probationership R.I.B.A., was held in London and the undermentioned provincial centres on June 7 and 8. Of the total number entered—viz., 251—58 were exempted from sitting, and the remaining 193 were examined, with the following results:—

Centre	Number Examined	Passed	Relegated
London	84	61	23
Belfast	3	3	0
Birmingham	9	8	1
Bristol	12	10	2
Cardiff	9	5	4
Exeter	4	3	1
Glasgow	5	4	1
Liverpool	4	2	2
Leeds	24	18	6
Manchester	19	13	6
Newcastle	15	11	4
York	5	5	0
	193	143	50

The passed candidates, with those exempted—201 altogether—have been registered as Probationers. The following are their names:—

M. S. R. Adams, Bedford-park, Chiswick; A. D. Aitken, Airdrie, N.B.; E. G. Allen, S.

Woodford; P. R. H. Allfree, Clerkenwell, E.C.; J. D. Ashley, Sneyd-park, Bristol; H. S. Badenoch, Newcastle-on-Tyne; G. B. Baird, Bridgeton, Glasgow; C. H. Baker, Kingston-on-Thames; F. N. Bamford, Leytonstone, Essex; T. P. Bausor, Cambridge; W. Barraclough, Barnsley; J. B. Barrow, Barrow-in-Furness; F. J. Barton, Bridgewater; V. Cinatti, Batalha-Reis, Notting Hill, W.; V. Beer, Southville, Bristol; S. G. Bentley, Farsley, near Leeds; V. H. Birbeck, Cottingham, Hull; A. E. Birmingham, Cliftonville, Margate; J. E. Bolam, Blaydon-on-Tyne, co. Durham; T. H. Bolton, Arley, Leeds; C. G. Boucher, London; T. Braddock, Wimbledon; F. H. Brazier, Windsor; R. B. Brierley, Bedford; C. Bristol, West Norwood, S.E.; G. A. Bryan, Knightsbridge, S.W.; A. G. Bullock, New Southgate; J. E. Bullock, Walton-park, Cleveon, Somerset; J. S. Burgess, Acton Hill, W.; F. T. Bush, Crouch Hill, N.; C. H. Calvert, Nottingham; J. Carey, Slepther's Bush, W.; H. Carter, Liphook, Hants; A. J. H. Clarke, Dromore, co. Down; R. H. L. Cock, The Boltons, S.W.; C. B. Cole, Exeter; R. L. Collingwood, Richmond, S.W.; F. S. Cooper, Herne Bay; E. C. Core, Bayswater; A. R. Corwell, Hanley, Staffs; D. J. Corrigan, Duffus, Elgin; L. V. Cousins, Taunton; C. Diodati Cox, Shepherd's Bush, W.; T. H. Crawshaw, Barnsley; C. K. Crichton, Perth; R. Cromie, Lavender Hill, S.W.; J. A. Crush, Lavender Hill, S.W.; J. C. Davies, Pentreoph, Morriston, S. Wales; H. D. Dawson, Faversham; W. F. Dawson, Leeds; W. R. Dawson, Halifax; J. L. Denman, Brighton; I. Dixon, Wavertree, Liverpool; F. Donaldson, Bishop Auckland; F. J. Drake, South, Southsea; W. B. Y. Draper, Kensington; B. A. Dyer, Hereford; T. Eager, Holywood, Belfast; A. R. Eaton, Forest Gate, E.; J. M. Fairweather, Dublin; J. H. Farrar, Harehills, Leeds; J. Farrell, Sydney, N.S.W.; G. R. Farrow, Clapham Park, S.W.; E. G. Fidler, Caversham, Oxon; F. H. Fitzgerald, Hither Green, S.E.; T. O. Foster, Ealing, W.; J. A. Fowler, Hastings; F. B. Fulker, Salisbury; J. V. Gifford, Croydon; E. H. Gibson, Harrogate; G. Gifford, St. John's Wood, N.W.; W. Gill, Stanimirey, near Leeds; W. M. Gillow, Alderley Edge, Cheshire; T. G. Gilmour, Glasgow; G. N. Glazebrook, Plymouth; H. Goldstraw, Hanley, Staffs; C. Gordon, Harrow-on-the-Hill; W. G. Gradon, Durham; C. J. Graham, Chiswick, W.; E. R. Green, Sydney, N.S.W.; J. Grieve, Bradford; C. E. Gurney, Headingley, Leeds; H. W. Hall, Liverpool; C. E. Hanscomb, New Cross, S.E.; F. M. Harker, Brighton; W. H. Harrold, Alva, by Alho, N.B.; A. W. Harwood, Highbury, N.; S. T. Heath, Blackpool; J. D. Henderson, Berwick-upon-Tweed; W. T. Higgins, Hanslope, Stony Stratford; H. S. Higginson, Carlisle; S. Hirst, Marsden, Huddersfield; J. K. Hopkinson, Bury, Lancs.; H. E. Horth, Hereford; T. S. Hosking, Bristol; W. Howe, Barnsley, Yorks; W. Hoyle, Greenhithe, Kent; E. LaFontaine Hutton, Burnt Ash Hill, Lee, S.E.; G. E. Hunter, Gosforth, Newcastle-on-Tyne; J. S. Huxley, Eastbourne; W. J. Isaac, Warrington; R. M. Isaacs, Paddington, Sydney, N.S.W.; F. Jackman, Frimley, Surrey; F. R. Jelley, Swansea; C. G. B. Kaye, Harpenden, Herts; J. V. Kershaw, Burnley; F. E. Keymer, Gorleston, Great Yarmouth; D. Kibbler, Standford Hill; H. L. Kiddle, Tottenham, N.; J. S. Knyvett, Edgubston, Birmingham; E. Lamster, Darwen; A. L. Levy, Ladbroke Grove, W.; W. Lindsay, Glasgow; D. Longden, Langside, Glasgow; W. G. Lovell, Eastbourne; A. V. Low, Paddington, W.; J. G. N. Marchant, Mansfield; H. H. Meadus, Rochester; H. I. Meriman, Kensington, W.; K. H. Milne, Strand, W.C.; C. W. Mitchell, Shirley, Southampton; H. W. Mole, Newcastle-on-Tyne; E. S. Munt, Balham, S.W.; F. A. Murray, Pollokshields, Glasgow; S. A. Neave, Lonqueville, Sydney, N.S.W.; C. J. Newbery, Battle; E. A. Nicholl-Garrett, Herdrol; W. Nicol, Blackburn; G. R. Oddy, Northwram, Halifax; G. Parker, Barrowbourne, Worcester; G. H. Parry, Upper Warlingham, Surrey; W. H. Pearson, Hull; V. H. Peart, Gorleston-on-Sea, Great Yarmouth; F. R. Priest, Clapham Common, S.W.; F. A. M. Rawes, Colleton Green, Exeter; W. S. Read, S. Hampstead, N. W.; P. Richards, Southampton; H. T. Richardson, Handsworth Wood, Birmingham; G. A. Richards, Walton Park, Cleveon; W. W. Roberts, Maidenhead, Berks; H. M. Robinson, Coventry; B. Robson, Scarborough; W. A. Rodger, Cardiff; J. A. Rogers, West Hampstead;

C. H. Ross, Balham, S.W.; H. Ross, Belfast; H. A. Ross, Shepherd's Bush, W.; J. P. Salwey, Reading; R. T. Sault, Leicester; J. M. Scott, South Kensington, S.W.; E. D. Sherlock, Withington, nr. Manchester; N. V. Shiels, Randwick, N.S.W.; C. H. Simpson, London; W. H. Singer, Penarth; H. E. Smith, Balsall Heath, Birmingham; R. F. Smith, Hull; R. G. Smith, Reading; J. H. Somerset, Kersal, Manchester; A. W. Stabler, Shincliffe, nr. Durham; A. A. Stamford, Cambridge; A. W. Stelfox, Ormeau Park, Belfast; W. H. Stubington, Cranleigh; A. K. Sutcliffe, Felliscliffe, Ripley; C. A. Sutton, Nottingham; C. Swain, Baxton; E. A. Taylor, Wollstonecroft, North Sydney, N.S.W.; S. P. Taylor, Hanley; G. Thomas, Sketty, R.S.O., Glam.; N. D. Thompson, Whytelade, Surrey; E. V. Todd, Blackpool; Niall Tom, Cardiff; J. W. Tove, Lytham; A. Turnbull, Sunderland; F. L. Turnbull, Newcastle-on-Tyne; W. T. Turner, Redburn, Barnsley; F. A. Vernon, West Dulwich, S.E.; H. C. Walker, Ulverston, Lancs.; A. R. Walton, Cullercoats, Whitley Bay, R.S.O., Northumberland; F. D. Ward, Hastings; S. J. Ward, Northampton; F. C. Webster, Broughty Ferry, Scotland; W. R. Webster, Aberdeen; A. Welford, Brondesbury, N.W.; R. H. Whiteing, Beverley; J. Whitelaw, Pollokshields, Glasgow; N. Wizzell, Barnsley; J. Wilks, Stockton-on-Tees; E. S. Williams, Taunton; J. H. Willman, Wellingborough; R. S. Wilshear, Leicester; D. M. Wilson, Harpenden, R.S.O., Herts; R. Wilson, Lewisham, S.E.; W. H. Wilson, Burwood, Sydney, N.S.W.; G. C. Wingrove, Bow, Durham; G. W. Wintersill, Mill-hills-borough; A. S. Wood, South Kensington, S.W.; F. Worrow, Woodford, Essex; W. H. Wright, Battersea, S.W.; J. R. Young, Belfast; N. L. Young, Rotton, nr. Oldham, Lin's.

The Intermediate Examination, qualifying for Studentship R.I.B.A., was held in London and the undermentioned provincial centres on June 7, 8, 9, and 10. One hundred and forty-three candidates were examined, with the following results:—

Centre.	Number Examined.	Passed.	Relegated.
London	104	47	53
Belfast	2	1	1
Bristol	7	5	2
Glasgow	3	2	1
Leeds	13	10	3
Manchester	11	8	3
Newcastle	7	4	3
	143	77	66

The successful candidates, who have been registered as students, are as follows, the names being given in order of merit, as placed by the Board of Examiners:—

J. M. Smith, Chelsea, S.W.; R. W. Thorp, Headingley, Leeds; H. B. Richards, Butevant, co. Cork; J. J. Bock, Doncaster; J. T. Penfold, Hammersmith, W.; B. Watson, North Shields; V. Constable, Springburn, Glasgow; P. F. Warren, Norwich; C. H. Perkins, Wokingham, Berks; H. Wormald, Boston Hill, Leeds; Q. M. Bluhm, St. Anne's-on-the-Sea, Lancashire; L. Blanc, Earl's Court, S.W.; K. W. Matheson, Clapton, N.E.; H. A. Fairhead, Enfield, N.; T. H. Rhodes, Roundhay, Leeds; C. C. Makins, Harrow; J. W. Hepburn, London; B. W. Oliver, Barnstable; W. H. Rife, Leicester; C. P. Wade, Yoxford, Suffolk; G. Morland, Croydon; J. R. Hobson, New Eltham, S.E.; H. M. Spence, North Shields; R. C. Foster, Loughton, Essex; D. W. Clark, Twickenham; H. C. Holt, Bolton; T. C. Marwick, Edinburgh; R. G. Sniller, Taunton, Somerset; J. B. Burman, Elphinston, Birmingham; J. M. James, Weston-super-Mare; S. P. Smith, B.A., Oxon, Leeds; G. M. Stone, Tuxford, Notts; A. A. Carder, Clapham Common, S.W.; E. E. Hodder, Thornton Heath, Surrey; T. M. Bricksell, Shepherd's Bush-green, W.; H. A. Dalrymple, Edinburgh; H. E. Adams, Brixton, S.W.; W. Baird, London; J. B. Cubey, South Shields; H. B. Downs, Guiseley, Yorks; R. J. Tall, Gravesend; G. B. Bridgman, Camlen-square, N.W.; G. Dunn, London; C. M. Drevitt, Southampton, Lancs; W. H. Johnson, Great Yarmouth, M. Thompson, Doncaster; F. Osler, London; M. E. Stahl, Weston-super-Mare; H. L. Bown, Harrogate; C. B. Smith, Ipswich; W. A. Mackay, Seven Kings, Hford; G. W. Jarrett, Wandsworth Common; A. H. Kirk, London; W. Stelfox, Todmorden; B. C. Hill, Bristol; E. B. Crossley, Sherwood, Nottingham; D. M. Adlis, Edinburgh; W. J. Brough, Finsbury Park, N.; W. W. J. Calthrop, Farncombe, Surrey; H.

Carnley, Barnsley; W. T. Clarke, Liverpool; J. O. Cook, Plumstead, S.E.; B. R. Gribbon, Leeds; R. F. Gutteridge, Southampton; A. H. Hasnup, Hastings; C. J. Hazard, Stoke Newington, N.; S. T. Hennell, Wandsworth Common; H. D. Hird, Halifax; E. A. Jackson, Wood Green, N.; N. Jones, Southport; J. N. Keesley, Meadvale, Redhill; W. P. Langman, Notting Hill, W.; T. S. Lello, Goodmayes, Essex; P. Minor, West Didsbury, A. Purgess, St. Helen's, Lancs; W. C. B. Sinclair, Lynton, Bexley, Kent; B. C. Westwick, Mansfield, Notts.

The Final and Special Examinations, qualifying for candidature as Associate R.I.B.A., were held in London from June 24 to July 30. Of the sixty-seven candidates admitted, thirty-two passed, and thirty-five were relegated in certain subjects. The following are the names of the passed candidates, the † prefixed to a name signifying that the candidate passed the Special Examination designed for candidates exempted by resolution of the Council from the Preliminary and Intermediate Examinations and from submitting testimonies of study:

E. G. Allen, Croydon; †R. J. Allison, Honor Oak-park, S.E.; W. H. Bagot, Portland-place, W.; W. J. Ball, Warrington; E. Bates, East Croydon; C. Batley, Little Roundwood, Ipswich; W. E. Brown, Camberwell, S.E.; A. N. Campbell, Hampton-on-Thames; C. M. Childs, London; B. C. Chilwell, Wednesbury; C. B. Cleveland, Earl's Court-gardens, S.W.; †J. C. Cook, Cape Town, South Africa; N. Culley, Hudersfield; †S. C. Curtis, London; W. T. Curtis, West Dulwich, S.E.; W. J. Davies, Sidcup; A. H. Gloyne, Richmond, Surrey; H. P. Gordon, Harrow-on-the-Hill; P. W. Hawkins, Beckenham; B. B. Hooper, Brixton, S.W.; K. D. Robinson, Westminster, S.W.; G. A. Ross, Montreal, Canada; T. T. Sawday, Leicester; A. Scott, Jun., Dennistown, Glasgow; N. O. Searle, Paternoster House, E.C.; R. E. Stewardson, Upper Tooting, S.W.; F. E. Stratton, Figgs Marsh, Upper Mitcham; P. J. Westwood, Haymarket, S.W.; G. H. Widdows, Derby; F. Wilson, Sheffield.

The following shows the number of failures in each subject of the final:—

I. Design	20
II. Mouldings, etc.	33
III. Materials	20
IV. Sanitation	14
V. Specifications	17
VI. Construction: Foundations, Walls, etc.	9
VII. Construction: Iron and Steel, etc.	22

THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring Gardens, Mr. J. Williams Benn, M.P., Chairman, presiding.

Loans.—On the recommendation of the Finance Committee, it was agreed to lend Camberwell Borough Council 2,030*l.* and 1,237*l.* for housing purposes; Poplar Borough Council 13,340*l.* for sewer works, and 25,000*l.* for electric light installation; Stepney Borough Council 1,715*l.* for housing purposes; and the Guardians of St. George's Union 8,500*l.* for Poor Law purposes. Sanction was also given to borrowing the following sums:—4,500*l.* for paving works for Woolwich Borough Council; 15,636*l.* for electric light installation for Islington Borough Council; 18,500*l.* for street improvement, Kensington Royal Borough Council; and 234*l.* for housing purposes, Shoreditch Borough Council.

Engineering Jobbing Works.—The General Purposes Committee reported as follows:—"On May 5, 1903, the Council decided that the revised schedule of prices for engineering jobbing works, adopted on July 16, 1901, should continue in force until September 30, 1903. The engineer and the manager of works agreed after consultation that the schedule should remain in force until March 31, 1904, and that on and after April 1, 1904, a revised schedule to be prepared by them should be adopted. The Works Committee now inform us that a careful consideration of all the items for altered work, which have been modified and measured in many cases. An arrangement has been made whereby the items representing day-work have been eliminated and provision made for the actual cost of labour and materials only to be certified for, with an allowance of 15 per cent. to cover charges and to represent con-

tractor's profit, in accordance with the practice that generally prevails for work executed in this manner. We recommend:—(a) That the course taken in continuing until March 31, 1904, the revised schedule for engineering jobbing works adopted by the Council on July 16, 1901, be approved. (b) That the revised schedule for engineering jobbing works submitted to and approved by the General Purposes Committee on July 11, 1904, be adopted as from April 1, 1904.

The recommendations were agreed to. *Paris International Exhibition.*—The same Committee also reported:—“We report the receipt of a letter, dated June 30, 1904, from the General Administrator of the International Exhibition held in Paris in 1903, forwarding diploma awarded to the Council for its exhibits of photographs and drawings of working-class dwellings. The Architect of the Council has been awarded a similar diploma.”

Schools.—The Education Committee recommended, and it was agreed, that the clerk of the Council be authorised to sign on behalf of the Council the contracts with the undermentioned firms at the amounts of their respective tenders for carrying out the following works:—

Electoral Division.	Name of School.	Contractor and Amount of Tender.	Description of Work included in Plans.
<i>New Schools:</i> Lewisham	Gordonbrook-street	Mr. W. Downs, £22,363	Three separate one-story buildings providing accommodation for 999 children, also cookery and laundry centre.
Rotherhithe	Magdalen-street	Messrs. Spencer, Santos, & Co., Ltd.	One-story school for 372 junior mixed and infants (to take the place of the existing school).
<i>Enlargement, etc.:</i> Lewisham	Sydenham Hill-road	Messrs. J. & C. Bowyer, £10,357	Net addition of 94 places, new halls (boys' and girls' departments), combined cookery and laundry centre, enclosing, etc., additional land.
<i>Improvements:</i> N. Hackney	High-street, Stoke Newington	Messrs. J. Chessum & Sons, £5,133	New halls for all departments, redividing, restrepping, and relighting existing classrooms in each department, etc.
Haggerston	Shap-street	Messrs. J. Chessum & Sons, £11,651	Halls for all departments, redividing, restrepping, and relighting existing classrooms, staircases, and cloak-rooms, lavatories, teachers' rooms, drawing class and science rooms, etc.

That application be made to the Board of Education for approval to the finished plans of the following special schools, centres, etc.:—

Electoral Division.	Name of School.	Names of Contractors.	Description of Work included in Plans.
Battersea	Basnett-road	On schedule of Messrs. Garrett & Son, contractors, for the physically defective school. Estimate, £3,852	Separate school for 40 older men ally defective boys, together with a manual room; and also a manual training centre for 30 boys.
Chelsea	Middle-row	On schedule of Mr. E. Triggs, for junior mixed school. Estimate, £947	Manual training centre for 40 boys.
Wandsworth	Ensham-street	On schedule of Messrs. Lorden & Son, contractors, for new school. Estimate, £473	Enlargement of manual training centre so as to accommodate 40 boys.
Lewisham	Plassy-road	On schedule of Messrs. J. & C. Bowyer. Estimate, £533	Enlargement of mentally defective school by one classroom for 20.

Science and Drawing Classrooms.—A report was submitted stating that the Committee had had under consideration the question of the provision of science and drawing classrooms in ordinary public elementary London County Council schools, together with a suggestion of the Board of Education that the Council should consider whether science-rooms and drawing classrooms should form part of the equipment of a public elementary school. The Committee recommended that the Board of Education be informed that the Council considered the provision of such rooms to be necessary for the educational efficiency of public elementary schools.

Mr. Leon moved that the report be referred back. He doubted the necessity for every school having such rooms.

Mr. Thompson seconded the amendment, and said that in half the schools in London they had not got these special science-rooms, and if they passed the resolution they might be called upon to provide the accommodation.

Mr. Graham Wallis pointed out that the Board of Education had hung up several plans pending the decision of the Council as to whether they considered the provision of such rooms desirable.

The amendment was defeated and the recommendation carried.

Proposed Woolwich Tunnel.—The Bridges Committee again brought up a recommenda-

tion to the effect that the Standing Orders should be suspended to enable the Council to take the necessary steps for promoting legislation in the next session for powers to construct a footway tunnel to connect North and South Woolwich. The estimated cost of the tunnel was 145,000*l.*, the annual charge for interest and repayment on the outlay being 7,530*l.*, and the annual cost of maintenance 2,500*l.*

Mr. Torrance, in speaking against the scheme, urged that the proposal should not be considered until the boroughs of West Ham and East Ham promised to make a substantial contribution towards the cost.

After some discussion, the Council decided, on a division, not to suspend the standing orders by 71 votes to 39.

The scheme, therefore, fell through.

Tramway Receipts.—Mr. Allen Baker, the Chairman of the Highways Committee, in reply to Mr. Hubbard, stated that to realise the committee's estimates of receipts from the electric trams they would require an addition to the income of last year of 66,788*l.* Of that sum in the last three and a half months they had received 32,170*l.* That looked hopeful

Arbitration: Tottenham Court-road at Bozier's court.—The Improvements Committee reported as follows:—“We have to report that Mr. B. T'Anson Breach, the surveyor appointed by the Local Government Board to make the award upon the final assessment of the property upon which the Council has power to levy an improvement charge in connexion with the widening of Tottenham Court-road at Bozier's court, has now issued his award. The premises affected are the houses, shops, etc., Nos. 1A and 2 to 5, Tottenham Court-road, Tottenham-chambers, No. 4, Oxford-street, and the entrance to the Oxford Music Hall, Tottenham Court-road. The award determines that the value of all the property in question is substantially and permanently increased by the improvement, and that the enhanced value, after making all fair and proper deductions for rates, taxes, assessment, and impositions on the lands according to such increased value, is 18,996*l.* The Council is entitled to a payment from the owners of the property at the rate of 3 per cent. per annum upon one-half of this sum, which amounts to a charge of 285*l.* 10*s.* per annum. The owners have the right to redeem the charge upon payment of a sum equal to thirty-three times the amount of the charge. We have given instructions for the necessary steps to be taken to give effect to the award, and we report the facts for the information of the Council.”

Cardinal Wolsey's Palace.—Mr. Piggott inquired of the Chairman of the Local Government Committee whether anything was likely to be done with regard to Wolsey's Palace, otherwise known as the “Barber's Shop,” in Fleet-street, and when it was likely that the public would be permitted to see the ceiling. The existing state of the building was a disgrace, and he did not think there was anything like it elsewhere in the City.

Mr. Johnson, in reply, said unfortunately a dispute had arisen between the City Corporation and the Benchers of the Middle Temple. The sub-soil rights were claimed by the Corporation, and that claim was disputed by the Benchers. He regretted to say that he could hold out no hope of any immediate settlement of the dispute.

New City Fire Station.—On the recommendation of the Fire Brigade Committee it was decided that during the summer recess the solicitor should serve notices to treat for the acquisition of the remaining interests of four houses in Cannon-street and Queen Victoria-street, the site selected for the building of a new City Fire Station, in substitution of the Watling-street station.

Churches and Paving Charges.—The Local Government Committee brought up a report on the subject of securing an amendment of the law so as to remove the anomaly which arises from the fact that whereas places of worship of the Established Church are exempt from contributing towards the cost of paving new streets on which they abut, Nonconformist places of worship are liable to contribute in the same way as other property.

After a short discussion it was decided that the Local Government Board should be approached with the object of obtaining such amendment of the law as will make places of worship now exempt from such charges subject to them.

George Eliot's House.—The Local Government Committee recommended that in connexion with the work of indicating houses of historic interest in London the residence of George Eliot at Holly Lodge, Wimbledon Park-road, Wandsworth, should be commemorated by a memorial tablet. The facts connected with the house have been verified, and the necessary consent obtained to the fixing of the tablet.

The recommendation was adopted.

The Building Act Committee reported as follows, the recommendation being agreed to:—

District Surveyor for St. James, Westminster.—“We regret to have to report that the health of Professor Robert Kerr, District Surveyor for St. James, Westminster, is such as to incapacitate him from attending to any business. Professor Kerr is eighty-one years of age, and has been district surveyor for forty-two years, during the last twenty-one months of which it has been necessary to appoint a deputy district surveyor, owing to Professor Kerr being too ill to discharge the duties of the office. Professor Kerr's duties as district surveyor have always been performed to the satisfaction of the Council, but his health has now completely broken down. In the circumstances, and as it is impossible for Professor Kerr to tender his resignation of the office of district

surveyor owing to his being too ill to write, there is no alternative but for us to ask the Council to terminate the appointment. We have extended the appointment of Mr. H. N. Kerr, who has been acting as deputy district surveyor since November 9, 1902, until November 9, 1904, and we recommend that the appointment of Professor Robert Kerr, as district surveyor for St. James, Westminster, be terminated as from November 9, 1904."

Proposed Erection of a Shelter at the Cadogan Hotel, Sloane-street.—They also recommended, and it was agreed, that Messrs. Maple and Company, Limited, be informed that the Council is not prepared to favourably consider any application for consent to the erection of a shelter upon the Sloane-street frontage of the Cadogan Hotel, Sloane-street.

The Council soon after adjourned.

APPLICATIONS UNDER THE 1894 BUILDING ACT.

The London County Council at their meeting on Tuesday dealt with the following applications under the London Building Act, 1894. The names of applicants are given between parentheses:—

Lines of Frontage and Projections.

Brixton.—Dwelling-houses with bay-windows and porches on the eastern and western sides of Athelford-street and northern side of Landor-road, Brixton (Mr. W. P. Goosey).—Consent.

Hammersmith.—A one-story shop on the forecourt of No. 230, Uxbridge-road, Hammersmith (Messrs. Macintosh and Newman for Mr. G. E. Jones).—Consent.

Holborn.—The erection of the Council's Central School of Arts and Crafts and London Day Training College upon a site abutting upon Southampton-row, Orange-street, and Fisher-street (Mr. P. N. Ginham for the Education Committee of the Council).—Consent.

Islington, North.—Two houses upon a site abutting upon the northern side of Anson-road and eastern side of Dalmeny-road, Islington (Mr. A. D. Watson for Lieut.-Colonel E. Tufnell, M.P.).—Consent.

Kensington, North.—A porch at the Congregational church on the south side of Lancaster-road, Kensington, eastward of Basing-road (Mr. W. Theobalds).—Consent.

Kensington, North.—An iron and glass covered way in front of No. 2, Pembroke-square, Kensington (Mr. G. N. Watts for Mr. E. Jacobs).—Consent.

Kensington, South.—An iron and glass covered way in front of No. 43, Phillimore-gardens, Kensington (Messrs. A. E. Hughes and Son for Mr. H. E. Walters).—Consent.

Hackney, Central.—An oriel window at No. 222, Mare-street, Hackney (Messrs. Holman and Goodham for the Royal London Friendly Society).—Consent.

St. Pancras, East.—Balconies and an external staircase at the eastern end of the Midland Grand Hotel, St. Pancras (Mr. C. Trubshaw for the Midland Railway Company).—Consent.

St. Pancras.—An external staircase at the south-western end of the Midland Grand Hotel, St. Pancras (Mr. C. Trubshaw for the Midland Railway Company).—Refused.

Brixton.—A projecting show case in front of the railway abutment between Nos. 456 and 462, Brixton-road, Brixton (Mrs. J. May for Mr. A. G. Clark, trading as J. Dent).—Refused.

Islington, West.—Buildings upon the site of Loraine-place, Holloway-road, Islington (Messrs. Burne and Wykes for Sir John Dickson Poynder).—Refused.

Wandsworth.—Fifteen houses with bay-windows on the east side of Mayford-road, Wandsworth-common, northward of Ravenslea-road, Wandsworth (Mr. H. Bignold for Mr. W. E. Korven).—Refused.

Islington, East.—A warehouse building at the rear of No. 32, Newington-green, Islington, to abut upon Mathias-road (Mr. J. H. Storrar for Mr. C. Fell).—Refused.

Islington, North.—A building abutting upon Windermere-road, Holloway-road, Islington (Mr. J. W. Stevens for Messrs. Knowlman Brothers).—Refused.

Width of Way.

Finsbury, East.—Buildings on the site of Nos. 3, 5, 7, 9, and 11, Westmoreland-place, City-road, Shoreditch, with external walls at less than the prescribed distance from the centre of the roadway of the street (Mr. E. Hasehurst for Messrs. Perry Brothers).—Consent.

Rotherhithe.—A two-story dwelling-house on the site of No. 3, Cornick-street, Southwark-park-road, Rotherhithe, with external walls at less than the prescribed distance from the centre of the roadway of the street (Mr. W. J. Dixon).—Consent.

Rotherhithe.—That the application of Messrs. F. Chambers and Son for an extension of the periods within which the erection of a one-story building on the north side of Gibbon's-rents, Bermondsey, was required to be commenced and completed, be granted.—Agreed.

Woolwich.—A building at the Woolwich cemetery, King's-highway, Plumstead-common, with the forecourt fence at less than the prescribed distance from the centre of the roadway of King's-highway (Mr. F. Sumner for the Council of the Metropolitan Borough of Woolwich).—Consent.

Lines of Frontage and Construction.

Lewisham.—A building on a site on the northern side of Ravensbourne-park and western side of Catford Bridge, Lewisham (Messrs. Hatch and Hatch).—Consent.

Lewisham.—The retention of a wood and iron building at the rear of No. 39, Silvermere-road, Catford, abutting upon Holbeach-road (Mr. W. G. Robson).—Refused.

Islington, North.—Additions and the carrying out of alterations to a wood and iron chapel of a temporary character on the west side of Horsey-road, Islington (Mr. A. Goodchild for the representatives of the Horsey-road Baptist Chapel).—Consent.

Width of Way and Line of Frontage.

Chelsea.—A cloak-room addition to No. 125, Sloane-street, Chelsea, to abut upon Cadogan-terrace (Mr. R. G. Hammond for Mr. F. C. B. Clark).—Consent.

Hackney, North.—A cellar under the forecourt of "Grafton House," Church-street, Stoke Newington (Mr. H. Kennington for Mr. A. Benning).—Consent.

Lewisham.—Three houses, with one-story shops in front, upon the site of No. 63, Dartmouth-road, Forest-hill, Lewisham, with the external walls of the southernmost building at less than the prescribed distance from the centre of the roadway of Dartmouth-place (Mr. E. C. Christmas).—Refused.

Width of Way and Space at Rear.

Whitechapel.—A building next No. 3, Alie-place, Whitechapel (Messrs. J. Hood and Sons for Mr. M. Specterman).—Consent.

Woolwich.—Two houses on the eastern side of Graydon-street, Plumstead-common-road, Woolwich (Mr. C. H. Bidge).—Refused.

Formation of Streets.

Hammersmith.—That an order be issued to Mr. W. J. Ingram sanctioning the formation or laying out of new streets for carriage traffic in continuation of Heath-place, Uxbridge-road, Hammersmith (for Messrs. Griggs Brothers).—Consent.

Lewisham.—That the time within which the new street, to be named Bourneville-road, out of the east side of Ravensbourne-park, Catford, was required to be defined throughout by posts and rails, and thrown open to the public as a highway, be extended to three years from January 21, 1902.—Agreed.

Deviation from Certified Plans.

Brixton.—Deviations from the plan certified by the District Surveyor, under sections 13 and 43 of the Act, so far as relates to the proposed re-building of Nos. 44 and 46, Robarts-street, Brixton, abutting also upon Ingelborough-street (Mr. H. Bignold for Mr. W. Slade).—Consent.

Strand.—Deviations from the plans certified by the District Surveyor, under section 43 of the Act, so far as relates to the proposed re-building of Nos. 118 and 120, Wardour-street, Strand (Mr. W. Woodward for Mr. J. Newell).—Consent.

Height of Buildings.

Holborn.—Buildings on the eastern side of Kean-street, Burry-lane, Holborn, Catford, was required to be defined throughout by posts and rails, and thrown open to the public as a highway, be extended to three years from January 21, 1902.—Agreed.

Buildings for the Supply of Electricity.
Bow and Bromley.—A temporary annexe to the engine-room of the electricity generating station on a site at the corner of Glaucois-street and Yeo-street, Bromley (Mr. P. N. Hooper for Poplar Borough Council).—Consent.

Alteration to Buildings.

Battersea.—Alterations to premises on the north side of Green-lane, Battersea (Mr. F. Bannister for the Committee of the Battersea Liberal Club).—Refused.

Hackney, South.—An addition at the rear of "Nursery House," Millfields-road (Mr. G. W. Evles for Mr. G. Porter).—Refused.

Means of Escape at Top of High Buildings.

Kensington, South.—A deviation from the plans approved in respect of the means of escape in case of fire proposed to be provided in pursuance of section 55 of the Act, on the fifth and sixth floors of a building in course of erection on the north side of High-street, Kensington, at the corner of Brown's-buildings, so far as relates to the formation, at the ground level, of three window openings,

measuring 4 ft. by 3 ft. 3 in. each, in the wall separating the shop from the passage leading from the foot of the escape staircase to Clarence-mews (Mr. P. E. Pilditch).—Consent.

The recommendations marked + are contrary to the views of the local authority.

OLD EDINBURGH: THE SECRET OF ITS CHARM.

On the 13th inst. Professor Baldwin Brown delivered at St. Cuthbert's Hall, Edinburgh, a lecture on "Old Edinburgh; the Secret of its Charm, and How to Preserve it." He began by explaining that he did not intend to speak of the Edinburgh of world-famous monuments, such as the Castle or Holyrood or St. Giles', but rather of the Edinburgh of the smaller picturesque features, which singly were of minor importance, though in combination they imparted to the streets their special physiognomy. By these were meant the divisions and grouping of the masses of the older houses and their rugged masonry, the frequent gables, the dormer windows, with their carved finials, the timber projections, the rough stone slating, the harling, the moulded doorways and inscribed lintels, all of which helped to impart such a pleasant old-world aspect to the more ancient thoroughfares. The secret of the charm of Edinburgh resided partly in the natural features of the site, and partly in the general architecture, the treatment of the site, with the effective contrast between the classic regularity of the New Town and the picturesque confusion of the crowded and towering "lands" of the Old. It was the latter features that formed the main subject of the lecture. These older architectural relics, with the historical associations which gathered round them, were among the attractions of Edinburgh which intelligent strangers found of special interest. They were in this sense civic assets that had really a commercial as well as an artistic and historical value. Their preservation was, from all points of view, a matter of importance, for it must be remembered that they were a class of possessions which, when once destroyed, could never again be restored. The question how to deal with the older parts of the city, so as to retain as far as practicable its ancient charm, was one requiring serious attention. In all large towns there were improvement schemes in progress, and these were commonly preceded by wholesale clearances. In most towns the older property thus eliminated had no value, and was often already in a tumble-down condition. In Edinburgh, on the contrary, the older houses, dating from the XVth and XVIIIth centuries, were, as a general rule, solid stone structures, many of which might stand for centuries, and they possessed the artistic and historical value already referred to. For their preservation it was worth while taking a good deal of trouble, and even facing some immediate outlay, which, if Edinburgh retained all her attractions to visitors, would soon be repaid. It was a matter for congratulation that a policy of wise conservation was now in the ascendant in that department of municipal government which had this matter in charge. The old "lands" might have to be gutted and their interior spaces redistributed, but the matter of importance for the charm of Old Edinburgh was the judicious reparation and preservation of the external fabric. Some excellent instances of the carrying out of this policy would be afterwards shown on the screen. It might be hoped that this would be the established policy for the future, both on the part of the city and on the part of corporate bodies and private individuals who were holders of property in the older parts of the town. Whether or not the civic authorities should be armed with certain powers in respect to private property of artistic and historical value was a further question on which it was not possible then to enter. Abroad, in old cities of the class of Edinburgh, such powers were being sought and acquired, and though in Great Britain there was at the moment nothing of the kind, Edinburgh might well take the lead, as she had done on previous occasions, in making the needed application to Parliament. They were fortunate indeed who yielded to no one in his affection for his native town, and who was sincerely anxious that she should continue to attract from all parts of the world the lovers of beauty and romance, both in nature and art. They were really now at the parting of the ways. Enough remained of the ancient heritage of the town to make the term "Old Edinburgh" still a word to conjure with, but if much more were allowed needlessly to perish, the town was in danger of becoming hopelessly modernised. The matter was ultimately in the hands of the citizens at large, and it was for them to determine how

best to deal with the heritage that had descended to them from the past. He was not a fanatic on the subject of preservation; all they wanted was that they should preserve everything that could possibly and reasonably be preserved.

There were then thrown upon the screen a number of photographs illustrating both the grander and the more homely features of the older Edinburgh architecture, and, in conclusion, it was pointed out that, though more than eighty views had been shown, no one of the more famous monuments of the city had been included in the survey. The minor or secondary features of Old Edinburgh had proved sufficient in themselves to fill the time allotted. This gave an idea of the richness of interest which the city was able to provide.

Scotsman.

WESTMINSTER CITY COUNCIL.

The usual fortnightly meeting of the Westminster City Council was held on Thursday last week at the City Hall, Charing Cross-road.

Piccadilly Improvement.—The Mayor called attention to an error in the return of votes recorded in a division on a report of the Improvement Committee dealing with the widening of Piccadilly between St. James's street and Duke-street. The motion before the last meeting was that the Council should agree to give a sum, not exceeding 8,000Z., towards the improvement. From the counting it appeared that the matter was referred back, but this was wrong. The Mayor put the resolution again to the meeting, and it was carried.

Louisa. It was agreed to make application to the London County Council to borrow 1,146Z. for sewer works in Bond-street, Park-lane, Regent-street, and Trafalgar-square.

Gift of Pictures.—On the recommendation of the General Purposes Committee, it was agreed to accept four prints of Westminster views, and an etching of the old bridge, Putney, the gift of Coun. illor Burch.

Improved Lighting of Parliament-square.—It was decided to enter into an arrangement with the Gas Light and Coke Company for the erection and maintenance of eight lamps in Parliament-square, on the same terms and conditions as attach to the contract recently entered into by them for the lighting of Aldwych. The globular lamps, in clusters of five, on the railings of the enclosed gardens in the centre of the square, will not be affected by the proposed arrangement.

Sewers.—Sanction was given to the City Engineer to renew part of the Kinnerton-street sewer. The Works Committee submitted a report dealing with the question of the proposed construction of a new sewer along Ruidland-street, and it was agreed to authorise such sewer, subject to the London County Council agreeing to leave the question as to who is liable to bear the cost to be settled hereafter. Further, it was resolved that the County Council be invited to agree to state a case to the City Council, for submission to the High Court for their decision, whether the City Council or the County Council are liable to bear the cost of constructing the sewer. The engineer's estimate of the cost of the sewer is 2,600Z.

Wood Paving.—The Works Committee reported having come to the decision that the work of repairing the wood carriageways of Chancery-lane, Sackville-street, Shaftesbury-avenue, Wardour-street, and Hobart-place could be more economically executed under contract than by the Council's own staff, and having had tenders from Messrs. W. Griffiths and Co., the Improved Wood Pavement Company, and Messrs. Mowlem before them, recommended that the offer of the Improved Wood Pavement Company be accepted. This was agreed to.

Closing of Thoroughfares.—On condition that Mr. C. E. Mallow gives a portion of land in Vardon-street to enable that thoroughfare to be widened, it was agreed to allow Horse-shoe-alley to be stopped up. It was also decided to allow Messrs. Hampton and Sons, Ltd., to close Monmouth-court, Whitcomb-street, on their agreeing to pay 50 guineas, and in future to treat the sewer in the court as a private drain.

Widening of Chandos-street.—The Improvements Committee again reported on the question of widening Chandos-street, in connexion with the Mayor's Building Improvement scheme.—The cost of widening Chandos-street in the north side from Bedfordbury to St. Martin's-lane, and the partial improvement of the two latter thoroughfares, is estimated by the Valuation Surveyor at 187,000Z., while the cost of widening this thoroughfare from No. 40 eastwards as far as Bedfordbury, is estimated at 73,000Z., which latter estimate is considered might be reduced to 60,000Z. if the owners, etc., of the "Marquis of Granby" public-house would consent to be reinstated on part of No. 1, Bedfordbury (his estimate in-

cludes the value of the portion of No. 1, Bedfordbury, which would be so utilised). At the present moment the Committee were disposed to favour the adoption only of the proposal to widen from No. 40 eastwards to Bedfordbury, providing that the County Council would undertake the improvement, to which the City Council would contribute, and they were communicating with the County Council on this matter. Besides relieving the Strand and general traffic from east to west, and *vice versa*, the improvement would, it was anticipated, facilitate the heavy traffic to and from Covent Garden Market, and the Committee, accordingly, propose to communicate with the Trustees of the Bedford Estate for the purpose of ascertaining whether they will be disposed to contribute towards the cost of the proposed improvement. The report was received.

House-Breaking Operations.—On the recommendation of the Law and Parliamentary Committee, it was agreed that a communication be addressed to the London County Council suggesting that further powers are urgently needed for dealing with nuisances arising from the demolition of buildings in the metropolis, and asking them to include a provision in their next General Powers Bill for dealing with the question.

COURT OF COMMON COUNCIL.

The usual fortnightly Court of Common Council was held at the Cuildhall, E.C., on Thursday last week.

Street Improvements.—The Improvements and Finance Committee submitted a report dealing with the widening of Skinner-street and Mansell-street. It was agreed, on the recommendation of the Committee, to acquire premises at the eastern end of Skinner-street, for the purpose of the widening, for the sum of 6,150Z.

A recommendation that an arrangement be made for the removal of the buildings over the entrances at either end of Duke's Head-passage was referred back for further consideration.

It was agreed to pay the sum of 1,401Z. for the portion of the site of St. George's Church, Botolph-lane, needed to widen the public ways of Botolph-lane and George-lane, Billingsgate.

Illustrations.

SCULPTURE, MUNICIPAL BUILDINGS, CREWE.

THE illustration shows the sculpture executed by Mr. F. E. E. Schenck for the decoration of the new municipal buildings at Crewe, of which Mr. H. T. Hare is the architect.

The idea of the sculpture was to illustrate or symbolise the Industries of the County of Cheshire. The signification of each of the separate figures is given on the plate.

The panels, which are divided by large columns, are carved in Coxbench stone. The scale of the figures is 10 ft.

ST. BARTHOLOMEW'S HOSPITAL.—NEW OUTPATIENTS' DEPARTMENT.

This building will contain the casualty and outpatients' department, the special departments, the dispensary, the resident medical officers' quarters, etc.

It will have a frontage to Giltspur-street of about 144 ft., faced with stone, and designed to harmonise in style with the other buildings of the hospital.

The resident medical officers' quarters will be in the front, and in the rear of them will be the outpatients' waiting hall, 140 ft. long and 45 ft. wide, and capable of seating 850 people.

Surrounding this waiting hall there will be twenty rooms, to be used by the house physicians, house surgeons, and others who will attend to the casualty patients, a dental room, two operation-rooms, rooms for the sister, nurses, etc. Rooms will be provided for the reception of accident and other emergency cases.

A large dispensary will be provided at the south-east angle of the block, with separate entrances and exit for the patients.

On the first floor will be rooms for the treatment of medical and surgical outpatients; and on the second and third floors will be the throat, ophthalmic, aural, diseases of women, skin, dental, electrical, and orthopedic outpatients' departments.

On the fourth floor will be a clinical lecture theatre, and provision will be made in the basement for baths, isolation-rooms, etc.

The architect is Mr. E. B. Anson.

GRAMMAR SCHOOL, NEWCASTLE-ON-TYNE.

We give illustrations of the design by Messrs. Russell and Cooper, which has been selected for the new Royal Grammar School, at Newcastle-on-Tyne.

The following extracts from the report sent in with the drawings will explain the architects' intentions in the design:—

"The school is disposed on the site to insure as large and uninterrupted a playing area as possible. An alternative block plan is submitted showing the main school block placed south of the sewer (a, b) in case the Governors should not approve of the main building being placed hard to the boundary in Lambton-road. The school is planned in as compact a manner as possible with a minimum of corridor, the majority of the class-rooms having a southern aspect and the remainder facing east and west. The art-room is incorporated with the main school building, and has a north light. It is on the ground floor of the assembly hall, and is placed in this position so that it will be easily accessible for all the boys in the school. If placed in conjunction with the science school it would necessitate the youngest boys using that school for this purpose only.

The Changing Rooms, Lavatories, and Latrines.—The Changing Rooms, Lavatories, and Latrines are grouped together in two blocks for seniors and juniors external to the school, so that they may be accessible to the boys when the school itself is shut. The lockers are ranged round the changing-rooms in two tiers.

The Masters' Lavatories, &c., are arranged in connexion with the juniors' block, and a changing-room is provided for their use. Two shower-baths are provided in each changing-room.

Future Extensions.—The parts required for the completion of the school are planned in such a manner that they can be carried out without interfering with the working of the school, and when executed would preserve the balance of the scheme. It will be noted that the method of designing the extension leaves unimpaired the appearance of the part of the school to be executed at present when viewed from Lambton-road. To obtain access to the four future class-rooms in the main school, short corridors would be formed across the present locker-rooms, and these could be turned into cloak-rooms.

Design.—The buildings are designed in a simple manner with Renaissance feeling, carrying on the accepted traditional type of the English grammar school.

Materials and Construction.—The walls are to be carried up in brick, with selected red brick facings and Prudham stone dressings. The roofs to be covered with green slates on boarding and felt. All floors to be of fire-resisting construction, with wood block flooring in hall and class-rooms. The entrances, staircases, corridors, class-rooms, and latrines to have glazed brick dados. The joinery to be in yellow deal.

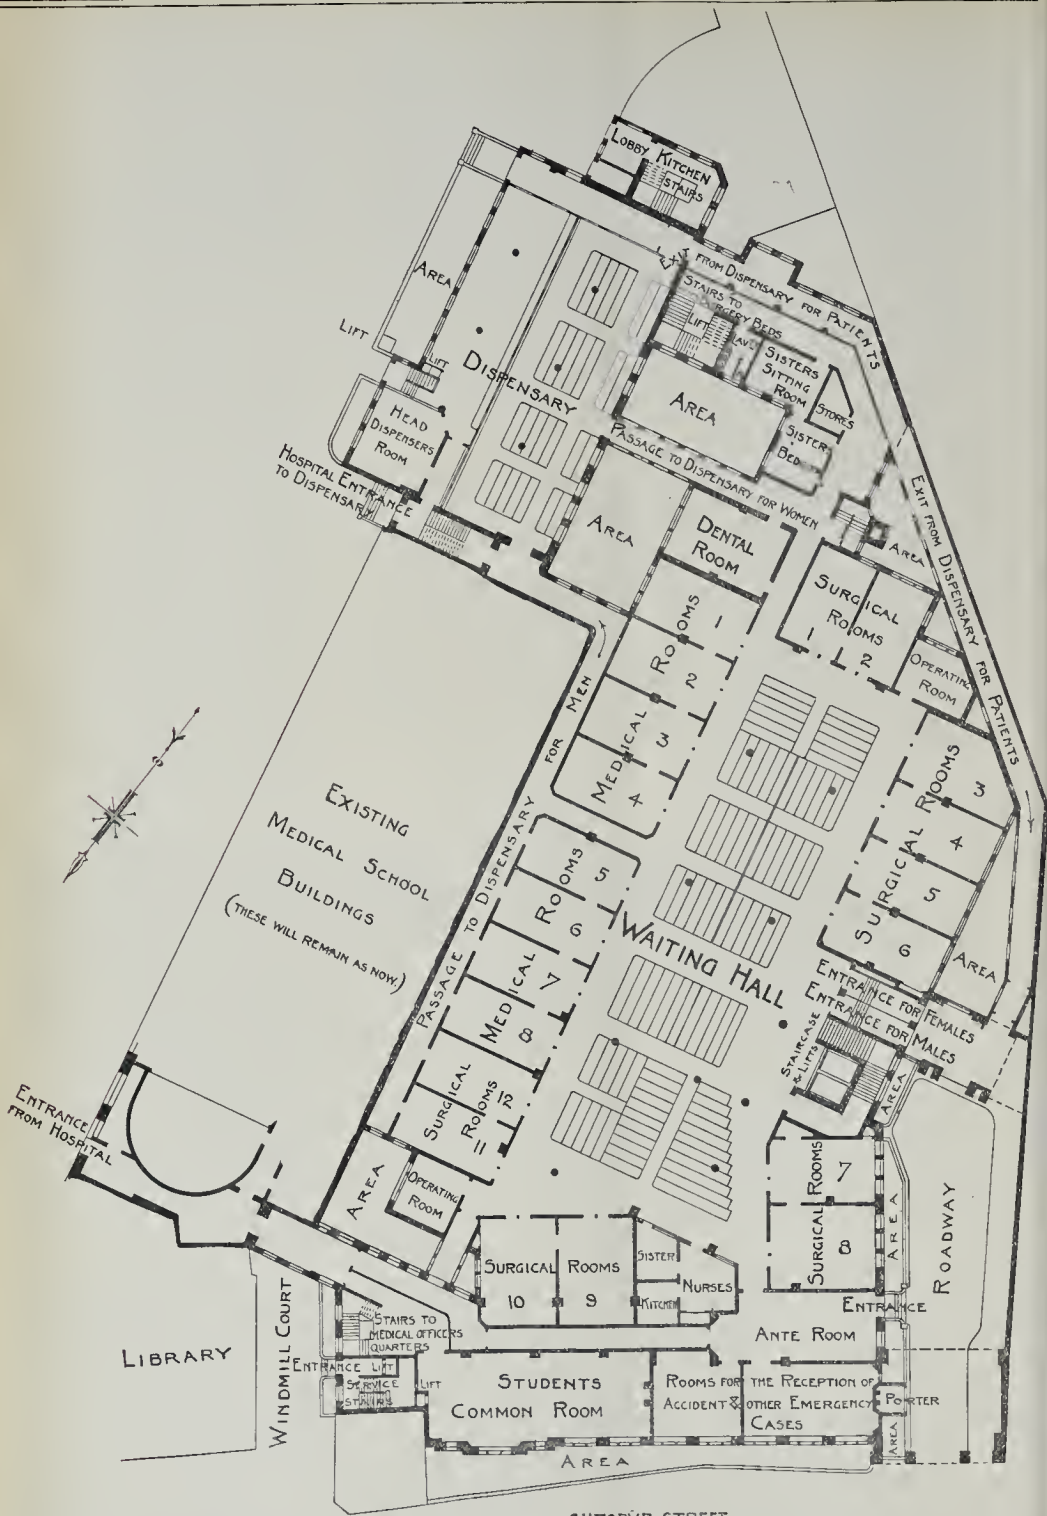

The heating to be carried out on the low-pressure hot water circulation system, with central boiler and cast-iron main, carried either way in subway under corridor and covered way. From these mains service pipes are to be carried to serve the radiators in class-rooms, gymnasium, changing-rooms, and lavatories.

The central hall to be heated by rows of cast-iron pipes underneath the lockers ranged round the walls. A row of pipes to be placed also along the front of galleries to counteract any down draught. Each radiator to be fitted with a proper ventilating base. Extraction flues with gratings, with silk flaps, fixed near the ceiling level to be carried up in the inside walls of the building and collected in the main duct over corridor, and the foul air to be discharged by means of electric fans. The fans and flues to be arranged to effect a change of air six times in the hour in each room. Extraction to be provided through each of the fume chambers in the chemical laboratory and to be connected to separate fan."

COMPETITIONS.

MUNICIPAL OFFICES, SMETHWICK.—In a recent competition for new municipal buildings for Smethwick, to be erected on a site adjoining the entrance of Victoria Park, plans were invited from five architects in the Midlands, and Mr. T. E. Colcutt, of London, was appointed assessor. A special meeting of the Town Council was held on the 11th inst., when it was found that the assessor recommended the acceptance of the No. 2 plans. The sealed envelopes were opened, and it was found that these were the plans of Mr. F. J. Gill, a local architect. The Mayor then proposed that the plans be accepted. Alderman Cheshire seconded, and the resolution was carried.

ETON WAR MEMORIAL COMPETITION.—The assessor, Mr. Norman Shaw, has awarded the premiums in this competition as follows:—First premium, Mr. L. K. Hall, 24, St. James's-street, S.W.; second premium, Mr. Francis Mount (Messrs. Eden and Mount), 3, Staple-inn,

LONG Eaton FREE LIBRARY.—Premiums of £25., £15., and £10. were offered in this competition for the best plans and designs, the competition being confined to architects residing in the town. There were five sets of plans sent in, and the awards were given as follows:—First, Messrs. German and Ross; second, Mr. Reginald Smith; third, Mr. W. H. Woods.

BOOKS RECEIVED.

SEA COAST EROSION AND REMEDIAL WORKS. By R. G. Allanson-Winn, M.Inst.C.E. (The St. Bride's Press. 1s.)

BAYEUX: ITS CATHEDRAL AND CHURCHES. By the Rev. R. S. Mylne. (Geo. Bell and Sons. 2s. 6d.)

THE PLANNING OF POOR LAW BUILDINGS AND MORTUARIES. By Albert C. Freeman, architect. (The St. Bride's Press. 7s. 6d.)

TRADE CATALOGUES.

THE Campbell Gas Engine Co., of Halifax, send us their catalogue of "Little Samson" oil engines and "Little Samson" pumping plants. Each type of machine is made in accordance with the standard methods of design and construction adopted by this firm, and the prices appear to be particularly reasonable for the duties quoted.

We have received from the Linolite Co., of Victoria-street, Westminster, a printed copy of a report on the photometry of linolite by Mr. J. S. Dow, of the Central Technical College. Very exhaustive photometric tests were made on this type of straight filament lamp both with and without reflectors. It was found that with a polished aluminium reflector the mean spherical candle-power was highest, a white enamelled reflector came next, and a nickelled copper reflector was a good deal worse than the others. The light thrown forwards over an angle of 70 deg. was practically double of the light that would have been obtained without a reflector. The reflector therefore seems to fulfil its functions in a very satisfactory manner. The report says nothing about the efficiency or the life of these novel lamps.

We have received from the Edison and Swan Electric Light Co. Limited, of Queen-street, London, Section X. of their catalogue. All kinds of telephones and their accessories are described in this section. The private house telephones, called "parlyphones" in this catalogue, deserve to be more widely known. They can be attached at once to an ordinary electric bell circuit, and no extra wires or batteries are required when it is only necessary to ring up from one end. When it is desired to be able to make calls from either end an electric bell mounted on a wooden box containing a dry cell is also provided. Numerous standard forms of magneto-telephones, etc., constructed according to stringent specifications, are described and illustrated. The automatic inter-communication telephones should prove useful in large warehouses.

From Messrs. J. M. Henderson and Co., of Aberdeen we have received a catalogue of patent compensating derrick cranes, including particulars of the Mitchell-Williams rapid luffing gear. Some of the various advantages claimed for this patent gear are that the load is kept perfectly level while the jib is being luffed; that the jib will remain at any angle, with or without the load, without brakes or locking gear; and that the power required for luffing, which it is claimed is from one-fourth to one-tenth of that usually required, is the same for all loads. This gear should be very useful in loading and unloading contractor's materials, and especially in securing the rapid handling of goods in confined spaces.

Messrs. John Mullin and Co. (West Bromwich) have sent us a specimen piece of their fire-resisting curtain material for theatres, called the "Ajax Uralite Fireproof Curtain." With it is enclosed a note from Mr. A. R. Tozer, chief officer of the Birmingham Fire Brigade, to the effect that a piece of this curtain was subjected for three minutes to the flame of a brazier's blow-pipe, at a heat sufficient to melt brass in 45 seconds, and that the result was "most satisfactory." The framework of the curtain is of 2 in. angle iron, with stiffening pieces across the centre in each way. The whole area of the curtain is covered with thin layers of uralite, so arranged that all joints are broken in bond, and firmly riveted together. In

addition to this, each sheet, 6 ft. by 3 ft., is, when ready for fixing in position, thickly coated with a special composition which makes them adhere together, so that when completed and allowed to set hard the whole fabric is as one sheet of uralite, $\frac{3}{4}$ in. thick, stiffened by steel framework. The curtain is raised by the agency of a small electric motor, and rises as soon as the current is switched on. It is lowered by raising a lever which can be worked from the flies, or the stage, or any other point within 100 yds.

The Saxon Portland Cement Co., of Cambridge, have sent us a pamphlet giving an account of their process of making cement, together with a short description of their works. The book contains useful data relative to cement tests generally, as well as to tests made by various experts on the Saxon cement. The average results of tests made at the County Laboratory, Cambridge, shows the main characteristics of the Saxon brand cement to be as follows:—Tensile strength, four days, 400 lb. per sq. in.; tensile strength, seven days, 620 lb. per sq. in.; tensile strength, twenty-eight days, 780 lb. per sq. in.; fineness, 3 per cent. residue, 75 by 75 sieve; sp. gravity, 3.14; steam test, thoroughly sound; contraction or expansion, nil.

The Abner Doble Company, of San Francisco, send us their catalogue containing particulars of the Dohle tangential ellipsoidal water-wheels, and of the various parts used in their construction. One illustration shows a water-wheel of this type, 10 ft. 5 in. diameter, and weighing over 10,000 lbs. Under 1,531 ft. head, two wheels of this size are driving two 2,000 kw. generators at the de Sable Power House of the California Gas and Electric Corporation. Illustrations and brief descriptions are also given of a 1,300 horse-power Doble wheel at the works of the Edison Electric Company, Los Angeles, as well as of the wheel buckets, needle regulating nozzles, housing, bearings, and small water motors for laboratory and other purposes.

Messrs. J. Sagar and Co., of Halifax, send us an eight-page illustrated descriptive of their surface planing, thickening, and moulding machine, with hand or roller feed. Several sizes of this machine are illustrated, and the chief details are fully described, as well as the safety guard made by the same firm.

We have received from the General Electric Company, of Queen Victoria-street, London, the ninth edition of their telephone catalogue. It is thoroughly up to date, and many novelties are illustrated and described. The loud-speaking navy telephones described are new to us, and appear to be well adapted for their purpose. Special telephones, suitable for rifle ranges, electric tramways, and fire-alarm systems, are listed, and we notice that slight alterations have been made in some of the older forms of apparatus. We were interested in the lightning protectors and arresters for telephone lines. Some of them are novel, and should prove effective. There are many things that are worth studying in this catalogue, and everyone interested in telephony should write for one.

The General Electric Company has also sent us the eleventh edition of their switch and fuse board catalogue, which contains also lists of the Robertson glow-lamps and of Nemst lamps. In addition to the usual electrical sundries, water-tight switches are illustrated, including the Admiralty pattern switches and distribution boxes. We have noticed that in some cases reductions in price have been made.

We have received from the Electric and Ordnance Accessories Co. Ltd., of the Stellite Works, Birmingham, a catalogue of the Stellite short-distance telephones and a leaflet entitled "A Short Treatise Telling How." The leaflet describes how it is possible to get better value from your electric-bell system by making it serve as a telephone system as well at a slight extra expense. For 15s. a pair of telephones, with suitable cords, switch, rosette, hanger and bell wire, are provided, which will enable anyone to speak directly from the dining-room to the kitchen. In the catalogue full descriptions are given of the Stellite telephones, and the methods of using them with existing electric bells are fully described.

LEYSIAN MISSION BUILDINGS, CITY-ROAD.—We omitted to mention in our brief description of this building last week that the terra-cotta work was by the Ruabon Coal and Coke Company, Ltd. (Dennis, Ruabon).

Correspondence.

TRAFALGAR-SQUARE AND REGENT-STREET.

STR.—With reference to the interesting articles which have appeared in your issues of 2nd January and 2nd July, I think that the enclosed letter from Mr. John Nash, which is a report or valuation on some premises in the line of the New Street, may be of interest to your readers. The valuation shows how much care was taken by the architect over a somewhat unimportant matter. The original letter, with others, is in my possession, bearing the date 1817; they are entirely written by the architect himself. The wonder is that he could have found time to enter so fully into details.

W. HILTON NASH.

"THE NEW STREET.
"29, Dover-street.
"27th Dec., 1817.

"DEAR SIR,—I am sure you will not be influenced by the rig-my-roll writing which Mr. Bull has laid before you; I shall therefore not annoy you with contravening his unfortunate statements, drawn from absurd arguments. I will now only send you my calculation of Ostler's claim. The others you shall have to-morrow. "You saw the wretched mansion in which he lives and of which he is more an inmate than a householder, not having an upright house from top to bottom. I am of opinion that the extreme value of the house is what he pays, 42l. It is well-known that Walker, his landlord, lets his premises at the extreme rent, but the building will speak for itself. He is out of this liable to repairs, and you will, of course, see what they would be if enforced. The house, therefore, as a house is worth nothing, or less than nothing; it is the situation, therefore, gives it a value, as a retail trade, and that situation is certainly of the best kind, but Walker, aware of that, has demanded 42l., which in other streets would not be worth 20l.

"I hope you are aware that because a house happens to fall in the line of the New Street, that it must necessarily be worth something; it may, however, be nothing more than the compensation a man ought to receive for the expense of getting another, and this is little more in the present case. Look at the man's stock of turnery. I will venture to say 100l. will clear his shop. As a turner he has, I daresay, fixed customers; besides this he carries on a very small carpenter's business; for this, too, he has fixed customers, and, go where he will, he can make boxes and put up a turning lathe. This concern is of the smallest kind, and in my original survey I had put this man's goodwill and moving at 70l. If he gets 100l. it will, I have no doubt, be more than he ever expected to be worth in his life, and, between man and man, I think he would be most liberally remunerated by 100l.

"To go into a minute calculation of this case is ridiculous, because there are no data to go by. The house, the situation, the man, his stock, and his circumstances should be looked upon from a judgment formed on the whole. Did the man ever realise 100l. in his whole living there? If he gets 100l. it would be clear gain. In a week you will find him in another similar dwelling, working as a box-maker and carpenter, and his wife selling toys or something else.

"Ever, dear sir, faithfully yours,
"JOHN NASH.
"JAMES FIELD, ESQUIRE."

JUMIEGES ABBEY.

STR.—The illustration and account of the *Abbaye de Jumieges* are delightful to read and examine by anyone who knows and loves the building itself. Two points of some interest might be worth adding for the benefit of those who contemplate a visit to the ruins:—(a) The interesting fragments in the gatehouse, especially a portion of the tomb of "Les Enervés"; (b) the, to me, unique treatment of many of the round arches, which have a central joint. There is also much to interest in the parish church here (as also at that of Yainville, *en route*), notably a bit of old glass supposed to have been brought here from the Chateau of Mesnil hard by, where Agnes Sorel died—its subject "Suzanne et les Vieillards," seems to justify the statement.

I fancy that, when capitals were decorated with conventional foliage in colour, it was the intention to leave it at that. Perhaps some learned writer would clear up so interesting a point. Great as was co-operation in old days, it is a doubtful point if the colour decoration man would like to pose as a mere provider of a pattern for the carver to cut away. Where means are limited (and they generally are just now) it would give a chance to adopt this treatment as a new *point de départ*.

E. SWINFEN HARRIS.

STAMFORD LIBRARY COMPETITION.

SIR.—Your issue of July 9 contained a paragraph relative to the Stamford Library Competition, stating that the time for sending in designs had been extended to July 30. Some months ago the Stamford authorities stated in your columns that the conditions of the competition would be sent in due course to any architect depositing 1*l.* 10*s.*, which I forthwith did, and, so far, have received no intimation beyond the receipt for my cheque, until, in your columns of the 9th, I saw that the designs had to be sent in by July 30. I thereupon wrote asking for the conditions, site, plan, etc. and again after a week's interval, to both of which letters I have received no reply.

T. R. BRIDSON.

CEMENT BRICKS.

SIR.—The great advantage of cement bricks is that they can be made anywhere, indoors as well as out-of-doors. They take no brick-yard space, require no brick-kiln, nor any great time to dry or to set, and when they are made they are as good as Woolpit bricks or any spurious imitation thereof. They could be made in a house in Cheapside or Fleet-street if it were not for the terrific rents required, and could be produced to order on a day's notice. Some indoor factories in East London could easily be established, where rents are comparatively low and employment greatly in demand.

WALTER SCARGILL.

CONSTRUCTION OF ICE-HOUSE.

SIR.—Could any of your readers kindly inform me of the cheapest and most efficient mode and construction of a building for the storage and preservation of shiploads of block ice. The building would be situated on a public street, in an exposed position, and would be about 100 ft. by 40 ft. by 9 ft. to the eaves. How should the wall be built, of what thickness, and material (if concrete, please state proportions), and should the roof be circular or flat, and how constructed?

Would vulcanite roofing or granolithic be of any use? I would also like the names of any firms who make this class of work a speciality, and also the number of cubic feet allowed for each ton of ice.

COLD STORAGE.

The Student's Column.

NOTES ON PORTLAND CEMENT: CHAPTER II. (cont. need).—THE ANALYSIS OF CEMENT MIXTURES.

Do make a good even cement the manufacturer must keep his mixture as near as possible to the same composition. When he has found what proportion of limestone or chalk and clay give the best results, his endeavour should be to keep the "mixing" as nearly as possible to that limit. For this purpose it must be tested at frequent intervals; half-hourly with variable material, or a few times a day when the mixture is not so variable. There are many quick methods of determining the composition of the "mixing," all of which, when carefully carried out, are valuable. When the test is done, say, three times daily, or if there is much lime present not in the state of carbonate, the total clayey matter may be determined. One gramme of the dried raw mixture is treated with 10 ccs. hydrochloric acid and 20 ccs. water, boiled for a few minutes and diluted to about 250 ccs. Ammonia is then added in very slight excess, which will precipitate the silica, iron, and alumina, along with the clay and sand. The precipitate is filtered, washed with hot water till free from chlorine, transferred to a platinum crucible, and ignited. The filtrate contains the lime, magnesia, sulphuric anhydride, etc., a complete separation of which should be occasionally done. There is always some of the lime in the ammonia precipitate, but, with experience in manipulation and care, this need not exceed 0.2 per cent., which is near enough for a practical test. When the test has to be made hourly, the method used must be much more expeditious.

The carbonate of lime may be treated with standard hydrate of lime as being used as indicator, but the end point is difficult to determine; or it may be decomposed with hydrochloric acid, estimating the loss in weight as carbonic acid (Mohr's

apparatus). In the author's opinion there is no more convenient method than by the calcimeter. This essentially consists of a graduated tube for measuring the carbonic acid gas evolved, from which the carbonate of lime is calculated. Fig. 1 is a sketch of an apparatus suitable for this purpose. The cylinder D contains ordinary water, the tubes A and B distilled water, so full that when the water in A stands at zero not more than about 5 ccs. are in B. The *modus operandi* is as follows:—The barometric pressure and the temperature of the water in D are noted. From this data the weight of substance required is obtained. A sample of the raw mixture is dried in an air oven, finely ground, and the necessary quantity weighed out sharply. This is put into the clean dry bottle C. A small tube containing 10 ccs. hydrochloric acid of 1.2 specific gravity is placed in the same bottle, which is connected to the tube A by a rubber tube E; the stopcock E is opened, and the water level brought to the zero mark in A. The stopcock is now closed, and the acid gradually tipped on to the substance, the bottle being well shaken to expel the carbonic acid

correction for absorption being added, the true percentage of carbonate of lime is obtained. Example.—Barometer = 740 mm.; temperature = 16° C. By reference to a table 0.807 grammes is found to be the weight required. The reading on the measuring tube is 72 and 2.7 is the correction for absorption, giving a percentage of 74.7 carbonate of lime. With slight variation in details all calcimeters are the same. The author's objection to them is that current of cold or hot air blowing on the measuring tube quickly effects the gas volume, so giving erroneous results, sometimes as much as x 3 per cent. To avoid this error a calcimeter was devised by the author. From sketch (fig. 2) it will be seen that the entire gas volume is surrounded by water which is not quickly effected by changes of temperature. The water in the measuring tube is also saturated with carbonic acid gas, as fresh water absorbs its own volume of this gas. The test is carried out in precisely the same way as already described, and can be completed in ten minutes from the time of procuring the sample. Tables of weights of substances to be taken and corrections for absorption are obtained with the calcimeters.

Coke and Coal (Proximate Valuation).

The other chief material used by the cement maker is the fuel to burn the raw mixture into clinker. If burned in the rotary kiln coal will be used, and the moisture, volatile matter, ash, and calorific power should be determined.

The calorific value is no criterion of the value of a coal for use in the rotary kiln without knowing the volatile matter, which should be about 35 per cent. These determinations may be carried out in the following manner:—

Moisture.—Powder 2 grammes of the fuel very finely, weigh between two watch glasses, and dry in a water oven. Allow to cool every hour in a desiccator and weigh. Since the weight increases after a time by oxidation, the lowest should be taken. The loss is moisture.

Volatile Matter.—Put 1 gramme of the dry coal in an even layer in a platinum crucible. Cover with the lid and place over a Bunsen flame, so that the results may be comparable. The length of flame and position of the crucible in it should be the same each estimation. So soon as the gases from the fuel cease to burn, continue the heating one minute. Allow the crucible to cool, and weigh without the lid. Loss is volatile matter.

Ash.—Weigh out 0.5 gramme of the dry fuel on a platinum crucible lid, and heat quickly and strongly till all the coke is burned. The residue will be ash. This result will be too high, owing to oxidation, but for the purposes of the cement maker it is sufficient to know how much ash the fuel will yield when burned completely in contact with air. It is very necessary that the ash should be known, as all of it enters into combination with the raw mixture. Thus, if a coke contains 16 per cent. of ash, and 40 per cent. is used to produce one ton of cement clinker, then in every ton of clinker there will be incorporated 1.28 cwt., or 6.4 per cent. fuel ash. If the raw mixture is proportioned so that when burned out of contact with the fuel the lime in the resulting clinker is 66 per cent., then when burned with 40 per cent. of fuel containing 16 per cent. ash, the lime would be $\frac{66 \times 100}{106.4} = 62.04$ per cent. Now, say the fuel contained 20 per cent. of ash, with the same raw mixture the lime in the clinker would be $\frac{66 \times 100}{108} = 61.1$ per cent. Thus it will be seen that if a cement has to be well prepared, the fuel ash entering into its composition must be known as well as the constituents of the other raw materials.

Fire Bricks.

Kiln linings being a very expensive item in the manufacture of cement, the maker should see that he gets the best for the purpose by determining the "fire value." To do this, a gross analysis is made in the same manner as explained for clay, and the "fire value" calculated therefrom as shown in the example.

A fire brick gave on analysis:—

Silica	54.33	per cent.
Alumina	40.90	" "
Oxide of iron	1.21	" "
Lime	2.55	" "
Magnesia	trace	" "
Alkali	nil	" "
54.38 parts silica	contain	28.99	parts oxygen.		
40.90 " alumina	"	19.21	"		
1.21 " oxide of iron	"	.36	"		
2.55 " lime	"	.10	"		

FIG. 1

FIG. 2

gas, which is disengaged and passes through a lead worm in D, thus reaching the measuring tube in a cool state. The apparatus is allowed to stand at rest for about three minutes, with the bottle C placed in the jar D. The water level in A and B is adjusted, and the amount of carbonate of lime read on A. This result is low, some of the carbonic acid gas being absorbed by the hydrochloric acid. The

The total oxygen in the iron oxide, lime, magnesia, and alkalies is 46 parts.
 Then $\frac{192}{46} = 41.73$ and $\frac{28.99}{19.2} = 1.51$.
 The fire value is $\frac{41.73}{1.51} = 27.8$.

In valuing the raw material for cement making it should be borne in mind that only silica, alumina, and lime are the necessary compounds. Any other ingredients shown by analysis are impurities, some of which may be perfectly harmless, even in large quantities, while others may produce a cement of poor quality, varying in proportion to the quantity present.

Some shales contain large quantities of sulphide of iron, and are perfectly useless. Magnesia and sulphate of lime should not be present in quantity, although a large part of the sulphuric anhydride escapes as alkaline sulphate in the waste gases.

A clay containing a large percentage of insoluble silica is not good. The higher the percentage of soluble silica the better the clay, as chemical combination in the burning is more effectual where the silica exists in combination than when present in the free state as sand. A clay having too much alumina should be avoided, as it produces a quick setting and weak cement with a dirty brown colour. Iron also produces an objectionable colour. The effect of magnesia and sulphates will be discussed in another chapter.

In the tables below are some typical analyses of cement-making materials.

OBITUARY.

MR. RAWLE.—The death, on Monday, July 11, is announced of Mr. William Harry Rawle, of Manchester. Mr. Rawle was in his fiftieth year, and was formerly a partner in the firm of Messrs. Henbcoote and Rawle. He was architect of the new Roman Catholic Church of St. Mary, having a capacity for 600 persons, with presbytery, at Eccles, near Manchester, designed after the XIIIth century style, 1897-8; the conventual chapel in Victoria-park, Manchester, for the Sisters of Charity of St. Vincent de Paul, erected six years ago; and the St. Mary's-road school at Newton Heath, built in 1901 for the School Board of Manchester.

GENERAL BUILDING NEWS.

LIVERPOOL CATHEDRAL.—King Edward and Queen Alexandra visited Liverpool on the 19th inst, and there His Majesty laid the foundation-stone of the new cathedral, which is to be built on St. James's Mount. The first stage of the building work—the erection of the cathedral nave, together with the site and the foundation-stone expenses—is estimated to cost a quarter of a million. The architect is Mr. Gilbert Scott, with whom is associated Mr. George F. Bodley, R.A. Illustrations of the building have appeared in the *Builder*.

NEW CHURCH, CRESTONES, NEAR DUBLIN.—Newstones Catholic Church, when complete, will be 114 ft. long by 66 ft. across transepts, and 23 ft. across nave. The style is Romanesque, and the building consists of nave, two transepts, chancel with side chapels, and circular apse end. There are at present built the apse, chancel, side chapels, transepts, and

breadth of 60 ft. The church consists of nave and side aisles, chancel, morning chapel, organ chamber, and two large vestries for the clergy and the choir. The architects are Messrs. Habershon and Fawcener, of Newport and Cardiff. The work has been carried out by the contractors, Messrs. A. S. Morgan and Co., of Newport. The contract amounted to 4,300l. The walls are carried up in red local stone, with freestone dressings. The west elevation, facing Bridge-street, is surmounted by a bell turret, with a new bell, the top of the cross being 70 ft. above the ground. The church accommodates about 300, including the choir stalls, which provide for fifty. The organ of the old church has been overhauled and rebuilt by Messrs. Vowles, of Bristol. The font of the old church has also been fixed in the new building at the right of the west door.

CHURCH, GREENHILL, HARROW.—Lady Elbury laid the dedication-stone on Saturday last week of the Church of St. John the Baptist, Greenhill, Harrow. The new building is from the designs of Mr. J. S. Alder, and is built of stone. The seating accommodation in the old structure was 470; in the new building it will be 300.

PROBES CHURCH, CORNWALL.—Some alterations and additions are being made to this ancient church, under the direction of Messrs. St. Aubyn and Wadling, architects, of London. The work embraces the conversion of the north chancel aisle into a morning chapel, decorated with carved oak panelling. The five-light east window will be filled with stained glass, and there will be a new carved oak reredos and altar immediately beneath. The present pulpit, which is of Caen stone, will be removed and presented to St. Sithney Church, at St. Sithney, and an oak one with a carved representation of the Sermon on the Mount will be placed upon the opposite side to that the old one now stands upon. The organ is to be moved from its present position in the north chancel aisle to a new organ chamber south of the south chancel aisle. Mr. C. Miners of Marazion, is the general contractor, and the carving is being executed by Messrs. Harry Heims and Sons, of Exeter.

BAPTIST CHURCH, STOCKFIELD, NORTHUMBERLAND.—A new Baptist church is to be erected at Painshawfield, Stockfield. The chapel is to be built to plans by Messrs. W. Dixon and Son, architects, Newcastle, and will provide sitting accommodation for 200, and is expected to cost, inclusive of site, between 1,000l. and 1,100l.

PRESBYTERIAN CHURCH, CROYDON.—The foundation-stone of the new Presbyterian church, which is to be erected in South Croydon, was laid recently. The building will provide accommodation for 550 people, and the cost will be 6,633l. Mr. Charles Henman, architect, has prepared the plans, and the contractors are Messrs. J. Smith and Son.

CONGREGATIONAL CHURCH, SHIREBROOK, DERBYSHIRE.—The foundation-stones of a new Congregational church were laid on the 6th inst. at Shirebrook. The new church will seat about 350 persons, and the end gallery, when added, will accommodate from 100 to 150 more. The heating will be by means of low-pressure hot water. Externally the building will be faced with Rushley stone rock, with Cox bench stone dressings, and the rear portions of wall will be faced with Leicestershire sand stock bricks. The roof will be covered with American sea-green slates, and the small spire with lead. The contract for the church (without fittings) is about 1,550l. The architect for the scheme is Mr. C. Nelson Holloway, Nottingham, the contractors being Messrs. Lee and Kirk, of Chesterfield and Alfreton.

UNITED METHODIST FREE CHURCH AND SCHOOLS, SEVEN KINGS.—The foundation-stone of these buildings was laid on the 16th inst. The portion of the building now being erected embraces the church nave and temporary apse, also a square tower, with open tracery parapet, and surmounted by a spire and hial vane rising to a height of 91 ft.; also main schoolroom, 51 ft. by 40 ft., together with superintendent's room, etc., and the usual conveniences. The contract amount for this portion is 3,488l., and 400 persons in a mixed congregation will be accommodated. The facings are of red brick, the dressing in Bath stone. The architects, whose designs were selected in a recent competition, are Messrs. George Baines and R. Palmer Baines, Clements-inn, Strand, London, W.C. The contract is let to Mr. C. North, of Stratford.

BAPTIST CHURCH AND SCHOOLS, SWINDON.—Baptist church and schools have been erected in the Crikklade-road, Corse-hill, Swindon. The church, which will accommodate about 400 persons, is built of red bricks, with St. Aldhelm Bath stone dressings, and has an open pitch-pine roof, covered with green slates. The baptistry is sunk in the chancel floor. The schools are in the rear of the church, and have accommodation for about

about 15 ft. of the nave. But the foundations for the whole structure, including tower, are already laid, and about 40 ft. of a temporary wooden structure erected between the foundations, leaving room for the main building to be completed outside and over it. The walls of the transepts are carried on three arches, supported on Aberdeen granite shafts, with carved caps and bases. All arches and window jambs and recesses are deeply moulded. The chancel, transepts, and passages are tiled. The windows are glazed with tinted lead lights, supplied by Messrs. W. Martin and Son. The contractors were Messrs. Kinlen Bros., of Crestones, and the architects, Messrs. Wm. H. Byrne and Son, Dublin. The whole structure, at present, will accommodate about 700 persons, and when finished 850.

MISSION CHURCH, FORNETT, NORFOLK.—The foundation-stone has just been laid of the mission church, to be erected at Fornett End. The building will consist, when completed, of a nave, to seat 110 persons, chancel, vestry, and western porch. At the present time it is proposed to erect only the nave and porch. The walls are to be built of red brick with Cossey brick windows, mouldings, strings, and buttresses. The upper portion of the walls will be finished with rough cast stucco. The nave will consist of three bays, with three light windows in each, on both the north and south sides, and the windows will be treated with Cathedral glazing. The roof will be of open construction. The floor of the porch will be laid with 4 in. red Staffordshire tiles, with appropriate border. The roof of the nave is to be covered with permanent green slates, and the porch with best Brocley tiles. Messrs. James and Chellis Humphreys, of Fornett, have obtained the contract for the work, and are carrying it out from the plans and specification, and under the personal supervision, of Mr. Arthur J. Lacey, architect and Diocesan Surveyor, of Norwich.

ST. LUKE'S CHURCH, NEWPORT.—The new Church of St. Luke, Bridge-street, Newport, Mon., was dedicated recently by the Bishop of Llandaff. The church, which has been built upon the site of the old chapel-of-ease, in the parish of St. Woolos, extends from Bridge-street to the frontage of Railway-street, and has a length of 142 ft. and a

300 children. A kitchen is attached, and the main portion of the schools is divided up by folding partitions, so that the schools may be converted into an assembly room. The cost of the whole of the buildings, including seating and furniture, has been about 3,500*l.* The work has been carried out by Mr. A. J. Colborne (Swindon), under the supervision of the architect, Mr. George A. Lansdown (London), whose designs were accepted in competition.

OFFICES, SUNDERLAND.—New offices for the River Wear Commissioners are to be built upon the site of the old Sunderland Post Office. The architects are Messrs. J. Henderson and Hall, of Sunderland.

WESLEYAN CHAPEL, BONBY LODGE, HULL.—The memorial-stone of the Bonby Lodge new Wesleyan Chapel was laid recently. The architect is Mr. Gibson, of Stalybridge, and Messrs. W. King and Son are the bricklayers, Messrs. King and Son stone masons, and Mr. J. Stamp joiner.

SYNAGOGUE, NEW CROSS.—The laying of the foundation-stone of the New Cross London Association Synagogue took place recently. The new synagogue will be Romanesque in style, and is being erected from the design of Mr. Duliss Joseph. The exterior will be of red brick with stone dressings, and there will be a complete system of electric lighting. The total cost is estimated at 5,000*l.*

COUNCIL SCHOOLS, BRIMINGTON, DERBYSHIRE.—The new council schools at Brimington, which were opened on the 9th inst., have been erected from the designs of Mr. W. Cecil Jackson, architect, of Chesterfield. The contract for the work has been carried out by Mr. W. Forest, Chesterfield, the heating apparatus being installed by Mr. W. Huslam, Harstoft. The cost has been 4,000*l.*

NATIONAL NAUTICAL SCHOOL, PORTSHEAD, BRISTOL.—Her Royal Highness Princess Henry of Battenberg laid the foundation-stone last week of the National Nautical School, which is to be erected at Portshead. The site is at the end of the Nore Road, close to the channel, and near the Nore Lighthouse, and it consists of about 15 acres of land belonging to the Corporation of Bristol. The building has been designed by Mr. Edward Gabriel, of London, and the contract has been let to Messrs. W. Cowlin and Sons, of Bristol, and the scheme will involve an expenditure of about 30,000*l.* The main building consists of two wings divided by a central tower. It will have a frontage of 332 ft., and will rise 45 ft. high from the parade ground. Owing to the rapid fall in the site there will be a basement extending the whole length of the building, and 40 ft. in width. The space thus provided will be used as carpenters', tailors', shoemakers', and other shops, and for stores, laundry, and heating apparatus. There will also be a band-room and instruments' store. The school will have three stories of brickwork, finished with a facing of white rough-cast, with red brick plinth, and red brick Ionic pilasters between the windows. The roof will be covered with red Bridgewater tiles.

Under the tower in the central building will be the main entrance, surmounted with carved figures of Neptune and Britannia. The tower, which is to contain a clock 90 ft. high, will be finished with a wood and copper sheath. The small towers at the corner of each main block will contain staircases. The two upper floors are to be used as dormitories, and from each dormitory there will be two staircases for use in case of emergency, the steps of solid blocks of timber. The entrances for the boys will be on each side of the central building. The ground floor of the west block will be used for a mess-room for the boys, officers' mess-room, with kitchen, scullery, and store-rooms adjoining. At the extreme end of the west block is to be the chief officer's house and rooms for resident schoolmaster. At the rear of this block there will be a bay for sick boys, for which hereafter a separate cottage hospital will be substituted when the necessary funds are available. The great floor of the east block is to be devoted to schoolroom and classrooms, library, and teachers'-room. At the extreme east of this building will be the residence of the captain-superintendent, which will be connected with the main building, and from which house there will be supervision of the parade ground and playing fields. The central building is to contain committee-room on one side of the main entrance, and offices for the captain-superintendent on the other. On the upper floors of this building there are to be spare cabins for officers and a ward for boys who may hereafter visit the institution. Each large dormitory will have four officers' cabins, and inspection windows for efficient supervision. The floors of the dormitories are to be of solid balks of timber, tongued together, and the space will be made to resemble the deck of a vessel as much as possible. The lads will sleep in hammocks, as on board ship. The bathrooms and lavatories will adjoin the dormitories, but cut off by means of cross-ventilated lobbies. Passing through the hall

from the main entrance, access will be gained to the gymnasium, which will be at the rear of the central building. The dimensions of the gymnasium will be 84 ft. by 50 ft., and 20 ft. high in the springing of the roof. It will be used not only for physical exercise, but also for meetings and entertainments, and for services when the weather may prevent the boys attending church. The buildings are to be warmed by hot water on the low-pressure system. The heating and hot water-supply apparatus is to be erected by Messrs. James Crispin and Sons, of Bristol. The granolithic paving for the courtyard and staircases is being executed by Messrs. W. B. Wilkinson and Co. From the parade ground access will be made by broad flights of steps to a lower terrace. The land between this and the channel is to be laid out as playing fields. There will also be a jetty and boathouse on the fore-shore. Drainage is to be by means of a septic tank and a filter, of the type designed by Mr. Wallis Stoddart, the effluent flowing into the sea. Rain water from the roofs will be collected in a large central tank, and used to supply boilers and the laundry. Accommodation will be provided in the school for from 350 to 400 boys.

INFANT SCHOOL, ABERCYNON.—The Mountain A-H Education Authority recently opened the new Infant School for infants at Greenfield. The school, which cost the estimating site, 4,243*l.*, is built to accommodate 250 infants, the plans being prepared by Mr. O. Evans, architect, Pontypridd, and the building erected by Messrs. Jenkin and Sons, Porth.

SCHOOLS, ABERBARGOED.—The opening ceremony of Aberbargoed schools took place recently. The new school provides accommodation at present for 200 boys and girls, and 150 infants, and is planned with a view to future extensions for 150 boys and girls, and 100 infants. There are four class-rooms in the mixed department, opening on to a central hall. The infants' department has for the present three class-rooms, opening on to a central hall. The four central class-rooms are divided by means of a sliding swivel partition, which allows of these rooms being thrown open into two large rooms if needed. The contractors were Messrs. W. Williams and Sons, of New Tredegar, and the cost was a little over 6,500*l.* The plans were prepared by the Board's Architects, Messrs. James and Morgan, Cardiff.

NEW MISSION HALL, PRESTON.—The opening of St. Mark's Mission Hall, Preston, took place on the 9th inst. The building has been erected by Mr. George Gardner, builder, Preston, from the designs of Messrs. Swindells and Rawcliffe, architects, Fishergate, at a cost of over 1,100*l.*

PROPOSED PUBLIC BATHS, HANDSWORTH, BIRMINGHAM.—A site has been acquired in Grove-lane, Handsworth, by the District Council for the purpose of erecting new public baths. The building will comprise two swimming baths, the first-class bath measuring 100 ft. by 35 ft., and the second-class, 100 ft. by 50 ft. There will also be Turkish and slipper baths. The plans for the work have been prepared by Mr. John Osborne, of Birmingham, and the cost will be 18,000*l.*

HOTEL DORNOCHE, N.B.—A new hotel has been erected by the Highland Railway Company at Dornoch. The external walls of the new building are rough cast in Portland cement, use being also made of stone dressings. Half-timbered work is introduced into the gable tops; the main portion of the roof is slated, with the use of red tiles in certain portions, red tile ridges and red terra-cotta chimney pots. Internally the building is finished in pitch-pine, the walls and ceilings of the principal apartments being panelled in that wood. The architects of the building were Messrs. Cameron and Burnett, Inverness, and the work was carried out by the following contractors:—Mason work, Messrs. Wm. Alexander and Co., Inverness; iron work, The Rose-street Foundry Company, Ltd., Inverness; carpenter, Mr. James Robertson, Forres; plumber, Mr. William Anderson, Glasgow; slater, Mr. John Reid, Inverness; scablator, Messrs. W. G. Walker and Sons, Edinburgh; plaster and tile, Mr. George Gray, Elgin; painter and glazier, Messrs. J. Tullock and Co., Inverness; electric light, Messrs. Wylie and Lochhead, Glasgow; lift, Messrs. A. and P. Steven, Glasgow.

