is to be built of pennant stone, with freestone facings, and the interior is to be freestone work. The floors will be of oak blocks over the sitting areas, and of terrazzo cement paving for the walking ways and chancel. The roof is to be of red Broseley tiles, surmounted by a ventilating flèche on timber framing covered with sheet lead. The heating of the building will be by low-pressure hot water. Carved and moulded tracery will divide the chancel from the morning chapel, and the vestry and the north transept from the choir vestry. Chairs will be used