NEW INSURANCE OFFICE, NORWICH.—A new head office has been erected for the Norwich Union Life Insurance Society in Surrey-street, Norwich. The building is stone-fronted, and is recessed from the street, having a rusticated basement in the central portion, with six stone columns, each about 50 ft. in height. These columns support a pedimented entablature. There are flanking blocks on either side, the chief features in which are balconies and detached columned windows, and also, at the extreme ends,

pavilions running out to the street front. These pavilions are recessed for two heroic-sized statues in stone, under stone canopies. There is a central hall, about 70 ft. square, and forty marble monolith columns are used in its construction. The whole of the walls, door linings, etc., are finished in marble. The staircase is also of marble, and the marble walls are continued on the first floor and along the corridor which gives access to the board and committee rooms. The chieft of the corridor floors is also laid with marble pavements. The central hall is covered with a dome enriched with colour and gold. The architects are Messrs. George J. and F. W. Skipper, of Norwich.

THE CARNEGIE LIBRARY AT GAINSBOROUGH.—For a public library at Gainsborough, Mr. Andrew Carnegie has offered 4,000*l.* The plans have been prepared by Mr. H. G. Gamble, of Lincoln, and the tender of Messrs. Sprakes and Son, of Doncaster, has been accepted at 3,100*l.* The site of the library is the square fronting the Old Hall.

LIBRARY, LOWESTOFT.—The foundation-stone of a free library was laid at Lowestoft recently by the Mayoress (Mrs. H. Bourne Walker). The site of the new building is in Clapham-road, adjoining the Technical Schools. The architect is Mr. G. W. Leighton, of Ipswich, whose plans were selected in competition by Mr. J. Bootle, F.R.I.B.A., of Yarmouth. The main entrance is by way of the tower porch, the new-room being the first apartment reached. A corridor gives access to the borrowers' lobby. A marble staircase, lighted by a dome, ascends to the first floor, where, overlooking Clapham-road, is the magazine-room, which has an open timber roof. At the other end of this floor is the reference library. This room will be lighted by a central dome, as well as by side windows. There are other staff rooms and offices, and retiring-rooms. The walls of most of the rooms, corridors, and staircase are to have a dado of Dutch enamelled tiles.

THE WORKING MEN'S COLLEGE, ST. PANCRAS.—The Prince of Wales, accompanied by the Princess of Wales, paid a visit to St. Pancras on Saturday last to lay the foundation-stone of the new buildings, in Crowndale-road, of the Working Men's College. The buildings will occupy a site at the corner of Crowndale-road and Camden-street, not far from the Cobden statue, in the Hamstead district. W. D. Caroe, architect to the Ecclesiastical Commissioners, is the architect for the new college. His plans show a hall, to accommodate 250 persons, offices for administrative purposes, with common-rooms, clubrooms, and gymnasium for the students, a library, fitted for 10,000 books, museum, and a number of class-rooms. There are added electricity and chemistry laboratories. Altogether there is teaching space provided for 700 students.

POLICE STATION, CITY.—The Lord Mayor opened the new police station at Moor-lane, Fore-street, recently. The work has been carried out by Mr. Arthur Porter, of Tottenham, from the designs of Mr. A. Murray, the City Surveyor. The new structure takes the place of an old police station on a smaller area, and gives accommodation for sixty-seven single men to reside on the premises instead of thirty-three as formerly.

ANCOATS HOSPITAL CONVALESCENT HOME, SANDLEBRIDGE.—This building is situated on the road from Soss Moss to Moberley, turning to the west from Alderley Edge and Astle-road past Warford Hall. The main building faces nearly due south, and has projecting wings at the ends. These are connected to sunhouses by covered ways which form the eastern and western sides of the forecourt, and lead out of the day-rooms for men and women as places for walking and sitting in in wet weather. There are separate entrances to and from the grounds, with day-rooms, dormitories, staircases, and sanitary arrangements, the latter cut off with intercepting lobbies. There are a few small bedrooms for special cases on either side. The dining-hall is in the centre and common to both sides of the house, and the kitchens are to the north of the dining-hall, connected by a covered way to the outdoor buildings. These surround a kitchen court or quadrangle, open on one side with flagged walks and grass. The buildings have been erected under the supervision of the architects, Messrs. Thomas Worthington and Percy S. Wortbington, of Manchester.

NEW WING, RICHMOND HOSPITAL.—The new wing of the Royal Richmond Hospital, constructed as an out-patients' and ophthalmic department, was opened on the 9th inst. by the Duchess of Albany. The new out-patients' department building, erected to the design of Mr. Frank Brewer, architect, is separated from the main hospital, and fronts to the Shaftesbury-road. The building is approached by a flight of steps, and has a wide entrance with vestibule, enclosed by a polished oval

reen and folding doors. Next the vestibule is a hall with mosaic paving, and on the right is the waiting hall, with open-timbered roof and lantern light. This hall is divided into two by a movable partition, thus giving a separate waiting-room for male and female patients. The hall is paved with polished oak block flooring, and the walls are lined with bouillon ware. The woodwork is stained green and varnished. There is a suite of four consulting rooms in the rear of the outer hall. The dispensary, which is on the left of the entrance-hall, has been fitted up by Messrs. Law and Son. Below the dispensary are the dispensers' stores, approached by a side entrance. The first floor, which is approached by a stone staircase from the entrance-hall, is to be used for ophthalmic patients. The heating of the building is by hot water with radiators, and by Boyd's air-chamber stoves. The hot water heating has been carried out by Messrs. Jeffreys. The chimney pieces, wall-nings, decorative panels, etc., were carried out by Messrs. Dorr and Co. There is electric lighting throughout. The builders are Messrs. S. N. Soole and Sons, of Richmond.

LIBRARY, TINSLEY, YORKSHIRE.—The cornerstone of a public library has just been laid at Tinsley. The new library will stand at the end of Bawtry-road. On the ground floor will be a porch, entrance-hall, and staircase, a reading-room, 30 ft. by 18 ft., a lending library, 15 ft. 6 in. by 15 ft., and hall for applicants for books. The first floor will be provided with a ladies' reading-room, reference library, and a spare room for stores, etc. In the basement there will be a hot-water apparatus for heating the building, and on the ground and first floors there will be a lavatory and other accommodation for the visitors. The building is in the Renaissance style. It will be faced with local pressed bricks and Grenoside stone casing. The architects are Messrs. Holmes and Watson, Sheffield, and the contract for the building, which amounts to 1,276l. 16s. 8d., has been let to Messrs. Gray and Sons, Builders, Tinsley.

PRINTING AND PUBLISHING PREMISES, SOUTHAMPTON.—New premises for the proprietors of the *Hampshire Advertiser*, *Hampshire Independent*, and *Southern Daily Echo* are to be erected above Bar from the plans of Mr. H. Hill.

NEW CHURCH, FISHPONDS, BRISTOL.—On the 7th inst. the foundation-stone was laid of All Saints' Church, Fishponds, the eastern portion of which is now to be carried out, and which consists of a chancel, south morning chapel, and north choir vestry (with organ chamber above), with a clergy vestry on its eastern side. One bay of the nave and aisles is also to be erected. The style adopted is XIVth century Gothic. The walls are to be of rock-faced Pennant stone, with Bath stone dressings, the arcades having clustered shafts of abbed Pennant stone, and those to support principals will be of polished marble. The roofs will be covered with brindled Broseley tiles. The architects are Messrs. Lingen Barker and Co., of London, Bristol, and Hereford, and the builders Messrs. Clark and Sons, of Fishponds.

STAINED GLASS AND DECORATION.

STAINED GLASS WINDOW, WANDSWORTH.—The unveiling of the new stained-glass north-west window in St. Stephen's Church, Wandsworth, took place recently. The work has been designed and executed by Messrs. Jones and Willis, of London.

WINDOW, ST. JOHN'S CHURCH, HOXTON.—The Bishop of Ripon unveiled on Saturday last a memorial-window, placed by relatives and friends in St. John's Church, Hoxton, in the memory of the late Dean Farrar. The window, designed by Mr. J. A. Reeve, was the architect of the restored church, and was executed by Messrs. Campbell and Christmas, of West Brompton, and represents Christ seated in glory as seen by St. John in his vision at Patmos. The scheme of coloring is executed to harmonise with the decoration of the church, the subject commemorating the representation of the vision of St. John.

APPOINTMENTS.

DERBY.—A meeting of the Derby Education Committee was held a few days ago for the purpose of appointing a building surveyor, an entirely new office rendered necessary by the Education Act. The commissioning salary for a year was fixed at 1,500l. 5 applicants, and four of these attended the committee's meeting. They were Messrs. C. Copestick (in the office of the County Surveyor at Derby), W. Percival (Longton), S. Walker (Liverpool), and G. H. Widdows

(Derby). Mr. Widdows secured the appointment. The successful candidate has qualified for associatehip of the Royal Institute of British Architects, and has been in the service of the Derby Corporation for some years.

BOLTON.—Mr. D. Campbell has been appointed to the position of Architect and Buildings Inspector to the Education Committee.

DEVON COUNTY EDUCATION COMMITTEE.—This Committee have made the following appointments on the Architect's staff:—Chief assistant, J. Sidney (York); clerks of works, W. J. Davies (Hereford), R. J. Mathews (Penarth); draughtsmen, H. T. A. Halestrap (London), J. G. Hinton (Lancaster).

APPOINTMENT OF SANITARY OFFICERS.—The Local Government Board has sanctioned the appointment of the undermentioned sanitary inspectors:—Lewisham—Miss Irene Whitworth; St. Pancras—Mr. E. W. Adkins; Southwark—Miss M. R. Burrows, and Miss H. M. E. Blackwell; Woolwich—Miss A. M. Middlebrook.

SANITARY AND ENGINEERING NEWS.

THE SANITARY INSTITUTE.—At an examination in Practical Sanitary Science, held at Liverpool on July 15 and 16, ten candidates presented themselves, and the following five candidates were awarded certificates:—A. Brook, Lintwaite; H. W. Garside, Rochdale; C. B. Goodyer, Manchester; A. Reoch, West Norwood; and E. Ryder, Levenshulme.

FOREIGN.

FRANCE.—M. Mercie's monument to Alfred de Musset, which was exhibited in the last Salon, is to be erected outside the Theatre Français.

It is understood that M. Carolus-Duran will succeed M. Guillaume as Director of the French School at Rome.—The churches of Saint Sulpice, St. Bernard, and St. Etienne du Mont are shortly to undergo extensive repairs and restorations.—The General Council of the Seine Department has voted 3,700,000 francs for the rebuilding of the bridges of Notre Dame, de la Tournelle, and l'Archevêché, at Paris.—M. Coutan and M. Verlot have been commissioned by the Government to produce two large sculpture groups symbolising "Le Terre" and "l'Eau" for the decoration of the park of St. Cloud. MM. Sicard, Paul Gasq, Hector Lemaire, and M. d'Inc. Symour are to execute the "Heurs du Jour," and MM. Gustave Michel, Larche, Desbois, and Lefebvre are to execute "Les Quatre Saisons," all for the park of St. Cloud.—The Municipal Council of Paris have purchased the estate of Bagatelle at a price of six and a half million francs, to add it to the Bois de Boulogne.—New school buildings (*groupes scolaires*) have been erected at Puteaux, from the designs of M. Desestre; at Issy-les-Moulineaux, from the plans of M. Delaire; and at Asnières, from the designs of M. Ricard.—A monument to the memory of Augusta Holmes, the musician, by M. Caillard, has been erected in the cemetery at Versailles. It consists of a stele with a portrait medallion, surmounted by a figure of a muse draped in mourning, and leaning on a lyre.—The Municipal Council of Brest have resolved on the erection of a Bourse du Travail, at a cost of 100,000 francs.—The death is announced at Beyrouth, at the age of eighty-three, of a very learned archaeologist, M. Paul de Saint-Aignan, of the Franciscan order. He was a member of the Institut, of the proceedings of which he contributed numerous papers on numismatics and on Oriental archaeology.

GERMANY.—The third exhibition of Industries and Arts at Dresden will take place in 1906; the preparations are under the management of the architect, Herr W. Lossow. A sinking in the new Maximilian bridge at Munich was observed last month; the matter is being thoroughly investigated.—The sum of 2,500,000 francs is to be expended on extensive restoration at the cathedral at Cologne.—A girls' school is to be built at Freiburg, from the designs of the architect, Herr Leon Hertling; the building is to be in Early Renaissance style.

AUSTRIA.—The foundation-stone of the new hospital at Vienna was laid on June 21.—The sculptor, Alfonso Canciani, is at work on a statue of the Empress Elizabeth, to be erected at Pola.—The church at Oberloitsch is being enlarged under the direction of the architect, Herr Ferdinand Trummler.—The fountain erected in Vienna in commemoration of the golden wedding of the Archduke and Archduchess Rainer was unveiled on July 5; the work has been carried out by the sculptor, Herr Kaufungen.—The statue of the painter Hans Canon, by Professor Wever, is completed, and will be set in the Park at Vienna; the figure is in bronze and life-size.

SWITZERLAND.—Herr Karl Köehlin, of Basel, has been appointed director of the Swiss Confederation Railway, in place of the late Herr W. Hensler.—The new town hall, at Basel, by the architect, Herr E. Vischer, was opened on June 23.—When cleaning the Dominican Church, at Bern, some interesting frescoes were discovered, among others one representing the Day of Judgment, and several symbols and coats of arms.

THE ST. LOUIS EXHIBITION.—There seems to be, as yet, very little interest taken in the St. Louis Fair, if we may judge by the paucity of information concerning it which is to be found in the daily papers, a scarcity so marked as to cause one to suspect that the authorities may have done something to lead the newspaper managers to feel that it is just as well to let the affair pass as merely a local matter. This attitude would be very unfortunate for the financial outcome, but it is not the only misfortune that already attaches to the Fair. The wrecking of a building by a mob was not exactly a good advertisement, and the recent order that the Exposition guards shall arm themselves with slung-shots is another warning that visitors to St. Louis this summer may expect exciting experiences before they get away from the town. Moreover, there have already occurred two or three fires in the smaller buildings within the grounds, fires, fortunately, that the excellent fire-lighting arrangements prevented from attaining dangerous proportions.—*American Architect.*

ITALY.—The Municipality of Spezia have voted a sum of 400l., to be assigned as a premium to the winner of an international competition, who presents the best drainage scheme for that city and suburbs. The competition will be open until December 31, 1905, on which date it will be finally closed, and foreign architects, engineers, and doctors are to be allowed to compete. A commission will be appointed in due course by the Municipality to examine the various plans and award the prizes. Inquiries with regard to the competition should be addressed to Il Signor Sindaco, Spezia, Italy.—A despatch received through the Foreign Office from H.M. Ambassador at Rome reports that a Bill providing for the construction of the Apulian aqueduct by the State has been submitted to the Italian Chamber of Deputies, and been favourably received. The original plan has undergone certain modifications in the Bill now presented to Parliament, which only concerns the construction of the aqueduct, at a cost of five millions sterling, to be provided by gradually increasing assignments spread over the budgets of the next twenty years. The up-keep and working of the aqueduct will form the subject of a separate Bill. A clause has been inserted authorising the Government, within a period of eighteen months from the publication of the new law, if it is agreed to by Parliament, to hand over the construction and working of the aqueduct to private enterprise under the conditions laid down in the law of June 26, 1902. If, therefore, as appears probable, the new Bill should, with certain modifications, be adopted, the participation of foreign capital will not be necessarily excluded.

ROMANIA.—PRIZES FOR ARCHITECTURAL DESIGNS.—The Roumanian Minister of Public Worship and Education has invited designs for the construction of a cathedral at Galatz, premiums of 160l., 120l., and 60l. being offered for the three best designs. The competition will be closed on August 25.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—Mr. E. F. M. Elms, architect, having purchased from the Trustee in Bankruptcy of his late partner, Mr. W. H. Arber, his share in the practice of architects and surveyors formerly carried on by Mr. Arber and himself in partnership, under the style of "J. H. Wimperis and Arber," has arranged to take into partnership Mr. Sydney Jupp, who has been for many years identified with the business, and the practice will, for the future, be carried on by them, at 25, Sackville-street, W., under the style of "Elms and Jupp."—Messrs. Killee Bros., the proprietors of the Hopton Wood stone quarries at Middleton, have incorporated their business as a limited liability company. The business was founded by the father of the present senior member of the firm about seventy years ago.

CHURCH OF ST. PETER, BETHNAL GREEN.—At a sitting of the Consistory Court in St. Paul's, on June 30, the Chancellor of the Diocese of London consented to grant a faculty to the vicar and churchwardens for the erection of a new vestry, to be 15 ft. by 11 ft., upon a portion of the disused churchyard, and abutting upon the present.

vestry, which is quite inadequate for its purpose. No interments have been made in the ground chosen for the new building, and all that part of the churchyard will be covered with concrete. Dr. Tristram, K.C., stated that he felt justified in law, and under the provisions of the Disused Burial Grounds Act of 1884, in complying with the prayer of the petition, and he also agreed to extend the faculty to the screening off of a portion of the church, near the new vestry, for use as a choir vestry. The church was erected in Hackney-road in 1841, after Lewis Vulliamy's plans and designs, for about 1,000 sittings.

BUILDING BY-LAWS, CARDIFF.—In answer to a question put by Mr. John Chappell at a meeting of the Public Works Committee on Thursday last week, Mr. Veall and other members stated that many of the by-laws were ridiculous. The limit of headroom was 10 ft., and if a man wanted to get 10 ft. 6 in. he must increase the thickness of the walls from 9 in. to 13 in. Mr. Harpur called attention to several breaches of the by-laws, in one case the builders not having put in woodwork of the dimensions required. Mr. Morgan Thomas remarked that some builders believed the Corporation would not enforce the by-laws. Alderman Mildon said the same by-laws were in force at Barry, but in many respects absolute compliance was not insisted upon. The Borough Engineer replied, in answer to a question, that he did not know any place where they were insisted upon in their entirety. The Committee endeavoured to get alterations made, but the Local Government Board would not accept them. Alderman David Jones observed that some of the by-laws were absurd. On the motion of Mr. Chappell, it was resolved that in the case referred to the by-laws be adhered to, and that proceedings be taken against the builders for not carrying them out.—*Western Mail.*

DISFIGUREMENT BY ADVERTISEMENTS.—In addition to the Metropolitan Borough Councils which have already been reported in the *Builder* as having taken action upon the circular letter from the Royal Institute of British Architects upon the abuse of buildings by advertisement hoardings, the following have considered the matter:—St. Pancras Borough Council has resolved to send a communication to the Institute, expressing sympathy with the objects they have in view; Shoreditch Borough Council has passed a motion agreeing with the purport of the Institute's letter, and in support of legislation to regulate the display of advertisements; Paddington Borough Council has, upon the recommendation of the General Purposes Committee, resolved to inform the Institute that it has "no observations to make" upon the letter.

WYTHAM HILL.—The name of the clerk of works, given in our last issue as "Mr. Fletcher," should have been "Sletcher." The mistake arose from a not very clear handwriting in the communication sent to us. Proper names should always be very clearly written, or mistakes are inevitable.

TOTTENHAM COURT-ROAD (SOUTH END) IMPROVEMENT.—Mr. B. L'Anson Breach, of No. 29, Fleet-street, surveyor, has just issued his award, dated July 14, made by him as arbitrator, under appointment by the Local Government Board, for the purposes of the London County Council's Improvements Act of 1897, in respect of the demolition of the southern end of Tottenham Court-road, by the demolition of the block known as Bozier's-court. Mr. Breach's award relates to a valuation made by Mr. James Crean in 1898, under appointment by the Local Government Board, and to the premises on the west side of the footway which, until recently, extended from Oxford-street to Tottenham Court-road. He adjudges that the enhanced values, arising out of the improvement, of No. 14, Tottenham Court-road and Bozier's-court, and No. 4, Oxford-street and Bozier's-court are, respectively, 5,200l. and 7,700l., as compared with the Council's assessments of 7,432l. and 7,840l.; and he confirms the Council's assessments, made in July of last year (to which, however, no objection had been taken) in respect of the enhanced values of the four remaining properties—namely, the entrance to the Oxford Music Hall, 1,271l.; No. 2, Tottenham Court-road, 1,588l.; No. 3, 1,857l.; and Nos. 4 and 5, 1,380l. The fee simple of No. 4, Oxford-street, vests in Balliol College, Oxford. The schedule attached to the awards specifies the improvement charges on the several six properties, being, respectively, equal to 3 per cent. per annum upon one-half of the enhanced values; the latter are assessed after all fair and proper deductions made for rates, taxes, etc.

DRURY-LANE THEATRE.—The arbitration between the Drury-lane Theatre Company and the London County Council, as to the works to be done to comply with the requisitions of the latter body, is being held before Mr. John Slater, architect, the arbitrator. Mr. Philip

E. Pilditch is the architect acting for the Theatre Company, and Mr. W. E. Riley, the Superintending Architect to the London County Council, for the Council, assisted by members of their respective staffs.

THE EXPORTATION OF WORKS OF ART.—A Bill has been presented to the Spanish Cortes, proposing to prohibit the exportation of works of art from Spain, except by special authorisation from the Minister of Education and Fine Arts. The following are to be regarded as works of art:—Architectural monuments, sculptures, paintings, inscriptions, books, manuscripts, coins, medals, costumes, tapestry, engravings, pottery, arms, instruments, and all other objects of archaeological or historical interest. The Bill, however, empowers the Minister of Public Instruction to allow the temporary exportation of works of art, under guarantees insuring their preservation and re-importation into Spain. The Bill does not apply to the works of living artists, or to reproductions of such works.

ENGLISH CEMENT IN PORTUGAL.—Mr. Consul Grant writes from Oporto that there is a steady increase in the demand for English cement, but he adds that very little now comes from the United Kingdom, on account of its inability to compete in price with that coming from Belgium. In 1900, the imports amounted to 5,135 tons; in 1901, 5,708 tons; in 1902, 5,923 tons; and in 1903, 5,974 tons.

HONDURAS TIMBER.—Acting-Governor Cork, reporting on the Book of British Honduras for the year 1903, states that the quantity of cedar forwarded to the United Kingdom during the year was 292,201 ft., value 1,483l., and the quantity of mahogany so forwarded was 1,887,336 ft., value 111,116l. The export of mahogany and cedar to the United Kingdom is now limited to wood of good grain and of large size, the price obtained for wood of this class repaying the cost of squaring, etc., whereas, in former years, the total output was sent to that market. The decrease in 1902 shipments of mahogany to England was 1,846,790 ft.; in 1903, there was a further decline of 1,951,954 ft. The general output of mahogany and cedar, however, during 1903, showed an increase, as compared with 1902, of 3,335,132 ft., this increase being solely due to the operations of two American firms engaged in supplying the American market. The wood is purchased unsquared, and paid for on the spot, thus saving the wood-cutters considerable labour and expense in preparing the logs for the home market, freight, etc.

MUSEUM OF PRACTICAL GEOLOGY, JEMMYN-STREET.—Arrangements have been made which will make it unnecessary to close the museum for a month in autumn as heretofore; it will therefore remain open to students and visitors daily.

CONNECTION.—Referring to the Savoy Hotel announcement in our issue for June 25 last, Messrs. W. and J. R. Hunter ask us to point out that the oak *only* for the panelling at Simpson's Restaurant was supplied by them, not the panelling itself.

INDIAN ARCHEOLOGY.—According to the annual Blue Book on the progress and condition of India, the archeological surveyor was occupied during the past year in visits to monuments in Ahmedabad, Bijapur, and other parts of Bombay, and also toured with the Director-General of Archeology in Central India, Rajputana, and Sind. The expenditure on the conservation of ancient monuments in the Bombay Residency amounted to 1,120l. In the United Provinces a report on Akbar's tomb at Sikandra, near Agra, by the late Mr. Smith, was submitted to the Government; the staff was engaged in surveying historical buildings in the Agra fort. The amount of 10,570l. was spent in the province during the year from Government revenues on conservation. The Surveyor of the Punjab circle reports that several important works were commenced and partly completed with a view to the conservation of monuments, an allotment of 4,300l. having been made for the purpose. He also submits a memorandum on the preservation of archeological material in the Peshawar district. In Madras the expenditure is given as 1,477l. The excavation of prehistoric remains at Adinachallur was the most notable operation of the year, and resulted in the unearthing of a very large number of objects of great interest. In Bengal the Archeological Surveyor visited seven districts, and also Assam, in the course of his tours. The Director-General was to have visited Bengal, but the visit had to be postponed. In Burma, 2,746l. was spent on conservation. Much progress was made in improvements to the Mandalay palace and its surroundings. The Director-General has been engaged in tours of inspection in several provinces, in the course of which he was able to give advice to the local authorities with a view to the organisation of archeological efforts on a consistent plan throughout India.

Legal.

ACTON ANCIENT LIGHT DISPUTE.

In the Chancery Division on the 12th, 13th, and 14th insts. Mr. Justice Kekewich had before him the case of Kine v. Jolly, an action by the plaintiff, Mrs. Sarah Kine, the owner of a house and premises known as "Woodthorpe," Acton-road, Acton, against the defendant for an injunction and damages in respect of the alleged obstruction of the ancient lights of the plaintiff, and also for trespass. The case had been tried by his lordship before, and now came on for a re-trial on an amended statement of claim.

By the amended statement of claim it appeared that the ground floor of the plaintiff's premises had on the west side two windows, lighting respectively the drawing-room and a smaller sitting-room, and a door with glass panels and a window or fanlight over it, lighting the entrance-hall. The plaintiff alleged that, in spite of remonstrances made on her behalf, the defendant had erected and maintained, and still maintained, a high building near to the said windows, glazed panels, and fanlight, and had thereby materially obstructed the light from entering into the said dwelling-house, and interfered with the plaintiff in the use and enjoyment of the said land and dwelling-house. The plaintiff also alleged that the defendant's building projected over and overlung her land, and that the defendant, by erecting and maintaining his said building, trespassed, and was still trespassing, on her land. Hence the present claim for an injunction and damages.

The defence was a general denial of the allegations in the statement of claim.

Mr. P. O. Lawrence, K.C., and Mr. Cann appeared for the plaintiff, and Mr. Stewart Smith, K.C., and Mr. Vernon for the defendant.

Mr. Lawrence, in opening the case, said that plaintiff, Mrs. Kine, was a lady living at "Woodthorpe" with her daughter and son-in-law. That was the condition of things in October, 1902, when the next plot was sold to the defendant, Dr. Jolly, who commenced to build a house on the property. There was then a dispute as to some encroachment on the plaintiff's land, and there was an interview between Mr. Reed (plaintiff's son-in-law) and the defendant's architect, Mr. Monson. His contention was that at that interview the question of ancient lights was mentioned. Mr. Monson told Mr. Reed that the plaintiff's lights would not be interfered with. The building of defendant's house went on, and on February 10, 1902, the plaintiff's solicitor wrote a letter to the defendant saying that his building obstructed the plaintiff's light, and he should commence an action on the plaintiff's behalf if the obstruction was not removed. Defendant therefore could not say that he had erected his house in ignorance of the plaintiff's rights. The writ was issued on April 2, 1903. At that time the defendant's house was not completed, and there would have been no difficulty in so modifying the plans as to prevent the defendant's house obstructing the plaintiff's light. The plaintiff's house was an ordinary dwelling-house of a suburban character. On the ground floor it had a morning-room.

His lordship: What are the ordinary purposes of a room?

Mr. Lawrence: Habitation, I should suggest. The ordinary purpose of comfortable occupation, I should submit. Our contention will be that this building of the defendant comes within the definition of nuisance as laid down in the case of the Home and Colonial Stores v. Colls, in so far as it materially diminishes the enjoyment by the plaintiff and her household of her house as a dwelling-house.

Mr. and Mrs. Reed both gave evidence to the effect that the light of the plaintiff's house had been materially and substantially interfered with by the defendant's building.

Mr. P. W. Virgo, a merchant now residing at Teddington, but who formerly lived at "Woodthorpe," proved that the plaintiff's lights were ancient. He also said that the light of the plaintiff's house was very much diminished by reason of the defendant's building.

Mr. R. Nichols, a builder, examined, said he had lived in the neighbourhood of "Woodthorpe" for twenty-five years. He had frequently been in "Woodthorpe," and had done decorating work there for Mrs. Kine. He noticed a considerable difference in the plaintiff's house since Dr. Jolly's wall was up. The difference was that, instead of going into a nice, bright house as formerly, you went into a dingy one now.

Cross-examined.
It was impossible to read in the morning-room at all now unless you got close to the window.

Mr. E. C. P. Hodgkinson, an architect and surveyor practising in Wellington-street, Strand, said he visited the premises in question on February 3, 1903, and again on February 5, when he took measurements from which he had prepared the plans put in. The distance between the wall of Dr. Jolly's house and the morning-room window of plaintiff's house was 26 ft. 9 in., and the height of Dr. Jolly's wall was 24 ft. 6 in. He came to the conclusion that Dr. Jolly's wall seriously deteriorated the light in the morning-room of Woodthorpe," and caused a slight defect in the light of the drawing-room. The height of Woodthorpe" was also interfered with by Dr. Jolly's wall. He considered that Dr. Jolly's wall had rendered "Woodthorpe" less comfortable for the purposes of habitation. Mr. C. P. Pratt, an architect and surveyor, so gave evidence generally corroborating the evidence of the last witness. This evidence included the plaintiff's case.

His lordship said he thought it would be convenient if Mr. Stewart Smith told him his view of the position of the law as it was applicable to the facts as they emerged. Mr. Stewart Smith said that the decision in the Colls case had entirely changed the issue. He first thing that a plaintiff had to establish was not whether there had been a diminution of light, but whether there had been a nuisance. The question therefore was, was there in the present case a nuisance within the meaning of the decision of the House of Lords in the Colls case? He submitted that a nuisance was something for which a jury would award damages. His evidence would prove that there was no diminution of light in this case which made the house less habitable—that used any serious inconvenience. There was another point he relied upon, and that was the angle of 45 degrees. The angle of 45 degrees had been adopted as a rough test, and both Lord Byles and Lindley, following Lord Selborne, appeared to think that, assuming other things to be equal, an angle of 45 degrees of light coming to the window of a plaintiff was all that he or she was entitled to. Mr. Edward Charles Monson, an architect, as called, and stated that he had prepared plans in the case. With regard to the light to the windows complained of, he found that the plaintiff's drawing-room window had been unobstructed to the angle of 45 degrees down to the grass line. The morning-room had over 45 degrees of unobstructed light. Witness applied the test of reading in the drawing-room about mid-day on November 7, and he could read in all parts of the room, and even with the blinds down. The same test was applied in the morning-room, and with the same results. In his opinion, the building of the defendant's house had not interfered with the comfortable enjoyment of the plaintiff's use.

Cross-examined, He was of opinion that the value of plaintiff's house had not diminished at all by reason of the defendant's building. He really thought that the value of the plaintiff's house had been enhanced by reason of having alongside it such a handsome and comfortable house. In answer to his lordship's witness said he did not deny that there was some obstruction to the light of the plaintiff's living-room window.

Mr. L. R. Vigers, surveyor, also gave evidence to the effect that, although the defendant's building had obstructed some of the light formerly coming to the plaintiff's rooms, there was a sufficiency of light for all ordinary purposes.

Mr. E. B. P'Anson and Mr. E. Monson, architects, also gave evidence on behalf of a defendant.

At the close of the evidence Mr. Stewart Smith addressed his lordship, contending that a decision of the House of Lords in the case of the Home and Colonial Stores v. Colls reversed this case, and that judgment should be for the defendant.

Mr. Justice Kekewich said that the decision of the House of Lords in that case had created a large number of judges, including himself, as regarded some misconception as to a law relating to ancient lights. He should go no further than that with Mr. Stewart Smith's contention.

was adopted, the other side were unable to agree to that being done.

His lordship: Of course they are entitled to thrash the matter out in their own way.

Mr. Stewart Smith, K.C., said his real difficulty was this:—If the surveyor gave an opinion, there would be no means of testing the grounds upon which he gave it, and it might be very important, if the case was discussed elsewhere, to ascertain the grounds upon which any damage was alleged.

His lordship: Very well, you must deal with it in your own way, but I cannot help thinking you are very foolish.

Mr. Lawrence: The only question remaining is when will it be convenient for your lordship to go on with the case.

His lordship: I will take it to-morrow week, and fix nothing else for that day.

EMPLOYERS' LIABILITY ACT: QUESTION AS TO PACKING AND FENCING SAW BENCHES.

AT the Marylebone County Court on the 11th inst., before Judge Stonor, George Smith, a builder's machinist, 2, Chichester-road, Kilburn, N.W., brought an action, under the Employers' Liability Act, against Mr. William Giles, builder and contractor, Macroom-road, Paddington, W. The plaintiff claimed 423s. damages, in respect of personal injuries, alleged to have been caused owing to negligence on the part of the defendant or his servant or servants.

Mr. E. Abinger, counsel, appeared for the plaintiff, and Mr. W. Shakespeare, counsel, for the defence.

Plaintiff's counsel stated that his client had been in the defendant's employ, and met with the accident in question while engaged in cutting rebates in long window sills, by means of a large circular saw. The cut was required to be 5 in. deep, but the only available saws on the job were one 13 in., and another, 28 in., in diameter. The former was too small for the work, while the latter, even when the bed of the bench was raised to its full extent, left the saw 7 in. above the bench. He asked the foreman what was to be done, and was told to "pack" the bench 2 in., so that the saw would cut only 5 in. deep. Under the supervision of the foreman the bench was so packed, and the foreman assisted in pulling the sills through the machine. They had just finished one of the cuts when the strip of wood slipped off the packing-piece. The plaintiff was in the act of replacing the strip when, it appeared, the length was raised, and three fingers of the man's left hand were caught by the saw and completely cut off. Counsel said his case would be that, although the plant might have been perfect in itself, it was defective, by reason of the packing being required, and he also contended that there was negligence on the part of the defendant in not providing a guard or fence for the bench.

Medical evidence having been given as to the man's injuries,

The plaintiff bore out counsel's opening statement. He added that he had had some twenty-one years' experience in the trade. There was a "hood" above the bench, but this left the saw quite "naked." It was usual in the trade to have several different sized saws in the shop.

In cross-examination, the plaintiff said it was not customary in the trade to use packing, either on rising and falling benches or those with a fixed bed. If, however, packing were used, it was usual for the machinist to select and arrange it himself. The foreman on the job in question was not a machinist, and he (plaintiff) arranged the packing. Prior to the accident he told the foreman that a smaller saw would be required, and the foreman promised to get one suitable for the job.

George Bartlett, builder's machinist, said he had had about thirty-five years' experience in the trade. Witness maintained that at least half a dozen saws of different sizes should be kept for such work, and that all circular saws should have guards upon them.

William George Watson said that he had had about seventeen years' experience as a machinist, and that of late years it had been the custom to use guards on saw benches.

For the defence, Mr. Walter Fish, of the firm of Fish and Son, builders' machinists, Curtain-road, E., said he had had about thirty-five years' experience in the business. For the work in question he did not consider that a guard was necessary, because the top of the saw was completely embedded in the wood until the cut was made, and then the machinist had no need to touch the wood.

Cross-examined, witness said that the object of the rising and falling bench was to obviate the necessity for packing.

Mr. Stanley F. Prest, engineer, Suffolk-lane, Cannon-street, E.C., said that, when visiting shops on the continent, in America, and also

in this country, he had found that there was no invariable practice in the trade as regarded the use of the guards. All guards to circular saws were more or less modern inventions, and a guard for fixing at the back of the saw—like one produced—was one of the latest developments of the invention.

Counsel for the defence submitted that an employer was not bound to look out for and adopt every fresh invention for the safety of his men, such as the guards in question, and that the omission of the defendant to provide such a guard did not amount to negligence within the meaning of the Act, but only meant that he had not adopted one of the latest improvements. Counsel also pointed out that there was no evidence as to the plaintiff having complained about the absence of a guard.

Counsel for the plaintiff said he did not suggest that an employer should adopt every new contrivance for use in his work, but he submitted that employers were under the legal obligation of using all ordinary precautions for the safety of their men, and that the defendant in the present instance had failed to do so.

The judge said that, in view of the extremely important questions raised by this most difficult case, he must take time to consider his decision.

PAVING APPORTIONMENT DISPUTE.

THE case of Scott v. the Investors' Property Corporation came before a Divisional Court of King's Bench, composed of the Lord Chief Justice and Justices Kennedy and Phillimore, on the 12th inst., on a case stated by the magistrate of the North London Police Court on a point of law under the Metropolitan Local Management Act, 1855.

The case stated that Scott was a paving rate collector to the Hackney Borough Council, which was the paving authority for the district. The respondents were the owners of No. 22, Tyssen-street. In July, 1903, the Council resolved to make up and pave Tyssen-street as a new street, and an apportionment was duly made, the sum of 26s. 9s. being apportioned upon the respondents. The street adjoined the North London Railway. The respondents were taken to recover the amount.

The part of Tyssen-street in question is situated on the south side of the railway, to which it runs parallel. The north side of the street was supported by a retaining wall abutting on the railway, which is 9 ft. below the level of the street. Before 1880, when the houses were erected, the site occupied by the street was surplus land belonging to the railway company, who sold to the respondents' predecessors-in-title, and they filled up the land and got the permission of the Metropolitan Board of Works to lay out Tyssen-street as a new street 20 ft. in width. The houses were then erected, including the one in question, of which the respondents were the occupiers for the residue of a term of ninety-nine years. No part of the wall was included in any of the leases of the houses abutting on the street. No sun had been apportioned in respect of the retaining wall. At the hearing it was contended, on behalf of the respondents, that their predecessors-in-title were the owners within the meaning of section 250 of the Metropolitan Local Management Act, 1855, of the retaining wall, and that the apportionment was bad by reason of the omission to apportion on them any part of the cost of paving the street. For the appellants it was contended (a) that the land did not abut on the street, by reason of its being at a lower level; (b) that the land on which the retaining wall was built, not being capable of producing a rack-rent, was *extra commercium*; and (c) that the wall, having been built with the object of supporting the highway and being essential to the user thereof, and the highway having been dedicated to the public, the wall was part of the road, and vested in the appellants as the highway authority, and the predecessors-in-title of the respondents had no longer any beneficial ownership in it. The learned magistrate was of opinion that the ownership of the land on which the retaining wall was built remained vested in the respondents' predecessors-in-title, and that the land on which the street was made, having been artificially raised, the contention that the land belonging to the said predecessors-in-title did not abut on the street, by reason of its being at a lower level, was not maintainable. He also held that there was no evidence before him to show that the land and wall had become vested in the appellants as the highway authority. He further held that the land and wall thereon were not incapable of commanding a rental, and that the case fell within the principle of Williams v. the Wandsworth Board of Works, and he therefore dismissed the summons. Hence the

present appeal, the question being whether the magistrate's determination was right in point of law.

Mr. Horace Avory, K.C., appeared for the appellants, and Mr. Macmoran, K.C., and Mr. C. Glen for the respondents.

At the conclusion of the arguments the court dismissed the appeal, holding that the decision in *Williams v. the Wandsworth Board of Works* governed the point in question.

PATENTS OF THE WEEK.

APPLICATIONS PUBLISHED.*

13,835 of 1903.—R. STANLEY and STANLEY BROS., LTD.: *Waste Fittings for Sinks.*

This invention relates to waste fittings for sinks, the object being to provide a waste plug which fits perfectly tightly in the waste hole without the aid of cement, or the like, and which is capable of being removed at any moment for the purpose of cleansing or for any other object. The invention also enables the gully to be easily detached, the same being held up against the sink bottom by the waste plug, or a projection thereof, and connected by a Stanford or other non-prominent joint with the waste pipe. According to the invention the hollow waste plug carries a threaded nozzle which projects downwards, and engages with a corresponding thread inside the top of the gully. Should the latter be made of stoneware, the thread will be round, and of a quick type, but a cast-iron gully may sometimes be used, in which case, the thread, although preferably a fast one, would be smaller. Before applying the plug, the seating connecting the mouth of the waste hole is provided with a rubber or other water-tight ring.

16,072 of 1903.—J. G. SHIDDER: *Jointed Connections between the Flush and Discharge Pipes to Closets and other Arms and Outlets for same.*

Connections between the new and old work for flush or discharge pipes for closets, lavatories, and the like, comprising a rubber ring having wedge-shaped elevation with scarfed joint, a metal staple passing through two holes, one in each side of scarf so as to secure the ring in position on the pipe or arm ready to receive a metal back ring with wedged and beaded projections made in two parts, with jointing lugs and screws, and two or more slotted arms made on this ring for the bolts to pass into, a metal expanding ring, provided to pass round the arms or pipes, with hooked eye-bolts and nuts for securing the same into position. On this ring two or more loose eye-bolts are fixed, which pass into the slotted lugs on back ring, when these nuts are screwed up the scarf rubber ring is forced into position, thus making a water or air-tight joint.

16,372 of 1903.—W. THOMSON: *Pulley Fittings for Carrying Sliding Doors, and the like.*

Pulley fittings for carrying sliding doors, and the like, consisting of a frame formed with two parallel bars, with projecting down end stop pieces, and having a transverse stop stay bar.

18,064 of 1903.—J. E. WILLIAMS: *Cement for Use in Repairing Retorts, and for like purposes.*

This invention has for its object to produce a fireproof cement, specially suitable for repairing retorts, crucibles, and other objects subject to very great heat. According to the invention the cement is made of the following material—viz., magnette, a species of iron ore, china clay, barytes, silicate of soda, and borax. The proportions are, by preference 25 per cent. of ore, to 75 per cent. of the remainder, the actual quantities of which latter may be, for example, 200 cwt. of china clay, 100 cwt. of barytes, 40 gallons of silicate of soda (100 twaddle), 24 gallons of water, and 25 lb. of borax. In making and using the cement the various materials are first well mixed together, and then applied to the object to be repaired in like manner to applying mortar to brickwork.

18,200 of 1903.—J. DANSETT: *Ceramic Tiles, Plates, Panels, and the like, and the Method of Manufacturing same.*

A method for the manufacture of trussed ceramic tiles, plates, and the like, in which metal network is placed vertically and centrally guided between revolving cylinders or gypsum, or the like, and the ceramic paste is fed by conveyors above the cylinders to each side of said network, so that on revolution of the cylinders the paste is caused to adhere to both sides of the network, the latter thus enclosed in the paste being guided on to an inclined path formed by closely-placed, freely-revolving rollers.

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

21,654 of 1903.—D. DONE and C. BRAWN: *A Lock, Principally Applicable to Expanding or Collapsible Gates, used for Closing the Openings of Lifts, Shop Fronts, Gateways, and for other purposes.*

A lock for doorways, gateways, and other openings, consisting of a pivoted latch, or bolt, which is capable of engaging a stud or recess provided on one part of the opening to be closed, and which is capable of being turned back within the lock case, and retained therein when the gate or door has been opened.

24,331 of 1903.—D. M. BARNETT: *A Gauge and Scribing Tool.*

A scribing tool for carpenters, plasterers, and others, consisting of a number of wires, rods, or needles arranged parallel to each other within a holder or frame in combination with a presser plate; a metal bearing plate engaging therewith and having forked ends engaging with said bearings or supports of said frame; a pressure spring bearing upon said bearing plate and a set screw or its equivalent.

24,951 of 1903.—D. McLEAN: *Chimneys, and Means for Preventing Smoking.*

This consists in providing a chimney with one or more upwardly inclined outlet passages, having open ends and arranged in any convenient position between the top of the chimney and the fireplace from which the chimney extends.

26,007 of 1903.—W. BROTHERS: *Manufacture of Crystalline Gypsum, Applicable for Filling purposes.*

A process of preparing a loose crystalline mass of calcium sulphate ($\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$) known as pearl hardening satin finish, crystal finish, or by other name, from calcium sulphate, comprising the cooking or boiling of such calcium sulphate in the presence of water, or in an aqueous solution, cooling the crystals so formed before removing the water, and agitating the mass during the process of cooling, to cause such crystals to form or precipitate separately, and subsequently removing the water and drying them.

26,313 of 1903.—W. H. GLASER: *Adjustable Scale for Use with Scribing Blocks, and the like.*

An adjustable scale for use with scribing blocks, and the like, which consists essentially of a scale, mounted upon a base, and a plane-working surface, in such a way that relative motion is possible between the scale and the base, the divisions being parallel to the plane-working surface of the base; and the scale being furnished with an endless numbering band, arranged so that any selected numeral can be brought opposite to any selected main division of the scale.

9,992 of 1904.—W. J. EDLAND: *Windows or Casements.*

This relates to the construction of windows, casements, fanlights, skylights, and the like, with an outer frame and an inner or glass frame, said inner frame being hinged or otherwise suitably mounted on a cranked bar pivoted to the outer frame.

9,762 of 1903.—A. DREES and E. LIENSCH: *Pipe and like Joints, and Means for Securing the same.*

A packing for wrought-iron flanged or bell-mouthed pipes, having funnel-shaped enlarged sleeves, consisting in the combination of an internally suitably tapering or conical, or like shaped clamping, mounted on the tapering bell-mouth, with a clamp ring, mounted on the smooth end of the tube, and provided with an annular rib projecting towards the interior of the sleeve.

11,379 of 1904.—L. PARTI, G. KÁROLYI, and E. PARTZ: *Means for Generating Heat and Applying it for Useful Purposes.*

Means for generating heat by the addition of water, consisting of burned lime, to which are added either separately or in groups, potassium carbonate, magnesium carbonate, sodium phosphate, calcium phosphate, sodium nitrate, and sugar.

11,012 of 1904.—F. REHFUSS: *Ceiling Blocks.*

Ceiling stones, rhomboid or quadrate in form, having parallel abutments by means of which they are pushed, dovetailing into each other for the construction of flat ceilings, and also having one or more corners truncated.

11,738 of 1904.—T. JONES: *Construction of Panic Bolt for Doors.*

A panic bolt, adapted to retain single or double folding-doors in a closed position until pressure is applied on the side from which immediate ingress is required, consisting of a combination of a push element which is guided to slide normally to the surface of the door, to links extending in opposite directions, which links are pivoted to the push element, and two bolts, pivotally connected to

the side links, which bolts are guided to move in a line parallel to the surface of the door, and arranged to recede from, or approach one another, when actuated by the movement of the push element transmitted through the links, the relative situations and proportions of the parts being such that, in the outward extreme position of the push element, corresponding to the closed and fastened position of the door, the links are approximately in line with one another and nearly parallel to the line of motion of the bolts.

11,713 of 1904.—F. NORDMANN and F. SAUERLAND: *Water-closets.*

A water-closet ventilation, frost proof, and without stagnant water, characterised by the service pipe passing into a two-way valve, which, when the closet is used, automatically lets the water pass on to the cistern, and causes the water left between the two-way valve and the cistern to run off into the drain, so that every time the closet is used, the weight applied to and removed from the seat brings about the filling and the complete emptying of the pipes and cistern exposed to frost.

13,950 of 1903.—T. BRETHERTON: *Paving Blocks.*

A paving block, consisting of an iron casting resting on supports, and studded over on its upper surface with iron projections, and formed with dovetailed or toothed edges and perforations for wooden blocks, the whole being held together and filled up solid with a suitable filling material.

14,000 of 1903.—J. STEPHENSON: *A Building Block.*

A building block, made in accordance with this invention, is formed of two headers and two stretchers enclosing a central cavity or opening. The width of the block is equal to the thickness of the wall to be built, and the blocks may be provided with a spigot or projection at one end, and a socket or recess at the other, to interlock or bond with each other.

18,090 of 1903.—J. L. FERRELL: *Fireproofing Compounds, and the Art of Making the same.*

A process of making a fireproof compound, which consists in mixing with four parts of a 45 Baumé aqueous solution of sodium silicate, one part of a 24 Baumé aqueous solution of sodium chloride, and adding to said mixture one part of a 25 Baumé aqueous solution of sodium hydrate, and adding to such mixture sufficient water to reduce the same to 20 Baumé.

18,092 of 1903.—J. L. FERRELL: *Fireproofing Compounds, and the Art of Making the same.*

A process of making fireproofing compound, which consists in making an aqueous solution of aluminum sulphate, and mixing with said solution an organic acid capable of obviating the discoloring effect of said salt *per se* in the presence of iron.

19,534 of 1903.—G. H. WARREN and S. FONTAINE: *Construction of Storage Tanks, Bins, Silos, and the like.*

A storage tank, characterised by having an outer casing and an inner casing spaced apart, the inner casing being formed of fireproof bricks, having channels formed therein, plastic binding means arranged in said channels, binding bands embedded in the plastic binding means in the channels, and braces between the inner and outer casings.

6,825 of 1904.—D. D. McBEAN: *Sheet Piling for the Support of Excavations.*

A composite sheeting, comprising a plurality of similar rectangular timbers of varying lengths, secured edge to edge, the edges of the sheeting being provided respectively with a tongue and a groove, and the entering end or point of the sheeting being tapered across its width, and provided with inclined shoulders at one edge.

6,829 of 1904.—D. D. McBEAN: *Method of and Means for Forming Foundations for Cofferdams, and the like.*

This relates to excavation work, consisting in the combination of piles driven into the bed of the excavation, a frame supported upon the same, and having wallings serving as sheeting guides, series of piles in and along the banks of the excavation outside the sheeting walls, and sheeting-driver platforms mounted thereon.

7,756 of 1904.—H. SPATZ: *Manufacture of Fireproof Stone or Stoneware and Mortar.*

The manufacture of artificial stone or stoneware from finely-divided quartz, or other suitable silicious mineral, and a calcareous binding medium, adapted to form silicates of lime, which consists in using as a binding medium a mixture of the said calcareous substance with waste liquor obtained from the manufacture of chemical wood cellulose.

542 of 1904.—R. J. GODDARD: An Asphaltic Mosaic Flooring or Paving Composition. An asphaltic mosaic flooring or paving, consisting of a mixture of white asphalt, incorporated in a heated state with pieces of marble, limestone, spar, slag, or other suitable material.

580 of 1904.—N. R. GRIMM: Two-Story Tenements. A two-story tenement, having a basement or cellar, a light shaft accessible therefrom, a driveway leading from the basement or cellar to the second floor, and disposed partly in the light shaft and partly in the first floor, and cover for that portion of the stairway which is in the light shaft.

1,518 of 1904.—J. RUDIGER: Self-acting Flushing Cistern, with Periodical Discharge. A self-acting flushing cistern for the periodical discharge of water, comprising in combination a tank, a syphon vertically arranged in said tank, a vertical inflow branch at one end of the syphon provided with an opening for the escape of air, and a vertical outflow branch at the other end of the syphon, passing through the bottom of the tank, a narrow tube in the centre part of the syphon extending above the curvature of the same, an air escape in said narrow tube, and a narrow tube connecting the centre part of the syphon and the outflow branch.

1,565 of 1904.—J. DRAENERT: The Method for the Manufacture of Bricks, Building Blocks, and the Like, and Apparatus therefor. A method for the manufacture of bricks, building blocks, and the like, with strengthened edges and corners, in which a mould is first completely filled with suitable plastic material, hereupon the latter is compressed to a certain degree at the edges and corners of the mould by means of a frame-like stamp or die, the space thus produced in the mould by such compression being then again filled with plastic material, and subjected to a final compression.

ASHBY-BY-BRIGG (Lincolnshire).—For additions to elementary schools, for the Lindsey County Council Education Committee. Messrs. Scorer & Gamble, architects, Bank-street-chambers, Lincoln. Quantities by architect:— A. Watson, £2,233 0 0 W. Pallister £1,750 0 0

ASHBY PUERORUM.—For additions to Elementary School at Ashby Puerorum, near Horncastle, for the Lindsey County Council Education Committee. Messrs. Scorer & Gamble, architects, Bank-street-chambers, Lincoln. Quantities by architect:— K. Miller £156 10s 6d Hensman Bros., Horn-castle* £141

BLACKWOOD (Mon.).—For new Primitive Methodist Chapel, for the Trustees. Mr. R. L. Roberts, architect, Abercarn. Quantities by architect:— J. Dean & Son £1,437 12 0 E. Williams £1,175 0 0

BRAMFIELD.—For enlarging infants' room and building entrance porch and cloakroom, for the Managers of Bramfield (Non-provided) School. Mr. Arthur Pells, architect, Beccles. W. P.H.S. £220 W. Woodyard £212 0 0

KEASDEN.—For water supply works, for Settle Rural District Council. Mr. T. A. Foxcroft, Engineer and Surveyor, Town Hall, Settle:— Contract No. 1. Reservoirs and Pipe Laying, etc. Contract No. 2. Collecting Wells, etc.

KELLING.—For farm buildings, Kelling, Norfolk. Mr. T. Ingle Gollie, architect and surveyor, Bank House, Kelling, Norfolk. Messrs. J. W. Weston, £442 13 0 H. Bullen £295 0 0

LLANSTYLLIN (Oswestry).—For repairs, alterations, and additions to buildings at Ty-Tela, for the Town Surveyor, Guildhall, Oswestry. Quantities by Borough Engineer:— J. E. Morgan £294 9 6 J. Higgins, Oswestry* £137 0 0

LONDON.—For erecting an operating room, etc., at Infirmary, St. Dunstan's-road, Fulham Palace-road, W. for the Fulham Guardians. Mr. A. Saxon Snell, architect, 22, Southampton-buildings, Chancery-lane, W.C. Quantities by Mr. W. T. Patten:— C. Deering & Son £1,350 0 0 Mattock & Par-cowley & Drake £1,173 16s 6d

LONDON.—For extensions to the Town Hall, Horwood-road, Fulham, for the Borough Council. Mr. Francis Wood, Borough Engineer, Town Hall, Fulham. Quantities by Mr. T. Woodbridge Biggs, 10, Clifford's-tun, Temple Bar, E.C.:— F. G. Minter, Ferry Works, Putney* £22,172

LONDON.—For Magirus' turntable long ladders, for the London County Council:— J. Morris & Sons* £675

LONDON.—For the reconstruction of the bridge carrying Kingsland-road over the North London Railway near Dalston Junction, for the London County Council:— Padrette & Co. £14,250 0 0

LONDON.—For 1,000 hydrant indicator tablets, for the London County Council:— S. Pontifex & Co.* £120

LONDON.—For the renewal of the gearing of the penstocks at the outlets of the Essex-street, Norfolk-street, and Savoy-street sewers into the River Thames, for the London County Council:— Goddard, Massey, & Warner £252 14 6

LONDON.—For the supply and fixing of cases on hauldrails in a portion of the south gallery of the Horutman Museum, for the London County Council:— W. Ford & Co.* £117 7 0

LONDON.—For the execution of certain works at No. 18, Lancing-street, St. Pancras, for the London County Council:— R. Harding & Sons, £400 T. Laphorne & Co., Barlow & Roberts 310 London* £269

LONDON.—For provision of additional electric cables, for the London County Council:— The British Insulated and Helsby Cables, Ltd., at prices 7 1/2 per cent. above those specified in the contract entered into with the company.*

LONDON.—For works at Eagle Wharf, Narrow-street, for the Stepney Borough Council:— Parrot & Isom £1,537 17 6 Harris & F. & F. Wood 1,185 0 0 Wardrop £1,065 0 0

CONTRACTS.—Continued.

Table with 4 columns: Nature of Work or Materials, By whom Advertised, Forms of Tender, etc., supplied by, and Teniers to be delivered. Includes various construction contracts such as 'Inishing Union Infirmary', 'Building Torr Bdge, Yealton & Newton Patters', etc.

PUBLIC APPOINTMENTS.

Table with 4 columns: Nature of Appointment, By whom Advertised, Salary, and Applications to be in. Lists appointments such as 'Assistant Electrical Engineer', 'Assistant Town Treasurer', etc.

Those marked with an asterisk (*) are advertised in this Number. Competitions, iv. Contracts, iv. vi. viii. x. Public Appointments, xvii. xix.

TENDERS.—Continued from page 107.

ONDON.—For the erection of the superstructure of first portion of the Greenwich generating station, erection of the pump-house, etc., for the London City Council.— Messrs. H. Lovatt, Ltd., at a reduction of 1/4 per cent. on the schedule rates, under their existing contract with the Council.

LONDON.—Alterations to No. 41, Kingsland-road, Shoreditch, N.E., for Messrs. Thos. Eaton & Co. Mr. John Jas. Downes, architect, 199, Lewisham High-road, S.E.:— W. O. Collingwood... £547 | R. Schooley & Son*... £511

LONDON EDUCATION COMMITTEE TENDERS. For painting or cleaning schools during the summer holidays, 1904.— City of London, Great-lane (Cleaning Interior). G. Barker... £223 10 | J. Appleby & Sons £183 0

Fulham, St. Dunstan's-road (Cleaning Interior of Main School and Painting Interior and Exterior of Special School). W. Hammond... £674 | Lathey Bros. £375

Additional tender notices and company information at the bottom of the page, including 'North Lambeth, Addington-street' and 'North Paddington, Amberley-road'.

Iron and Steel.

OME interesting figures are to be found in the annual return, issued last week as a House of Commons paper, relative to the production and consumption of iron and pig iron and the production of steel in the United Kingdom and the principal foreign countries. In this particular instance "the imports and exports of certain classes of iron and steel manufactures" have been included. Most of the figures are given only to the end of the year 1902, but the imports and exports are carried on to 1903. The statistics to which we refer demonstrate striking advances made in the production of iron ore by various countries. During 1902 the quantity of iron ore mined by the United Kingdom and Germany increased by more than one million tons in each case, while the output of the United States exhibited a rise of nearly seven million tons. So far as can be judged by the returns for 1903, it appears that the United Kingdom has advanced by about 300,000 tons, and Germany by 3,000,000 tons, while the United States has lost ground by nearly 900,000 tons. Other facts worthy of note are that the output of Sweden has increased threefold since 1891, and that one-third of the ore used by the iron and steel manufacturers of this country is imported from abroad. Even the most

cursorious view of the foregoing statistics is sufficient to indicate that our position is anything but satisfactory.

We will now turn to the figures relating to pig-iron, which show that, comparing the years 1901 and 1902, the production in the United Kingdom and Germany was greater in each case by about three-quarters of a million tons, while in the United States there was an upward bound of nearly 2,000,000 tons. From the preliminary figures given for 1903 it appears that there has been little movement in the production of this country and the United States, but that an increase of 1,500,000 tons has been effected in Germany, thus placing that

From this statement, it is clear that the United Kingdom, having been long since surpassed by the United States, is now definitely relegated to the third place among the nations, so far as the production of pig-iron is concerned. What the future may bring forth we do not predict, but there seems to be little ground for hope in the statistics here quoted.

With regard to steel, the position is even more unsatisfactory, in spite of the fact that in 1903 the production amounted for the first time to more than 5,000,000 tons. The following is a statement of the production for the leading countries during the years 1900 to 1903:—

Country.	Total Production (in Thousand Tons).			
	1900.	1901.	1902.	1903.
United States	10,188	13,474	14,947	Not known.
Germany	6,261	6,107	7,302	8,660
United Kingdom	4,901	4,904	4,849	5,034

country for the first time in front of the United Kingdom. The figures for the three countries during the period 1900-1903 are stated below, the records for other countries, being individually of comparatively little importance, are not included in the table.

It will now be instructive to supplement the foregoing statistics with others dating back to the year 1876, so that we may be in a position to judge more accurately the developments that have taken place during the last quarter of a century. As a matter of convenience

Country.	Total Production (in Thousand Ton).			
	1900.	1901.	1902.	1903.
United States	13,789	15,878	17,821	18,009
United Kingdom	8,960	7,929	8,680	8,811
Germany	8,370	7,740	8,381	9,860

we take the figures from the Report of the Tariff Commission issued last week. The data therein given are based on British and foreign official returns, and therefore may be accepted as authoritative. The following table gives the average annual production for the three leading countries and for the whole world between 1876 and 1903.

AVERAGE ANNUAL PRODUCTION OF PIG-IRON (IN THOUSAND TONS).

Period.	United Kingdom.	Germany.	United States.	All Countries.
1876-80	6,660	2,140	2,200	14,810
1881-85	8,100	3,340	4,260	20,100
1886-90	7,760	4,130	7,080	23,640
1891-95	7,040	4,990	8,130	26,210
1896-1900	8,890	7,310	11,490	35,590
1901	7,930	7,740	15,880	40,230
1902	8,680	8,260	17,820	43,840
1903	8,810	9,850	18,000	47,340

Examination of this table shows that at the end of the seventies the total amount of pig-iron produced in this country was about 55 per cent. more than the combined output of Germany and the United States, and nearly half the total output of the world. At the end of the eighties the production of the United Kingdom was little more than that of the United States, only two-thirds that of the two next countries, and less than one-third that of the world. In other words, the output of pig-iron had increased by only 17 per cent., while the output of Germany and the United States had increased by 93 per cent. and 175 per cent., respectively.

Early in the nineties the United Kingdom lost the premier position, and the United States took the first place, while, more recently, Germany has usurped the second place. In 1903 the output of the United States was nearly equal to the combined output of Germany and the United Kingdom, and approached almost to two-fifths of the entire production of the world, while the output of this country was less than one-fifth of the total production of the world. Further, it is evident that in the United Kingdom the production of pig-iron has been almost stationary, and has in fact done no more than keep pace with the growth of population, while the reverse has been the case in Germany and the United States.

Turning next to the case of steel, we have the following data:—

AVERAGE ANNUAL PRODUCTION OF STEEL (IN THOUSAND TONS).

Period.	United Kingdom.	United States.	Germany.	All Countries.
1876-80	1,020	810	510	3,060
1881-85	1,970	1,850	1,070	5,880
1886-90	3,270	3,290	1,790	10,630
1891-95	3,080	4,670	2,780	13,070
1896-1900	4,660	8,450	5,620	23,250
1901	4,900	13,470	6,290	30,530
1902	4,850	14,940	7,650	35,890
1903	5,030	(not known)	8,700	(not known)

Consideration of these figures makes clear some very striking facts. Thus, in the seventies the production of steel in this country was one-third that of the entire world, while at the present time it is less than one-seventh. Notwithstanding the largely increased demand for steel, production remains almost stationary so far as the United Kingdom is concerned, while the production of other countries has advanced by leaps and bounds.

We refrain from adducing other figures, because those already given are sufficient to indicate the eminently unsatisfactory condition of the British iron and steel industries. The whole subject is one that deserves the most earnest consideration from a national standpoint, without political bias of any kind. In the recent report of the Tariff Com-

mission our readers will find an immense and invaluable collection of facts, furnished by men who are practically engaged in the manufacture of iron and steel, and whose opinions have been solicited without regard to their political creeds. The Commission is in no way political, and it includes members representing all shades of opinion. It was established for the purpose of obtaining facts which could only be secured by the consent, approval, and assistance of all branches of the iron and steel trades in the country. The information so elicited is presented in the form of a voluminous appendix to the report, to which we can make only a few brief references.

The relative decadence of the British iron and steel industries appears to be further confirmed by the replies received in answer to inquiry forms supplied by the Commission. There is a fairly general consensus of opinion as to the severity of foreign competition in the home market, the progressive substitution of foreign for British-made materials, the loss of foreign markets, and the increase of foreign competition in British dominions across the seas. It was but natural that foreign countries, possessing the raw materials in abundance, should commence the manufacture of iron and steel, and that they should adopt the methods of production first established in the United Kingdom. Foreign countries have made it their business to foster national industries and to secure their home markets, from which British pro-

ducts have been virtually excluded. During recent years their policy has been to capture the home, colonial, and foreign trade of the United Kingdom, and evidence before the Tariff Commission indicates clearly that this country is merely at the beginning of foreign competition, which is likely to become more and more severe as time goes by.

Various reasons have been suggested for the relative decline of the iron and steel industry. These we will now con-

sider in the light of information afforded by manufacturers.

One natural disadvantage is that a proportion of the ore required has to be imported from other countries. The evidence of witnesses shows, however, that the adequate supply of iron is largely a matter of organisation, and in respect of distance the United Kingdom is under no disadvantage as compared with her most formidable competitor, and that the coal supply is fully equal to that of any other country in the world. The evidence tendered to the Commission leads to the conclusion that no natural conditions have been sufficient to account in any way for the loss of supremacy which has taken place.

With regard to the question of technical education, the conclusion to be drawn from the evidence is that, including under technical and higher education thorough training in the policy and methods of organisation of foreign countries, the British iron and steel trades have suffered somewhat from the lack of instruction in such subjects, though not to such an extent as to account materially for the ground lost. It is shown, further, that in the higher branches of the industries, where scientific training is most important, British manufacturers are efficiently served. Nevertheless, we are of opinion that the many excellent institutions already existing should be further extended and supplemented by new educational agencies, particularly of the types that have been so admirably described in the reports of Dr. Rose, British Consul-General in Stuttgart. Among other causes detrimental to the British manufacturer are the heavy burdens of local rates, the cost of labour, and excessive rates charged for transport. None of these, however, appear adequate to account for the demoralisation which has marked recent years. Numerous witnesses believe that the difficulties which the British iron and steel trades suffer are chiefly due to the organisation and policy of foreign countries combined with the system of free importation.

All the manufacturers examined placed particular emphasis on the importance of continuous operation and large output as the best means of securing the lowest cost. As typical examples of economy, the following are selected from the evidence of witnesses:—

(a) The saving in the production of steel from pig-iron due to increased output is shown by the figures for two periods, one of which the average production was 2,293 tons and in the other 10,630 tons. The saving in wages, coal, and general charges amounted to £1,000 per ton, equivalent to a total saving of about 45,000*l.* a year.

(b) In the case of another steel works the difference of cost at full work was half work—taking into account the cost of pig-iron, and other materials, as well as depreciation and all charges—represented the following savings:—on 15s. 6d. per ton, on bars 22s. per ton, and on plates 32s. per ton.

Costs vary week by week and month by month, according to the output, but many witnesses have stated their opinion that, under equal conditions of Free Trade or Tariff, British iron

urers could hold their own with any competitor. The necessity for working short time is, in their opinion, the most severe circumstance which has to be encountered. These witnesses state that foreign countries, and particularly Germany and the United States, have not only grasped the truth of this proposition, but have made it the basis of their export organisations. Such organisations are effected (1) to the control of home markets by protective tariffs, (2) to the granting of preferential export rates by land and water, and (3) to the establishment of trusts and kartels, intended to govern the operations of different industries on a broad and comprehensive scale, to secure home markets, and to foster export trade.

These three causes combine to deprive British iron and steel manufacturers of work which would enable them to reduce the cost of production by keeping their works fully and continuously employed. Foreign systems are skillfully designed and ably administered, not only for the benefit of foreign manufacturers in the home markets, but are stretched in every available way against British manufacturers who have to fight tariff walls abroad and unfairly reduced prices at home.

The manner in which unfair prices are secured in the United Kingdom is by the practice of what is known as "dumping," involving a most efficient organisation for securing maximum output and continuous running, foreign countries, by producing iron and steel at the minimum cost, and keeping up prices at home, can afford to deliver the surplus to the British market at any price it will fetch. In the opinion of numerous witnesses examined by the Tariff Commission, the openness of the British iron and steel industry to attacks of this nature is the principal cause of its existence. As illustrations we quote the following examples:—(a)

February last German steel joists were offered in Antwerp for shipment at 80s. 6d. per ton, the estimated net cost being 90s. 6d. per ton. (b) American iron sections, costing at least 81s. 2d. per ton at Pittsburg, were being offered at any British port at 75s. per ton. It may be thought that if foreigners are allowed to lose 10s. or more per ton on their goods, they are very foolish. But they are not really so, as profit is actually made, so long as the export sales amount to less than fifty-nine per cent. of the total output. By means of protective tariffs and the operation of trusts and kartels, the home price in Germany is maintained at 105s. per ton. Hence, 10 tons be sold at 105s. and 59 tons at 80s. 6d., the average price is just equal to the cost of 90s. 6d. per ton; and if the exports be limited to 50 per cent. of the total output, the average price is 92s. 9d. per ton.

The ability of the foreigner to make profit, actually to increase profits by "dumping," is proved by the evidence of a British firm. Last year they produced 1,000 tons of steel at a cost of 95s. per ton. Selling this at an average price of 105s. per ton, their profit was 28,500*l.* If fully employed, the same works would have turned out 152,000 tons, the cost would have been reduced to

90s. per ton. If the extra production of 38,000 tons had been sold at the cost price of 90s. per ton, the profits of the firm would have been increased to 57,000*l.*, owing to the all-round reduction upon cost of production. Thus the surplus of 38,000 tons could have been "dumped" upon any free foreign market, if there were one, at 15s. per ton less than cost, yet without involving any diminution of the original profit of 28,500*l.* This illustration serves to show the worldly wisdom of the foreigner, and indicates the permanence of "dumping" as part of an organised policy. To fight this is clearly the duty of those who are the natural guardians of the most important among British industries. It has already caused serious loss of employment, and brought about a feeling of insecurity throughout the iron and steel industries, which cannot be regarded as counterbalanced by the savings secured by individual buyers of dumped products.

For the evils to which we have directed attention there is one grand remedy, to which everyone in this country would agree—Universal Free Trade. But as foreign countries have deliberately established their tariff walls, for the express purpose of safeguarding native labour and of fostering national industries, they can scarcely be expected to expose these interests to the full force of British competition. Hence it is difficult to avoid recognising that there is some excuse for the contention raised by many iron and steel masters, that the present conditions can be best met by the establishment of an import tariff sufficient to prevent unfair competition on the part of foreign nations. The views of the Tariff Commission—formed after consideration of the evidence given by firms representing 87 per cent. of the persons employed in the iron and steel industries—are fully stated in the Report, where they may be examined at leisure by our readers.

In the appendix to this volume will be found much instructive matter beyond that already mentioned. It includes summaries of articles by Mr. Glier upon "Recent Developments in the United States Iron and Steel Industry," and of evidence before the "United States Industrial Commission on the Iron and Steel Industries," a memorandum on "The Organisation and Working of German Kartels," and a large number of statistical tables. It may be mentioned further that the summary of evidence given in the appendix includes 1,193 paragraphs, dealing with practically every point salient to the subject under investigation.

It would be impossible to over-estimate the value of the work done by this organisation, and whatever may be the political opinions of those who read it, we feel sure all will recognise the important service it has rendered to the nation at large.

SCHOOLS, LEICESTER. New schools, situated in Harrison-road, were opened at Leicester on the 18th inst. It is a one-storied building in two divisions, and is built on the principle of a large central hall, with classrooms round it. The walls are of Whitwick bricks, there is a tiled roof, and two large extraction towers. Mr. Edward Burgess was the architect, and the contractor, Mr. Charles Wright, of Leicester.

NOTES.

The Decoration of the House of Parliament.

THE painful subject of the decoration of the national palace of Legislature was brought up in the House of Lords on Monday by Lord Stanmore, who moved that a Select Committee be appointed "to inquire and report with respect to the unfinished condition of the rooms in the Palace of Westminster appropriated to the service of this House, and their approaches." Unfortunately, to the majority of English members of Parliament, the idea that rooms in a public building are "unfinished" because they have not received the artistic decorations once vainly intended, would not recommend itself as "practical." The temper of the House of Lords is more sympathetic in regard to art, but unhappily they have no control of the purse-string. Lord Stanmore drew a satirical picture of what the foreign visitor would see on entering the House through Westminster Hall: the empty niches, reserved forty years ago for the statues of Marlborough and Wellington, still vacant; the panels surrounded with stone mouldings intended as a framework for mosaic, but only inclosing spaces of blank paper; and so on. Lord Windsor, of course, could only express sympathy coupled with the conviction that it would be hopeless to approach the Treasury on the subject at present; it is always impossible "at present" to spend any money on art; but the future opportunity never arrives. In some other countries it would be considered a national discredit that the most important building in the country, after being up for more than half a century, was still wanting its highest class of artistic embellishment. In this country it is regarded as a trivial matter, and Lord Stanmore's motion was "negatived without a division."

Manchester Ship Canal.

ALL who desire the success of this great undertaking should be pleased to hear of any improvement calculated to encourage traffic. One of the most important proposals of the kind is represented by the project now before Parliament, which contemplates the deepening of the channel by 2 ft. for the whole distance between Manchester and the Mersey. This work is rendered necessary by the fact that many large vessels would be glad to use the waterway, but are at present prevented by reason of insufficient depth in the channel. Although the undertaking will be a costly one, it will result in certain gain to the company, and to those whose interests are more or less directly associated with the prosperity of the canal.

River Pollution.

WHILE recognising the difficulties encountered by local authorities in the important question of sewage disposal, we fear such bodies are not always sufficiently ready to rectify defects which have been clearly established and are known to be detrimental to health. The decision of the Stratford bench, given last week against the Walthamstow Urban District Council, comes as a useful reminder to local authorities that the mere discussion of

complaints, even if attended by the passing of a resolution, is somewhat unsatisfying and inefficacious. In this particular case, the Lee Conservancy Board, having had many complaints as to the pollution of the river, remonstrated with the District Council, and as long ago as 1902 suggested a scheme for taking the sewage right down to the Thames. The Council thereupon passed a resolution and waited further developments. These took the form of a summons for having allowed offensive matter to pass from the sewage farm into the Lea or its tributaries. After taking confirmatory evidence, the magistrates imposed a penalty, which, although comparatively small, should act as a useful stimulus.

Easements of Necessity.—The case of *Ray v. Hazeldine*, reported in the *Law Reports* for the current month, is one that owners of house property should note. The plaintiff was the purchaser of a house adjacent to another house which belonged to the vendor and was retained by him. In the wall of this latter house were two windows, that of a pantry and that of a lauding which overlooked the yard forming part of the premises conveyed to the plaintiff. Neither of these windows was an "ancient light," and no reservation of the right to the light had been inserted in the deed of conveyance to the plaintiff. The plaintiff erected a wall close to these windows completely blocking the access of light to them. The defendant took his own remedy and twice knocked the wall down from his own premises. The plaintiff then proceeded for a declaration that she was entitled to build the wall and for an injunction restraining the defendant from knocking it down, and succeeded, since the court held that, in the absence of any reservation of the easement of the light, the defendant could only succeed if an "easement of necessity" could be set up, and, by reference to former decisions, the court defined an "easement of necessity" to be not an easement without which the property could not reasonably be enjoyed, but one without which it could not be used at all. The learned judge held that this had not been proved, since there was no absolute necessity that the room should be used as a pantry, as it could be used for other purposes. There was evidence the pantry was rendered useless, but that light could be obtained elsewhere for the landings. It is to be observed that, had the "easement of necessity" been construed as one necessary for the reasonable enjoyment of the premises, little distinction would be made between such a case and one where there is a right to "ancient lights."

The Electrical Transmission of Power. It is highly probable that in the immediate future engineers will use very much higher pressures for the transmission of power than they have been employing hitherto, and thus great economies can be effected which will have an important effect on the industry. Ten years ago the pressure of 10,000 volts which the London Electric Company use to transmit electric power from their station at Deptford to the sub-station in Trafalgar-

square was regarded as being practically the extreme limit of the pressure at which it would be safe to work. Engineers now regard 10,000 volts as the normal pressure at which to transmit power. The electrical power, for example, required by the Metropolitan and District Railways and by the various tube railways now in course of construction in London is to be generated and transmitted at 11,000 volts. The cables used for the transmission are all sheathed with lead, and are drawn into cast-iron pipes, or are heavily sheathed with galvanised iron wire, so that the risk to workmen and employés is reduced to a minimum. As a matter of fact, double the pressure could be now safely used with cables and four times the pressure with overhead transmission wires. At Caffaro in the north of Italy the Oerlikon Company of Switzerland have installed plant for a 40,000-volt transmission line, which is now working successfully. Five 4,000-horse-power alternators are used, which produce three-phase currents at a pressure of 10,000 volts. This pressure is then raised to 40,000 volts by means of water-cooled oil transformers, the transformation being effected at a loss of less than 1½ per cent. of the power transmitted. Pressures higher than this are in use in America, and engineers have now plenty of data in connexion with the working of these very high pressure transmission lines. At one time it was thought that the losses would be excessive, as the transmission lines have a faint phosphorescent appearance at night-time and brush discharges take place if there are any sharp edges on the wires. These losses, however, can barely be measured. The Oerlikon Company have transmitted power to their own works for about three years at a pressure of 30,000 volts from the turbines at Hochfelden, a distance of nearly two miles. Although thunder-storms are very frequent, yet there have been no breakdowns, as the Siemens' lightning arrester fulfils its function satisfactorily.

Safety Buffers. SINCE the disastrous accident which occurred in Glasgow some months ago, we are pleased to learn that several sets of hydraulic buffers have been installed at the Central Station in that city, but we do not gather that any have yet been fitted at St. Enoch's station, the scene of the recent disaster. Seven sets have been furnished, however, at King's Cross station, London, and it is to be hoped that the example will speedily be followed by other companies. The type of buffer to which we refer has pistons with a stroke of 7 ft. and is designed to bring to rest, within that distance, a train weighing 400 tons when travelling at the speed of ten miles an hour. The buffers offer a constant retarding effect, and as the pistons are forced in, water passes from the back to the front through holes so proportioned that, as the speed of the train is reduced, so also is the flow of water. Experiments conducted both in London and in Glasgow showed that trains weighing about 370 tons, and moving at the rate of 9.4 miles an hour, could be brought to rest smoothly and without the slightest risk to passen-

gers or rolling stock. Useful as appliances of this kind may be, they should not be allowed to encourage the neglect of improved brakes, which are so urgently required on nearly all British railways.

Electric Tramways for North London. FURTHER evidence is afforded of the change gradually being effected in the suburbs of the Metropolitan, by the opening of an electric tramway between Finsbury Park and Tottenham. The work, which has done so much for the benefit of the people, by destroying the rural character of many delightful districts in the south and west, is now being extended to the north. The tramway routes, transferred in 1901 to the Metropolitan Electric Tramway Co., are being actively converted to electric traction. But these routes represent only a small portion of the electric lines in course of completion, for the company have in hand a network comprising some forty miles of track, many lines of which are almost ready for traffic. A large generating station is already erected near Enfield, and sub-stations, in course of equipment at Edmond Wood-green, Finchley, and Hendon. Taking into account the lines belonging to the company and those to be operated in agreement with the Middlesex and Herts County Councils, it is easy to see that the most pleasant places in the northern districts will soon become enjoyable than they have been. But change is inevitable, and that it will be for the good of the greatest number one can doubt.

The Working Men's Council make an appeal to the College. PROFESSOR DICEY and his colleagues have made an appeal for contributions to an estimated amount of 8,000l. to enable the college to carry out its extending work in new buildings that have been begun in Crowndale-road, Camden Town, and Mr. W. D. Caroe's plans and designs. The sale of the two old houses in Grosvenor-street, occupied by the college during nearly fifty years past, and the descriptions already made, yield a sum of about 32,000l., whereof 8,000l. have been expended upon buying the fresh buildings and 24,000l. are set aside for the buildings and a "maintenance fund" for payment of teachers, plant, etc. The college was founded in 1854 by Frederick Denison Maurice, Mr. T. Hughes, Mr. Furnivall, Professor Westlake, K.C., Mr. J. M. Ludlow, and Mr. J. M. Ludlow and others, for giving working opportunities of gaining education to men as a means of living and not merely means of livelihood. The students, whose numbers increase yearly, include men employed in the building, furnishing, coach-making, printing, leather-working and other trades, together with postmen, clerks, and waiters, who are represented upon the board of management. On the roll of past teachers are the names of Hughes, Burne-Jones, Rossetti, Madox Brown, Charles King, and Ruskin; the greater part of the teaching-staff are Cambridge and Oxford men, who give their services gratuitously as do some who themselves were educated in the college.

The parishioners have passed a resolution in approval of the proposed union of the united benefices of St. Peter-le-Poer and St. Bene't Fink with those of St. Michael, Cornhill, and All Hallows, London Wall. St. Ben's church of St. Bene't Fink (Finch), Threadneedle-street, was pulled down in 1842-4 for the rebuilding of the Royal Exchange. The church of St. Peter-le-Poer, formerly "St. Peter by St. Austines Priory," which will now share the same site, was built in 1789-92, after Jesse Gibson's plans and designs, on the site of the one which, having been erected in the prior half of the XVIIth century, and enlarged in 1615-30, escaped from the Great Fire (see the two views in vol. lix. of the *Gentleman's Magazine*). The older edifice projected into the street; at the building the front was set back and part of the graveyard was taken in at the rear. Gibson's church forms a quadratum on plan, having an inner diameter of 56 ft., and is lighted by twelve large arched windows in the rounded lantern of the domical roof. The front includes a central order of four engaged Ionic columns having enriched capitals and carrying an entablature and pediment, above which rises a square tower of two stages, surmounted with a stouated cupola and a finial. In 1890-1 Messrs. Arthur and A. E. Billing carried out an extensive alteration and redecoration of the interior of the fabric; they removed the gallery that extended around the whole of the walls—the western apse excepted—leaving only a small portion for the organ, converted the old oak seats into open benches, raised the apse floor by three steps, and raised a part of the floor of the body of the church by two steps for a choir. There are nearly 700 sittings; the organ by Green, 1792, was enlarged and improved in 1874 by Castello. It is not commonly known that in the former church was buried Edmund Gunter, rector of St. George's, Southwark, in 1615-1626, who in 1619 was appointed Professor of Astronomy at Gresham College (then in Old Broad-street), where, with Briggs, he computed the first set of logarithmical tables wherein the base is the number ten—Briggs calculating the logarithms of the natural numbers, and Gunter those of trigonometrical functions. He introduced the chain since called by his name, and invented in 1624 the logarithmical or "Gunter's" scale, also known as the slide-rule, and in 1606 published an explanation of the uses of the cross-staff, and of the sector, as invented by him. In 1622 he was the first to observe a change in the variation of the compass-needle after a lapse of time—a change which Gellibrand conclusively proved subsequently. His two successors—Gellibrand and Samuel Foster—in the professorship were buried also in the church.

A REPARATION of the fabric of Hogarth's House, Chiswick, has been carried out by Mr. F. W. Pell for Colonel Shipway, who, it is understood, is about to dedicate it to the public as a museum associated with the life and works of Hogarth. Hogarth occupied the house, which in itself is an uncommon example of its period, as a summer residence during

the latter years of his life; he lived there some months immediately preceding his death in Leicester-fields on October 26, 1764. Drawings of the house from the opposite side of the road and from the garden on the west side (the latter being by Mr. Roland W. Paul) were published, with descriptions of the structure, in the *Builder* of February 8, 1890, and June 22, 1901, respectively. Fourteen years ago the house was taken by the Typographic Etching Company for their Hogarth Works. The property was offered for sale in November, 1901, and bought at auction for 1,500*l.* by Colonel Shipway. Hogarth purchased it in or about 1750, after he had returned from his unlucky visit to Calais, and left it to his widow, who demised it to her relative, Mrs. Mary Lewis, with remainder to some persons named in Mrs. Hogarth's will. A subsequent tenant, in 1814-26, was the Rev. Henry Francis Cary, the translator of Dante. It is said that Hogarth planted the mulberry tree and that the two leaden urns upon the gate-posts were given to him by Garrick.

THE ROYAL ARCHAEOLOGICAL INSTITUTE AT BRISTOL.

AFTER an interval of fifty-three years the Royal Archaeological Institute has again chosen Bristol as the centre of its annual meeting, and the popularity of the choice has been sufficiently demonstrated by the fact that over one hundred members and their friends have taken part in the proceedings.

The inaugural meeting was held at twelve noon on Tuesday, July 19, at the Council House, where the Lord Mayor of Bristol, Sir R. H. Symes, opened the proceedings with a few words of welcome. Mr. F. F. Fox also welcomed the Institute as President of the Bristol and Gloucestershire Archaeological Society. The President of the Institute, Sir Henry H. Howarth, K.C.I.E., having thanked the Lord Mayor and Mr. Fox for their kind words, the chair was taken by the President of the meeting, the Bishop of Bristol, who delivered an address, in the course of which he said:—

President's Address.

You will see the main outlines of the Saxon town preserved with unusual clearness, unusual considering the vast growth which has supervened. I call it Saxon, but in my belief the outlines are British. If you place side by side the simple ground-plan of the nucleus of Bristol and the ground-plan of the early British fortress of Malmesbury, one of the most unchanged ground-plans in the kingdom, you will see that the resemblance is most striking. At Bristol the River Frome and the Avon surrounded the site, except at one narrow neck where in later times the Norman Castle and the New Gate barred the approach. Below the town the two rivers joined and flowed on together to the sea. At Malmesbury the Newton Water and the same River Avon played exactly the same part. They enclosed the site, except at the narrow neck where in later times the Norman Castle and the West Gate barred the approach. Below the town the two rivers joined and flowed on together to Lacock and Bath and Bristol. This looks as if the Britons on the Avon had a fixed principle in their methods of forming strongholds. When we go to Malmesbury next Thursday, you will see all these features with striking clearness; whereas in Bristol they are greatly obscured, especially by the fact that the turbulent and mischievous River Frome is now made to run in tunnels underground. The resemblance is, of course, not in any way spoiled by the fact that at Malmesbury the rivers run from west to east, from which it follows that the main gate, by the Castle, is the West port; at Bristol they run from east to west, and the castle and the gate are at the east. In these two cases we have, as I believe, as clear examples as can be found in this island of British strongholds retaining their outlines to the present day, notwithstanding the superposition at Bristol of a Saxon town, a Norman town, a mediæval town, and, since the Tudor time, when Bristol

was fortunate enough to get a Bishop, an English city.

It is open to the imagination to suggest that the early British camp here was afterwards put into order and made into a place of permanent residence and defence by the Romans. The two main thoroughfares run at right angles to one another, intersecting at the centre, and forming a cross. The northern limb of the cross leans a little towards the west, but the orientation is otherwise rather curiously correct.

We have the added interest of a church at three of the four angles of the cross, while in the centre of the meeting-place of the highways there stood the High Cross of Bristol. To see the cross, you must go to Stourton, in Wilts. Of the churches, you can see two still *in situ*, each in its own special way very worthy of inspection. The other church is represented by the Council House, in which we are now met.

Further, at the points at which the two highways cut the encircling walls on the north, west, and south, again were churches, and, of course, gates. To the east was the only approach by land, on the narrow neck between the two rivers. This, being the point most liable to hostile attack, was naturally the point which in the early times was least secure and safe for the site of a church—the point at which the changes have been greatest, as successive methods of defence have been rendered necessary by successive methods of attack. In this region, but south of the main thoroughfare, there is now a fine church, the original building probably coinciding with the erection of the great tower by Earl Robert, which effectually blocked the approach from the east, and made St. Peter's safe from attack. The old town, like the modern city, recognised the force of the saying, "Ein feste Burg ist unser Gott."

Of the churches at the other gates two remain, St. Nicholas and St. John. No member of the Institute should leave Bristol without visiting both of these churches, and both stories of each, church and crypt. St. John's Church is the width of the town wall, and St. John's Gate is the only one of the four gates which remains.

The original circular contour of the ramparts of the British fortress remains unchanged on the north, west, and south. If you emerge from the original fortress or camp by St. John's Gate, on the north, and turn to the left, you can walk or drive by a fairly regular semi-circle till you reach St. Nicholas's Church, where was the gate on the south. On your way you pass the site of the west gate, St. Leonard's; but it and its church have disappeared.

Let anyone should suppose that I am speaking of considerable distances from extreme point to extreme point, commensurate with the idea of a modern city with a population of some 400,000, I may say that the walk or drive which I have suggested round this semi-circle is only about 515 yards; while the distances from the central crossing to the three gates are in two cases 190 yards, and in the third case, to the south gate, only 125 yards. My Lord Mayor rules gently and quietly over a larger domain than did those turbulent and haughty chieftains, to whom there once came an unbelievable rumour that some foolish and impudent barbarians had tried to land on the southern shore of Britain, led by a person called Caesar.

Among the multitude of interesting places within reach of Bristol it has, of course, been a difficult matter to make a selection of places to visit. How rich our store of archaeological neighbours is may be gathered from the fact that we do not even include Berkeley Castle. Indeed, we leave Gloucestershire entirely alone, crowded as it is with striking objects, some of them almost at our gates. This tends to ethnological simplicity, for it almost eliminates the Hwiccas from the peoples whose lands we invade. I say almost, not altogether, because I claim that Bath was Hwiccan from the time of the battle of Deorham in 577 to quite late in the Anglo-Saxon times. For the rest, your visits will be paid to lands permanently occupied by the West Saxons, and the lands almost or quite as permanently occupied by the Britons. To one whose diocese includes, as the diocese of the Bishops of Bristol now does, besides the city itself, a considerable part of Hwiccan Gloucestershire, 100,000 people in British Somerset, and eighty parishes of West Saxon and British North Wilts, the characteristics of those various peoples, physical and otherwise, stand out clearly marked to this day. The two types of skull, the long and the round, are still located with curious accuracy. There is probably no place in the kingdom where this

is more clearly the case than at Malmesbury, in hut not of the West Saxon land. It was a great British fortress down to the year 656. Its isolation in the dense forests, and its established importance as a British and Sootic school of learning, preserved its individuality, and kept its population British after the conquest of the West Saxons. King Athelstan riveted that stamp upon it by presenting it with a large estate, to be held by commoners, who must reside within the walls of the town, and must be sons of commoners or men who have married commoners' daughters. Those strict provisions account for the accuracy with which the boundaries of the town have been preserved, and for the British roundness of the skulls.

Mr. Hope, Mr. Brakspear, and the present President trust that when you are at Malmesbury you will be pleased to approve the work we have done to arrest the threatened decay there. I personally regard it as among the most conservative works done in this generation.

I will, in conclusion, only refer to one point of detail; but it is a detail of very high interest, affecting an event of the highest importance. When you dive down into the Severn Tunnel on Friday and Tuesday next you will be very few miles from the striking Severn Cliff at Aust. When you are at Malmesbury next Thursday you will be only a few miles from Cricklade. At one or other of those two places, both in the diocese of Bristol, Augustine of Canterbury, came to found a new church of the English, met the representatives of the ancient British Church.

The Britons on the other side of the Severn would not pray in the same church with West Saxons, or sit at the same table. If a Saxon left anything at a meal, the Briton threw it to dogs and swine. Before a Briton would condescend to use a dish which a Saxon had used, it must be scoured with sand or purified with fire. The Briton would not give the Saxon the kiss of peace—a blessing, I suspect, in a rather thin disguise. If a Saxon crossed the Severn the Britons would hold no communication with him till he had endured a penance of forty days. A vote of thanks to the Bishop for his address terminated the proceedings.

After luncheon a visit was paid to some of the more important ancient buildings in the city, beginning with the Cathedral. Here the members, having been received by the Dean, Dr. Pigeon, assembled in the chapter-house to hear a description of the building from Canon Barnett, who afterwards conducted the party round the church and pointed out the chief features of interest. A move was next made to the Church of St. Mark, till recently known as the Mayor's Chapel. This formed the church of a priory of Black Canons, founded first as an eleemosynary establishment by one of the Gaunt family. The church was originally cruciform and aisleless, of excellent XIIIth century work, with the choir extending half-way down the nave; but in the XIVth century a south aisle was added to the western half of the nave, and in the succeeding century the south transept was carried up as a tower. To the east of this, in the reign of Henry VIII., was added a richly-decorated chapel with a fan vault and a gorgeous floor of Spanish tiles. The great west window is a fine example of the beginning of the XIVth century, and the eastern end owes its reconstruction late in the XVth century to the munificence of Miles Salley, Bishop of Llandaff (ob. 1516), whose tomb and effigy remain in the north wall. The church is rich in monumental remains of all dates, including several interesting effigies of cross-legged knights. The history and leading features of the building were pointed out by Mr. W. R. Barker. The well-known Church of St. Mary, at Redcliffe, was next visited, and described by the Rev. C. S. Taylor.

St. Peter's Hospital, Bristol.

Returning into the more ancient part of the town, the party reached St. Peter's Hospital, a half-timber house, mostly of the XVth and XVIIth centuries, now used as the offices of the Bristol Board of Guardians. The visitors were here received by Mr. Evans, the chairman, and Mr. Hiscox, the Vice-chairman of the Board, and then assembled in the old Court-room, when Mr. J. J. Simpson read the following notes on the history of the building:—

This building is an interesting example of the picturesque domestic architecture of olden times, perhaps the completest specimen remaining in the city, some portions dating from the XIVth century and other portions dating from the commencement of the XVIIth century.

The earliest ascertained owner of the house, or an earlier one on the same site, was John Corne, who in 1401 disposed of it to Thomas Norton, who had come into a great fortune through Elias Spelly, Mayor of Bristol in 1390-1. Thomas Norton was himself Mayor of Bristol in 1413. In 1435 the mansion passed into the hands of Norton's two sons, Thomas and Walter, who divided it into two dwellings, Thomas residing in the eastern and Walter in the western portion of the building. The whole came into the possession and occupancy of Walter Norton in 1458. Walter had two sons, both named Thomas, and two daughters, married to wealthy Bristolians—Robert Strange (thrice Mayor) and John Shipward, jun. (Mayor 1477-8). One of these sons was notorious in 1479 for his hostility to the Mayor, William Spencer, against whom he alleged high treason to the King (Edward IV.), a very long and interesting account of which appears as a "Remembrance," compiled by John Twynho, then Recorder, in the Great Red Book of the City. The mansion remained in the occupation of successive generations of the Norton family until 1580, when Sir George Norton, the then owner, and also owner of the mansion of Leigh, sold it to Henry Newton, afterwards Sir Henry Newton, of Barr's Court. The next known owner was Robert Chambers (1602), who sold it in 1607 to Robert Aldworth, a wealthy merchant, whose initials are to be seen on the river front, with the date 1612. At the latter date this gentleman made considerable alterations and additions, practically rebuilding the house in the style of the period, for in a later deed it is described as having been "by the said Robert Aldworth erected and new built." In September, 1612, the Corporation granted him, at a fee farm rent of 3*l.*, the fee of another house in the same parish of St. Peter, and it is possible that this acquisition forms the earlier portion of the building, which the alderman left unaltered. At any rate, this eastern frontage in the churchyard is of much earlier date, and there is little doubt that it formed part of the original edifice of the Nortons. The open timbered Gothic roof over the Jacobean plaster ceiling in the court-room is also of this earlier date, and was probably the canopy of the great hall of the mansion before the reconstruction of 1612, and extended from the back to the front of the building. The street frontage, with its bold spurs and brackets, which sustain the successive stories, the carved fillets between the stages, the grotesque woodwork, panels, bay windows, and gables form part of the reconstruction effected in 1612 by Aldworth. So is the court-room, the chief apartment of the house, a beautiful Jacobean sitting-room of Aldworth's time, with its panelling of oak and its sumptuously executed plaster-work ceiling, constructed in square, diamond, and quatrefoil compartments in bold relief, with floral ornaments, emblematical devices and winged figures, fringed with a deep cornice. The window some time ago replaced a former one which had bold stone mullions. The adjoining apartment is similar in character, but there are some quaint sculptured figures in the porch of the river front, near the monogram and date (1612) before referred to. Practically all other portions of the building are of modern reconstruction. Briefly pursuing the history of the building from Aldworth's time (and by the way, there is a fine tomb in the adjoining church to the memory of Aldworth, who died in 1634), we find it in the possession of Aldworth's relative, Eldridge, and successively inhabited by various families, until it became appropriated to trade purposes about the middle of the XVIIth century. It was first used as a sugar house, and it is supposed that this was the place in Bristol visited by Evelyn, who in 1654 wrote:—"Here I first saw the method of refining sugar and casting it into loaves." Then, in 1696, on the Government determining to supplement the coinage at the Tower by the establishment of branch mints in some leading provincial towns, the civic authorities pressed the claims of Bristol, and, being informed that provision of a suitable house must first be made at the cost of the citizens, it is recorded that the City Corporation appointed a committee "to make a bargain with Sir Thomas Day for the Sugar House, and the House will find the way of paying the rent." The Sugar House referred to was this building, and it was occupied as a mint from 1696 to 1698. In the British Museum is a unique placard, issued by the Mayor and aldermen in August, 1696, giving notice that the Government had sent down, for the benefit

of the city, one thousandweight of silver valued at upwards of 3,000*l.*, to be coined at the new Mint, and requesting the inhabitant to further the operations by furnishing oil plate, for which a reward of 6*d.* per ounce would be paid in addition to the standard value of 5*s.* 2*d.* Holders of old hammered money were also promised a premium on the amount they sent in. How largely the invitation was responded to is attested by the fact that within about sixteen months the Bristol Mint dealt with nearly 2,000,000 oz. of silver, which were converted into 473,728*l.* in coin. Finally, in 1698, the old house passed into the hands of its present owners, then known as the Corporation of the Poor. This body was established, under special Act of Parliament, in 1696, and was the first Board of Guardians formed in England. The Corporation of the Poor, finding in 1699 their workhouse inadequate, appointed a committee to select some other building, and this body reported in December that they found "none so fit or convenient for the purpose as the Mint." Negotiations were opened, and in 1698 it was purchased for 800*l.* from Edward Colston and others, and thereupon converted into a workhouse for the poor. The beautiful Jacobean sitting-room, erected by Aldworth, was fitted up by the guardians as a chamber or court-room for their meetings, and has been used continuously since October, 1698, for this purpose. The entire premises are now occupied for administrative purposes only by the guardians, who on quitting the court-room in 1901 for the new board-room in the south-western portion of the building preserved the historic apartment intact.

Bristol Churches.

The adjoining Church of St. Peter, an interesting building of the XIVth century, with some good late monuments and a fine XVIIth century altar-piece, was next visited under the guidance of Mr. C. E. Bonebrake. Lastly, a move was made to the Church of St. John, which is noticeable for its vaulted under-church and a western tower built over one of the city gates. The upper church is a aisleless parallelogram of six bays with a short chancel, also of the XVth century, and containing a handsome Jacobean communion-table and an interesting post-Restoration font of peculiar form decorated with cherubs' heads in relief and retaining its old wooden cover. There is a good tomb and effigy of a civilian on the north side of the chancel. The tower was used in common with the destroyed Church of St. Lawrence, which adjoined it on the west. The under church is not now used for services, but contains an interesting early XVth century alabaster tomb with effigies of a civilian and his wife, as well as other ancient memorials. The chief features of the church were pointed out by Mr. H. C. M. Hirst.

Lake Dwellings.

At the evening meeting Dr. Monro read a paper summarising the latest researches on Lake Dwellings, a subject which he has made especially his own.

Dr. Monro described lake dwellings as a unique phases of bygone civilisation, narrated the circumstances which led to research being made, and gave details of lake dwellings in different parts of the world. Speaking of the Glastonbury lake dwellings, the lecturer said they were discovered in the spring of 1892 by Mr. Arthur Bulleid, and had since been largely excavated under his care. The site of this remarkable settlement occupied some three or four acres of a flat meadow within the boundaries of what was supposed to have been formerly a marshy lake. Before excavation were begun all the eye could discern were sixty or seventy low mounds huddled in the corner of a field. These mounds were the debris and sites of dwelling huts, and the foundations on which they stood consisted of layers of brushwood and stems of small trees bound together, in some places at least, with transverse morticed beams precisely similar to the Scottish and Irish crannogs. The huts were circular or oval, and varied in size from 20 to 35 ft. in diameter. Each hut contained a central hearth, sometimes neatly made by flat stones imbedded in the clay flooring, which existed in all of them. But as subsidence, due to the compression and decay of the understructure progressed, the occupants superadded new clay flooring. The relics illustrated with rare and singular completeness the life history of the community which inhabited them. Many of them exhibited the special characteristics of

to Celtic art, which gave the collection an exceptional importance among lake dwellings hitherto discovered within the British Isles. The paper was illustrated by excellent engravings, showing remains of typical lake dwellings and the relics discovered within them.

Crocombe Church.

On Wednesday the 20th a special train conveyed the party, which numbered about ninety, to Shepton Mallet, when carriages were in readiness for a visit to Crocombe. Here the parish church, an interesting aisled structure, chiefly of the XIVth century, with western tower and spire, was inspected under the direction of Mr. J. T. Micklethwaite, who called special attention to the magnificent Jacobean screen, parloise, and pulpit with sounding-board, set up in 1616, as interesting testimony of the efforts made by the Carolines to revive the decent arrangements of our church, which had been done away with under Puritan influences. The church is also rich in woodwork of older date, retaining, as it does, most of its XVth century pews, as well as an open roof of exceptional richness. At the west end of the south aisle is a two-storied treasury with strongly grated windows, and to the north of theancel the shell of a two-storied vestry, with a ribbed stone vault to the upper chamber.

Glastonbury Buildings.

The drive was next continued through Glastonbury. Here, after luncheon at the George Inn, an almost unaltered hostelry of the late XVth century work, with an elaborately decorated front, a visit was paid to St. Mary's hospital, the history of which was explained by Canon Grant. This consisted originally of a XIIIth century hall, which served as the living and sleeping room of the inmates, with a chapel at the east end. Through later alterations and changed conditions the hall has been roofed, and the cubicles that lined the outer walls have given place to two rows of small utes, which have so encroached upon the hall as to reduce it to a narrow passage. The magnificent XIVth century barn of the abbots of Glastonbury was next visited, and described by Mr. Brakspear, who demurred to a suggestion made by Mr. Micklethwaite that the small side-aisle of exit were to furnish a draught of air for the main hall. The perambulation was continued to St. John's Church, a large XVth century building with grand western tower, but originally cruciform, with a tower over the crossing, which was lucidly described by Mr. R. Peers, who pointed out the evidence of the former arrangements.

From St. John's Church the party went to the Abbey, where Mr. W. H. St. John Hope explained in detail the architectural history of the buildings, and pointed out from the evidence of the existing remains that the great church was built, as usual, in regular order from east to west. He also discussed the singular history of the beautiful western Galilee and Lady Chapel, and showed that the accepted opinion of the latter with the name of St. Joseph Arimatea had no earlier authority than an engraving made by Hollar in 1650. The Bible XIVth century kitchen of the abbots' hall, and the chapel of Abbot Beor's almshouse for poor women in the outer court, with its original stone altar, were also inspected.

After an examination of the interesting series of objects discovered in the Glastonbury lake-dwellings, and now in the museum, the party returned by special train to Bristol.

Roman Somerset.

At the evening meeting a paper was read by Mr. F. Haverfield on "Roman Somerset." Mr. Haverfield described Roman Somerset as an interesting subject which had not been properly worked out. Its principal features were (1) an important spa at Bath; (2) a village at Emerton, explored by Mr. Skinner about 1815, and another at Hebestor; (3) lead mines at Mendip, of which our record was shamefully scanty; and (4) various villas, all apparently of normal types, distributed in groups (as near Merton, or in the Wrington Vale) or near the Fosse. Survivals of late Celtic art could not be traced, as on Ham Hill. Of these features the most important was unquestionably the spa at Bath, which was early used by the Romans. Its two great buildings were the temple of Sulis Minerva and the baths. The temple was a tetrastyle edifice with fine Corinthian columns and a pediment singularly well served containing a wonderfully vigorous head of Medusa. This head, fixed on a circular

shield, was no doubt connected with Minerva, like the owl which also appears in the same pediment. Its astonishing and barbaric vigour made it unique among the products of provincial art in the Western Empire. It was also remarkable for the beard and moustache on the Medusa's face, an almost "unique detail, but perhaps explicable as a "contamination" of similar heads. Another feature of the temple, or of its vicinity, was a pilastered façade, decorated (*inter alia*) with small bas-reliefs of the Four Seasons, poorer in style than the pediment. The baths were noticeable for the plan, which deviated widely from that of ordinary city baths, like those lately unearthed at Silchester. They consisted of large basins, the largest quite 80 ft. by 40 ft., with hypocaust rooms at the eastern and western ends of the suite. They resembled the baths of Badenweiler or of *Aqua Flavianæ* (in Numidia), and seemed to exemplify the plan of thermal baths as distinct from city baths. The visitors to Roman Bath consisted of invalided soldiers or veterans, and of civilians from various parts of Britain and actually from the north-west of the Continent—for example, from what are now Chartres and Metz and Trier—and must have formed a discreet society of a simple, provincial kind.

Corsham, Lacock, and Malmesbury Buildings.

On Thursday, the 21st, a special train conveyed the party to Corsham, when the picturesque group of freeschool and almshouses founded and built by the Lady Margaret Hungerford in 1663 was first inspected under the guidance of Mr. Harold Brakspear. The buildings comprise an L-shaped block, of which one wing contains the hall, with its carved wooden gallery, and which served also as the chapel and schoolroom. At the angle is the master's house, and the other wing contains the two-storied chambers of the inmates. In rear of these is an interesting covered ambulatory or portico, forming a gallery of communication with the hall, etc. and opening on to a row of little gardens divided by low stone walls. The journey was next continued to Lacock, where the parish church, an interesting building of the XIVth and XVth centuries with a very ornate lady-chapel, was first visited. The lady-chapel bears the arms of Bishop Nevill, and has a rich fan vault with pendants encircled by carved garlands of flowers. Against the north wall is the elaborate tomb of Sir William Sharington (*ob.* 1553), the grantee of the abbey. Through the courtesy of Mr. C. H. Talbot, an inspection was also made of the abbey itself. This was founded for a convent of Austin Canonesses by Ela Countess of Salisbury in 1232, and at its suppression in 1539 was converted into a dwelling-house by Sir William Sharington, who pulled down the church as superfluous, but added a picturesque courtyard of offices on the north. The cloister, with its XVth century groined ambulatories, is still perfect, and is surrounded by the two-storied ranges of the original monastic buildings, which are based upon the usual plan. The chapter-house is of considerable architectural interest, as is a large vaulted vestry on the north of the site of the choir, which served also as a quasi-transsept. The moulded chimneys, the picturesque gables, and other features of Sir W. Sharington's work are quite equal in interest to the remains of the mediæval period. The house also contains many important pictures and examples of old furniture, and in the muniment room and the prospect tower above it are two wonderful tables with marble tops and richly-sculptured stone supports with figures of satyrs, etc. After an examination of the buildings under the guidance of the Rev. W. G. Clark-Maxwell, the journey was resumed to Chippenham. From here the party went after luncheon by train to Malmesbury, and on arrival climbed the hill above the station to inspect the abbey church. This was described by Mr. Harold Brakspear as consisting of six bays of the nave only of a vast church, the eastern half of which has entirely disappeared, but the size of it can be recovered from the dimensions recorded by William Botener *alias* of Worcester. He also showed that the ascription of the building of the church to Bishop Roger was erroneous, the style of the work according more nearly to about 1150-60, by which time the property of the Abbey had reverted to the monks through the bishop's death in 1139. The existing remains consist of six bays with pointed arcades and triforium of transitional Norman work, with a fine XIVth century clerestory and ribbed vault, a rich porch, also of Norman date, and some

remains of the west front and central tower. The porch has been eased in the XIVth century, apparently with the object of carrying it up as a tower, but this was abandoned, and the steeple actually built over the last two bays of the nave. This seems to have collapsed during the latter half of the XVIIth century, ruining in its fall the western end of the nave, which has since remained walled off from the rest. After inspecting the market cross, a very complete example of a date about 1500, the party returned by special train to Bristol. The evening meeting, by invitation of the Lord Mayor of Bristol, was held at the Mansion House, when the Rev. Canon Church read a paper on some incidents of history at Wells in 1464, 1470, and 1498.

THE ETON WAR MEMORIAL COMPETITION.

THE Eton Memorial to those who fell in the war is to be, when executed, in the form of a memorial building containing a hall and library. The designs, all by architects who are old Etonians, were privately exhibited at Eton, and are now on view publicly at the rooms of the Society of Antiquaries. It should have been, we should think, the business of the Hon. Secretary to the Committee, in justice to the architects, to see that they were properly and intelligibly arranged, which has not been done. The drawings of several sets appear to be mixed; and while the names of a good many competitors are given on cards placed in front of them, two of the most important sets, at the time of our visit, had no name attached, and one of these must have been that of Mr. Mount, the winner of the second premium, whose name we could find nowhere in the room; but which of the two was his there was no means of knowing. That is not the way to do things.

If "the plans, sixteen in number, obtained warm approval from the assessor," as stated in the circular sent to competitors, we fear that the assessor's natural amiability induced him to make things pleasant all round; or else the Committee interpreted his praise in a more comprehensive sense than he intended. There are four good designs; the rest are but mediocre, and some of them very poor.

Mr. L. K. Hall (a name new to us), who obtained the first premium, has produced a refined and original design, with a plan which is perhaps a little too original; that is to say, though certainly calculated to be effective, it rather wants simplicity. He places his Hall on the upper floor of a longitudinal block, on the ground floor of which is a gateway in the centre of one side, opening on a wide columned passage which runs across the width of the building, and gives access to a museum on the right and to a pillared Hall leading to the main staircase on the left. Apparently this cross passage is intended for the purpose of a carriage porch when there are meetings in the Hall. Parallel to it on the left is an indoor corridor, as one may call it, leading to a porch at the other side of the block, which gives access to the library, an octagonal domed building attached unsymmetrically to the main block. It is certainly not a commonplace plan, but it is rather wanting in decisive lines of setting out. The general architectural style is late English Renaissance: a stone rusticated ground story; semi-circular headed windows above with stone architraves on a ground of brick-work, and festooned garlands over. Internally the hall is divided into bays by coupled columns, and decorated in the lower portion by rich and effective wood panelling; the roof is a segment of a circle with Welsh vaults over the windows. The library has a central dome on arches carried by coupled columns at each angle of the octagon, with an aisle between them and the outer wall. The columns are rather too narrow for their height. The drawings are very good, and the whole shows artistic feeling.

The design which is probably the second premiated one, shows the side elevation of the Hall block with a plain brick ground story, in the centre of which is a main entrance rather powerfully treated with a coupled order in rusticated masonry and a riot of rococo details above the entablature; at each end of the façade is a minor entrance, the two treated symmetrically; concerning these we may observe that a band of rusticated work lining up each jamb and carried round the arch in the same way, has a rather tame and

mechanical effect. In the upper story the windows are treated with massive masonry "dressings," alternately angular and circular, with heavy keystones; all this is in a very good style of work of its class. The plan is a straightened one with a longitudinal block for the Hall, and a square library block attached to it.

A design with a plan of somewhat similar type shows a very carefully worked out and rather grandiose classic exterior showing the influence of Wren. The flank façade shows stone pilasters on a brick ground, with large circular windows in the upper part of each bay; the two end bays are kept solid and treated entirely in masonry. In the section the Hall is shown decorated half-way up with wood wainscoting, again strongly suggestive of the influence of Wren; and the ceiling is treated in a monumental manner, with circular and side panels divided by massive bands of foliage in the orthodox manner. There is, it is true, much originality in all this, but the whole effect would be dignified and consistent.

The design by Mr. Ambrose Poynter (third premium) is more really collegiate in style than any other; at least, it turns a collegiate face towards one side of the site, the hall being lighted on that side by large mullioned windows; though on the entrance side the treatment, with separate smaller windows, is more of the late Renaissance type. The plan is cleverly arranged in regard to approaches, with a reception room communicated with two entrance vestibules, the one at the end the other at the centre of the side. The section of the hall roof is a semi-circle springing from a flat at each side; in the section the decorative treatment of the ceiling, in panels and with figures at intervals, is well indicated.

Another design we noticed which shows an effective side elevation with a plain coursed-stone ground story, and brick pilaster-like strips above with long windows in stone encadrements between, and circular windows worked in above as a part of the design of the bay. This is a good bit of work. It is one of the nameless designs; at least, there was no name attached to it when we saw it. There are others with the authors' names attached, but we fear we cannot say anything very complimentary of them, and therefore they may as well remain nameless.

THE ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

In continuation of our report of the annual meeting of the Association of Municipal and County Engineers, held at Shrewsbury under the Presidency of Mr. A. T. Davis, C.E., we give the following abstracts of papers with discussions:—

Shrewsbury Main Drainage.

Mr. Ridley Taylor, M.Inst.C.E., F.C.S., read a paper on "The Main Drainage of the Borough of Shrewsbury." He said Shrewsbury had an area of 3,525 acres and a population of 28,595 persons. The population was not rapidly increasing one, but provision had been made in the drainage scheme for an increase up to 35,000. The water supply to the borough amounted at the present time to about one million gallons per diem, and it was anticipated that this quantity would be sensibly reduced when the borough was provided with an improved water supply. Hitherto the borough had been supplied with a very limited quantity of drinking water from springs, whilst the bulk of the water supplied to the houses was unfiltered river water. In 1895 the author's firm were called in to advise the borough upon the general question of main drainage and purification of the sewage. The scheme was adopted by the Corporation, and presented to the Local Government Board, and had now been successfully brought to a conclusion. The difficulties that had to be contended with in the design of the scheme were, firstly, the necessity of keeping the sewers at such a level that they would not penetrate to any great depth in the beds of running sand; secondly, the necessity of laying the intercepting sewers at self-cleansing gradients; and, thirdly, the necessity of keeping the head of each intercepting sewer at such a depth as to admit of the existing sewers being connected with the intercepting sewers. The main intercepting sewer on the right-hand bank of the river did not present any great difficulty in its designing, as it was found that, by following along the bank of the river into Frankwell, a

sewer could be formed with satisfactory gradients and at a level sufficient to intercept the whole of the existing sewers. The problem presented on the left bank of the river, however, was a much more serious one, as an intercepting sewer laid under similar conditions to that on the right bank of the river would have been out of the ground at its higher end if self-cleansing gradients had been adopted; it was found, in fact, that the intercepting sewer could not be laid beyond Welsh Bridge at a sufficient depth to pick up the existing sewers. The two intercepting sewers described dealt with the majority of the sewage entering the river, but there still remained considerable volumes of sewage from the Cotton Hill and Castle Fields districts. It was found possible to bring the sewage from these neighbourhoods to the pumping station by means of a tunnel passing under the hill between Shrewsbury Castle and the gaol. These main intercepting sewers, with the necessary extensions, provided drainage facilities for the whole of the borough. The work of constructing these sewers proved an extremely difficult and costly undertaking, the nature of the ground involving the use of large quantities of concrete, and many thousands of cubic feet of timber had to be left in the trenches. The site of the pumping station was fortunately free from running sand, and the subsoil consisted of a fairly water-tight clay. Under these circumstances, it was found possible to construct a large circular storage sewer in brickwork, a cast-iron sewer after its passage across the river, was led into the bottom of this storage sewer, so that when it was full the sewer crossing the river practically became an inverted siphon; but when the suction tank and storage sewer were empty, as happened many times a day in the course of the pumping operations, the sewer crossing the river had a free outfall. This arrangement had been proved after some years' working to be entirely satisfactory. The connexion of the existing sewers with the intercepting sewers had proved an exceedingly difficult and costly undertaking, the work involved being of considerable magnitude. The principle adopted had been to trace out the line taken by the sewer to be intercepted, and, as far as possible, to intercept the sewer at a point above the level of the highest known flood. Owing, however, to the fact that many of these existing sewers passed for considerable distances across private property and under buildings, this had not been found possible in every case. Each intercepting chamber had to be of a separate and special design, but, generally speaking, the principle adopted was, after carefully ascertaining the dry-weather sewage flow down the sewer, to form controlled openings in the intercepting sewers of such a size as to admit a volume of liquid equal to six times the ascertained dry-weather flow. The old sewers had been retained to carry off as storm-water direct to the river any quantity of liquid in excess of that which had passed through the controlled opening. The intercepting sewers varied in size from 30 in. to 12 in., and each particular sewer was laid at a gradient sufficient to give a minimum velocity of liquid of about 130 ft. per minute when running half full. Experience had shown that these velocities were sufficient to keep the intercepting sewers in a clean and proper condition. Various storm overflows were provided along the lines of intercepting sewers, so as to relieve them of excess storm-water which might be brought to them in times of excessive rainfall. The sewage, on its arrival at the pumping station, was screened through double removable screens with $\frac{1}{2}$ in. spaces. After leaving the pumps, it was passed through a large air vessel, which was kept constantly charged with air by a special pump, and was delivered through a 21-in. cast-iron pumping main to the head of the gravitation sewer. This gravitation sewer was 30 in. in diameter and ran direct to the purification works without pumping. The sewage on its arrival at the purification works was passed through a mixing channel with slat baffles, and was chemically treated with cream of lime prepared in a pneumatic lime mixer. About 10 grains of lime per gallon was added, and, when necessary, a small dose of aluminoferric was also added to the sewage by placing eakes in trays suspended in the channels. After the sewage had received its proper dose of chemicals, it passed into one or other of six precipitation tanks. These tanks were each 23 ft. 9 in. wide by 111 ft. long, with an average depth of liquid of 6 ft. The combined capacity of these tanks was about 600,000 gallons, or rather more than

50 per cent. of the daily dry-weather flow. The tanks were provided with sloping bottoms, the deepest end of the tank being that at which the sewage was admitted. A sludge culvert ran the whole length of the tanks at the deepest end and the deposited sludge was swept into this culvert and eventually pressed. The tank effluent was finally purified by land irrigation. The total area of the land purchased by the Corporation for the purpose of sewage disposal was about 170 acres, and at the present time about 75 acres were laid out for irrigation.

Mr. J. Price (Birmingham) mentioned that the system adopted for dealing with storm water was on similar lines to the method had adopted at Birmingham.

Shone's System of Sewer Ventilation.

Mr. E. George Mawbey, M.Inst.C.E., read a paper on experiments on Shone's system of sewer ventilation at Leicester. He said that in July 1902, the Highway and Sewerage Committee of the Leicester Corporation entered into an arrangement with Messrs. Shone and Auld to instal a small district with Shone's system of drain and sewer ventilation (according to Shone and Auld's patents), for the purpose of carrying out experiments in order to test its practicability and efficiency, together with the working expenses involved therewith.

The area under the influence of the system was 2½ acres, and comprised portions of one of the modern built-up parts of the borough. The streets were 40 ft. wide. It included eight six-roomed houses of the artisan class, at a rental varying from 17l. 10s. to 19l. 10s. per annum, and having a population of 356, with an average of 4·45 persons per house. The total length of foul-water sewers ventilated was 297 yds., constructed on the separate system, the storm-water sewers being quite distinct and receiving the rain-water from the streets and front roofs only. The main line in Paton-street was a 12-in. pipe sewer 202 yds. long, with two branches at right angles, viz., 57 yds. of 12-in. pipe sewer in Wilberforce-road and 38 yds. of 9-in. pipe sewer in Crow-lane. The sewers were laid at an average depth of 10 ft. They discharged into a 3-ft. by 2-ft. brick foul-water sewer constructed on the separate system in Western-road. The sewers dealt with were constructed of Hassall's single lined stoneware pipes, laid in the years 1896-1897. The gradients of the 12-in. sewers varied from 1 in 120 to 1 in 36, and that of the 9-in. sewer was 1 in 50. The private drains operated upon comprised a total length of about 583 yds. They were 6 in. in diameter, with 6-in. branches to the water-closets and 4-in. branches to the sink wastes, constructed with ordinary stoneware socketed pipes. Rather more than half were jointed and filled with Portland cement. The remainder had the puddle joints. In both cases the joints were surrounded by a band of clay puddle 8 in. wide. There were no intercepting traps on any of these private drains. Four-inch diameter cast-iron ventilating pipes, jointed with red lead, were fixed at the heads of the private foul water drains, and carried up above the eaves at the back parts of the houses. To the eight houses there were twenty-seven of the ventilating pipes. The section of sewer experimented upon was trapped off from adjoining sewers at the outfall end by a siphon trap constructed in the manhole of the 3-ft. by 2-ft. brick sewer, and at the flushing manhole near the fan and at the manhole in Wilberforce-road at the junction of Equity-road by shutting down the flushing penstocks. At the upper end of the system a fan and motor chamber was constructed. A 9-in. brickwork in cement mortar, 6 ft. 6 in. long by 3 ft. wide, built under the footway opposite the flushing manhole. In this chamber was fixed a 15-in. Sirocco fan, driven by an electric motor working at 750 revolutions per minute, the current being supplied off the electric lighting cables at 200 volts. Connection was made between the flushing manhole at the fan by 18-in. stoneware socketed pipe. On the footway at one end of the chamber was erected a 9-in. circular steel ventilating shaft 40 ft. high. The fan was connected to this pipe by means of a zinc air discharge pipe, tapered in size from 7 in. square to 9 in. diameter. The main features of the arrangement were that the existing private ventilating pipes or soil pipes, as the case might be, were provided with suitably regulated fresh-air inlets, so that the entire lengths of soil pipes and drains should be swept by the ventilating current into the pub-

and drawn thence to the main extraction shaft, the volume of fresh air drawn in through these ventilating pipes to be sufficient not only to draw away the foul air through the drains from the vicinity of the dwellings in the direction of the flow in the drains, but to so dilute it that could be safely discharged through the main extraction shaft into the open air above the level of the houses, rendering it impossible for there to be any escape of dangerous foul air to or around the dwellings. The most important feature was the constant and uniform drawing away of the soil pipe and drain air from the dwellings and workplaces of the people, thus preventing it finding access thereto. The author had not gone into the question of the capital outlay, as this had been partly borne by the patentees, and would be variable according to the local conditions; but he was of opinion that it would not be such as to prejudice the adoption of the system. The actual working expenses were practically confined to the cost of the electric current consumed in driving the motor. The repairs and maintenance could not be a serious matter, and the attention required was obviously very small. The first complete experiments were commenced on April 27, 1903, and continued for five consecutive days. The average result of these five days' tests was that 16.10 cubic ft. per minute were extracted through the 6-in. shaft, at an average velocity of 1,266 ft. per minute, and a total of 17 cubic ft. per minute was admitted through the twenty-seven inlets on the private ventilating pipes at an average velocity of 3.3 ft. per minute. The total of 31.17 cubic ft. per minute represented an average per inlet of 1.15 cubic ft. per minute, or an average for the house of .43 cubic ft. per minute for the twenty houses in the system. After these experiments the author formed the opinion that not only was the sectional area of the inlets too small, but that the sectional area of the extraction shaft was also too small to obtain results from the motor and fan, and in consultation with Messrs. Shone and Ault, it was decided to experiment on the extraction shaft only. An experiment was then carried out by disconnecting the fan from the extraction shaft, and delivering the air at the street level. This not only resulted in discharging nearly four times the volume previously discharged through the 6-in. shaft, viz., 998 cubic ft. per minute measured in the 18-in. branch leading to the fan, but increased the air admitted through the twenty-seven inlets on the private ventilating pipes from 21.17 cubic ft. per minute to 105.55 cubic ft. per minute, representing 1.5 cubic feet per minute of air per house, at an average velocity of 99.27 ft. per minute, against 29.3 ft. per minute previously obtained, and every one of the inlets was found to be acting at such a velocity as could be recorded by the anemometer. In order to maintain as far as possible this increased efficiency, a main extraction shaft was then substituted for the 6-in., and the fan connected therewith, and tests were made, with a result that 741.9 cubic ft. per minute were extracted through the shaft at an average velocity of 1,264 ft. per minute; and a total volume of 74.59 cubic ft. per minute was admitted through the twenty-seven inlets on the ventilating pipes at an average velocity of 70.2 ft. per minute through the anemometer, representing an average per house of .94 cubic ft. per minute, which was more than twice the quantity of fresh air admitted into the inlets when the 6-in. diameter shaft was in work. At this point of the experiments, viz., in November last, the author felt satisfied that this was a practicable and efficient system of sewer ventilation, which could be thoroughly reliable at all seasons of the year, but the consumption of electrical energy, and, of course, also the cost thereof, was, in the author's opinion, too great for the number of houses dealt with. Although no large intercepting sewers had been at present experimented upon at Leicester, the author saw no reason to doubt that equally satisfactory results would be obtained by the application of the system thereto, and if some other of their members took this up, it would be desirable that he should apply it to a section of sewers of this character. When this system was first proposed by Mr. Shone, the author had serious misgivings as to its practicability, but was nevertheless so impressed with a paper read on this system at Eastbourne, at the Congress of the Royal Institute of Public Health, when he was President of the Engineer-

ing Section, that he felt it was well worth submitting it to a practical trial, and it was only after very exhaustive and practical investigations, extending over a period of at least two years, that he had felt at all justified in expressing any definite opinion thereon. The author was, however, now able to say that the soil-pipes, drains and sewers had by this system been satisfactorily and uniformly ventilated for the period referred to, under the varying conditions of the atmosphere and of the air within the sewers, and that this had been effected without any siphoning out of any of the traps in connexion with the house drains. In fact, the vacuum in all parts of the system had been too small to be registered by a water gauge, although many attempts had been made to obtain readings. The experiments certainly went to show that, by the Shone system, a quantity of fresh air direct from the atmosphere could be supplied into, and circulated through, soil-pipes, drains and sewers, to dilute the air therein to any extent which might be necessary, and according to the results obtained in this practical test at a cost which, having regard to the importance of efficient ventilation, could not fairly be considered to be prohibitory.

Mr. Scott Moncrieff said one of the cardinal points of present-day sanitation was to prevent anything like sewer gas getting into the house. The object of this system was to carry that out on a larger scale in the streets, and it deserved all encouragement.

Mr. W. Weaver (Kensington) said the question of sewer ventilation was a pressing nuisance, and they had so far not been able to get rid of it, especially as regarded large brick sewers. He would hesitate to say that with the large brick sewers they would get a fan effectually to draw out the air at any distance from the base. Mr. Mawbey had shown them that something could be done in the direction of ventilating small pipe sewers, and if some one could embark on another experiment to see how it could be applied to large brick sewers, he was sure the various municipal councils would not hesitate to spend a moderate amount of money to achieve results such as had been obtained at Leicester.

Mr. L. Shone claimed that the system could be as easily applied to large brick sewers as to pipe or iron sewers.

Mr. Caink (Worcester) said that, according to the section, the openings were governed by the distance from the extractor and the number of openings into the sewer. If that was so a difficulty arose when extensions came to be made and houses were added to the section.

Mr. Mawbey, in reply to Mr. Caink, said they calculated the number of houses to be built the same as if they were sewerage a district.

THE SANITARY INSTITUTE CONGRESS AT GLASGOW.

LAST week Sir John Ure Primrose, the Lord Provost of Glasgow, in the presence of a large company of delegates from different parts of the kingdom, opened within the buildings of the recent East-end Exhibition, Glasgow, a health exhibition, which has been organised in connexion with the Congress of the Sanitary Institute. The exhibition is divided into colonial, municipal, and educational sections, and among the exhibits is a model hospital and a model one-house dwelling. In the various sections are sanitary appliances, building materials, heating, lighting, and cooking appliances, water fittings, washing and wringing machines, clothing, disinfectants, disinfecting apparatus, and hospital and sick room appliances. Amongst the most interesting departments is that relating to the hygiene of schools, trades and manufactures, hospitals, prisons, barracks, ships, workhouses, asylums, the burial of the dead, cremation and other means of disposal, and the prevention of accidents and fires, the filtering, softening, and purifying of water, flushing, and sewage treatment are all represented. There is also an equally interesting exhibit of apparatus for water supply, water waste preventers, sinks, baths, lavatories, sewers, drain-pipes, and sanitary goods. Over one hundred of the leading sanitary firms of this and other countries are represented. The main object of the exhibition is to illustrate the practical steps that are being taken to deal with the many problems that present themselves to municipal authorities. The Lord Provost, in declaring the exhibition open, said that they were that day on the threshold of a great sanitary Congress in Glasgow, and while they would

hear much of the onward march of sanitation, it was proper that the material results of that progress, in the way of appliances for healthier and more wholesome living should be demonstrated at the same time. The exhibition served therefore to bring forward in a practical way the methods and problems discussed at the meetings of the Congress in the past.

The annual Congress of the Institute opened on Monday at Glasgow, when the members were received in the St. Andrews Halls by the Lord Provost, Sir John Ure Primrose.

Presidential Address.

Dr. A. Wynter Blyth (Registrar of the Institute), in introducing Lord Blythwood, the President, reminded the members of the valuable service Lord Blythwood had rendered to the country in the furtherance of questions affecting improved sanitation. He also alluded to the fact that a quarter of a century ago the Sanitary Institute, at the invitation of the Corporation, held an exhibition and Congress in Glasgow, which was successful in every way, and excited a great deal of interest and attention in the country. Since then they had many eminent men as presidents, and the list showed that to develop the aims of the Institute, and to diffuse the science of public health, required the efforts of eminent men trained in various schools, and that it could not with profit be relegated to any one class or profession.

Lord Blythwood in the course of his presidential address, said that if any one who was at the first Congress in Glasgow, twenty-five years ago, was at the conference that week they would be able to see the fruits of their labours in the increase of the sanitary arrangements of the city. He was reading the remarks of Dr. Russell, the medical officer, on the condition of Glasgow in 1818, in which he pointed out that the narrow alleys were the receptacles of every kind of filth which was left to rot in the roadway, while the cellars inhabited by human beings were in no way different from pig-stys. In 1837, with a population of 253,000, the death roll of Glasgow was 31 per thousand; in 1847, with a population of 320,470, it was 56 per thousand; in 1893, with a population of 677,880, the death rate was 23 per thousand; and in 1903 it fell to 18.4 per thousand. That was a proof of what had been done in Glasgow in the way of sanitary education and sanitary work. Proceeding, the President referred to the introduction of a pure water supply to the city in 1859 and the passing of the City Improvement Act in 1866, and also to the establishment of hospitals, a refuse destructor, and the construction of sewers. With a vast population continually increasing, the question of the getting rid of filth had always to be faced, and drainage works were now being carried on. He trusted that when these were completed the city would be able to call on the neighbouring towns to purify and clean themselves and their waters, and that they might look forward to the time when salmon would again disport themselves in the Clyde. A great problem which now had to be faced was the smoke nuisance, which was most necessary to be dealt with, for the sun was the greatest of all sanitary agents, and if the health of the people was not to be deteriorated, they must have that power of recuperation. He knew as a boy that seven miles from Glasgow in the gardens apricots and plums grew, but although the trees were there no fruit was forthcoming now. This was no doubt due to the geographical position, for the smoke generated in Glasgow and around blotted out the rays of the sun. Were it not for what he would term the awful conservatism of manufacturers, he believed that many of the inventions would purify the smoke at not an expensive cost. He trusted the meeting of the Congress would do something to stimulate efforts to get rid of the pall which hung over them. The Institute was doing a great work by increasing the sanitary condition of the country. If they wanted to hold what their forefathers had won, they must keep up the high standard of the population, and one of the agents in this direction was sanitation.

The Lord Provost, in moving a vote of thanks to the President, which was carried, said the death rate of the city was now down to 15 per thousand. They were endeavouring to blot out some of the disfigurements of the city, and the Clyde was becoming purer. The smoke question was a difficult one, for there were commercial considerations to which due weight must be given, but he believed the smoke pollution was preventable and economically preventable.

Sanitary Science and Preventive Medicine.

Section I. of the Congress met in the Medical Jurisprudence Class-Room on Tuesday, under the presidency of Professor Glaister, when papers were read by Professor H. R. Kenwood on the "Practical Disinfection in Rooms and Workshops occupied by Sufferers from Consumption"; by Dr. Raw on "Tuberculosis in Cattle and its Conveyance to Human Beings"; and by Dr. Jackson Clarke, on the cause of small-pox.

Conference of Engineers and Surveyors.

On Tuesday morning a conference of engineers and surveyors to county and other sanitary authorities was held in the Law History Class-Room of the University, under the chairmanship of Mr. W. Weaver, M.I.C.E. (Borough Engineer and Surveyor, Kensington).

In a short presidential address, Mr. Weaver referred to the great increase in the number of incapables amongst the population, and said that sanitation should apply to the individual as well as to his dwelling.

Mr. C. H. Cooper (Wimbledon) followed with a paper on "Card Index as Applied to the Works of Local Authorities." For years he said he had kept his notes on cards, which, being inserted in trays under their different headings, are available for reference at any time, independent of the period over which such notes extend. The saving in time by the adoption of his system was enormous. The author exhibited the cards, books, etc., he used, and explained his system.

Motor Vehicles and Municipal Service.

Mr. E. Shrapnell Smith, secretary and treasurer of the Automobile Mutual Protection Association, read a paper on "Motor Vehicles in Relation to Municipal Service," in the course of which he referred to the great increase in the number of motor-cars, and said this great increase in the popularity of light motor-cars had brought proportionate benefit to roadside interests throughout the land, though its train was chiefly remarkable for one grievous accompaniment—the dust nuisance. The dust problem is admittedly one for every user of the highway, but it should be the permanent concern of the municipal or county surveyor. The remedy is to be found in the gradual laying of metal that has been steeped in tar or other similar liquid. The use of surface treatment *ad interim* can be urged as an expedient only, and not as the final attainment. He advocated the provision of motor-cars for borough and county engineers as time-saving machines, and referred to the trials made by the Liverpool Self-Propelled Traffic Association in 1899 and 1901 of heavier machines suitable for street removal, haulage of material, and refuse removal. These trials were followed by what might be called a commercial experiment in road transport, and operations were carried out in Lancashire with fourteen waggons of 3 tons over a period of twelve months. The result was a breakdown with this weight of cars, but the Association is being maintained with a view to renewed activities when fresh circumstances shall have rendered the scheme more feasible. There were now about 950 heavy motor vehicles at work in the United Kingdom, which was a solid argument to advance in support of the purchase of motors for heavy transport as soon as the new regulations occur. Mr. Smith concluded by submitting the following resolution, which he suggested should be carried by the meeting:—"That this conference of engineers and surveyors to county and other sanitary authorities is of opinion that the advent and increase of motor vehicles on public highways renders it imperative, in the interests of public health, (a) that municipal, urban, and county estimates should in future provide for the use of fixing liquids during dry weather on existing macadamised roads, and (b) that in the construction and repair of macadamised roads the metal should be impregnated before spreading with some cohesive liquid appropriate to the local conditions, and this meeting recommends the Council of the Sanitary Institute to make known these views as widely as practicable."

Mr. Humphreys doubted the wisdom of passing the resolution as it stood, seeing the great disagreement there was as to the best methods of reducing the dust nuisance.

Mr. Cooper suggested that they should merely pass an abstract resolution. The Chairman moved, "That this conference of engineers and surveyors to county and other sanitary authorities is of opinion that the

advent and increase of motor vehicles on public highways renders it imperative, in the interests of public health, that municipal, urban, and county authorities should adopt methods for the prevention of dust during dry weather on existing macadamised roads." When wheel traffic took the place of packhorse traffic the people made the road, and there was not the slightest reason for doubting that engineers would be able to make the roads suitable for the altered needs of the age.

In the course of further discussion there was a general agreement that for dust collection motor vehicles were not economical, and also that in the case of very large towns electric tramways were more suitable than motor buses.

The resolution as moved by the Chairman and seconded by Mr. Mawbey was carried.

Utilisation of Destructor Residuals.

Mr. W. Hillman next read a paper on the "Utilisation of Destructor Residuals," and said that in connexion with refuse-destructors the problem was how to dispose of the indestructible residuum. Assuming he said, that the leading types of destructors are of equal efficiency, and produce a vitreous clinker—with the present high temperatures there is no justification for any other—there are many purposes to which it can be applied, and the object in view is to ascertain the most remunerative. As a filtering medium for sewage works, crushed clinker is unsurpassed, being harder, more porous, and less liable to disintegration than coke. As an aggregate for concrete it is superior to such materials as broken stone or ballast. Ground into mortar it finds a ready sale for building works, and makes an excellent plastering material, provided the iron particles are extracted. It may be crushed or graded for tar paving. For road making rough clinker from the cooling floor makes the best hard core procurable, providing, as it does, a superior drainage bed, tending to keep the road surface dry. A new industry was springing up in the manufacture of bricks, and this seemed to him one of the most satisfactory methods of clinker utilisation. A plant to produce 50,000 bricks per week would cost approximately 3,000*l.*, and the working expenses 30*l.* per week, summarised thus:—Interest on capital and depreciation at 10 per cent., 6*l.*; labour (estimated), 15*l.*; power, 2*l.* 10*s.*; lime, at 10*s.* per ton, 6*l.* 10*s.*; total, 30*l.* Assuming fifty working weeks to the year, this gives the average cost of 12*s.* per 1,000 bricks made. A combination of flag and brick making would be still more profitable—i.e., making bricks and flags alternate weeks, the same preparation plant serving for both purposes. No serious difficulty seems to be experienced with the disposal of the dust, its absorbent qualities being such that up to 30 per cent. of pure carbolic acid can be added, thus making an economical disinfectant for ordinary purposes. The greatest source of inconvenience in a destructor works is the number of tins and discarded metal vessels, inasmuch as they uselessly occupy much valuable cube space. It is possible to reduce them to marketable form at one operation by running off the solder, hurrying off the tin, and then compressing the sheets into "cheeses" with the miscellaneous bits of old iron interposed.

Mr. Mawbey, who opened the discussion, said that his experience at Leicester was that the disintegration of a filtering medium in sewage work it was surpassed by a number of different materials. Then they found they could not make good enough flags to put down in Leicester unless they used a proportion of gravel. With one proportion of granite to two portions of crushed clinker they had certainly got a good flag.

Dr. Willoughby impressed on the Congress the fact that destructors were for the destruction of refuse, and too much ought not to be expected of them as heat producers.

Mr. Cooper thought they could get no better foundation for ordinary macadam roads than clinker from the destructors.

Mr. Hillman, replying to a vote of thanks, said that it was true clinker flags were not things of beauty, but for paving cellars and side streets there was nothing better.

This closed the sitting of the conference.

Conference of Municipal Representatives.

A conference of municipal representatives was held in the Examination Hall on Tuesday, under the chairmanship of Mr. Councillor W. F. Anderson.

The Smoke Problem.

Sir John Ure Primrose (Lord Provost) read a paper on the "Smoke Problem," in which he recalled the fact that, at a Congress in 1896, the problem of smoke pollution and its remedies brought forward and discussed, and he remembered how they listened to Sir Wm. Raw and Mr. A. F. Fletcher, H.M. late C. Inspector under the Alkali Acts, whose addresses did much to attract public attention to smoke pollution and its dire effects. They had travelled during the three intervening years considerably nearer a solution of the problem. He was quite convinced that mechanical science in its application to the proper combustion of fuel, whether fuel be coal or the gas obtained from it, was quite capable of relieving them from nuisance. Further, this much-needed remedy may be obtained in a manner quite consistent with economy, so far as steam production concerned. It was only fair, however, to state that many manufacturers who had hitherto adopted the best structural means they knew of to prevent the pollution, had had their efforts rendered abortive by the absolute carelessness of their firemen. In such cases it appeared to him that the penalty should fall on the absolute transgressor. The domestic boiler also was by no means free from blame in regard to the evil, and he was led to the conclusion that the time might not be far distant when the gas fire would supersede the burning raw coal in the grate.

A short discussion followed, and a vote of thanks was passed to the Lord Provost, on motion of Mr. W. Whitaker (Chairman of Council of the Sanitary Institute), seconded by Mr. A. H. Reid (Chairman of the Board of Examiners of the Sanitary Institute in S. Africa).

The Work of the Plumber.

EX-BAILIFF R. Crawford, LL.D., gave an address on "The Municipality and the Plumber." He said that the plumber is pre-eminently the man whose work is difficult to find or understand. It was hidden work, which might be termed *caevare* to the general public, but which most immediately affects public health. The plumber was the tradesman who in recent times had made persistent efforts to organise himself for a view to legislative recognition, and to secure his trade from the influx of incompetent men who in recent times had taken the place of the old plumber. He said that it might become a protection and a security instead of a menace to the public. A doctor might by incompetence kill his patient quickly, but the unskilful or incompetent plumber might do his work so as to poison a family and imperceptibly a whole family. They were protected against the one, but were open to the mercy of the other. Last year drainage of 1,526 old properties in Glasgow were tested by the smoke test and only 100 were found in order. This was not a satisfactory record, and suggested that a large amount of defective plumbing work still lay undiscovered in city property. He asked if the rates should for all time have to keep up an army of inspectors to insure themselves against the risk of disease traceable to the work of ignorant and incompetent men. Was it not much more reasonable to seek for a condition of the work so closely connected with the public health, which would, by examination and registry, prevent it from being occupied or invaded by the ignorant and the unworthy? Dr. Crawford proceeded to refer to the efforts which the plumbers had put forth in their Registration Bill to secure legislative recognition for their trade and the nature of the opposition which for so many years been successful in opposing it in the House of Commons. In conclusion he said that local and water authorities should render much help to reform by deciding to give preference so far as lay in their power to the employment of registered plumbers against plumbers not registered. He said "That it is necessary to the effective administration of the Public Health and Water Act that the authorities be recommended and enabled to require that the competency of plumbers employed to execute or inspect plumbing work under the regulations of those authorities shall be certified by the Plumbers' Company under conditions appertaining to the registration of plumbers or by such other means as may be set up by statute or by agreement with the Local Government Board."

Mr. Cooper (Aberdeen) asked why the resolution had been altered from the one of notice had been given.

Dr. Crawford explained that the object of the plumbers' Registration Bill was to create a new authority, the Plumbers' Company being the body acting authority up to the present time. Mr. Hind (Stockton-on-Tees) seconded the motion, and pointed out that, while they might be the most perfect plans and most stringent regulations, yet if they had indifferent workmen the whole of the work was prejudiced. The importance of having plumbing work done effectively could be realised when it was remembered that, while decorative and other work was within view, the work of the plumber was hidden away out of the sight of the architect and clerk of the works. This question had been agitated since 1884, and people now giving instructions for buildings were insisting on the sanitary arrangements being as perfect as possible, and this was a proof of the general progress which had been made in the matter. Mr. Robinson (Durham) asked if the effect of the resolution would be that in future a medical officer, surveyor, or sanitary inspector was to be a plumber would be unable to certify as to the sanitary effect of the fittings. Mr. Crawford said that was not so. Mr. Smith (Birmingham) considered that attention should be given to the plumber's work, who was often given work to do while the plumber was enjoying himself in the neighbouring hotel. Mr. Crawford thought the plumber's boy was peculiar to Birmingham, for he had never known plumbing done by the boy. In any case, the object of the proposed registration was to make the plumber responsible for the work he did, and one feature of the movement in connexion with registration was to insist on apprenticeship for plumbers. After some further discussion the resolution was carried.

Housing of the Poor.

Sir S. Chisholm, Bart. (Glasgow), in the course of a paper on "The Municipality and the Housing of the Poor," said that the whole of the science of sanitation might truly be said to be introduced in the home. It was to make the homes of the people sweet and clean that this science had been founded. Had the municipality any responsibility in this connexion, it should the so-called law of supply and demand be left to deal with the question? His answer was not far to seek, because, if the law of supply and demand were left to take its untrammelled action, society would quickly come to chaos and fall back into absolute anarchy. Under the direction of the local authority, many slums had already disappeared and many were still disappearing; whereas, if the matter were left to the landlord and tenant to settle, with need and greed on the one hand and poverty and vice on the other, the homes of the poor would remain the reeking abodes of stilted and death. The housing problem was essentially a complex one, and if it were to be solved there must be better-behaved people, as well as improved housing conditions. The people must live, and live as human beings should live, and no theories, however plausible, should be allowed to stand in the way of the attainment of this end. The municipality could build with a minimum of loss to the community and in many cases with no loss at all. When the necessity arose for this, the municipality acted as neglected to act was preparing for itself day of retribution. Mr. Councillor Burgess (Glasgow) opened the discussion, and opposed the provision of single-apartment houses, as was done by the Glasgow Corporation. Mr. Gleaves (Liverpool) said that in the district he came from, a few miles from Liverpool, he had six-roomed cottages to let at six shillings a week, and if that could be done at Liverpool he did not see why it could not be done at Glasgow. Mr. Lambie (Larkhall) defended the Glasgow Corporation against the criticism of providing re-tenement houses. It was all very well to talk about having three or four roomed houses, but where was the money to come from? Dr. Simpson (Liverpool) corroborated what Mr. Gleaves had said as to six-roomed houses at Liverpool at six shillings a week. In answer to the Chairman, Dr. Simpson said the cost of the ground was 1s. per sq. yd. and the cost of the houses was £150 each. Considerable discussion followed, most of the speakers referring to the dirty habits so prevalent amongst the very poor, and contending that the people themselves must be improved.

The President, in closing the discussion, said he did not wish to provide for those who could earn a sufficient wage to look after themselves, but for that portion of the community who, strive as they would, could not earn sufficient to maintain themselves. They would be materially helped in solving the problem if they had a more sympathetic department of the State to which they might appeal, and sixty years was not long enough in which to spread over the payment for dwellings, houses, and land.

HEALTH CONGRESS AT FOLKESTONE.

The annual Congress of the Royal Institute of Public Health was held at Folkestone from Thursday, July 21, to Tuesday, the 26th inst., many hundreds of members and delegates representing County, City, Borough, Urban and Rural Councils from all parts of the kingdom, port, sanitary, municipal and other authorities, and a number of learned societies, taking part, and the Earl of Radnor, lord of the manor of Folkestone, being President of the Congress. The inaugural meeting was held on Thursday morning in the Pleasure Gardens Theatre, which was attended by the President (Professor W. R. Smith) of the Royal Institute, and some of its leading officials, and the chief officials of the Congress, the company including, besides the Earl of Radnor, Sir Albert Sassoon, M.P. for the division, the Mayor of Folkestone, Chairman of the Executive Committee, the Mayors of Hythe, Salford, and other towns, and many municipal representatives. The Mayor of Folkestone opened the proceedings, followed by the President of the Royal Institute, who, after a brief address, in which he alluded to some of the leading objects of the Institute, invested the Earl of Radnor with the badge of office as President of the Congress, and presented him with a diploma as Honorary Fellow of the Institute. In an extempore address the Earl of Radnor welcomed the delegates to their beautiful town, expressing the hope that the deliberations of the many experts assembled would lead to very satisfactory results. The meeting was also addressed by Sir Edward Sassoon, M.P., the Bishop of Dover, the Mayors of Hythe and Salford, Sir Charles Cameron, M.O.H., Dublin, and Mr. Councillor Todd, Chairman of the Health Committee of Edinburgh.

The work of the Congress was distributed over six sections, including a Ladies' Section, presided over by the Countess of Radnor. One or two of the sections sat in the afternoon, but most of them commenced the sectional proceedings on Friday morning.

Section C.—Engineering and Building Construction.

The President of the section, Mr. Wm. Harpur, M.Inst.C.E., Borough Engineer, Cardiff, in his inaugural address devoted himself chiefly to two points, the status of the building surveyor, and the necessity of amendments in the building regulations. It was a matter of great regret that for the office of surveyor, with the hundred and one important duties he was called upon to perform, no diploma or proof of qualification was imperative. The appointment depended on the good will of the council or local authority, who might, if they chose, appoint to the office a farmer, a tailor, or a carpenter. The surveyor ought to be an officer possessing due qualifications, and working under the authority of government. In order to secure duly qualified men to fill the office the salaries must be adequate. At present they were quite inadequate to command the services of the right sort of men. With regard to the building regulations, in most cases the sanitary authority was unable, under the by-laws as they stand, to carry out the provisions of the Housing Acts, except at enormous cost. In dealing with insanitary areas and in rehousing families that had been dispossessed, they were harassed by a multitude of restrictions and conditions, so that it became impossible for the local authority to compete with the builder. As soon as it became known that the local authority proposed to build, the price of every eligible site was run up and costs were multiplied so that the builder could always let his houses at less rent than the local authority could do without throwing a burden on the ratepayers. The costs would be reduced if the requirements of the model by-laws were relaxed, and if the Government would assist the municipality in getting better terms for loans. The cost of sites within

the boundaries of large towns was prohibitive, and where building operations were active outside the boundary, the local authority had no control over the class of houses erected, or over the width or direction of new streets. A much needed amendment was the giving of powers to local authorities promptly to extend their boundaries where new streets and buildings were likely to be wanted. With regard to the model by-laws of the Local Government Board, where they were intelligible, they were impracticable and incomplete. The maximum width for streets of 36 ft. or even 40 ft. was now quite insufficient with all the new means of locomotion. In many cases landlords were broad-minded and generous, and readily acceded to the demand for wider streets. But to depend upon the generosity of landlords was not enough. The local authority ought to be able to obtain, through a reformed Local Government Board, the right to fix the width of streets at such a maximum as circumstances might require. At present little townships are allowed to spring up all round the larger towns under all sorts of undesirable conditions, and defects have subsequently to be remedied at enormous cost. Government regulations ought to make it easy for a municipality promptly to extend their boundaries so as to bring new districts under proper jurisdiction.

A vote of thanks to the President of the section was proposed by Mr. H. G. Whyatt, Borough Engineer, Grimsby, who said he agreed in the main with the views expressed in the inaugural address, but upon one point he differed from the President. He agreed that the requirements of the Local Government Board needed modification in numerous cases to make them practical, but he did not agree in the suggestion that the special by-laws governing the erection of dwellings for the working-classes should be relaxed. The members of the Local Government Board should be more practical, and should make themselves better acquainted with the special difficulties encountered in different localities that made the model by-laws inapplicable in many cases, and rendered modifications absolutely necessary. But whatever concessions might be obtained by local authorities would at once be claimed by the jerry-builder. If the by-laws were relaxed, or if they had no by-laws, they would be unable to control the jerry-builder.

Mr. Councillor Musgrave (Rugby), in seconding the vote of thanks, said we must not seek to relax the requirements of the by-laws in the interest of the jerry-builder. He should oppose the interference of the Local Government Board in the appointment of surveyors. On many occasions the Local Government Board had proved itself incompetent. The model by-laws were much in need of amendment. As they stood they were a mass of verbiage, the interpretation of which would puzzle a Philadelphia lawyer.

The vote having been accorded by the section, Mr. Harpur replied. He said he did not suggest that there should be any retrograde action on the part of local authorities, and perhaps, instead of the word relaxation, he ought to have used the term modification. The main point was that, with all the expenses that have to be incurred by a local authority in building cheap houses under the Housing Acts, it became impossible to compete with the builder. The exaction of a height of 10 ft. and of 14-in. walls for cheap cottages of two floors was unnecessary. The scantling of the timber prescribed was often also too great. For such cottages, 9-in. walls were quite thick enough. The expense of building such cottages must be reduced. The term for the repayment of loans had been extended by the legislature from fifty years to eighty years, but the Local Government Board would only grant the extended term for freehold property. Local authorities ought to have the benefit of improved legislation to the fullest possible extent. It was an impertinence on the part of the Local Government Board to put obstacles in the way when the law had granted eighty years for the repayment of loans. Again, with the assistance of Parliament, loans might be obtained by local authorities on much better terms. Mr. Musgrave objected to the interference of the Local Government Board in the appointment of surveyors. But there should be some authority to control those appointments, and if the Local Government Board were reformed and would exercise its powers, it might render great services to the public in this and other matters.

Seaside Sewage Disposal.

The first paper called for was on "Seaside Sewage Disposal," by Mr. A. J. Martin, of Westminster. A town possessing a well-chosen sea-outfall had a much less difficult problem to face in the disposal of its sewage than an inland local authority. An efficient sea-outfall gave a nearer approach to finality than any other mode of disposal yet in vogue. South Wales and Monmouthshire were laying trunk sewers to take the sewage from their river valleys and towns to the Bristol Channel, and for London itself a scheme had been propounded to carry the sewage 56 miles across the whole breadth of Kent to an outfall at Dungeness Point. An instance of an efficient sea-outfall was found at Torquay, which for the past forty-five years had discharged its sewage into deep water in the English Channel. Very few seaside towns were so happily situated as Torquay. In most cases the absence of adequate fall or other causes necessitated preliminary treatment of some kind for the sewage of seaside towns. The efficiency of treatment by the removal of the solid matters in suspension, and of treatment by the septic tank system, were compared in the paper, and the following conclusions were arrived at:—

"1. That under certain exceptionally favourable circumstances the discharge of untreated sewage may yield perfectly satisfactory results.

"2. That under ordinary conditions the separation of the solids is desirable.

"3. That this may be partially accomplished by screening, and more effectually by sedimentation, precipitation or septic action.

"4. That under ordinary conditions septic treatment will be most satisfactory.

"5. That the effluent should, if possible, be discharged continuously.

"6. That if storage is inevitable, it should take place in a tank rather than a sewer, and that the opening and closing of the valves should be effected automatically.

"7. That the utmost care should be taken in selecting the point of discharge."

The President proposed a vote of thanks to the reader of the paper. He was engaged in carrying out the trunk sewer for Monmouth, and three years ago had been interested in a scheme before Parliament for a sewer of 4 ft. 6 in. diameter three miles away. They knew they should meet with opposition, and it had been necessary to be prepared for every difficulty. They could not obtain the necessary conditions for a continuous discharge, and would have to discharge on the top of the tide. They had to discharge a sewer containing 4½ millions of gallons in four hours. But where conditions were favourable, a continuous discharge was the most desirable.

The motion having been seconded, Colonel Brownridge, borough engineer, Birkenhead, supported the motion. He was glad to be able to say that the works on the Mersey, with which he was connected, permitted of a continuous discharge. They could discharge into the Mersey at all states of the tide, but he did not know if that would be practicable in cases where all the sewers concentrated into one. If possible they should obtain a continuous discharge into the sea. It was possible to trace the course of a stream of sewage at a great distance by means of birds. When the sewage could be broken up and rapidly mixed with sea-water, it must be better. He did not propose to discuss, where treatment was necessary, whether it should be septic or otherwise. The main thing was to provide for the discharge of an effluent under good conditions, and if they had the advantage of being able to select the method of treatment, the disposal of the sewage of a seaside town would not offer much difficulty.

Mr. Martin said the discussion had left him no points to reply to. He was gratified to find so kind a reception given to his paper, which was on a subject upon which it was not easy to say anything new.

Sewage Discharge into Estuaries of Small Tidal Rivers, Etc.

A paper of much interest on a cognate subject was read in section B, over which Dr. Edward E. Klein, of London, presided. The paper was prepared by Dr. A. G. Russell Foulerton, Director of the laboratories of Middlesex Hospital, to show the results of the discharge of sewage into the estuaries of small tidal rivers and on the coast, on the health of the populations residing near the outfall. The paper first dealt with the injury to fish and fishing, and especially to the oyster industry, through the pollution of tidal waters by sewage and the possible danger of typhoid through the consumption of shell fish, and then considered the danger of the direct causation of typhoid among the communities dwelling near the

sewage-polluted foreshores of rivers and estuaries. The report of a commission appointed last year to consider the subject, issued in January, stated that some alteration of the laws dealing with the pollution of rivers was required. The investigations of Dr. Foulerton were chiefly in Sussex, and extended to Chichester Harbour, a village of 241 inhabitants at the mouth of the Sussex Ouse, a town of 6,770 population, about 8 miles from the outfall of the sewage of Lewes, two large towns respectively of 45,344 and 36,535 population, twelve urban districts and twelve rural districts in the county. The general conclusion arrived at is, that the danger of the air-borne infection of typhoid from the sludge on the banks of tidal rivers into which crude sewage has been discharged, has been overlooked. Dr. Foulerton thinks it unfortunate that the "Prevention of Rivers Pollution Act" allows such discharges as are not a nuisance to the eye or the nose. Leaving to the future the question of crude sewage discharges on open coasts, he has no doubt that danger to public health exists through the discharge of crude sewage into narrow estuaries to settle on the foreshores of rivers. In the village of 241 inhabitants there had been fifteen cases of typhoid in twelve years. Typhoid is prevalent in the town of 6,770 inhabitants a few miles from the point on the Ouse where Lewes discharges its crude sewage. It only requires a fly to feed on the sewage polluted mud and then on milk or other human food to provide an effectual means for propagating typhoid. The morbidity rates observed in the two large towns referred to, the twelve urban and twelve rural districts, show a contrast which is very significant. The morbidity rate for typhoid was for the whole county 4.08, for the two large towns 6.03, for the twelve urban districts 4.7, and for the twelve rural districts 2.5. Of fourteen urban districts the towns with the highest morbidity rate were the least crowded; six on rivers or coasts showed the highest, and six inland towns showed the lowest morbidity rates. These facts prove, in the opinion of Dr. Foulerton, that our ideas of the causation of typhoid require to be extended, and that we must reconsider the advisability of allowing the discharge of large quantities of crude sewage in the neighbourhood of towns situated on our tidal rivers and on our coasts.

Conservation of Subterranean Water Supplies.

A paper, prepared by Mr. W. H. Maxwell, Borough and Waterworks Engineer, of Tunbridge Wells, was read by Mr. Nicholls, of the hon. sec. of the section, in the absence of the author through illness. The subject was "The Conservation of Subterranean Water Supplies." In fifteen of the largest towns of Kent and Sussex, with an aggregate population of 687,700 people, the sole or the main sources of water supply are subterranean. Hence the question of maintaining at all seasons such sources of supply becomes of the utmost importance. This was so clearly recognised in 1902, when the Cray river disappeared, through the excessive pumping (so it is alleged) of a London water company, that an Underground Water Preservation Association was formed in that year with the object of preventing, if possible, the excessive abstraction of underground water. Diagrams accompanying the paper showed some of the devices by which the natural storage of underground water may be increased, and the escape of underground water through natural outlets can be diminished.

In the absence of the author of the paper it was not discussed before the section adjourned.

Disposal of Waste of Public Institutions.

On Monday the proceedings of the section were resumed with the reading of a paper on the "Disposal of the Waste of Public Institutions and Works," by Mr. W. Francis Goodrich, of London. The great improvements which had taken place in recent years in the construction of Municipal Refuse Destructors had led medical men and sanitarians to look for a small destructor for the purpose of burning the waste of hospitals and other public institutions which, from the nature of the case, required to be as perfect as possible. Noxious fumes or nuisance of any kind could not be tolerated within the walls of such institutions. The defective features of the older types of destructors were pointed out in the paper. The adoption of forced draught had been the means of effecting great improvements in the smaller as well as in the large municipal refuse destructors, and a temperature of 2,000 deg. Fahrenheit being now easily maintainable, no nuisance of

any kind was now possible. A number of photographs accompanied the paper, showing various types of small destructors, one designed for a small London isolation hospital, with a destroying capacity of only ½ cwt. of refuse an hour. Another illustration showed a portable destructor, with a destroying capacity of 5 tons per day. Types of small destructors for tra refuse were also illustrated in the paper.

Before the discussion was entered upon, second paper was read on the same subject. It was entitled "Disposal of Refuse," by Mr. E. Watson, A.M.Inst.C.E., of Leeds. Having on previous occasions expounded the principle of an efficient refuse-destructor should be constructed, Mr. Watson, in the present paper described the leading features of three types of destructors on which he had recently been engaged—one at Brussels, opened last year for a capital city, which was of the large kind; a plant of moderate size, with two cells, for the town of West Hartlepool; and small one of three cells erected at Folkestone.

The plant at Brussels was one of two or four cells, in two groups of twelve cells each, which embodied all the most recent improvements. The cells are of the back-to-back "top-fed" type, each capable of burning from 8 to 10 tons of refuse per day or a total capacity of 240 tons per day. Special difficulties to be met in the case of Brussels were the getting rid of immense accumulations of refuse formerly sold to farmers, but of late years discarded for agricultural purposes, and the sparseness in the refuse of combustible matters, such as cinders. It had long remained doubtful whether the expense of providing coke or other fuel to help in the cremation of the refuse would be necessary. Mr. Watson, in his paper, stated that there has never been any difficulty in keeping steam either in summer or winter, although, owing to climatic conditions and an extensive use of gas cooking stoves, the refuse of Brussels contains far less combustible matter than is the case in any ordinary English town.

The plant at West Hartlepool was of two periods, the fires in the original six cells being lighted in 1901 and those of the six extension cells in 1903. The contract for the new plant as well as for the old was offered to open competition, the committee being determined to obtain in the extension plant the best furnace without regard to what they had in use already. The original plant was guaranteed to evaporate 1 lb. of steam per lb. of refuse, the new plant was guaranteed to evaporate 1.25 lb. of steam per lb. of refuse burned. In both cases guaranteed evaporation was exceeded. The evaporation realised in the old plant averaged 1.25 lb. of steam per lb. of refuse and in the new plant it rose to 1.52 lb. The cost of labour, 10d. per ton of refuse consumed, and in new plant only 9d. per ton.

The Folkestone plant, which has just been completed, differs in several important respects from the others described. The cells are capable of dealing with 15 tons of refuse per day every twenty-four hours. They have an enlarged grate area of 42 sq. ft. per cell, by which it is expected that considerable economies will be effected as compared with the standard. The arrangements permit of an increase in size of the destructor when the growth of borough demands such a step. The boilers are made ample for an enlarged plant, and another boiler can be added when required. The author, in concluding his paper, expressed gratitude for valuable suggestions made by Messrs. E. Putzeys, Chief Engineer of Brussels, Mr. J. W. Brown, M.I.C.E., of West Hartlepool (late Borough Engineer), and the Borough Engineer of Folkestone, Mr. A. E. Nicolson, A.M.Inst.C.E., with whom he has collaborated in the creation of the several plants, and to whom are due in large measure the success achieved in the respective cases. To illustrate the paper a large number of enlarged photographs were thrown upon the screen, each of which being described by Mr. Watson as it appeared.

The President proposed a vote of thanks to both the readers of papers. He would like Mr. Watson to tell the section why the Babcock-Wilcox boilers were, in the case of destructor, preferred. Did they possess any advantage over other types of boilers?

Mr. Councilor Atkinson (Hull) seconded the motion. The section was deeply indebted to both these experts. In Hull they had a good deal of experience of destructors.

r population of 250,000 they had two destroyers, one of them of an old and very primitive type. They had adopted Horsfall's destroyers, after a very full consideration, at a cost of £22,700. In reply to the President, Mr. Mott perhaps be allowed to say that the Babcock and Wilcox boilers were adopted because they were the most economical. The destructor at Hull had twelve cells, with room for more. Last year they had burned off 15,577 tons of dry dust, which was collected and delivered to the destructor works of the corporation. They supplied steam for electric lighting and the crushed clinker was used with a disinfectant and used as a deodoriser, thus effecting a great economy.

Colonel Brownridge (Borough Engineer, Birm.) asked the authors of the papers if they could state the average cost of a destructor for a long period. Too often the cost of a destructor was given over too short a period, and the works were new and everything was in order the cost for repairs was naturally small, but as the years went on the cost for repairs became greater and greater, and therefore, as an engineer, he would rather have the cost of maintenance stated for a lengthened period. He happened to have been mixed up in the early experiments with destructors, which had led to the introduction of high temperatures. He had followed the developments and the improvements made from time to time by rival manufacturers. A healthy rivalry between different inventors could only result in benefit to the community. The claims of inventors were sometimes misleading. They were not concerned to know how much water had been evaporated. They wanted destructors to destroy the refuse of towns, but if they could do that object, and could get other commercial results, so much the better. The duty to be looked for in a destructor was that it should destroy refuse in a satisfactory manner.

Mr. Alderman Cohen (Hull), in supporting the paper of the author, said he was a decided advocate of the destructor. He was at the laying of the foundation-stone of the first destructor erected in this country, and he had watched with interest the scientific improvements introduced from time to time in the later types. In the case of most towns a great economy could be effected by the use of the destructor in the disposal of their refuse.

Mr. Councillor Short (Bootle) said Mr. Mott's paper was very interesting as showing the improvements made in the application of the destructor to the production of a good destructor. He hoped that, by means of such papers, they would get the very latest up-to-date destructor. The question was increasingly important to the municipal administrator, whose chief concern was to safeguard the health of the people and to save life.

Mr. Alderman Burridge (Bedford) said that what they wanted to find was a destructor which would do its work without causing a nuisance. He would avoid creating a nuisance by putting up a destructor in a central situation, they were advised to go a mile or two out. But this would involve great cost for cartage, and he hoped a destructor would be produced some day which could be erected in a central situation without itself being a nuisance and a danger to health. Mr. Walker Smith (Borough Engineer, Barrow-in-Furness) thought their thanks were equally due to the readers of both the papers. How were they to gain instruction unless firms would come to these meetings to give them the benefit of their experience? A previous speaker had explained that here in section C they had only two papers before them and that of the President. Was it worth the while of their authorities to send them to a Congress which had so little before it? Might not the section be amalgamated with the Sanitary Congress?

The President ruled that the remark was out of order. They might as well ask why the papers of both bodies should not be read before the Association of Municipal Engineers. Mr. Turley (City Surveyor, Canterbury) said he would like to know what was the average cost of working a destructor. At Canterbury the cost for repairs to the destructor was enormous. They had a destructor erected only three or four years ago, and already the cost for repairs was getting rather alarming. Was it always wise to go in for high temperatures? He thought it was wrong to seek after high temperatures for the sake of saving the rates by utilising the destructor for electric lighting. If the temperature was less, they might be able effect-

nally to destroy the refuse and save a good deal on the cost of repairs.

Mr. Morrall (Mayor of Bridgnorth) said they must get their information from gentlemen who possessed it. They wanted to determine which destructor was the most suitable for their requirements. He would like to know what would be the first cost of a destructor for a town of 10,000 and for one of 20,000 inhabitants, and how much they might expect to incur for repairs. The reported enormous cost of repairs at Canterbury was not encouraging.

Mr. Whyatt (Borough Surveyor, Grimsby) said he would rather like to dissociate himself from the remarks of some of the previous speakers. Who else was there to tell us what we require to know if not the manufacturers? It was a decided advantage to hear their views. He should certainly apply Mr. Goodrich's suggestion as to forced draught to small hospital destructors. At present these destructors were usually of low temperature, and therefore gave off foul effluvia. The next he had to construct should be adjoining the laundry, and he would use a forced draught. With regard to the fewness of papers, was it not to their own discredit rather than that of the Institute? There was now no nuisance from the chimney of a well-built destructor, and it was better to put it in the centre of a town. A far greater objection to a distant site was that the difficulties of inspection were increased. When the destructor was only a few hundreds of yards from your office you could find time to drop in when your visit was not expected; but if three miles away, your visits would be fewer and more or less expected. At the worst there was only a burnt smell perceptible, and as the wind varied a good deal at Grimsby each part of the town got it in turn.

The President of the section, before calling upon the readers of papers to reply, said the subject they had been discussing was one of great moment at the present time. The authors of the papers had treated it in an impartial manner, and he had great pleasure in tendering them the thanks of the section. Personally he was sorry that there were not more papers, but there were other sections sitting, and all the sections were open. It was a pity that Mr. Smith had not himself given them a paper. With regard to another suggestion that had been made, he would only say that this Institute would always take its own course.

Mr. Goodrich was then called upon to reply. He said a delegate in the centre of the room (Colonel Brownridge) had asked for an estimate of the cost of maintenance of a destructor over a considerable period. He was not able to give the required information with regard to trade refuse destructors. The man in charge would have other duties to perform, and therefore it would be difficult to say how much was due to the destructor. With regard to the cost of the destructors he had described, a small destructor to destroy from 56 lb. to 1 cwt. of refuse per hour would cost from 75l. to 100l. The larger type would cost from 200l. to 300l. The portable destructor to burn half a ton per hour would cost about 500l. With regard to papers prepared by manufacturers, he would reply by stating what had recently taken place at a joint meeting of British and American Mechanical Engineers at Chicago. Two papers were read on this subject, upon which the American engineers were anxious for information. One which was read by a London engineer was so full of commonplaces and inaccuracies as to be pronounced ridiculous. Instead of being informed, the American engineers would have been misled had there not been another paper on the same subject read by the representative of a manufacturer. The reader of the latter paper, which was very helpful to the American engineers, was Mr. George Watson, brother of Mr. F. L. Watson, whose paper they had just heard. With regard to the question of Mr. Turley, of Cautehrury, it was not to him a matter of surprise that high-temperature cells in a destructor put up four or five years ago should be in need of some repairs.

Mr. Thornley (St. Pancras), representing the Metropolitan Asylums Board, said his experience of small destructors for isolation hospitals was not so favourable as that given in the paper read before the section. In the case of a destructor of which he had experience, he found it in continual need of repairs ever since it was erected. He complained that the papers before the section were private. How could he inform his colleagues if the information was not to be published? It was necessary too that they should have some more independent testimony.

He wanted the testimony of somebody not connected with the destructor manufacture.

Mr. F. L. Watson, in reply to the President's question with regard to the Babcock and Wilcox boiler, said he could not affirm that there was any very considerable economical advantage in the use of the Babcock and Wilcox boiler over boilers of the Lancashire type, for example, but it was more convenient. If the two types were equally suitable to the work to be performed, the results obtained would be about equal.

A delegate asked whether it was not the fact that the Babcock and Wilcox boiler was a more rapid steam-raiser than the Lancashire boiler. The question was not answered.

Mr. Watson, continuing, said it was not easy to give an estimate of the cost of maintenance of destructors over long periods. He must refer his questioner to the reports of municipal authorities. The cost of a destructor for a population of 2,000 would be from 2,500l. to 3,000l. Refuse varied so much in character that it was difficult to give an exact estimate. If a town had a good destructor they would not have any noxious smell. In saying that he did not imply that there was only one form of good destructor. There were several firms who made good destructors.

The proceedings of the section then closed.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

Board of Architectural Education.

THE following additional appointments as advisory members have been made:—

Sir Isambard Owen, M.D., to represent the University College of South Wales and Monmouthshire; Professor Elsey Smith, to represent King's College, London.

Visit to Newcastle-on-Tyne.

The following arrangements have so far been made for the Institute visit to Newcastle-on-Tyne, where the annual dinner will be held on Friday, October 7.

Members will be welcomed on their arrival at Newcastle on Thursday evening, October 6, by an influential local committee at the County Hotel, Newcastle, which will be the headquarters of the Institute during the visit.

On Friday, October 7, the Right Worshipful the Mayor (Mr. Alderman A. P. Anderson) will receive the members at the Council Chamber at 10 a.m., and deliver an address of welcome on behalf of the city of Newcastle.

The members will then adjourn to the lecture theatre of the North of England Institute of Mining and Mechanical Engineers, where the President of the Institute will take the chair, for the purposes of a conference on matters of interest to the profession. The Cathedral Church of St. Nicholas and Trinity House will be visited during the morning.

At the conclusion of the conference the members of the Northern Architectural Association will entertain the visiting members at luncheon at the County Hotel.

Arrangements will be made to enable members to visit in the afternoon "Jesmond Dene House," the residence of Sir Andrew Noble, K.C.B., and "Jesmond Towers," the residence of Mr. Charles Mitchell, returning through Jesmond Dene.

In the evening, at 7.30, the annual dinner of the Institute will be held at the County Hotel.

On Saturday, October 8, arrangements will be made (for those who desire to do so) to visit Hexham Abbey and the Roman Station at the Chesters, Chollerford, under the guidance of local members.

Members will be able to return to the south via Newcastle, or those who prefer to do so can proceed to Carlisle and the Lake District, and return by the West Coast route.

A handbook is in course of preparation, containing full information as to hotels, train times, places of rendezvous, etc., and will be sent to any member who decides to attend the meeting. *Seventh International Congress of Architects, 1906.*

At the closing meeting of the General Committee of the Sixth International Congress, Madrid, 1904, the following were appointed as British members of the Permanent Committee of the International Congresses of Architects:—Mr. John Belcher, A.R.A., Mr. Aston Webb, R.A., Mr. T. E. Collett, Mr. Henry T. Hare, Mr. Alexander Graham, Mr. John Slater, Mr. Leonard Stokes, Mr. John W. Simpson, and Mr. W. J. Locke.

The Council of the Institute have appointed the above to be the Executive Committee of the

estate, Cantarbury-grove, West Norwood (Mr. J. Wilson).—Agreed.

Wandsworth.—That an order be issued to Messrs. Lucas and Sons refusing to sanction the formation or laying out of new streets for carriage traffic out of the western side of Tooting Bec-road, Upper Tooting (for Messrs. F. W. and E. Lucas and H. Erichsen).—Refused.

Lewisham.—That an order be issued to Mr. H. Langton refusing to sanction the formation or laying out of new streets for carriage traffic on land abutting upon the south side of Southend-lane, and east side of Worsley-bridge-road, Lewisham.—Refused.

Formation of Streets and Line of Frontage.

Woolwich.—A deviation from the plans approved for the formation of Bereta-street, Foots-crays-road, New Eltham, and sanction to the creation of buildings on the western side of Foots-crays-road, northward of Bereta-street (Mr. G. Busb).—Consent.

Space at Rear.

Lewisham.—A modification of the provisions of section 41 with regard to open spaces about buildings, so far as relates to the proposed erection of four houses on a site adjoining No. 123, Leahurst-road, Lewisham (Mr. J. Johnson).—Consent.

Paddington, South.—A modification of the provisions of section 41 with regard to open spaces about buildings, so far as relates to the proposed erection of residential flats on the north side of Moscow-road, Bayswater, between Palace-court-mansions and the Greek church, with open spaces at the rear (Messrs Gordon and Gunton for Mr. Raffety).—Consent.

Means of Escape from the Top of High Buildings.

Holborn.—Means of escape in case of fire on the fifth story of Nos. 112 and 113, High Holborn, for the persons dwelling or employed therein (Mr. A. Burr).—Consent.

Buildings for the Supply of Electricity.

Poplar.—For an addition to the transformer station at Glengall-road, Poplar (Mr. H. Heckford for Poplar Borough Council).—Consent.

The recommendations marked + are contrary to the views of the local authority.

Illustrations.

SCULPTURE FROM THE PARIS SALON.

We illustrate this week two of the best works in sculpture which were exhibited at the Paris Salon this year. We should have been glad to have given them earlier, but the photographs of the year's sculpture which are readily procurable at the time of the Salon, and are sold in the Palais des Beaux-Arts, are never those of the best sculptural works of the year, but of those which appeal to popular taste.

M. Levasseur's "Nymphé" is one of the class of works which aim simply at the realisation of beauty of form, without any special intellectual meaning being attached to the work; nor can sculpture, perhaps, be better employed than in producing a thing of beauty, which indeed, rightly regarded, has its own spiritual significance. No one has produced finer work of this class than M. Gustave Michel, the author of the other figure illustrated; but in this case he has chosen, as French sculptors sometimes do, to express through the medium of sculpture an intellectual idea—the effect on human feeling of the contemplation of the infinity of space. The figure suggests an astronomer who has been considering the orbits of the planets (see the chart of ellipses and the compass), and is carried beyond them to the contemplation of the infinity of space.

We might attach to it, as a motto, George Herbert's verse:—

"O rack me not to such a vast extent|
Such distances belong to Thee;
The world's too little for Thy tent,
A grave too big for me."

[NEW] CREMATORIUM, SHEFFIELD.

This building is being erected by the Sheffield Corporation at their City-road Cemetery, and forms an annexe to the existing chapel on the unconsecrated portion of the cemetery. The chapel, together with the remainder of the cemetery buildings, was the work of Messrs. M. E. Hadfield and Charles Hadfield, and was carried out in 1880.

The new building takes the form of a square chamber, 36 ft. by 36 ft. inside, to accommodate two cremating furnaces of Messrs. Simons, Ltd.'s latest type; only one is being installed at

present. The building is entirely fireproof, being roofed with an octagonal dome of stone ribs and concrete, covered with roofing slabs of artificial stone. It terminates in a stone lantern which is designed to provide both light and ventilation, and which also serves to enclose the main furnace shaft.

The building is being erected for the Corporation by Messrs. D. O'Neill and Son, contractors, from the design of Mr. Charles Hadfield and Mr. C. M. Hadfield, the joint architects.

SHEFFIELD POOR CHILDRENS' HOLIDAY AND CONVALESCENT HOME, HOLMESFIELD, DERBYSHIRE.

This building is proposed to be erected at Holmesfield, about seven miles from the centre of Sheffield, on a sloping site commanding a beautiful view of the Cordewell Valley. It is intended mainly as a summer holiday home for about eighty of the poorer children from the Sheffield elementary schools, boys and girls being sent alternately. It will also be used as a convalescent home throughout the year for a limited number of children.

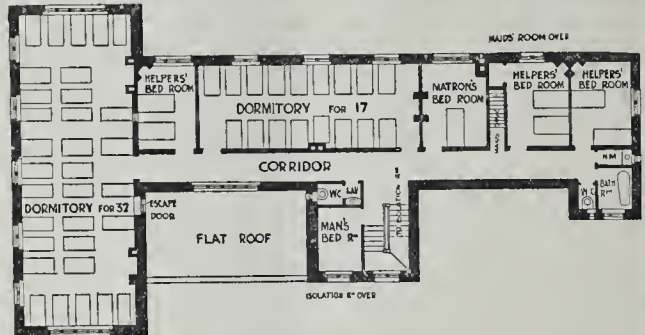

The materials proposed are irregularly coursed local stone, with ashlar dressings for the lower portion, and roughcast rubble walls for the upper portion. The roof will be tiled.

The architect is Mr. H. L. Paterson, Sheffield.

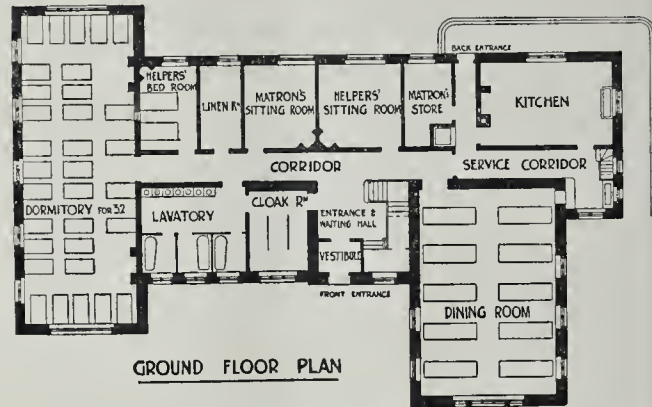

HOUSE AT WINDERMERE.

This building is intended to serve the joint purpose of a residence for Mr. R. R. Mawson, the head of the firm of Mawson Bros., nurserymen and garden furnishers, and also as central offices for the various nurseries and other departments of the firm.

It is to be built adjoining the Rayrigg Wood, and the Rayrigg nurseries, according to the best Westmorland traditional methods of building—native rock roughcast and lime-tinted, with very little in the shape of dressings except sills and coping and steps; and to be roofed with the pale blue-grey Coniston slates. The aim throughout is to obtain a quiet restful feeling from large masses of tone or sober colour as regards both house and garden; the needed variety and brightness in colour being obtained from a few herbaceous borders filled

BLYTHWOOD DAIRY, STANSTEAD, ESSEX.—MR. W. D. CARREL, F. R. I. B. A., ARCHITECT.

ith old-fashioned perennials and climbers on the walls; and if it is thought that the surrounding furze and woods are insufficient to give the desirable balance of warm colouring in winter a proportion of beech and hornbeam hedges would be introduced. T. H. MAWSON.

BLYTHWOOD DAIRY, STANSTEAD, ESSEX.

This dairy was erected some years ago for Sir James Blyth, Bart., at Stanstead, Essex, and was one of the first dairies equipped with electric plant.

Sir James Blyth has recently lent his farm to the Blythwood to the Government for the work of the Tuberculosis Commission, whose interim report was published a short time since.

ARCHITECTURAL SOCIETIES.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.—On the invitation of the York Architectural Society, a party from the Leeds and Yorkshire Architectural Society, including Mr. G. B. Bulmer, the President, visited York on Saturday to inspect the west front of York Minster. A scaffolding is at present erected at the Minster, and afforded an opportunity for minute inspection which may not occur again for many years. The party were shown over the work by the clerk of works, and were able closely to examine the south tower, and afterwards went over the stone yard in connexion with the work.

ENGINEERING SOCIETIES.

INSTITUTE OF SANITARY ENGINEERS.—The members of the Institute of Sanitary Engineers in the 16th inst. visited Tunbridge Wells, on the invitation of their President, Mr. W. H. Maxwell, the Borough Engineer. The Mayor greeted the members on their arrival at the Town Hall. Mr. Maxwell then accompanied the party to the various public works in the district. The water supply of the borough is derived from twelve deep-seated springs gravitating through iron collecting pipe lines to a large open storage reservoir of about 45,000,000 gallons capacity, and is supplemented, when required, by an excellent water obtained from deep artesian borings through the Wadstrey clay into the Ashdown sands. The works are situated at Pembury, about four miles to the north-east of Tunbridge Wells. The daily supply fluctuates from about 700,000 gallons to 1,000,000 gallons, according to the time of year, and the total yearly supply is about 60,000,000 gallons, equivalent to a total consumption of about 20 gallons per head per day, including that used for trade, garden, and municipal purposes. The waste in distribution is therefore reduced to an almost negligible percentage. From the works at Pembury the supply is pumped through some two miles of rising main (12 in. in diameter and provided in duplicate) into a covered service reservoir of about 1,000,000 gallons capacity, situated at Blackhurst, on the eastern outskirts of the borough. In pumping into this reservoir the engines work against a total head, including friction, of 385 ft., which is equal to a pressure of 167 lb. to the square inch on the lower end of the rising mains. The top water level of this reservoir is 500 ft. above the sea level and the lowest portion of the borough supplied about 40 ft. above the same datum, a difference of head which is capable of giving a pressure of about 113 lb. to the square inch. For the better supply of high portions of the borough not fully reached by the service reservoir a stand-pipe 40 ft. in height is provided close to the reservoir, and over which a supply is given daily. For drainage purposes the borough is divided into three watersheds, one gravitating to the northern sewage farm situated near the Southborough railway station (S.E.R.), one to the southern sewage farm near Groombridge (L.B. and S.C.R.), and one to the Hurstwood pumping station, where the sewage is pumped into the outfall sewer gravitating to the southern farm. The sewerage system of the town consists of brick and pipe sewers, varying in diameter from 6 in. up to 5 ft. diameter. At the Hurstwood pumping station are two Crossley gas engines, for the purpose of raising the sewage through about three-quarters of a mile of 9 in. rising main against a head, exclusive of friction, of 14 ft. During the year 1903 this plant pumped about 50½ million gallons in 4,150 hours, or at the rate of 12,170 gallons per hour, at a cost for gas of .88d. per 1,000 gallons

—the price of gas being 3s. per 1,000 cubic feet. The two sewage farms above named are each of about 200 acres in extent, equal to about ninety persons to the acre, and deal with the sewage and a portion of the storm-water on the broad irrigation principle. The heavier solids are first removed in precipitation tanks, and the sewage then distributed by means of "carriers" contouring the slopes of the land. The treatment consists of from three to five applications, according to circumstances, and the two farms engage some twenty-two men on the sewage treatment and farming operations. The crops grown consist principally of ryegrass, root crops, etc., and a little hops.

THE JUNIOR INSTITUTION OF ENGINEERS.—The members of this Institution, through the courtesy of Messrs. Coode, Son, and Matthews, the engineers, and Messrs. S. Pearson and Son, the contractors, were recently afforded the opportunity for inspecting under special facilities the National Harbour Works at Dover. Permission was also kindly given for the works of the Dover Harbour Board, of which Mr. A. T. Walmisley is the engineer, to be seen, and the turbine South Eastern and Chatham Railway Channel Steamer *The Queen*. On arrival at Dover the party (about one hundred in number) went aboard *The Queen* just previously to her starting for Calais, the chief interest, of course, being centred in the engine-room, containing Parsons turbines of 8,000 I.H.P., capable of propelling the vessel at 21.73 knots. From the Admiralty Pier the members were taken by a tug belonging to the Dover Harbour Board across to their Prince of Wales Pier, where the big Atlantic liners of the Hamburg-American Line now call. This pier was built by Sir John Jackson to the designs of Messrs. Coode, Son, and Matthews. The swing bridge on the connecting railway was shown in motion. After luncheon the Admiralty Harbour Works were seen, the members being conveyed along the East Arm by the contractors' railway. All the operations in the preparation of materials and in the processes of construction were explained in detail. Some of the party viewed the work from one of the Harbour Board's tugs. The total length of sheltering works is 9,520 ft., and the area enclosed will be 610 acres at low water. All the under-water work of the Admiralty Pier extension and of the East Arm is practically completed, and a commencement has been made on the island breakwater, which is to be built in a similar manner by concrete blocks, the bedding of the first course being prepared by means of grabs and the use of diving-bells.—On July 22 a visit was paid to Messrs. Bryant and May's Match Manufacturing at Bow, the processes in the making of both square stick matches and wax vestas being shown. Special interest was manifested in the continuous machines for both classes of matches, which treat the raw material and convert it into the finished product automatically throughout, filling into boxes which are then placed in the covering by operatives stationed at the machines.

COMPETITIONS.

SCHOOL, OLDHAM.—At Oldham the outgoing School Board had held a competition for a new school on the Clarksfield-road site. Not being satisfied with the result, they left the matter over to be dealt with by the new authority. The Education Committee of the Corporation have now held a fresh competition consisting of local architects only. With the aid of Mr. Edward R. Robson, F.S.A., as assessor, they have awarded the first position to Mr. Harold Cheetham, the second to Mr. Arthur Turner, and the third to Mr. Charles T. Taylor.

CHELSEA TOWN HALL EXTENSION AND PUBLIC BATHS.—On Tuesday the committees of the Chelsea Borough Council who are in charge of the matter reported having invited Mr. R. Dickenson, Messrs. Sheppard and Burkinshaw, Mr. L. Stokes, and Messrs. Wills and Anderson to furnish preliminary reports and plans for the extension of the town hall and the reconstruction of the public baths. With reference to the extension of the town hall, six schemes were received (alternative designs being submitted by Messrs. Sheppard and Burkinshaw and Messrs. Wills and Anderson), and these had been carefully considered. All the architects practically provided the accommodation required. The scheme which, subject to certain alterations, the committee were of opinion best suited the Council's

requirements, was that of Mr. Stokes, the estimated cost of which, exclusive of alterations to the town hall, cloakrooms, and gallery staircases, is 17,704. Designs for new baths were submitted by the four architects, and the committee had selected that of Messrs. Wills and Anderson as being the one best adapted for their purposes. Mr. A. G. Cross was appointed quantity surveyor in connexion with the extension of the town hall, and Mr. F. H. A. Hardeste quantity surveyor in connexion with the reconstruction at the baths. Information had been obtained as regards the latter work as to the cost of a second-class swimming-bath, Turkish bath, water supply, electric light and superintendent's house, and the quantity surveyor is to report on the prices for these extras as planned by Messrs. Wills and Anderson.

PUBLIC LIBRARY, PETERBOROUGH.—The competition for the Public Library, Peterborough, has now been decided as follows:—First premiated design, Messrs. Hall and Phillips, 6, Great James-street, Bedford-row, London, E.C.; second premiated design, Messrs. Briggs and Wolstenholme, Central-buildings, Richmond-terrace, Blackburn; third premiated design, Mr. Thomas Davison, 28, Great Ormond-street, London, W.C. Mr. Leonard Stokes of Westminster was the assessor, and his award was received and adopted by the Council.

Books.

Pocket-Book of Useful Formulae and Memoranda for Civil and Mechanical Engineers. By SIR GUILDFORD L. MOLESWORTH, K.C.I.E., President Inst.C.E., M.I.Mech.E., and HENRY BRIDGES MOLESWORTH, M.Inst.C.E. Twenty-fifth Edition. Revised and enlarged, with an Electrical Supplement, by WALTER H. MOLESWORTH. London: E. and F. N. Spon, Ltd., 125, Strand. 1904.

VERY little need be said about this book, for the simple reason that, during a period of more than forty years, it has been the constant companion and daily guide of engineers throughout the world. Although other pocket-books of somewhat similar character have appeared within recent years, "Molesworth" retains the premier position, and it is a noteworthy fact that the eminent engineer who produced the first edition is still one of the authors of the present volume. Fully recognising the obligation of keeping abreast of the times, the authors have made considerable alterations and additions in many of the subjects covered; new matter has been substituted in place of that which has become obsolete, and full recognition has been taken of the immense strides taken by electrical science. Notwithstanding the fact that the book is dedicated simply to engineers, we recommend it strongly to architects, surveyors, and builders, who will find in it much information that is applicable to their respective avocations.

How to Estimate. Being the Analysis of Builders' Prices. By JOHN T. REA, F.S.I. Second Edition. Revised and Enlarged. London: B. T. Batsford, 94, High Holborn. 1904.

THE author must be congratulated upon the well-merited success of his work, the first edition, as he states, having been sold out within a year. We gave a somewhat lengthy review of that edition at the time of its appearance, partly on account of the importance of the subject dealt with, and partly because of the very thorough way it had been treated by the author. At that time we praised his effort, but with certain qualifications. This second edition is much more than a reprint of the first, and the author must be commended for the very thorough way he has taken up the revision—no small task in a work of this size and description. This revision has been most judiciously done, and the work bears evidence that the author has conscientiously considered almost every item upon its merit. Many of the strictures we passed in our review of the first edition do not, in consequence of this, now apply. In addition to the revision, the work has also been somewhat extended, with increased usefulness, and we have little doubt that we shall be able to congratulate Mr. Rea upon a similar success with this edition as with the first. One little slip we notice on page 270. While throughout the work the author, in arriving at his prices, has revised the rate of wages (from 10d. to 10½d.),

in the example given on this page he has allowed the old rate (10d.) to stand. On the other hand we may take as an example of the drastic nature of the revision the items on concrete on pp. 89, 90, and 91.

Spons' Architects' and Builders' Price-book, with Useful Memoranda and Tables. By W. YOUNG, Architect. Thirty-first edition. Edited by CLAUDE YOUNG, A.R.I.B.A. London: E. and F. N. Spon, Ltd., 125, Strand. 1904.

We note with a certain degree of pleasure that the editor has at last seen his way to attempt some revision, both in prices and arrangement; but a good deal more requires to be done before it can take the place it did in the earlier editions—say those of twenty years ago and thereabouts. There is much in the work that might be of a useful character were it brought more up to date—a most important consideration in an annual publication. We still notice the glaring inconsistency which we pointed out in our review of the thirtieth edition, of a list of rolled steel joists with rolled iron weights. The standard list which was arranged last year is not given, but an old list which used to appear in the appendix now turns up in the "Useful Memoranda and Tables" section, and this differs from that given in the prices section in every particular. We must still insist upon the position we have previously taken—viz., that the work substantially requires re-writing, or at least complete revision item by item.

Builders' Quantities. By HERBERT C. GRUBB. London: Methuen and Co., 36, Essex-street, London, W.C. 1904.

THE author in his preface hazards the startling opinion that "The study of builders' quantities is probably the most fascinating of any undertaken by architectural and building students," an opinion that will be received with a large measure of scepticism by those who are best qualified to judge. In the case of the "architectural student," we are afraid that the fascination is not altogether unconnected with the opportunity of turning an honest penny by doing work that would more properly be left to those specially trained in this class of building practice. Be this as it may, there seems a tendency at the present time to treat the subject as a "school" one, rather than a "professional" one requiring a practical training, and in perusing this book this opinion is strengthened. In fact, the author opens his preface by candidly stating that the work "has been compiled to assist students who are preparing for examination." This is most obvious to any one who studies the work, and doubtless the student who is bent upon passing his examination will find it useful, especially as sample questions are given in the appendices. Taking the work as a whole, the author, with the view of passing examinations before him, has doubtless achieved his object. The form in which the examples of abstracting are given will be of very little use in practice. The various diagrams throughout the work are worthy of all praise, but some of the descriptions are very bald, and would be the cause of very wide tendering. This is, of course, quite a matter of detail in more senses than one, but it is a just cause for the complaint on the part of contractors as to the paucity of description in "architects'" quantities. The "building student," who is taking quantities for his own use only, and not for the use of other builders, will probably find the work useful.

Journal of the Sanitary Institute, Vol. XXIV, Part IV. London: The Sanitary Institute, Margaret-street, W. 1904.

This issue of the *Journal* consists principally of papers read at the Institute's Congress at Bradford last year. Many of these are of more or less general interest, but we must confine ourselves to those relating to building and sanitation. A short paper by Mr. M. S. Briggs on "Cottages for Agricultural Labourers" is not without value, but the "two typical sketch-plans" with which it is illustrated are far from perfect; in Plan A the living-room is too narrow, the copper and sink in the scullery are awkwardly placed, and bedroom No. 1 is L-shaped; the living-room in Plan B has five doors and the window is in the same wall as the range; the scullery is inadequately lighted, and in two of the bedrooms there is no space for furniture except the beds. Mr. J. G. D. Armstrong, in a paper on "Cement Joints in Drains," points out the causes of failure in the joints of stoneware pipes,

and advocates the use of neat cement, thoroughly air-slaked, and finely ground; the paper elicited an interesting discussion. A large part of the volume is occupied by papers on various details of school hygiene, of which the most important to the architect is that by Mr. D. M. Nesbit on the "Warming and Ventilating of Public Schools." Mechanical ventilation is advocated, and plans and sections of two schools at Bradford, ventilated in this manner, are given. The report of the discussion on "Practical Considerations in Connexion with Modern Methods of Treating Sewage" is decidedly interesting, and shows a marked preponderance of opinion in favour of percolating filters and against contact-heds.

Stresses and Thrusts: A Text-Book for Students.

By G. A. T. MIDDLETON, A.R.I.B.A., Third Edition, Revised and Enlarged. Illustrated with 170 diagrams. London: B. T. Batsford. 1904.

IN the present edition of this work several alterations have been made, which ought to increase its popularity among architectural students. The chapters upon "Rectangular Beams" and "Arches" have been remodelled, and worked examples have been added to the chapters dealing with struts, and the design of steel joists and steel plate girders, these alterations and additions clearly adding to the utility of the work. The inclusion of some selected R.I.B.A. examination papers is a useful feature of this excellent text-book in its latest form.

A Digest of the Law Relating to the Easement of Light. By E. S. ROSCOE, Barrister-at-Law, Admiralty Register of the Supreme Court. Fourth edition, revised and enlarged. London: Stevens and Sons, and Reeves and Turner. 1904.

A FURTHER edition of this practical little hand-book on the law relating to light is especially welcome at a time when the attention both of lawyers and the public has been drawn to the subject by the recent decision of the House of Lords. The author has added to this edition an historical introduction, which was originally published in these columns, in which he traces the origin of our present law back to the principles of the Roman law. The decision of the House of Lords is considered and explained in this edition with great clearness, but we could wish a little more had been said of the influence it will have on prohibitive injunctions. In Art. 39, which deals with this question, the reference to the above case, *Colls v. Home and Colonial Stores*, is to the decision in the Court of Appeal, but in the House of Lords some important dicta on this point were enunciated. The effect of their decision being that there is no proprietary right to all the light, but that the obstruction to the light must amount to a nuisance, there is some difficulty in obtaining an injunction to abate a nuisance not at the time committed, as the question of degree comes in, and Lord Macnaghten especially dealt with this question. Those who have read former editions of this digest will need no advice from us to possess themselves of this later edition, whilst to those who require an exposition on a difficult point of law in a most clear and readable form, this manual can be confidently recommended.

Correspondence.

LIGHT AND WATER.

SIR,—I am encouraged by your kind appreciation of "Light and Water" in your last issue, to write a few words of explanation of my note on the "Reflection of a Rainbow," which I regret I did not make sufficiently clear. In that note I said that "the reflexion consists of a smaller area than the actual rainbow, its extremities springing not from the ends of the rainbow proper, but from points inside them." Let us assume, for the sake of argument, that the drops of water forming the bow are stationary. The rays of light from these drops all converge to one point, namely, the eye of the observer. The rainbow thus differs from a real object in that (taking only the primary bow into account) any point in it sends out a ray in one direction only, instead of rays in all directions. It is, therefore, manifestly impossible for the rays from this particular how to

reach the spectator's eye by reflexion from the surface of the water. If he shifts his position, he will see a how formed by other drops—another how, in fact, and not the one that appeared to him in his first position. Now, the only bow that can appear to him by reflexion from the water is the bow that he would see were he lowered to a point as far below the surface as he is actually above it. Hence the break of which I have spoken between the actual and the reflected how (which must exist unless the sun happens to be on the horizon).

But, as I said in the note, if the spectator were standing close to the level of the water, this break would be hardly perceptible. One would not, therefore, venture to maintain that Turner had incorrectly represented a reflected rainbow in his water-colour drawing of Arundel Castle in the National Gallery. I do not myself profess to be an expert in optical science, and therefore before printing I obtained the opinion of one of our first mathematicians, a distinguished member of the Royal Society, who said that my reasoning was quite correct. So much for theory. Coming to fact, since my book appeared, I have been told by a friend—a lawyer by profession, but a man of no little scientific knowledge—that on September 19, 1901, walking on the esplanade at Bray in Ireland, about two hours before sunset, he distinctly observed such a bow and its reflexion in the sea, the reflexion appearing as a smaller arc starting from points inside the ends of the actual bow. It was nearly low water at the time, but even then the esplanade is not much more than 20 ft. above sea-level.

M. F. MONTAGU POLLOCK.

SIR,—I have read with much interest your article upon "Light and Water," the subject of reflections and colouring in water having been always a very attractive one to me.

With regard to the question of the reflection of a rainbow, there is a picture—I do not know in whose possession, but I have an etching of it in my house—by the late Mr. Keeley Halswelle, of Killyburn Castle, in which the clouds, in varied colours, are reflected in the calm water of Loch Awe; a fragment of rainbow is represented towards the right of the picture, apparently resting—if one may use the term in this connexion—on the surface, and reflected, though only for a very short distance, at the reverse angle; the break between the rainbow and the reflection is, however, not distinguishable. I mention this as an instance in which the artist has apparently seen some such effect. I have never seen it myself, but I certainly agree with the writer of the article that a rainbow showing against a dark cloud would be reflected. I should very much like to see this tested, and I shall be on the look out for an opportunity.

I have frequently studied the reflections of ships in partially ruffled water, and have noticed some curious effects, which are not always truthfully represented by marine artists. For instance, in the case of a vessel in ruffled water, at a distance of a quarter of a mile or so, there is no reflection of the hull, the more or less broken reflections of the masts and funnels springing from the water-line. The same thing is noticeable in the case of a lighthouse on a low rock.

Another curious point is the colour of a partial reflection of, say, the shaft of a lighthouse. The column may be, and usually is, white, or perhaps particoloured, like the Eddystone, but under certain conditions the reflection, springing, as above described, from the water-line, does not represent the colouring of the lighthouse, but simply a well-defined outline of it, of a deeper shade of green or blue than the water. I have noticed the same thing when seagulls, their plumage dazzling white in the sun, swoop near the ruffled surface. The widening path of light under the moon as the sea gets rougher is familiar enough to seamen, who see it in all its gradations, from a broad, heaving track to no track at all, but simply a shimmering reproduction of the moon, at a corresponding apparent distance beneath the surface. This latter is not very common, requiring of course a glassy sea, free from swell, and the effect has apparently little charm for artists.

The most perfect reflection I have ever seen was in Loch Achrae, in Scotland; a photographer was on the spot, and invited me to look into

camera and say whether or not it was an eriting lens. I could not tell!

E. P. STATHAM
(Commander, Royal Navy).

PROVISIONAL SUMS IN CONTRACTS.
Q.—May I be allowed to submit the following question to your readers?—
A manufacturer A instructs an architect B to prepare plans and specifications for alterations in his premises, and the work entrusted to firm C; if, in the specification, provisional lump sums are allowed, say 100£. lighting, 200£. drainage, etc., on C renders his account, is it usual for A to give details for the provisional sums or B certifies, and is it usual for B to pass the account in detail for settlement?
INQUIRER.

The Student's Column.

NOTES ON PORTLAND CEMENT.

PART III.—CHEMICAL ANALYSIS OF CEMENT AND INTERPRETATION OF RESULTS.

THE chemical analysis alone of a pure cement is no criterion of its value, but, in conjunction with the physical tests, it gives very necessary information. Moreover, although the presence of adulterants may be detected by a microscopical examination, their presence requires to be proved and their amount estimated by chemical analysis. In the first part of this chapter is given a method for the exact analysis of cement, in quick technical methods.

Loss at a Red Heat.—Ignite 2 grammes of the finely pulverised cement in a platinum crucible of constant weight. The loss is combined water, carbonic acid, and organic matter. The carbonic acid may be estimated in another portion of the sample by Mohr's apparatus if in quantity, but more exactly by the direct method absorbing the gas, liberated by the action of hydrochloric acid, in soda lime.

The combined water is obtained by heating a sample in a hard glass tube through which a current of dry air is passed, and absorbing the water expelled in pure dry calcium chloride.

Silica, Alumina, Oxide of Iron, Magnesia, and Alkalies.—To 1 gramme of the finely pulverised cement in a porcelain basin add about 20 ccs. water, and stir to prevent setting; then add 10 ccs. hydrochloric acid. Evaporate to dryness, take up the residue with a few drops of dilute hydrochloric acid, and again evaporate to dryness. Heat in the air oven at 110° C. for 2 hours to render the silica insoluble, dissolve a few ccs. hydrochloric acid, add water, and dilute. Filter and wash thoroughly with hot water till free from chlorine, using care not to stir up the precipitate, dry and ignite in a platinum crucible till perfectly white, care being taken to prevent any of the silica, which is very light, being carried out of the crucible.

The result gives the silica and insoluble residue. The insoluble residue is estimated in another portion of the sample, as explained hereafter. To the filtrate, which is brought to the boil, add ammonium chloride and ammonia in very light excess, and again boil till the smell of ammonia is no longer perceptible. Filter the precipitate, which consists of alumina, iron oxide, and a little lime, wash several times with hot water, pierce a hole in the filter paper, and wash the precipitate into the beaker in which it was precipitated. Dissolve in hydrochloric acid, and repeat the precipitation. This time the alumina and iron should be free from lime. Filter the precipitated oxides, wash thoroughly with hot water till free from chlorine, transfer while yet wet to a platinum crucible, and ignite, along with the filter paper used in the first filtration, for ten minutes after the papers are ashed. The result gives Al_2O_3 and Fe_2O_3 as the weighed oxides in the platinum crucible with acid sulphate of potash, dissolve in sulphuric acid and titrate the iron with standard permanganate of potassium. Mix the two filtrates from the iron and alumina, which should be about 300 ccs. in bulk, add a few drops of hydrochloric acid, boil, and carefully add crystalline oxalic acid, then slight excess of ammonia. If allowed to stand overnight, in a warm place if possible, no magnesia will be along with the oxalate of lime, which is filtered, and wash thoroughly with hot water till free from chlorine. The reason for using oxalic acid instead of oxalate of ammonium is that no carbonate of lime is formed, as is the case if the latter be used. It is very important

to see that excess of ammonia is present before filtration of the oxalate of lime as ammonium chloride and oxalic acid react with formation of hydrochloric acid. Partially dry the oxalate of lime in an air oven, ignite in a platinum crucible over a blow-lamp till the weight is constant, and weigh as CaO. To the filtrate from the oxalate of lime add a few ccs. hydrochloric acid, and boil down to about 250 ccs. bulk. After cooling, add 250 ccs. of 10 per cent. ammonia and phosphate of ammonia. Stir well till the phosphate of ammonia begins to separate, allow to stand twelve hours, filter, and wash with cold water to which 20 per cent. of ammonia has been added. Dry the precipitate in an air oven, and, if in small quantity, ignite along with the filter paper in a porcelain crucible. Should the quantity of magnesia be large, separate as far as possible from the filter, burn the paper in a platinum wire loop, adding the ash to the precipitate in the crucible. Ignite till no black points are seen, adding a drop of nitric acid if necessary. Weigh the $Mg_2P_2O_7$, and calculate to MgO.

The alkalies are usually obtained by difference, but in a well-burned cement there should not be much.

Sulphuric Anhydride and Insoluble Residue.—To 2 grammes of the sample add 250 ccs. of water and 20 ccs. hydrochloric acid, and boil for about five minutes. Filter, and wash till free from chlorine, transfer filter and residue to a nickel basin, and boil with 20 per cent. soda carbonate solution. Filter while hot, wash first with hot soda carbonate solution and then with distilled water till silver nitrate gives no milkiness with some of the washings. Ignite the residue and paper while yet wet in a platinum crucible. This result is the insoluble residue, which should be deducted from the first result for silica.

Precipitate the sulphuric acid in the first filtrate from the insoluble residue with barium chloride. Allow to stand about twelve hours, and filter through a good filter-paper or moisten the paper with a few drops of ammonium acetate, which prevents the barium sulphate going through. If the quantity of barium sulphate is small, wash with cold water, otherwise use hot water. Wash till free from chlorine, ignite in a porcelain crucible till the paper is ashed, add three drops hydrochloric acid and one of sulphuric acid, heat carefully till dry, and ignite five minutes longer. Calculate to sulphate of lime, deducting the lime necessary from the total lime.

Technical Analysis.—It is very necessary for the manufacturer to make a partial analysis of his product from time to time, and for this, quick methods are required. The insoluble residue, sulphuric anhydride, and lime are the chief ingredients required to be known.

Insoluble Residue and Lime.—Dissolve 1 gramme of the finely pulverised cement in water and dilute hydrochloric acid. Filter the insoluble portion, and treat with soda carbonate solution as before explained. This will give the insoluble residue. To the boiling filtrate add ammonia in very slight excess. The silica, alumina, and iron are precipitated along with a little lime. The precipitate is filtered, redissolved in hot hydrochloric acid, again precipitated with ammonia, and filtered. All the lime should be in the filtrates, which, when mixed, should be about 300 ccs. in bulk. Precipitate the lime with ammonia and oxalic acid as before explained. The error should not exceed 0.1 per cent.

Lime.—If lime only is required, precipitate twice with ammonia from the hydrochloric acid solution and estimate the lime in the two filtrates.

Sulphuric Anhydride.—If only sulphuric anhydride is required, dissolve 2 grammes of the cement in dilute hydrochloric acid and boil for about five minutes. Filter off the insoluble residue, and make the filtrate up to about 300 ccs. in bulk. Precipitate the sulphuric acid as before explained. If the boiling is not too long continued, nor the liquid too concentrated, there is no danger of silica coming down with the sulphate of barium.

Interpretation of Results of Analysis.—No fixed figure can be given for the quantity of each compound which should be present in a good cement, but there are certain ingredients always present which should not be excessive, such as magnesia and sulphuric anhydride. The definition of Portland cement as given by the Association of German Cement Makers is generally accepted as nearest the correct one.

It is as follows:—"Portland cement is a product manufactured by burning to clinkering state a good mixture of lime and clay materials as chief constituent parts and grinding the resulting clinker to meal fineness."

As all Portland cements are made from the same materials—lime and clay—it is natural that the difference between their chemical compositions cannot be very great. The composition of French and other Portland cements is given by E. Candlot ("Étude Pratique sur le Ciment de Portland," Paris, 1886), and is as follows:—

Lime	from 58.00 to 67.0	per cent.
Silica	" 20.0 " 25.0	" "
Oxide of iron	" 2.0 " 6.0	" "
Alumina	" 5.0 " 10.0	" "
Magnesia	" 0.5 " 3.0	" "
Sulphuric anhydride	" 0.5 " 2.0	" "

The German Portland Cement Association gives the following values for German cements:—

Lime	from 58.22 to 65.50	per cent.
Silica	" 19.80 " 23.45	" "
Oxide of iron	" 2.19 " 4.47	" "
Alumina	" 4.16 " 9.45	" "
Magnesia	" trace " 2.89	" "
Alkalies	" 0.19 " 2.83	" "
Sulphuric anhydride	" 0.13 " 2.19	" "
Loss on heating	" 0.26 " 2.67	" "
Insoluble residue	" 0.12 " 1.38	" "

The values given by Dr. Karl Schosch are:—

Lime	from 57.0 to 66.0	per cent.
Silica	" 19.0 " 26.0	" "
Oxide of iron	" 2.0 " 4.0	" "
Alumina	" 4.0 " 9.0	" "
Magnesia	" trace " 5.0	" "
Sulphuric anhydride	" trace " 2.0	" "
Alkalies	" trace " 3.0	" "

The following values, deduced from numerous analyses by the author, are for English and American cements:—

<i>English.</i>		
Lime	from 58.0 to 64.5	per cent.
Silica	" 19.0 " 25.0	" "
Oxide of iron	" 1.5 " 5.5	" "
Alumina	" 5.0 " 11.0	" "
Magnesia	" trace " 2.0	" "
Sulphuric anhydride	" trace " 2.75	" "
Insoluble residue	" 0.4 " 2.75	" "

<i>American.</i>		
Lime	from 59.0 to 65.5	per cent.
Silica	" 19.5 " 25.0	" "
Oxide of iron	" 2.0 " 5.5	" "
Alumina	" 6.0 " 10.0	" "
Magnesia	" 0.5 " 5.0	" "
Sulphuric anhydride	" 0.5 " 3.25	" "

When these tables are compared it will be seen that they are very near one another, and, if the values are far from these, the cement is sure to be a poor one or adulterated.

Magnesia.—Chemists differ very considerably in their opinion as to the action of magnesia. Dr. Newberry says, "Magnesia, though possessing marked hydraulic properties when ignited alone, yields no hydraulic products when heated with silica, alumina, or clay, and probably plays no part in the formation of the cement. It is incapable of replacing lime in cement mixtures, the composition of which should be calculated on the basis of the lime only without regard to the magnesia present."

Dykerhoff's report to the German Association of Cement Manufacturers on this subject went to prove that over 4 per cent. of magnesia resulted in a weakening of the cement. He showed that magnesia caused expansion, and took a longer time to develop disintegration than does loosely combined lime. Le Chatelier mixed 5 per cent. of magnesia with a good cement and placed a pat in cold water; swelling did not take place till after six months. Another pat he hoiled; expansion began after six hours and ended in forty hours. It is difficult to state absolutely what effect magnesia has on a cement. From experiments it is evident that it should not be present in greater quantity than about 3 per cent., though it greatly depends on the grinding and burning whether even this amount is permissible.

Sulphate of Lime.—This is one of the most dangerous compounds that can exist in Portland cement when in quantity. For most purposes a cement containing over 2 per cent. sulphuric anhydride is dangerous (59 per cent. SO_3 represents 1 per cent. $CaSO_4$). Candlot found that aluminates of lime and sulphate of lime produced a body of the formula $Al_2O_3 \cdot 3 CaO \cdot 2 CaSO_4 \cdot 6 H_2O$, which causes expansion. Michaelis has described a similar body which he called the "cement bacillus," to which he gave the formula $Al_2O_3 \cdot 3 CaO \cdot 3 CaSO_4 \cdot 30 H_2O$. This body occupies a much larger space than the aluminate and sulphate which enter into its composition, and hence when formed in quantity causes expansion. Le Chatelier, Schott, and Klinkenberg have confirmed these statements that sulphate of

lime forms expansive compounds with aluminates of lime. The former two experiments have shown that sulphate of lime has no effect on cements specially prepared containing no iron or alumina. Schott found the same effect of sulphate of lime on calcium ferrite as on aluminates of lime.

Fresenius established the following limits for pure Portland cement:—

- (1) The specific gravity not less than 3.1.
- (2) The alkaline strength such that a water solution containing 0.5 grm. of cement neutralises 4 to 6.25 ccs. $\frac{1}{10}$ N hydrochloric acid.
- (3) An action of permanganate of potassium solution (1.589 gms. per litre) so that 1 gramme of cement reduces from 0.79 to 2.8 mgs. of permanganate, and in any case very little more than this. [Since Fresenius established these limits, rotary kiln cement has come much into vogue, and this product, being burned in the reducing flame, decomposes much permanganate, so this test can only be employed as a preliminary one.]

(4) Specific gravity test. Using a mixture of turpentine and methyl iodide (spec. grav. 3.01) the light parts which swim can be:—

(1) Coal or coke dust of average specific gravity	1.39
(2) Gypsum	2.33
(3) Coal slack	2.73
(4) Furnace slag	2.94

With suitable fluids these different parts can be separated. The parts which sink in solution of 3.01 specific gravity can be:—

- (1) Cement of specific gravity . . 3.035
- (2) Iron and certain iron compounds.

A NEW FIRE-RESISTING BRICK.

THE Hempstead patent brick, made at the works of the Hempstead Patent Brick Company, near Hemel Hempstead, Herts, consists of local clay so treated in the course of manufacture that the specific gravity of the product is barely three-fifths that of ordinary brick, and its consistency is such that it can be cut to any shape or size by an ordinary saw, and is easily penetrable by soft iron nails or by ordinary wood screws. It follows naturally that the mechanical strength of the material cannot be so high as that of good brick as ordinarily made, but that is a matter of secondary importance, as partitions—for the construction of which it is specially recommended—are never intended to withstand high compressive or other stress. The clay used for the purpose of manufacture contains a sufficient proportion of silica to ensure high resistance to heat, and the other features mentioned above are due to the admixture of hardwood sawdust with the clay before it is passed through the pug-mill. After having been moulded into the required form and dried, the mixture is transferred to the kilns where the sawdust is entirely consumed during the process of burning, thus leaving voids uniformly dispersed throughout the finished product.

The Hempstead bricks are made in two forms:—(1) of standard dimensions, which can be built into walls so that door-frames and other fittings can be nailed to them; and (2) of different dimensions, such as 12 in. by 9 in., and 12 in. by 6 in., and of thicknesses varying from 2 in. to $\frac{1}{2}$ in. As a general rule the bricks are made hollow, for the purposes of reducing weight and of affording resistance to the conduction of sound. The bricks intended for the construction of partitions are moulded in a machine which forms grooves with jagged edges on the outer faces, so as to afford a good key for the mortar; but, as a matter of fact, the entire surface is sufficiently rough and porous to furnish an excellent tooth even without the grooves.

Some tests, which we witnessed last week, were conducted in two brick-built kilns on the works of the Company at Hemel Hempstead. Two partitions were built in each kiln, so as to form a narrow space communicating directly with two furnaces, one at each end, and fed through doors outside the building. The whole space, divided for the height of about 3 ft. from the bottom by a brick wall, virtually formed a flue for the flames, which passed through two vertical flues into the open air. In kiln No. 1 the front partition was $\frac{1}{2}$ in. thick, and the back partition 3 in. thick, and in kiln No. 2 the front and back partitions were $\frac{1}{2}$ in. and 2 in. thick respectively.

The fires were lighted early in the morning, and were kept up until after 6 p.m. in the evening, although two of them were drawn about 5.30 p.m. for the purpose of a water test on the inside and outside surfaces of the partitions. Constant readings of the temperatures were taken, under the direction

of Mr. H. Brandon-White, M.I.E.E., from four electrical pyrometers, of the type invented by the late Sir W. C. Roberts-Austen. The recording apparatus of these instruments was placed in a small shed between the two kilns, the readings being taken at intervals of five minutes throughout the day. At 11.50 a.m. the maximum temperatures attained were 1,755 deg. F. in kiln No. 1, and 1,695 deg. F. in kiln No. 2, and as notwithstanding the evident increase of temperature, this record was very little surpassed at 3 p.m., the suggestion was made that the position of the pyrometers did not permit the maximum temperature to be recorded. This idea was confirmed by the fact that a piece of cast iron placed at the back of one furnace had evidently melted. Accordingly, the pyrometer tubes were inserted through two fresh holes situated more directly in the course of the flames, with the result that the temperatures recorded became 2,100 deg. F. in kiln No. 1, and 1,800 deg. F. in kiln No. 2.

In spite of the great heat maintained, none of the partitions suffered the slightest damage, with the exception of two or three unimportant surface cracks, and, on the application of cold water, the only perceptible effect was to cause a slight contraction of the cracks mentioned. The tests here described were quite sufficient to convince us of the valuable fire-resisting properties possessed by the new material, which, we are informed, has already been adopted by the London County Council and in connexion with the new Gaiety Restaurant.

METROPOLITAN ASYLUMS BOARD.

THE usual fortnightly meeting of the Managers was held on Saturday last week, at the offices, Victoria Embankment, E.C., Mr. Scovell presiding.

Among the correspondence received was a letter from the Local Government Board, assenting to the carrying out of certain works in connexion with the laundry at Leazesden Asylum, and promising to issue an order authorising the expenditure of a sum not exceeding 1,800*l.* on the scheme.

On the recommendation of the Finance Committee it was agreed to apply to the Local Government Board for authorising the expenditure of a sum not exceeding 595*l.* on the provision of additional male staff and store accommodation at the Western Hospital; and for an order authorising an expenditure of not more than 1,825*l.* on the conversion of certain ordinary blocks at Leazesden and Caterham Asylums into infirmary blocks.

The Works Committee reported that, with the concurrence of the Hospitals Committee, they had approved of certain recommendations (which arose out of a report by the architects, Messrs. T. W. Aldwinckle and Son) which had been submitted to them by a special sub-committee, and endorsed by the Engineer-in-Chief, for providing better means of access to, and at the same time improving the ventilation of, the subways at the Brook Hospital. It was proposed to do away with the stairs which at present give access from the ground floors of the assistant nurses', night nurses', and female attendants' houses, and men's quarters to the subways below the corridors outside the buildings, and to fix ladders in the area wells outside, the present windows in the subways at the foot of the stairs to be converted into open doorways; and to provide five additional entrances to the subways.

It was agreed, on the recommendation of the Committee, to have plans prepared and to forward them to the Local Government Board for their sanction.

On the recommendation of the same Committee it was agreed to carry out internal painting works in the administrative block of Joyce Green Hospital, the estimated cost of which was 350*l.* The works will be carried out by temporary labour.

The Committee recommended, and it was agreed, that the sketch plans, prepared by the Engineer-in-Chief, for the provision of two additional infirmary blocks, additional staff quarters, and hall, with covered way to the same, at the Tooting Bec Asylum, be approved and adopted, and forwarded to the Local Government Board for their sanction. The cost of the works is estimated to be 33,600*l.*

A revised scale of wages for artisans and others employed by the Managers at their asylums, was submitted by the Asylums Committee, and approved of by the Board.

CHURCH, NEWINGTON.—The fine old parish church of St. Mary, Newington, Kent, is about to be restored under the direction of Mr. G. H. Godsell of the firm of James Brooks, Son, and Godsell, of London. Mr. William Parmenter, of Braintree, is the contractor.

GENERAL BUILDING NEWS.

JOHNSON MEMORIAL CHURCH, BICKERSHAW.—This church is being erected by the trustees in memory of the late Mr. James Henry Johnson, J.P., of Abram Collieries and Hall Garth, Lancashire. The church is being erected on a site in Bickershaw-lane, adjoining the schools belonging to the Abram Collieries, and provides seating accommodation for over 200 people. Externally the building is faced with red Rainhill stone, and the window tracery of red Rainhill stone, and the roofs with red tiles, with red ridges. Vestries are provided on the north side, with separate entrance for use of clergy and choir, and are separated from the chancel by an ornamental screen. A small organ chamber is also provided on the south side, and heating chamber, &c., under vestries. The heating will be hot water and coils on the low-pressure system, and the electric light will be used for the lighting throughout. The main entrance porch is placed at the north-west corner of the building, and another entrance is also provided at the south-west corner. The new church is being carried out from the designs of Messrs. E. Knill, Freeman and Son, architects, Bolton, under the supervision of Mr. Frank Freeman, Messrs. Moore Brothers, of Rawtenstall, being the contractors, with Mr. Henry Molyneux, of Abram Collieries, acting as clerk of works.

TOWER, WORSTHORNE CHURCH, BURNLEY.—A new tower, which has been added to St. John the Baptist, Worsthorne, near Burnley, by Sir John Thursby, as a memorial to his father, was dedicated on the 11th inst., by the Bishop of Manchester. The tower, which is from designs by Messrs. Austin and Paley, of Lancaster, is 61 ft. in height and 20 ft. square at the base. In addition to the erection of the tower, the old vestries at the west end of the church have been removed, and the east in the nave continued up to the west wall. The edifice has also been renovated and re-coloured, and a new scheme of lighting carried out.

RE-OPENING OF WINTERTON CHURCH.—The Church of All Saints, Winterton, was reopened on the 14th inst. The restoration has been completed from the plans of Mr. C. Hodgson Fowler, of Durham, the contract for the work being secured by Mr. S. F. Halliday, of Stamford. The cost is put down at about 2,800*l.* An embattled parapet and pinnacles have been added to the tower. The nave and chancel have been re-roofed, the nave being raised to its original height, with clerestory windows. In the interior the roofs are of oak panelling, with carved bosses. A thick coat of plaster has been removed from the walls, so that the stonework of the window, arches, and jambs can now be seen. A new altar and vestments have been provided, and a brass altar cross, studded with crystals, has been given. Some interesting discoveries were made during the restoration. It was found that a tower had been built up against the west end of a still earlier nave, which had been plastered and whitewashed outside, as Saxon churches often were. A recess was found in the east wall of the north transept, which, it is conjectured, may have been intended to hold pictures of sculptures for the recesses of the chancel altars. Similar recesses exist at Wath, near Ripon, and Northallerton.—*Sheffield Telegraph.*

ALL SAINTS CHURCH, FISHPONDS, BRISTOL.—On the 12th inst. the Bishop of Bristol laid the foundation-stone of All Saints' Church, Fishponds, which is to be erected on a plot of land at Grove-road. The eastern portion, now about to be carried out, comprises a chancel 36 ft. long, 24 ft. wide, and 34 ft. high to crown of arched ceiling, separated on the south side by a morning chapel 23½ ft. long, 18 ft. wide, and 21 ft. high, by a couple of arches supported by clustered pillars, and from the nave by an archway supported each side by clustered columns, and on the north side by a doorway to choir vestry, with organ chamber above, and a clergy vestry on its east side, the heating chamber being below the former, and approached by a flight of steps from the outside of the church. One bay of the nave and aisles is also to be erected. The walls are to be in level courses of rock-faced plaster, the roofs being wren-boarded outside upon arched ribs with mixed red and brown Broseley tiles. The floors will be wood blocks below seats and stalls, those of the gangways being of oak with glazed encaustic tile bordering. The work to be carried out has been designed by Messrs. Linzen Barker and Son, of Bristol.

WESLEYAN CHURCH, NORBERTY.—The foundation-stones of a new chapel were laid at Norberty recently. The building will be situated in London-road, and will have a frontage of 100 ft. to the main road. Built in red brick, with white

tone dressings, it will have a fleche about 00 ft. high. The work is being carried out by Mr. Charles Brightman, builder and contractor of Watford, Herts, the architects being Messrs. Gordon and Gunton.

WESLEYAN CHURCH, LISCARD.—The Manor and Wesleyan Church, Liscard, was opened on the 12th inst. Mr. James Merritt, of Birkenhead, was the contractor, and the architects were Messrs. Grayson and Ould, of Liverpool.

PRESBYTERIAN CHURCH, TYNE DOCK.—The foundation-stone of a new church hall, to accommodate the congregation of St. Andrew's Presbyterian Church, Tyne Dock, was laid in the 20th inst. on a site in Bath-road, South Shields. The church hall, which will accommodate between 400 and 500 persons, is being erected by Mr. James Young, contractor, from plans prepared by Mr. Fred Rennoldson, architect, South Shields.

CHAPEL, HUDDERSFIELD.—The members of the United Methodist Free Church in the Rashcliffe district of Huddersfield are replacing the iron structure which has served as a chapel with a building of stone. The chapel is being built from plans prepared under the direction of Mr. S. Stocks, and it will cost about 1,200l.

SUNDAY SCHOOL, STONEHOUSE BIBLE CHRISTIANS.—On the 20th inst. the memorial-stones were laid of new Sunday-school buildings for the Stonehouse Bible Christian Church. The tender for the schools, which are to accommodate about 500 children, amounts to 2,253l. The building will face Quarry-road, and is being carried out in limestone and Portland stone, with brick dressings. It is of two stories, and comprises five classrooms and several vestries on the ground floor, and a main schoolroom on the first floor. The architect is Mr. H. J. Snell, of Plymouth, and the builder Mr. Ambrose Andrews. In connection with this work there is to be carried out, at a further cost of about 350l., a scheme for adding to the chapel itself an organ loft, with accommodation for the choir.

SUNDAY SCHOOLS, HEATON BAPTIST CHURCH.—On the 20th inst. the foundation-stones of new Baptist Sunday schools were laid on the vacant corner site adjoining the main building. The principal room will be 60 ft. by 2 ft., and there will be galleries on three sides. Mr. F. Tattersall, architect, Newcastle, prepared the designs, and the contractors are Messrs. J. and G. Douglass, also of Newcastle.

SCHOOL, LIVERPOOL.—A new school is being erected in Tiber-street, Liverpool, for the Education Committee. The school, which is capable of accommodating 1,170 scholars, is in the Renaissance style, and has been erected from plans by Mr. T. Mellard Reade. The walls are faced with St. Helena bricks, with rough terra-cotta dressings. The infants and mixed juniors are accommodated on the ground floor and the mixed seniors on the floor above. For the infants there is a classroom capable of holding 130 children, and this is divisible by glass sliding partitions. There is also a classroom for sixty children, and two others for sixty-six each. The mixed juniors' schoolroom provides accommodation for 100 scholars, and can be divided by glass sliding partitions into four classrooms, two of which will each accommodate fifty-four children and two sixty each, separate exits for boys and girls, leading to their respective playgrounds, are attached to all the classrooms, while the necessary cloakroom and lavatory accommodation is provided in convenient positions adjacent to the entrances. The central portion of the mixed seniors' department contains a schoolroom, divisible by glass sliding partitions, for 100 children, and two classrooms, each capable of holding sixty children. These rooms can be thrown together so as to form one large hall 61 ft. long by 52 ft. across. There are also four other classrooms, designed to accommodate respectively forty-eight, seventy-two, fifty-four, and sixty-six scholars, the variation in size being arranged for the purpose of giving facilities to the working of the school. In addition there are four teachers' rooms, and the usual cloakrooms and lavatories. A gymnasium has been erected on the Tagus-street side. It is 47 ft. long by 29 ft. wide, and contains dressing-rooms, shower baths, etc. The building is lighted by electricity.

HIPPODROME, LOWESTOFT.—A hippodrome building has been built on the Battery Green-road, Lowestoft, the architect of the new building being Mr. R. Scott-Cockerill. The contractors were Messrs. J. Youngs and Son, of Norwich, whose manager (Mr. Andrews) directed the operations. The front is built of red brick, with cement rendering and terra-cotta panels. It is flanked by two towers, at the base of each of which there is a symbolic figure representing the Spirit of the Hippodrome, two dromes, two horses drawing a chariot, in which is seated a female figure. Seating accommodation is provided for 800 persons.

The tradesmen responsible for the work inside the building are:—Messrs. Crotch, of Norwich, plastering; G. N. C. Mann and Co., Lowestoft, electric lighting; C. Payne and Co., Norwich, gas and heating; E. B. Whalley, Lowestoft, and Dean, Birmingham, upholstery; and Bull, of London, scenery.

MUNICIPAL SCHOOL, SEEDLEY.—On the 14th inst. the Mayor of Salford (Alderman W. Stephens) laid, in Liverpool-street, Seedley, the foundation-stone of the sixteenth school building erected directly from the rates. The area of the site is 9,633 sq. yds. The school will provide accommodation on three floors for 420 boys, 370 girls, and 360 infants, or a total of 1,170 places. There will be a special room for cookery instruction. The estimated cost of the building is 15,510l., and of the furniture about 1,080l. The architect of the school is Mr. Henry Lord, and Messrs. W. Southern and Sons are the builders.

BAPTIST CHURCH, BRADFORD.—The new Baptist Chapel, which has been erected at the corner of Horton Grange-road and Legramslane, Bradford, was opened and dedicated on the 13th inst. The building has been designed by Mr. Abram Sharp, and provides accommodation for 550 worshippers, and there is a schoolroom connected with it which is adapted for 500 children. The building will cost nearly 10,000l.

HOTEL, HUNSTANTON.—A new hotel has been built on the site of the ancient hostelry known as the "Strange Arms." The buildings have been erected from the designs of Mr. Herbert J. Green, of Norwich and Lynn, the contractor being Mr. J. Cracknell, of Peterborough.

FREE LIBRARY, CALNE.—Lord Kerry recently laid the foundation-stone of the public library at Calne. The building was designed by Messrs. Smith and Marshall, architects, and will face the New-road.

BELFAST DOGS' AND CATS' HOME.—A dogs' and cats' home has been erected, in Belfast, in Tate's avenue. It is constructed of corrugated iron, and contains twelve separate boxes for dogs and cats. The building was erected by Messrs. Boulton and Paul, Norwich, under the supervision of the architect, Mr. Vincent Craig. The concrete foundations were supplied by Messrs. McDowell, Leatham, and Frazer.

VICTORIA STATION.—In connexion with the work now in progress for enlarging Victoria Station, the London, Brighton, and South Coast Railway intend to construct over the booking-office block an annex to the Grosvenor Hotel in the Renaissance style, the material used in the main front being Portland stone, relieved with red brick. The ground floor will be reserved for station purposes, and there will be new waiting-rooms and a new booking-hall, 120 ft. long by 70 ft. in breadth. The whole of the works have been designed under the supervision of Mr. Charles L. Morgan, the Company's Engineer.

NEW PREMISES, UNBRIDGE-ROAD.—A block of seven shops, with flats over, is to be erected in Unbridge-road, having a frontage of 202 ft., with return frontages to Ormiston and Bloemfontein roads, at a cost of (including the site) 20,000l. The elevation is to be in red bricks, with gauged work and Bath stone dressings, and the roof covered with green slates. The contract has been signed, and the work is to be proceeded with immediately. Messrs. L. Whitehead and Co. are the contractors, and the architects are Messrs. Palgrave and Co.

NEW LABORATORY, FRAMLINGHAM COLLEGE.—A physical laboratory has been built at this school from the plans of Mr. G. F. Bisshopp, of Ipswich. The building work has been undertaken by Mr. W. H. Gibbs, of Saxmundham, and the apparatus supplied by Messrs. Townson and Mercer, London.

THE ROYAL HORTICULTURAL SOCIETY'S NEW HALL.—The new hall and offices of the Royal Horticultural Society have just been opened by the King. The site of the new building is in Vincent-square, Westminster, behind the Army and Navy Stores, in Victoria-street. It contains 18,000 sq. ft., and has been secured on lease for 999 years at a ground-rent of 690l. per annum. Mr. Edwin Stubbs, the architect, has built upon it a hall which measures 142 ft. by 75 ft., and which, with the two annexes opening into it, each 47 ft. by 24 ft., gives a total floor space of nearly 13,000 superficial feet. The new hall is lighted by a roof constructed entirely of glass, and the annexes are lighted from it and by large round-headed windows on the ground floor of the front elevation. The main entrance for visitors is by the door in the middle of the building facing Vincent-square, and for plants the door is at the end of the hall abutting on Bell-street; but there are also subsidiary entrances and exits, one out of each annex and one on each side of the plant entrance, while there are two other doors in the front which can be used as emergency exits, one leading to the stairs and lift up to the

library and offices, and the other to the lecture-room. The exhibition hall and the entire building are heated by radiators and lighted by electricity. The lecture-room occupies the whole of the east wing on the first floor of the front building, and is fitted with an electrical lantern. In the west wing of the same floor are three committee-rooms. The east wing of the second floor will be devoted to the administrative work of the society. This includes the council-room, secretary's and clerks' offices, waiting-room, etc. In the west wing of the second floor will be housed the library of the society, with which is included the collection of horticultural works known as the "Lindley Library."

APPOINTMENTS.

DERBYSHIRE.—The notice of the appointment of Mr. Widdows last week should have read that he was appointed Surveyor to the "Derbyshire" Education Committee, not "Derby" as printed.

SANITARY AND ENGINEERING NEWS.

SEA WALL, MILLOM.—On the 20th inst., at Hodbarrow Mines, Millom, the sea was finally shut off from the large area enclosed by the new sea wall at dead low water. In the presence of the directors and representatives of Messrs. John Aird and Co., contractors, and Messrs. Coode, Son, and Matthews engineers, the sluice-gates, four in number, were shut down. This wall is a mile and a quarter in length, and protects the workings of the mines from the inroads of the sea.

WATER SUPPLY, BIRMINGHAM.—The Elan Valley Waterworks were inaugurated by the King and Queen last week. The scheme, which was prepared and carried out by Mr. James Mansergh, F.R.S., Past-President of the Institution of Civil Engineers, has been eleven years in execution, the total cost up to date being 5,885,000l. The catchment basin, acquired by the City of Birmingham 30 miles away among the Welsh hills, is 12½ miles long from north to south, and 8½ miles from east to west, and embraces an area of 71 square miles. Over this watershed the average rainfall is 63 in. per annum, and the storage provided under the scheme is sufficient to maintain in a dry year a supply of 75,000,000 gallons a day for 200 days, in addition to 27,000,000 gallons a day for compensation water to the river Elan. The entire scheme in the Elan valley comprises a series of six reservoirs on the rivers Elan and Claerwen, the construction of the other reservoirs on the Claerwen river is postponed until the requirements of Birmingham necessitate further storage. From the waterworks an aqueduct, 73 miles in length, will convey the water to the service reservoir at Frankley, 7 miles from Birmingham. The aqueduct is now complete in its entire length, consisting of 13½ miles of tunnel, 23 miles of covered conduits, and 37 miles of double iron siphons. A feature of the scheme is that the water will be filtered at the head of the aqueduct, in order to avoid the growth of a deposit in the pipes. The thirty filter beds, which are now approaching completion, form the site of the inaugural ceremony performed by the King. For the accommodation of the 2,000 workmen employed, a model village was erected, with a hospital, school-room, public hall, bath-houses, canteen, and fire-brigade depot. The Craig Goch dam holds in check the highest artificial lake that has been formed on the Elan river. Its height is 120 ft. and its length 520 ft., and the reservoir thus formed, at a height of 1,040 ft. above Ordnance datum, has a surface area of 217 acres, with a storage capacity of 2,000 million gallons. It is spanned by a viaduct connecting the roads on the opposite sides of the river. Next to it, and at a level of 95 ft. lower, is the Pen-y-gareg reservoir, with an area of 124 acres, and a capacity of 1,300 million gallons. The dam containing it is 123 ft. in height by 500 ft. in length.

FOREIGN.

FRANCE.—M. Pascal is carrying on actively the new buildings of the Bibliothèque Nationale, Rue Vivienne, which will soon be completed. Between these buildings and those of Rue Colbert now rises an immense rotunda in stone, to be roofed with a steel cupola, which will cover the new reading-rooms. This part of the work will take at least a year to

complete.—The restoration of the church of St. Pierre at Montreux is also in progress; the estimated cost is 140,000 francs. The Fine-Arts Department has at last taken in hand the work for the arrangement and furnishing of the Château de Malmaison, commencing with the apartments of the ground and first floors, which are of special historical interest.—The jury in the competition for a church at Colombarius has selected, for the second and final competition, the designs of MM. Duval and Robiña, Felicien Bailly, Emile Brunet, Jardel, Despeyroux, and René Berger.—M. Chedanne has been commissioned by the King of the Belgians to transform the mansion lately occupied by the Princesse Napoléon, in the Rue de Berri, so as to fit it for occupation as the Belgian Embassy.—M. Emile Robert, architect, of Clamart (Seine), has obtained the first premium in the competition for the new cathedral of St. Andrew at Patras in Greece.—The Académie des Beaux-Arts has awarded the "premier grand prix" in architecture to M. Ernest Hébrard, pupil of MM. Guinain and Scellier de Gisors.

A large hospital has been opened at Lisieux. M. Campervaux is the architect. A new Post Office establishment is to be built at Lyons, at a cost of nearly 700,000 francs.—The death is announced, at the age of forty-five, of M. Théophile Landry, architect, and member of the Société Centrale. He was a pupil of MM. Moyaux and André. He carried out numerous private residences, in particular a chateau, in the style of Louis XIII, in the Landes; he was also architect of the Mahemann hospital at Neuilly.

GERMANY.—An official report received at the British Foreign Office states that the project of building a tunnel underneath the river at Hamburg, so as to provide a more satisfactory connexion between the two sides of the harbour, seems likely to be carried into effect at an early date, and the work will, it is stated, be undertaken by a Frankfort firm for about 425,000.

UNITED STATES.—The Governor of Massachusetts has appointed a commission to consider the revision of the existing building laws of the Commonwealth. The Commission consists of an architect, a lawyer, and a real estate trustee. At present, the State laws are mainly concerned with the proper building and maintenance of factories, schoolhouses, hotels, and public buildings, but as the State becomes more thickly settled, the State Police, upon whom rests the enforcement of these laws, find it desirable to give more and more attention to the methods of building employed in mill villages and small factory towns, which, as yet, have no local code of laws of their own; and for this reason it has become advisable to add to the present laws some of the refinements of particularisation that belong to city building codes.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—Mr. E. Stanley Mitton, architect (Birmingham), has removed from Oxford-road, Moseley, to 11, Ocean-chambers, Waterloo-street, Birmingham.—Messrs. Pearson Brothers and Campbell, slate importers and merchants (Liverpool), have removed their offices from 5, Castle-street, to 13, Water-street, Liverpool.

The Hydraulic Brick and Stone Company (Liverpool) have removed their offices from 5, Castle-street, to 13, Water-street, Liverpool.—Mr. Lewis F. Day is removing from 13, Mecklenburg-square to 15, Tavilton-street, Gordon-square, W.C.—The Cloissonés Glass Company have removed from 66, Berners-street to 9, Berners-street.

THE CORPORATION RECORDS, LONDON.—During the past twelve months Dr. Sharpe has completed and issued a calendar of the Letter Book "E" and has added an exhaustive index with the aid of Mr. Herbert Trotter. A similar calendar for Letter Book "F" is also ready for issue. The period of fifteen years ending with 1352 relates to a record of civic history when King Edward III. was waging war for the possession of the French crown and the Duchy of Aquitaine, the campaign including the naval victory of Sluys, the battle of Crecy, and the surrender of Calais. The Letter Book "E" contains an account of the storage of guns and gunpowder at the Guild Hall of the City, and the King's despatch to the citizens describing his strategic dispositions for meeting the French forces at Crecy.

CHURCH BUILDING SOCIETY.—The Incorporated Society for Promoting the Enlargement, Building, and Repairing of Churches and Chapels held its usual monthly meeting on the 21st inst. at the Society's House, 7, Dead-end, Westminster, Abbey, S.W., the Rev. Canon C. E. Norman in the chair. Grants of money were made in aid of the following objects—viz., building new churches at Fern-

dale, St. Dunstan, Glamorgan, 100l.; Manselton, St. Michael and All Angels, near Swansea, 150l.; Wandsworth, St. Mary-the-Virgin, Surrey, 150l.; and Luton, St. Saviour, Beds, 275l., in lieu of a former grant of 250l.; rebuilding the churches at Chepstow, St. Mary, Mon., 25l., making in all 75l.; Kirby Woodhouse, St. John, near Nottingham, 60l.; and Skelmersdale, St. Paul, near Trimsirk, 105l., in lieu of a former grant of 55l.; and towards enlarging or otherwise improving the accommodation in the churches at Armley Hall, Holy Trinity, near Leeds, 10l.; Babraham, St. Peter, near Cambridge, 10l.; Barnes, St. Mary, Surrey, 75l.; Fobbing, St. Michael, near Stanford-le-Hope, Essex, 30l.; Gainsborough, St. John, Lincs, 10l., making in all 110l.; Stonebridge, St. Michael and All Angels, Middlesex, 50l., making in all 130l.; Tilsworth, All Saints, Beds, 25l.; and Wrentham, All Saints, near Norwich, 20l. Grants were also made from the special Mission Buildings Fund towards building mission churches at Cwmllwdder, near Pontypool, 55l., and Merrymont, near Liskeard, 55l. The following grants were also paid for works completed:—Thurleston, Christ Church, near Kingsbridge, 25l.; Moreleigh, All Saints, South Devon, 10l., on account of a grant of 20l.; Dalston, St. Philip, 20l.; Dovercourt, St. Augustine, Essex, 60l.; Wilmington, St. Mark, near Hull, 50l.; Balsall Heath, St. Barabas, near Birmingham, 300l.; Westcliffe-on-Sea, St. Andrew, near Southend, 100l.; Mold Green, Christ Church, near Huddersfield, 55l.; Mark, Church of the Holy Cross, near Highbridge, 40l.; Snargate, St. Dunstan, Kent, 5l., balance of a grant of 15l.; Hull, St. Augustine, 10l., on account of a grant of 20l.; Ilfracombe, St. Peter, Devon, 130l.; Whitwick, St. George, near Ashby-de-la-Zouche, 75l.; Walthamstow, St. James, Essex, 250l.; Gilling, St. James, Middlesex, 75l.; Hornsey, St. Luke, Middlesex, 75l.; Bettws Ewan, St. John, near Newcastle, Emlyn, 20l.; Newlyn, St. Andrew, near Penzance, 40l.; and Newport, St. Luke, Mon., 100l. In addition to this the sum of 295l. was paid towards the repairs of thirteen churches from trust funds held by the Society. The Society likewise accepted the trust of a sum of money as a repair fund for the Church of St. Mary, Great Ilford, Essex.

INSTITUTION OF HEATING AND VENTILATING ENGINEERS.—The sixth summer conference in connexion with the Institution of Heating and Ventilating Engineers (Incorporated) was held on the 22nd inst. at the Hotel St. George, Liverpool. Mr. Palmer, of Liverpool, President for the year, occupied the chair. Amongst those present were ex-Presidents Messrs. Walter Jones (Stourbridge), Louis F. Pearson (Beeston), and W. R. Maguire, J.P. (Dublin); Vice-presidents Messrs. S. Naylor (Halifax), G. Crispin (Bristol), Taylor, hon. treasurer (London), W. Nelson (London), (Trowbridge), and R. E. Atkinson (Leicester); Messrs. T. Pottertout (Balham), E. W. Mayer (Redhill), W. Yates (Swinton), A. B. Simpson (Pimlico), C. J. Haden (Trowbridge), and C. Barter (Birmingham), members of the Council; and Mr. Arthur Taylor (London), Secretary. At the general meeting held in the afternoon of the first business transacted the election of four new members from Croydon, Peckham, London, Birmingham, and Berlin, and two associates from Darlington and Brook Green, London. Interesting papers were contributed by Mr. George Chasser (Stourbridge), who was awarded first prize in the assistants' competition in 1903, on "An Inquiry into the Waste Heat from Gas-engines, with Some Suggestions for its Useful Application"; by Mr. Walter Yates, M.I.Mech.E. (Swinton), on "Mechanical Draught for Boilers"; and by Mr. Chas. Barter (Birmingham), on "Smokeless and Economical Burning of Fuel." Mr. Louis F. Pearson, referring to Mr. Chasser's paper, said the competition had proved so interesting that the Council of the Institution were offering this year three prizes of higher value. The papers were of a purely technical character, and gave rise to considerable discussion. It was decided that the next meeting should be held in London on October 13. In the evening the delegates sat down to dinner at the Hotel St. George, under the presidency of Mr. John S. Palmer. The toast list included "The Institution," "The American Society of Heating and Ventilating Engineers," "Our Visitors and Guests," and "The Local Committee." Councillors Joseph H. Jones and Boote delivered brief addresses. Nearly 900 books were distributed, this function being undertaken by Mrs. Joseph.

ST. JAMES'S CHURCH, WORSBORO' BRIDGE, BARNSELY.—This church was re-opened recently, after clearing and decoration. The nave walls have been covered with diaper work, and elaborate borders; and a large group of angels, on a blue background, has been painted over the chancel arch. The

work has been designed and executed by Messrs. Powell Brothers, of Leeds, who also executed the east window.

NEW ORLEANS TIMBER TRADE.—It is stated in an official report that, during the year 1903, the trade in every description of New Orleans wood was prosperous, and that a steadily increasing growth of exportation is to be noticed. Ten years ago shipments of wood were of little importance, but now timber has become one of the leading staples and a factor in the ocean-carrying trade from the port. The forest lands of the Mississippi valley, some 500 square miles in extent, which New Orleans is the natural outlet, abound in valuable timber. The most important kinds are oak, ash, hickory, walnut, cottonwood, gum, pine, and cypress. The last-named has the valuable quality of being avoided by the white ant, and on this account is shipped from New Orleans to every part of the globe ravaged by that pest. Every tree when felled is taken to one of the numerous saw-mills to be sawn into lumber for shipment from New Orleans. Most of the wood arrives there by rail, but some still comes down the river in barges. It is all taken alongside the ships, without breaking bulk, for transmission principally to the United Kingdom, Denmark, France, Germany, and Holland. A great deal of yellow pine and cypress is also exported from Jacksonville, the trade having been the largest ever known in that city. Direct shipment to Liverpool by steam and sail has commenced. At present the docks are all overstocked with lumber for want of sufficient steamers to carry it away.

THE WALLS OF BERWICK.—Mr. Bryce having inquired in Parliament whether any arrangement had been made for the preservation of the Edwardian walls of Berwick-on-Tweed as an historical monument of exceptional antiquity and interest, and, if so, what were the terms of that arrangement, Lord Balfour replied:—Negotiations are in progress between the Town Council and the Office of Works. It is understood that the Committee of the Town Council is to submit its report in the first week in August, and it is hoped that satisfactory arrangements will be made for the protection and maintenance of these historic remains.

THE OBELISK.—The Southwark Borough Council recently applied to the Corporation to be allowed to remove the well-known Edwardian obelisk in the Southwark, to be attached to the erection on its site of an ornamental clock-tower to be presented to the Borough. The Bridge Houses Estate Committee, on whose property the old land mark stands, are in favour of the application provided that the design and material of the clock-tower and the inscription on it are approved by them, that no advertisements are permitted, that the Southwark Borough Council pay all the costs of the removal and re-erection of the Obelisk on a spot to be hereafter agreed upon, and that such other conditions as the Committee may impose are fulfilled.—*The Times*.

CAPITAL AND LABOUR.

EMPLOYMENT IN THE BUILDING TRADES.—According to returns supplied by eighty-two employers' associations, whose members are estimated to employ about 92,500 building operatives of all classes, and by trade unions with an aggregate membership of about 194,700, an employment in the building trade generally continued dull during June, and the whole showed little change as compared with May. It was rather worse than a year ago. With bricklayers, employment is reported as dull, but better than a month ago, and much the same as a year ago. Employment with masons is fair in England, dull in Scotland and Ireland. With carpenters and joiners employment is dull. The percentage of unemployed trade union carpenters and joiners was 63 at the end of June, compared with 59 in May and 54 a year ago. Employment with painters generally has been dull and rather worse than a month or year ago. It has been dull also with plasterers and plumbers. The percentage of unemployed trade union plumbers was 99 at the end of June, compared with 92 in May and 76 a year ago. Slaters and tilers report employment as dull in England and Ireland, fairly good in Scotland.—*Labour Gazette*.

Legal.

ACTON ANCIENT LIGHT DISPUTE.—In the Chancery Division, on the 23rd inst. Mr. Justice Kekewich resumed the hearing of the case of Kine v. Jolly, an action by the

plaintiff, Mrs. Sarah Kine, the owner of a house and premises, known as "Woodthorpe," Aecia-road, Acton, against the defendant, for an injunction and damages for the alleged obstruction of her much diminished light and also for alleged trespass. His lordship had the case before him on the 12th, 13th, and 14th insts., a report of the proceedings appearing in the *Builder* of last week.

Mr. P. O. Lawrence, K.C., and Mr. Cann appeared for the plaintiff, and Mr. Stewart Smith, K.C., and Mr. Vernon for the defendant.

Mr. Wm. Eydmann, examined by Mr. Lawrence, said he was an auctioneer and licensed valuer, and had practised as such in Acton for twenty years. He had sold and let numerous kinds of house property in Acton. He had known "Woodthorpe" and its surroundings for the last twenty years. He knew the former tenant, Mr. Virgo, and had frequently been into the house during his tenancy. He had visited the house during the last fortnight at all times of the day. He found the light coming to the morning-room and the hall very much diminished owing to the erection of Dr. Jolly's house. He considered that the loss of light had reduced the letting value of the plaintiff's house by 25% a year. He thought the selling value of the freehold was reduced by 450%.

Cross-examined by Mr. Stewart Smith, What do you say the value of this house was before Dr. Jolly's house was put up?—2,160%.

In your opinion, has the freehold value of the house risen during the last five or six years?—Well, I do not think it has increased in value much.

Cross-examination continued. He should not be surprised to hear that the property about 1895 sold for 1,500%. It was very likely that Mrs. Kine purchased the property for 1,675%.

Mr. Lawrence said that Mrs. Kine purchased the property in March, 1902.

Cross-examination continued. In the immediate neighbourhood of the plaintiff's house, about 100 houses had been put up during the last five years. About 80 per cent of those houses were of a rental value of 40% to 45% a year. Some of the houses were let to two families.

So that, apart from the question of light, it is rather an advantage to have a house of the class built by Dr. Jolly next door to "Woodthorpe," than to have a 40% a year house?—Oh, undoubtedly.

Cross-examination continued. The width of Dr. Jolly's plot was about 50 ft. There was nothing unusual in the height of Dr. Jolly's house for a house in a suburban neighbourhood on a plot of that kind. The letting value of the plaintiff's house, without the light obstructed, was 120% a year. He estimated the rental value now at 95% a year. In that estimate he had not taken the obstruction of light to the drawing-room into consideration at all; but only the obstruction to the morning-room and the hall. The footing on which he had made the deduction was, that the house now was less agreeable as a residence than formerly.

Do you attribute the diminution in value to the loss of cheerfulness?—Quite so. The rooms are darker, and therefore it is less cheerful naturally.

You do not suggest that the morning-room could not be used for the ordinary purposes of a morning-room?—That would depend on the time of year.

You will not pledge yourself to anything more definite than that?—No, I could not.

Mr. E. B. Athawes, an auctioneer, surveyor, and estate agent, examined by Mr. Lawrence, said he was a member of the Urban District Council of Acton, and a member of the Assessment Committee of the Brentford Union, and valuer of the assessments for the purposes of the King's taxes. He had valued every house in the neighbourhood for a number of years for the purposes of the King's taxes. He remembered "Woodthorpe" being built. He considered there was a considerable loss in the letting value of the house owing to the loss of light. He put it at 20% a year. He put the loss of the selling value at 370%.

Cross-examined by Mr. Stewart Smith, He put the capital value of the plaintiff's house, on the assumption that Dr. Jolly's house was built in a reasonable position, at 2,035%. This concluded the plaintiff's case.

Mr. E. B. Athawes, an architect, examined by Mr. Stewart Smith, said he had had a large experience in valuing property in this immediate neighbourhood. He thought there was no diminution in the letting or selling value of the plaintiff's house by reason of the erection of Dr. Jolly's house.

Cross-examined. There was no material diminution of light at all.

Mr. Chas. Augustus Laing, a surveyor and estate agent, examined, said he recollected

the plaintiff's house being built. The neighbourhood had altered in character of late years, and smaller houses being built caused larger ones to depreciate in value. He did not consider that there was any diminution in the letting or selling value of the plaintiff's property by reason of the erection of Dr. Jolly's house.

Cross-examined. In his opinion the present rental value of "Woodthorpe" was 90% a year. He put the capital value at 1,800%.

Mr. H. W. Collier, an auctioneer, surveyor, and estate agent, and Mr. Harold Edward Carter, a surveyor and valuer, also gave evidence generally corroborating that of the last witness. This concluding the evidence in the case, his lordship, addressing Mr. Lawrence, said he wished to hear him on one point only. He considered he was bound by the decision of the House of Lords in the case of the Home and Colonial Stores v. Colls to dismiss the action, unless he was convinced there had been substantial interference with the light of the plaintiff's house. He had said already that he did not intend to dismiss the action, and it followed, therefore, that he thought there was substantial interference with the light of the plaintiff's house. The question, therefore, the learned counsel had to address himself upon was, what was the remedy, and whether he ought to grant a mandatory injunction, or ought he to incline to granting the plaintiff damages instead of granting an injunction.

Mr. Lawrence claimed that he was entitled to an injunction. He had got to prove now nuisance to property or person.

His lordship: In that I am with you.

Mr. Lawrence: In this case I say that although you can assess the value of the nuisance to the property, you cannot properly assess the nuisance to the inhabitants. This is not a case where the plaintiff wants to be turned out of her house, and, therefore, I submit it is a case for an injunction. If you assess damages only it would be making the plaintiff sell her comforts at a price. Therefore, I say, she is entitled to an injunction. The plaintiff is not in want of money. All she wants is the house and home. It is difficult to value such a thing in money. Mrs. Kine bought the house to establish a home for herself, her daughter, her son-in-law, and her grandchildren. All she asks is that you will restore to her the light she formerly had. This is not a case of trying to extort money.

His lordship: I am quite satisfied of that. I am satisfied that there is nothing of that kind.

Mr. Lawrence: I do not say that we will reject damages if you will not grant us an injunction. I ask your lordship to say that this is a case for an injunction.

His lordship said he thought there was some interference with the drawing-room light, but he was of opinion that, on the judgment of the House of Lords in the Colls' case, he was bound to hold that it was not such as would entitle the plaintiff to any relief. He took the morning-room and the hall together. Mr. Stewart Smith must take it that he held there was substantial interference with the light of the morning-room.

Mr. Stewart Smith said that the plaintiff must have contemplated some kind of building on the plot where Dr. Jolly's house stood, and really the damage was the difference between the damage caused by the offending building, and a building which would not offend. His lordship had had no evidence of what such damage would be. He submitted that in this case the injury could, and should, be compensated for in money.

His lordship said he would reserve his judgment. He was rather inclined to awarding damages in mercy to the parties, because probably, if he were to award damages, there would be no appeal, and there would be no increase in the costs, which were already large. If he granted an injunction, he took it that there must be an appeal. All he had to do was, however, to do justice between the parties, and he therefore reserved his judgment.

PATENTS OF THE WEEK.

APPLICATIONS PUBLISHED.*

14,607 of 1903.—W. REED: *Skirting Dado or Bordering*.

This invention has reference to the improvement in skirting, dado, or bordering, that is to say, to prevent insects from climbing up the walls and partitions of dwellings. Hitherto the skirting dado or bordering of rooms has permitted insects creeping up the walls to the discomfort of those who dwell in the rooms. This defect is overcome by

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

having a dado skirting and bordering composed of smooth glass.

15,421 of 1903.—D. SEGURA: *Connecting or Binding Brackets, and the Like, for Furniture and other rooms*.

In carrying the invention into effect, in its application to a connecting bracket for connecting together the respective adjacent parts of a chair seat frame, a bracket, having two horizontal lateral extending lugs, is provided which are connected together by an arm integral with said lugs, while integral also with said arm vertical downwardly extending lugs are provided. The horizontal lugs serve for being laid upon the horizontal faces of the adjacent extremities of parts of the said frame; while the vertical downwardly extending lugs lie against the vertical face of the adjacent extremities of parts of the said frame. Screws or nails may be passed through the said lugs so that the respective parts of the frame that are connected by the bracket are firmly secured against vertical or lateral displacement.

15,545 of 1903.—C. L. STIFF: *Clayware, Stone-ware, and similar Troughs, Channels, Conduits, and the like*.

Channels, and the like, for bacteria and filter beds, or under drains therefor, having a curved or angular and gapped or perforated face, and longitudinal edge gaps forming lateral openings to the level of the bed or area to be drained and aerated.

15,159 of 1903.—J. MERRILL: *Automatic Discharging and Flushing Siphon*.

The object of this invention is to provide an automatic flushing siphon that will work with either sewage or water, and more particularly in the discharge of bacteria beds and the like. To effect this a trapper siphon is constructed, one part of which is connected to an air chamber placed in or in connexion with an automatic flushing cistern, the discharge of which will cause the main siphon to discharge.

16,399 of 1903.—D. HADLINGTON: *Construction of Brick and Analogous Kilns*.

Kilns for working in series on the continuous system; each kiln having a middle flue in the floor, and flues at the sides, consisting in the employment of main hot-air flues, and an independent main steam flue which are common to the whole of the kilns in the series, and are placed in communication with both the middle and side flues of the kilns, by means of branch flues so arranged, in conjunction with a system of dampers, as to admit of the hot gases exhausted from a firing kiln being conducted along the hot-air flues into either the middle flue or the side flue of a kiln containing goods to be dried off, whereby the drying-off may be accomplished with either an upward or a downward draught, whilst the steam from the drying goods is conducted into the main steam flue from the said flues of the kiln without drying-off with an upward draught, or from the cooling flue without drying-off with a downward draught; the said arrangement also providing for the utilisation of the hot air or hot gases from one or more kilns of the series to promote more perfect combustion in a kiln that is being fired.

17,447 of 1903.—A. H. HIGGINBOTTOM and A. B. LENNOX: *Brick or Briquette-making Machines*.

A machine for making bricks or briquettes, characterised by a series of moulds which are adapted to rotate round an axis, and a plurality of dies or covers for the moulds, said dies or covers being mounted on an endless chain or band, and said band being travelled by and at the same speed as the moulds.

17,684 of 1903.—J. McVEAN: *An Adjustable Work Holder or Clip, particularly applicable for Plumbers' Work*.

This invention relates to an adjustable steady, or clip, particularly applicable for plumbers' work, the object being to provide a steady, or holder, for a coupling when soldering to a pipe, and so dispense with the building up of pipes whilst a coupling is being soldered to the said pipe. The appliance is constructed in tubular form with the bottom end of the tube open and the top end closed, the top portion of the said tube being larger than the bottom, and is preferably constructed pear-shaped. Within the said tube a round rod is employed, which is provided with a cone at the bottom thereof; the top of the said rod being screwed and passed through the top of the pear-shaped tube, at the centre thereof.

18,271 of 1903.—J. DUPONT, SEN.: *A Caster for Furniture*.

A caster for furniture, or other uses, having a pivot, the shank of which is grooved, a roller consisting of two cup-shaped parts, stamped from sheet metal, and a yoke, also stamped from sheet steel, or other metal.

18,373 of 1903.-F. W. ADAMS: *Fanlight Gear or Openers.*

Fanlight gear, consisting in the combination of a link hinged to the fanlight, a sliding block hinged to the link, a three-way guide in which the block is mounted, a spring rod attached to the block extending through the guide, and means, such as a swivel handle adapted to engage a toothed bracket, for retaining the rod in the position to which it is adjusted.

18,547 of 1903.-J. TIPPER: *Manufacture of Bolts for Doors, and the like.*

A barrel bolt, having the plate and barrel formed in a single piece of sheet metal, and tongues also formed in the same piece of sheet metal, and meeting, or nearly meeting, in the plane of the plate in position therealong between the ends of the barrel so as to be behind the barrel.

18,597 of 1903.-G. H. LLOYD: *Manufacture of Pipes.*

Manufacture of pipes, consisting essentially in rolling a bar with a groove in two of its opposing faces, the internal faces of said grooves being waved or curved longitudinally, inserting the plain margins of plates which are bent round to form the pipe into the waved grooves, and finally closing the grooves by pressure, so that the inserted margins of the plates are caused to follow the convexities and concavities of the grooved faces.

18,715 of 1903.-H. F. LUTTEY: *Wall and Table Brackets.*

Making a bracket shelf by forming a suitable blank from flexible sheet material, cutting portion of same through any desired configuration, leaving a piece connecting the cut portion with the blank, and subsequently bending said cut through portion at said connecting piece to form a bracket shelf on said blank.

18,802 of 1903.-W. A. MARSHALL: *Automatic Sprinklers for Fire Extinguishing.*

Sprinkler heads for automatic fire extinguishing, consisting of a strut composed of three parts, one part having a lateral extension, a bearing, and a holder, or its equivalent, and the other parts being held together by a strip.

21,100 of 1903.-G. J. WILLIAMS and G. T. PIGGOTT: *Manufacture of Metallic Facing for Stairs.*

Metal facings for stairs, produced from sheet metal strips by feeding them into and drawing them through a suitable die, combining a mandrel and serrated planing tool, so that the strip issues as moulded and grooved stair facing.

855 of 1904.-J. BRAE: *Ashpans for Domestic Fireplaces.*

Improvements in ashpans for domestic purposes, consisting of an ashpan and sieve combined. The sieve is half the depth of the ashpan, and fits closely within, resting on four bearers, occupying the upper part of the ashpan, the lower part of the ashpan being the receptacle for the ashes. The sieve, which is altogether free in the ashpan, can be lifted out and placed within without unfastening and fastening. The bottom of the sieve is of fine, strong crossed bars sufficiently open to allow the ashes to fall through. The back end of the sieve is made and fixed slantingly to allow the cinders to be thrown off easily.

6,423 of 1904.-C. BAER: *Hinged Windows, and the like, and Means for Closing and Opening the same.*

A watertight window prevented from closing when once opened, in which the window sash has a suitable groove located beneath in its weather rail, which groove engages a suitable projection of a corresponding bar of the window frame, and may there be suitably washed by means of a washing cord, or the like, in such a way that neither wind nor rain can penetrate through the joint of the window and in which a suitable apparatus for raising the sash over the projection of the window frame, for the purpose of opening the window, is provided in such a way that when the window is open it again drops by reason of its own weight, and thereby fixes the lever serving for opening the window—that is to say, prevents the window closing automatically by reason of a draught, gusts of wind, or the like.

10,040 of 1904.-O. DEVILLERS: *Process for the Making of Slabs or Sheets, Imitating Marble.*

A process for manufacturing imitation marble plates, said process consisting in spreading on glass plates the fragments of burst glass bubbles, blown from refined glass of various colours, over which fragments is sprinkled powdered or liquid enamel, with or without the addition of sand, the whole being then fired at a temperature of 800 C., and afterwards allowed to cool gradually.

10,789 of 1904.-W. LIVINGSTONE and S. H. POMEROY: *Pulleys or Wheels for Sashes, and other purposes.*

A sheet-metal pulley, consisting, in combination with the rim, of a tubular sheet-metal hub, comprising two sections arranged end to end, a set of arms integral with each of said sections extending radially from the inner end of the same, each of said sets comprising members of different lengths, the longer of said members having angular portions engaging the rim.

11,372 of 1904.-J. R. NESBITT: *Method of, and Means for, Planning Decorations for Application to Walls, Ceilings, Floors, or other surfaces.*

A method of, and means for, planning decorations for application to walls, ceilings, or other surfaces, consisting in the employment of a suitable surface, having a number of lines ruled or otherwise indicated thereon, and a series of cards, or the like, having upon them designs, or components of designs.

11,606 of 1904.-G. A. HARVEY: *A Cowl for Chimney Flues, Ventilation, and the like.*

A cowl for chimney flues, ventilation, and the like, with a conical ring surmounted by a dome-shaped cover and tubular opening, so arranged as to permit the free passage of air currents.

11,803 of 1904.-J. H. MARLOW: *Manufacture of Tiles, Bricks, and the like.*

The manufacture of tiles, bricks, and the like, by the use of a die, the upper part of which consists of two plates, loosely-connected plungers adjustably connected to the upper plate, and working in slots formed in the lower plate, and a dovetailed piece formed on, or fixed to, the lower plate.

12,022 of 1904.-G. MUSGRAVE, D. MUSGRAVE, and C. and D. MUSGRAVE, LTD.: *Water-closets, and the like.*

A water-closet, or the like, consisting in the combination with the pan or basin of an outlet leg, the down branch of which is internally provided with corrugations, or equivalents so placed or formed as to divert or direct the passing water and cause it to drive the air in the leg-branch before it.

17,152 of 1903.-E. WILDING, T. CATERALL, and J. WARRISON: *A Method of Securing or Fastening Scaffolding-poles Together by Means of a Clip or Clips.*

This improvement, consists of a pair of wrought-iron steel or malleable-iron clips, for the erection of scaffolding used in the construction of buildings, instead of the old method of lashing the scaffolding-poles together with ropes.

BRIGHTON.—For glazed drain pipes for year ending July 31, 1905, for the Corporation. Mr. F. J. C. Borough Engineer and Surveyor, Town Hall, Brighton:—

TO CORRESPONDENTS.

A. A. T.—J. E. (Below our limit).—A. P.—R. (Amount should have been stated).

NOTE.—The responsibility of signed articles, letters and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, manuscripts, or other documents sent to left at this office, unless he has specially noted them.

Letters or communications (beyond new news items which have been duplicated for other journals are NOT DESIRED.

All communications must be authenticated by name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

We are compelled to decline pointing out books giving addresses.

Any communications sent to a contributor to write an article or to execute or lead a drawing for publication, is held subject to the approval of the article or drawing, if received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of proof of an article in type does not necessarily imply acceptance.

All communications regarding literary and artistic matters should be addressed to THE EDITOR, the name and address of the sender, whether for publication or not, should be addressed to THE PUBLISHER, and not to the Editor.

MEETINGS.

The Church of Chipping Ongar.

WENTY-THREE miles due north of London, on the little river Roding, is the old town of Chipping Ongar, thus called because of its ancient "chepe," or market, which probably served for the hundred that took its name from this place. This old Anglo-Saxon settlement chiefly consists of a long street with more than one picturesque bend in it. Although much has been lost in the last fifty or sixty years several of its old houses and cottages, and not a few of its trees, Chipping Ongar still lay claim to a beauty and interest of its own, though not of so high an order as might be expected from the writings of Isaac Taylor (the literary congregationalist minister of this town at the beginning of last century) and his two literary daughters.

Essex possesses several simple moated mounds, as well as mounds with base courts, the origin of which have been again debated with energy in the last few years. Of the latter of these two classes Ongar is a most striking example. The height and bulk of the great mound of Ongar Castle, the depth and width of its moat, and the solid rampart round the inner bailey unite in proving that there was here at one time a fortress of sufficient importance to dominate the immediate district. Part of the rampart and base of a second or outer bailey sweeps round for about 400 ft. on the west, to embrace, as it were, the town or settlement, though the rest of this has for the most part disappeared. There are also some traces of another, and probably later, court on the east. It is necessary to be fairly explicit as to these earthworks, for the date of the oldest part of the fabric of the present church hinges to some extent on this question. Those interested in this matter should consult the plan and description by Mr. T. Chalkley Gould in his excellent paper on the ancient earthworks of the county in the first volume of the "Victoria County History of Essex" (1903). A small piece of solidly-huilt rubble and tile masonry has been found in the rampart of the inner bailey, at a place where it is supposed that there was a communication with the outer bailey. The idea that masonry of a like character ran round the bailey rampart has been disproved, for excavations show that a chalky houlder-clay, gravel, and sand rammed together are the main constituents of the wall. There are also one or two other disjointed fragments of like rude masonry. On the whole, after careful examination, and after weighing analogous cases, the probable truth of the matter is that there was a mound here with an adjacent earthwork in pre-Norman days for an Anglo-Saxon defensive settlement of importance, which was held, just before the Conquest, by Ailida, a certain free-woman, as the centre of her broadlands. Such a view does not, however, clash with Mr. Round's belief that, when Count Eustace of Boulogne obtained his large

grants from the Conqueror, he made Ongar the "caput" of his great Essex fief; for doubtless the old defensive works would then be put in repair. The moat was probably deepened, the keep mound of a castle raised, and a new or renewed outer bailey thrown out by Richard de Luci, Chief Justice of England, in 1162, when he made Ongar into a vast fortress. Ongar was bestowed on De Luci by William Earl of Mortaigne, son of King Stephen, and the lordship then became an honour. In 1176, after the rebellion of the barons, Henry II. took into his own keeping nearly all the English castles, including, as is expressly stated, that of his intimate friend Richard de Luci. The castle was demolished in Elizabeth's reign, and the fine dwelling-house erected in its place was in its turn removed in 1744.

As to the church, which stands under the shadow of the castle mound, history is almost silent. All that Morant's folio "History of Essex" (1768) has to say of Chipping Ongar in this connexion is contained in a paragraph of extreme brevity:—"The Church, dedicated to St. Martin, is of one pace with the Chancel, tiled. A spire, leaded, contains one Bell." It is further stated that the rectory has always been appendant to the manor, and that, the value of it being hut small, the neighbouring church of Greensted was united to it, temp. Edward VI., by Act of Parliament, hut that this Act was repealed in the next reign.

Records yield a single entry of interest relative to the early story of this fabric.

Fig. 1. Built-up Doorway, North Side of Nave.

Fig. 2. Early Blocked up Window, North Side of Nave.

John, the clerk of Ongar, was ringing the church bell in 1285 when the clapper fell on him and killed him instantly. A verdict of death by misadventure was returned, and the value of the bell and clapper was assessed at 8s. 2d., or about 5% of money of the present value. According to the custom of the time the bell and bell-clapper that caused the death became dead and were forfeited to the Crown, or rather they had to be redeemed at the full value by the owner, which in this case would be the churchwardens of Ongar.

The church of St. Martin consists of chancel, nave, and south aisle, and is but of small proportions for the church of an old market town that gave its name to a Hundred. This seems to prove that the town did not expand in any material degree during mediæval days after the Norman period. The chancel is but 18 ft. long and the nave 51 ft. The south aisle was not added to the church until 1884, at which date the fabric underwent considerable repair, including the stripping of the walls of rough-cast and the insertion of a new east window in the chancel.

The building shows, however, various interesting remains of considerable antiquity. It has been assumed that, when Richard de Luci, the devoted servant of Henry II., secured Chipping Ongar, he built the church "largely of ruined Roman work." He died in the year 1179. But, at any rate, it may be maintained with confidence that the term *Chipping Ongar* betokens a market town on this site of pre-Norman date, and, further, that it is highly improbable, nay,

almost impossible, that such a town, within easy distance of London, would be destitute of a Christian church during the later Saxon period. It is only natural then to look round and see if the fabric bears any trace of Saxon workmanship.

This brings us at once to the important factor in Essex church buildings—the prevalence of brickwork. The county has some noble specimens of ecclesiastical brickwork of the latter part of the XVth and the beginning of the XVIth centuries. Such are the fine towers of Fryerning, Ingatestone, and Rochford, and the porches of Leigh and of the recently described ruined church of Chingford.

But there is a far more interesting brickwork question in connexion with Essex churches than that pertaining to its development at the close of the mediæval period. Those who have made a study of this question are well aware that the once confidently-made assertion as to the disuse of brickmaking in England from the time when the Romans left us up to the XVth century is an error. A visit to the East Riding, notably to Walton, will afford convincing proof that bricks were used in England in the XIIIth century. We are not, however, aware of anything having arisen or been discovered to substantiate in any way the idea, once propounded in an early issue of the *Essex Archaeological Society's Transactions*, that the Normans made tiles in England. There are various Essex churches wherein the flat Roman bricks or tiles are much used in what is usually termed Norman

workmanship. This use of old Roman material is certainly far more likely—unless other circumstances contradict the supposition—to have been done by the Saxons rather than the Normans. In certain well-known cases the considerable use of Roman material in pre-Norman churches is accepted by everyone—as at St. Martin's and St. Pancras', Canterbury, or at Stone-by-Faversham, Kent. In two cases these Saxon church builders undoubtedly made large use of Roman tiles in turning their arches, notably at Brixworth, Northamptonshire, and also at Britford, near Salisbury. Now at Chipping Ongar there is a large built-up doorway on the north side of the nave, the jambs and turn of which are formed of Roman tiles (Fig. 1). It should be compared with a somewhat similar built-up door or archway in the outer north wall of the fine church of Prittlewell in this county. This doorway, to anyone well acquainted with Brixworth and Britford, looks far more like pre-Norman work than the work of Richard de Luci in the middle of the XIIIth century.

Then, again, on the north side of both the nave and on both sides of the chancel are small built-up early lights with a turn of Roman tiles at the top (Fig. 2). These should be compared with somewhat similar lights to the nave of the church of Fryerning; only in this case an unhappy restoration has brought about their rebuilding on a larger scale.

Again, the quoins of this church, both of the west end of the nave and the east end of the chancel, are formed of Roman tiles, as shown in Figs. 3 and 4.

Fig. 3. Chipping Ongar Church : South-east View.

It is exceedingly unfortunate that the original character of the east end of the church has been destroyed by the insertion of a large window, but the "long-and-short" work of parts of four small lights (Fig. 3) seem to be pretty clearly of pre-Norman character. The timber work at the sides and apex of the east gable is obviously of much later date.

On the whole, we incline to the opinion that there is much more likelihood of a good deal of the oldest work of this church being late Saxon rather than Norman. At all events, this fabric deserves closer attention at the hands of capable archaeologists than it has yet received. The round-headed plain priests' door on the south side of the chancel is among the early and somewhat puzzling features.

The south side of the chancel is lighted by a graceful triple lancet, with the centre light higher than the side ones. This is in good brickwork. We believe it is possible that this is original brickwork of the XIIIth century, though the bricks are somewhat larger than others of that century. If it is of later workmanship, it is a clever reproduction of XIIIth century proportions.

At the west end of the nave is a small modern porch, which partly obscures a rebated window. Above that window, in the gable, is a plain early single light, which has now a round head; it has been altered in construction, and probably had originally a lancet head of Henry III. date.

In the north wall of the nave are three two-light pointed windows of XIVth century style; they date from 1884, but are said to succeed others of like construction.

On the north side of the chancel is a small modern vestry. On this side, too, of the chancel, behind the organ, is a three-light window in moulded brickwork, apparently of XVIIth century date. There is also a modern-looking low doorway (reconstructed, we believe, in 1884), giving access to a very small chamber in the thickness of the wall.

Inside the chancel at this point, in the north wall, may be noted a small opening, measuring 13 in. by 6½ in., which probably served as a squint from a narrow anchorite's cell.

In the interior of the chancel may also be noted a piscina niche on the south side, with a large grooved drain, of the time of Edward I. There are also remains of a

holy-water stoup by the blocked-up north door of the nave. The font is modern. The old tie-beams and king-posts of the nave remain. These and other features of the old roof are probably early XIVth century, but have been much altered. The pulpit has some handsome carving of the first half of the XVIIth century.

On each side of the nave roof are two dormer windows, which, with their wooden casings and neat blinds, have a curiously domestic look; they are probably *circa* 1800 in date.

The timber belfries of Essex are a common and characteristic feature of the churches of the county. The only other county where these are to be found in anything like the same frequency is Hampshire, and there only in certain localities and not generally distributed. Moreover, these western belfries of Essex have an advantage over those of the more southern county, as the square bell-chamber in the former county usually loses its awkwardness by being finished with a low spire. Chipping Ongar is a fair example of the simpler style of late timber work added to an existing building when the desire for more than a single bell swinging in a western cote was strong, and when lack of funds and lack of stone made tower building an exceptional luxury. Externally, in cases like Chipping Ongar, a square, plainly-built bell-chamber is to be seen, striding across, as it were, the western end of the gabled roof of the nave, and projecting some little way down its sides on

Fig. 4. Chipping Ongar Church : North-west View.

the north and south. Here, as is usually the case, it is covered with weather-boarding, which, from its often refreshed coat of light paint, looks fairly modern. The plain square belfry is surmounted by a short octagon-hroached spire, covered with diagonally-arranged lead.

But the interior of the church at once shows the age of the construction. A cleverly-arranged framework of massive oak beams rises from the floor level, "capable of sustaining the vibration of a ring of bells for three or four centuries without starting a joint." Here, as in most similar cases, there seems good reason to believe that the timber framework, with its spire-crowned bell-chamber is of the second half of the XVth century.

On the floor of the chancel, within the altar rails, concealed and perhaps preserved by a heavy covering of linoleum, is an inscribed grave cover of decided interest. It is sometimes stated that Jane, a daughter of Oliver Cromwell, the Protector, is buried here; whilst the last edition of "Kelly's Directory" of the county makes the lady the niece of the great Protector. The Latin inscription states that Jane, daughter of Oliver Cromwell, Knight of the Bath (*equitis balmiensis*), of Hinchinbrook, Huntingdon, and wife of Toby Pallavicini, Esquire, was buried here on March 24, 1637, aged 42. Sir Oliver was knighted by Queen Elizabeth in 1598; at his great house at Hinchinbrook he several times entertained James I., and probably also Charles I. He married firstly Elizabeth, daughter of Thomas Bromley, Lord Chancellor; and secondly Ann, widow of Sir Horatio Pallavicini. Robert Cromwell, a younger brother of Sir Oliver, settled at Huntingdon, and was father of Oliver, the Protector, who received his name from his uncle and godfather at his baptism in 1599. It thus follows that Jane of the Chipping Ongar monument, instead of being the daughter or the niece of the great Oliver Cromwell was simply one of his first cousins.

Sir Oliver Cromwell had four sons and four daughters by his first wife, of whom Jane was one. By his second wife, the widow of Sir Horatio Pallavicini (a Genoese and great favourite of Queen Elizabeth), Sir Oliver had three other children. Sir Horatio left two sons, Henry and Toby, and they were married when mere children in All Saints, Huntingdon, on April 24, 1606, Toby being several weeks short of thirteen years of age. Their child-wives were their stepsisters Katharine and Jane Cromwell. Jane, Toby's wife, was but eleven years of age at the time of their marriage. Both Henry and Toby Pallavicini were subsequently knighted. The issue of the marriage of Toby and Jane was three sons and a daughter. Horatio, the eldest, born in 1611, is buried by his mother. The floor stone is inscribed:—"Here lieth the body of that truly noble and religious gentleman Horacio Pallavicini, Esquire, who departed this life on the ninth day of May in the year of our Lord God 1648, being of the age of six and thirty years."

Against the south wall of the chancel is a mural tablet of white marble to the memory of "Mrs. Sarah Mitford (the

deservedly beloved wife of John Mitford, some time of this parish Esquire), who departed this life December 8, 1776, aged 31 years." It is perhaps as well to mention this monument in order to disperse a fond, quaint tale pertaining to its heraldry, which has not a few believers in the town of Ongar. On the occasion of one of our visits our attention was particularly directed to this monument by a worthy tradesman, who said that many persons came to the church expressly to see it. The arms above the tablet were described by him as bearing the fourfold cognisance of "a flea, a fly, a louse, and a comb," with a singular legend as to their origin! As the arms are now uncoloured and high up, they are somewhat difficult to decipher; but they proved to be a fesse between three moles (Mitford) impaling a chevron between three combs (Botell)!

NOTES.

Dangerous Highways. THREE points of much importance to the general public are now under consideration by the Board of Trade, having been brought to the notice of the department by a deputation from the Roads Improvement Association. The first relates to the erection of posts in the middle of carriage-ways for tramway purposes, a very unnecessary arrangement, which encourages drivers of light vehicles to race for the purpose of getting between heavy vehicles and the posts. This dangerous practice, we may observe, is also caused by the electric light posts which have been so unwisely placed in many streets of the metropolis. The second point arises out of tramway construction in roads which are so narrow as to leave insufficient space for the passage of ordinary traffic. Colonel Crompton properly expressed the hope that the Board of Trade would not sanction any lines unless the minimum widths of 33 ft. for double track and 27 ft. for single track were assured. These measurements are the minima recommended by the departmental committee on the subject of highway administration, and are none too ample for the safety and convenience of the public. As a third point, Mr. Rees Jeffreys urged that main roads should be uniformly paved for the entire width where tram lines are laid. This is clearly desirable, although perhaps of less importance than the other matters mentioned.

Flood Prevention in the Thames Valley. At the present period of the year attention may well be directed to measures intended to minimise the floods that will surely devastate portions of the Thames Valley in a few months' time. The Oxford City Council has recently been able to form the opinion that, in addition to the general inadequacy of the river to carry the required quantity of water in times of heavy rain, there are other causes which aggravate the trouble. For instance, figures furnished by the Thames Conservancy make clear the fact that the Godstow weir alone is able to deliver into the Oxford area far more water than can pass at Iffley and the weirs. Hence, with water coming from

Wolvercote and the Cherwell, every considerable rise in the rivers must inevitably cause a flood. By the provision of additional weir space at Iffley and the weirs bringing the collective discharge up to the quantity of water received from above, many of the floods now suffered at Oxford could be prevented, and others perceptibly diminished, if not entirely avoided. The present is clearly the time for the execution of such works, and we hope the Oxford City Council will not relax their efforts until this desirable object is attained. Very little practical interest seems to be taken in the matter by other public bodies along the Thames Valley, and it is surely time for the appointment of a Commission to inquire into the whole subject and to formulate a comprehensive scheme for dealing effectively with flood waters.

New Building By-laws, Hastings. THERE can be little doubt that building regulations ought to be revised from

time to time, and the example of the Hastings Town Council is one which may be commended to other authorities. Old regulations may prove to be either inadequate or unduly restrictive; in the former case narrow and inconvenient streets may be constructed and insanitary or unstable buildings may be erected, while, in the latter case, the cost of building may be unduly increased or, certain materials being prohibited, there may be little scope for variety in architectural treatment. The new Hastings by-laws repeal certain clauses in the by-laws of 1882 and 1894 and substitute others dealing with the width of streets, the construction of walls, floors, and roofs, and the drainage of buildings. The rules for hollow walls are as moderate as possible, and, under certain conditions, half-timber work and tile-hung timber framing may be used for external walls. The scantlings of timbers for floors, roofs, etc., are carefully specified, but provision is made for variation; thus, while the scantlings of floor-joists for different spans are given in detail, the depth and breadth may be varied, or other sizes may be adopted, and the spacing of the joists be increased or diminished, provided that the same strength of floor is obtained. The rule which provides that the sizes "apply only to . . . any species of fir or pine of sound and good quality" is open to criticism, as it places pitch-pine and white deal or spruce on the same footing, whereas the transverse strength of the former is at least 50 per cent. more than that of the latter and is equal if not superior to that of oak.

Technical Instruction in Germany. IN a report published in July by the Foreign Office, Dr. Frederic Rose, British Consul at Stuttgart, gives full details of special technical schools for the ceramic industries in Germany. We have nothing like them in this country, notwithstanding the progress made in technical education. At the present time there are four schools of the kind in Germany, all situated in the midst of the industries they are intended to promote. Their object is to afford thorough theoretical and practical instruction, and to qualify students for future positions

as owners, managers, foremen, and artists in various branches of the industries concerned. For details of the organisation, methods and courses of study of these schools we must refer our readers to Dr. Rose's excellent report. We may remark, however, that in the school at Lauban, devoted exclusively to the interests of brick-making and allied industries, the curriculum includes such subjects as mathematics, physics, chemistry, mineralogy, electro-technics, drawing, book-keeping, industrial legislation, and other more or less useful theoretical studies, as well as practical tuition as to the properties of raw materials and the most efficient methods of using them in manufacture. It will be seen, then, how thorough is the instruction available. A noteworthy point is that the authorities, and not the manufacturers, first recognised the need for the schools mentioned, a tendency which is frequently observable in the case of minor industries in Germany and elsewhere.

CONCURRENTLY with the efforts still being made for the complete development of Egypt proper, the Government is now actively engaged in the prosecution of works and measures for the regeneration of the Sudan. An expert Commission, appointed to decide between Sheikh Barghoot and Suakin as a port and the terminus of the railway to be constructed from Berber to the Red Sea, has practically arrived at a decision in favour of the former place, which offers excellent anchorage, and has an abundant supply of fresh water. Whichever of the two sites may be finally selected, it is certain that the new port will be of considerable importance, and will serve in a marked degree to hasten the prosperity of the country for whose products it will be the natural outlet. In view of the construction of the railway the Government is taking active measures for the sale of lands within easy reach of the new line. Those who undertake the work of development will be required to lay out the land for basin irrigation, and in such a way as not to interfere with any larger schemes of irrigation as may ultimately be adopted in the neighbourhood. All irrigation drainage and kindred works must be constructed in accordance with plans to be approved by the Public Works Department. Winter pumping for watering crops after the flood has subsided will be permitted so long as no interference is caused to the supplies required for Egypt and the remainder of the Sudan; but, unfortunately, no summer supplies can be guaranteed. This serious drawback will doubtless be removed in due course by the construction of reservoirs on the upper reaches of the Nile.

New Names for Old Streets: Stepney Borough. THE Borough Council are formulating a scheme for re-naming certain streets which will contribute to preserve the memory of some historical personages associated with Stepney parish and the vicinity. Whilst the preliminary researches are not yet concluded we gather that the Council are thus far minded to adopt the following changes of nomenclature: Morgan-street, Com-

mercial-road, St. George's-in-the-East, will under its new style of Hessel-street, commemorate the martial exploits of Phœbe Hessel, who was born in Stepney parish in the year 1713, and died at Brighton on December 12, 1821. She enlisted in the Fifth Foot, now the Northumberland Fusiliers, and was wounded at Fontenoy—as is recorded in her epitaph, transcribed in Brayley's "Topographical Sketches of Brighthelmston." Hugh de Fulbourne, rector of Whitechapel in the earlier half of the XIVth century, will give his name to Thomas-street, Whitechapel-road; Thomas-street, Limehouse, is to be called after Lake, a resident, who served as Secretary of State to King James I.; whilst the memory of an earlier inhabitant of Stepney, *temp.* Edward I., one de Waley, will be revived by the calling of Mary-street, Whitechapel, after him, and York-road, Commercial-road East, under its new style of Haddock-road, will remind us of Sir Henry Haddock, a local celebrity in pristine times. The project we describe moves in the right direction, and is one of many indications that the shade of Bumble which brooded over the vestries and local authorities is gradually being dissipated from our midst. It has, moreover, the merit of practical utility, inasmuch as it tends to reduce the re-duplication of street-names in London—a source of frequent error and confusion.

Sir Francis Chantrey's House in Pimlico. THE block of shops and residential flats to be erected after Messrs. Read and MacDonald's plans and designs will stand on the site of three or four houses each of which is worthy of a passing notice as associated with the careers of Chantrey and his assistants. The ground lies at the corner, north-east, of Buckingham Palace-road and Eccleston-street. Of the houses that have been pulled down, one was occupied by Chantrey from 1814 until his death in 1841. The house was originally Nos. 29 and 30, Lower Belgrave-place, which Chantrey converted into one, and he added a studio, a sculpture gallery, and a foundry for working in bronze. There he carved the busts of Roscoe and Canning, in Liverpool Town Hall; Sir Joseph Banks, in the National Collection; James Watt, at Glasgow; Lady Louisa Russell, at Woburn, and Sir Walter Scott; the statues of Pitt, in Hanover-square; James Watt, in Westminster Abbey; George IV., in Trafalgar-square; and the Duke of Wellington (finished by Weekes), Royal Exchange. In 1831 Soane built the ante-room, lighted by a lantern in the roof, of the sculpture gallery. The house was renumbered as No. 1, Eccleston-street, and again as No. 102, Buckingham Palace-road. Another of the houses, formerly No. 27, Lower Belgrave-place, but latterly No. 98, Buckingham Palace-road, was the home of Allan Cunningham, the poet, whom Chantrey employed during nearly thirty years as his secretary and foreman mason, and to whom he bequeathed 2,000*l.* and an annuity of 100*l.* In the adjoining house lived Henry Weekes, R.A., when Chantrey's principal assistant. After his master's death Weekes completed some of the former's commissioned

works, and removed to Chantrey's house, where he remained until his death in 1877. At No. 98 was born, in 1816, Peter Cunningham, a son of Allan Cunningham, who, on leaving Christ Hospital School, became a clerk in the Audit Office, and compiled the "Handbook of London" (1849-50). No. 13, Eccleston-street, whither Chantrey removed from No. 12, Charles-street, St. James's-square, on his marriage in 1807, has been pulled down.

EXHIBITION OF STUDENTS' WORKS AT SOUTH KENSINGTON.

TWO VERY instructive exhibitions, indicating the standard attained in the official art education of the nation at the present time, are to be seen at South Kensington, and will be open during the month of August.

The national art competitions are located in the Indian section of the Victoria and Albert Museum, and consist of an excellent selection, from important art centres, of works comprising designs in architecture, studies of old buildings, examples of textile fabrics, metal work, faience, enamels, wallpapers, modelling of figures, and designs for posters. In the architectural section a bronze medal is awarded Mr. J. H. Gibbons for some good measured drawings, and the same author obtains a silver medal for drawings of a large painted rood screen, a good design in many respects and well shown in a practical, detailed way. Mr. A. R. Atkinson sends his design for the treatment of a crescent in the streets of a large town, which was submitted at the R.I.B.A. exhibition in January last and received our favourable comment; the author is awarded a bronze medal for this work and a silver medal for a clever design for a covered bridge, a Gothic feature spanning a small river. The effects are perhaps hard and rigid, but the drawings are excellent. Mr. A. R. Richardsou gains a similar award for his design for a "Pavilion in a Public Park." A good design is "A Town Bank," by Mr. S. F. Parsons, which wins a bronze medal. Excellent work is shown in the time studies or examination in design, and the subject, a village club, is admirably treated by several students. The works in the applied arts are numerous and of considerable merit, but space does not permit of detailed reference.

The larger and perhaps more important exhibition, that of the works of students at the Royal College of Art, is to be found in an iron building known as "Block C," situated behind the Natural History Museum. The exhibits are selected from the studies made in the Architectural School, the Design School, the Craft Classes, and the Painting School. It is noticeable that a good training is given to students in architecture, under Professor Beresford Pite, by the thorough manner in which the subjects are worked out. The study of old buildings from actual example forms an important part of the instruction, for we find some scale drawings and great sheets of full-size details of the Mausoleum at Halicarnassos, which represent the work of a group of students to whom special facilities were given by the British Museum authorities. Another subject, an English Renaissance building, the Church of All Hallows, Lombard-street, E.C., now threatened with demolition, has been carefully measured. In this case the students specialising in architecture made the scale drawings of the fabric, while others following applied design have prepared full-size studies of the various carved fittings and other ornaments. Large sheets of mouldings show that Gothic architecture is practically studied in diagram and from actual example.

Coming to designs, the first year students' work cannot be said to rise above average merit. Subjects are set, based upon lectures given on the various styles of architecture. Upon the classic lectures is based the design for a colonnade, in which the student was directed to show the picturesque treatment of repeating symmetrical forms, and much good work in general ideas is to be seen.

Lectures on domed buildings formed the basis of the design for a small domed church in a British colony. Here scale drawings only are given, and the plans do not show any great imagination. In both subjects, however, Mr. E. Healey's work is of considerable merit.

A vaulted country church arises out of the mediæval lectures. In this case a plan was

given, and we should imagine that the heights were fixed; but no design has any country feeling in it, and only one student shows any knowledge of stone vaulting—scarcely a first year subject.

In domestic design, where we should have expected the most promising work, the standard falls considerably. In all cases plans are supplied, but permission is given to vary the arrangement; this, therefore, resolves the design into a problem in elevations, and, to a large extent, eliminates the difficulties of construction. It, moreover, tends to deaden the student's powers of imagination. The results of this process are borne upon the face of the actual work exhibited, for, with slight exception, there is little merit in the designs for a cottage, a country house, a small school, and an almshouse college. The best work is, perhaps, to be found in the designs for a fountain, some of which are excellently drawn to full size. In this subject it is seen that the students receive preliminary art training before entering the Royal College, for the drawing of sculpture and other embellishments is much in advance of that of the architecture.

The work of the second and third year students, while showing greater departure from type, does not mark, generally speaking, any great advance in design. The drawings of a town house are dull, and those of a domed church disappointing. The best work is seen, however, in the decorative treatment of an entrance-hall, staircase, etc., of a mansion. Some of these schemes have well-drawn designs in colour decoration, while others are limited to panelled and other wood fittings only. The work of Messrs. A. E. Martin, George, and H. Morley is excellent. The last-named, as travelling student, exhibits colour sketches and studies made during an Italian tour.

The work of the Design School is seen in a very comprehensive show, the subjects of which are too numerous for reference in this short review. Enough is seen, however, to demonstrate that the school is doing good work in the applied arts under Professor Lethaby.

The most attractive part of the exhibition is the work of the Painting School students, which bears an unmistakable influence of the master, Professor Moira, who directs the studies. Apart from the life subjects there are many decorative works of a very high order. The series of colour treatments of lunettes has produced very interesting designs, the subjects of which are supposed to represent some historical incident from the student's own district. Mr. W. G. Murray's arrangement of the semi-circle is the best in our opinion; the grouping and massing of the colour and the interests, is both satisfying and clever.

The decoration of an intersecting barrel vault, presumably, of a church, is the subject which possesses the greatest merit of the exhibition. The various schemes consist of small-scale coloured models of the vault and full-size cartoons of the chief figures, and it is interesting to note that a large proportion of lady students are represented in the excellent work exhibited; amongst whom Miss Browning, Miss Girard and Miss Pickavance are prominent. The work of the modelling class, under Professor Lantier, which contains gallery and decorative pieces and sculpture, is not the least interesting of a very interesting exhibition, which we can recommend to all our readers as worthy of a visit.

These works illustrate the systems and processes in operation for the study and application of architecture and the allied arts by British students, and the results may be said to be satisfactory, judged from the standpoint of the encouragement of individuality in design.

Other institutions that deal with architectural education—with the exception, we suppose, of the new day school of the Architectural Association—are handicapped by the very slight hold they have over the students working at their classes or for their examinations. Here we have the result of three years' systematised study. A student entering the school is trained immediately to make measured drawings and to think of them as practical working drawings such as a modern workman would require so as to reproduce the subject. A beginning is made with wooden panelling and ornament from English specimens in the Museum, taking examples in historical sequence, and observing the introduction of mitring and moldings upon the framings and the alteration of character in the ornamental forms derived from those employed in other materials, as the arced and shafts

of stonework, when used in woodwork, and so on to larger and more difficult subjects in the museum.

The study of design is enlivened by courses of lectures to each class of students, showing historical illustrations with demonstrations, as well as by visits to buildings of interest, suitable to illustrate the lecture and the subject for design. During their visits the students are instructed in making notes and sketches. Architectural perspective and pen-and-ink drawing are taught and encouraged. A student at the end of a three years' course of study has come into contact with architecture ancient and modern, and has heard discerning criticism and reference to modern requirements and methods of work. He has had a chance of learning to draw intelligently, both for his own pleasure and that he may be able to express his ideas and wishes to a workman on paper. The running accompaniment of lectures and demonstrations have taught him history and the elements of design, so that at the end of a course he is fitted to begin to learn the practice of architecture. How does this compare with the usual form of pupilage in an architect's office? There are shining exceptions, but too often, at the end of three years' pupilage, a young man is practically useless, and is without a foundation on which to place his subsequent enquiries and experience. The day school system has its disadvantages; some of them could be counterbalanced, if it were possible, by so many months' apprenticeship to competent clerks of works on big buildings in the course of erection.

Architectural pupils also have the advantage of excellent tuition in the allied crafts already referred to, a knowledge of which is essential to an architect in practice.

LETTER FROM PARIS.

The Académie des Beaux-Arts has awarded the "Grand Prix de Rome" in sculpture to M. Larrivé, a pupil of M. Barrias. This young sculptor, who obtained a medal of the third class in 1901, exhibited at this year's Salon a bronze group under the title "A la Carrière." The "second grand prix" in sculpture went also to a pupil of M. Barrias, M. Aimé Blaise. In painting, the "grand prix" has not been awarded this year.

While the "Vieux Paris" Committee is working with praiseworthy zeal to preserve the historical remains of the earlier city, certain practically-minded spirits are endeavouring equally to reconcile the modern requirements and future aspirations of the city with respect for its old associations. Hence the formation of the "Nouveau Paris" Committee, which has found even in the ranks of the Municipal Council supporters who are determined to follow out what is called the "transformation rationnelle" of Paris, professing at the same time every regard for matters of historical interest. An independent worker in the same direction is M. Eugène Hénard, who was a valued collaborator of M. Bouvard in the 1900 exhibition, and who has successively devoted himself to the solution of difficult cases in which there was a conflict between utility and sentiment. When the demolition of the fortifications was first talked of, he proposed a plan for a grand boulevard surrounding the whole city on the line of the fortifications. Later on, the question of the preservation of open spaces, so necessary for the hygienic condition of a city, led him to publish a comparison between London and Paris, in the matter of public gardens, which was to the disadvantage of the French capital. Lastly, having considered the means for utilising the Champ de Mars and the Galerie des Machines, M. Hénard has taken up the question of the Palais Royal, a quarter which is losing its old attractions for want of direct communication with the rich and populous quarters of the city. This scheme, which he calls the "nouvelle grande croisée de Paris," is to provide a new central avenue of communication, traversing the Palais Royal but without interfering with its architecture, and leading into the Rue Royale at one end and the Rue Sébastopol at the other end. This avenue, which he proposes to call the "Avenue de Palais Royale," would be intersected at a right angle by an "Avenue de Richelieu" formed by widening the old Rue de Richelieu. M. Hénard, who has studied the scheme very completely, estimates its total cost at about 35 million francs; a large expenditure no doubt, but one which it is considered would be justified by the great advantages to the centre of Paris that

would accrue from the opening up of old quarters which would have a new life infused into them; and the prevalent opinion is that historical considerations ought not to stand in the way of so great a public improvement.

The following is the scheme definitely adopted by the Municipal Council for re-arrangement of the Champ de Mars. At each side, along the Avenue Suffren and the Avenue La Bourdonnais, a space 40 mètres wide will be reserved for a first line of buildings, with shops on each face. Then will come an inner boulevard 25 mètres wide. A second line of buildings 20 mètres wide will follow, but restricted to a height of 15 mètres, and without shops on the side next the Park of the Champ de Mars. The esplanade of the Champ de Mars will be cut from east to west by two broad roads on the axes of the Rue de Grenelle and the Rue St. Dominique respectively, and all the portion between the first of these roads and the river will be laid out in "Jardins Anglais," while the opposite space, down to the Ecole Militaire, will be laid out in "Jardins à la Française," with large spaces reserved as play-grounds. A free space 60 mètres wide will be reserved in front of the Ecole Militaire, so that Gabriel's fine façade will, as before, close the perspective at the end of the Champ de Mars. This scheme of course necessarily implies the demolition of the Galerie des Machines, which however may very probably be rebuilt on some other site, where it will be useful without interfering with architectural effect.

The monument to Pasteur, by Falguière, has recently been inaugurated, but it is to be regretted that it is not in scale with its site, and that in the wide space of the Place de Breteuil, of which it occupies the centre, it seems very much lost, and it will be necessary to give it some kind of border or framework of artificial plantation, in order to give it the requisite emphasis.

The "Quartier de la Cité" will shortly be the scene of some important new works. In the first place, the Pont Notre Dame, which is a danger to the river traffic, is to be pulled down and rebuilt on different lines, at an estimated cost of 1,300,000 francs. Secondly, it is proposed to demolish the Morgue, situated at a point in the Ile de la Cité where it interferes with the view of Notre Dame. The removal of this building will allow of the garden of the Archbishop's palace being prolonged to the river bank, opposite the Ile St. Louis, and thus flowers and trees will take the place of a building of gloomy associations, which could more suitably be rebuilt near the still existing building of the ancient Hôtel Dieu.

Among other contemplated improvements may be mentioned the proposed removal to a site outside the fortifications of the Army Remount Depot, which at present occupies an extensive site between the Parc de Montsouris and the Porte d'Orleans. The Municipal Council has been in negotiation with the War Department to obtain this site for the erection of artisans' dwellings, leaving the central portion as an open square for games and gymnastic exercise.

M. Georges Trugard, a decorative sculptor of great talent, has died at the age of 56. He was a member of the Société des Artistes Français and obtained a gold medal at the 1900 exhibition, and also medals at various exhibitions of the Union Centrale des Arts Décoratifs. Among his more important work may be mentioned the carved decorations of the Eden Theatre, the Théâtre des Arts at Rouen, the Municipal Theatre of Epervy, the Salle des pas Perdus of the Municipal Buildings at Rouen, and the Salle des Fêtes at the Paris Exhibition of 1900.

BRADFORD DISTRICT BATH SCHEME.—The Mayor of Bradford (Alderman David Wade) opened the new baths in Drummond road, Manningham, on the 25th ult. The buildings are situated at the junction of Drummond road and Carlisle road. In the centre is a swimming bath, varying in depth from 3 ft. 5 in. to 6 ft. 6 in., and 60 ft. long by 20 ft. broad. Separate provision of slipper and other baths for males and females is made on each side of the swimming pond, to which there is access from both wings, with arrangements for shutting off each department as required. On the male side there are three slipper baths and fifteen douche, and on the female side two slipper and eleven douche baths. Mr. Booth was the contractor. Mr. F. E. P. Edwards, the City Architect, was architect for the work.

THE ROYAL ARCHÆOLOGICAL
INSTITUTE AT BRISTOL.*

FRIDAY, July 22, was devoted to a visit to Chepstow and Tintern. The party left Bristol at 9.45 a.m., and, on arrival at Chepstow, proceeded on foot to the parish church, which was described by the Vicar, the Rev. E. J. Hensley and Mr. Harold Brakspear. It consists of the nave only, now despoiled of its aisles, of the church of the alien priory of Strigul, which was founded as a cell of the Norman Abbey of Cormeilles soon after the Conquest. The nave, which is six bays long, has arcades of plain and simple character of a date, *circa* 1100, with a low triforium of two coupled arches and a clerestory. Both the aisles and the main span seem to have been intended to have been vaulted. The central tower fell in 1701, and only the base of its north-west pier is left. With its materials an effective new tower was built in the westernmost bay. The present north transept and chancel are modern. There are good tombs with effigies to Henry Herbert, Second Earl of Worcester (*ob.* 1549), and his countess, and to Thomas and Margaret Shipman, 1620. The font is an interesting one of the XVth century, with pierced pinnacled buttresses round the stem.

Chepstow Castle.

The grand remains of Chepstow Castle were next inspected, under the guidance of Mr. W. H. St. John Hope, who pointed out its identity with the "Castellum de Estrigoulet," or Strigul, mentioned in Domesday Book as the work of William (FitzOsbern), Earl of Hereford. The castle of Earl William, Mr. Hope thought, did not include the lower or outer bailey, which was added in the XIIIth century, and the plan and configuration of the ground seemed to point to the former existence of a rocky mound on the platform now called the barbican. Mr. Hope also showed that the so-called keep was really the great hall, and he saw no reason against its being actually the work of Earl William, and, therefore, prior to 1072, when the earl was killed in Normandy. The Count de Lasteysie, while agreeing that the so-called keep was the hall, was unable to assent to the early date claimed for it, and also expressed his inability to follow the reasons for the former existence of the moated mount at the western end. After inspecting the remains of the beautiful hall, etc. in the lower ward, and the great tower known as Martin's, or Bigod's, the party adjourned for luncheon.

Tintern Abbey.

Shortly after 2 p.m., brakes being in readiness, the journey was continued to the well-known ruins of Tintern Abbey, where Mr. Harold Brakspear briefly reviewed the history of the Abbey and the salient features of its architecture and arrangements. He also gave reasons for believing that the first church was a small one with an aisleless nave like the earliest church at Waverley, a theory that had been clearly proved by the discovery only a few days before of the foundations of the south wall of the nave exactly on the line indicated by him. The Abbey buildings are now vested in the Department of Woods and Forests under the charge of Mr. Philip Baylis, Deputy Surveyor of the Forest of Dean, and special efforts are being made to preserve everything as it stands, without loss to its beauty and picturesqueness. At present a tall scaffolding envelops the great east window, the central millium of which is in a critical condition.

The party subsequently returned by special train to Bristol.

In the evening a conversazione was held in the Bristol Museum by invitation of Mr. Francis Fox, President of the Bristol and Gloucestershire Archæological Society. By kind permission of the Lord Mayor the splendid series of swords, maces, and other civic insignia, as well as the valuable plate, was exhibited, and briefly described by Mr. Hope, who called special attention to the three earliest swords as being genuine productions of the XIVth and XVth centuries.

Bath Buildings.

On Saturday, the 23rd, the party left Bristol by the 9.35 a.m. train for Bath. Here a visit was paid first to the Roman baths, where, in the unavoidable absence of Mr. F. Haverfield, the arrangements were described by Mr. Hope, who pointed out the chief differences between this very perfect example of thermal baths and

those of the ordinary type, based on a similar system to the modern Turkish bath, found at Wroxeter, Silchester, and elsewhere. The wonderful collection of carved and moulded architectural remains, which are now being admirably arranged by the authorities in the practically vacant space north of the great bath, excited considerable attention.

The Abbey church was next visited, and described by Mr. C. R. Peers, who briefly reviewed its history from the foundation, and pointed out the leading architectural features. The present church, Mr. Peers showed, was begun by Bishop Oliver King after 1495, and completed sufficiently for the services to be held in it before 1539, and occupied the site of the nave only of the Norman church that preceded it. Some of the bases of this remain under the floor, and have been exposed for examination. At the suppression of the Abbey the church and buildings were sold, but the unfinished shell of the church was subsequently given to the mayor and citizens by Edmund Coulthurst, and in 1572 begun to be repaired and completed by Mr. Peter Chapman. Much was done to finish the building by Bishop Montague, 1608-16, but the actual completion was not effected until some thirty years ago, when the nave and aisles were vaulted by Sir Gilbert Scott.

Charterhouse Remains, Hinton.

After luncheon, carriages were in readiness to convey the party to Hinton, where Mr. Hope pointed out the chief features of the remains of the Charterhouse, one of the nine English houses of this Order. This was originally founded by William Longespée, Earl of Sarum, in 1222, at Hethrop, co. Gloucester, but moved to Hinton in 1227 by his widow, the Countess Ela. The buildings are said to have been completed in 1232, but only two isolated and half-ruined blocks now remain. The one contains the chapter-house, which, as usual, had an altar, with the sacristy and treasury above, now converted into a pigeon-house. The other is a vaulted undercroft, consisting of two chambers—a larger, and a smaller with a fireplace, and perhaps served as the frater and kitchen respectively. The church, which was vaulted, adjoined the chapter-house on the north, and the great cloister, with its circuit of the cells and gardens of the monks, lay to the south. Mr. Hope pointed out that the existing remains belonged to the *domus superior*, or upper house of the monastery, which also possessed, like Witham, a *domus inferior*, or lower house, known as the frary, about half a mile off, on the banks of the Frome, for the accommodation of the lay brothers, who there lived under the superintendence of the *procurator*. Of this nothing is now left. Some remains of the gatehouse of the upper house are incorporated into the modern mansion upon the site.

From Hinton the drive was continued past the fine XVth century hostelry at Norton St. Philips to Farleigh Hungerford, where the chapel of the destroyed castle, or fortified manor-house, was inspected under the direction of Mr. Brakspear, who called attention to the interesting series of Hungerford tombs, and the collection of Commonwealth armour displayed on the walls.

The journey was then resumed to Bradford-on-Avon, which, from its having been visited by the Institute so recently as 1887 from Salisbury, had not been formally included in the programme. So many members, however, expressed a desire to again inspect the place that a halt was made to allow of visits to the Hall, the parish and Saxon churches, and the Barton farm and barn.

The party subsequently returned to Bristol by the 6.41 p.m. train.

Wells Cathedral, etc.

At the evening meeting Mr. Hope read a paper on the architectural history of the cathedral church of Wells, with special reference to the site of the earlier church, and the building of the present structure. From the evidence of the topography of the city, Mr. Hope showed that the earlier building probably crossed in an oblique direction the site of the present cloister, and continued to be represented until late in the XVth century by the "Lady Chapel in the cloister." This perhaps included a portion of the older structure, since it retained its obliquity of axis as compared with the present church. This latter, Mr. Hope contended, could be shown by the recent researches of Canon Church among the Chapter monuments to have been begun on a new site by Bishop

Reginald (1174-91), and slowly carried on during the ensuing episcopate of Bishop Savaric, who may have completed its Lady Chapel. Under Bishop Jocelin, who succeeded in 1206, the building practically stood still on account of his long exile, the interdict, and other causes, and was not continued until 1220, when a huge grant of oak trees by the King "for the making of the limekiln," points to the beginning of some new work on a great scale. This, Mr. Hope believed to be the west front, which was probably completed as high as the roofs at the bishop's death in 1242, as well as most of its magnificent and unrivalled series of statues and sculptures. By the aid of a large plan with movable pieces Mr. Hope also explained the later alterations and additions to the church, as a preliminary to the forthcoming visit of the Institute to the building itself.

On Monday, the 25th, the party went by special train to Wells, and on arrival made its way on foot to the fine parish church of St. Cuthbert. This consists of a XIVth century chancel of four bays, with somewhat later aisles of three bays, north and south transepts of the XIIIth century, a nave and aisles of seven bays, with south porch and an exchequer or treasure-house opposite on the north, north and south chapels west of the transepts, and a western tower; there is also a small vestry north of the chancel. The architectural history was explained by Mr. C. R. Peers, who pointed out the curious manner in which the original XIIIth-century arcades had been taken down and rebuilt stone by stone, in the XVth century, when the pillars were lengthened by a some 7 ft. The church had also undergone a considerable remodelling at the same time, and the stately western tower was then built to take the place of the older one at the crossing. Mr. Peers also called attention to the mutilated reredoses of the Trinity altar in the north transept, and of the Lady Chapel in the south transept. The latter was made by contract by John Stowell, freemason, of Wells, in 1470, and contained an elaborate representation of the Tree of Jesse and Genealogy of Our Lord. Many interesting painted and gilded fragments of the statues, discovered during a restoration of the church in 1843, are stacked away in the aisles.

The cathedral church was next visited under the guidance of Mr. Hope, who pointed out the chief features of interest and the various stages of its architectural history. On the invitation of Sir H. Howorth, the Count de Lasteysie expressed his views upon the building. While agreeing with Mr. Hope that the work had been continuous from east to west, he was inclined to regard the transepts and nave as Bishop Jocelin's work, and the west front and its sculpture as later than his time. Mr. Hope, in reply, pointed out the use throughout the transepts and nave of the square abacus, and the general resemblance of the work to that at Glastonbury, which could be dated to 1184-1189.

After luncheon a visit was paid to the Deanery, which was inspected under the guidance of the Dean, Dr. Jex-Blake. The fine hall of the Archdeacon's house, now the Theological College Library, and the picturesque street of houses forming the Vicars' Close, with its ancient chapel, hall, etc. were next examined, and, after viewing the exterior of the cathedral church and the sculptures of the west front, a halt was made at the Bishop's Palace, the chief features of which were described by the Bishop of Bath and Wells. The party afterwards returned to Bristol by special train. The concluding evening meeting was held at the Palace of the Bishop of Bristol, when the Bishop read a short paper on the history of the See, and votes of thanks were passed to all those who had assisted in carrying out so successfully the Bristol meeting.

Tuesday, the 26th, the concluding day, was devoted to a visit to St. Pierre, Moynes Court, and Mathern, and to Caerwent and Caldicot. At St. Pierre the manor house was first examined, by the kindness of Major and Mrs. Stacey. The buildings are arranged round a courtyard, entered by a good but plain Tudor gateway, but have been much modernised. The adjoining parish church is of early Norman date, with some interesting coffin slabs. A walk across a couple of fields, past the site of a large moated homestead, brought the party to Moynes Court, a picturesque gabled house, built by Francis Godwin, Bishop of Llandaff, in 1609. In front of the house is a pretty enclosed garden, entered by a simple gatehouse of the XIVth century. The walk was continued across to

* Continued from last week.

the fields to Matherm, where the parish church of St. Twedric was first visited, and described by the Rev. W. Davies. The building consists of a XIIIth-century chancel and nave, with north and south aisles, and south porch of late XIVth-century work, and a western tower of the XVth century. The nave and aisles have good wagon roofs. The church is reported to be the burying place of Theoderick, King of Morgannek, commonly called St. Twedric, who was accounted a martyr though his having been slain in a battle against the pagan Saxons at Tintern in 600.

The ancient palace of the Bishops of Llandaff, which adjoins the church, was next inspected by the kindness of the owner, Mr. Tipping, who also lucidly described its history and arrangements. It includes the remains of a courtyard house of the XVth century, with a three-storied tower-porch, but the hall wing has been destroyed, and the house generally altered in late Tudor times. Part of an earlier house of the XIVth century is also preserved, with the remains of the gatehouse by which it was entered. After inspecting the beautiful gardens of the house, the party returned to Chepstow for luncheon.

The afternoon was devoted to a visit to Caerwent, where the abundant traces of the Roman town, now in course of systematic excavation, were inspected under the guidance of Mr. A. T. Martin and Mr. T. Ashby, jun. Special interest was taken in a newly-discovered gateway in the south wall. From Caerwent the journey was resumed to Caldicot Castle, the many interesting features of which were pointed out by its present possessor, Mr. G. W. Cobb.

The party subsequently returned to Bristol, and a most successful meeting was thus brought to a close.

THE SANITARY INSTITUTE CONGRESS.*

SECTION II.—ENGINEERING AND ARCHITECTURE.

The first sitting of this section was held on Wednesday in last week, under the presidency of Prof. Henry Robinson, M.Inst.C.E., who, in the course of his presidential address, said he recognised that the subjects which interested all those who were engaged in advanced sanitary work in engineering and architecture covered a very wide area, and therefore he would confine his remarks to those matters with which he had to deal with in his professional life. In advising as to the expenditure of public money on sewage outfalls there was abundant data now to determine the right system for each place. He was quite confident from his experience that the conditions varied sufficiently to require intelligent and impartial consideration to be given as to which of the several systems or combination of them best met each case, as it was too often the practice to apply an arrangement of works, or a system, to an outfall because it was applied successfully somewhere else, although the conditions varied materially. The want of proper provision for dealing with storm water at outfalls was often a fruitful source of trouble. He had examined several sewage outfalls where the results were unsatisfactory, and had found the failure mainly attributable to the fact that the discharge at the outfall, through defective construction of sewers or otherwise, more than three times the normal dry weather flow, which the Local Government Board required to be dealt with as sewage, prevented whatever system of treatment was in operation from having a chance of success. Waste land of a pervious character, or rough filter beds, if no land was available, should receive discharges due to abnormal rainfall, which should be carefully differentiated from the normal flow of sewage. In any arrangement of sewage disposal works a sedimentation tank is now regarded as useful in order to arrest the suspended inorganic matters in sewage which tend to clog any kind of bed. The neglect to adopt this simple preliminary treatment had caused most of the difficulties in regard to the silting up of bacteria beds. It had been found that fluctuations in the purity of effluents from bacteria beds will occur when the quality and quantity of the fluid applied varies considerably, and this was only what might be expected. New bacteria beds required to be treated at the outset with small quantities of fluid until they have become ripe. Experience had shown that with a given area of land a much larger volume of foul fluid could be bacterially treated by the trickling or sprinkling system than by the contact system. In either

* Continued from last week.

case the selection of suitable material for the beds is all important, and that which is used must be governed by the locality. In determining what standard of purity of effluent should be required the circumstances of each case would have to be dealt with. Perhaps some minimum standard might be fixed, but there should be no question as to the necessity for carrying out remedial works to prevent crude sewage being discharged into rivers and estuaries to cause nuisance. However skilfully outfall works may be designed and carried out, after all the results depended on efficient management, and he felt that some supervision by an official inspector of outfalls would be an advantage. The question of the better conservation of the rainfall of the country was one of national concern, and yet it had not received the attention it required on the part of the Government. What was imperatively required was an authority having control over the whole of a watershed area and responsible to a State department. The Royal Commission on Sewage had indicated the desirability of forming river boards, and the President of the Local Government Board had raised the hope that he would bring before Parliament a Bill to deal with these matters. He thought a Royal Commission would facilitate matters by bringing into definite shape the lines which legislation shall follow.

The Chairman touched on the heavy rainfall of last year, one good result of which was that by preventing dust blowing about, and by cleansing the drains, sewers, and surroundings of houses, there was a reduction in the death-rate. The adoption of wood-paving and asphalt in the main thoroughfares, although attended with less noise, required, especially during dry weather, systematic cleansing with hose and water, and good scavenging. As bearing upon road sanitation the present method of preparing the surface of main roads left much to be desired, for the constant patching of the very uneven surfaces was serious. He was hopeful that in the near future the main roads would be covered in a way that would be smooth, durable, and as noiseless as any existing arrangement, and he had under observation forms of construction which warranted him taking that view. In conclusion he welcomed those attending the section, and expressed the earnest hope that the outcome of their deliberations would tend to advance the great object the Institute had in view in promoting sanitary knowledge.

Control of Water Supplies.

On behalf of Mr. J. R. Kaye, Dr. Johnstone gave the chief points of a paper on "The Supervisory Control of Water Supplies." The author pointed out that the legal duty of providing a water supply usually rests absolutely on the individual sanitary authorities, of which there are no less than 1,800 in England and Wales. Obviously a very large proportion of these authorities must look beyond their own area for the source of supply, and thus it had come about that in many parts of the country there has occurred something like a scramble for the best available supplies. There was now a wide and growing feeling that some form of supervisory control is absolutely necessary to apply to all future schemes if not to many of those already carried out. The author dealt with the many remedies which had been suggested, and said that whatever class of supervising authorities is created they must possess or be able to acquire complete and detailed local knowledge of the area under control, so as to be able carefully to weigh the interests of all parties concerned in the protection and allocation of the water supplies in that area; not merely taking cognisance of the contending authorities, but duly appreciating the rights of silent parties, and even giving a thought to those of the non-existent communities which the future may see. The supervising authorities must be large enough to take a broad and complete view of the situation, yet not too large to undertake the co-ordinating and supervising of the actual local or parochial control which is so badly-needed, especially in some of the following directions:—

1. To supervise the collection, storage, and distribution of water supplies, with power to inspect all works. To direct measures for the better husbanding of supplies where necessary, and to promote economy by suitable combination of districts. To see that there are no unauthorised departures from schemes as approved.

To frame regulations for the protection of gathering grounds, and to enforce the exclusion of particular supplies where necessary. To approve of emergency measures in the case of scarcity or unforeseen eventualities.

2. To establish and carry on a regular system of comparative examination (physical, chemical and bacteriological) of all the public water supplies in their area, and thus gradually build up standards for each supply. Experience has shown, over and over again, that the significance of analytical data is relative and not absolute; that is to say, the early detection of slight mischief can best be made by comparison with previous regular records of the same supply.

3. To supervise all means for the corrective treatment of each supply, e.g., storage, filtration, softening processes, chemical treatment for the prevention of plumbo-solvent action, etc. As things are at present these processes usually give excellent results when first established, but changes in staff or personnel of the water authority often induces corresponding changes in the efficiency of the treatment—or considerations of finance and local politics bring about laxity and irregularities of which the consumers of the water remain in blissful ignorance. The recent report of the Local Government Board on lead poisoning has clearly shown that this single phase of the supervision of water supplies is an urgent matter of no little magnitude, affecting both old and new supplies in many parts of the country, and having no connexion whatever with the function of a Rivers Board.

4. To keep a watchful eye on the health statistics of the various communities within the area, with a view to studying the influences of the water supplies upon health at all seasons. To investigate any disturbances observed, and apply remedies.

5. To group together areas for the purpose of distribution, and to secure water for them on equitable terms, and generally to represent their interests in obtaining adequate and permanent supplies, and preventing the depletion of their natural sources by outside districts.

6. To regulate, supervise, and enforce where necessary the supply and use of water for other than domestic purposes in the interests of the public health, e.g., sewer flushing, road-watering, etc.

Dr. Barwise expressed the opinion that it was thoroughly absurd to suggest that Rivers Boards should be the supervising authorities over water supplies.

The Chairman moved, "That this meeting is of opinion that the whole question of water supplies demands investigation by a Royal Commission appointed specially to deal with the subject, and that representation be made to the Government accordingly."

The resolution was carried.

Domestic Sanitary Engineering.

Mr. Gilbert Thomson, M.A., Assoc. M.Inst.C.E., read a paper on "Domestic Sanitary Engineering in the West of Scotland." He referred to the unsatisfactory state of affairs when in 1883 he read a paper on "House Sanitation in and Around Glasgow," and said a vast change for the better had come about since then. The present position might be briefly described by saying that the standard arrangement of to-day is in its essentials very similar to the most advanced work of twenty-one years ago as regards design; that a first-class system of house drainage is now made of iron almost throughout; that the old notion of substantial and comfortable-looking woodwork has given place to the new one of impervious and non-absorbent construction; and that everything must now be done to the satisfaction of the sanitary inspector. In every new house, be it mansion, cottage, or tenement, and in every old one where suspicious circumstances have emerged, the drainage system is as a matter of course tested by smoke by the Sanitary Department. The question then arose whether the present methods are the best for securing good results now and satisfactory progress in the future, and his opinion was that they were not. The present standards of design, construction, and testing for the great majority of houses were simply those of the various building regulations. These regulations dated ten or twelve years back. Internal evidence suggested that their framers tried to ensure sound work and hoped they would get it, but had considerable doubts about it, and at that time probably their doubts were justified. Their tradesmen, however, had risen to the occasion and they

now found no difficulty in getting work far better than could then be generally anticipated. On the other hand, the ordinary run of work could only just pass muster, and this was not because of any great economy thereby effected, but because their regulations and methods of inspection did not give any inducement to do better. He was satisfied that it would be possible to bring all work up to the standard which was now regularly attained in high-class work. He thought they should get rid of the grotesque notion that two classes of sewage, having their origin in the same apartment and their termination in the same drain, must travel by different routes. Any such change depended on the possibility of ensuring tightness, and that for all practical purposes could be attained by the simple means of effective testing. The author dealt with the smoke and water tests, and advocated the air test as being a simple and convenient means whereby it could be proved in a few minutes whether or not a drainage system was tight.

A vote of thanks was passed to the author of the paper.

Sanitary Fittings.

Mr. John Shanks, in the course of a paper on "Sanitary Fittings," said he would confine himself to those connected with the most economical and commonsense method of disposing of sewage—the water carriage system. In an ideal building all fittings and drains should be designed and arranged so that waste matter of every kind may be carried outside as quickly as possible, and the necessary rooms and appliances should be so placed against outer walls that they may receive the maximum amount of light and air. The following general laws should always be conformed to:—1. The material used should be impervious, and, wherever possible, pipes should be left uncovered. 2. The general construction should be such that the accumulation of dirt can everywhere be easily prevented. 3. The supply arrangements (traps, etc.) should be such as to do their work as quickly as possible. 4. Bath and lavatory discharge, overflow, and waste pipes, as well as traps and pipes leading therefrom, should always be from 1½ in. to 2½ in. diameter, i.e., should be large enough to carry off the water with all supply pipes running full bore. The overflow pipes should be readily accessible and movable, so that they can be taken out for cleaning. The traps should be so placed that they can be easily fitted, removed, or examined; they should, wherever necessary, have large and properly contrived ventilating pipes (this prevents its siphonage or noisy discharge); and they should be self-cleansing. The best material for their construction is cast brass, or cast-iron enamelled, which does not give way under the action of hot water and soap as lead does. The best material for supply and waste pipes is copper, or brass nickel-plated.

Drainage of a House.

Mr. Samuel Smith submitted a paper on "The Drainage of a House." The author stated that it was not intended in the paper to discuss the method of drainage but rather to consider the relative merits of cast-iron and earthenware pipes when used for underground drainage. Through inferior qualities of earthenware pipes being used, the results thereby being unsatisfactory, cast-iron pipes, in a great many cases, are now substituted for them. So long as cast-iron pipes can be kept free from corrosion they may be regarded as being satisfactory for drainage purposes. Corrosion, however, soon sets in, with the result that the velocity of flow of the sewage matter in the pipes is seriously impeded, and the efficiency of the drain is lost. Details were given by the author of a number of tests made on various preservatives of cast-iron pipes by a weak solution of sulphuric acid, in every case the preservative being affected. It might be argued that a system of house drainage was not required to stand the action of acids, and that those tests were no guide to the suitability of cast-iron pipes connected with one of the preparations mentioned for the carrying away of soil and waste from dwelling-houses. He held, however, that a drain should be able to stand the action of any kind of liquid which might be poured into it. No objection on the point could be made against fireclay pipes of first quality. Details of tests made on fireclay pipes were next given, from which the author adduced the following conclusions:—(1) That a 6-in. layer of concrete round a pipe made the pipe sufficiently

air-tight. (2) The liability to fracture through unequal settlement of the ground on which they are laid may be overcome by the laying of a bed or layer of concrete underneath the pipes. He recommended that with regard to the joints nothing but a slow-setting cement, thoroughly cooled and aerated, be used, and that it should be well staved into the joints so that all the air in the cement be forced out and a thoroughly air and water joint would be the result. With regard to cost, also, there was considerable economy in the use of fireclay pipes. In conclusion, he suggested that fireclay pipe-makers should test their pipes to say 60 lb. of hydraulic pressure, and sell their pipes with a guarantee that they will stand that test. If this were done the users of pipes, in the knowledge that they were getting a satisfactory article, would readily pay an additional 10 per cent. on the cost of them, and the result would be more satisfactory to all parties concerned. Improvements have been made in recent years on fireclay pipes, and further improvements could and would be made if makers saw that it was to their advantage to do so, through there being a demand for a superior article.

Defects in House Drains.

Mr. J. W. Pearson, C.E., dealing with the subject of "A Few Common Defects in House Drains," said defects dealt with in the paper were chiefly those arising from the adoption of manholes with open channels, and the use of earthenware pipes. The best manholes of this description could not, without elaborate precautions and great expense, be made to remain air-tight, and in any case their walls, bottoms, and channels become foul; they interfere with the effective ventilation of any system of drains upon which they are used; when deep they are huge receptacles for foul air, which is not removed by the ordinary drain ventilators; they are often the cause of stoppages; and where metal access covers are used at all, these are often so fixed, or in such a condition through neglect, as to form a ready outlet for the foul air contained. Although they may look very well and very convincing when new, they never satisfactorily stand the test of time. The advantage to be derived from a perfect drain is at once annulled by the existence of a manhole which in a short time becomes defective and allows foul air to escape, perhaps under a window or floor ventilator, or it may be direct into the house itself. By using closed access bends or junction pieces instead of open channel inverts in all manholes, not only is the volume of foul air greatly reduced but it is confined to the pipes, and the manholes become what they really ought to be, viz., a means of access to, but not an actual part of, the drains; and this without adding to their cost. Earthenware pipes which are wholly unfit for the purpose are often used, but even when they are, of their kind, satisfactory, many defects crop up in laying them, any ordinary labourer being considered fully qualified to carry out this part of the work. They are also liable to injury when filling in or beating down the trenches, and any slight settlement of a wall or building is sufficient to break the pipes or the joints, and even the natural consolidation of the trenches may do so. The great number of the joints adds to this risk, and it is seldom that one tests an earthenware system of house drains that has been down for a few years without revealing defects more or less serious. By the adoption of iron piping the majority of the defects common to earthenware become at least very improbable, but where the drains are of iron, all connected traps, etc., should be of iron also; a connexion between an earthenware gully and an iron pipe is seldom a satisfactory one. Glass enamel, though providing a very smooth interior surface to an iron pipe, is not always a safe preservative, as it is not proof against the action of acids, and as the latter are likely to be present in the sewage it should be avoided. Iron pipes should, however, always be treated with Smith's solution. In several towns earthenware drains are not allowed to be laid under any building, but if this were carried further, and neither open channel manholes nor drains of other than iron piping permitted within a certain defined distance of any house wall, most of the defects now met with would soon become things of the past.

In the course of a short discussion on the three foregoing papers, Dr. Scourfield (Sheffield) urged the necessity of a second test. This was put into the specification for work for the Manchester Corporation. By the second test

it was discovered if the trenches had been carefully laid and whether the pipes were resting on their sockets. It also showed whether the cement used was good cement.

Mr. W. Parry said he had had twenty years' experience with fire-clay pipes, and he found that if they gave a second water test, and if the work was finished properly and no disturbance took place afterwards by building operations, it was perfectly easy to construct a fire-clay drain which would remain perfectly water-tight.

Mr. Saxon Snell thought that one way out of the difficulty was to require that a better class of labour should be employed. When iron pipes were laid the joint was made by a plumber who was a skilled man, but it was rarely that a builder employed anyone but a labourer to lay earthenware pipes. Another difficulty in laying earthenware drains was that of foundation. If they had a bad foundation it stood to reason that they could only lay iron pipes.

Mr. Smith, in reply, said his contention was that a drain should be laid so as to take any kind of sewage—not only domestic sewage, but any kind of liquid. If a man wanted to make chemical experiments at home his drains ought to be capable of carrying away his chemicals.

Mr. A. G. Wallis agreed that the second test was a good point. The only objection to cast-iron pipes was that they corroded outside, but if the trouble was taken to put gravel round them they would be saved from corrosion.

Distribution of Sewage on Filters.

A joint paper by Dr. Geo. Reid and Mr. J. E. Willcox, Assoc. M. Inst. C.E., followed, on "The Importance of Uniform Distribution of Sewage on Filters."

Mr. J. E. Willcox described the experiments recently undertaken by his firm in connexion with Dr. Geo. Reid, the County Medical Officer of Health for Staffordshire, which are the first in which power-driven distributors had been used. The experiments were carried out at Hanley, where there was a population of 62,000, and were on a large scale, dealing with 500,000 gallons per day. Dr. Reid did all the analytical work in connexion therewith. The installation for the purpose of the experiments consisted of a small detritus chamber and an open septic tank of 500,000 gallons capacity, together with two large filters having a total area of half an acre. The travelling distributor consists of a carriage with wheels running on rails fixed on each side of the central trough and supporting a pipe in the form of a siphon, with trapped outlet, by means of which the sewage is drained over the side of the troughs into the distributing pipes. The apparatus travels backwards and forwards the whole length of the filter, and by means of a simple automatic valve arrangement each side is fed alternately to insure equal intervals of time between each discharge on to the bed. The power required for the quarter-acre filter is only 1.08 horsepower, and the actual cost of driving the distributor, including labour, is 2s. 6d. per day of twenty-four hours, the quantity of sewage dealt with during that period being 250,000 gallons. The experiments had been carried on continuously by night and day, with occasional stoppages for slight repairs, for a period of fifteen months; the volume of sewage dealt with was 100 gallons per super yard, which was gradually increased to 230 gallons, and it is intended to still further accelerate the flow. The intervals of time have been varied from four minutes to seven minutes, the best results from a given volume being obtained with the longer interval. The neighbourhood of the sewage works is thickly populated, but no nuisance has arisen from them. It should, however, be mentioned that the sewage is discharged only a few inches above the bed. No difficulty was experienced by reason of frosts during the cold weather last winter, including four nights when no less than sixteen degrees of frost was registered. The results of the experiments have been so satisfactory that the author's firm has been instructed to carry out a complete scheme for dealing with the sewage of the borough on the same lines, it being intended to adopt rectangular beds, and eighteen power-driven travelling distributors, each controlling half an acre filter-bed, and capable of dealing with some 12,000,000 gallons per day.

Dr. Geo. Reid said it was now pretty generally admitted by those who have been actively at work in endeavouring to solve the sewage disposal difficulty by artificial biological methods, that "filtration" is to be preferred

to "contact" as a means of effecting the final process of oxidation. In advising the Hanley Corporation to construct the experimental works they had three chief objects in view, viz., to determine (1) whether the sewage in question could be disposed of by treatment in resolving tanks, followed by simple filtration; (2) the area and depth of filter necessary in view of the highly efficient means of distribution provided; and (3) the size of filter particles which would give the best results. They had a pretty firm conviction that with perfect distribution single filtration through a depth of filter of about 4 ft. 6 in. would answer the purpose, and that this conviction was justified had been demonstrated by the results of about eighteen months' working. In the case of the circular filter a constant and regular flow of 200 gallons per superficial yard was maintained, while in the rectangular distributor, owing to a defect, the mean flow was 162 gallons. Each yard of filter received its quantum of sewage at seven minutes interval, as recommended by Mr. Scott-Moncrieff. The author gave the analyses of sewage and effluents dealt with, and said the conclusion to be drawn was that in every case the degree of purification which had been effected was excellent.

Dr. Fowler (Manchester) protested against Dr. Reid's sweeping assertion that filtration was to be preferred to contact. Seeing that more sewage was purified in England by the latter process the assertion would not stand. He noticed that the cost of the Hanley system was fairly large, being about 10s. 6d. per million gallons. If they could build and work contact beds at about 3s. 6d. per million gallons, it hardly seemed to him that it could be said that filtration was to be preferred to contact.

Professor Kenwood said that no doubt, as far as Hanley was concerned, the results were very good, but they had had to unlearn so much that they must not hold too dogmatic views with reference to the treatment of sewage. He did not doubt that everything else being equal, sprinklers were better than contact beds. If they had purely domestic sewage rather weak, and had sufficient tankage to enable the solid matter to be dealt with efficiently, then no doubt the sprinkling bed was the thing to use; but, on the other hand, he had known cases where, owing to insufficient tankage accommodation, the sprinkling apparatus had to be discontinued on account of the smell, which became a nuisance.

Dr. Barwise said if they had sprinklers they must have a sufficient capacity of septic tank, but by having this they served a large area of other water-tight tankage in the contact-beds.

Mr. Martin (London) said that, in his own experience, he had produced results by single contact which were sufficiently good for the generality of purposes.

Mr. Willeox, replying to various points raised in the discussion, said the greater part of the Hanley district was separately treated. Mr. Martin had raised the important question of cost, and the reason for omitting the cost of the circular distributor was that the whole thing was an experiment. In actual experience, for instance, they found that a 34-h.-p. engine was sufficient, whereas they had installed a 6-h.-p. engine. These and other matters made it an unfair thing to give the actual cost. Now the whole thing was carried on one outside rail, but in a new distributor they would put a centre and reduce the weight, and so be able to work at less horse-power and consequently reduce the cost. The same remarks applied to the rectangular filter. Notwithstanding, he did not consider that 10s. a million gallons was an excessive cost, considering that they got a uniformity of distribution and the absolute control which was required for the purpose of the experiment. A question was asked whether, in the event of the distributor passing more slowly over the beds, the suspended matter came away, and he could answer in the affirmative to that. The whole object of the experiment, however, was to get absolute uniformity, both as to volume and time.

Dr. Reid also replied, and said that if the mechanical distributor did cost more money to provide and work, yet, if they could show that, by reason of the more perfect methods of distribution, they could save a large area of filter and a considerable depth of filter, the matter of cost became a secondary matter. It simply became a question of laying out a little more capital expenditure.

This concluded the sitting of the section on Wednesday.

Portland Cement.

At the sitting of the Section on Thursday, Mr. E. R. Matthews opened the proceedings with a paper on "Portland Cement; the Need of a Standard Test." The author pointed out that never was there a time when cement was used so extensively as now, and it was most necessary that it should pass a standard test. At present the matter rests entirely with the engineer or architect, and what one considers a fairly stringent test another considers miserably weak. He pointed out the fallacy of the old idea of considering that cement that went over 450 lbs. on the sq. in. was over-lined, and therefore not satisfactory. He urged that a 28-days' test, as well as a 7-days' test, are necessary in order to determine the regular increase of strength with age, the latter taken alone (as is the usual custom), he maintained, is not a test at all; it is a complete fallacy to suppose that it is, and he most strongly recommended, as the most reliable test, a sand and cement test. Further, he maintained that a compression test is absolutely necessary, although seldom adopted, and pointed out how such a test may be made.

The Chairman said the paper was hardly one for discussion, as they were all agreed with the necessity of having a standard for cement.

Factory and Workshop Ventilation.

Mr. H. M. Robinson followed with a paper on "Ventilation in Factories and Workshops." He referred to the necessity for thorough ventilation, and said that natural ventilation depended so much upon the construction of the room and the condition and temperature of the air outside that it was impossible to lay down rules on the subject. Natural ventilation might be obtained by openings in the chimney near the ceiling or by shafts through the roof or outside walls. In the lower rooms of buildings of more than one story these shafts should be carried up through the roof if possible, or at least some little way up the outside walls. In sheds, or buildings of one story only, louvre openings in the roof afford a good means of ventilation. Whatever method was adopted, however, it was necessary that the position and size of the openings should be determined by a competent person, and that there should be an ample supply of them. It would probably be found advantageous, speaking roughly, to provide one medium-sized outlet for every five or six persons in the room. The author next dealt with artificial ventilation by means of fans. Satisfactory results could only be obtained, whether the natural or artificial system of ventilation be adopted, if both the inlets and the outlets for the air were of sufficient size and properly placed in each particular instance.

Mr. G. Thomson said the question had a public point of view with reference to the extraction of dust, etc. While it might be satisfactory to the owner to get rid of the dust by discharging it into the air, it might be a nuisance to those around.

Mr. Robinson said his suggestion was that in the room there should be a settling chamber, into which injurious dust could be blown by the fan.

School Ventilation.

Dr. A. Greenwood gave the results of his investigations into the sanitary conditions of 52 public elementary schools at Blackburn. He summarised his conclusions as follows: (1) Natural ventilation is easy to manage, subject to certain conditions, which I have named, and will be more efficient if the fullest advantage is taken of this means. (2) In some schools provided with mechanical ventilation frequent reliance is placed upon natural ventilation. (3) There is a diversity of opinion as to the value of the known systems of mechanical ventilation, and there is a need for further inquiry upon this subject.

Mr. W. Key (Glasgow) said he thought the proper thing would be mechanically to change the air by an apparatus absolutely independent of the vicissitudes of the weather. He advocated the system of plenum ventilation. He thought it was most important that the dust should be removed and that could only be done by the plenum system, which would carry away the emanations. He found from the discussion in technical journals that architects and others were quite able to criticise plans for an infirmary or hospital but did not themselves understand what the word plenum meant, and consequently the public had an idea that plenum ventilation was to be avoided,

Dr. Greenwood said he could not agree with Mr. Key, and could not recommend that mechanical ventilation should be applied wholesale so far as the Blackburn schools were concerned. He found in the two mechanically-ventilated schools they had at Blackburn the results were no better than those obtained in naturally ventilated schools.

Housing and the Public Health Acts.

Mr. G. D. Armstrong read a paper on "The Past, Present, and Future Conditions of Housing Under the Public Health Acts," in the course of which he referred to the evils arising from the loose manner in which the regulations and by-laws were carried out in many cases. The greatest part of the dwellings of the working-classes had been built by speculative and sometimes, perhaps often, jerry builders, whose ideas of sanitary and permanently healthy dwellings did not enter into the case of profits. He did not condemn on the whole the speculative builder—he had been a most important factor in helping to decrease the troubles of overcrowding. The first and one of the most important data bearing on the housing question was the legal definition of overcrowding. He suggested a minimum of 400 cub. ft. per adult for all rooms. All associated houses, and all houses let in lodgings, for the working classes should be registered if required by the medical officer. Dealing with Parts I, II, and III. of the Housing of the Working Classes Act, the author advocated what he described as the "localisation" of land outside the town by the local authority. This was the purchase of land not ripe for building, which could either be held in trust for the ratepayers or immediately developed. Rapid and cheap transit must accompany localisation schemes. Most municipal work cost 20 per cent. more than ordinary building, owing to the many useless restrictions which should be abolished.

Councillor Burgess (Glasgow) said in Glasgow they had 104,000 people living in one-apartment houses, with a diversity of 34 persons per room. He contended that a local authority ought not to encourage and perpetuate one-apartment houses.

Dr. Honeyman (Glasgow) submitted that the great thing in the housing of the poor was to have cheap dwelling places. The death-rate was not due to the smallness of the houses but to the way the houses were occupied.

Dr. Sykes (London) criticised the idea of localising land in the way suggested, because if it was held it might become totally unsuitable for housing purposes. Of course, it might be said that the Corporation could sell the land, but that opened the path to municipal trading in land, and he did not think Parliament would allow that. He agreed that it was quite unnecessary to enforce the expensive construction required by the by-laws, and hoped they would be altered. They did not want to build houses to last 100 years, but they wanted cheap houses.

Mr. Munce (Belfast) said the question was not understood either in England or Scotland. They must build houses that a man could afford to live in. Local authorities, instead of selling land altogether, ought to let it for building purposes, and the houses should be built from the point of view of working people and not from the point of view of millionaires.

Mr. Campbell (London) remarked that the financial question was the crux of the whole matter, and they ought not to be compelled to pay the loan back in too short a time.

After further discussion, Dr. Sykes moved: "This Section recommends the Council of the Sanitary Institute to represent to the Local Government Boards of England and Scotland that the definition of overcrowding as 400 cub. ft. per adult person, and half the amount per child, in sleeping rooms is required in the interests of public health."

Mr. Armstrong seconded the resolution, and it was carried.

Cottages for Agricultural Labourers.

Miss Churton read a paper, prepared by Miss Constance Cochrane, on "Cottages for Agricultural Labourers." The writer held that the labourer's cottage should not be built with less than three bedrooms, as the two-bedroom cottage already furnishes by far the larger proportion of the existing supply, and is the unavoidable cause both of overcrowding, and of the herding together in the same room of persons of both sexes and of all ages. The two principal bedrooms should contain not less than 1,000 ft. of cubic capacity each; 300 cub. ft. of space

being the minimum health allowance for an adult or child over ten, and 150 for children under ten. There should also be a fireplace in at least one bedroom. There appears no sufficient reason why stairs should be inclosed between walls, instead of rising out of the kitchen or scullery. Two living-rooms are better than one, but one large room is very preferable to two small ones, and the scullery should be of a size which would make it impossible for the family to live in it. All the windows in the house, including one in the pantry, should be made to open, and should extend to the ceiling. The material used in building is less important, provided the soil is dry, the foundations good, and the walls rainproof, and with damp courses. And it would be well to encourage building with whatever material can be produced most cheaply in the neighbourhood; as is done, for instance, at Winterslow, near Salisbury, where a good detached cottage with three bedrooms can be built for 115*l.* out of the chalk of the country.

The Construction of Hospitals.

Mr. Alex. Cullen, F.R.I.B.A., then read a paper on "The Construction of Hospitals." The author said that he proposed to deal particularly with hospitals for the reception and treatment of cases of infectious disease, yet his remarks would, in a number of details, apply to hospitals of all kinds.

Proceeding, he said:—"Suppose, then, the sanitary authorities of a town of about 100,000 of a population have, after considerable pressure by the Local Government Board, resolved on the erection of a hospital for the treatment of cases of an infectious nature. The next question that comes to be considered is the number of beds for which provision should be made. It is customary to provide one bed for every thousand inhabitants within the area that the particular hospital has to serve. While this may be sufficient under ordinary circumstances, it is always well to provide accommodation on an ample scale. In order, therefore, to meet emergencies in times of exceptional epidemics, which are observed to occur at intervals of three, four, or five years, accommodation should be provided to the extent of three beds for every 2,000 of the population. In this particular case we shall assume that the hospital is to be planned on the higher standard and to accommodate 150 patients.

In the site of a modern hospital for infectious diseases an area of one acre for every twenty beds is considered sufficient, but in the present instance we are dealing with a model town council, and they have the wisdom to foresee the possibilities of a future extension of the buildings, and decide on acquiring ten acres of land. This question of site is a very important one, and it is well that the medical officer should be consulted on the matter, who in all likelihood will direct his attention to its physical conditions, such as aspect, prospect, and inquire into the nature and extent of the sickness and the rate of mortality in the particular district. After satisfying himself on these points, the medical officer recommends a site. It is situated in the open country yet convenient to the district the hospital has to serve, so that patients have to be driven only a short distance. The ground slopes gently towards the south, and it is well sheltered by trees, both on the north and on the east sides. The soil is of a dry loamy nature, and is well under drained. The water level in the subsoil is fairly deep and permanent, and there are no objectionable conditions near that might lead to the pollution of the soil. There is an abundant supply of water for the needs of the hospital, and a good drainage outlet can be obtained. The cost to the land will depend to a considerable extent on the situation, but supposing there are exceptional circumstances to be taken into account a fair value would be from 250*l.* to 350*l.* per acre.

The site having been fixed on, the next matter that comes under consideration is the nature and number of the diseases to be treated. On this question the medical officer will be guided by the statistics of the infectious diseases prevalent in the district more especially during epidemics. His experience also in the practical working of a hospital will indicate the extent of the administrative offices necessary for the effective management.

"Suppose, then, the following programme of classification with explanatory notes has been prepared:—Scarlet fever, 100 beds; enteric fever, 20 beds; diphtheria, 12 beds; measles,

10 beds; typhus fever, 8 beds. Total, 150 beds.

"The accommodation for cases of scarlet fever to consist of two observation or probationary wards of two beds each. In these wards will be received cases considered to be scarlet fever, but in which the diagnosis was doubtful. Here such cases will be detained until the nature of the illness has declared itself. The ordinary pavilions to provide for 72 beds divided into wards of 12 beds for females and young children and wards of six beds for male adults. Attached to each ward there is to be a one-bed ward intended for special cases or for private patients.

"*Isolation Block.*—Of two wards of four beds each for the isolation of cases of double infection, such as scarlet fever with diphtheria, scarlet fever with whooping cough, or scarlet fever with measles.

"*Discharge Block.*—Divided into two wards of four beds each. To this block would be sent the patients believed to be free from infection. Here they would receive special bathing, and be under careful observation for a few days prior to their discharge. These precautions are intended to avoid 'return cases'—that is, cases which occasionally occur in the households to which patients have returned from the hospital.

"*Enteric Fever.*—The accommodation for enteric fever patients to consist of two wards, one for twelve beds the other for six beds, and attached to each a one-bed separation ward.

"*Diphtheria.*—A block consisting of a general ward for eight beds, and four single-bed wards, besides a small room, well lighted from the roof, where operations may be conducted. In the one-bed wards are to be special steam connections to provide a moist atmosphere for critical cases.

"*Measles.*—A block having a six and a four-bed ward intended for the isolation of cases occurring under circumstances involving special risk of the spread of the disease.

"*Typhus Fever.*—A block divided into two wards of four beds each. Although cases of typhus fever are not of frequent occurrence, still it is better to provide for an emergency. This block when not in use for its special purpose would be available as convalescent wards for enteric fever patients when that disease is prevalent.

"*Administrative Block.*—This building should be located about the centre of the group, and convenient to the entrance gate, so that anyone calling on business, or vans delivering stores, would not go near the wards where patients are being treated. Accommodation should be provided sufficient to cope with any emergency that may arise, and the possibility of a future extension should be kept in view. In a hospital for 150 patients there will likely be a staff consisting of a medical superintendent and an assistant, a matron, thirty-nine nurses, fifteen female servants, such as ward-maids, laundry-maids, kitchen servants, and housemaids; besides four male attendants. The ground-floor on one side of the block should be devoted to the medical officer, and the other side to the matron and nurses. On the first floor should be the sleeping accommodation for the matron and nurses, each nurse to have a separate room about 12 ft. by 9 ft. Ample bathrooms and lavatories should also be provided. Special precautions to be taken to have the rooms for the night nurses in an undisturbed wing of the building. The female servants to have their sleeping apartments on the second floor, but entered by a separate stair from that to the nurses' quarters. In the rear would be the kitchen department. The kitchen should be a large apartment well lighted from the roof and thoroughly ventilated. Attached to the kitchen are to be a wash-up scullery, a vegetable scullery, and a service room with a recess for food trolleys; besides the necessary stores and larders. The milk store should have an intervening lobby for sealing milk pans.

"*Laundry.*—The laundry to be removed as far as possible from the infected buildings with which it should have no connexion by covered ways. This block may with advantage be divided into two sections, one for male and the other for female labour. In the first section will be placed, perhaps in the basement, the steam boilers, coal store, fire pumps, engine room, workshop, destructor for destroying the hospital garbage, and a steam disinfecter sufficiently large to receive bedding or other large articles. In the second section would be the wash-house and ironing room. The ironing may be common to the clothes of the staff and

the patients, but there should be separate wash-houses for the soiled linen of the staff. The receiving and discharge rooms should also be separate. The drying chamber would be convenient if placed between the wash-house and ironing room, the hot air being driven into this chamber by a fan; and a fan will also be required for extracting the steam from the wash-house. As a laundry is the place in a hospital where infected articles are gathered, special precautions should be taken. The soiled articles from the wards should be placed in steeping tanks, and the tanks classified for the different diseases.

"*Entrance Lodge.*—This building to be placed near the entrance gate where the head male servant would reside, and his wife act as gate-keeper. Attached to the gate lodge there is to be a waiting room for friends of patients. The accommodation for the male servants to be on the upper floor of the lodge, but entered by a separate entrance. Between the entrance gate and the wards there should be a waiting room for ambulance nurses, and fitted up with a hot plate and shelves for blankets.

"*Mortuary.*—This building to consist of a mortuary and post-mortem room, a small laboratory, and a room for friends to view the body; the body, instead of being placed on a slab in the usual manner, will be laid on a bed, and the bed can be wheeled into the viewing room.

"In the compiling of the programme I assume that the medical officer has been associated with the architect, and the architect will be wise if he continues this association until the general principles of the scheme are fully matured; after which the medical officer will be wise to leave the carrying out of the details to the practical architect. The architect in preparing the plans keeps closely to the programme of classification, and connected therewith the first point to receive this attention is the ward; for the form of a ward governs to a considerable extent the planning of a hospital. It may be taken as an axiom that where land space permits the wards are better if contained only on one floor; the pavilions are, therefore, planned one story in height. The distribution of the several buildings on the site is a matter of the utmost importance, in order that each ward may obtain the fullest amount of sunshine. The longitudinal axes of the several blocks are, therefore, placed north and south on the site, or, perhaps, a few degrees east of south and west of north. By this arrangement sunshine on three sides of the wards can be obtained. The plans are based on this principle, with the result that the wards are arranged on parallel lines, as shown on the block plan to which I wish to direct your attention. The space between the pavilions is 40 ft., and there is a zone of 50 ft. between the buildings occupied by infected persons or things and the hospital boundary. The communication between the several parts of the hospital is direct, and for the comfort of the staff the paths are roofed over but open at the sides.

"The floor area and cubic space of a ward have to be regulated to a considerable extent by a standard set up by the Local Government Board. The area is given at 144 sq. ft., and the cubic space at 2,000 ft. per patient. These units, however, need not be strictly applied in every case. For instance, is it not reasonable to suppose that the cubic space in an acute ward should be more than in a convalescent ward? Besides, medical authorities recommend that in cases of enteric fever and diphtheria the standard should be increased. The width of a ward will regulate the other dimensions, but it should be noted that floor area is of more value than additional height of ceiling. An ample width should be allowed for tables and fire stoves in the centre of the ward, and also to permit of the bed being kept about one foot from the wall.

"Taking all these points into consideration, it seems that 26 ft. is a suitable width and 13 ft. a convenient height for a ward. The width and the height having been fixed, the only question that now remains is the distance between the beds, and this distance will determine the cubic capacity of the ward. In the plans under consideration there is provided 12 ft. of wall space per bed for the scarlet fever convalescent wards, while in the scarlet fever acute wards and in the wards for diphtheria and enteric fever the distance is 13 ft. The cubic space in the one instance is 2,028 ft., and in the other 2,197 ft.

"The window space in a ward will be governed

by the floor area and cubic contents. Experience has shown that in this country one square foot of glass is required for every 60 cub. ft. of space, but where verandahs overhang windows, or where wards are lighted only from one side, the glass area should be increased.

"The bathroom is at the entrance end of the ward and is provided with two baths, one of the usual size of 6 ft., and a smaller one for children. The baths will be rapidly filled and emptied. The sanitary appliances are placed in a turret at one of the distant angles of the ward, and are separate therefrom by a well-lighted and ventilated lobby. Here will be two water-closets and a sink room. In this room will be fitted up a combined arrangement of sinks divided into three sections:—the first consisting of a grooved slope about 3 ft. 6 in. long for the cleansing of macintosh sheets, the second of a scalding sink for washing urine bottles, and the third a sink for flushing bed-pans, and which will serve also as a slop sink. In the sink-room there is also a small cupboard for the retention of bed-pans that have to be examined by the doctor.

At the other angle of the ward facing the south-east is a sun-room, which is divided from the ward by folding doors, so that patients unable to leave their beds can be wheeled into the room. Between the two angle turrets is a verandah for the use of patients who are able to move about. The one-bed ward is near the entrance, and has its own sanitary conveniences.

"The ward kitchen is placed between the two wards, and has an inspection window into each. In this room will be a small fire range or steam closet for keeping food warm; besides a wash-up sink and a dresser. Near the ward kitchen is a nurses' toilet-room and water-closet, a linen store and a milk larder.

"Having given a general description of the plans, let me now direct your attention to the construction, finish, and equipment of the hospital. The essential requirements are ample light and ventilation, no sharp angles or mouldings to catch dust, the wall surface and floors of a hard, non-absorbent nature, also as little woodwork as possible; the whole so planned and constructed as to require a minimum of care or repairs. The method of construction and finish of the plans now shown is intended to accomplish this result.

"The foundations will be of Portland cement concrete, and the damp-proof course of Caithness pavement 2 in. thick. The area under all floors will be covered with a layer of asphalt. The walls will be built of brick 16 in. thick, consisting of a 9-in. outer face, a 2½-in. hollow space, and a 4½-in. inner facing tied together with galvanised iron straps. The ward floors will be of teak wood, and the surface shellacked and wax polished. The skirting will be of the same materials as the floor, and hollowed or coved to a 3-in. radius. The corridors and sanitary turrets will be paved with marble-terazzo, while the bath-rooms will be paved with indiarubber interlocking tiles. The windows in the wards will have the lower part hung as an ordinary window and the top hinged to open inwards. There will be no other projections to harbour dust, and all the facings will be rounded and keyed to the plaster. The glazing will be of polished plate-glass, as this is preferable to double glazing with sheet-glass, for in course of time the space gets filled with dust. The doors will have flush panels and the plainest of furniture. The standarks on which the doors are hung will be checked for the doors and the wall plaster, so that no checks or facings will be required. The plumbing will be executed on the most approved principle. The pipes and fittings will be exposed, and all traps will be ventilated to the roof. The walls of bath-rooms, sanitary turrets, and corridors will be lined to a height of 5 ft. with white enameled tiles. The buildings will be lighted by electricity, and there will be telephonic communication through the several blocks.

"*Heating and Ventilation.*—The boilers for raising steam will be placed in the laundry block, the steam being conveyed in subways to a central point in each block. The steam will be led into calorifiers, of which there will be two—one for the supply of hot water to baths and sinks, and the other for the heating system. Between the beds will be hot-water radiators, with high legs and baffle plates on front and fitted with a ventilating register, through which the fresh air will be introduced. The radiators will be fitted with valves so that the temperature in each ward can be regulated. The heating power will be sufficient to maintain a uniform temperature of 62° in the wards and 57° in

the passage. In addition to the hot-water radiators there will be open fires. The foul air will be extracted by special flues in the walls and by shafts from the ceilings, terminating at the ridge with air-pump ventilators. Each outlet will be fitted with a regulating valve.

Mr. Campbell (London) said the arrangements shown on the plans were good. He liked the arrangements with regard to the sun-room and the verandahs. He would like to know what Mr. Cullen would estimate to be the cost per bed of the building shown on the plans, because he knew that the cost in hospitals had been run up to as much as 750*l.* per bed, and then they were prohibitive. He thought the discharge block was in too close proximity to the general infected area.

Mr. R. Lambie (Lanarkshire) said that Mr. Cullen had put up the Middle Ward Hospital at Motherwell, and he believed it stood unique in that country. It was one of the cheapest and best in the kingdom.

Mr. Wallis read a letter from Mr. Saxon Snell, who was unable to be present, in which he asked the following questions:—"Mr. Cullen advises the provision of the sinks in conjunction with the patent water-closets. I think the more modern practice is to keep them in a separate compartment with separate entrances from the ward. I have not had the advantage of seeing the plan of the ward referred to, but if, as I suppose, the sun-room is of the same area as the sanitary annex, it will be rather small. The whole end of the ward, of a depth of 12 ft. to 15 ft., and with both angles canted, would provide a much larger and better-lighted room. Mr. Cullen suggests ordinary sash window with hoppers at the top. It is the usual practice, but we may hope that in the near future some better form of window with fewer internal angles and grooves may be adopted. It would be quite possible to construct windows with the glass flush with the sash or casement frames. My personal preference is for casements carried down to within a foot of the floor. Doors can now be made absolutely flush both sides and veneered with wide hard wood. Referring to the heating arrangements, modern hospital practice rather than the use of calorifiers of each separate block. It is possible and much better to carry the pipes for one central station. One is always surprised to hear separate radiators with all their dust collecting properties advocated for wards. A couple of 2-in. pipes carried along the walls is a much simpler arrangement. The valves can be kept outside the wards. Ward furniture can no doubt be shod with wood, but indiarubber is better."

Mr. Cullen, in reply, said he saw nothing objectionable in the discharge block being near the other wards, because it was part of the hospital. It was entirely disconnected with the other buildings. He saw nothing to prevent a hospital of the kind described at a cost of 450*l.* to 500*l.* a bed. The cost of the Motherwell Hospital was about 400*l.* a bed. He appreciated Mr. Snell's criticism, but Mr. Snell was speaking of an entirely different type of hospital. Mr. Snell was speaking of a hospital for a city, but this one was for the country. He thought it proper to put the sinks in the same annexe as the water-closets. Mr. Snell thought it was the usual form of annexe with straight lines, but he proposed that it should be circular. If the sun-room was made larger it would take away the sun from the wards, and it was better to have a little sun than none at all. As to the windows there were no angles or grooves—everything was rounded and flush. It was objectionable to have pipes or radiators of any kind, but of the two he thought it better to have perpendicular lines of radiators than horizontal lines of pipes.

This concluded the sittings of the section.

Standards of Purity for Sewage Effluents.

On Friday there was a joint discussion by the Engineering and Architecture and the Physics, Chemistry and Biology sections. Professor Clowes presided.

Professor Dunbar (Hamburg) opened the sitting with a paper on "Standards of Purity for Sewage Effluent." The author stated that after many years of fruitless search it was believed they had at last found means to ensure thorough purifications of town and trade sewage, even in such cases where approved methods, as irrigation or intermittent filtration, are not applicable. What was to be aimed at was that the water of our public watercourses

does not become turbid, discoloured and foul, and that such water sustains fish life. It would be a mistake to search for a reaction that would enable them in one and all cases to affirm whether a certain sewage or effluent is fit to be discharged into the river or not. Such a reaction indicating whether the effluents are sufficiently free from albuminous substances, or from certain products formed in the decomposition of proteids, could come in question in such case only where a thorough purification of sewage seems necessary. He did not intend to formulate definite propositions as to how many standards or classes of requirements would seem necessary, and which requirements ought to be made for the different standards or classes. He limited himself to the discussion of one question of fundamental importance, namely—

"Does what we know of sewage analysis to-day put us in a position to judge from the results of chemical investigation, whether a certain sewage or effluent tends to undergo putrefaction or not?" He proceeded to give the results of various analyses, and said that it was beyond doubt that they were, by using the absolute figures obtained by the methods known to-day, not always in a position to know whether a crude sewage or effluent will putrefy, or will under given conditions create a nuisance in a river. The author summed-up his conclusion as follows:—"The absolute figures obtained even by the best methods of determining putrescible matter in sewage do not in all cases give definite indications as to the putrescibility of any given sample. Effluents of purification works may present a most satisfactory character, and yet under certain circumstances contain as large or even larger quantities of either organic carbon, organic nitrogen, and albuminoid ammonia; as high an oxygen absorption, and loss of ignition as other samples of crude sewage which are in a high degree liable to undergo putrefaction. We should, therefore, give up the attempt to find a standard of general applicability based on absolute figures. A far safer judgment as to the putrescibility of effluents can be obtained by calculating the percentage of purification effected. Simple methods like Kubel's oxygen absorption test give results entirely sufficient for wants of practice, if used only for calculating the percentage of reduction. The analytical determinations spoken of are not needed in all cases. The requirement, that all effluents should be absolutely non-putrescible needs only to be made where the river presents most unfavourable conditions, or where the river districts are densely populated. In many cases it will be sufficient to require only that all coarser suspended matter be removed from the sewage. In other instances all suspended matter, including finer particles, should be removed as efficiently as possible. In other cases, again, the authorities will have to insist not only on the removal of the entire suspended matter, but also on a reduction of between 40 and 50 per cent. of oxygen absorbed by the dissolved impurities, the determination being made after filtering the samples; and there will certainly be such cases, too, where it must be stipulated that the effluents are limpid and entirely non-putrescible. It would be desirable that leading men in Britain and Germany, where the great questions of rivers pollution and sewage purification are at present being discussed more than ever before, should come to an understanding to carry out the examination of sewage on the same lines. In such case the large amount of analytical work carried out in both countries every day, would lead to comparable results, and progress might be accelerated by mutual labour and interchange of ideas."

Mr. Ross (Barnley) said the authorities were composed of business men, and he felt it might be left to them, in conjunction with the chemist, to say what the standards should be.

Dr. McVail (Stirling) remarked that the whole question was whether the effluent discharged into the rivers would putrefy or not. He felt that they could say now that sewage treatment was one of the solved problems of sanitation. What was wanted was not a particular chemical composition, but that the sewage should not undergo putrefaction and not be disastrous to fish life.

Dr. Barwise (Derbyshire) observed that some of the samples of effluent submitted by Professor Dunbar would not be satisfactory in his county, where certain of their rivers were a source of income to the districts through which they ran.

Dr. McLean Wilson (Wakefield) said in his district they did not fix standards. An important point to be borne in mind was the

size and flow of the stream into which the effluent was discharged.

Mr. Archibald (London) said that the question of putrefaction must be determined not only by the actual state of the sewage effluent, but by the amount of water with which it was discharged.

A hearty vote of thanks was passed to Professor Dunbar for his paper.

Septic Tank System of Sewage Disposal.

Mr. W. Shanks described the results obtained at the Barrhead Sewage Works, where the septic tank system was in operation, and which had been designed to serve a population of 10,000 with a maximum sewage flow of 400,000 gallons per day. He gave details of cost, and stated that after the capital was repaid, sewage would be purified at something like 3d. per ft. rate per annum. The present sewage rate is 10d., but less than one-third of this is applicable to purification works. The analyses given showed the satisfactory nature of the purification and the continued efficiency of the works. The municipal council was perfectly satisfied with the purification.

Manchester Sewage.

Dr. Gilbert J. Fowler read a paper on "Recent Experiences in the Treatment of Manchester Sewage." He described the present state of the works, and said that at present two-thirds of the whole of the sewage of Manchester, including storm water, was purified at any rate to the point of being rendered non-putrefactive. Eleven more acres of contact beds would be at work by the end of the year. He referred to the characteristics of Manchester sewage, and gave tables with details of the sludge removed from the open septic tanks. The total volume of sewage filtered by the various beds during the year had amounted to 5,654,872,456 gallons, or 43 per cent. of the total quantity of sewage received at the works. The cost worked out at 3s. 8-6d. per 1,000,000 gallons actually filtered. Dr. Fowler dealt at some length with a table giving comparative results of filtration of tank effluent, which comprised results obtained at Manchester, Acerrington, Burnley, Oldham, and Birmingham. The following were some of the conclusions which appeared to him to be justified by the table:—(1) That it is not possible to say on merely general grounds that one process is to be preferred to another, equally good results being obtained by a number of methods if carried far enough. (2) That percolating filters are more expensive than contact beds in first cost. (3) That whether they justify this extra first cost depends on local conditions. (4) That where pumping would be necessary in order to operate sprinkling filters, as at Burnley, Manchester, and Oldham, then contact beds are cheaper. (5) That where a sufficient area of contact beds can be obtained at a low cost of construction as at Oldham, they are cheaper under all circumstances. (6) That, for purposes of comparison, costs should be calculated on the dry weather flow. (7) That, other things being equal, a small flow per head conduces to economical treatment.

Replying to various points raised in the discussion which followed the reading of the paper, Dr. Fowler said he was not a partisan of any system. To him it was indifferent how sewage was purified so long as it was purified, and done at the least possible cost. He thought they must consider the special circumstances relating to each case. He was interested to hear of cheaply-constructed continuous filters, and if they could be put down at a satisfactory price by all means put them down, but he did ask them to consider the whole thing from one end to the other before coming to a conclusion.

Sewage Disposal on Chalk Soils.

Lt.-Col. A. M. Davies, R.A.M.C., with Mr. W. C. Tyndale, submitted a paper on "Sewage Disposal on Chalk Soils." Tests were made on the site of some barracks on Salisbury Plain, near Amesbury. The sewage from 1,377 men and 523 horses was brought to the land in a crude state, and applied to it directly, and this went on for about two years. The conclusions derived from the experiments made were:—(1) That, in the case of a chalk formation, there is practically no lateral movement of fluid falling on or spread over the surface, but that the moisture passes vertically downward. (2) That, so far as our observations extend, the soakage consists of saturation only, and that in the upper portion of the chalk the

liquid forms no defined lines of percolation, resulting in trickles even where the surface is deluged. (3) That, when the surface is deluged, traces of sewage, as evidenced by bacteria, may penetrate to a considerable depth, but that when sewage is applied in an ordinary and reasonable way over the surface, no such contamination of the subsoil takes place.

Pollution of Rivers by Sludging of Mill Dams.

Mr. A. F. Somerville, Chairman of the Sanitary Committee of the Somerset County Council, in a paper on this subject, said the question was one which is practically outside the question of pollution of rivers by sewers or manufacturers' waste, and arises from the obstruction to the flow of water by the interposition of a weir or mill dam. The law on the subject is at present very unsatisfactory and conflicting, and the author instanced a number of cases which had been decided where the decisions were conflicting. He suggested that the special attention of the Royal Commission, which is now dealing with the prevention of pollution of rivers, be directed to it, and that they be asked to introduce further legislation with a view to the removal of a grave injustice to private individuals, an injury to the public, and a possible danger to water supplies.

SECTION III.—PHYSICS, CHEMISTRY, AND BIOLOGY.

This section held its first sitting on Thursday, under the Chairmanship of Professor Frank Clowes.

In his opening address the Chairman said the subjects which were brought together under this section were naturally associated. Chemistry, Physics, and Biology, not only constitute an ample field, but provide a conjoint area, the dividing boundaries of which are indefinite or non-existent, and over which each of us must more or less frequently have cause to travel. It is commonly considered that there is no very satisfactory delimitation of the field of the chemistry as compared with that of the physics, and it is quite certain that the biologist must concern himself largely with matters both chemical and physical. In respect of sanitary processes, it is indeed constantly found that one and the same purpose may be accomplished by chemical, physical, or biological methods. Perhaps no better instance of the alliance of these sciences can be given than in their application to the methods of sewage disposal. At one time the treatment of sewage by chemical processes was almost universally recommended, and discussion mainly turned on what chemical substances were the most efficient in rendering sewage inoffensive; then electrolytic treatment appeared upon the scene; and at the present time the discussion mainly turns upon the various means of applying biological treatment. The resolving action of organisms, which are excessively minute and are ranged at the bottom of the scale, appears to be likely to supplant the attempted purification of sewage by chemical precipitation and the more costly process of electrolysis. It appears now to be generally conceded that some method of controlled biological treatment will be the generally accepted means of rendering sewage inoffensive and of providing for its disposal. Professor Clowes proceeded to urge on the members the importance of purity of food and air. The increasing use of coal gas, petroleum, and electricity, for heating and motor purposes, was advantageously reducing the sources of atmospheric pollution, but the results thus far attained were very far from securing a satisfactory condition of the atmosphere.

Professor Gerald Henderson (Glasgow), in proposing a vote of thanks to Professor Clowes, remarked that, in view of the fact that the Glasgow authorities were committed to the precipitation method of sewage treatment, it was interesting to find such an authority as the Chairman stating, without hesitation, that the bacterial treatment was the right one.

Purification of Brewery Refuse.

Dr. H. Maclean Wilson read a paper on "Some Experiments in the Purification of Brewery Refuse." The results of the experiments undertaken at Rotherham showed that, although brewery refuse is more refractory than domestic sewage, it is quite practicable to purify it by ordinary bacterial means, aided by a preliminary treatment with lime. Taking

the average results from the table of analyses, the precipitation with lime produces a tank effluent in which, as compared with the crude refuse, the suspended solids have been reduced from 24.8 to 1.3 parts per 100,000, and the albuminoid ammonia from 3.8 to 1.8, while the oxygen absorbed figure is increased to 32.7; it produces, moreover, a liquid which no longer has an acid reaction, although in such a condition that the acidity soon returns. The alkalinity, however, persists long enough to permit of bacterial purification taking place. The double contact treatment of this neutral or alkaline tank effluent further reduces the albuminoid ammonia from 1.8 to 0.7, and brings the oxygen absorbed figure from 32.7 to 7.9—quantities which are still much too high to be satisfactory. The percolating filter fed with the effluent from the contact beds produces an effluent which, when strained through sand, may be considered very satisfactory, the albuminoid ammonia being reduced to 0.15 parts per 100,000, the oxygen absorbed to 1.8, while nitrates have made their appearance, and the earth filter yields nearly the same result. The purification thus effected by chemical precipitation, double contact, percolation, and sand straining, when judged by the amount of albuminoid ammonia, amounts to some 96 per cent., and when reckoned on the oxygen absorbed figure to some 93 per cent. The course taken by the experiments was to a great extent determined by the nature of the existing works.

In constructing works anew for the purification of such refuse, the best course to take would probably be to provide tanks for chemical treatment, a first percolating filter, and another at lower level, and finally a shallow strainer of sand for the removal of suspended matters. The tanks should not be too large, for fear of inducing acid fermentation in their contents, and the filters should be of sufficient area to allow of only a moderate quantity per yard being passed through them. With such an apparatus there should be no difficulty in producing an effluent quite fit to be discharged to a stream.

Other papers were read by Dr. S. Rideal on "The Hygienic Signification of Sulphur in Coal Gas," and a joint paper by Dr. Rideal and Dr. E. Baines on "The Suggested Use of Copper Drinking Vessels as a Prophylactic Against Water-borne Typhoid."

Conference of Sanitary Inspectors.

A Conference of Sanitary Inspectors was held under the chairmanship of Mr. T. F. Strutt, late chief sanitary inspector of the City of Westminster.

The Chairman devoted his opening address to the question of the insecurity of tenure of office of sanitary inspectors. He premised that his remarks did not apply to their brethren north of the Tweed, as he understood they had some security. He went on to show that if the public knew how oppressive their grievances were, and how they hindered their effectiveness, they would not any longer suffer under the present unjust conditions, which he regarded as a menace to public health. How could a sanitary inspector, he asked, be expected to do his duty fearlessly when the Council which employed him was, as was commonly the case, composed of slum property owners, house farmers, jerry builders, and their friends. What he proposed was that the sanitary inspector should have fixity of tenure in his office, with the right of appeal to the Local Government Board, and, if possible, superannuation. In conclusion, he advocated the establishment of a Ministry of Public Health, but he did not want one fashioned upon political lines, governed by a party ignorant of practical public health problems and science. In the absence of a Government Department, he testified to the value of the work of the Sanitary Institute.

Mr. J. H. Clarke, in the first paper, said that a new Public Health Act, embracing the Public Health Acts Amendment Act, 1890; the Housing of the Working Classes Act; the Factory and Workshop Act; the Public Health (Water) Act; and the Infectious Diseases Act, with certain readjustments and additional provisions, was a much-needed legislative reform, the need for which was becoming more and more urgent as the statutes accumulated.

In a paper on "Rights and Responsibilities in Relation to Sanitary Administration," Mr. W. W. Kelso said that nothing strikes deeper at the root of the great social and housing problems than the need for a greater measure of supervision over houses and property, and of

interest in and intercourse with the occupiers. This would play no mean part in the great and much-desired national reform in social and housing conditions. Were the conditions not about ripe for a voluntary system of social reform on the lines of the Elberfeld or Leipzig systems?

Other papers read at the Conference were: "Some Notes on Rural Inspecting," by Mr. T. Brice Phillips, and "What the People Sleep on," by Mr. P. Fyfe.

Mr. Anderson (Middlesbrough) moved that the Conference again adopt a resolution expressing regret that the Council of the Sanitary Institute had not seen fit to appoint one or more sanitary inspectors as members of the Board, and asking them to reconsider their decision.

The resolution was adopted.

Sanitary Science and Preventative Medicine.

At the Wednesday sitting of this section papers were submitted by Sir R. Temple on "Some Administrative Measures Taken Against Malaria and Consumption in the Tropics," and by Dr. Wright on "The Sanitary Condition of the Mercantile Marine."

In the afternoon there was a joint discussion with the section on Physics, Chemistry and Biology on "Shell-Fish and Enteric Fever," which excited much interest and a great deal of discussion. The paper leading up to the discussion was by Dr. A. Newsholme, medical officer of health of Brighton, who dealt with the cases of enteric fever and diarrhoea which appeared to be due to the oysters obtained from polluted layings at Southwick.

Dr. R. M. Buchanan, bacteriologist to the Glasgow Corporation, gave the results of his investigations into an outbreak of enteric fever amongst holiday-makers visiting a small watering-place on the west coast of Scotland. The outbreak was undoubtedly due to the visitors eating shell-fish taken from the foreshore polluted by the sewage of the town. The investigation proved that shell-fish at a distance of one to two miles from the sewer outfall were entirely free from evidence of contamination.

Conference on Hygiene.

On Thursday the Duchess of Montrose presided over a Conference of Women on Hygiene. Miss C. Cochrane, in a paper, strongly urged educated women with leisure to serve on rural councils, where, living in the country, they would naturally be conversant of the needs of cottagers as to water and milk supplies, housing, sanitation, etc., and would be able to furnish their councils with accurate information and suggestions.

The Conference sat again on Friday, under the chairmanship of Mr. Councillor J. Steele, when papers dealing principally with the conditions attending the employment of women were read.

Veterinary Inspectors.

Professor J. McCall presided on Friday over a Conference of Veterinary Inspectors.

In a paper on "Public Abattoirs," Mr. L. M. Douglas pointed out that the construction of public abattoirs in the United Kingdom was in a very backward state, and few had been constructed on modern lines, so far as plant was concerned. The strongest argument for public abattoirs lay in the fact that efficient inspection was possible with them.

Hygiene of School Life.

On Wednesday a Conference was held, under the chairmanship of Professor John Edgar, on the "Hygiene of School Life." Amongst the papers read was one by Miss E. M. Evans on "The Responsibilities of Municipal Authorities and County Councils with Regard to the

Development of School Sanitation.

The author insisted that the condition of the schools, their sufficient ventilation, the proper sanitary accommodation, provision of playgrounds, well-aired cloak-rooms, and a good supply of drinking water afford much ground for discussion and organisation. She suggested that the responsibility of these things should rest on the medical officer of health.

Dr. T. Wood, in a paper on "A Plea for Co-ordination of the Public Health of Schools," said he regarded the rules laid down in the Code by the Education Department as to air space for children in schools insufficient. He suggested that each child should be provided with at least 200 cub. ft. of air space and 15 sq. ft. of

area. It was on the report of H.M. Inspector that the Education Authority acted so that after schools had been built the inspector became the authority in connexion with heating, ventilation, overcrowding, and all matters relating to the general hygiene of the schools for scholars. He contended that the inspector could not possibly be regarded as an expert in such matters, and advocated that all matters connected with the public health of schools should be removed from the control of the Education Department and School Board, and conducted under one authority.

The Conference sat again on Thursday.

School Furniture.

Mr. J. Graham gave some particulars of adjustable school furniture first seen in continental schools. He said the present was an opportune time for all interested in the well-being of growing children and adult students to direct attention to the crying necessity for a hygienic revolution in the school furniture of our country. They wanted desks which would readily accommodate themselves to children's bodies, and seats to provide comfortable support where it was needed. In almost all schools the bodies of scholars had had to accommodate themselves to fixed seats and benches, and many evils had arisen from the system. "Hygienic" desks and seats reverse the old order of things, inasmuch as they accommodate themselves to the bodies, backs, legs, and eyes of the users. They provide, in addition, the natural angle required for reading, writing, and drawing, and the height of desk suited to the length of the scholar's body. In short, "hygienic" desks and seats should be so designed as to lead each person almost unconsciously to assume a natural and hygienic position, and supports for the left arm should be provided in the case of very young children, where necessary, in order that the correct position may be maintained with the minimum of strain.

The collection of *pupitres hygieniques* to which he directed attention have neither the key, the screw, the crank, nor the pinion movement, and have been designed in accordance with hygienic principles. He met with them while touring around Continental schools some two years ago, when they struck him as being a great advance on anything he had previously seen. They were invented by M. Manehain of Geneva, and had been adopted as official patterns by the Swiss Government. Specimens of the desks were imported by the West Riding County Council, and since then, under the direction and guidance of Miss Alice Ravenhill, the firm of Hlingworth, Ingham, and Co., of Leeds, have been making experiments with a view to improving the desks, and to producing seats which may be as satisfactory as is the movement of the desks—that is to say, they were in search of a series of desks and seats for elementary, secondary, and technical school purposes which are readily adjustable for the use of children and adults. The author described in detail a number of the desks, and said that some excellent features which may be claimed for these "hygienic" desks are that (1) they relieve the strain on the eyes, (2) they minimise the strain on the spine, (3) they enable the lungs to have a freer play, (4) they provide facilities for change of position for successive lessons, inasmuch as the scholars may work alternately sitting and standing, and (5) where adult evening work is carried on in elementary and secondary schools, men and women of from 20 to 30 and upwards have not to be squeezed into a low fixed desk built for children, but may get a desk of a suitable height.

Dr. Thomas Wood also read a paper on the "Great Importance of Hygienic School Desks and Seats," and said that the vast proportion of scholars attending school were compelled to sit at desks which caused them to assume postures which had a tendency to produce curvature of the spine and other bad effects.

Closing Sitting.

At the closing sitting of the Congress on Friday, under the chairmanship of Mr. Whitaker, Mr. White Wallis reported that between 1,500 and 1,600 members had been present at Congress. For the first time the Council had invited ladies, and fifty-one had attended.

The recording secretaries of the various sections handed in their reports, and votes of thanks were passed to the Corporation of Glasgow and other bodies for the hospitality offered.

THE ARCHITECTURAL ASSOCIATION.

The following is the list of papers to be read at the Ordinary General Meetings of the Architectural Association during Session 1904-5:—

September 30, 1904.—Annual General Meeting. Address by the President, Mr. E. Guy Dawber, and distribution of prizes.

October 14.—Photography as applied to Architecture, by Mr. E. Dockree. Illustrated with lantern slides.

November 11.—Ventilation, by Mr. W. Henman.

November 25.—Excesses in Westminster, by Messrs. E. Prioleau Warren and J. T. Micklethwaite.

December 9.—Some Architectural Reflections, by Mr. T. Radley Davison.

January 6, 1905.—Libraries, by Mr. Alfred Cox.

January 27.—Byzantine Architecture, by Messrs. E. F. Reynolds and J. B. Fulton.

February 10.—Church Fittings.

February 24.—Country Houses and Accessory Buildings, by Mr. F. J. Osborne Smith.

March 10.—Law Courts, by Mr. H. V. Lanchester.

March 24.—Sketch Plans and Working Drawings, by Mr. A. Newham Wilson.

April 7.—Subject to be announced, Mr. H. Phillips Fletcher, lecturer.

The meetings will be held at 7.30 p.m. on the Fridays stated, at No. 18, Totten Street, Westminster, S.W.

The A.A. Scholarship, value 5*l.* 5*s.*, has been awarded to Mr. C. E. Hanscomb, and the Andrew Oliver prize as follows:—W. A. Hodges (3*l.* 3*s.*), F. T. Bush (2*l.* 2*s.*), P. K. Kipps (hon. mention).

In the studio, the Travelling Studentship (5*l.*) has been awarded to Mr. J. H. Markham.

Arrangements are now completed for the annual excursion, and the headquarters will be at the Digby Hotel, Sherborne.

Among the places to be visited, the following may be mentioned:—Trent, Sandford Orens, North Cadbury, Beaminster, Melplash, Parsham, Crewkerne, Clifton Maybank, Brympton, Newton Surmalye, Milton Abbey, Piddletown, Waterson, Yeovil, Tintinhull, Montacute, and Preston Grange.

Illustrations.

JUMIÈGES.

 THE view of Jumièges Abbey is taken from the north-east of the nave. On the right is the north aisle, which, like the upper aisle seen above it, is groined; on the left is the south side of the nave, which was not vaulted. The south aisle has fallen. On the south side are two roofing-shafts, which probably carried gabled transverse arches, the spring of one of which remains, over the nave. The roofing-shafts seem to have been reconstructed in Gothic days, and are now in part of plaster. Above is a glimpse of the south-western tower. The Abbey has hitherto been in private hands, and photography and sketching have been prohibited. Lately, however, it has become an historic monument, and henceforward will be maintained at the expense of the State.

MANOR HOUSE, MOUNT GRACE PRIORY.

THE Carthusian Priory of Mount Grace, near Ingleby Arncliffe, in Yorkshire, commonly called Mount Grace Priory, Northallerton, is by far the most perfect and interesting of the Charterhouses formerly existing in this country. It is doubtful if there is any spot where the arrangements of the mediæval Charterhouse can be studied to such advantage, since there is no feature that cannot be found in one or another of the old dwelling-houses, which date from 1399-1420.

The building with which we are concerned does not, however, belong to the actual part of the establishment inhabited by the Carthusians, but forms part of the range enclosing the outer court, and runs north and south adjoining the old gatehouse, of which nothing remains above the gateway level.

In or about the year 1654 (the date is inscribed on the entrance porch) Mount Grace came into the possession of a member of the Lascelles family, and the new owner at once proceeded to "modernise" a portion of the buildings and turn them into a dwelling-house. This he did by taking a portion of the building on the west side of the outer court, about 130 ft. in length and 17 ft. 6 in. wide between the walls, and dividing it up into rooms by thick cross walls, in which he put fireplaces, and cutting a row of windows along the west front; he seems also to have raised the roof and built a row of three gables with a battlemented parapet between. Of these, only two gables remain, but there is evidence of the existence of the third. He also improved the

West Elevation.

not carried out, though in this case the design was made for a definite situation.

The church was to have been built with concrete walls, faced with rubble, and roofed with concrete vaults, covered with asphalt. It thus constitutes an experiment in a class of materials not hitherto much employed in church architecture.

The design is by Mr. C. H. M. Mileham.

BY-LAWS UNDER THE PUBLIC HEALTH (LONDON) ACT, 1891.

The Public Health Committee of the London County Council reported as follows at the last meeting of the Council:—

On February 16, 1904, we reported as to the necessity for an amendment of by-law No. 26, made by the Council under section 39 of the Public Health (London) Act, 1891, and the Council, on our recommendation, gave instructions for a copy of the proposed amended by-law to be sent to the London sanitary authorities for their observations pursuant to section 114 of the Act. This action was accordingly taken, and we have considered the observations made by these sanitary authorities and also alterations suggested by the Local Government Board. One of the Board's suggestions was that the existing by-law should be repealed and a new by-law made in its place, including a clause providing for penalties.

We are advised that before effect can be given to the alterations suggested by the Board it is necessary to again submit the by-laws to the sanitary authorities. We therefore recommend—That copies of the proposed by-laws set out in Appendix I. to this report be sent to the London sanitary authorities pursuant to section 114 of the Public Health (London) Act, 1891.

The recommendation was agreed to. The following is the appendix referred to:—

By-laws made by the London County Council under section 39 (1) of the Public Health (London) Act, 1891, with respect to water-closets, earth-closets, privies, and receptacles for dung.

1. The occupier of any premises shall cause every water-closet belonging to such premises to be thoroughly cleansed from time to time as often as may be necessary for the purpose of keeping such water-closet in a cleanly condition.

2. The occupier of any premises shall once at least in every week cause every receptacle for dung belonging to such premises to be emptied and thoroughly cleansed.

Provided that where two or more lodgers in a lodging-house are entitled to the use in common of any water-closet, or receptacle for dung, the landlord shall cause such water-closet to be cleaned, or receptacle for dung to be emptied and cleansed as aforesaid.

3. The owner of any lodging-house shall, subject to the provision hereinafter specified, provide and maintain in connexion with such house, water-closet, earth-closet, or privy accommodation in the proportion of not less than one water-closet, earth-closet, or privy for every twelve inmates of such house.

Provided that proceedings shall not be taken against the owner of any lodging-house for an offence against the last-mentioned requirement of this by-law unless and until the owner, after service upon him of a notice in writing by the sanitary authority, requiring him within such reasonable time as is specified in the notice to comply with the by-law, has failed to comply with the by-law within the time so specified.

4. For the purposes of this by-law, a "lodging-house" means a house or part of a house which is let in lodgings or occupied by members of more than one family.

"Landlord" in relation to a house or part of a house which is let in lodgings, or occupied by members of more than one family, means the person (whatever may be the nature or extent of his interest) by whom or on whose behalf such house or part of a house is let in lodgings or for occupation by members of more than one family, or who for the time being receives or is entitled to receive the profits arising from such letting.

"Lodger" in relation to a house or part of a house which is let in lodgings or occupied by members of more than one family, means a person to whom any room or rooms in such house or part of a house may have been let as a lodging or for his use or occupation.

5. Nothing in this by-law shall extend to any common lodging-house.

Penalties.

6. Every person who shall offend against the foregoing by-law shall be liable for every such offence to a penalty of 5*l.*, and in the case of a continuing offence to a further penalty of 4*0s.* for each day after written notice of the offence from the sanitary authority.

7. Provided, nevertheless, that the court before whom any complaint may be made or any proceedings may be taken in respect of any such offence may, if they think fit, adjudge the payment as a penalty of any sum less than the full amount of the penalty imposed by this by-law.

Repeal of by-law.

8. From and after the date of the confirmation of these by-laws, the by-law numbered 26 (twenty-six) in the by-laws relating to water-closets, earth-closets, privies, ash-pits, cesspools and receptacles for dung, and the proper accessories thereof in connexion with buildings, which were made by the London County Council on June 22, in the year 1893, and were confirmed by the Local Government Board on June 23, in the year 1893, shall be repealed.

OPERATING THEATRE, CHESTER INFIRMARY.—A new operating theatre has been opened at the Chester General Infirmary. The structural arrangements have been carried out by Messrs. T. M. Lockwood and Sons, Chester.

THE ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

A SCOTTISH meeting of the Association of Municipal and County Engineers was held at Glasgow, on Wednesday, July 27. The object of the meeting was to complete formally the amalgamation of the Scottish Association with the Incorporated Association of Municipal Engineers, thus welding the municipal engineering profession into a united association.

Mr. W. Weaver, Kensington, presided, and there were present—Messrs. E. G. Mawbey, Leicester; J. Price, Birmingham; J. Cochrane, Glasgow; C. H. Cooper, Wimbledon; H. Sileock, Mansfield; A. H. Campbell, East Ham; W. V. Anderson, Winchester; M. J. Buckley, Dublin; R. J. Wolfenden, Bootle; A. A. Turrill, Elgin; W. B. Madin, Rushden; W. Hall, Great Crosby; W. G. Leaves, Great Crosby; F. J. Rayner, Newhaven; W. Dawson, Leyton; J. Trumble, Forest Gate; H. B. Williams, Workington; D. Ronald, Falkirk; —Massie, Falkirk; R. S. Anderson, Peebles; J. Parker, Hereford; R. H. Dorman, Armagh; J. Stones, Sedgfield, Durham; A. H. Nathaniel, Glasgow; W. Bruce, Edinburgh; A. H. Goudie, Stirling; G. W. Lacey, Oswestry; G. G. Shepherd, Ilford; G. W. Tutley, Edinburgh; J. R. Lunsden, Kirkealdy.

The Chairman said, although he was not President at the present moment, the President who was elected and installed at Shrewsbury a fortnight ago had kindly allowed him to take the chair in order that he might welcome the Scottish members coming into the fold of their association. He, Mr. Davis, had left that duty to him inasmuch as he virtually initiated the movement that they were completing. On behalf of the Association he begged to tender to the Scottish members who had amalgamated with their Association a hearty welcome to their ranks, and he trusted that the amalgamation which they effected might be to the advantage of all the members who were joining. He was quite sure personally that it was to the mutual interests of all the members holding appointments throughout Great Britain to be in touch one with another, both for the object of mutual improvement and mutual support, and he trusted that in the future events would prove the wisdom of their action. He, therefore, begged to give them a hearty welcome, and to express his own personal feelings of pleasure in meeting them.

Mr. McDonald (Glasgow), on behalf of the Scottish Association of Municipal Engineers, which had now ceased to exist, begged to acknowledge the very kind observations that the Chairman had been pleased to address to them, and he cordially acquiesced and thoroughly believed in the accuracy of his anticipations that the amalgamation would be of mutual benefit. He was quite sure that the strong current of Scottish blood which was to be infused into the English association could not fail to be otherwise than advantageous, and as the period was far too remote for the memory of any man to remember any such thing as racial difference, he was quite sure they would all benefit from the closer relations which would exist with their professional confrères. He hoped that the associations now combined by amalgamation in enhanced usefulness would prove of the highest benefit to the profession, and that they would all avail themselves of the opportunity that now lay before them of attending meetings of the Association of Municipal and County Engineers.

The Chairman said the next business was the election of an honorary district secretary. Mr. Dyack, of Aberdeen, the present secretary, who was unable to be present, was not prepared to continue in office. It, therefore, rested with the Scottish members to elect someone from their ranks, who they thought would be a fit and proper person to fill the office. Of course, the member who was elected to discharge the duties of secretary for the Scottish district by virtue of that office became a member of the Council of the Association.

Mr. J. Pritty (Selkirk) proposed the re-election of Mr. Bryce, of Partick, as honorary secretary for the Scottish district.

Mr. Massie seconded the nomination of Mr. Bryce. He had been a friend of the Scottish Association from its inception, and if Mr. Bryce could see his way to accept the office, he was the right man in the right place.

Mr. Bryce said he would have preferred if someone else could have taken this matter up,

as he was looking forward to some relief at this period.

The Chairman said he was quite sure if Mr. Bryce would take the office upon himself, at any rate for a year, while things were getting into working order, that the members would be well served. It would be a wise act on their part to elect Mr. Bryce, who had taken a considerable interest in the amalgamation, and with whom he had had considerable correspondence. If he would take upon himself the duties of the office he was sure they would be efficiently discharged.

The proposition was carried unanimously.

Mr. Bryce thanked them very much for the honour they had conferred upon him, but he must say he accepted it only on condition that he got relieved next year. He took the opportunity of giving a year's notice of his resignation.

Building By-Laws in Scotland.

Mr. Bryce, Partick, asked permission to make a statement about building by-laws in Scotland. This matter was so urgent that he thought that was a very fitting time to bring it up. The Scottish surveyors of 1903 very well that in the new By-Laws Act of 1903 they had got authority to frame very comprehensive building by-laws for new buildings and drainage. He thought the list of them was more comprehensive than what was provided for by the model by-laws in England, but he might be wrong on that point. He thought that was the time to appoint a committee of their Scottish members to frame a uniform code of by-laws in respect of Scotland. It was quite true there were a great many local differences which would necessitate the alteration of the by-laws for particular towns, but on the main points the by-laws could be made uniform and adapted to Scottish practice. He need not inform their English friends that their by-laws were practically of no use to them. They knew that in England they were also looking into the matter of their by-laws, and making improvements on the model by-laws, so probably they might get some hints from them in this matter. There was also the question of the form of the by-laws as well as the uniformity. There had been a good deal of discussion lately about by-laws being too fixed, definite, and stringent in their specification. He remembered reading the evidence given before the Glasgow Housing Committee last year, and some of the witnesses made very strong objection to the Glasgow building by-laws on that ground.

The question would arise as to the best form in which to mould the by-laws. He might be wrong, but he thought, in addition to the deliberations of the Glasgow Housing Committee, they might be assisted by the views of the Royal Institute of British Architects and the Surveyors' Institution, as well as the Borough Officials' Association of Scotland, and the National Plumbers' Association. It seemed to him that they had a clear field before them, as they had no model by-laws in Scotland. Therefore they had to take this opportunity of appointing a committee and framing a model code for the Scottish boroughs. If this proved to be the feeling of the meeting, he was prepared to suggest a committee. He moved that a Committee of Scottish members be appointed to draft a code of model by-laws.

Mr. Holmes, Govan, seconded the proposition. The Act of 1903, which came into force in May, required the framing of by-laws. He thought a general code of by-laws was very necessary, because where they had separate boroughs joining up to each other very often troubles arose, and there were difficulties as to house drainage and the trapping of drains. If all the boroughs in Scotland could be induced to adopt a uniform system of by-laws it would conduce to the benefit of all.

Mr. J. Price, Birmingham, speaking as a member of the By-Law Committee of the Council of the Association, thought the Scottish section would be very wise in adopting the procedure proposed by Mr. Bryce, of drafting their own by-laws and not waiting until the Local Government Board or some other Government Department made them for them. Unfortunately that was what had happened in England. The Local Government Board made the by-laws, and they had had to suffer for them ever since. They were now trying to frame a set of by-laws which would be workable, which was more than could be said of those which had been used in the past. In making the by-laws it was well to make them sufficiently wide in scope, and yet not too wide to be ultra

wires. They did not want to be too stringent as to buildings, all they needed was to make the walls sufficiently stable, the roofs tight, and the drainage satisfactory. To do more than that was to go beyond their purview. He thought the movement the Scottish members were promoting that day was one eminently in their interests.

The Chairman then put the resolution, and it was carried unanimously.

Mr. Bryce, Partick, then proposed that the following form the committee: Messrs. Kellop, Perth; Lee, Paisley; Turnbull, Greenock; Holmes, Govan; Young, Ayr; Ronald, Falkirk; Goudie, Stirling; Wilson, Helensburgh; Wenning, Bronghty Ferry, and Lumsden, Kirkealdy. He explained that, as the by-laws would not affect Glasgow, Aberdeen, and Edinburgh, he had omitted the engineers of those cities.

Mr. Holmes, Govan, seconded the proposition, which was carried.

On the proposition of Mr. J. Parker, Hereford, a vote of thanks was accorded to Mr. Dyack for his services as secretary of the Scottish district, and votes of thanks were also accorded to Mr. W. Weaver for presiding, and to Mr. McDonald, of Glasgow, for his services as President of the now Amalgamated Scottish Association.

NATIONAL FEDERATION OF BUILDING TRADES EMPLOYERS.

The annual summer meetings of the National Federation of Building Trades Employers of Great Britain and Ireland opened at Scarborough on the 26th ult. Meetings of the Council, which were private, took place morning and afternoon at the Grand Hotel, which was the headquarters of the Federation during its visit to Scarborough.

In the middle of the day the Federation was formally welcomed to the town by the Mayor, Councillor W. Morgan, who, attended by the Deputy Mayor (Councillor J. Sinfield), met the master builders in the Council Chamber at the Town Hall.

Alderman W. H. Jessop, of Huddersfield, President of the Federation, acknowledged the welcome.

A banquet was held in the evening at the Grand Hotel. Mr. E. Good, President of the Yorkshire Federation, presided, and there were in all about 170 guests.

Mr. J. Dawson, of Huddersfield, in proposing "The National Federation of Building Trades Employers," said the credit, he believed, belonged to Lancashire for establishing the Federation, and in a few months Yorkshire followed suit. It was a success from the first, and to-day they held the respect of the officials of the men's union. He believed there would be fewer strikes in the future, because of the respect they had inspired. They intended to have fair play; they did not want anything that was wrong; they only wanted fair dealing, to be treated respectfully, and to have freedom to carry on their business.

Alderman W. H. Jessop responded. Councillor Green, of Liverpool, proposed "The Mayor and Corporation of Scarborough," and Councillor Morgan and Councillor J. Sinfield responded.

Mr. C. H. Barnsley proposed "The Architects and Engineers," and referring to the proposed statutory registration of architects, said, as practical men, they would respect and admire more than ever the profession whose members were able to combine skill of construction and business methods with the abilities of the artist.

Mr. F. A. Tagwell (Scarborough) replied. Mr. W. Shepherd proposed "The Yorkshire Federation of Building Trades Employers." He said they heard a great deal about the decision of the House of Lords in the Taff Vale and other cases, but he ventured to think that these decisions had been led up to by minor cases. The Hull case and the Halifax case were fought with a persistency creditable to any association or federation which might have undertaken them, and in his opinion the persistency with which those cases were fought had helped just as much to elicit the judgments lately given as anything possibly could have done.

The Chairman replied, and said the Council that afternoon adopted the Yorkshire scheme, which had for its object a closer union between employer and employed. They hoped to bring those Heathish practices of strikes and lock-outs to an end.

The health of Mr. Poynton, President of the South African Federation, was proposed by Alderman Bowen, and Mr. Poynton replied.

ARCHITECTURAL SOCIETIES.

SHEFFIELD SOCIETY OF ARCHITECTS.—The annual report of the Sheffield Society of Architects and Surveyors states that upon the completion of the seventeenth year of the Society's existence, the Council has pleasure in recording the sustained interest in its work shown by the attendance of members at the ordinary monthly and intermediate meetings, and by the influence which it has exerted in connexion with public matters affecting the interests of the profession, and particularly by the attendance of the younger members at the classes and lectures. The Council regrets to have to record the death of Mr. W. F. Hemmell (Fellow). The total number in each class is now three hon. members, 35 Fellows, 42 Associates, 17 students, and 20 lay members, total 117, as compared with 109 last year. With regard to public matters affecting the interests of the profession, the time of the Council has been fully occupied during the year. No further action has, to their knowledge, been taken with regard to the new building by-laws, and the Town Clerk has promised that the Society shall have further conference with the Highway Committee when the matter is again considered. The proposed competition in connexion with the Corporation building scheme at Winebank, referred to at the last report, has been carried out, but upon the facts being put before the assessor and the Council of the R.I.B.A. by the Council of the Society, the assessor appointed refused to act, and the R.I.B.A. sent out a circular to its members and to members of allied societies asking them not to compete. In consequence of this an assessor was appointed by the City Council who was not a member of the R.I.B.A. or the allied societies, and the Corporation accepted a design which does not comply with their own building by-laws. The Council deeply regret the action of the Corporation in this matter, as by violating the established traditions of architectural practice they made it impossible for members of the R.I.B.A. or the allied societies to compete, and consequently the city lost the benefit of much valuable experience. In consequence of repeated representations made to it by various members of the R.I.B.A., the Council of that body has appointed a Special Committee to report upon the question of architectural work done in Corporation offices. The Master Builders' Association have recently again opened the question of the contract agreement form. The matter is still under the consideration of the Council, who will report to the members of the Society in due course. The statement of accounts shows that the Society has a balance in the bank of 24l. 16s. 7d.

ENGINEERING SOCIETIES.

SOCIETY OF ENGINEERS.—A visit was made by the President, Mr. D. B. Butler, and members of the Society of Engineers, on Wednesday, the 27th ult., to the Shipbuilding and Engineering Works of Messrs. Yarrow and Co., at Poplar, where they witnessed the building and engineering of light-draught high-speed craft of all kinds, notably torpedo-boats, destroyers, and light-draught gunboats. The main workshop consists of four bays, each 360 ft. in length. There are two engineers' shops, 50 ft. and 36 ft. wide respectively; a light machine shop, a heavy machine shop, a pattern-makers' and a joiners' shop, together with a large boiler-makers' shop and an extensive shipbuilding department. At the entrance to the works is a fine suite of offices, including a large, well-lighted drawing office. Electrical driving has been adopted in the works, the main motive power being supplied by three Belliss and Morcom compound condensing engines, which drive three Parker dynamos direct, each dynamo being capable of an output of 430 amperes at 210 volts. Steam is supplied by three Lancashire boilers. Over the boiler-house is a cast-iron tank in which is a Ledward evaporative condenser. The drainage from the main roofs is collected in the tank, and is used for condensing purposes, an economy in the use of the town water thus being effected. Most of the machine tools in the various shops are of the latest pattern, and are placed in groups, each line of shafting being driven by its own motor. The shafting is 3 in. in diameter, and runs at 140 revolutions

per minute. The larger machines, which are not continuously at work, are driven by independent motors. The shops are fitted throughout with electric travelling cranes made by Messrs. Adamson. The air-compressing machinery is also driven electrically, a very complete pneumatic system being laid down throughout the works. There are arrangements for delivering compressed air on board vessels in course of construction on the river bank. The principal tools are fitted with pneumatic hoists. There is also a complete installation of hydraulic plant, which has been specially designed for the construction of the Yarrow water-tube boiler. Electric lighting is partially used in the establishment, the current being produced by the same dynamos that supply power; the circuits, however, are kept separate. The shops are all heated by steam which is taken from the main boilers, and the various departments are all in telephonic communication. These new works, which give employment to about 1,200 men, are of such capacity and so advantageously arranged that Messrs. Yarrow are enabled to carry out on the same premises nearly the whole of the operations connected with the building and engineering of the vessels they construct. The whole of the plant and machinery is of the newest type, and so laid down and arranged that they afford every facility for convenience in the execution of work and punctuality in its delivery. Upon the occasion of the Society's visit the members found the works generally in a state of considerable activity, and they inspected a number of boats of various types in all stages of construction.

THE JUNIOR INSTITUTION OF ENGINEERS.—The summer meeting of the Institution this year is to be held in Germany, Dusseldorf being the first stopping place. Here at the Town hall on Saturday, August 13, the members are to be welcomed into the Fatherland by the Burgomaster and the Society of Architects and Engineers of Dusseldorf. The Exhibition will be visited, and on Monday there will be an excursion to Oberhausen for viewing the works of the Gutehoffnungshütte (blast furnaces, steel works, etc.). The Beurather Crane Works will also be seen. On Tuesday the Elberfeld-Barmen mono-rail suspended railway is to be inspected in the morning, and in the afternoon the members proceed to Hanover for the purpose of visiting on the following day Messrs. Korting Brothers' Works, the Hanover Engine Works, and the works of the Westinghouse Brake Company. Thursday morning will be spent at Hanover, and in the afternoon Berlin will be reached. Here on Friday the overhead and underground railway will be seen, including car sheds, generating station, etc., also the Charlottenburg electrical engineering works of Messrs. Siemens and Halske. Saturday, August 20, will be spent in visiting the Mariendorf works of the Imperial Continental Gas Association and the Royal Technical High School at Charlottenburg. The members leave Berlin on the Monday for Leipsic, remaining there till Wednesday, when they go on to Frankfurt-on-Main to visit on Thursday and Friday, by invitation of Mr. W. H. Lindley, M.Inst.C.E., the municipal works, with an excursion to Homburg. On Saturday, August 27, the return journey to England will be made to include the Rhine from Breibich to Bonn.

COMPETITIONS.

OSSETT TOWN HALL.—The scheme for the erection of a town hall, municipal offices, and borough court on a site in the market place was considered by the Ossett Town Council at a meeting of the General Purposes Committee on the 27th ult. The thirty-three sets of competitive plans which had been received were reported upon by Mr. John Kirk, of Dewsbury and Huddersfield, the assessor appointed by the Council, and on his recommendation the plans submitted by Messrs. Hanstock and Sons, of Batley, were selected. The town hall is to cost 12,000l., exclusive of the site, which has been purchased at a cost of 5,500l.

STAMFORD FREE LIBRARY.—We have been asked to give publication to the following letter, which has been addressed to the competitors:—

"Town Clerk's Office, Stamford,
25th July, 1904.

BOROUGH OF STAMFORD.

FREE LIBRARY.

DEAR SIR,—My attention has been called to the fact that several of the competitors have not received

proper information herein. From time to time circular letters have been written by me to the competitors entering the competition and instructions given by me to a clerk to send the necessary details to every competitor. I now find, much to my surprise, that a number of the competitors have not received all the information.

The Chairman of the Free Library Committee has therefore, under the circumstances, agreed to further extend the time within which the plans are to be sent to me; therefore the time will be extended, in order to give each competitor an opportunity of entering the competition, until the 10th day of September next.

If you have not received a block plan and instructions please let me know by return of post and the same will be sent to you.

Further, if you have already sent in your designs for the Free Library Building the same will be returned to you, if you so desire, in order that you can spend the extended time upon them.

I enclose a circular letter written by me on the 2nd June last.

Yours faithfully,
CHARLES ATTER,
Town Clerk."

A TWOFOLD IMPROVEMENT.

SIR,—One of the finest sites in London is at present occupied by the most hideous of churches—that is to say, Pentonville.

One of the best churches in the City, at present quite useless, is buried behind the Mansion House. If this church—St. Stephen's, Walbrook—were taken down and removed to replace Pentonville church, it would be seen from many points in the City and suburbs.

The City and Corporation would gain greatly by such an improvement, for the site of St. Stephen's, together with the adjoining churchyard, would provide quite a decent-sized garden for the Mansion House.

The garden could be approached by means of a steel balcony, crossing the Mansion House passage, accessible from the Egyptian Hall, and descending by means of light steel staircases. I think that if the attention of the Corporation and of the authorities of Clerkenwell could be called to consider this matter, there would not be much difficulty in carrying out this improvement. WALTER SCARGILL.

WANDSWORTH BATHS COMPETITION

SIR,—I have been invited by the Council of Wandsworth Borough to submit a design in competition for proposed new public baths, to cost 4,500l. Twenty-two other architects have also been similarly honoured. Assuming that each architect spent in time and money 20l. on his design, the net out-of-pocket expenses would be rather more than double the amount of commission that the successful competitor would receive. It will be interesting to see how many of the twenty-three architects invited enter into the struggle for this vast commission. The conditions have been drawn up by the assessor, appointed by the Council, and, evidently in a spirit of gentle irony, it is stated that no competitor may submit more than one set of drawings. As these are to consist of four plans, two elevations, two or three sections, 1/4-in. details, etc., it is doubtful if such a clause to check "vaulting ambition" is really necessary. If the Council, under their by-laws, had to go to competition, surely it would have been better to make it an open one. There are many clever assistants who would have submitted quite creditable schemes, and who would have found (on paper) that the proposed expenditure of 4,500l. was more than sufficient to carry out

the work in the "best possible manner." It is only when the tenders come in that optimism receives a rude awakening!

NON-COMPETITOR.

The Student's Column.

NOTES ON PORTLAND CEMENT:

CHAPTER IV.—PHYSICAL PROPERTIES AND DETERMINATION.

ALTHOUGH the testing of cement has been engaging the attention of chemists, engineers, and manufacturers for many years, as yet no entirely satisfactory system has been proposed which will eliminate the personal equation of those who make the tests, a variation which renders the results inaccurate. On account of this personal error the endeavour should be to obtain apparatus and appliances to reduce it to a minimum.

Sneaton, in trying to determine the value of cements, placed balls made of them in water, thus showing their hydraulic properties.

Vicat devised an apparatus to measure the amount of penetration of a needle into a mass of the gauged cement, the amount of penetration being proportional to the hardness. A modification of this apparatus is now used to determine the setting time. A common early method of testing the cementitious value was to stick bricks together with the cement under examination, one at a time projecting horizontally from a wall. The cement which held the greatest number of bricks was considered the best. In this test no distinction was made between quick and slow setting cement, so that the former was adjudged superior. In 1830, six years after Aspdin took out letters patent for his Portland cement, Pasley, from his experiments, endeavoured "to lay down rules for judging the quality of cement offered for sale, and for ascertaining whether it has been adulterated or not, by attending to which the most inexperienced person may easily detect such frauds in twenty-four hours or less." Considering our present difficulties in cement testing, Pasley's statement, "that rules have been laid down by which their comparative strength may be judged of experimentally and in a short space of time, such as ten days, with very little trouble and the greatest accuracy," is very amusing. Pasley's method of testing the strength of mortars was to stick two bricks together with them, and, after allowing a certain time for hardening, he suspended them from a tripod, a pair of clamps fixed on the upper brick and a similar pair on the lower one, and, attaching weights thereto, noted the weight required to pull the bricks apart. He also ascertained the time required for cement to harden under water.

In 1858 John Grant, Engineer for the London Metropolitan Board of Works, began his well-known tests for Portland cement. He was the first to introduce definite methods, and he devised a machine for testing tensile strength. Later, Fajja showed the importance of testing the soundness of cement, and devised an apparatus for the purpose. Michaelis devised a short-lever machine; Fajja also introduced a similar one. The development of methods of testing came slowly after Grant set the pace and Michaelis and Fajja had improved and extended them.

Different committees and associations formulated rules, which served their purposes for the time, but, with the more general use of cement and the introduction of specifications, new methods had to be introduced and old ones improved on. A great deal of work has been done in this way by the German Association of Cement Makers, by the commission appointed by the French Government in 1891, and by the various conferences of the international association for testing materials. With this short *résumé* of the development of cement testing, it is proposed to consider the different tests and methods now in use in detail. As the majority of cement tests are made by mixing the sample under examination with water, and moulding into briquettes, blocks, pats, etc., it would be well to consider first of what consistency the paste for these should be, for on this depends the results obtained.

The paste should be of a normal or standard consistency, but, as nearly every operator has a different idea of what a stiff plastic paste should be, this consistency varies greatly.

At the Charlottenburg testing laboratories

the percentage of water to be used is obtained by mixing the sample to a syrupy paste, so that it will run from a spatula in long thin threads without forming lumps. Representing the quantity of water to produce this condition by N, then the percentage of water W required for normal consistency is obtained by the

$$\text{equations } W = \frac{N + 1}{2} \text{ for neat tests, and } W = \frac{N + 3}{4} \text{ for sand tests (three parts sand.)}$$

one cement). This gives a suitable paste for use with the Boehme Hammer apparatus, and is nearly of the same consistency as is the most general practice in this country. Another method in use in Germany is to make a paste to fill the mould of Vicat's needle apparatus, replacing the needle with a rod 1 c.m. in diameter, and weighted with 300 grammes. The penetration of the rod to a certain point gives the percentage of water required.

Some testers, again, prefer to use the minimum quantity of water—that is, just sufficient that, after beating the cement paste into the moulds, enough moisture rises to the surface to enable the cast to be faced with a trowel or spatula. In America the general practice is to mix rather wet, so the paste can be kneaded with the hands. Although none of the methods are entirely satisfactory, that as practised at the Charlottenburg laboratories might be universally adopted, as, when carried out in a proper manner, the most uniform results can be obtained. Numerous mechanical contrivances have been devised for mixing the cement into the required paste, but the objections to them all are that the cement tends to ball and it is difficult to tell when the mixing is complete; while quick-setting cements often begin to set during the mixing. To hand gauging the operation is fully under control, and the experienced operator can tell by the appearance of the paste when the mixing is completed. The author finds a very thorough mixing can be done in a large porcelain mortar, using care not to grind the cement particles. The mixing should always be done on some non-absorbing, non-corrosive surface, such as plate-glass, slate, or marble, otherwise water will be absorbed from the paste, rendering it drier than intended, and so materially affecting the results. The cement or mortar should be thoroughly mixed till the water is distributed evenly through the particles. In Germany the custom is to mix slow-setting cement three minutes, and quick-setting one minute, but the experienced operator tells from the appearance when the cement is sufficiently mixed. Should the paste begin to stiffen during the mixing the cement has begun to set, and should be thrown away, making another trial with more water. The addition of water to a paste which has begun to set must not be resorted to, as this would destroy the crystallisation of the cement compounds. Whatever forms the mortar is moulded into, care must be taken to keep them moist during setting, the hardening being a chemical change and entirely dependent on the water used in mixing.

The casts should be preserved in moist air or covered with a damp cloth, keeping it from coming in direct contact with them, otherwise the cloth may dry out and absorb water from the cast. A damp box is the most suitable arrangement, and the temperature can be kept even.

Having worked the cement into a suitable paste, the next step is to determine its various properties. In valuing a cement one of the most important, and in many cases the only test it is subjected to is the determination of its strength. The setting of cement is the change from a fluid to a solid state. When it has set, the process of hardening has commenced.

The relative degree of hardness is measured by determining its compressive, adhesive, or tensile strength.

In this country the compressive test is seldom done; in Germany it is always done along with the test for tensile strength.

For compression tests the specimens are usually 2-in. cubes. The machine in which they are broken should not be of large capacity, since the friction, which increases with the load, has an influence on the results, especially on cubes tested at short periods. Usually the compressive strength is eight to ten times the tensile strength. The chief point requiring attention in testing for compressive strain is that the weight is distributed evenly over the

OBITUARY.

Mr. MITCHELL.—We have to announce the death, on July 21 after a long illness, of Mr. W. E. Mitchell, aged forty-four years. Mr. Mitchell was a member of the firm of Messrs. William Henry Mitchell, Son, and Gutteridge, of No. 9, Portland-street, Southampton, architects. Of the more principal works carried out by his firm we may instance the Royal Southampton Yacht Clubhouse, Above Bar, Southampton (Mr. W. H. Mitchell) the Infants' School, Totton, near Southampton; the Board Schools at Eastleigh, Hants; the boiler-house, chimney-shaft, etc., South Stoneham Union Work-house, at West End; the school buildings in Ludlow-road, Woolston; the decoration, with repairs, improvements, new pulpit, etc., of the Congregational church at Freemantle, Hants; the town hall and offices, with fire-station, stables, men's quarters, etc., for the District Council of Eastleigh, for which they won the first premium in competition; the Crown Hotel, Lyndhurst; Taunton's Trade Schools, Southampton, opened in March, 1899; the workhouse infirmary, for about 300 patients, at Shirley Warren, for the Guardians of the Poor of the Southampton Incorporation (1900-2), Mr. A. F. Gutteridge being, we believe, mainly responsible for the preparation of the plans and designs as architect of the building; drainage and other works at West End, Southampton, for the South Stoneham Board of Guardians; St. John's Mission Hall, in French-street, and the Highfield Hotel, in Church-street, Southampton; the schools in the High-street, Pear Tree Green, for the St. Mary Extra United District School Board, Hants; additions, with new classrooms, etc., to the Harley University College, Southampton; and the recent improvements, with iron fire escape, staircase, and bridge, and so on, at the Southampton Workhouse for the Guardians.

GENERAL BUILDING NEWS.

ST. PATRICK'S CATHEDRAL, ARMAGH.—The Roman Catholic Cathedral of St. Patrick has just been consecrated by the Papal Legate, Cardinal Vannutelli. St. Patrick's Cathedral stands on a very high eminence at the approach to the City of Armagh. It faces the approach to the City, and stands on an ancient Cathedral, which also stands on an eminence, and was commenced in the year 1840. The work of rearing the cathedral was continued slowly, and, in the end, with considerable alterations in the original plans. In its completed form the building is cruciform in plan, comprising nave, aisles, and transepts, with chancel and choir. The total length in the clear is 212 ft., the internal length 208 ft., the breadth across the transepts 120 ft. The length of the nave is 114 ft., the length of the chancel 60 ft., and breadth of nave and chancel 75 ft. The transepts are 41 ft. by 34 ft., and the choir is a square of 38 ft. The external roof is 100 ft. in height, the internal one 81 ft. The two western towers and spires rise to a height of 210 ft., and are surmounted by 10-ft. crosses. The crossing of the roof where the transepts intersect the nave is supported by four arches 80 ft. high by nearly 40 ft. wide. The principal entrance is on the west end, comprising a large central doorway and two smaller flanking doorways in the towers. There are also auxiliary doorways in the transepts, a doorway which originally opened under the east window in the chancel wall having been filled up on the erection of the Lady altar. The entrance from the sacristy is in the same chancel wall, between the Lady altar and St. Joseph's altar in the northern aisle. The building has a seven-terraced flight of steps, 225 ft. long, leading from the entrance gates to the piazza that fronts the western doors. In the interior there are some fine mosaic decorations on the walls. The subjects are very diverse, many being Irish themes, such as St. Brigid founding her monastery at Kildare, but Biblical subjects have also been availed of. The great attraction is the crossing where the high altar stands, the six spandrels of which, over high arches, are inlaid with mosaic figured subjects in gold and colour, representing "The Good Shepherd," "The Resurrection," "Christ and Magdalen," and "The Ascension." The one facing towards the nave contains a picture of St. Patrick converting and baptising the Irish. The subjects of the decoration of the ceilings are incidents in the lives of the Irish saints, from St. Patrick to St. Laurence O'Toole. The panels contain pictures of many of the saints, prophets, and patriarchs. For the marble work about thirty different types have been used. The Gothic high altar, which stands against the rood screen in the crossing, is executed in statuary marble. The front contains a panel group, after Leonardo da Vinci, by the Roman sculptor, Signor Cesare Aureli. Two years and more Professor Aureli devoted to this work. It is

an alto-relievo presentation, in white statuary marble of Carrara, of Leonardo da Vinci's "Last Supper." The pulpit is the work of Signor Medici, of Rome. It stands against the main south-western pier at the crossing. The work is carved and resplendent with inlays of various old marbles. The width of the body of the pulpit is over 6 ft., and the plinths and cornice stones are all got out in solid marble blocks. The plan is octagonal, with angle niches containing figures of the four Evangelists, St. Patrick, and St. Brigid; the canopies above these statues being ground and carved. The panels between the niches are filled with tracery and inlaid marble. The Stations of the Cross take the form of fourteen plaster statuary groups in alto-relievo, resting on semi-circular pediments, springing from the wall level, and ornamented with Gothic foliated tracery and flowers. Behind each group a Gothic arched and moulded panel forms a background, having in its upper portion a small inlet in quatrefoil shape for the reception of the wooden cross necessary for the attachment of the indulgences of the Via Crucis. There are nineteen stained-glass windows. The architect was Mr. C. J. McCarthy, of Dublin.

RENOVATION OF PETWORTH PARISH CHURCH.—The parish church of St. Mary, Petworth, has been reopened after alteration. After inspection of the building, a report on the fabric was drawn up and prepared by Mr. C. E. Kempe, with whom was associated Mr. Walter E. Tower, architect; and Lord Leonfield undertook to bear the expense of the restoration of the whole of the nave, aisles, and the north chapel, which is dedicated to St. Thomas of Canterbury.

CONGREGATIONAL CHURCH, EPSOM.—The foundation-stones of the new Congregational Church in Church-street, Epsom, were laid recently. The building will accommodate about 500 people, the dimensions of the main building being 80 ft. by 37 ft. The fabric will be of Corsham Down stone with red brick facings, and at the front will be a square tower, with a spire 70 ft. high. There will be a main entrance leading into a vestibule, an entrance beneath the tower, and a side entrance. The flooring will be of wooden block, the seating in Orham wood, and the roof of open timber. There will also be a west end gallery to seat eighty people. Two vestries are provided for at the rear of the chapel. The lighting will be by electricity, and the heating on the low-pressure system. The architects are Messrs. T. Gregg and C. Stapley, and the builders Messrs. Cropley Brothers.

ADDITIONS TO THE GRAMMAR SCHOOL, DRAX, NEAR SELBY.—The foundation-stone was recently laid of the new wing which is being built on to the grammar school at Drax. The work is being carried out from the designs of Mr. Thomas S. Ullathorne, architect, Selby, by Messrs. Jackson and Dunberline, builders, Goole.

ENLARGEMENT OF BURNTWOOD OLD SCHOOLS, STAFFORDSHIRE.—The memorial-stone for the enlargement of the Sunday schools connected with the old schools at Burntwood was laid recently. The new buildings comprise a schoolroom, 57 ft. 6 in. by 25 ft. 5 in., and two classrooms, 18 ft. by 16 ft., giving accommodation for 300 children, in addition to the 150 children provided for in the old schools. The work has been placed in the hands of Mr. Robert Harris, builder and contractor, Sheffield. The new buildings have been designed by Mr. H. E. Lavender, architect, Walsall, and are of brick.

WORKHOUSE EXTENSIONS, YORK.—At a meeting of the York Board of Guardians on the 21st ult., Mr. Snaith moved that sanction be given to the proposal of the Building Committee to erect a new tramp ward and nurse quarters, and the motion was ultimately carried. It was resolved that Mr. J. H. Morton, architect, South Shields, be appointed to carry out the work.

CONSERVATIVE CLUB, SUTTON-IN-ASHFIELD.—The memorial-stone was recently laid at Sutton-in-Ashfield of a new Conservative club, on a site centrally situated in Portland-square. Mr. F. P. Cook, of Mansfield, is the architect of the new premises, and the contract has been secured by Mr. J. Greenwood, of Mansfield, the estimated cost being 1,500l. The building will be of brick, with limestock facings and stone dressings. The main entrance will face Forest-street, and on the ground floor there will be the billiard-room, with accommodation for two tables, a smoke-room 14 ft. by 13 ft., and serving bar, with direct communication to the billiard-room. The club-room upstairs will be 42 ft. by 28 ft. Accommodation for a caretaker will also be provided.

FIRE STATION, ARDYOYNE.—The new branch fire station, which has been erected at Ardoyne, by the Council of the County Borough of Belfast, was opened on the 27th ult. The building is Georgian in style,

KING'S COLLEGE, LONDON:

LIST OF PRIZE WINNERS, 1903-4.

DIVISION of Architecture (day school).—History of Architecture—1st division, H. Niemann Smith, silver medal. Studio—1st year, W. Hoyle, 1l. in books. Building Construction—2nd year, 1st division, H. Niemann Smith, 1l. in books; 1st year, 1st division, W. Hoyle, 1l. in books. Faculty of Arts:—Division of Architecture (evening)—1st division, W. H. Judges, 1st prize; W. Fern, 2nd prize. Sketching Class—S. Ixer, prize. Quantities—Chas. C. Blomfield, 3l. in books; Alex. W. Percival, 2l. in books; Wm. F. Foster, 1l. in books. Constructional Drawing—W. J. Burton, silver medal; G. Winteringham, 3l. in books; E. F. Wicks, 2l. in books; J. Perkins, 1l. in books. Building Construction—Wm. F. Foster, silver medal; A. W. Percival, bronze medal; W. J. Burton, 1l. in books; E. A. Townsend, 2l. in books. Sir George Faudel Phillips' bronze medal for Sanitary Building Construction—W. H. Judges.

WESTMINSTER CITY COUNCIL.

The usual meeting of this Council was held on Thursday last week, at the City Hall, Charing Cross-road, W.C.

Hoborn to Strand Improvement.—The General Purposes Committee reported that they had caused a representation to be made to the London County Council that, in consequence of the very great loss of rating to the City of Westminster through the large tracts of land at present unoccupied on the route of the above improvement, the County Council should immediately consider such other conditions of agreement for the disposal of such land as would permit the land to be occupied on equitable terms. The action of the Committee was endorsed.

South African War Memorial.—On the recommendation of the same Committee it was agreed to consent to the erection of a memorial to the officers and men of the Royal Artillery who fell in South Africa, in Waterloo-place, opposite the Guards' memorial.

Middlesex Guildhall.—The report of the Works Committee contained a recommendation, which was agreed to, to permit the Middlesex County Council to alter the building-line in Little George-street, at the rear of the Guildhall.

Victoria Station Enlargement.—On the recommendation of the Committee, it was agreed to authorise the City Engineer to issue a licence for the erection of a hoarding on Eccleston Bridge, in connexion with the enlargement of Victoria Station, on the application of Messrs. Maxwell and Co.

Wardour-street Widening.—On the recommendation of the Improvements Committee it was referred to the Law and Parliamentary Committee to consider and report on the advisability of promoting a Bill in Parliament to authorise the Council to carry out the widening of Wardour-street.

COURT OF COMMON COUNCIL.

The usual fortnightly Court of Common Council was held in the Guildhall, E.C., on Thursday last week.

By-laws with regard to Closets, etc.—The Sanitary Committee submitted a copy of by-laws under the City of London (Various Powers) Act, 1900, with respect to water-closets, earth-closets, ashpits, cesspools, etc. The City Seal was affixed to the copy of the by-laws.

Removal of the "Obelisk," St. George's-circus.—On the recommendation of the Bridge House Estates Committee, it was agreed to consent to the erection of a clock-tower on the spot now occupied by the Obelisk, St. George's-circus, on condition (among others) that the Southwark Borough Council re-erect the Obelisk on a spot to be hereafter agreed upon.

The Demolition of Buildings in the City.—A letter was received from the Local Government Board enclosing the by-laws made by the Court on March 24 last, sealed and confirmed by the Board.

CHURCH, ROOKHOP, DURHAM.—The foundation-stone has just been laid of a new parish church for the village of Rookhope. The architects are Messrs. Carrol and Passmore, London, and the builder, Mr. Wm. Hall, of Gateshead.

and the outer elevations are in red brick, relieved with white Scotch sandstone dressings. The interior walls throughout are of bricks, plastered with cement dado. The roofs are covered with Welsh Countess slates. The contractors for the building were as follows:—Mr. Hurcheson Keith, builder; Messrs. James Loudon and Co., plumbers and gasfitters; Mr. Stanley Johnston, electrician; Messrs. Musgrave and Co., Ltd., stable fittings; Mr. Thomas Foy, automatic door fittings; and Messrs. Young and Mackenzie, architects.

THE ROWTON HOUSE, DOG BANK, NEWCASTLE-ON-TYNE—It is proposed to erect this building in Dog Bank, at the foot of Pilgrim-street. The plans have been passed by the Town Improvement Committee, and the scheme has the approval and support of the Corporation. The plans have been prepared by the architect, Mr. J. C. Maxwell. The building has a frontage of 162 ft. on the Dog Bank, sloping to the east, and a mean height of 74 ft.

BANK PREMISES, BRISTOL—The new premises of the London and Provincial Bank, Ltd., No. 3, Clare-street, were opened on the 2nd inst. The building is of Doubling stone, with polished granite base, and is in the later Renaissance style. Messrs. Oatley and Lawrence were the architects, Messrs. R. Wilkins and Sons being the contractors, and the carving was done by Mr. Gilbert Seale, London.

MINERS' HOMES, BACKWORTH, NORTHUMBERLAND—The chief corner-stones for the seventh colony of cottages in connexion with the Northumberland Aged Mine-Workers' Homes Association were laid recently at the West Allotment, near Backworth. The cottages are being built by Mr. G. Burdiss, contractor. Costing £10,000, from the plans of Mr. T. Tulip, Chop-lington.

THEATRE, LIVERPOOL—The Queen's Theatre, Paradise-street, Liverpool, has just been opened. From floor to ceiling the house has been reconstructed. Seating accommodation is provided for 2,000 people within view of the stage. Eight boxes on the stalls and circle level each accommodate six persons. The stage, 27 ft. wide, 26 ft. high, and 53 ft. long, has been reconstructed, and fitted with a freepiece curtain. Mr. J. H. Havelock Sutton was the architect engaged, the builders being Messrs. Holme and Green.

APPOINTMENTS.

KING'S COLLEGE, Mr. Arthur Stratton has been appointed lecturer in the Architectural Division of King's College, London, in succession to Mr. C. H. Reilly, and Mr. Ronald P. Jones has been appointed assistant lecturer to Mr. Stratton.

SANITARY AND ENGINEERING NEWS.

GOSPORT AND ALVERSTOKE MAIN DRAINAGE.—Gosport and Alverstoke are situated on the western side of Portsmouth Harbour. The whole district comprised in the area to be drained is very flat, the greatest difference of level being 22 ft. The difficulty of draining the district is increased by its peculiar conformation, there being no less than four creeks which penetrate the district—viz., Forton Lake, Haslar Lake, Workhouse Lake, and Stoke Lake; therefore, before considering the general details of the scheme to be adopted, it was first necessary to consider how and where the sewage should be dealt with—viz., whether the creeks should be used as outfalls, or whether there should be one main outfall into the sea. The creeks are left dry at low water, exposing a large surface of mud, which, owing to the sewage at the present time being discharged into the creeks, is in a very offensive state. The lowest portions of the district are on the borders of these creeks, and are separated from each other by intervening ground at a higher level. A sea outfall was selected for the following reasons:—A higher state of purity in the effluent would be required if discharged into the harbour than would be necessary if discharged into the open sea. Furthermore, the creeks being left dry at low water, the outfall sewers would have to be taken to the mouths of the creeks. The iron sewers required to carry the effluents to low water would cost a very large sum. A septic tank would be required for each of the four outfalls. Furthermore, the land required for each of the four tanks would be very difficult and costly to obtain. After examining the shore, the deep-water channels, and set of the tides, the point selected for the outfall is near the western boundary of the district. The flatness and low-lying nature of the district to be drained, rendered a pumping scheme necessary, but the waterlogged nature of the ground rendered the deep sewers necessary for a central pumping station impossible. The present population is between 27,000 and 30,000; the prospective population is taken at 40,000. The volume to be dealt with is as follows:—From rainfall, 650 cu. ft. per min.;

from sewage (twice the average flow), 267 cu. ft. per min.; total to be dealt with in tanks, 897 cu. ft. per min.—say 900 c.f.m., 1225 c.f.m. per person, 202½ gallons per day per person. The outfall fittings are the sewage at the eighteen different points are Shoue's ejectors, in duplicate, at each station, supplied with air from air compressors in duplicate at a central station in Westfield-road. The sewage is treated in septic tanks before being discharged into the sea, but there are no contact beds, as the effluent is discharged into the sea. Briefly, the works consist of, for the district:—26 miles of sewers varying in size from 6 in. diameter to 3 ft. diameter, thirteen ejector stations varying in size from 50 gallons to 800 gallons; 2½ miles of rising mains; 7½ miles of air mains; a tank 300 ft. by 75 ft.; two 180 h.p. air compressors. On Government property there are five ejector stations. The whole of the works have been carried out under the supervision of Mr. R. St. George Moore, M.Inst.C.E., of Victoria-street, Westminster, assisted by Mr. Herbert Frost, A.I.M., and C.E. The contractors for the general works being Messrs. B. Cooke and Co., of Westminster, and for the machinery, Messrs. Hughes and Lancaster, of Westminster.

MISCELLANEOUS.

NATIONAL REGISTRATION OF PLUMBERS.—A conference of representatives of the six District Councils for the National Registration of Plumbers in Scotland was held recently in Glasgow. The meeting was convened by the Glasgow and West of Scotland District Council, which took the opportunity of the assemblage of the Sanitary Institute in Glasgow to bring together the representatives of the Scottish councils, some of whom were members of the Institute, for the consideration of various matters connected with the registration movement, including the existing facilities for the education of the young plumber in the theory and practice of his art, the conditions at present prevailing for admission of qualified masters and operatives to the list of registered plumbers, the prospect of Parliamentary legislation, and other matters. Ex-Bailie James Dick presided. On the subject of education, general admiration was expressed at the arrangements which have been made in Glasgow for the works of the Technical College, where, under the supervision of the Scottish Education Department, the theoretical and practical plumbing classes are now under the management of a committee reporting to the Governors, but containing a full representation of the District Registration Council and the plumbing trade. It has further been arranged that the College, as well as the Technical College, an examination, which has been approved by the Scottish Education Department, the District Council, and the Worshipful Company of Plumbers, and the last-mentioned body has seen its way to accept the results of that examination as equivalent to its own. A full interchange of opinion on topics of importance to the movement took place, and, at the conclusion of the conference, Ex-Bailie Crawford reported on the steady and persistent efforts which have been made in promoting the Plumbers' Registration Bill, and the very large amount of Parliamentary support which has been obtained from all quarters. The Bill had more than once passed its second reading in the Commons, and had once passed through all its stages in the Lords; but the excessive difficulty of passing private members' Bills was the chief cause of the disappointing delay in obtaining an Act. On the motion of Mr. James Hyslop, Dumfries, seconded by Dr. Crawford, the conference agreed to place on record its sense of the value of the registration movement and of its advantages to the trade.

Visit of Plumbers to London.—A party of Dusseldorf master plumbers recently visited the metropolis, and devoted a day to craft matters. The arrangements were made by the London Society of Associated Master Plumbers. The new buildings of the Royal London Friendly Society, in Finsbury-square, were first visited, where there was an exhibition of British workmanship. Luncheon followed at which the London representatives were the guests of their German friends. After luncheon, the Guildhall was visited. Having been conducted through the museum, the great hall, and the Council chambers, the party journeyed to Parke's Museum, and here the various sanitary exhibits were studied. Next the Polytechnic was visited, and to conclude the programme, the Dusseldorf masters were entertained to luncheon by the London Society. The Dusseldorf masters have resolved to form an institution in their own country based on the organisation of master plumbers in this country. Messrs. J. J. Rawlings, R. A. Marshall, J. Johnson, and J. Wright Clark conducted the party on behalf of the London Society.

DEVONSHIRE STREET, W.—A memorial-tablet has been affixed against the front of No. 56, Devonshire-street, Portland-place, being the house occupied by Sir John Herschel in 1824. At their meeting on Friday, July 23, the Borough Council of Islington passed, by thirty-six votes to seventeen, a resolution for the adoption of the Free Libraries Acts without a limit of the rate to 1d. It was announced at the meeting that Mr. Carnegie would undertake to defray the cost of the buildings provided the Council would find the site and would levy a 1d. rate.

WAR MEMORIAL, ISLINGTON.—A memorial statue in bronze will be executed by Mr. McKelland to commemorate the ninety-one inhabitants of the borough who fell in the South African campaign. The statue, a female figure symbolical of victory, will follow a design recommended for adoption by Sir E. J. Poynter, P.R.A., and Sir W. Richmond, R.A., and will be erected in Highbury Fields, at a cost of about 800l.

RAMSEY ISLAND, SOUTH WALES.—The Ecclesiastical Commissioners have just sold to Mr. Wynford Philipps, M.P. for Pembrokehire, the island of Ramsey, together with the chapel of St. Justinian on the opposite sea-coast. The chapel forms one of several resort of missionaries and pilgrims in olden days. Its erection is ascribed to Bishop Edward Vaughan (1505-23), who built the chapel, on the east side of the chancel of St. David's Cathedral, wherein he was buried. Ramsey Island has been somewhat fancifully termed the "Iona of Wales," by reason of its ancient association with the church founded by St. David in the Vth century.

SWEDISH GRANITE.—Mr. Schele, British Vice-Consul at Halmstad, writes that about 30 per cent. of the entire export of granite from that district has been lately shipped to the United Kingdom. The price obtained this year is no less than 8s. per ton below that of two years ago. This has caused a severely felt loss to producers, but now, since the price of labour has been considerably reduced and improved methods of manufacture introduced, it is hoped that this export, which is so important both to the port and district, may be maintained and further increased. The local quarrying company having purchased a German patent for shapin granite, a new article for street-paving purposes will be placed on the market for export from Halmstad and from the Lysekil district. The paving sets turned out by these machines are of a smaller size than the ordinary ones, and are specially suitable for streets and road work; their cost and manufacture is about one-third of the manufacture of ordinary paving stones.

THE ABBOT'S HOUSES AT ARBROATH.—Negotiations have been opened between the Arbroath Town Council and H.M. Board of Works for Scotland for the transference from the former to the latter, under the Ancient Monuments Preservation Acts, of the ruins of the Abbot's House, adjoining Arbroath Abbey ruins. Abbot's House is said to be one of the oldest inhabited buildings in Scotland, and King Robert the Bruce and other Scottish monarchs were occasionally entertained there. The basement or sunk floor is the kitchen of the house, and remains just as it was centuries ago, untouched. The masonry is described as being very fine. The wine-cellar is also on the basement floor. The proposed transference has been brought before the Town Council, and is discussed adjourned pending a conference with the representatives of the Crown.

FIRE TESTS OF THE BRITISH FIRE PREVENTION COMMITTEE.—On Thursday last week the British Fire Prevention Committee had a series of testing operations on their Porchester-road testing ground. The tests were attended by Major-General Festing, on behalf of the Council, and several members of the executive, together with a number of public officials from the Government departments, the London County Council and other corporate bodies, the insurance companies, and the fire service. The first test was with a plastic partition under 2½ in. thick constructed by Messrs. Knechtel. The fire was of one and a half hours' duration, the temperature reaching 1,800 deg. F., and water being applied for two minutes. This was a test for the "Partially Protective" class, under the new International Standards of Fire Tests. The partition was the first of its kind to attempt this standard. The second test was with a partition 3 in. thick constructed of a pumice product by Messrs. Cullum. The fire

was for a period of two hours, at temperatures reaching up to 2,000 deg. F., followed by the application of water. This was also for the "Partially Protective" class, under the new International Standards, the extra thickness over 2½ in. being met by the additional time during which the partition was subjected to the test. To attain the "Fully Protective" class a partition must be under test for two and a half hours if under 2½ in. in thickness, or four hours under test if over that thickness. The third test was with sprinklers by the Albion Sprinkler Company, and comprised a systematic series of full-sized and laboratory tests with sprinklers, both dry and wet, relating more particularly to their sensitiveness and their powers of water distribution. The fourth test was with vapour lamps by Petrolite, Ltd. These were lamps in which the vapour is produced from petrol. The tests were mainly in respect to ignition and explosion when upset, broken, etc.

THE PULPITS OF WESTMINSTER ABBEY.—The marble pulpit, which was shown in the Great Exhibition of 1851, and, until lately, stood in a bay of the nave of the Abbey, has been taken to St. Anne's Cathedral, Belfast. It was carved by Wm. Field, after Sir G. G. Scott's designs, and presented in January, 1851, to the Abbey for the Sunday evening services. In its place has been set up the XVth century pulpit, formerly kept in Henry VII.'s chapel, in which, it is said, Craumer preached at the coronation and the funeral of his god-son, King Edward VI. That earlier pulpit, constructed of oak, is of what is termed the wine-glass shape, having six sides and a slender pedestal. Portions of another pulpit, used in the XVIIIth century, have for a long while been stored in the triforium; its successor was removed from the choir in 1827 to the church at Trotterscliffe, near Maidstone, and to that succeeded another which, having been removed to Shoreham, gave place to the marble one mentioned above.

Legal.

CLAIMS FOR REMUNERATION:

HURRELL AND TAYLOR v. AINSCOUGH; MATEAR v. AINSCOUGH.

THESE actions were tried together. The plaintiffs in the first are quantity surveyors, and the plaintiff in the second, Mr. Huon Arthur Matear, is an architect, practising in Liverpool. Both claims were for professional fees and costs on account of work done. Mr. Horridge, K.C., and Mr. Greer were for the plaintiffs, and Mr. Pickford, K.C., and Mr. Keogh for the defendants. It was stated by Mr. Horridge, in opening, that Mr. John Ainscough, who is a miller in a large way of business at Burscough, decided in 1902 to build at that place a residence to cost, including furniture, about 10,000l. Mr. Ainscough at that time lived at Southport. He consulted Messrs. Waring and Gillow, through whom the preparation of the plans was entrusted to Mr. Matear, who is architect of the Assize Courts at York, of the new Liverpool Cotton Exchange, and other buildings. The house at Burscough was to be a first-class gentleman's residence, with a great deal of oak-work about it. Mr. Matear took the matter up, and, as the furniture and fittings were to cost some 2,000l., prepared the plans, about which, as this was to be an artistic piece of work, there was a great deal of detail. Some difficulty, however, arose as to the cost. One part of the defence, said counsel, was that Mr. Matear was told to prepare plans for a house to cost 5,000l., but that, it was now suggested, was an afterthought, because from the correspondence and interviews the idea formed of the cost of the building was roughly 8,000l. To get a close idea of the cost Messrs. Hurrell and Taylor were engaged to take out the quantities, and this was done. Afterwards Messrs. Waring, as contractors, sent in on the basis of the quantities an estimate for building amounting to 7,114l. However, Mr. Ainscough, in a subsequent interview with the building manager of the contractors, said that, as he had lost money on the cora market, he would like the plans modified so as to reduce the cost to 5,000l. This was done, and the estimate was cut down to 5,500l. In June Mr. Ainscough intimated that he had decided not to build, and the business, having gone off, the architect and the quantity surveyors brought these actions to recover their fees, which were, in each instance, 2½ per cent. on the first estimate of cost. The defendant declined to pay, on the ground that, as the matter had fallen through, he was not liable for percentage charges. Mr. Matear, in his evidence, said 2½ per cent. was the usual charge for drawing the plans of a building of this class.

The hearing was adjourned, and the parties subsequently agreed to accept judgment for Mr. Matear for 105l. and costs, and for Messrs. Hurrell and Taylor for 100l. and costs.

CIVIL ENGINEER'S ACTION FOR FEES.

THE case of Robinson v. Cadogan came before Mr. Justice Lawrence, sitting without a jury, in the King's Bench Division on the 1st and 2nd insts.—an action by Professor Henry Robinson, civil engineer, to recover 400l. for professional services alleged to have been rendered to the defendant, Earl Cadogan, in advising him with respect to his opposition to a certain sewage scheme.

The defence was that the charges, which included 10l. 10s. a day for twenty-seven and a half days, for the plaintiff's own services, in addition to charges for his assistants, were excessive and unreasonable.

Mr. C. A. Russell, K.C., and Mr. F. Newbolt appeared for the plaintiff, and Mr. Lawson Walton, K.C., and Mr. J. R. Atkin for the defendant.

Mr. Russell, in opening the case, said that the defendant was the principal landowner in the neighbourhood of Westoe, near Bury St. Edmund's. In 1903 the Corporation of Bury St. Edmund's were about to apply to the Local Government Board for a loan to enable them to carry out certain works in connection with a sewage farm they possessed. That sewage farm had been a nuisance to the neighbouring landowners, and it was important to them that the Corporation scheme should be adequate and efficient. Defendant accordingly was anxious to have advice in the matter to enable him to determine whether he should oppose the scheme or not, and for that purpose he retained the services of the plaintiff. With regard to the defence, the learned counsel submitted that it was impossible for a man like the plaintiff to take up the position of critic without being prepared to suggest a better method of dealing with the sewage. As to the amount of the charges, the learned counsel submitted that, if the defendant employed a gentleman of high standing, like the plaintiff, he must pay the plaintiff's usual and proper fees.

The plaintiff, examined, said he spent the time charged for in preparing his report. His charges were quite usual and recognised for persons in his position.

Cross-examined,

He had formed the opinion that the first scheme was sufficient, but the alternative scheme would be more perfect. His item charges for the report amounted to between 70l. and 80l. only, but the past fee would have been 100 guineas.

Mr. Charles Hawksley, past-President of the Institution of Civil Engineers, and Mr. J. C. Mellis, M.I.C.E., gave evidence to the effect that the plaintiff's charges were reasonable and proper in the circumstances.

The evidence of Mr. Geo. Strachan for the defendant was interposed at this point. He said he had been Engineer to the Borough of Bury St. Edmund's and to advise the Borough of Bury St. Edmund's as to the sewage scheme. He advised a mechanical scheme, costing about 8,000l., and if this was not sufficient, then, in addition, a bacteriological scheme, costing an extra 15,000l. There was no difference of opinion between himself and the plaintiff, except as to whether the whole thing should be carried out as one scheme.

Mr. Keith Robinson, the plaintiff's son and his chief assistant, gave evidence as to the time spent on the work. His time, he said, was charged at 2l. 2s. per day of seven hours.

This being the plaintiff's case,

Mr. Walton, on behalf of the defendant, submitted that the claim had arisen out of a misapprehension on the part of the plaintiff as to the work he was engaged to do. The plaintiff was only asked to come to a conclusion as to whether the scheme of the Bury Corporation would be satisfactory. The plaintiff reported that Mr. Strachan's complete bacteriological scheme was satisfactory, and when the plaintiff had done that he had done all that the defendant required. But the plaintiff went further, and suggested an improvement of his own, and the whole of the account relating to the alternative scheme ought to be struck out. The learned counsel said that, with regard to the plaintiff's report, it would be straining the scale of professional remuneration to put it at 100 guineas.

Lord Cadogan gave evidence to the effect that he did not ask anyone to prepare a special scheme.

Cross-examined,

He directed no inquiries as to what plaintiff's charges would be, as he trusted that a gentleman in the plaintiff's position would charge proper fees.

Mr. M. W. Mortimer, defendant's agent at Culford, said he had not given plaintiff instructions to prepare an alternative scheme.

Sir A. Binnie, Engineer to the London County Council, stated that he did not think,

in the circumstances, it would be usual to prepare an alternative scheme.

This evidence concluding the defendant's case, counsel addressed his lordship, and, in the result, judgment was reserved.

THE ACTON ANCIENT LIGHT DISPUTE:

MANDATORY INJUNCTION GRANTED.

IN the Chancery Division, on the 2nd inst., Mr. Justice Kekewich delivered judgment in the case of Kine v. Jolly, the action by Mrs. Kine, the owner of a house, known as "Woodthorpe," in Accia-road, Acton, against Dr. Jolly, the owner of an adjoining house, claiming a mandatory injunction, or, in the alternative, damages for the obstruction of her ancient lights.

The facts of the case and the evidence were fully reported in the issues of the *Builder* of July 23 and 30 last.

His lordship, in giving judgment, said that the first question was, whether the plaintiff had a cause of action. That question had to be considered on the lines of the recent decision in the House of Lords in the case of the Home and Colonial Stores v. Colls, which laid down a rule admittedly difficult of application, but, in itself, comparatively simple. The Lord Chancellor had said that the question in each case was, whether the obstruction of light amounted to a nuisance which would give a right of action, and Lord Lindley said that the question to be decided was not how much light was left, but whether the plaintiff had been deprived of so much light as to constitute an actionable nuisance. In the present case, that there had been an obstruction of light, sufficient to be felt, was clear and beyond dispute, and that was not contested. But the question was, was it such as to constitute a nuisance, and such as caused a material privation of light for practical purposes for business or occupation, and upon this depended plaintiff's right to maintain the action. At the first trial he was convinced that there had been interference by the defendant's building with the light of the plaintiff's drawing room, and he would thought, although it still remained a well-lighted room, there was some obstruction. He saw no reason now to alter that opinion, but, in accordance with the rule laid down by the House of Lords, he could not deem the obstruction of light to that room to be actionable, and he decided that, taking that room alone, the plaintiff had no cause of action. At the second trial there was put in a new question, viz., whether there had been an actionable obstruction of the light coming to the plaintiff's hall by reason of the defendant's building. The evidence was clear that this part of the plaintiff's house had a considerable amount of light, and, taken alone, he could not regard the obstruction as a nuisance within the meaning of the judgment in the House of Lords. The great cause of complaint was as to the obstruction of light to what had been called the morning room in the plaintiff's house. It was, before the erection of the defendant's house, an exceptionally well-lighted room, and even now was well lighted. The question was whether there was sufficient light left to enable the room to be used for the ordinary purposes of a room of that character? The evidence was that, in houses like the plaintiff's, being a suburban or country residence, the third room on the ground floor, not being the dining-room or drawing-room, was the most used. For the complete enjoyment of such a room good light was essential. That there had been a large obstruction of the light coming to that room by the erection of the defendant's house was abundantly clear, and he thought it was clear that there had been a large interference with the comfort of that room. There had been a considerable body of evidence as to the altered character of that room by reason of the erection of the defendant's house. He was convinced that the character of that room had been altered, and, although it was still a well-lighted room, it had lost, by the obstruction of light, one of its chief charms and advantages. Having given the evidence and all the circumstances full consideration, he had come to the conclusion that the obstruction of the light to the plaintiff's morning-room was a nuisance within the meaning of the authorities on that subject. The plaintiff, therefore, had a cause of action, and the question then was as to what form the relief should take. The plaintiff said that a mandatory injunction should be granted, and that damages would be inadequate for the injury she had suffered. In that his lordship agreed. There was no reason why the court should incline to damages rather than to an injunction. Under these circumstances he thought it his duty to grant a mandatory injunction, and the next point was as to what should be its form or extent. It was argued, on behalf of the plaintiff, that he must regard the nuisance to her house as a whole. He considered that

he must treat the obstruction as to the morning-room, plus the obstruction of light to the hall. He proposed to order the defendant to pull down so much of his house as caused a nuisance to the plaintiff by the obstruction of the light to the windows of the morning-room and the hall, as the same existed previous to the erection of the defendant's house. The defendant must pay the costs of the trial. His lordship said he desired to make these further remarks. The first was that he supposed the defendant might wish to take the opinion of the Court of Appeal on the matter. If he did, full opportunity for this should be given. To enable this to be done he thought the best course was, not to suspend the operation of the injunction, but to intimate, as he did, that no application to enforce the order would be regarded as proper so long as an appeal from his decision, presented with reasonable diligence, was pending. Should the defendant appeal, he suggested that the plaintiff's solicitors should not at present tax their costs; but if they did they must give the usual undertaking to refund the costs paid by the defendant if his appeal succeeded. His lordship said, in conclusion, he wished to offer this advice both to the plaintiff and the defendant. He had said that, in his opinion, damages were not an adequate remedy for the injury the plaintiff had suffered. They were, however, a partial remedy, and he thought the plaintiff would be well advised if the defendant offered it, to accept a substantial sum as compensation, and so put an end to the expenses of further litigation.

On Wednesday, the 3rd inst., Mr. Hughes, K.C., mentioned the case to the Court of Appeal, composed of Lords Justices Vaughan Williams, Romer, and Cozens-Hardy. The learned counsel said that he appeared for the defendant, and the previous day Mr. Justice Kekewich had granted the plaintiff a mandatory injunction. The case had previously been before this court, when he (Mr. Hughes) appeared for the defendant, Dr. Jolly. When the appeal was opened, his learned friend, Mr. Lawrence, who had represented the plaintiff in the court below, said that, having regard to the decision of the House of Lords in the case of the Home and Colonial Stores v. Colls, he could not support the judgment as it then was. It was said that Mr. Justice Kekewich had really misdirected himself. Their lordships then took the view that the matter must go back to Mr. Justice Kekewich for re-trial, and reserved the question of costs. The matter had now been back to the learned judge, and he had, as before stated, granted the plaintiff a mandatory injunction. Their lordships, when the case was last before this court, had stated that, if possible, the matter should be again brought before them during the present sittings in order that it might be disposed of while the court was constituted as at the present moment. The defendant not only desired to appeal from the original order, but also from the judgment delivered on Tuesday, granting the plaintiff a mandatory injunction.

Lord Justice Romer said that the defendant could only appeal from the final decision. Mr. Hughes supposed that would be so, as the original judgment of Mr. Justice Kekewich was discharged, the Court of Appeal reserving the question of costs.

Lord Justice Romer: You must appeal in the usual way. There is no reason why the appeal should be advanced.

Mr. Hughes: If your lordships think that the appeal should take its ordinary course, so be it.

SWINDON ANCIENT LIGHT DISPUTE.

THE hearing of the case of Cook v. Wm. McIlroy, Ltd. concluded before Mr. Justice Warrington, in the Chancery Division on the 28th ult., an action by the plaintiff, Mr. E. J. Cook, a pastrycook and confectioner, of Regent-street, Swindon, against the defendants, drapers, of Havelock-street, Swindon, for a mandatory injunction to restrain the obstruction of plaintiff's ancient lights. There was also an alternative claim for damages.

Mr. Norton, K.C., and Mr. Church appeared for the plaintiff, and Mr. Rowden, K.C., and Mr. G. Lawrence for the defendants.

Mr. Norton, in opening the case, said that the plaintiff claimed a mandatory injunction and damages, and the question was which he was entitled to. The only point at issue was whether or not the defendants' building was a nuisance to the plaintiff by depriving him of the access of the light to which he had been accustomed. Mr. Cook was the freeholder and occupier of Nos. 72 and 73, Regent-street, Swindon, at the corner of Havelock-street and Regent-street, and the premises consisted of a shop facing Regent-street and a book-shop, now vacant, with a window facing Havelock-street. There was a dwelling-house over both shops, and that portion in the plaintiff's occupation faced both Regent and Havelock

streets. The windows of his sitting-room and a room used as a nursery faced Havelock-street, and it was these rooms which were most injuriously affected. Plaintiff's premises extended 95 ft. down Havelock-street. The windows of the sitting-room and nursery had always been in the same condition and position since the premises were purchased by Mr. Cook's father in 1856. Previous to the erection of the defendants' new building plaintiff enjoyed a considerable amount of sunlight and had a view of nearly a mile. On the opposite corner of Havelock-street and Regent-street, for as long as the plaintiff remembered, there was a grocer's shop and dwelling-house of about the same height as the plaintiff's building. The slope of the roof faced towards his building, and the wall from the pavement up to the eaves was about 17 ft. high. The premises were purchased by the defendants and pulled down by them in the autumn of 1903, and defendants then commenced building operations on the site of the old buildings extending for about 90 ft. along Havelock-street. Plaintiff first complained on April 21, 1904, but at that time the defendants were putting up their building in skeleton; that was merely the iron girder framework, as was the case with modern buildings, so the light was not interfered with very much; but as the defendants began to fill in the brickwork it sensibly diminished the plaintiff's light. On April 30 Mr. Cook again complained, and defendants admitted that what they were doing interfered with his light. On May 4 the plaintiff, finding that the light of his sitting-room, nursery, bakehouse, and workrooms was being interfered with and daily diminished issued a writ for an interim injunction. The matter came before Mr. Justice Buckley on motion, and he directed that the action should be tried at once without pleadings, and giving the defendants liberty to pay 500. into court as damages, with a denial of liability. Plaintiff said it was often impossible to use his sitting-room for office work and book-keeping, as he did before, and the light in his bakehouse and workrooms had been sensibly diminished. The light in the lock-up shop had also been reduced, but he made no claim with regard to that. There was a tower at the corner of defendants' building which further obstructed the light.

The plaintiff was called and generally bore out the opening statements of counsel. He said he bought the premises from his father's trustees about six years ago for 3,000., and had spent about 400. in improving them and making the corner shop into a lock-up shop.

Cross-examined. The business was not so good as it was previously, as there was now a good deal of competition. He kept three men, two boys, a domestic servant, and a nurse.

Mrs. Julia D. Cook, wife of plaintiff, stated that since the erection of the defendants' building their sitting-room was absolutely useless for any purpose but a bedroom.

Mr. Ellis Herbert Pritchett, an architect and surveyor of Swindon, examined, said he had made the model which was being used to show the elevations. Defendants' building on every floor projected nearer Regent-street than the old buildings which formerly stood on the site, and was very much higher. The angle of light to the plaintiff's sitting-room was formerly 60 deg. to 64 deg., now it was only 33 deg. to 37 deg. The diminution was very much the same with regard to the nursery window. In his opinion there was no doubt that plaintiff's premises had been very greatly affected by the erection of the defendants' premises at a distance of 31 ft. 9 in. Plaintiff's sitting-room was very dark at the back, and it now would only get a small proportion of sunlight during the summer and would be very dark in the winter. In his opinion the deprivation of light to the plaintiff's premises was so great as to constitute a nuisance to the plaintiff. It had depreciated the selling value of the plaintiff's property to some extent, which he had not calculated. Mr. Thomas Bell Silcock, an architect and surveyor, gave it as his opinion that the letting value of the plaintiff's property had been considerably depreciated, the residential portion as much as 50 per cent.

Mr. Chas. Bishop, an auctioneer and surveyor, said that the letting value of the plaintiff's premises had depreciated by the obstruction of light caused by the defendants' building.

Cross-examined. He did not agree that the erection of the defendants' building had improved the letting value of the plaintiff's premises and of the adjoining property. At the close of the plaintiff's case Mr. Chas. Bell Silcock, architect and surveyor, was called. He said he had inspected the plaintiff's premises. The sitting-room was well lighted and bright enough for all ordinary purposes, and he could read very small print at the back of the room with his back to the window. There

was plenty of light coming between the gables and the defendants' building, and the angle of light was not at all bad for town buildings. The bakehouse was also bright enough for all ordinary purposes.

In cross-examination the witness admitted he had not seen the plaintiff's premises before defendants erected their building. He did not think there had been any depreciation in the letting or selling value of the plaintiff's premises owing to the erection of the defendants' building.

Several witnesses were called, who said that the erection of the defendants' building improved the plaintiff's property.

Mr. James Dunham, one of the managing directors of the defendant company, examined, said that the contract price for their building was 15,000., and the fixtures and fittings another 1,000. In round figures the site cost 6,000.

At the conclusion of the defendants' case Mr. Norton, in reply to his lordship, said Mr. Cook did not want to be unneighbourly, and if his lordship decided in his favour, he would be content with damages, and would not insist upon defendants' building being pulled down.

His lordship remarked that he was glad to hear that, because it relieved him of a difficult question which might have had to be considered on account of the building having been allowed to go on to the condition in which it now stood.

In giving judgment, his lordship said that, when he came to consider the angles of light now existing in comparison with the light which formerly existed, there was no doubt that the loss of light was very considerable indeed, especially with regard to the plaintiff's sitting-room and nursery. What he had really to consider was laid down by the House of Lords in the case of the Home and Colonial Stores v. Colls—namely, whether the obstruction complained of was a nuisance, and if, by the erection of the defendants' building, the plaintiff had suffered substantial deprivation of light sufficient to make the occupation of the house uncomfortable and prevent the plaintiff carrying on his business on the premises as beneficially as he had formerly done.

As to the sitting-room, it was a small room, lighted by one window with a south-easterly aspect, and it was used by the family as their only sitting-room. The plaintiff also used the room for the keeping of his books, and it was used for meals and so on. Then there was the loss of light to the nursery and bakehouse. His lordship having referred to the evidence, said he came to the conclusion that, as far as the sitting-room and the nursery were concerned, the effect of the defendants' building had been to render the occupation of the rooms uncomfortable and was sufficient to be regarded as a serious injury to the plaintiff in his occupancy of the house. He held, therefore, that the plaintiff had a good cause of action. He now had to decide what relief the plaintiff was entitled to. If the building had not been erected he thought, under the circumstances of the case, he would have granted an injunction, because he thought there was really an injury, and it was doubtful whether it could be compensated for by money. But the defendants' building was erected to a height of 42 ft. before any complaint was made, and at the date of the issue of the writ it was practically complete. He might have had considerable difficulty if the plaintiff had pressed for an injunction. Plaintiff had, however, said he would not do so, and, that being so, the only question he had to consider was as to what damages he ought to award to the plaintiff for the injury he had suffered. After considering all the evidence, he came to the conclusion that the plaintiff was entitled to 500. damages, and he entered judgment for him for that amount with costs. Order accordingly.

ACCIDENT THROUGH A DEFECTIVE BALCONY.

THE case of Tredway v. Machin came before the Court of Appeal, composed of the Master of the Rolls and Lords Justices Stirling and Mathew, on the 23rd ult., on the application of the defendant for judgment or new trial on appeal from verdict and judgment at trial before Mr. Justice Grantham and a common jury in the King's Bench Division. The case was reported in the *Builder* of April 2 last.

The action was brought to recover damages for personal injuries sustained by the plaintiff owing to the non-repair of premises let by the defendant to the plaintiff's husband. The defendant, who was tenant of No. 15, Sidmouth-street, W.C., under a repairing lease granted in October, 1902, sublet the first floor unfurnished to the plaintiff's husband in December, 1902, upon a weekly tenancy at 10s. 6d. a week. On August 8, 1903, the plaintiff stepped out on to a balcony in front of the window of her room, and the balcony gave

way, causing the injuries of which she complained. The plaintiff, in her evidence at the trial, stated that she did not know that the balcony was unsafe, but had pointed out to the defendant the places of the cement which covered the stonework of the balcony was defective. She further said that the defendant had to do the repairs to the premises. There was no written agreement between the plaintiff's husband and the defendant, and it appeared from the evidence that the defendant had done repairs to the premises to the extent of 200l., which included the putting right of something wrong with the balcony, to which the plaintiff had called his attention, and that the repairs were inspected and passed by the lessor's surveyor. At the trial the jury awarded plaintiff 150l. damages, and judgment was entered accordingly. The defendant now appealed on the grounds that there was no evidence of any contract by the defendant with the plaintiff's husband to do repairs; that he was only liable to his own lessor to do repairs; and that there was no evidence of notice to the defendant of any defective state of the balcony.

At the conclusion of the arguments of counsel, the Master of the Rolls, in giving judgment, said he would assume that there was an obligation to repair on the part of the landlord, but on the cardinal point in the case, the evidence was all one way—viz., that no one suspected the existence of any such defect in the balcony as to render it unsafe. The defendant, being under an obligation to his own lessor to repair, carried out certain repairs in accordance with a specification prepared by the lessor's surveyor. A slight defect in the balcony was pointed out, consisting merely of a want of plaster; but no one knew of the indication of any structural defect. No notice of the defective state of the balcony having been given to the defendant, he thought the application should be allowed, and judgment entered for the defendant.

The Lords Justices concurred.

Mr. A. J. Ashton and Mr. W. C. Clay appeared for the appellant, and Mr. Cranrot for the respondent.

PATENTS OF THE WEEK.

APPLICATIONS PUBLISHED.*

16,053 of 1903.—LOCKEBIE and WILKINSON, LTD., and J. M. LOCKEBIE: *Coin-freed and Indicator Locks.*

A coin-freed and indicator lock, by which, after the insertion of the coin, the indicator is operated and the coin slot closed by the action of the outside handle, in combination with a bolt-plate connexion by which, in case of the interior handle having been accidentally operated, the action of bolting the door again reverses the indicator and closes the coin slot.

16,722 of 1903.—A. BROOKER: *A Combined Spirit Level, Plumb, and View Finder for Photographic, Artists', and General Use.*

This consists in the combination, in one portable instrument, suitable for carrying in the pocket, or affixing to cameras and other articles, of a view selector, a horizontal spirit level, and plumb, so constructed that it will test vertical and perpendicular lines.

17,940 of 1903.—M. WEBER and CLATWORTH and Co., LTD.: *Mechanism for Adjusting to and Setting at Variable Angles the Backs of Seats, and the like.*

Back frames for settees, couches, and the like, having the end posts pivotally mounted, and having locking bolts adapted to lock in racks fitted in the end posts, the locking bolts being forced to locking position by springs attached to pivoted arms connected by chains, or the like, to an operating lever, whereby the locking bolts can, at will, be withdrawn from engagement with the racks, thus enabling variation in angle of inclination of the back frame, relocking taking place by rebound of the springs on return of the operating lever.

18,796 of 1903.—G. R. URE and T. MCGROTHER: *An Adjustable Roof Flange or Nozzle for the Smoke Pipes of Stoves, Ventilating Pipes, and such like.*

An adjustable roof flange, comprising in combination a plate with a dome and a nozzle, said dome having grooves and nozzle projections, the nozzle being fastened to the dome by a bolt-and-shot arrangement, and being provided with a removable ring or washer.

19,610 of 1903.—A. M. LAMBERT: *Partition Walls.*

This invention relates to the construction of partition walls with slabs formed of suitable materials, being comparatively thin in

section with relation to the area of the faces of the slab. An essential feature consists in forming the pattern or design upon one or both sides of these slabs, and with them building up a partition wall in such a manner that no further ornamentation is required upon the surface, and by this means a partition wall is formed having ornamental surfaces on both sides, and requiring no additional ornamentation whatever, although, if desired, the whole may be painted, or certain portions may be picked out in the desired colours, or the slabs may be formed in the first instance with a glazed surface in any well-known manner.

19,707 of 1903.—S. EWART: *Baths.*

A sheet-metal bath having pockets or loop holes, and set screws with which said pockets or loop holes are fixed on the bottom of the bath for the purpose of receiving and holding in position the legs of the bath.

20,032 of 1903.—R. CRANE: *Fire Grates and Stoves for Occasional Use as Cooking Ranges.*

A cooking range, consisting of an oven under the fire, with a space between for air and the ascending fire blocks on each side, with slots for the descending flues, also at the back with a slight recess for the shifting plate, and fire bars in front, flue passages, which are inclosed on the outer sides with cast-iron pieces properly framed, and which are also continued under the oven before they ascend the back flue, the entire top surface of the fire being covered with cast-iron in two or more pieces, and the top of the front bars being likewise covered by a removable door.

20,593 of 1903.—W. H. LUTHER: *Roofing, Skylight Windows, Side-Lights, and the like.*

According to this invention the frame is secured round the top, and two sides of the rectangular or other opening cut in the corrugated iron or other roofing or part of the building. Each part, or side of the frame would be made of one piece, and be formed of a "double thickness, kneed, projecting, out-flanged shape," and have the inner part "kneed outwards at end as a midfeather," to form one side of a channel, while the outer part would be kneed out parallel with same to form the other side of the channel, and then bent backwards at end and doubled round and secured to the roof. The channel thus formed between the "kneed" parts of ends of plate would have inserted within it a packing of rope, or other fibrous or like material, over which the sheet of glass would be placed.

23,129 of 1903.—W. CALWAY: *Construction of Portable Buildings.*

A portable building, cement, stone, or similar slabs supported at their edges in grooves formed by wood-external members, in conjunction with external cappings and internal strips fastened to said frame members.

256,876 of 1903.—C. M. SCOTT: *Sash Balancing Devices.*

A combined sash hanger and lock, consisting of a spindle, mounted in a bracket, and carrying a clock spring and a pinion with a circular groove in its side, containing holes adapted to be mounted behind a pulley style of a window and opposite a rack or an adjacent side rail, so that pulling the upper sash down, or raising the lower sash, as the case may be, will wind up the spring, and a spring pin, adapted to pass through the inside window facer, and engage in one of said holes, so as to lock the sash.

1,235 of 1904.—J. WHITE: *Apparatus for Releasing Drop Curtains, and the like.*

An apparatus for releasing drop curtains, and the like, consisting essentially of a bell-crank lever, pivoted to a batten, from which is suspended the curtain or like, by operating which bell-crank lever a pin can be withdrawn from holes in two eyes attached to the batten, and from a hole in a hanger by which the whole is suspended.

6,157 of 1904.—C. NOVAK: *Locks or Latches for Doors, Windows, and the like.*

A right and left handed lock for doors, windows, etc., having a bolt reversible around its longitudinal axis, a gear for regulating the stroke of said bolt, allowing, after being put out of gear, of the bolt being pushed in to the lock case for the purpose of being reversed.

10,535 of 1904.—F. BOHNE: *Means for Locking Folding Doors, and the like.*

A means for automatically locking folding doors and windows, comprising a spring-operated bolt, in the shape of a two-armed lever, notatably arranged on a horizontal pivot, a tapered or rounded head at each end of the bolt, said heads projecting into the path of the two sides or wings of the door or window, a metal line recess in the upper surface of the top transverse bar of one of the wings for

the reception of the larger bolt-head, and a metal plate on the upper surface of the top transverse bar of the second wing for pressing back the second bolt head and turning the bolt accordingly.

12,742 of 1904.—A. HENDEL: *Ventilating Apparatus.*

An automatic ventilator, consisting of separate dampers or light material (mica, or the like), so hung in a frame that, when a current of air in one direction is produced either by difference of temperature or by artificial means, the respective dampers will automatically open outwards, and when a contra current of air is produced, the dampers will automatically close.

12,776 of 1904.—L. PEARCE: *A Holder for Window Sashes.*

A vertical sash holder, consisting of a drop pawl formed with a heel and button piece, and held and pivoted in a casing secured to the window, said pawl being in operative engagement and combination with a ratchet, whereby the window is retained in any position.

12,787 of 1904.—J. PORLENZ: *Casters.*

A caster in which the vertical swivel pin is attached to the lower surface of the socket, and engages or enters a recess in the roller-bearing block in such a manner that the lower surface of said socket and the upper surface of said block make contact with each other.

12,909 of 1904.—P. JAEGER: *Roll Shutters.*

A roller shutter having bands drawn through it, in which these bands are made impervious to the action of weather by their being saturated with a substance, such, for instance, as resin, tallow, or the like, before the roller shutter is made up, which substance has the property of being very fluid under heat, and becoming solid when cold, so that a thin elastic and water impervious coating is formed round the separate fibres of the bands, which prevents the bands altering in length, that is to say, contracting by the absorption of water and stretching on drying.

19,108 of 1903.—J. E. LEACH: *Gully Traps, and the like.*

This invention relates to certain improvements in the gully trap, or similar drain trap as described in the specification to Patent No. 17,593 of 1900, and its object is to allow of the cap therein described as forming part of the seal being removed for the purpose of cleaning out the gully, or similar vessel, without affording a free passage for sewer gases, or the like. This is accomplished by placing underneath the trap, as described, a "teapot" trap, or the like, either as a separate casting, or as part of the gully or similar vessel, so that when the cap of the uppermost trap is removed, the gases from the sewer cannot escape, being prevented from doing so by the "teapot" trap.

19,151 of 1903.—S. H. ADAMS: *Manhole and Inspection Covers.*

The use of a lever or levers in combination with a manhole, or other cover, said lever or levers serving to separate the cover from its frame, or to serve as a lock to hold both together.

20,648 of 1903.—P. DUCHEMIN: *Hooks or Supports for Carrying Slates, Plates, or Tiles on Roofs.*

A support for square tiles or slates, consisting of three points of support for the lower point of the tile or slate, formed by a bent wire or strip having a vertical part, the upper part of which forms a spring hook embracing the batten of the roof, its lower end being bent down laterally to form one of the supporting arms, then bent across the front to form a bridge piece, and finally bent up laterally to form the other supporting arm, its end meeting the vertical part.

24,249 of 1903.—A. TOUSSAULT and E. A. FRADET, L. PIDEFFERT (trading as Toussault, Fradet, and Cie.): *An Introducer for Crematorium, and other furnaces.*

An introducer for crematorium, and other furnaces, comprising a trolley or wagon, adapted to run on rails, carrying a girder, or pair of girders, considerably overhanging or projecting beyond the front end of the trolley or wagon, by means of levers having hingo or pin connexions to the girder, or girders, and the trolley or wagon on which they are carried, and provided with means for raising and lowering said girder, or girders.

218 of 1904.—C. VON FORELL: *A Process for Manufacturing Cement from Slag.*

A process for manufacturing cement from slag, in which slag granulated by water, and mixed or not with powdered slag, is submitted to an oxidising flame, to just below the point of fusion, whereupon the whole burnt mass is suddenly cooled by a dry process, and finally powdered.

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

7,205 of 1904. C. VON RIMANÓCZKY: Stage Structures for theatres, and other places, for Preventing the Spread of Fire.

A stage structure for theatres, and other places, characterised by the stage being connected by means of openings provided in the rear wall, and closeable by plates or doors, with suitably-high towers, for the purpose of producing such a strong draught as to cause the products of combustion, in the event of a fire, to be drawn from the stage through the door into the open air.

12,013 of 1904. T. ZIMMERMANN: Means for Strengthening Scaffold Boards, Planks, and the like.

This invention relates to cleats for scaffold boards, planks, and beams, which can be driven into the wood. These cleats are formed of separate S-shaped sheet-metal pieces, which are driven into the wood, so that the bent ends of adjacent pieces hook one within the other.

12,354 of 1904. J. HASKE: Apparatus for Moistening the Air of Rooms and Enclosed Spaces.

A humidifier, comprising a pan, a trough, superposed upon said pan, a set of elements of absorbing material, supported upon the edge of said trough, a goose neck formed on each of said elements on the upper part thereof, and adapted to almost touch the bottom of said trough, the lower portion of said elements extending into said pan.

12,518 of 1904. W. L. WATSON: Material and Composition to be used for Damp-courses in Building, for Covering Roofs, the Surfaces of Bridges, Viaducts, Arches, Sewers, and the like, for Preventing the Access of Damp to Iron Girders, and the like, for the Insulation of Electrical conductors, and for other purposes of like kind.

A material for damp-courses used in buildings, consisting in the combination of a continuous layer or sheet of lead, with a coating upon both sides, said coating consisting of a mixture of bitumen, powdered pumice stone, and oil, and outside this mixture a coating of asphaltic felt.

MEETINGS.

MONDAY, AUGUST 8.

British Archaeological Association.—Annual Congress opens at Bath.

Institute of Sanitary Engineers, Ltd.—Organizing Committee at 3 o'clock. Examination and Literary Committee at 5 o'clock. Council Meeting at 7 o'clock.

TO CORRESPONDENTS.

S. F. H. (Amount should have been stated).

NOTE.—The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, manuscripts, or other documents sent to or left at this office, unless he has specially asked for them.

Letters or communications (beyond news items) which have been duplicated for other journals are NOT DESIRED.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

We are compelled to decline pointing out books and giving addresses.

Any commission to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing when received by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exhibitory business matters should be addressed to THE PUBLISHER, and not to the Editor.

PRICES CURRENT OF MATERIALS.

* Our aim in this list is to give, as far as possible, the average prices of materials, not necessarily the lowest. Quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

Painting—From the Artist's Point of View.

NOTHING strikes one more in listening to passing remarks in public picture-galleries, or to current conversation in society about pictures, than the inability of average exhibition-goers to formulate any judgment of pictures on principle, to realise what makes the quality of a picture good or bad, or even to perceive that there is any principle involved at all. They are persuaded that it is entirely "a matter of taste." Yet if one were to ask two or three competent painters or art-critics to go round a gallery and select, independently, what they each considered the good pictures of the collection, though their preference for one example over another might vary, their lists of the good pictures would be nearly or perhaps entirely the same. This is because they would know what should be the objects and what are the difficulties of the art of painting, and whether these objects are attained or not. The general public think nothing of such questions; they merely "like" this or "don't like" that, and in most cases their liking depends either on whether the subject of the picture interests them, or whether it appears to them to be a successful imitation of some object natural or artificial. The idea that the

object of the art of painting is not imitation is bewildering to them. If not for that, what is painting for?

And the question is too large and complex, certainly, to be answered in a sentence; nor are we attempting to answer it here. It would be matter for a separate treatise. But something may be learned of the objects of painting, and of what are not its objects—of the painter's aims and methods, and of the difficulties with which he has to contend—of the true intellectual interest of the art, from Mr. Clausen's six lectures on painting, now published, with some alterations, as a book.* The lectures were originally delivered especially to the art-students of the Royal Academy; but if the general public could be induced to read them (and there is nothing in them that requires expert knowledge to follow and understand), they would be in a way to understand more about painting than they mostly understand now, to enjoy it more and to judge it with more insight. We are not sure indeed, that a book like this is not really far more valuable to the general reader than to the art-student. It cannot teach the art-student to draw or colour, which is his business; it can only suggest to him the aim and direction of his studies. But it can or should teach the general reader—the spectator at exhibitions—to think, both as to the objects of painting,

and as to its relation to nature. As the author says at the close of his third Lecture:—

"We can only see what we have learned to look for. An uneducated person will consider a face in a picture beautiful if it has bright eyes, pink cheeks, and red lips; or a landscape beautiful if it also presents him with the obvious facts. It will be enough for him; it is as much as he sees in nature. But Nature does not reveal her beauties unsought, and the study of paintings by those who are not artists is not only an education, but an added pleasure to their lives, enlarging and directing their minds, so that they learn to detect and appreciate beauties in nature to which they would otherwise have been blind."

This, it may be observed, suggests something much beyond Browning's celebrated and certainly admirable expression (in "Filippo Lippi") to the effect that we care for things for the first time, when we see them painted, which we have seen fifty times before and never noticed. The reason is a double one: first, there is the natural interest in the display of skill in drawing and colouring; secondly, the comparison of the drawing with the original (or our recollection of it) leads us to notice points in its form and structure which we had not noticed before. This is, however, merely the realism of painting; and implies that even imitation, though not the true or highest object of art, has its interest and its educational value. But Mr. Clausen's suggestion goes further than this; it implies the perception of a beauty and a sentiment in nature sought out and translated by the painter, whose work in turn may suggest to the spectator something in the scene of deeper interest than a casual inspection of its mere physical facts would reveal. Thus in

* Six Lectures on Painting, delivered to the students of the Royal Academy of Arts in London, January, 1894. By George Clausen, A.R.A., R.W.S., Professor of Painting in the Royal Academy. London: Elliot Stock, 1904.

landscape-painting the artist is the translator, not the mere imitator of nature.

For all painting, as the author says elsewhere, is a partial statement—a reading or rendering of nature, rather than an inventory. This is in his second chapter, "On Lighting and Arrangement," where the amateur may obtain many hints as to the problem of the general composition of a picture, a far more complicated and difficult one than those who view the finished result are likely to surmise: the difficulties of picture-making really lying not in the treatment of separate details, but in what Mr. Clausen calls "The control of the whole canvas"—the determining what part of a picture is to be given prominence, and how that is to be attained; and composition in line and in light and shade is well illustrated by two sketches after Velasquez and Corot. Then we have the difficulties, which are quite out of the grasp of most exhibition-goers, arising from the necessity, because pigments have no positive light, but only absence of dark, of arranging the values of a picture so that the sun, for instance, if introduced, shall have sufficient light effect by contrast; or that the light in the sky shall be sacrificed to the ground or the figures, or *vice versa*, if necessary. A good example of the want of convention is mentioned in the case of Holbein's "Ambassadors," where the figures, as we have always felt, do not assert themselves sufficiently, in consequence of the realistic working up of all the accessories. Some remarks on "the disturbing influence of photography" should not be overlooked. The photograph sees what the human eye cannot; it therefore cannot present nature as seen by the eye. Photography can be suggestive (or, we may perhaps add, useful as a memorandum), but "you cannot make that yours which the camera chooses to give you. You must make your own selection from nature." And he remarks, as we have often done, that photographers are now seeking to use, though clumsily, the conventions of the painter, by arranging the tones and concentrating the lights of their pictures; which in fact is only doing badly what a painter can do much better.

The lecture on "Colour" is full of suggestions which will be new, or at least unthought of usually, to many who examine pictures. What a field for observation is suggested by the mere remark that "nothing in nature is actually the colour that we see it. It only appears to us at a given moment as a particular colour, in relation to the other colours that surround it"; and some facts illustrative of this are mentioned. The tendency to paint out of doors in too cold a key is given as the reason why we often see "pictures of sunlight which give no impression whatever of warmth," changing their key when brought into indoor light. This may be the reason for those pictures of the modern Dutch and modern French school which we sometimes see, with the title "Summer," or "Sunny day," and which are absolutely chill in their effect. The question of "quality" in colour is another curious problem. Two men will paint a sky with the same pigment; one will give an impression of sky, the other

only of blue paint. In what does the difference lie? It is impossible to define; it is a kind of intuition on the part of the painter. The painter in water-colour, however, has his quality to some extent made for him by the conditions of the transparent material. The author speaks finely of "the emotional power of colour—*i.e.*, the power which colours in themselves have in inducing a mood—as an important element in painting."

"The sad, golden tone of Rembrandt seems to strike the keynote of his sentiment, and to bring us into his frame of mind before we realise his subject. In the same way, the rich reds and warm colours of Titian, Rubens, and Reynolds produce in our minds the sense of activity, richness, and splendour, quite irrespective of the drawing or modelling of their figures, or of the meaning."

Nothing could be more true, yet it is surely pushing the thing too far to say that truth or beauty of colour is "the only thing that gives a picture a high place among the masterpieces." How does that square with the author's great admiration for Michaelangelo, as standing apart from all other painters, and who was certainly not a great colourist? The inspiration of a picture certainly appears more in colour than in any other quality; but it may have a high intellectual power independent of colour.

Our space is limited, or we would gladly have followed Mr. Clausen more in detail through his lecture on the fascinating subject of "Landscape and Open-air Painting," in which however we cannot but draw attention to an admirable remark as to the essential element in landscape art. A landscape must be a record of a scene, and true to the appearance; but there must be something more. And what is that "something more"? "The interest for us lies in seeing or recognising the great elemental forces of nature, living and acting through the little things upon the earth. A landscape should not be so much an inventory as a transcript or translation of a mood of nature." If people could only be got to understand this, there would be a very different popular appreciation of landscape painting and landscape-painters from what at present obtains in this country. Not but that "transcribing" may be carried too far; we are perhaps tempted to think that Mr. Clausen himself carries it too far occasionally. But in any case it is more intellectually interesting than realism.

We may conclude with a reference to a point touched upon in the Introductory chapter, on which we cannot quite agree with the author. He says that the distinction made in the present day between painting which is decorative and painting which is pictorial is unfortunate, and ought not to exist, as "all pictures should decorate the walls or places on which they are placed." It is of course true that all pictures should in one sense be decorative in line and composition; that is the artistic element in the design of a picture; but this need not be confounded with the use of the word "decorative" to imply a certain conventional and architectural character of design, which is not, and is not intended to be, realistic. We are, in fact, using the same word in two distinct meanings. A "decorative picture," in the latter meaning, is one which is kept on a front plane, and designed with a certain severity of line;

it is the style, in fact, suitable to fresco painting on a mural surface, as again that suitable to oil-painting on a frame canvas. The latter, no doubt, may also be decorative, but in a different sense. We want another word in our artistic vocabulary.

There are few points indeed, however which we should question or take exception to in this admirable book, which we hope will be widely read; it cannot be intelligently studied without profit to the reader.

SOME BRETON CHAPELS.

By F. C. EDEN.

ABOUT ten miles north of Quimper, on the departmental road running between that town and Carhaix, there is a spot where the traveller who keeps a sharp look-out towards the east may be able to detect a group of three slender spireless towers, just showing their points above the trees. A gate in the hedge opens into some squalid farm premises, across which a dirty track, almost impassable in wet weather, must be followed, and it loses itself in a green field, where the rises out of the grass just opposite the charming Gothic front of S. Fiacre Chapel. Here we have a typical building of its class, and a veritable treasure-house for painter, architect, or ecologist. Typical in many respects, to the fact of its being not a parish church but a simple chapel, where the only services held during the year are the annual "Pardon," or dedication feast, it owes an entire immunity from restoration.*

Even in remotest Brittany it is hard to find an unrestored church, so that it is to the chapels that the true lover of "old, unhappy, far-off things"—of this Gothic, in fact, must needs turn. Typical too, is S. Fiacre in the way it eludes discovery—even when you know the whereabouts of one of these buildings it is often extraordinarily hard to get upon, and usually impossible of access except on foot—and so, also, in evidences of former prosperity, and having been designed in a fine enthusiasm and with far greater originality and skill than the average parish church of the district, where too often dullness reigns. There is one almost invariable accompaniment of a chapel which, however S. Fiacre lacks, and that is the grove of closely-planted beech or chestnut trees which make thin shadows about the Calvary, and on the mossy turf, as it seem to suggest, as things in Britain so often do, some Druidic prototype.

To return to the façade. The chapel is a remarkably good example of a fairly common type (*cf.* Penmarch and Tronoët where it stands over the chancel area, and the ruined church at Kéruity). The west wall is of enormous thickness and carries three spire-crowned turrets. The central spire is crocketed, and springs between traceried gables from the square open stage in which the bells are hung. At the foot of this sta-

* An immunity it is not likely to enjoy much longer, for the building has been made a *monument historique*, so that if anyone would see it before it is re-roofed, re-plastered, re-ceiled, and re-glazed, let us set about doing so without delay.

which is sturdier than usual) is an over-arching gallery, prettily corbelled forwards, and bridged across right and left by lesser flanking turrets, one of which loses a newel stair, and the other a little octagonal room with square-headed windows. The side spires are of unequal height, and the southern, or stair turret, set somewhat behind the plane of the other two—a delicate subtlety of design, in no way dictated by structural necessity, but completely justified by results, in that the three spires, as seen in different points of view, group in a confusingly puzzling and picturesque perspective. The material is a close-grained variety of granite, capable of receiving exceptional delicacy of treatment, and the detail is all of the most refined character.

The south porch is of the "Apostle" type, so common throughout Brittany, with double entrance doors, and a copied stoup corbelled out from the *meau*. The interior exhibits many characteristic features. Here you may expect to find a floor, partly of heavy granite slabs, and partly of earth; a painted rood screen, with its loft and figures; mouldy altars defaced and discoloured; tattered shreds of rich glazing painted across traceries of extreme elegance; a large east window, with a central mullion in a square, English-looking *chevet*; whitewashed walls sensibly striped along the base with black; any homely images on brackets about the altars, those of Our Lady and the Virgin on the east wall enshrined in high shuttered tabernacles of timber; boarded barrel ceiling, distempered red, but with its wall-plates and dragon-headed beams uncoloured; and perhaps a wheel of bells or a decayed altar canopy lying somewhere in a corner.

Such, surely, must have been the appearance of many of our own village churches in Elizabeth's reign. Here we have the very items of the XVIIth century inventories, with that old-world savour clinging about them yet, which the quaint directness and antique spelling of the inventories themselves seem so curiously to reflect. How better could one describe the rood screen at S. Fiacre, for instance, than as a "parclose of old paynted tymbre evyding the quyer and the body of the church, whereon stoundyth a roode with dyvers olde ymages of tymbre"??*

The altar in the middle of the aisle, now covered with broken imagery, shows signs of having been "inclosyd with oke." What the early ecclesiologists called a "bench-table" runs along the north wall and round the transepts, and is the only "sitting accommodation" in the chapel. There are many fragments of glass. The most complete window is that over the altar in the south transept. The centre light displays a jesse-tree on a blue ground, and the sidelights the twelve apostles in couples under canopies. In the quire there is "jytell galery of tymbre" capable of holding about three persons, and approached by a stone turret stair. Whether it was a pulpit or a singer's gallery could not be determined. It is now rickety and unsafe.

The screen was badly tinkered some time in the sixties, when its stair was

probably made away with. There is no evidence to show whether it was straight as at S. Nicolas, or spiral, as at Lambader; and now there is no means of access to the loft.

The little market town of Le Faouët, situated on a hill about two miles to the north, will be found an agreeable stopping-place—at least it used to be so before it was "discovered" by artists. From here may be visited two other chapels of great interest—viz., S. Barbe and S. Nicolas.

A pleasant walk of about a mile along a paved pilgrim's way through field and forest brings us to the brink of a deep wooded combe, at the bottom of which sparkles the Ellé. Here the chapel of S. Barbe comes suddenly into view over the precipitous edge of the valley,

growing naturally enough from a kind of rocky ledge among trees and boulders. The first glimpse is disappointing, for the heavy hand of the XIXth century has been laid sore upon the little sanctuary, knocking the mediæval fun out of it, and leaving all sleek and prudish.

We are standing on a paved platform, from which a noble granite stair branches downwards to right and left; in front a bridge carries the gangway across to the tiny chapel of S. Bernard, perched on an isolated rock, but, save for its position, uninteresting. The stair to the left lands us just in front of the entrance to S. Barbe. The building, small as it is, is provided with two large double doorways, side by side, each pair under an enclosing arch, doubtless arranged for the stream of pilgrims to file past

S. Fiacre: West Front.

* From the inventory of Temple Balsale.

S. Fiacre: Ground Plan.

in an orderly way on the occasion of the "Pardon," which is said to be much frequented.

The plan is curious, and consists merely of a quasi-transsept, from which a shallow apse juts over the steep valley side. The exterior of this part of the building has an air of dignity and repose out of all proportion to its size. The north-west angle turret is probably designed to represent the traditional emblem of S. Barbara—viz., the tower in which she was imprisoned by her father, and one may see the image of the saint peering from an unglazed upper window. Here is some fair late glass, much mixed with had modern stuff, and a carved gallery, but the chapel has been considerably modernized, and, compared with the outside, the interior presents few features of interest.

The Chapel of S. Nicolas, in Prisiac, is most difficult to find. It is too far from le Faouët for a guide to be taken, and as the peasants speak no French, it is little use for one unacquainted with Breton to ask the way. It stands on high ground, about half a mile from the road, and is completely hidden by trees. The belfry is simple and good, but otherwise the outside is not particularly attractive. The great feature of the chapel, however, is its magnificent late screen. The whole is painted, and both sides of the loft bear figure sculpture; the west, scenes from the life of the patron, and the east, the twelve apostles; on this side there is a fixed desk in the form of a pelican. An unusual feature is the panelled and canopied backboard to the road, which stands in the usual Breton way, not in the loft, hut on the gallery front. The screen was repainted, as an inscription testifies, in the year 1768, but all the same the colouring is excellent, if somewhat rough in execution, and doubtless follows the old lines. The plan of the chapel is cruciform, without aisles, and, as at S. Fiacre, the screen stands west of the crossing.

The nave is very dark; in fact there is only one window, and that a small rose set high up in one of the side walls. It is not unusual for the smaller chapels to be thus scantily provided with

windows. One near Le Saint has only two, both being in the chancel, and in a cornfield near Belle-isle-en-Terre is a chapel, capable of holding some fifty worshippers, which has no windows at all. At the "Pardon" (as the writer had the opportunity of observing) the bulk of the assistance is "accommodated" outside.

S. Nicolas has some interest for Englishmen, in that an effigy of Dutch William, called Pistolance (Prince d'Orange), was for more than a century solemnly burnt at the annual "Pardon"; an edifying ceremony now fallen into desuetude. Probably the best-known and the most ambitious edifice of its class is the chapel of N. D. de Folgoët, near the remote town of Lesneven, in the north-west corner of Finistère. Its very richness in carving and mouldings has been its undoing. Its Gothic spirit is now quite broken, for the whole building has been so scarified within and without that the frigid inhuman interest of the typical *monument historique* is all that remains. There is a good stone *jubé*, remarkably effective on the east or wrong side, and a high altar, 14 ft. long, adorned along the front with a row of niched figures.*

Lambader is easily reached on a bicycle from the old cathedral town of S. Pol de Léon. It is a former chapel of the Templars, and in plan and scale much resembles a parish church. Two fine crosses are passed on the approach, and there is a broken shaft and a Gothic fountain in the churchyard. The fabric has been utterly modernized, but still retains sundry features of interest. There are three mediæval altars, each with its stone "halpas," or low reredos, provided with a broad top for the display of images or reliquaries, and not to be confounded with the modern "gradine." The halpas is itself a reredos, the top of which forms a shelf or ledge; not a shelf for candlesticks set in front of a reredos.

The screen is delicate and elaborate rather than beautiful, and is chiefly noticeable for the excellent contrivance

* Nodier gives a fine measured drawing of this altar.

of its spiral stair. So cunningly is the managed that, though standing between screen and altar, it interferes in no way with the view of the latter as seen between the muntins. Nor is it a flimsy affair by any means. The steps, eighteen in number, are solid, of about 6½ in. rise, and tenoned into a 4½-in. newel post. Each is pinned to the step above it, and, though no support is given to the outer string, which is purely decorative, the stair is as firm and noiseless as when first put together.

The chapel known as the Creisker, at S. Pol, has likewise been made a national monument, and with the usual result. It is of the general form and scale of the parish church, and has an ugly steeple which is much admired.

Belle-isle-en-terre, a small town on the main road, between Morlaix and Guirivamp, though, like le Faouët, it possesses no buildings of any interest, is a convenient stopping-place, and has a comfortable inn. About seven miles to the west, in the direction of Morlaix, and right upon the high road, lies the chapel of Keramanach ("house of the monks"). This little edifice exemplifies what has been said of the extreme care which was often bestowed upon the design of these buildings. The simple belfry is entirely satisfactory in proportion and detail, while the windows show what time and skill can do with such a stubborn material as granite. The tracery is both strong and refined; that of the great east window comprises over ninety openings, and, unlike so much flamboyant work, is divided into orders duly subordinated; indeed, considering the nature of the material, the grace and freedom of its lines are quite wonderful.

The plan is a simple parallelogram with a porch and north aisle, the latter apparently added as an afterthought. Behind the altar is a low wall inclosing a small sacristy, which is entered by a minute door on the gospel side. The middle part of the wall is stepped up to make space for a reredos composed of alabaster reliefs set in a black wood frame. The only remains of the screen are two moulded uprights, and a short piece of cross-beam set gallow-wise against the south wall as a support for the rood. A canopy, or tester, which was formerly suspended by a chain over the high altar, of Gothic form but debased detail, now lies neglected by the west door. The tracery of the east window is full of delicate XVth-century glass, consisting mostly of heraldic devices and angels in white and stain.

In a valley that intersects the curious boulder-strewn country about Huelgoat lies the beautiful chapel of S. Herbot. Seen from far is the great square tower which gives such nobility to the little sanctuary as the smaller Breton churches can seldom boast. In the churchyard is a Calvary group poised on a tall shaft. It is a good specimen of its kind, and more satisfactory than the wild processions of crude imagery which attract so many tourists to the ambitious structures at Guimilian and Plougastel. The screen is fully developed Renaissance, and has no loft. On either side of the rood, its painful contortions, are the gibbeted figures of the two thieves. Several other painted saints stare out of tabernacles

beside the altars, or stand on iron brackets against the columns. The building is in good repair, and looks as if it were used for parochial purposes, but, happily, it has not yet been "brought up to date."

Kerfons Chapel is in a very remote situation, far from the high road, and, perhaps, for this reason, retains more of its ancient fittings than any chapel which the writer has visited. It has, however, suffered terribly from neglect and ill-usage. Part of the nave has evidently been open to the weather for some considerable time—it is now rudely ceiled with deal boards, and the condition of much of the woodwork is sufficiently deplorable to be made the excuse for a good deal of doubtless drastic renovation whenever it is taken in hand.

The screen, with its loft and spiral wooden stair, is of exceeding richness. The painting lacks the delicacy and precision of English work, but is soft and pleasant in tone. Images of SS. Mary and John, much weathered and withered, still adorn the gallery front, but the rood itself lies in pieces in the loft. It is a simple cross *ragulé*, but when reconstructed was found to be of such admirable proportions, and to compare so well with the side figures, that the dimensions are worth noting. They are as follows:—

Height of cross, 7 ft. 8 in. (The top has been fitted to a socket, possibly for the pelican in her piety.) To underside of arms, 5 ft. 10 in. Width across arms, 5 ft. 7 in. Diameter of section, which is roughly circular, $3\frac{1}{2}$ to 4 in. Height of the Christ, 4 ft. 11 in.; of side figures, 3 ft. 4 in. Distance apart of same, centre to centre, 5 ft. 6 in. Height of loft front on which all stand, 3 ft. 9 in.

Beside the broken rood there was a "standing letterne of tre in the rood lofte," a triangular pedestal covered

with flamboyant carving and supporting a double turning desk, the feet in the shape of clenched hands. There is some good panelling in the transept with a fixed bench against it; several linen panelled doors with braced stiles; quite a "populus statuorum," forlorn things on brackets; an interesting and peculiar Renaissance ceiling in the south transept, and some good furniture in the sacristy falling to decay.

Of the other chapels visited by the writer, Kernascléden, a rich, vaulted building, is a *monument historique*, and has been vulgarised *à la mode*. It is now parochial. There are some paintings of angels in fine floating draperies on the north transept vault, and an elaborate porch. N. D. des Cieux, near Huelgoat, has a picturesque belfry, but the inside is spoilt.

Locmaria, finely situated on the lofty river bank just above Belle-isle, has a beautiful screen, which has lost one, and that the more elaborate side of its loft, by its unfortunate conversion into a western gallery. Judging from the beauty of what remains it must have been quite as fine as the Kerfons example. The good painted rood figures were found stowed away in a little ossuary adjoining the porch.

The following particulars of the mediæval altars in S. Fiacre and elsewhere will be of interest to ecclesiologists. They are all of granite, and, with very few exceptions, perfectly plain. The *mensa* is a thickish slab, chamfered on the under side, and there is usually a simple hollow for a base-mold just above the floor level. It seems unlikely that the lesser altars had foot-paces, but if so they were doubtless of wood, and movable.

It may be noted that, as in England, the altars, when not set against screens or pillars in the body of the church, stand under windows, the glass-line of which is seldom more than 2 ft. or 3 ft. above the *mensa*; the window itself, in conjunction with the inevitable pair of images on brackets, doing duty for a reredos. The dimensions of the high altar at S. Fiacre are 11 ft. 7 in. by 4 ft. 1 in. by 3 ft. 3 in. high. The fore part of the *mensa* is carried on columns, the back part resting on a block of masonry. The sill-line of the east window is 2 ft. above the top of the altar, and the total width of the chancel is 21 ft. 8 in.; less than twice the length of the altar, be it noted, in view of the undignified stumpiness of most modern altars. I measured an unusually large altar in the parish church of Plouaret. The slab is 18 ft. long, by 3 ft. 10 in. in width, and is 10 in. thick; here the altar is even larger in proportion to the width of the chancel, which is only 26 ft. 6 in. between walls.

S. Sebastian's altar stands outside the screen, against the eastern pier of the nave arcade, and has a stone reredos 4 ft. 8 in. high, resting on the altar itself, not, as is the usual modern arrangement, on a separate erection. The dimensions are 5 ft. 7 in. by 3 ft. 3 in. by 3 ft. 7½ in. high. Altars in the body of the church against columns and so forth, are of course relatively short.

The screen altar is 5 ft. 2 in. by 3 ft. 9 in. by 3 ft. 6 in. high; and has a rough ledge

Keramonach : East End.

at the back raised an inch or two above the slab, which probably carried a halpas or low reredos.

The north end of the aisle altar is built right up to the wall, interrupting the bench table, and there is a bracket *piscina* projecting at the back. The slab is 6 ft. 4 in. by 2 ft. 6½ in. wide, including a space 7 in. wide on which a reredos formerly stood. The height is 3 ft. 1¼ in. above the present floor level.

At Lambader a Gothic altar in the nave measures 5 ft. 10 in. by 3 ft. 10½ in. by 3 ft. 4½ in. high, and carries a halpas about 2 ft. in height. The altar in the north chapel is 5 ft. 3¼ in. by 3 ft. ½ in. by 3 ft. 4 in. high. Its halpas is 2 ft. 2½ in. high, and 10¾ in. broad, and carries two plain shields in front, and a moulded cornice. From the top of the halpas it is 1 ft. 8 in. to the glass line of the window.

The north transept altar in S. Nicolas measures 6 ft. 2 in. by 2 ft. 6 in. by 2 ft. 11 in. high, and is 1 ft. 5 in. below the splay of the window-sill. The high altar at Keramonach is 11 ft. 1 in. by 2 ft. 10½ in. by 3 ft. 8 in. high, in a sanctuary 21 ft. wide, so that the proportion is about the same as at S. Fiacre. One point to be noted in connexion with old altars is their ample width from front to back; a dimension almost as essential to dignity as length, but the importance of which is rather apt to be overlooked nowadays.

The few chapels described above are those alone which the writer has had the opportunity of studying; but when it is stated that in the department of Morbihan there are no less than 118 (omitting those which are in ruins or quite modern), in the Côtes du Nord 98; and in Finistère 45, whose dates range from the XIIth to the XVIIIth centuries; and that some of them, as Rosgrand, S. Avoye, Bréhan, N. D. de la Clarté at Baud, S. Nicolas at Plédran have rood screens, or considerable remains of such; that several still preserve mural or roof paintings; that still more retain reredoses, imagery in wood and stone, and considerable quantities of stained glass, and that there are more or less interesting crosses, calvaries or fountains in the vicinity of the majority, it will be seen what a field for discovery is open to anyone who should be led to make a special study of these unique buildings.

Keramonach : West Front.

NOTES.

Electrification of the Metropolitan Railway. LONDONERS are still waiting with commendable patience for the completion of the improvements now in hand by the two underground railways—the Metropolitan and District Companies. The work of changing these lines from steam to electric traction is of onerous character. Bearing in mind the mileage and the heavy train services involved, it may fairly be said that the undertakings are of far greater magnitude than any works of the kind hitherto attempted in the whole world. The generating station of the Metropolitan Company has already been completed; the cables and conductor rails are laid, and the general equipment of the permanent way is complete from Baker Street to Uxbridge. Similar work is now in progress night after night on the Inner Circle section of the line, and we believe will shortly be completed. The new rolling stock is partly delivered and the remainder is in course of construction in Birmingham and Manchester. Considering the difficulties and delays that always arise in connexion with important engineering works, it is evident that satisfactory progress has been made by the company, and that at no distant date one of the most beneficial works of modern times will be consummated. We are glad to learn that some of the principal officials of the company are about to visit the United States to inquire carefully into the methods of working electric railways in that country, with the object of obtaining some hints that may be of service when electricity furnishes power for traction on the Metropolitan Railway system.

The Hotel Astor, New York. PROBABLY the Hotel Astor, which will shortly be opened in New York, is the finest building of its kind ever erected. Every possible detail has been included, whether for securing economy of management or the convenience of residents. One of the most interesting features is the mechanical plant, which is fully described in a recent number of the *Engineering Record*. This installation will be open to the inspection of visitors, in accordance with the custom usually followed in numerous modern American hotels. The plant includes watertube boilers with an aggregate capacity of 2,400 horse-power, a refuse destructor with a 50 horse-power boiler for the utilisation of waste heat from the furnace, electricity generating sets of 1,600 horse-power, from which current will be supplied for lighting, for lifts, as well as for pump and other motors. The lighting system includes 13,000 lamps of 16 candle-power; the lift equipment seven passenger and two luggage lifts, besides conveyors and hoists, and represents 336 horse-power in motors. The heating and ventilating plant comprises over 43,000 square feet of radiating surface, and sixteen fans, capable of circulating 240,000 cubic feet of air per minute. Hot and cold water supplies, pneumatic delivery tubing, compressed air and refrigerating plant are also important features of the equipment. We must refer our readers to the detailed description for full particulars of this remarkable installation, which, in addi-

tion to its utilitarian purpose, is of distinct educational value.

Extraordinary Traffic on Highways. THE recent case of the Kent County Council v. The Corporation of Folkestone, in which Mr. Justice Darling found as a fact that there had been an extraordinary use of a highway by the Corporation of Folkestone so that they were liable to the cost of repair of the part so used, exemplifies a growing legal tendency of great importance to contractors and hauliers. This tendency is the increasing activity of highway authorities to take proceedings in respect of extraordinary traffic. It is natural that they should do so, being stronger and more business-like bodies than the old parish surveyors and highway boards. The principle of making those who use the roads to an extraordinary degree pay for their special use has a good deal to be said for it, but if carefully analysed it would probably be seen not to be so sound as at first sight it appears. True, at present it is the law, and a law which is likely every year to become more burdensome to those who have to use portions of highways to an unusual degree for a special purpose.

Pneumatic Despatch. ALTHOUGH the pneumatic despatch system has been used in London for nearly half a century, its application has been confined chiefly to the post-office service, and the tubes employed are rarely more than 2½-in. diameter. The same system is applied in connexion with provincial post-offices for the conveyance of telegrams. In the United States the tubes are of far greater size, those installed between the New York post-office and the central station being of 8-in. diameter, while tubes of the same, and even of larger diameter, are employed in several American cities for the despatch of parcels as well as of letters. A proposal is now on foot to promote a Bill in Parliament to authorise the establishment of a pneumatic parcels service in London. Such a scheme, to be effective, would involve a very heavy capital expenditure, probably running into millions, but if sanction can be obtained and the money raised, the project would be of immense convenience, and should also have the effect of reducing vehicular traffic to a marked extent.

Manchester Ship Canal. FROM the half-yearly report of the company, it is satisfactory to learn that, in spite of unfavourable trade conditions, the seaborne and large traffic on the canal amounted to 1,903,833 tons in the first half of this year, as compared with 1,835,805 tons in the corresponding period of 1903. We referred in a previous "Note" to the Bill relative to the deepening of the canal, and are glad to find this measure will be passed before the close of the present Session. Another Act, which has already been passed, is of much importance, and confirms an arrangement between the Corporation of Manchester and the company, which will greatly facilitate the construction of wharves and dock accommodation at the Manchester end of the canal. The liberal support of the Corporation has

been of inestimable value in the past, and the new Act will still further benefit the company, shipowners, and traders alike. At the present time additional jetties are being built at various places along the waterway, spare upper gates are being provided for the 40 ft. wide locks, and additional plant is in hand for the No. 9 dock and the transit shed. These works will probably be completed in June, 1905. It will be seen that due attention is being paid to the requirements of traffic in every possible direction, and one most satisfactory circumstance is that the expenditure of capital in this manner has always led to increase of net revenue, which, for the past six months, amounted to more than 92,000*l.*

A Small Museum at Famagusta. AN interesting small museum has recently been created out of an old church in Famagusta, Cyprus, by the successful efforts of the new Curator of Ancient Monuments. It contains about 100 examples of the most interesting stone carvings of the XIIIth and XIVth centuries, some of which have been illustrated by M. Enlart in *L'Art Gothique en Chypre*, besides a quantity of old arms and armour found in the city at different times since the British occupation. There are also some curious relics of stained glass singularly preserved, in spite of the ruin of all the old churches at the time of the Turkish bombardment. This new institution will form an additional attraction for visitors to this most famous old city.

Vestiges of the Fleet River. IN excavating the site for a block of new buildings at the corner of Farringdon-street and Seacoal-lane have been found some relics of a time when the Fleet was navigable for small craft. At a depth of some 20 ft. were discovered a row of blackened oak piles, with camp-sbedding, which had been constructed to hold up the bank and to serve as a retaining wall for a wharf or quay formed of bricks and stones bonded with lime. The curve of the wharf up Seacoal-lane indicates that there was a creek or dock for the loading and unloading of barges and lighters that were plied on the Fleet near its junction with the Thames.

The Architectural Association Excursion. PARTICULARS of the thirty-fifth annual excursion of the Architectural Association, which is to be held in Sherborne and neighbourhood from August 15 to August 20, have now been issued. On Monday, the 15th, the party are to visit Trent Church, chantry and bouse; Sandford Orcas house; and North Cadbury Court and church. On Tuesday they will journey to Crewkerne, Beaminster, Melplash, and Parnham, and on Wednesday the bouse at Clifton Maybank and the bouse and church at Brympton are to be seen and Newton Surmaville visited. Thursday will be devoted to the following visits: Templecombe, Blandford, Milton Abbey, Piddletown, Waterson, Dorchester, and Yeovil. The party will again visit Yeovil on the following day, when the village and church of Tintinbull, Montacute House, and Preston Grange will be seen. On Saturday the excursionists will remain in Sherborne. The

Ion. Secretaries of the excursion are Messrs. W. Talbot Brown and A. W. Jennings. Second-class reserved compartments on the 2.55 train from Waterloo will be arranged for on Saturday, the 13th, and the headquarters of the excursion will be at the "Digby Hotel," Sherborne. Favoured by good weather the excursion should be a very successful one.

MAGAZINES AND REVIEWS.

TO THE *Art Journal* Mr. C. F. Bell contributes an article on a curious and interesting subject, that of the series of artistically-embellished "Oxford Almanacks," issued by the University annually since 1674, and of which we gather that complete examples still exist with the exception of that of 1675, the second of the series, of which no copy is extant. These Almanacks consisted each of a large sheet containing a time-table of University events for the year, which time-table, however, is quite subordinate, especially in the earlier examples, to the decorative treatment of the sheet. Reproductions on a small scale are given of a good many of the sheets, and very interesting they are, especially the older ones. The latter, according to the fashion of the XVIIIth century, are almost entirely allegorical and symbolic; the XVIIIth century examples that are given show rather mechanical and perspective views of this or that college, accompanied by imaginary or allegorical figures in the foreground; while, when we get to the XIXth century, allegorical and decorative character have been like dropped, and we find views of Oxford in landscape style, to some of which the great names of Turner and de Wint are appended. Turner drew the Almanack annually for some years, having been first appointed as artist at the age of twenty-five, before he was famous. Before he abandoned the post he had become a man of renown, but was not the less taken to task by the Dons for inaccuracy in his representation of some of the buildings which he took as the subjects for his illustrations—probably with reason, if accuracy was an object with them. In his younger days Turner was one of the most masterly and painstaking of architectural draughtsmen, but later the spirit of the landscape-painter, in search of broad effects, relegated architectural accuracy to a secondary place. In spite of the high artistic quality of the later landscape-painter's illustrations, and of the old-fashioned and (to us) eccentric character of some of the earlier allegorical designs, one cannot but feel that the latter were really much more the right kind of thing for the situation, being decorative in intent and effect, and showing a good deal of fancy and invention. The earliest one (1674) is very curious; the main feature is a circular building (in bad perspective), with a large arched opening in front and rear, with water all round it, and numbers of small allegorical figures swimming in the water, perched on brackets on the walls, or flying in the sky; the calendar is engraved on panels on the upper part of this building, and where the last one on each side would have become illegible from foreshortening, small flying genii have obligingly taken it out of its place on the wall and hold it up to face the spectator. Those for 1677 and 1680, both by Michael Burghers, are in a less naive style; a portion of the sheet is occupied by the Almanack, on a square symmetrical space, the remainder being occupied by symbolic figures and landscape, of some power of design. The point of the whole matter, and the reason we have commented on it at some length, is that the older artists of the Oxford Almanacks had a much better idea of the decorative treatment of an Almanack than those of the early XIXth century, and that, compared with the invention of decorative symbolical figures and compositions, the mere insertion of a view of a college or a street in Oxford is a prosaic and unintellectual proceeding. What is the class of work in favour at the present moment does not appear, as 1866 is the latest example given. The frontispiece to this number of the *Art Journal* is an admirable etching of "Hindhead," by Mr. Percy Robertson.

An article by Mr. Sturge Moore, in the *Burlington Magazine*, on "A Canon of Proportion for the Human Figure," is not rightly described in the title, since it only deals in a general way with the question whether such a

canon is possible or necessary, and with suggestions as to the real meaning of Abrecht Dürer's theory of proportion; viz.: that it was only a central or normal standard by which to measure differences or deviations from it, as required for artistic expression. But surely this is only the mere common sense of the matter; no one supposes that an ideally perfect or standard form is to be applied mechanically, as it were, to control all a painter's figures. To arrive, however, at a normal standard of physical proportion in the human figure is a matter of very great interest, and the article does not assist us to it, as the title seemed to promise. The article on "Old Moustiers Ware," translated from the original of M. Henri Frantz, is of real interest as making us acquainted with a once famous pottery ware in France of which the examples are scattered and difficult to come at; and the beautifully executed illustrations add to its value. A short article by the Editor on "Art as a National Asset" should be attended to. It seems a low view to take of art, to regard it as a power commercially valuable to the nation which possesses it; but it is nevertheless one form of the national value of art, as strikingly shown in the case of Italy and France. It is their art which brings to those countries multitudes of visitors who would otherwise not trouble about it; and this is a point which might appeal, perhaps, to that rigid sense of economy which characterises British legislators, who always look on public money spent on art as a form of extravagance. If one could get it into their heads that money spent in improving English art is likely in the long run to benefit the financial position of the country, perhaps even the House of Commons might take a different view of the matter. As the Editor says, one could not make the British nation artistic by an Act of Parliament; "nevertheless, a sound and systematic programme for putting good and bad art before the public with the prominence they respectively merit might effect a considerable improvement in their powers of discrimination." It is suggested that any attempt to help art and artists must include helping the public also, more especially by reorganising our galleries and museums so as to emphasise the distinction between good and inferior art. And in connection with such an effort comes in also the great importance of sound choice and judgment in such a matter as the purchases with the Chantry Fund.

In *Public Works* will be found some description of municipal work at Rouen and at Nice, and an article on "The Bridges of Berlin." This latter is of interest as a historical sketch of the development of bridge-building in Berlin, but the more recent and pretentious of the bridges are in the worst and most tawdry taste, both in their masonry and in their decorative iron-work. Some of the sculptural decorations are better—the bears on the pedestals of the Moabit bridge, for instance; but in general design the oldest bridge illustrated, the Kurfürsten bridge, is by far the best in point of good taste and propriety of architectural treatment. In fact, the progress of city bridge-building seems to have been much the same in Berlin as in London; the older bridges simple and monumental, the later ones pretentious and covered with florid and coarse ornament.

In *The World's Work* is an illustrated description of Dr. Barton's air-ship, which has for a long time been in process of construction at the Alexandra Palace, and which was to make its first trip during the present month. It is a very complicated construction; we hope it may be successful in carrying the problem one step further, and without fatal accidents; but one cannot avoid the impression that before any real success is arrived at in aerial navigation (and we believe success is probable in the long run) a great deal of simplification of the machine will have to be achieved. Each experiment, however, may be useful in showing how simplification can be arrived at.

The *Architectural Record* (New York) contains another instalment of Professor Goodyear's studies to prove that all the lapses from vertical line and rectangular setting out in mediæval churches were made designedly by the builders, and are what he calls "refinements" of architectural design. He seems to have got to the climax in the case of St. Quentin, where the crossing piers have all taken a bend outwards half-way up their length. That the position was regarded as dangerous is shown by the tie-rods, which Professor Goodyear evidently recognises as an awkward fact for his thesis,

but he dismisses them with the assumption that they were put in recently. If he had found evidence that they were ancient it would have made short work with his theory, and he has apparently not tried to get any evidence. He wants to know how piers could go 2 ft. out of the perpendicular without the vault falling in. Did he examine the condition of the vault? At Peterborough, as we all know, the piers have moved more than 2 ft. out of the perpendicular, but the vault did not actually fall in, though it was in a very precarious state before the recent restoration. We have no doubt, by the way, that if ever Professor Goodyear condescends to take English Gothic into his consideration (with American writers this is always a condescension), he will discover that the west piers at Peterborough were purposely built leaning outwards, and the choir piers at Salisbury leaning away from the crossing. But is it even necessary to consider this difficulty at all? If the tie-rods are ancient, as we surmise, the story told by the building itself seems to be this—that the thrust of the crossing arches and vaulting ribs began pushing out the piers, that tie-rods were then inserted and the arches corrected (perhaps taken down and rebuilt), and the filling of the vault inserted subsequently. It is a more reasonable explanation than Professor Goodyear's, at all events; for supposing that these piers had been deliberately built broken-backed, how is this an "architectural refinement?" On the contrary, it is one of the most clumsy, useless, and stupid things that could possibly have been done. There are a few undoubted cases in which buildings have been narrowed on plan towards one end in order to produce a false effect of increased length, but the widening of the piers at the upper portion would have the effect, not of increasing but of diminishing the apparent height of the building, and this at a time when French Cathedral builders were vying with each other in the endeavour to increase height! The notion is really too preposterous to do anything but laugh at, except to lament that a clever man should have got such a hee in his honour. Among the other articles in the *Record* is one on the work of Messrs. Rutan and Russell, who appear to be the leading architects in Pittsburg; we cannot say that we are struck by any very remarkable quality in their buildings as here illustrated; the large Hotel Schenley is a simple and massive treatment of a large hotel block, but it might have been made a good deal more attractive without losing simplicity. Mr. Charles de Kay's article on "The Future of Decorated Metals," which runs here into a third chapter, seems intended chiefly to introduce illustrations of American metal work; some of these are rather commonplace, and have more apparent relation with the past than the future, and the wrought-iron electrolier on page 151 is a piece of very bad naturalism; but we are grateful for the illustration of the bronze stairway in the Chicago Public Library, a good translation of a classic stone ideal into bronze form; we should have been glad to have had some details of that. The designer's name is not given.

By far the best thing illustrated in the *Berliner Architektur-Welt* is an example not of architecture but of sculpture—a funeral monument by Herr Von Dammann, consisting of a perfectly plain square stele, with an inscription cut so as to form a decorative square on the surface, and a heavily-draped female figure seated on the top of the stele, with one hand up to her chin, in an attitude of musing. There is a dignity and repose both of line and expression about this which we do not often see realised in German sculpture. Among the architectural designs illustrated the most noticeable is a lake-side restaurant, of which MM. Berndt and Lange are the architects; an erection of very fanciful character, not unsuitable for a building of the kind, and with some good application of sgraffito decoration in the interior. The number contains an essay by Dr. Hans Schmidkunz on "Kinderlust und Stadtbausehmerz," beginning with considerations on the difficulty of finding safe and adequate playing-space for children in towns, and going off (rather illogically) into a Utopian scheme for three-story streets in cities, one for heavy traffic, one for quick traffic, and one for various purposes (including apparently the children's sports). Proposals of this kind, besides being, on economic grounds, outside the region of practical politics, would result in conditions absolutely unhygienic as well as

inconsistent with anything like nobility of effect in city architecture. Proposals of the same nature have been made in England, concerning which all one can say is that their authors, to overcome a minor inconvenience of crowded traffic, would inflict on cities an expensive and permanent disfigurement and loss of air circulation.

The *Architektonische Rundschau* does not contain this month a single design worth remark except one on which we have already commented in reference to an illustration which appeared in the *Berliner Architektur-Welt*.

The *Quarterly Review* contains an article under the title "Recent Lights on Ancient Egypt," a collective review of various recent works on the subject. We do not understand why M. Choisy's "L'Art de Bâtir chez les Egyptiens" is not included among the list of books at the head of the article, although it is the subject of some two pages of special comment in the course of the review. The article is a good comprehensive summary of the present state of our knowledge of Egyptian art and history, and concludes with an expression of the opinion that, amid the great and rapidly growing bulk of material for Egyptian study, aency of observation and of interpretation, "which also means distinguishing clearly between fact and conjecture," should be especially aimed at. "If leading scholars would bear this in mind, their books would be either fewer or smaller, and each contribution would mark a definite and positive step in the advance of knowledge." The number also contains an article on "Giotto and Early Italian Art," ostensibly a review of the new edition of Crowe and Cavalcaselle, edited by Mr. Langton Douglas, assisted by Mr. S. A. Strong. We gather that the editor has taken a different line from the authors, who regarded Giotto as essentially Florentine and a follower of Cimabue, while Mr. Douglas regards Giotto as essentially Roman in his artistic descent and education, and dismisses Cimabue as a myth. As we have before taken occasion to remark, this attempt by some recent art-critics to deny the influence and even the existence of Cimabue as a painter is absurd in the face of Dante's explicit reference to him as the head of painting in his day; Dante was too close to the period to have mistaken a myth for a man. The summary of Giotto's position in Italian art, at the close of the article, is eloquent and written in a true spirit of criticism.

In the *Monthly Review* Mrs. Ady writes an article on G. F. Watts which very adequately represents the feeling with which the nobility and steadfastness of Watts's life and his artistic aims must be regarded by all seriously thinking people. But as a critical review the article is pervaded by the same kind of mistake—a mistake of a noble nature, no doubt—which pervaded Watts's own view of art. Watts, in his later years at all events, made too much of the didactic element in art, to the manifest injury of the artistic element; and Mrs. Ady is so much occupied with the moral greatness of Watts's life and character (in which we are entirely in sympathy with her), that she seems rather to regard this as assuring the artistic greatness of his works. She quotes, we observe, the French critic M. de la Sizeranne, as having confessed that "the works of this English master had first made him believe in symbolic painting." Something like this may be deduced from de la Sizeranne's remarks, but those who refer to what the French critic actually said about Watts, in his book "La Peinture Anglaise," will see that this representation of his opinion is hardly accurate. We have not the book at hand at the moment for quotation; but we remember that de la Sizeranne emphasised very strongly his opinion as to the mistake of making painting into a sermon, and complained that Mr. Watts had been "le bourreau des tous nos joies" in art. The mistake of moral painting is that the moral dies, the art remains. Watts was a much nobler character than Titian, but Titian was a much greater painter.

The *Fortnightly Review* contains an article by Mr. W. B. Woodgate on the important question of the proposed Thames Barrage, with special reference to the essay by Mr. Barber in *Public Works*, which we have before commented on. Mr. Woodgate's article is a very important and thoughtful one, and should be read by those who will be officially concerned in settling the question. His opinion, which is the same as we heard long ago from one of the oldest and most experienced of river and harbour

engineers, is that the stoppage of tidal action at Gravesend, which would be the result of the barrage, will only have the effect of removing the difficulty as to water to a situation lower down; in other words, that the Thames at Gravesend will then be under the same conditions (relatively) as the Thames at Teddington now is, and that we shall have less water at low tides at Gravesend, and more silt, than now exists. Considering the enormous expense of the work, and that once done it cannot be undone, the most serious consideration of the problem on all sides ought to be given to it before anything is decided on.

In *Scribner's Magazine*, under "The Field of Art," Mr. Ernest Flagg, the well-known architect, writes an article on the deficiencies of the plan of New York, with a grand scheme for a city improvement, consisting in driving a great central avenue 160 ft. wide right along the centre or back-bone of the city; a block plan of the scheme is given. Mr. Flagg makes suggestions in regard to sale or exchange of sites which he thinks would make it economically feasible; of that we cannot well judge; but that the scheme would be a grand one there is no doubt; the plan speaks for itself.

In the *Century* an article on "The Summer Splendour of the Chinese Court" is accompanied by some illustrations of the architecture in connexion with the Summer Palace (twelve miles from Peking), which are of some interest, and include a view of a pavilion pier built in the form of a marble boat; a fancy which reminds one of the Roman treatment of the island in the Tiber.

Harper includes an article, rather historical than architectural, on Château Gaillard, with effective but rather sketchy illustrations. The number also contains a short but most important article by Sir Oliver Lodge, "Electric Theory of Matter," to which we may return.

The *Gentleman's Magazine* includes the first part of a lengthy and carefully-studied essay on the Roman remains at Fréjus, the ancient Forum Juli.

The *Antiquary* includes an article by Mr. Thomas E. Maw on "The Church Libraries of King's Lynn," a collection of books in the Stanley Public Library of that town, and which goes by the name of "The St. Margaret's Church Library." On November 4, 1631, it was ordered "that fifty pounds be bestowed by the Mayor and Burgesses towards the furnishing with hooks of the Library in St. Margaret's church." The article describes some interesting books in the collection, with illustrations of two cuts from the Hall Book. Mr. MacMichael's essay on "London Signs and their Associations" is continued.

Knowledge contains an article by Miss Clarke on "The Inevitable Ether"—inevitable, because the mechanism of the universe appears to be inexplicable without it. Astronomers and physicists seem to be coming to a certain unity of thinking in regard to the ether, which however, so far, seems to be only a name for a condition of space which we can only appreciate by its results. Fifty years ago people talked of the "electric fluid"—an idea now only relegated to the ages of faith. Possibly fifty years hence the term "ether" may have become equally antiquated. The same number contains the first chapter of a practical essay on "The Temperature of the Air" and the means of observing and recording it, by Mr. William Marriott, and an article on "The Later History of the Horse," which we refer to because two engravings, representing the horse in Assyrian art and the horse in Greek art, have got the titles transposed, the Assyrian picture being described as Greek, and vice versa; which indicates a want of "knowledge" on the part of some one.

ROMAN NOTES.

THE excavations in the Forum are still proceeding, but no discoveries of great importance are announced as having been made since the writing of my last article (*Builder*, July 23, p. 88).

On the south-west side of the Lacus Curtius, a well of the Republican period, of the oldest type, has recently been explored; it was excavated in the hard subsoil, with footholes for descent, and not lined with tufa slabs, like the wells of later date. The upper part of it was filled with lumps of tufa; at the bottom were found three skeletons of large watchdogs, together with fragments of archaic terra-cotta antefixæ. The exploration of the lower strata

near the base of the equestrian statue of Domitian is not yet complete. (*Tribuna*, July 11.)

The problem of the Via Cavour has been examined by a Commission appointed by the Ministry of Public Instruction, and its report which has been drawn up by Comm. Boni, has just been published. It was originally intended that the Via Cavour—a comparatively new street descending from the railway station—should cross the open area of the Forum by a bridge superseding the present road which runs on a viaduct between the arch of Septimius Severus and the Capitol, and cuts off the temples of Concord and Vespasian from the rest of the Forum, thus ruining the view of the north-west end of it. But the recent extension of the area of excavation has rendered such a bridge almost impossible, while, owing to the removal of the street which passed in front of the Curia and covered the site of the Comitium, the present road has become more inconvenient and dangerous than ever, owing to its narrowness and the sharp curves which it makes, and, being an important artery of communication (as a glance at the plan of the city will show), it has a good deal of traffic to carry.

The Commission does not discuss this point but contents itself with recommendations with regard to the Via Cavour—which, it may seem, seems to be agreed on all hands, only be carried to the Piazza Venezia, and under no circumstances across the Forum.

The municipal engineers desired to take it close to the back of the Curia (now the Church of S. Adriano) and across the site of the temple of Venus Genetrix, which occupied the centre of the Forum of Caesar. But the Commission's report urges that the sites of the Imperia Fora, which are to a considerable extent covered by modern streets and buildings, should be respected (in order not to prejudice the possibility of their eventual exploration), and that the new prolongation of the Via Cavour should keep on the north-east side of the Forum of Augustus, and then run round two sides of the Forum of Trajan to the Piazza Venezia. From an archaeological point of view, there is everything to be said for the recommendations of the Commission, though the engineering difficulties may be considerable, inasmuch as the slope of the Quirinal come right down to the north-east side of the Imperial Fora, the hemicycle of the Forum of Trajan being, indeed, built right against the hill.

An interesting discovery has been made in the Church of S. Maria Maggiore, by Sig. Arduino Colasanti. (*Tribuna*, July 12.) On the upper part of the walls of the basilica, above the present flat gilded ceiling, which was completed by Pope Alexander VI. (1492-1503), are remains of frescoes which appear to belong to the end of the XIIIth century. On the two sides of the walls of the nave, and on the upper part of the wall over the triumphal arch, are the busts of Saints on a blue ground in large medallions while a medallion on the south-east wall, over the main entrance, has a representation of the *Agnus Dei*. Above these medallions is a line of small arches, shown as if constructed in coloured marbles, and resting upon pilasters, with acanthus leaf capitals; and above these again a line of rosettes between red and yellow bands.

These frescoes are works of considerable power, and, though inspired by classical models, are by no means lacking in life and vigour while they reveal careful calculation on the part of the artist of the effect that they ought to produce at a considerable height above the floor level. They possess the characteristic of the Roman school of the latter half of the XIIIth century, and present several points of similarity with the frescoes of Pietro Cavallini in S. Cecilia in Trastevere, discovered only two or three years ago, and unluckily quite inaccessible to the public, situated as they are in the nuns' choir.*

We know, too, that Pope Nicholas IV. (1288-1292) restored the church of S. Maria Maggiore; indeed, the mosaics of the apse were executed by his order, and in them he appears as an adorer of the Virgin at her Coronation; while an inscription set up by him recorded that "he restores the Virgin's ruined fame, and the old church is made new."

On the other hand, Sig. Colasanti notices that the frescoes of S. Maria Maggiore are less fine in execution than the other known works of Cavallini, and declines to pronounce a decided

* Cf. Hermann in *Gallerie Nazionali Italiane*, I (1902), 61.

pinion as yet. In any case, the discovery is one of considerable importance for the history of the evolution of Italian art.

THOMAS ASHBY, JUN.

BEAR-YARD AND ARCH-ROW, LINCOLN'S-INN-FIELDS.

THE houses in Bear-yard and Portsmouth-lane, a passage leading from the yard into Lincoln's-inn-fields, with some in Portsmouth-treet, are being pulled down. One of the houses, No. 2 in the street, formerly Louches-buildings, and now named Lincoln's-inn-fields Chambers, is noteworthy as being the last remaining house of Arch, or West-row, built by Inigo Jones, that has retained its original front in red brick, though the top story is a subsequent addition, seemingly, for the attic above the blocking course. The three pilasters have ionic capitals with hanging wreaths or swags; the middle one has an ornamented band bearing fleur-de-lis; on the similar bands of the two other pilasters are roses displayed. Those roses, carved in stone, commemorate the act that when Inigo Jones laid out the Cup, or Cop, and Purse-fields, under the commission issued in 1618, he began on the west side, including part of Great Queen-street, the site of the Pightells and Purse-fields, which belonged to the jointure of the Rose and Lily Queen, Henrietta Maria. Jones made an archway across the end of Foriue, or Fortifue-lane—now Sardinia, formerly Duke-street (1648)—leading from Fyckett's-fields through the Purse-fields, and so alongside Fortifue-garden to the Via de Aldwyche, now Drury-lane. The elevation of the house we cite gives some idea of what the whole row was originally like under his hands; for of the remaining houses six—namely, Nos. 50A, 50, 56, 62-3, and 65, have been re-built, and of five, Nos. 51-2-3, 61, and 64, the fronts have been changed and stuccoed, whilst Nos. 57-8, one house, has a stone front apparently of a later time, and Nos. 66-7 is Newcastle House, built by Captain Winde, a scholar of Jones's pupil and executor Wehh, for the Marquis of Powis in or about 1686. But the pilasters remain of Nos. 51-2, 54-5, and 64, and in three houses of that group they still carry the rose and fleur-de-lis devices. On October 22, 1898, we illustrated the rare silver medal, by George Bower, struck to commemorate the pillage and burning on the night of December 11, 1688, of the Franciscans' Chapel in Duke-street, since the Sardinian chapel or church of SS. Anselm and Cecilia. The medal, presented to William and Mary on their accession, bears on its reverse a beautifully wrought relief showing Arch-row with its old elevations, the forecourt walls with their gate-piers, and the wooden posts and rails of the square wherein the Protestant mob are burning crosses, etc., from the chapel, which with the Friars' house, now No. 54, the Presbytery at the arch-way, is depicted as in ruins. There, as at Covent Garden, Inigo Jones's designs were not carried out in their entirety; a plate, attributed to Hollar, was found a few years ago by Mr. H. Fancourt, of Highbury, which, as he considers, delineates the architect's original designs, whereof only that for the west side of the square was completed as he had intended. Timbs records that Inigo Jones built Portsmouth House in the south-west corner of the Fields "for the Earl of Portsmouth." The so-called "Old Curiosity Shop" of Charles Dickens is a reputed relic of the Duchess of Portsmouth's dairy-house; the Ordnance Survey marks Portsmouth-place as being the site of Portsmouth House.

The inner square of Bear-yard is the site of Charles Gibbons's tennis court, opened as a theatre by Killigiew and the King's company on November 8, 1660, with a performance of "King Henry IV." The remains of that play-house, which should not be confused with the adjacent Duke's Theatre, in Lisle's tennis-court, Portugal-street, were discovered after a fire on September 19, 1809, and are illustrated in Wilkinson's "Londina Illustrata." Some slaughter-houses erected on the site gave way fifteen years ago to the casual and receiving wards of the Strand Union, built after designs by the late W. S. Cross.

POLICE BUILDINGS, SEDGLEY, WOLVERHAMPTON.—The new police buildings at Sedgley were opened recently. The plans for the work were prepared by Mr. Chadde, the County Surveyor, and Messrs. H. Gough and Sons, of Wolverhampton, were the contractors. The total cost of the buildings was 5,000l.

BRAUWEILER ABBEY.

SITUATED at about a mile from Königsdorf Station, near Horrem, and at about half an hour's train journey from Cologne, on the Aix-la-Chapelle line, this striking church attracts the attention of the traveller on account of its splendid grouping of towers, lantern, and lofty spire, and its commanding position on the top of a hill overlooking the great expanse of flat country below.

The first structure on its site was a timber chapel of small dimensions discovered by a rich man in a wood, and consecrated to St. Medardus. The Count Palatine Hornmann, whose castle stood at Branweiler, caused the chapel to be rebuilt in stone, and this was consecrated by Archbishop Warinus of Cologne (976-85). The Count's son and successor, Ezo, who married Matilda, daughter of Otto II., resolved to build a monastery at Branweiler, and on April 14, 1024, the foundation-laying was performed, a little to the north of the site of the little chapel, by Archbishop Poppe von Stahlo, and Archbishop Pilgrim consecrated the church on November 8, four years later.

In 1048 it was necessary to enlarge the church and buildings, and Abbot Elio laid the new foundation on June 30 of that year. The third abbot, Wolfhelm (1065-91), richly decorated the church, and finished the fabric.

About the middle of the XIIIth century buildings around the church were commenced, and in 1141 an altar was dedicated in the west tower, to St. Michael—apparently a not unusual place in churches in Germany for altars to that saint.

The aisles were also vaulted about then, and several columns erected and others strengthened in the nave, with buttresses outside. No definite plan seems to have been followed for a while, the old work and the new mingling curiously, and new work extending west without being finished. About 1196 Abbot Bertram of Anrath planned an extension of the church, and raised funds in the Cologne diocese for the

work. The next abbot (Godesman) continued his predecessor's labours, and in 1200 the whole of the east end was rebuilt, from east of the choir to the transepts, the choir being extended 12 ft., but the old crypt was not altered. In the same year three new altars were consecrated in the crypt.

The works were left, in 1226, unfinished, the south turret of the tower being only at part of its height, and covered with a provisional roof. The northern one was less high, and was later on lowered to about half the height of the choir and the foundation of the west tower was laid, but not more.

An organ was placed on the north side of the church at the end of the XIVth century.

In the XVth the original vaulting gave place to a Late Gothic one, shortening the interior by 4 ft., but raising the nave by that amount.

In a great storm in 1606 the west tower fell in and greatly damaged the roof, and the steeple was restored in 1629.

A decree of Napoléon, in 1802, refounded the Abbey, and in 1806 the church was made parochial. Since 1815 the buildings have been government property, and are now a reformatory and house of correction. The paintings and altars and carvings, as well as the beautiful cloisters, are alone worth a journey to go and inspect.

The restoration of the church was commenced in 1860, and the works were practically completed in 1895.

J. A. R.

IRONWORK IN THE SAVOY HOTEL EXTENSION.

THESE two drawings show some of the wrought-iron work halustrading carried out at the Savoy Hotel Extension by Messrs Starkie Gardner, from the designs of the architect, Mr. Colcutt. They form good examples of work of the kind which has character and interest without eccentricity.

The railing along the cornice is a large piece

Iron Railing along Cornice, Strand and Savoy Court Elevations.

Railing between Columns of North Wall (South Block).

Ironwork in Savoy Hotel Extension.

of work, as when finished it will extend from the eastern end all along the Strand frontage, returning along Savoy Court, and it is then carried to the western extension round Herbert's Passage, finally ending on the south side of the building; a length in all of nearly 500 feet.

SANITARY FITTINGS.*

In bringing before you once more the question of Sanitary Fittings, which has so often been discussed at your meetings, I confine myself to those connected with the most economical and common-sense method of disposing of sewage, the water-carriage system. Till a comparatively recent period all water-closets were, as a rule, placed in the darkest and most out-of-the-way corners, shut off alike from light and air, and with no escape for the effluvia except into adjoining rooms; a state of matters only, alas, too common still. Water-closets, baths, lavatories, and sinks were, besides, all connected with the same soil-pipe, and were also inclosed in wooden linings which soon became sodden with filth, and gave off most offensive smells; water cisterns and storage tanks were placed where they were bound to receive foul gases from closets and drain-ventilating pipes; and the ground underneath the house contained a perfect net-work of soil-pipes. Now, all this was exactly the opposite of what ought to be the case. In an ideal building all fittings and drains should be designed and arranged so that waste matter of every kind may be carried outside as quickly as possible, and the necessary rooms and appliances should be so placed against outer walls that they may receive the maximum amount of light and air.

Baths.—These, for public or for the best private work, should be of enamelled fire-clay; but for general use, the material most to be recommended is cast-iron porcelain-enamelled, i.e., with the inside coated with white porcelain enamel which is practically incorporated with the iron by fusion in a muffle furnace. Almost equally good is cast-iron vitreous-enamelled, where the coating is coloured instead of white. Confusion has arisen between the two, but the difference is of colour rather than of kind, the essential constituents of the coating, and the methods of application and manufacture, being the same in both. Porcelain enamel is more costly, not so much because it contains a larger proportion of silica and is more durable (though this is the case), as because it is more readily soiled by dust specks, etc., in the process of manufacture. The white coating has, on the other hand, the recommendation of readily showing dirt, and therefore of promoting that cleanliness so necessary in connexion with sanitary appliances. The inferior quality of some of the earlier porcelain-enamel raised a prejudice against baths of the kind; but nowadays the improvements in making and firing that have been introduced render the goods of any high-class manufacturer thoroughly trustworthy. The metallic enamelled and japanned baths, so common in this country, are not to be recommended. The surface, merely a superior kind of paint, very soon becomes discoloured, and gives way under the action of soap and hot water. What the porcelain-enameller aims at is such an adjustment of fluxes and silicates as will give a coating that cannot be affected by any ordinary means.

Every bath should have a roll-top edge to throw off moisture, should be raised on feet, and should be set out from the walls. It can thus be kept thoroughly clean all round and underneath. After use it should always be rinsed out with clean cold water applied by a sponge or clean cloth. Bath-rooms should be well lighted and ventilated; and they should also be properly heated by means either of radiators or of hot-water towel drying racks.

Closets.—Every closet should have floor and walls alike of impervious material—marble, mosaic, tiles, enamelled-brick, endeca (that is, enbossed zinc sheets enamelled), or cement. Cement or plaster walls should be painted and varnished; or where, for cheapness, they are hung with American cloth or paper, the former should be painted and varnished and the latter varnished. Any wood used should be hard wood. Closet traps should, if possible, be what is called the P pattern, and should, if at all long, be separately ventilated. If the outlet require to go through the floor with an S trap, this ought to have a 2 inch ventilating connexion.

* Part of an abstract of a paper read by Mr. John Shanks at the Sanitary Institute Congress in Glasgow.

Closets should never have wooden inclosures; the only wood necessary is the hinged seat, and this should be connected directly with the pedestal. The pedestal itself should stand at least 6 in. clear of the wall, so that it may be possible to sweep and wash all round. The pan and plug and the two-piece hopper closets may be said to be entirely gone, and the wash-out is, in consequence of its large soiling surface, fast following them; but, of the older types, the valve, or Bramah, pattern still holds its ground, and is, if properly made and fitted, a good enough arrangement. The most modern types are the wash-down and the siphonic; and either of these, of good design and properly fitted up, should give complete satisfaction.

Storage Tanks and Flushing Apparatus.—For perfect efficiency all houses ought to have storage tanks to furnish a supply for every purpose except drinking—drinking-water should always be taken direct from the main. These should be placed in the highest part of the building; should be of large capacity; should always have good-sized supply valves and overflows; and should have tight-fitting covers to prevent dust from getting in. They should be cleaned at least twice a year, and should have, on the pipe leading to the various fittings, a full-way, screw-down, stop-tap, to enable the supply to be cut off for repairs, etc. The actual flushing process may be accomplished in three different ways:—(1) By what is known as a regulating supply valve, fixed over, or at the side of, the water-closet, and fed from the storage tank referred to. Regulating valves of good construction are noiseless, and with a good and ample water-supply very suitable and convenient. (2) From a cistern $\frac{1}{2}$ ft. to 6 ft. above the closet. (3) From a cistern immediately above and behind the closet. Cisterns fitted some distance above the closet should be placed directly over the pan; and the connecting pipe should be, by preference, of brass or copper, straight, or with as few bends as possible, from 4 ft. to 6 ft. long, at least $\frac{1}{2}$ in. in external diameter, and set at least 1 in. clear of the wall. The centre window so common in closet-rooms may perhaps interfere with this arrangement, but if the tank be fitted above the window the pipe can still be carried straight down. If the cistern must be placed at the side, care should be taken that the discharge pipe has as few bends as possible, since these create friction and diminish the force of the flush. Cisterns vary greatly in shape and design, and over no sanitary fitting does more grumbling arise, sometimes on the ground of noise, and sometimes on the ground of bad quality. Here again it is largely a matter of price. If purchasers be willing to pay, they can have an article that will last, and that will work with comparatively little noise. The best materials are those least affected by corrosion—porcelain; enamelled fire-clay; cast-iron, glass-enamelled internally or porcelain-enamelled inside and outside; or wood, lined with lead or copper. Cisterns placed immediately above and behind the pan, though at first looked on with considerable disfavour, have proved very successful. A regulating stop-tap renders them almost noiseless, the larger inlet more than compensates for the lack of height pressure, and the greater quantity of water washes the basin, clears the trap, and flushes the drain in a perfectly satisfactory manner.

Sinks.—Sinks are, of all our sanitary appliances, those that probably receive least care and attention. Many people seem never to consider, or else readily to forget, that badly-fitted and foul-smelling kitchen and scullery sinks may cause serious pollution of cooking-pans, dishes, and cutlery, and even of food itself. These appliances should be made of strong fire-clay, white glazed all over, with round edges, and with no woodwork settings or casings of any description whatever. A loose teak-wood grating may be placed in the bottom to prevent the breaking of crockery, or damage to the enamel from saucepans, etc.; but even here a wire cage is perhaps better. The large drain boards at the sides should be covered with tinned or nicked copper. Sink and boards should be supported on cantilever brackets. The trap, discharging through the wall so as to leave the floor quite clear, should be of glass-enamelled cast-iron, as lead is much more liable to injury from external violence. The waste and overflow pipes should be large. If the sink be placed a few inches clear of the wall, the latter should be lined with white glazed tiles extending from the floor to 12 ins. above the top of the sink; and if it be placed against the wall

there ought to be a glazed fire-clay back at least 12 in. high. All angles, crevices, and sharp corners should be scrupulously avoided.

The absolute necessity of using the highest class of sanitary appliances, of having these arranged and fitted up in accordance with hygienic laws, and of following the best skilled advice that can be obtained, are matters that cannot be too strongly or earnestly impressed on the general public.

ARCHITECTURAL SOCIETIES.

MANCHESTER SOCIETY OF ARCHITECTS.—Some members of the Manchester Society of Architects recently made a three days' visit to Oxford. Arriving on Friday night, the whole of Saturday was spent in visiting the Town Hall and six of the colleges. After service on Sunday at the Cathedral, the new church for the Cowley Fathers was seen. The afternoon was spent in punting down to Ifley, where some hasty jottings were made of the famous Norman church and of the charming old rectory. Monday was devoted to sketching at St. John's or Magdalen.

Books.

Modern Cottage Architecture. By various architects. Edited by MAURICE B. ADAMS. London: B. T. Batsford. 1904.

No book could possess a title more alluring to architects than this work, for no subject lends itself to illustration more attractively than cottages. There is, however, such endless variety to be met with in these smaller dwellings that it becomes necessary to hold some principle or aim in view which will exercise restraint in the selection of examples, an element which is lacking in the publication under notice.

Here is a collection of fifty exterior views reproduced from various well-known architects' drawings, prefaced by "Notes Concerning Cottage Building," by Mr. Adams. Numerous plans are given, but the selection is wholly one of picturesque designs for lodges and cottages gathered from a wide range, with no other object than illustrating certain excellent buildings produced in recent years. No single type of dwelling predominates, nor does the book serve to indicate the tendency of present-day cottage design.

The preface emphasises certain difficulties which beset the path of the cottage builder, consequent upon the economic conditions of our times; but the illustrations do not attempt in any way to present solutions of the problems. The author avoids all reference to questions of cost, which is generally the first factor in the erection and maintenance of this kind of property. Little is said about the types of plan necessary to produce inexpensive or artistic designs, and, practically speaking, the question of interior treatment is omitted entirely.

Much useful information is given in the preface, together with some practical hints upon matters of detail. But a book of this description should be ahead of the times. Reference is made briefly to the septic tank treatment of sewage, which is more suited to larger houses, but no information or suggestions are given as to "surface" disposal of wastes, such as is found most convenient and simple for cottages in country places. Ferro-concrete is lightly touched upon, but it is one of the few methods yet in vogue which will, in course of time, help to overcome the financial difficulty of the problem, when brought more into general use. Papering is recommended in preference to the distempering of walls, which we do not think meets with general acceptance.

Taken as a whole, this publication is an interesting record of some excellent cottage architecture of a good class, but we do not anticipate that any direct purpose will be served by its appearance.

Bayeux Cathedral. By REV. R. S. MYLNE. Bell: Cathedral Series. 1904.

This little handbook will be useful to visitors to Bayeux and the neighbourhood. It contains much information about the cathedral, and useful references to the churches of the district. No mention is made, however, of the great and important abbey-church of C  risy-la-For  t, which is within an easy bicycle ride; Ouistreham also deserves detailed description. The illustrations from French photographs are

admirable; equally bad are those by some amateur, taken with a snap-shot camera without rising front or swing-back; those of Haon and Ryès, with all the windows lurching inward towards the central tower, are particularly discreditible. In another edition the writer would do well to consult more recent authorities; especially Ruprich-Robert's "D'sours à la Société des Antiquaires de Normandie," 1882. He would also do well to consult Viollet-le-Duc's "Dictionnaire Raisonné," I., 360, where he would learn that the architecture of Bayeux choir is no more French than that of Lincoln or Salisbury. The book differs from the rest of the series in possessing an introduction on the principles of Gothic architecture. This needs considerable revision. We are told that if a Gothic vault falls, it will crush all the pillars and arches below. How is it, then, that the piers and arches are all standing at Tintern? The vaults fell long ago. There is also a little too much sermonising, and not always good sermonising—e.g., we are told that the combination of Norman arcade and Gothic derestory in the cathedral nave is "so beautiful in every way that in gazing hereupon a deep sense of spiritual repose is had over the soul of man." This sort of thing is not wanted in an archaeological handbook.

Ancient and Modern Furniture. By JOHN W. SMALL. Stirling: Eneas Mackay.

We have seldom met with a book the title of which was more misleading. The author should have called it, surely, "Furniture, Ancient and Modern." The section on modern furniture consists exclusively of illustrations of his own designs, or, as he says in the preface, "examples of modern furniture which during the last few years have been designed and executed for manufacturers and others from full-sized drawings supplied by the author," though what he means by "designing from full-sized drawings" we are at a loss to imagine. Not content with the profuse illustration of his own work, the author naively tells us of one piece that "it forms a very imposing piece of furniture," and of another "that it has had great success on the market, as fast as the number made can be taken as a test"; and the reader is tempted to exclaim that he can well believe it.

It is only just to add that the illustrations of old furniture are well and carefully done, and often of great interest; but they are far too few for a book which does not profess to deal exclusively with any particular period. Had the second section been illustrated with the same fragility from the best examples of modern work it might have been of some value and interest.

Andean Innocents in Spain. By F. E. SIDNEY, F.S.A. London: Simpkin, Marshall, Hamilton, Kent, and Co., Ltd. 1903.

How comes it that Spain fails to make herself attractive to the tourist? Why does not that class, English and American, that visits Italy, make a diversion by crossing the Pyrenees? The climate is not, it is true, so agreeable as the climate of Italy. But there is much beauty in the later spring and autumn. The matter of language is but a superficial difficulty, and is not a serious bar to travel nowadays. Spanish architecture and painting are of unquestioned interest. The characteristics of the people are various and picturesque. Yet, despite everything that may be urged, Spain fails to appeal to the popular imagination. She has produced—and we think the reason of her failure lies here—no great personalities that touch the common sentiments of humanity. She has neither a Michelangelo nor a Savonarola. In the place of the one she offers us Velasquez, whose talents, however pre-eminent, can reach but the few. In place of the other we have the spirit of the old Iberian fanaticism that found outlet in the Inquisition—the Iberian ferocity that still holds carnival at the bull fight; a legacy recorded upon the frescoes of the Palace of Minos four thousand years ago, marking the trail of this tribal migration from the shores of the Black Sea.

Much of the neglect of which we speak is due, no doubt, to the scantiness of a literature calculated to inform. George Borrow's "Bible in Spain" still remains a classic. Richard Ford's "Gatherings in Spain" and the guide-books he compiled for Murray provide information of attractive interest. George Edmond Street has given us his "Gothic Architecture in Spain," wherein he laid hold of the vital elements of

her architectural development, following the growth of the Romanesque and Romantic periods in the north, rather than the accidental creations of the Saracen at Seville and Cordoba. At the same time it may be questioned whether Street was entirely fitted to do justice to the licence by which the Spanish builder sought and found the picturesque. Finally we should not forget to mention Lord Leighton's admirable estimate of Spanish art, contributed in a lecture to the students of the Royal Academy. Yet our information must be considered meagre. And so to fill the void, pleasant and communicative travellers describe to us the Alhambra, the Alcazon, and the bull-fight, while they trust to the camera to fill up the blanks. Mr. Sidney in no way falls below the standard of this class of production. We would point out, however, that if the Saracen element in architecture is to be exclusively admired, the home of this, and of its purest examples, may be sought for in the French North African province of Mauritania. The Tower of Mousourah at Tlemcen is perhaps one of the finest towers ever erected in any style.

Stained Glass. By LEWIS F. DAY. London: Chapman and Hall, Ltd. 1903.

This small book of just over 150 pages forms one of the Art Handbooks to the Victoria and Albert Museum, and is published for the Board of Education. It is a capably written and illustrated guide by a well-known authority on a most fascinating subject, and the opportunity has been wisely taken of illustrating the book with examples for the most part from those in the Museum, and, as is explained in the preface, of drawing attention to the fine series of tracings now in the Art Library made by the late Octavius Hudson. The author traces the history of stained glass in its various forms from Early Gothic to Renaissance, and at the end of the work is a useful inventory of the examples in the Museum, arranged as far as is possible in order of date. The illustrations are throughout excellent; particularly good are some of the examples given of XIVth century quarries and grisaille. Equally interesting in their way are the reproductions in Chapter VII. of Renaissance drawings for armorial and domestic glass.

Dunstable: its History and Surroundings. By WORTHINGTON G. SMITH. London: Elliot Stock, and the Homeland Association, Ltd. 1904.

This forms Vol. III. of the "Homeland Library," and contains a very full account of the chief points of interest of this historic Bedfordshire town, and much information concerning the prehistoric remains, natural history, geology, etc., of the almost equally interesting district of which it forms a centre. Three chapters are devoted to the fine fragment of the nave of the Priory church, illustrated with two plans and photographs. One plan shows the arrangement as in 1850, and the other includes a conjectural restoration of the monastic church and cloister. Much no doubt of great interest would result if the site of the presbytery were examined; and, unlike many such sites, it is free of obstructions, and has not, we believe, been built upon. Although much has been removed at various times, as in other cases of the kind, sufficient should remain to give us a pretty accurate idea of how this fine church was arranged. The author contributes more than one careful drawing towards the illustrations, but the majority are from photographs. A very beautiful pulpit and canopy at Edlesborough is one of the best. Two excellent maps of the town and district are placed in a pocket at the end of the book, and help to complete a very interesting and carefully-prepared monograph.

Slingsby and Slingsby Castle. By ARTHUR ST. CLAIR BROOKE. Methuen and Co. 1904.

THE Rev. A. S. Brooke has printed in a good and convenient style the records of his parish, his church, and the adjacent manor. It was not written, we may suppose, with the idea that it would be widely read; but it should appeal to those who dwell in the historical neighbourhood to which the records refer; and it is certainly very desirable that such records should be written. We noticed some little while since, we remember, a "History of Litton Church," compiled by its Rector, a similar class of work of unquestioned interest, although the interest was for the most part a local one.

Antwerp: an Historical Sketch. By WILFRED C. ROBINSON. London: R. and T. Washbourne. 1904.

BYZANTIUM—Venice—Antwerp, these are the centres around which the modern world has revolved, for we must include its commercial with its social progress and with those interests which develop with society. Indeed the development of the arts have always run concurrently with commerce. We wish we could add that the converse were equally true.

Antwerp—the city on the wharf—became famous at the beginning of the XVIIth century, under the reign of the enterprising Charles V. "Antwerp was then truly a leading city in almost all things, but in commerce it headed all the cities of the world," says an old chronicler. Bruges, the great banking centre, yielded her position, and the Hanseatic merchants removed to the banks of the Scheldt. "I was astonished and wondered much when I beheld Antwerp," wrote an envoy of the Italian Republic, "for I saw Venice outdone." In what direction Venice was outdone is not recorded. Not in her architecture at least; scarcely in her painting. We cannot concede a Tintoret to a Rubens. Yet, inasmuch as Antwerp was the home of Metsys, of Rubens, Van Dyck, and the Teniers, the home also of Christopher Plantin, the great printer, her glory is not to be sought in trade alone. She is still remembered as a mother of art and of letters, while her mercantile pre-eminence belongs to a buried past. Important and interesting as the history of the city is, we cannot touch on it further. We must leave our readers to follow her fortunes, political and religious, under Mr. Robinson's able guidance.

Hampshire. By J. CHARLES COX, LL.D., F.S.A. Illustrated by M. E. Purser. London: Methuen and Co. 1904.

This is one of "The Little Guides," convenient in form and well printed. Mr. E. H. New has contributed the illustrations to most of the books of this series. The simplicity of his style is well known, and it is one that is eminently suitable for conveying information without prejudice to his charm as a draughtsman; far preferable, in our opinion, to a manner of illustration that is much in vogue, where the topographical interest has to be sought for amid a riot of clouds. Miss Purser, who is responsible for the drawings in this book, is a follower in Mr. New's school. The guide is conveniently arranged alphabetically and not in routes. The antiquarian interests of the county have been treated by the author with both knowledge and appreciation.

Near Oxford. By REV. H. T. INMAN, M.A. Oxford: Alden and Co., Ltd. London: Simpkin, Marshall, and Co. 1904.

THIS small book is a good example of the kind of guide which has of recent years been the outcome of increased interest in places lying off the beaten track, formerly but little known except to the enthusiast, but now more readily reached by bicycle and motor. The letterpress is the result of the author's own personal visits and notes, and the majority of the illustrations are from photographs specially taken for the work. Some of the best are those illustrating the churches at Ewelme, Cassington, Eynsham, Thame, and Burford. The district included has a radius of about fifteen miles from Oxford, an extremely rich one in examples of both church and domestic work. It will be found a good guide both for the amateur (for whom a glossary of terms is provided) and the architect and student desirous of learning the chief points of interest to be found in each village. An index is given, and also a clear map of the district at the end of the book.

Adventures among Pictures. By C. LEWIS HIND. London: Adam and Charles Black; 1904.

We do not see where the "adventures" mentioned in the title come in; the book is a volume of collected papers of criticism on pictures and painters, mostly reprinted from the *Academy*. The author writes pleasantly and sympathetically about painting, in an easy-going manner, and those who are interested in the art will enjoy turning over his pages, though they will hardly find any important questions of art-criticism settled in them. There is a little too much of the tendency of the modern English art-critic never to allude to the Royal Academy

without a sneer. In Goldsmith's time the secret of acceptance as an art-critic was "to praise the works of Pietro Perugino"; nowadays it is to sneer at the Royal Academy. It is true that the Academy bangs a great deal of uninteresting work, and that it is somewhat narrow in its sympathies; but it is not the less true that from every annual Academy exhibition could be picked out a sufficient number of good pictures to make up a better collection than any other that is habitually to be seen in London.

The Country Gentleman's Estate Book, 1904. Edited and compiled by W. BROOMHALL. London: The Country Gentleman's Association (1903), Limited. 1904.

This book has a great quantity of varied information connected with landed estates. The part which will be most useful to our readers is that entitled Building Memoranda. In a short space this contains a number of facts which the land agent, when he has to turn his attention to building, will find useful.

Timber: Growth and Structure; Felling, Converting, and Buying, etc. Edited by PAUL N. HASLUCK. London: Cassell and Co. 1904.

This little book of ninety-six pages contains, according to the preface, "a comprehensive digest of the knowledge of timber scattered over seventeen volumes of *Building World*." The compilation is well done, and the book includes a large amount of useful and interesting matter, but it is questionable whether the editor was wise in confining himself to the matter which had already appeared in his periodical. In the chapter on "Measuring Timber" nothing is said as to the allowances made for bark in round timber, or as to the special methods adopted in the sale of certain woods, such as teak. The chapter entitled "Varieties of Builders' Woods" contains short but useful descriptions of the principal timbers used in building, but can scarcely be regarded as comprehensive, as no mention is made of jarrah, karri, maple, cedar, sequoia, and some other varieties which are now on the market. In the paragraph on page 66 the effect of knots in timber under tension and compression is not by any means clearly stated. These, however, are matters of minor importance. The book contains fifty-six illustrations, and can be recommended as a convenient and useful handbook, especially for students.

Subject List of Works on Electricity, Magnetism, and Electro-Technics in the Library of the Patent Office. Published at the Patent Office, London. 1904.

We have received for review the "Subject List of Works on Electricity, Magnetism, and Electro-Technics, in the Library of the Patent Office." We can congratulate the compilers on the very careful manner in which they have done their work. Under the various headings the works are arranged in chronological order, and this arrangement is of great value to the historian as well as the inventor. The headings have been judiciously chosen, and the key given at the end we have found convenient. There are one or two minor headings which might be improved. On p. 18 we should have written "Darsonvalisation" instead of "Arsonvalisation," and on p. 206 we should have written "perpetual motion" instead of "perpetual motors." We notice, on p. 33, that the spelling of the author's name in a recently-translated German work has, very properly, been corrected. We have only noticed two misprints, namely, one on p. 69, where Mr. A. W. Heavyside's name is spelt "Heavyside," and the other on p. 112, where his brother's name is also wrongly spelt. On p. 167 we would have included Dr. Larmor's and Professor Rutherford's books under "Ions and Electrons."

Railway Maximum Rates, Charges, and Traffic Acts. By M. B. COTSWORTH. London: Bennrose and Sons. 1904.

With profits steadily falling off and tending towards the vanishing point, the manufacturing and trading public naturally search diligently for openings for retrenchment. Wages and cost of raw material affording no relief whatever, "expenses" are overhauled. Of these "railway charges" often forms one of the least satisfactory features, from a feeling of helplessness as to whether the charges are legal or not. It has seemed in the past almost impossible to get to the bottom of the railway companies'

powers in this respect; but, armed with Mr. Cotsworth's little volume, the mystery becomes wonderfully simplified. The inquirer can very soon ascertain the charging limit of every company for any distance and for any description of traffic—always remembering that the item of "cartage" is an uncertain quantity not dealt with by the Railway Rates Acts.

A feature of this work is the free use of heavy type and italics for the accentuation of important passages, while the scales of rates are most exhaustive and comprehensive. Possessors of the earlier editions will have already appreciated all this, and they will find much additional information of value in this third edition. As an example of the thoroughness which characterises the work we may instance the new sections dealing with light railways. The authorised charges will be found (set out with the same careful exactness as the scales of charges for the main lines) applicable to all light railways which have secured Parliamentary powers. Many of these are not yet in existence, and some in all probability never will exist, but the author has apparently missed no undertaking authorised up to date.

Oil Engines: Their Selection, Erection, and Correction. By W. A. TOOKER. London: Merritt and Hatcher, Ltd. 1904. (Is. net.)

This is a companion work to the handbook on "Gas Engines," reviewed in our columns last October. After an introductory chapter in which the author enters into a general explanation of the capabilities of oil engines and the manner in which they operate, successive sections of the book are devoted to "Selection," "Erection," and "Correction." These three chapters give much useful and reliable information which should be appreciated by intending purchasers, as well as owners, and attendants of oil engines. An appendix containing illustrations of some twenty well known types of oil engines is a very serviceable addition to the book, affording means of ready comparison between the various forms of such motors made in the present day.

Notes on Blacksmiths' Work. By MAJOR R. F. SORSBIE, R.E. Chatham: Royal Engineers Institute. (Agents: W. and J. Mackay and Co., Ltd., Chatham.) 1903.

This pamphlet consists of a very businesslike collection of notes compiled for the instruction of officers and men of the Royal Engineers, whose duties frequently require them to superintend the work of blacksmiths, and sometimes to establish workshops and to teach unskilled men the essentials of modern practice. Detailed comment on a work of this character can scarcely be expected, but we may say generally that the subject matter is well selected, and that the individual notes are clearly and concisely stated. The book is divided into eleven chapters, dealing with such matters as the construction and equipment of the smithy; forging, welding, and otherwise treating wrought iron and steel; hardening and tempering steel; bench work of various kinds; and coach smithing. The letterpress is elucidated by a series of forty-one plates, containing no less than 230 figures, illustrating smiths' tools of various kinds and the manner in which they are to be applied. Although specially written for the Service, we confidently recommend this book to all who desire to obtain trustworthy information as to the work conducted in the smithy.

The Law and Practice Relating to Private Street Works, together with an Appendix, containing Particulars and Decisions of Cases. Reported by WILLIAM SPINKS, M.L.C.E. London: E. and F. N. Spon, Ltd. 1904.

This is rather a mixed kind of book. The first part contains portions of statutes, the second remarks on the law, and lastly there is an appendix giving a *précis* of different decisions. This is well done; but, on the other hand, the value of judicial decisions is often much lessened to the reader when the judgment cannot be read in full. The absence of an index is rather a serious drawback to the work.

Saw Mill Work and Practice: A Book for Owners, Overseers, and Operators of Wood-Working Machinery. By W. J. BLACKMUR. London: William Rider and Son, Ltd. 1904.

In this book the author deals with wood-working machinery from the standpoint of the actual user. It is no part of his programme to discuss the design and mechanical construction

of such appliances, and the whole of the matter and illustrations relate to the everyday work of the saw mill. Although the greater part of the book is devoted to the care and operation of saws and sawing machines of various kinds, there are three or four chapters which deal with rotary cutter and fixed-knife planing machines, and with machines for special objects. So far as these subjects are concerned, the author is evidently writing on matters with which he has the familiarity begotten of long personal experience. The same cannot be said of the chapters on "Shafting and Belting," and "Motive Power." Many hints contained in the last mentioned chapters are both useful and practical, but it is manifest that the author possesses a very limited qualification to offer advice on the subjects in question, and especially on that of motive power. Considering the book as a whole, we must say that it is well worth the careful study of those who desire reliable guidance on the ordinary routine of the saw mill. It is to be regretted, however, that the work of the printer and binder has not been better performed.

Illustrations.

JUMIÈGES.

THE illustration of Jumièges Abbey shows the XIII century nave, as seen from the southwest. On the right is seen the western wall of the central tower now disappeared. Weatherings of three different roofs are seen on this wall. The XIII century roof of the nave rested on gabled transverse arches. These gables would naturally be built as flat as possible to diminish the weight on the arches. It may be inferred, therefore, that the lowest of the three weatherings represent the pitch of the XIII century roof. At some period a balustrade was constructed in front of the triforium arcade; marks of the balustrade still remain. A similar balustrade, also not of the original construction, remains in the triforium of the nave of the Abbaye-aux-hommes at Caen. The capitals, as is usual in the XIII century work of Normandy, are of Corinthian type, with the acanthus omitted; the cushion capital is rare in Normandy till the XIII century. Illustrations of Jumièges towers and nave appeared in our issues of July 16 and August 6. Longitudinal and transverse sections of the nave are given in Ruprich-Robert "L'Architecture Normande," Vol. I, Plates 12 and 13.

SOME BRETON CHAPELS.

THESE illustrations are in connexion with an article appearing on another page, in which the buildings illustrated are referred to; with the exception of the gallery at Locqueffret, which is given as a typical example of Breton woodwork. It is probably taken from a demolished roof-loft, and is brightly coloured. The church also contains some very rich Renaissance altar-pieces.

The illustrations on Plate I. are from photographs by M. Villard, of Quimper; those on Plate II. from photographs by Mr. F. C. Eden.

HOUSE AT CROYDON.

THE lower portion of this house—erected about three years ago—is built of red bricks with a white flush joint. Stocks were employed in the upper portion, covered with rough cast mixed with a proportion of coppers before being rendered, sufficient to impart a bismit tint. The woodwork was brought out to the general face of the work. The roofs are covered with thick rough-edged green slates.

Parts of the interior were panelled in soft wood of simple design, and painted mostly a stone colour. The architect was Mr. W. F. Harber.

EXMOUTH COTTAGE HOSPITAL.

THIS building has been recently completed at a cost of 4,000.

The general contractor was Mr. Albert Hayman, of Exmouth. The sanitary work was executed by Messrs. Hubber and Son, of Exeter, and the heating by Messrs. Whippell and Row, of Exeter.

The ground plan is given. Upon the first floor are placed the kitchen and offices, and bedrooms for the staff.

Lifts communicate between the kitchen, ward, scullery, and cellars.

The architects were Messrs. Tait and Harvey.

TRADE CATALOGUES.

WE have received from the General Electric Company, of Queen Victoria-street, their Progress Sheet for July. They have also sent us a catalogue of their desk, bracket, and ceiling fans. In the progress sheet a novel and compact switch and cut-out board is shown, which is well adapted for its purpose. The prices of the various sizes of the "Union" system of screwed braided conduit are also given. A much better finish can be given to braided conduits than to welded conduits, since less heating is required for brazing than for welding. Standard gas threads are used, so an ordinary plumber ought to have no difficulty in fixing this conduit. The protected wall plug shown is ingeniously designed, and is worthy of special mention. In the fan catalogue a great variety are shown, which can be driven either by direct or alternating current motors.

OBITUARY.

MR. J. S. STEWART.—We regret to record the death, on the 5th inst., of Mr. J. S. Stewart, of the firm of Messrs. Lancaster, Stewart, and Rickards. Deceased had a distinguished career as a student, receiving both the gold and silver medals of the Royal Academy, and, amongst other distinctions, was placed second in the Soane competition of the Institute of Architects. He was associated with Messrs. Lancaster and Rickards in winning the competition for the new town hall and law courts at Cardiff, and other works, such as the new Deptford town hall, the new art school at Hull, and Godalming town hall, and in the preparation of many other designs submitted in public competition by the firm. Before joining the firm he had, in collaboration with Mr. W. Grace, won the competition for a new Kursaal at Weston-super-Mare, which has since been completed from their designs. Two years ago he developed an aneurism of the heart, which recently forced him to retire from participation in the business of the firm, unfortunately before the chief works in which he was associated were completed. His age was thirty-eight years. He left a widow, but no family.

GENERAL BUILDING NEWS.

LATIMER MEMORIAL CHURCH, BIRMINGHAM.—The Bishop Latimer Memorial Church, Handsworth New-road, Birmingham, was consecrated by the Bishop of Worcester recently. The new building, which has been erected on a piece of land measuring 10,500 sq. yds. near Soho Station, takes the place of a mission-room. The church has been designed by Mr. W. H. Bidlake, of Birmingham, and the contract has been carried out by Messrs. William Sapcote and Sons, of Birmingham. The design is in the late decorated style, and is carried out mainly in Staffordshire brick, with Greenhill stone dressings. The interior is lined with buff brick, and the roof of the nave is supported by a stone arcade. A feature externally is the square tower, 100 ft. high. The belfry will eventually contain eight bells. The nave is lofty, with an open-timbered roof. The chancel is almost as high, and has a gabled stone roof. There are a morning chapel, vestry, and a baptistry, containing a marble tank for total immersion, as well as a font. The church is 149 ft. long and 53½ ft. wide within the walls, and has seating accommodation for 1,000 persons.

CHURCH EXTENSION, SHEFFIELD.—The foundation-stone was laid recently of the extended nave of St. Cuthbert's Church, Sheffield. At present the church accommodates about 300 people, and the completion of the nave will give accommodation to 400 more. Local stone and Derbyshire sandstone form the material for the outside of the building; the interior stonework consists of Bath stone. The architects are Messrs. J. D. Webster and J. Douglas Webster, of Sheffield; and Messrs. George Longden and Son, of Sheffield, are the contractors.

WALTHAM ABBEY CHURCH.—A fund has been opened for carrying out a restoration, under the directions and superintendence of Mr. J. A. Reeve of the parapet of the tower, by reinstating the battlements and the angle-turrets in accordance, as far as modern conditions will permit, with the original design of the middle of the XVIIth century. The proposals extend to the replacement of the present one-light window with a two-light window in each face of the bell-chamber.

REOPENING OF DURNFORD CHURCH, WILTSHIRE.—The ancient parish church of Durnford has lately been restored, under the supervision of Mr. C. E. Ponting, the Diocesan surveyor. During the progress of the work some very interesting discoveries were made, not the least of these being several frescoes

over the chancel arch, while a figure of St. Christopher was found on the south wall. Another interesting discovery was part of a window against a Norman buttress which proves the antiquity of the church. The pulpit, reading desk, lectern, and altar rails, all date back to the early part of the XVIIth century. The old gallery, which was found to be very dilapidated, has been removed, and a smaller one raised in its stead. The ceiling of the latter is of very fine oak, and the whole is supported by two Corinthian pillars. The altar has been redecorated. The pews have been repaired. Although a considerable sum was expended in the restoration of the interior, a large part of the money has gone in underpinning. The exterior has also been thoroughly overhauled, and the roof and walls have been renovated. The north and south porches, which date back to the XVIIth century, have also had their woodwork repaired. The greater part of the ivy—the trunk of which is as large as a man's body, and which has embedded itself 10 in. into the tower, and consequently displaced several large stones and buttresses—has been removed. The dilapidated belfry has been restored.—*Wiltshire County Mirror.*

CONGREGATIONAL CHURCH, EPSOM.—The foundation-stones of the new Congregational church at Epsom were laid recently. Accommodation will be provided for 500 persons, and the cost will be about 4,000. Messrs. Gregg and Stakley, of London, whose plans were accepted in a limited competition, are the architects for the work.

ST. NICHOLAS CHAPEL, CALISBROOKE CASTLE.—Mr. Percy Stone, F.S.A., is engaged upon the restoration of St. Nicholas Chapel as a national memorial to King Charles I. The chief exterior features of the new works comprise the building of a porch at the west end of the north wall, and of a restoration of the early XIIIth century doorway. The seating, for fifty persons, and the dado of the inner walls is made of oak from the hull of the *H.M. ship Arctik*. The roof will be panelled with oak decoratively painted, the floor of the body of the church is to be of terrazzo mosaic, and that of the sacarium will be inlaid in marble. The King has presented the organ from the Chapel Royal, Savoy, with the carved oak table and altar furniture from the late Queen's private chapel in Osborne House. It is intended, should the funds permit, to insert in the west wall a bronze medallion portrait of Charles I., modelled after the profiles by Van Dyck, and to decorate the panels of the east window with the armorial bearings of lords and governors of the Isle of Wight. The chapel was rebuilt in 1738 on the site of an ancient structure which stood there at the time of the conqueror's survey, and was an appendage of Quarr Abbey, in Binstead parish.

SCHOOLS, FULNECK, YORKSHIRE.—A new school has been erected at Fulneck. The new buildings have been provided at a cost of about 4,000. The building, formerly known as the Sisters' House, has been taken over for school purposes, and a new modern wing erected, containing classrooms, a lecture hall, measuring 53 ft. by 25 ft., and rooms for residential purposes. The lecture hall on the top floor is so arranged as to be available for use as a gymnasium for the young ladies. In addition to three large classrooms, six smaller rooms are obtained in the east wing, and there are a dormitory and smaller bedrooms provided in the old block, where also are located the kitchen and the governors' apartments. The corridors and classrooms are heated by hot-water pipes and radiators, and attached to the bedrooms is a range of lavatories and hot and cold water baths, etc. There are also a wash-house and laundry. A hockey and tennis ground is in course of preparation. The contracts have been carried out as follows:—Masonry, Mr. Wm. Hutton, Fulneck; joinery, Mr. W. Procter, Pudsey; plumbing, Messrs. J. Scarth, Pudsey; plastering, Messrs. A. and L. Wheeler, Calverley; slating, Messrs. Hill and Nelson, Bradford; and painting, Messrs. Armitage and Driver, Pudsey. The work has been in progress eighteen months, and has been carried out from the drawings and under the superintendence of Mr. C. S. Nelson, architect, Fulneck and Leeds.

WESLEYAN SCHOOL, CHADDERTON, OLDHAM.—The foundation-stones were recently laid of a new Wesleyan school at Chadderton. The principal contractor is Mr. Emanuel Whitaker, and the sub-contractors are Mr. Whitaker, bricklayer and excavator; Messrs. S. and J. Witches, masons; Messrs. Enoch Shaw and Son, plumbers; Mr. Kelly, plasterer; and Mr. Pogson, slater. Mr. Thomas Hilton, architect, Oldham, prepared the plans for the work.

NEW SCHOOL, ALNWICK.—The new Duke's School, at Alnwick, was opened on the 27th ult. The style of the structure is Tudor. The west wing of the quadrangle is formed by

the sub-warden's house, and hostel for ten resident masters; while on the east side is the main building, providing for English and classical instruction on the ground floor. A library, reading-room, and office are also provided, the classrooms for the lower senior boys being on the left. The upper senior classrooms, also the large examination hall, are on the right. The hall is about 50 ft. by 27 ft. There is a gallery over the corridor, and it is so arranged that two classroom doors open into it by a folding partition, giving accommodation in the total, for about 800 persons. The first floor also contains special classrooms, and rooms for science and art subjects, including art classrooms, physical laboratory, lecture theatre, masters' preparation and chemical laboratory. The architect for the work was Mr. J. Wightman Douglas, of Newcastle, and the cost, inclusive of site, was 15,000.

INFECTIOUS HOSPITAL, ROTHERHAM.—The foundation-stone of the new infectious hospital for the County Borough of Rotherham was laid on the 29th ult. The site is on the north-west side of Badsley Moor-lane, a little over a mile from the parish church. The area of site available for hospital purposes is 9½ acres, and the portion present to be enclosed about 5½ acres. The hospital buildings are arranged on the pavilion plan, and have frontages to the south-east. There are five ward blocks, each with equal accommodation for males and females—viz., acute scarlet fever, eighteen beds; mild scarlet fever, sixteen beds; typhoid, fourteen beds; diphtheria, fourteen beds; observation block, four beds; total, sixty-six beds. Included in this accommodation are six private wards, one bed each. Attached to each block are the nurses' room, bathroom, stores and linen places, water-closets, and slop sinks. The floors will be of pitch-pine, polished. All internal angles to floors, walls, and ceilings will be curved. Verandahs will be placed at the front of each ward block. An administrative block will be placed at the front, to Badsley Moor-lane, and provide accommodation on the ground floor for the medical officer, matron's rooms, nurses' sitting and dining rooms, corridors, lavatories, etc., cooking kitchen, scullery, larder, stores, etc., with side entrance for nurses and serving the wards, etc. On the first floor fifteen bed-rooms will be provided for matron and nurses, each fitted with lavatory, bathroom, etc., and box-rooms are provided on this floor. The different rooms in this block will be heated by open fireplaces, the corridors, staircases, etc., by hot water apparatus. The laundry block comprises washhouse, mangling-room, sorting-room, etc. Adjoining the laundry is the disinfectant house, engine and van, houses, boiler-house, with duplicate Cornish boilers. Stables and ambulance house is also provided on the west side of the laundry. A discharge block and mortuary are also arranged on the east side. The lodge is to be erected near the entrance to the hospital. The different blocks will be built with local bricks and Marlcock stone dressings, relieved with white Lincolnshire brick bands, and graded string courses. It is proposed to adopt the electric light to all the blocks. The contract for the building (minus the mild scarlet fever block) has been let to William Thornton and Sons, of Rotherham, for the sum of 11,994.7, the work to be completed in fourteen months. The total cost of the whole scheme, including mild scarlet fever block, steam laundry fittings, electric light installation, and laying out of the grounds, will be about 20,000. Mr. J. Platts is the architect.

DISPENSARY, LIVERPOOL.—The foundation-stone of new buildings for the Liverpool Medical Missionary Society, to be erected on the site of the old dispensary, in Burlington-street, was laid on the 25th ult. The new premises, designed by Messrs. R. Owen and Son, are to consist of a waiting-hall to hold 350 persons, and named the "Hakes Memorial Hall" in honour of the late Dr. James Hakes, and adjacent, an administration department, three stories in height. The hall, entered from Bevington-hill, is to be 45 ft. by 40 ft. Adjoining is a nurses' room, with surgeries on each side, a dispensary, and in the basement a smaller waiting-room for 150 persons. A doctors' room, with entrance from Burlington-street, a keeper's dwelling, and other apartments are provided. On the outside, the building will be of red brick, with terra-cotta dressings.

MARKET EXTENSION, BRADFORD.—The extension to the market, in Rawson-square, Bradford, is now nearing completion. When finished, the building will consist of market hall in the centre, surrounding which there will be ten shops, with frontages to Rawson-square, Northgate, and James-street, and a hotel. The exterior is built of stone, and is in the Italian Renaissance style. At either end of the Northgate elevation there is a domed tower, 34 ft. in height from the street level to the top of the finials, and a third dome, in

shape hexagonal, and 60 ft. high, rises above the main entrance. The area of the market-hall, which will be covered with a single-span roof of glass and iron, is 6,684 sq. ft., and the floor area of the shops and the hotel is 51,400 sq. ft. The shops and the hotel market-hall will be used for cold storage purposes. Entrances are provided on each of the three frontages, and there is a wagon entrance from James-street, and also a covered way communicating with the present meat and fish market. The tenders accepted amount to 24,537l., and certain additional work, not provided for in the original contracts, has cost 1,132l., making the total cost of the land and building 50,669l. The following are the contractors:—Masons' work, Messrs. Thomas, Obank and Sons, Idk.; Joiners' work, Messrs. E. Fearnley and Sons, Bradford; ironfounders' work, Messrs. Taylor and Parsons, Bradford; plumbers' work, Mr. Albert Ross, Shipley; painters' work, Mr. Arthur Wear, Bradford; plasterers' work, Messrs. Crabtree and Berry, Bradford; slaters' work, Messrs. W. H. and E. Walton, Bingley; roof glazing, Messrs. Helliwell and Co., Brighouse; Messrs. T. C. Hope and Son, whose plans were selected in competition, are the architects of the work.

REBUILDING IN HOLBORN.—The enlargement of the premises of A. W. Gamage, Ltd., outfitters, on the north side of the street, will be carried out after the plans and designs of Mr. Joseph Sawyer, the architect of that company's premises in Holborn and Leather-lane. The new buildings, to be constructed of Portland stone and ironwork, with those recently erected, will cover a total area of 11,050 ft. super., and will have a frontage of 95 ft. to Holborn. They will occupy the site of Nos. 113-122, Holborn, the old Black Bull coaching-house and tavern, and Bull Inn-chambers at the rear, which were built in the former yard of the inn. The ground has been leased by the freeholders, the Prudential Assurance Company, for a term of ninety-nine years, by an indenture of April 28 last, at a ground rent of 3,220l. per annum, the lessees covenanting to erect an improved block of buildings at a cost of not less than 50,000l. The basement and upper portion of the block is to be planned for purposes of a restaurant and show-rooms and offices respectively for other tenants; the ground floor will be appropriated to the company's shops and sale-rooms.

NEW BUILDINGS, KENSINGTON.—A block of land in High-street, Kensington, on the north side, with frontages to three streets, and an area of about half an acre, has been built upon by Messrs. John Barker and Co., according to the designs of the architect, Mr. Philip E. Pidditch. The buildings are in Portland stone and red brick, and consist of Messrs. Barker's business block on the ground and first floors, and five floors of flats over, approached by one central staircase, and with three subsidiary ones.

INSITUITE BUILDING, HOYLAKÉ, LIVERPOOL.—The foundation-stone of the Hoylake Institute, at which the Hoylake Gospel Temperance Society are to take up their headquarters, was laid a short time ago. The buildings will extend over an area of about 2,500 sq. yds., at the junction of the Birkenhead and Hoylake roads, and will comprise an assembly hall to accommodate a number of 350 persons, a crush-room, and suite of apartments to be used as a club. Externally the building will be faced with Ruabon wire-cut bricks, with Grinshill stone dressings. The architect is Mr. W. M. Law, of Liverpool.

AVR NEW GAIEY THEATRE.—The New Gaiey Theatre, Avr, which was partially burned on August 4, 1903, has been reconstructed in accordance with plans prepared by Mr. Alex. Cullen, architect, Hamilton. The building has been heightened 11 ft., and eight boxes now take the place of the original four. An amphitheatre has been introduced, the entrances and exits have been improved, so that there are two exits from each section of the house. The entire auditorium has been remodelled, and the galleries taken down and re-erected with steel and concrete. The roof has also been renewed, and is entirely of steel beams and concrete. The stage has also been improved.

Bristol Channel Yacht Club.—The Earl of Jersey opened recently the new club premises of the Bristol Channel Yacht Club at Mumbles. In May last the committee instructed their architect, Mr. Glendinning Moxham, Swansea, to prepare the necessary design for the work, and shortly after the contract was let to Messrs. Bennett Brothers.

FIRE STATION, BALLYMACRETT, BELFAST.—The new branch fire station, erected in Ballymacrett, by the Council of the County Borough of Belfast was opened on the 29th ult. The new station is Georgian in style. The outer elevations are in red brick, relieved with white Scotch sandstone dressings. The interior walls throughout are of bricks, plastered with cement dado. The engine-house

and stables are in enamelled bricks, the engine-house, duty-room, and recreation-room having varnished pitch-pine ceilings. The roofs are covered with Welsh Countess slates. The engine-house will accommodate three machines and is placed towards the principal front. It is 35 ft. long, 33 ft. wide, and 6 ft. high, and immediately behind the engine-house are the stables. Accommodation is provided in the stable to stand four horses immediately behind the engines, with loose-boxes for two horses at the back of the stable. Alongside the engine-room is placed the duty-room and recreation-room. At the back of the building is a yard, 62 ft. long and 34 ft. wide, with entrances at each end. A range of buildings is placed round two sides of the yard, consisting of lavatory, fodder store, washing-shed, and coal stores. A laundry and store are provided on the ground floor next the dwelling-houses. The dwellings for the staff are at the front and side of the site, those at the principal front being over the engine-house, watch-room, and recreation-room, and those at the side being on the ground floor and first floors, one house over the other. All are self-contained, and the entrances to all are from the yard and the balcony. The lighting throughout is by electricity. The engine-house and stables are paved throughout with adamantine elinkers, and the yard with square sets. The contractors for the building were as follow:—Mr. William Dowling, builder; Mr. John Dowling, plumber and electrician; Mr. Stanley Johnston, electric bells; Messrs. Mustgrave and Co., Ltd., stable fittings; Mr. Thomas Try, automatic door fittings; Messrs. Young and Mackenzie, architects.

WALDORF THEATRE, ALDWYCH.—It is expected that the new theatre will be ready for occupation in the course of the spring of next year. The building is being erected after Mr. W. G. R. Sprague's plans and designs, and a lease of the property has been taken by it. It is said, Messrs. Schubert Brothers, performers by American companies of musical comedies.

A NEW OPERA HOUSE, LONDON.—A project has been opened for the erection of an opera house in Aldwych, on the land between the churches of St. Mary-le-Strand and St. Clement Danes. It is stated that the Duke of Bedford intends to demolish the opera house in Covent Garden shortly, in order to carry out a contemplated extension and improvement of Covent Garden market, on the north-east of the Piazza.

OPEN-AIR SEA-WATER BATHS, CARNARVON.—The Carnarvon Corporation have accepted the tender of Messrs. Geo. Roberts and Brothers, contractors, Ruabon Works, Llandudno, for the construction of a concrete open-air sea-water bath on the foreshore of the Menai Straits, from plans prepared by Mr. Edward Hall, the Borough Engineer, and approved by the Local Government Board, who have already sanctioned the borrowing of 2,500l. for its erection, the loan to be repaid in twenty years. The bath will be of elliptic form, and provided inshore with a caretaker's office and twenty dressing-boxes, all arranged with flat roofs for the accommodation of spectators. The impounded water will measure 250 ft. in length, 35 ft. in breadth, and range from about 3 ft. to 9 ft. in depth at highest states of tides.

OFFICES, COCKSPUR-STREET, LONDON.—The new offices, to be occupied by the Amalgamated Shipping Companies—namely, the White Star Line, American Line, etc., in Cockspur-street, will occupy the site of the building formerly Messrs. Hampton's offices. The architect is Mr. Henry Tanner, Junr., and the builders, Messrs. Waring-White Building Company, Ltd. The concrete floor and roof construction has been let to the Columbian Fireproofing Company, Ltd., King William-street, E.C.

HOTEL, PICCADILLY.—The new Great Ritz Hotel, Piccadilly, is being erected on the site of the old Walsingham Hotel. The architects are Messrs. Merys and Davis, Dean-street, Soho, and the builders, Messrs. Waring-White Building Company Ltd. The contract for the concrete floor and roof has been let to the Columbian Fireproofing Company, Ltd., King William-street, E.C.

STAINED GLASS AND DECORATION.

St. Winstan's Church, Repton.—A stained-glass window, consisting of three lights and tracery has just been unveiled in this church. The subject chosen is "Christ Blessing Little Children," which is contained in the whole three lights, while in the tracery openings above there are angels holding scrolls with texts beneath. Practically all the stonework is new, but the architect, Mr. Naylor, of Derby, has retained some of the old, and has introduced it in the tracery. The work was carried out by Messrs. Percy Bacon and Brothers, of Newman-street, London, W.

SANITARY AND ENGINEERING NEWS.

NEW BRIDGE, ILFORD.—The new bridge over the Roding at Ilford was opened a short time ago. The bridge is 60 ft. wide, and there is a clear span of 40 ft. On each side are abutments of red brick, with Aberdeen granite quoins, ornamented with pilasters, and with moulded caps. The bridge is constructed with steel girders and trussing, with cast-iron fascia and an ornamental parapet above in open ironwork, bearing an iron device with the county arms displayed. There is wood-block paving on the bridge and the paths are of non-slip Yorkshire paving, with granite kerb. Iron railings have been put up from each side of the bridge to where the paths join the houses and shops. The work has been carried out by Messrs. A. Fassy and Sons, contractors, of Leytonstone, at a cost of 12,619l. Mr. Neave was the engineer in charge of the work.

RESERVOIR, GIRVAN, N.B.—The new reservoir at Girvan was opened on the 21st ult. The works, which cover close on 5 acres of ground, have a storage capacity of 15,000,000 gallons of water. The cost of the reservoir will be 12,000l. Mr. Jno. Eaglesham, C.E., Avr, was the engineer; and the contractors, Messrs. Osburne, Avr.

WATERWORKS FOR BRADFORD, NIDD VALLEY.—The new Bradford waterworks, situated in the Nidd Valley, were opened recently. The works were commenced in September, 1893, by the construction of the masonry dam at Gouthwaite, and which forms a lake nearly 24 miles long. In the following year Haden Carr reservoir and the main conduit to Chelvey Heights, 35 miles in length, with the branch mains, were in operation. With the exception of the bridges carrying the aqueduct over the valleys, the intake dams on the streams which deliver the water into the conduit on the way to Bradford, and the valve, measuring and screening chambers, the works are underground. There are four tunnels on the line of the works, over 6 miles in length:—Rain Stang, 1½ miles long, 404 ft. deep; Burn and Ashfoldside Beck, 13 miles in length; Greenhow Hill, which divides the valleys of the Nidd and the Wharfe, ¾ miles long, 450 ft. deep. There are 12 miles of main aqueduct in cut and cover, 6 ft. 3 in. by 5 ft. 9 in. inside; 15 miles of steel and cast-iron pipes, 3 ft. diameter; and 6 miles of branch pipe feeders. The drainage area is 18,000 acres of clean moorland, which rises from 900 ft. to 2,000 ft. at Great Wharfedale. Mr. James Watson, M.Inst.C.E., was the engineer for the work, Mr. Barlow being the resident engineer. The total cost of the scheme will be about 2,000,000l. sterling.

MANCHESTER SHIP CANAL.—The following is the recently issued report of Mr. Hunter, the Chief Engineer to the Manchester Ship Canal Company, as to works:—"The depth of water in the Ship Canal and docks has been fully maintained throughout the entire length of the waterway by means of the dredging operations. The leading jetty at the inner end of Eastham locks has been completed and is in use. The spare steel gates for the upper end of the 80-ft. lock at Eastham have been completed and delivered. A timber wharf is being constructed on the southerly side of the canal at Runcorn, adjacent to the new transporter bridge between Widnes and Runcorn. The new berth and the railway sidings in connection therewith on the northerly side of the canal at Weaste for the accommodation of the coal traffic has been completed, and the coaling crane is now in course of erection thereat. Considerable extensions of the railway system at and about the docks at Manchester are in course of formation. The embankments and slopes of the canal are generally in good condition, and the works throughout have been efficiently maintained. The works in connexion with the new dock on the site of the old racecourse, and with the transit sheds on the southerly side thereof, which are being carried out by Mr. Henry Lovatt and others, under contract with the Manchester Dock and Warehouse Extension Company, Ltd., have made good progress during the half-year."

NEW BRIDGE, EXETER.—The foundation-stone of the new bridge, which is being built over the river at Exeter was laid recently. The bridge will consist primarily of eight pairs of steel girders, each pair meeting in mid-stream. The road is to be of jarrah wood blocks, in which will be laid electric tram lines. Under the slightly raised paths will be gas and water mains. The facing and corners are of granite, chiefly from Blackingsstone Quarries on Dartmoor. The cost will be over 25,000l. The design and construction of the works have been under the supervision of Mr. Cuthbert A. Brereton, engineer, Mr. Woodman being the contractor, and Mr. A. T. Easton sub-contractor for the stonework. The resident engineer is F. G. A. Pinckney, and the clerk of the work, Mr. G. A. Mason.

FOREIGN.

SWITZERLAND.—The hospital at Basel is to be enlarged according to the plans of the architects, La Roche, Stähelin and Cie.; besides the enlargements, the older portion of the building is to be supplied with heating apparatus, electric lighting and other modern conveniences.—The architect, Emil Probst, died at Berne on July 23, in his seventy-sixth year.

AUSTRIA.—New elementary schools are to be built in Vienna for boys and girls respectively; each building is to contain sixteen classrooms, a conference room, a gymnasium, etc., and they are to be completed by the summer of 1905.—A new children's hospital is to be built in Vienna; the building will owe its existence to the grants of Herr Bernard Pollak.

PUBLIC WORKS IN PANAMA.—In accordance with a law dated May 20 last, the National Convention of Panama has voted a sum of \$5,250,000, or approximately 325,000,000 of the money received for the Canal concession, for the purpose of carrying out improvements throughout the Republic. Of this sum about 100,000,000 is assigned to improvements in the province of Panama, the remainder to be divided in varying proportions amongst other provinces, the expenditure to be spread over a period ending September 30, 1905. The improvements contemplated in Panama itself consist of a capitol, or Government palace, a public prison, a theatre, public lavatories, a municipal palace, a library and museum, a university, and a palace of justice; likewise repairs and enlargements of the existing Government palace, schools, repairs to various important thoroughfares, a number of police stations, and sundry smaller matters, such as the extension of the electric light system, etc. The improvements in the provinces will comprise a wholesale construction of roads, involving some sixty or seventy bridges, many of them of iron (presumably, for the most part, of small dimensions), and numerous schools, electric light installations, hospitals, municipal buildings, police stations, etc. A number of architects and engineers are to be despatched to the various provinces within a period of two months from the date of the promulgation of this law, and are to prepare plans and estimates for these undertakings, to be presented to the Government Department of Public Works not later than December 31 next, after which bids for the execution of the work are to be solicited.

MISCELLANEOUS.

A REVIVAL OF PNEUMATIC DESPATCH IN LONDON.—A measure will be promoted in the course of next Session for powers to adopt the American system of the Batcheller Pneumatic Tube Company, within the limits of the four miles radiating from Charing Cross. Sir John Wolfe Barry is appointed engineer to the undertaking. The first tube, laid between Euston terminus and the Northern District Post Office, had a cross-section of about 1 ft. 4 in., and proved so efficient that the Pneumatic Despatch Company essayed a similar project in 1859-60, when Mr. Latimer Clarke and Mr. T. W. Ransom, as joint engineers, laid a tunnel, constructed by Mr. John Aird, of cast-iron \square -shaped sections, 1 in. thick, and measuring 4 ft. by 4 ft. 6 in., beneath Newgate-street, Holborn, New Oxford-street, Tottenham Court-road, Hampstead-road, and Drummond-street, for carrying mails and parcels to Euston terminus from the General Post Office. The line extended through a distance of 2½ miles; the engine-house was situated between High Holborn and Whetstone Park, at the rear of the Soane Museum. But by reason of the leakage of air and other mechanical defects in the tunnel, the engine, albeit worked up to 800 horse-power, proved to be unequal to the task of maintaining the enormous vacuum required for the desired speed of the train of cars. Five years ago Mr. George Threlfall, consulting engineer, propounded a scheme for using that tunnel for an electrical train, controlled from a central station, carrying nine tons in each of its four or five cars, at a rate of about thirty-five miles an hour, and for fitting a smaller pneumatic tube within the roof, through which "late" letters could be flown to Euston station in less than two minutes. He and Mr. George Neill had made an exploration of the tunnel, which they found in good condition, though obstructed with brickwork in places, and full of water underneath Holborn Viaduct. The portion beneath Tottenham Court-road had been used for the conduct of electric light mains; in another portion a brick wall had been built to support a sewer. The present project relates to an initial system of 12-in. tubes, laid in double lines, extending over 95 miles, with 150 stations, at an estimated cost of 3,000,000.

CAMBRIDGE UNIVERSITY.—The Museums and

Lecture Rooms Syndicate state in their annual report that the departments of medicine, surgery, pathology, and pharmacology have taken over the new buildings of the Medical Schools which were recently opened by the King, and that the contents of the Woodwardian Museum are now deposited and arranged in the Sedgwick Memorial Museum. The Woodwardian Museum, the Arts Schools, and the ground for the block designed for the new Senate House, are now at the disposal of the Library Syndicate, who have effected some structural alterations of two rooms in Scott's building for the housing of the Acton Library lately presented by Mr. John Morley to the University. The greater part of the books have already been received, to an amount whose weight exceeds 40 tons. Some valuable donations of Oriental MSS. have been made during the past twelve months, amongst the benefactors being Mrs. Lewis, Mrs. Gibson, Syed Ali Bilgrami, University teacher of Marathi, and the Maharajah of Ulwar.

CEMENT NOTES.—There are numerous references to the cement trade in the consular reports recently received at the British Foreign Office, and we subjoin some examples. Mr. Consul Kessel writes from Cadix:—"The chief work in the cement factory has been the production of bricks for the enlargement of the buildings and the manufacture of some 6,000 tons of cement. It is expected to reach an annual output of 20,000 to 30,000 tons. The realisation of this estimate has been delayed, owing to the non-arrival of certain necessary machinery. A dividend of 4 per cent. has been paid to the shareholders." Mr. Vice-Consul Sterne writes from Novorossiisk, in the Batoum district:—"I have been unable to obtain the figures for cement for 1903, but I am informed that the total production was 1,500,000 barrels, or 241,936 tons."

Reporting on the trade of Hanover, the Vice-Consul remarks that the cement business has shown scarcely any improvement, although it has been paid to the shareholders. "The unfortunate conditions prevailing in the United States—e.g., building strikes and over-production—there was a serious falling-off in exports, though this was more than counter-balanced by the increased demands of the home trades. The Vice-Consul at Los Angeles, U.S.A., writes:—"The bulk of the cement used here is now of American manufacture. American cements have driven the British article out of the market." On the other hand, Mr. Allen, reporting from San Diego, says:—"The cement imports amounted to 24,769, showing an increase of 7,341, over 1902; of this 16,713 came from the United Kingdom, and 8,056 from Belgium and Germany." Mr. Consul Laidlaw, describing the commerce of Portland, Oregon, U.S.A., observes that:—"The trade in cement was large during the year 1903, and California-made cement is being shipped to an increasing extent. It is packed in bags and sells at 1s. to 1s. 6d. less than the best foreign, which there is a strong probability it may supplant in the near future. Some quantity was received which, through a mistake in manufacture, would not set, but this has been remedied, and the quality is well spoken of. Japanese cement was received in this market to the extent of 8,541 casks, and is considered fair quality, selling at about the price of imported natural cement. German cement has the best market, and of this there were received here 101,650 casks. Of Belgian cement the receipts were 40,920 casks, and of British 30,235 casks. Best brands of cement sold at an average of 10s. 3d. per cask for artificial, the natural being from 1s. to 1s. 6d. less. A larger trade in fire-bricks was done at an average price of 5s. 10s. per 1,000. So far this trade is entirely British."

The Vice-Consul at Seattle, Oregon, writes:—"The question of cement imported to this port is one to which the attention of British exporters should be paid, for cement is in great demand, and will bring for years to come. There are several large buildings contemplated, including a 200,000 Government building, a public library to cost 40,000, and a railway tunnel, now in course of construction, to cost 200,000. In 1903 all the cement imported came from Germany."

FRANKFORT MUNICIPAL BUILDING ENTERPRISE.—The population of Frankfort-on-Main is rapidly increasing. According to an estimate published by the Chamber of Commerce early in 1904, it then amounted, including the suburbs, to 313,600. The rapid increase has at times produced a scarcity of dwellings, more especially small dwellings, and this scarcity has led to the pooling of suburban building sites under the Lock-Adickes, which, roughly speaking, provided the municipality with the power of laying out new streets in quarters previously undeveloped owing to the great number of small landed owners there who could not be prevailed upon to sell at a

fair price, nor could come to terms among themselves. The municipality has also, since 1888, as a further remedy for the scarcity of small dwellings, built houses to be let to their officials and workmen. The municipality has also furthered the construction of small dwellings by granting prolonged leases of municipal building sites; by granting building loans, in some cases up to nine-tenths of the capital sum required; by taking shares in such building enterprises; by granting mortgages; by guaranteeing the interest due on the capital sums, provided always that the moneys were required for the construction of smaller (artisan) dwellings. In March, 1902, the municipality owned forty-seven dwelling-houses for officials, etc., in the construction of which 1,500,000 marks had been spent. The guarantees given for capital and interest amounted to 5,500,000 marks; shares had been subscribed for to the extent of 500,000 marks. Besides these sums the municipal savings bank has advanced moneys in the nature of mortgages on the same kind of buildings to the extent of 625,000 marks. The municipality-owned houses are said to be a good investment, and need no financial assistance. The rents charged for the flats contained in these houses (as far as they are let to municipal officials, who have a claim upon the flats if they draw a salary the initial amount of which does not exceed 2,500 marks) are as follows:—198 flats with two rooms, 18m. 50pf. per month; 46 flats with three rooms, 34m. to 38m. per month; 7 flats with five rooms, 75m. to 87m. per month. Besides these, the town had in March, 1902, the first call upon 20 flats with one room (no kitchen), 9m. per month; 122 flats with two rooms, 25m. 50pf. to 31m. 50pf. per month; 41 flats with three rooms, 40m. 50pf. to 48m. per month; 30 flats with four rooms, 60m. per month. The rents of houses are said to be a good investment, and need no financial assistance. The rents charged for the flats contained in these houses (as far as they are let to municipal officials, who have a claim upon the flats if they draw a salary the initial amount of which does not exceed 2,500 marks) are as follows:—198 flats with two rooms, 18m. 50pf. per month; 46 flats with three rooms, 34m. to 38m. per month; 7 flats with five rooms, 75m. to 87m. per month. Besides these, the town had in March, 1902, the first call upon 20 flats with one room (no kitchen), 9m. per month; 122 flats with two rooms, 25m. 50pf. to 31m. 50pf. per month; 41 flats with three rooms, 40m. 50pf. to 48m. per month; 30 flats with four rooms, 60m. per month. The rents of houses are said to be a good investment, and need no financial assistance. Up to the present the municipal official dwellings have always been well let.

BUILDING TRADE IN GERMANY.—The building trade (writes Mr. Consul-General Oppenheimer) continued lively in 1903, for the average annual increase in the population of 800,000 to 900,000 must be provided for. The trade received a fresh impetus also from the policy of sanitary improvement carried out by many municipal authorities. New thoroughfares are cut through old districts, thus bringing down great numbers of small dwellings, and many old houses are closed by authority, so that numbers of the population are compelled to find habitations in new quarters. Such measures have produced in the population a certain taste for modern requirements, and the rapidity with which new blocks of artisans' dwellings are let, though often at some distance from the factories and workshops, proves that the working classes of the population have been educated in this respect. The supply of extended new quarters has been facilitated by a tendency for speculative building to be carried out by financially-strong societies formed for that purpose, rather than by individual speculators. The activity in the building trade has, of course, influenced the immediately dependent trades, such as iron, stone, and bricks; the benefit has spread also to the glass and wood industries, and to those embracing interior decoration; but the cement industry, owing to great over-production, has not benefited.

OPEN SPACES.—In response to representations made by the Hampstead Heath Extension Committee, the St. Pancras Borough Council have agreed to contribute 500l. towards the fund of 59,000l. for the acquisition of the 80 acres belonging to the Eton College trustees on the north-western boundary of the heath; the balance still to be collected amounts to 5,000l.

—The Metropolitan Public Gardens Association have, in co-operation with the Billingsgate Christian Mission, opened to the public the ground appertaining to the former St. Botolph's Church, Billingsgate, and have obtained the insertion of an amendment in the Bill for the abolition of the Church of St. Bartholomew-the-Less in West Smithfield, whereby the existing area of open space will not be curtailed by the scheme for rebuilding within the precincts of the hospital.—The Westminster City Council are prepared to maintain the garden of Colden-square, Soho, in the event of its being acquired and laid out by the Association; the Association have undertaken to lay out the churchyard of St. Nicholas, Deptford, subject to a guarantee for its upkeep; to restore the churchyard of St. Mary, Whitechapel, and to take steps for preserving, as an open space and garden, the disused burial ground, nearly 3 acre in extent of Wycliffe Chapel, in Philpot-street, Stepney.—The National Trust have accepted from Mr. W. H. C. Nares the gift of a tract of about 21 acres on the summit of Rockbeare Hill commanding a view of the Exe valley, near Exeter, which will in future be called "Prickly Pear Blossoms Park" after Mr.

Nation's book of poems; and have acquired about 3 acres on a southern ridge of Crockham Hill, near Westerham, affording a beautiful prospect over the weald of Kent as far as Leith Hill and Haslemere; the purchase was made by Miss Octavia Hill with a sum of money bequeathed to her "in memoriam," for use at her discretion.—A park of about 40 acres has been opened at Romford, whereof one-half was bought by the Council for 3,000l. and the other half was given by Mr. H. H. Raphael.—Colley Hill, Reigate, a tract traversed by the ancient road afterwards known as "Pilgrims' Way," in its course through Surrey to Canterbury, is now secured to the public by Mr. G. Taylor's gift, in commemoration of Queen Victoria's reign.—An appeal is made for 12,000l. to secure 700 acres marching for about one mile with Ullswater Lake, and comprising Gowbarrow Park and ravine, and the cascade by Aira Force; the property is offered for that sum to the National Trust by Mr. Henry Howard, of Greystock Castle.

ARBROATH ABBEY BUILDINGS.—On the 4th inst. Mr. W. P. Oldrieve, of H.M. Office of Works, had a conference with the Property Committee of Arbroath Town Council at the Abbey in connexion with the proposal that the part of the Abbey buildings in the custody of the Town Council, which includes the Abbot's House and the Regality Tower, be handed over to H.M. Board of Works. It is the desire of the Board of Works to have the buildings transferred to them, so that adequate attention may be given to their preservation. Another aim of the Board of Works is to make the whole of the buildings accessible to visitors. The Regality Tower would be made accessible from the Abbey Pond, and visitors be enabled to get to the top of it. Whatever might be the ultimate intention regarding the Abbot's House, which is uninhabited, nothing would be done to disturb present arrangements, except to repair the Abbot's kitchen, so that visitors might more comfortably inspect it. It would be to the advantage of the town to have these places, which are strictly exhibition buildings, made as attractive as possible to visitors, and some parts of the buildings are greatly in need of the attention which the Board of Works would be able to bestow upon them. The matter will now be brought before the Town Council in definite form.—*The Scotsman.*

BUILDING BY-LAWS, LITTLEHAMPTON.—At the last monthly meeting of the Littlehampton Urban District Council, Mr. Etherington moved the adoption of a recommendation by the Works Committee that the Local Government Board be asked to sanction an alteration of the building by-laws to allow the construction of garrets in small houses without an extra thickness of wall being required. Mr. Pile seconded, and said the alteration was intended to benefit the tenants of small houses, who required all the room they could possibly get during the season. If this was done the buildings would be strengthened by the additional timber used on the roof. As a matter of fact, it was found that in the past this idea had been adopted by builders surreptitiously. Mr. Blanchard said he considered the proposal would encourage jerry building, and also expressed an opinion that someone was very much to blame if their by-laws had been evaded as Mr. Pile stated. Mr. Jones supported Mr. Blanchard in his objection, but the other members of the Council approved, and the alteration of the motion was carried. An elevation of the proposed free library building was submitted by the surveyor, and approved by the Council, the cost being estimated at not exceeding 2,000l.—*Sussex Daily News.*

WAR MEMORIAL, CHESTER.—The memorial, which has been placed in the south transept of Chester Cathedral, in memory of the men of the Cheshire Regiment who fell in the Boer War, was unveiled by Earl Roberts on the 1st inst. The memorial consists of a tablet of white English alabaster and white Carrara marble, and has been designed and executed by Mr. Thomas Rudge, of London.

EXPORTS OF WOOD FROM SWEDEN.—Mr. MacGregor, British Consul at Stockholm, sends some interesting notes on the condition of the timber trade there. He remarks that, in 1903, white wood deals did not sell well. This was owing to the fact that white wood from the southern part of Europe has, to a considerable extent, taken the place of that grown in the north. Though inferior to the latter as regards quality and shape, the southern product possesses certain advantages as regards longer average dimensions and cheapness. With respect to red wood, considerable quantities of deals, battens, and planed boards were sold early in the season, and at remunerative prices, to South Africa. When, later on, wood from the White Sea and Canada was offered for sale at lower

rates, the Swedish goods did not sell well, though prices at Stockholm, it is stated, gradually sank from 15s. to 1l. per standard under those previously obtained. In spite of all this, the exporters were unable satisfactorily to dispose of their heavy stocks. British buyers, and especially those in London, adopted a very reserved attitude throughout the year. French importers also were very cautious in placing their orders, but purchased about the average yearly quantity. Swedish exporters are said to have generally succeeded in keeping up prices for sawn wood during the first half of the season; but as regards planed wood the quotations fell considerably. The market for the latter goods improved somewhat in the autumn, when there was a slight rise in prices, especially for wood sent to the Cape. For some years the market for floorings has been in a very depressed state. This is attributed to keen competition and the want of anything like co-operation on the part of the different exporters. Fears are therefore entertained that a once remunerative industry will be ruined. According to the report of the Swedish Sawmill and Wood Exporters' Association, the export of deals, battens, and boards, planed and unplanned, from the whole of Sweden was, in 1903, 1,039,462 standards, an increase of about 35,000 over the previous year. The quantity shipped to the United Kingdom was 440,718 Petersburg standards, which was a decrease of about 8,500 standards as compared with the year 1902. A marked increase took place in the export of wood to Denmark and Spain, and, in a less degree, to France, Germany, Netherlands, and Portugal. As compared with 1902, not half the amount of wood goods was exported to Australia, whereas the export to South Africa and Egypt increased by no less than 30,500 standards. During 1903 a large combination of sawmill companies and firms took place within the district of Lulea. The amalgamated company has in this way obtained control of large forests and of about 70 per cent. of the total shipment of the wood from that district.

Legal.

POINT UNDER THE LONDON BUILDING ACT, 1894.

The case of Leadbetter and others v. the Mayor of St. Marylebone and others came before the Court of Appeal, composed of the Master of the Rolls and Lords Justices Stirling and Mathew, on the 6th inst.

This was an appeal from an order made by Mr. Justice Phillimore, in chambers, granting an interim injunction restraining defendants from increasing the height of a party-wall between Nos. 33 and 34, John-street, Edgware-road, without giving notice to the plaintiffs, as adjoining owners, in accordance with the provisions of the London Building Act of 1894. The motion, by consent of the parties, was treated as the trial of the action. It appeared that, on April 7, 1902, a building agreement was come to between the freeholders of No. 33, John-street, and one, Eccleston, to be followed up by a lease for thirty years. Eccleston wanted to rebuild No. 33, and, for that purpose, it was necessary to deal with the party-wall. Notice was accordingly given to the defendants under the London Building Act. The defendants intended, at some future time, to build workmen's dwellings on the site of No. 34, and they desired that the party-wall should be strengthened, and certain alterations made in it with a view to their ultimately building these dwellings. The parties, being unable to agree, each side appointed a surveyor to act as arbitrator. In the result, these gentlemen made an award in which they directed that the party-wall should be altered in accordance with the wish of the defendants, the additional thicknesses to be on the defendants' land, and carried out at their expense. The award further directed that the defendants should be at liberty at any time to build their proposed premises to such a height as they desired; in case of dispute, either party were to apply to the arbitrators. These directions were carried out, and in September, 1902, Eccleston parted with his lease to Leadbetter. The defendants had pulled down No. 34, and intimated that they intended to build on the top of the party-wall. Plaintiffs thereupon said they were entitled to a party-wall notice. Defendants denied this, and said they were entitled to do as they wished under the award. The plaintiffs replied that, in so far as the award dealt with a future user of the party-wall, it was *ultra vires*. The question, therefore, was whether the award on this point was binding, or whether, as the plaintiffs alleged, they were entitled, as adjoining owners, to a party-wall notice.

Mr. English Harrison, K.C., and Mr. G. A. Scott appeared for the appellants, and Mr. J. Eldon Banks, K.C., and Mr. Poyser for the respondents.

At the conclusion of the arguments of counsel, the Master of the Rolls, in giving judgment, said that Mr. Justice Phillimore had held that the award, so far as it dealt with a future user of the party-wall, was *ultra vires*, and, therefore, bad. The plaintiffs who, since the award, had changed from the position of building owners into that of adjoining owners, were clearly entitled to insist on their right to a notice being served under the London Building Act, and to a reference in the event of there being a dispute. He thought the appeal should be dismissed, and judgment entered for the plaintiffs, with costs. The Lords Justices concurred.

CASES UNDER THE WORKMEN'S COMPENSATION ACT, 1897:

BEECHER v. BEALE AND SON.

The case of Beecher v. Beale and Son came before the Court of Appeal, composed of the Master of the Rolls and Lords Justices Stirling and Mathew, on the 9th inst., on the appeal of the plaintiff from a decision of Judge Emden, sitting at the Dartford County Court, under the Workmen's Compensation Act, 1897.

Mr. Senhouse, for the appellant, said that the only point which arose on this appeal was as to construction of the word "about," used in a certain section of the Act. He (counsel) was unable to persuade the learned County Court judge that the case was not governed by previous decisions of the Court of Appeal. If he could not distinguish the present case from those decisions, he could not succeed on this appeal. The plaintiff was a foreman of navvies, and had been engaged for a considerable time in building some shops, and his employment was entirely on the buildings which were being erected. At the moment of the accident the plaintiff happened to be, by chance, not on the building, or, in the ordinary acceptance of the term, not in proximity to the building. The plaintiff, at the time the accident happened, had gone down to the railway station, which was 500 yds. away from the building, to see after some cement, and that was to oblige his foreman. With that exception the plaintiff had had no work to take him off the building. It was admitted that the terms of the man's employment was that he should be employed entirely on the building. The learned counsel contended that the accident arose out of the plaintiff's employment, and came within the meaning of the words of the section of the Act "on, in, or about" a building, although the plaintiff happened not to be there at the precise moment of the accident.

At this stage the Master of the Rolls said that for a workman to recover compensation under the section he must be "on, in, or about" a building. In the present case the plaintiff was not physically approximate to the building.

Mr. Senhouse said he could not put the case for the plaintiff higher than he had done.

The Master of the Rolls: I think that this case is entirely consistent with the previous decisions in this court, and that the appeal fails.

The Lords Justices concurred, and the appeal was accordingly dismissed, with costs.

PATTISON v. WHITE AND CO., LTD.

The case of Pattison v. White and Co., Ltd., came before the Court of Appeal, composed of the Master of the Rolls, and Lords Justices Stirling and Mathew, on the 5th inst., on the defendants' appeal from an award of the Judge of the Darlington County Court under the Workmen's Compensation Act, 1897, in favour of the plaintiff.

The facts were as follows:—The defendants were engaged under a contract with the Darlington Corporation in the construction of a system of light railways at Darlington. Clause 30 of the specification provided that the sand used for the permanent way construction was to be the best river or pit sand, and defendants selected a sandpit about 3½ miles or 4 miles from the place where they were laying the permanent way, and they contracted with a man, named Wilkinson, to cart for them the sand from the pit to the railway works. A man named Pattison, who was employed by Wilkinson as a carman to cart the sand, while engaged in driving a cart from the pit to the works fell from the cart and was run over and killed. The accident occurred about 2½ miles from the works. The plaintiff, the widow of Pattison, claimed compensation from defendants under the Act of 1897, contending that the accident happened

"on or in or about" the engineering work within section 7 of the Act. The defendants admitted that they were "undertakers" in respect of the engineering work of constructing the railway, but they contended that, as the accident happened a long way from the works, the employment at the time of the accident could not be said to be "on or in or about" the engineering work, within section 7 of the Act. The County Court Judge held that the employment of the deceased man at the time of the accident was about the engineering work, notwithstanding the fact that the accident occurred at a considerable distance from the scene of the work where the said work would be ultimately unloaded or used. He accordingly made an award in plaintiff's favour for 187*l.* 4*s.* From this decision the defendants now appealed.

Mr. A. Powell, K.C., and Mr. W. Addington Willis appeared for the appellants, and Mr. Manisty, K.C., and Mr. G. Taylor for the respondent.

At the conclusion of the arguments of counsel, the Master of the Rolls, in giving judgment, said that, in his opinion, "on or in or about engineering work" denoted locality. In each limb of the definition of engineering work, following in this respect the scheme of the Act, physical locality was pointed out as that on or in or about which the employment must be at the time of the accident. That was laid down in a series of decisions in this court, and it was not competent for the County Court Judge to emancipate himself from those decisions. He thought the appeal should be allowed. The Lords Justices concurred.

POINT UNDER THE FACTORY AND WORKSHOP ACT, 1891.

THE case of *Hornor v. Franklin* came before Mr. Justice Darling, sitting without a jury in the King's Bench Division on the 10th inst., an action by the plaintiff against the defendants, Messrs. J. and L. Franklin, to recover 165*l.* 12*s.* alleged to be due under covenants contained in a lease, dated May 8, 1890, and made between the plaintiff and the defendants. Defendants denied liability.

It appeared that the plaintiff owned two warehouses or sheds, which constituted a factory within the meaning of the Factory and Workshop Acts. The premises in question were situated in Lamb-street, Spitalfields, and were let to the defendants by the lease before-mentioned. By the lease the defendants covenanted, during the term of the lease, to pay all existing and future taxes, rates, assessments, and outgoings of every description payable in respect of the demised premises (the landlord's property tax alone excepted). The plaintiff also covenanted within one month of the execution of the lease to brick up two doorways leading from the premises demised into No. 27, Lamb-street, and into the stable yard. The London County Council, on February 7, 1901, served the plaintiff with notice to carry out certain work under the Factory and Workshop Acts in respect of the premises, part of such work being to unblock the drains which had been bricked up. The plaintiff did this work at a cost of 165*l.* 12*s.*, the amount he now sought to recover from the defendants as "outgoings" within the meaning of their covenant.

Mr. Poyser appeared for the plaintiff, and Mr. R. C. Glen for the defendants.

Mr. Poyser contended that the plaintiff was entitled to recover the amount claimed from the defendants under their covenant as "outgoings."

Mr. Glen, for the defendants, contended that the expenses were not "outgoings" within the meaning of the covenant. He also contended that, by section 7, sub-section 2 of the Factory and Workshop Act, 1891, the plaintiff should have applied to a County Court Judge, that being a condition precedent to his right to recover any part of these expenses from the tenants.

In the result, his lordship, in giving judgment, said he had come to the conclusion that the plaintiff ought to go to the County Court, and get a decision from the County Court Judge. He relied upon the words of the statute for saying that the plaintiff was bound to go to the County Court, and could not come to the High Court if he chose. The statute gave the plaintiff the only remedy that he had got, and it did not give him a remedy of any kind, except in the County Court. For these reasons he gave judgment for the defendants, with costs.

A stay of execution was granted, with the view to an appeal.

SOUTH KENSINGTON BUILDING DISPUTE.

In the Court of Appeal, composed of Lords Justices Stirling and Mathew, on the 8th inst., the case of *Bullingham v. Pocklington* was

heard on the appeal of the plaintiff from an order of Mr. Justice Bucknill in Chambers.

Mr. Montague Lush, K.C. (Mr. Grosier with him), said that the order the plaintiff objected to was one depriving him of his right to have the action tried before a judge of the High Court and a special jury. The learned judge had ordered the case to be referred to Mr. Verey, the Official Referee. His submission was that he had no jurisdiction to make such an order. The action was brought by the plaintiff, a photographer, at South Kensington, against the defendant, who owned the adjoining house, for damages for negligent work in consequence of which plaintiff's house began to settle. There was a contract between the parties that, if the defendant did certain work, he should put the plaintiff's premises right. The defendant's case was that he had not been negligent, and that it was a mere coincidence that the subsidence occurred. The learned counsel said that there was nothing at all to entitle the defendant to have the case tried before an official referee.

Lord Justice Stirling: You are suing on a contract to make good any damage?

Mr. Lush said that was so. The defendant denied the contract and the negligence. His (counsel) said the plaintiff's premises had been very seriously damaged.

Lord Justice Stirling: If your case is based on negligence I think that is a proper case to be tried by a jury.
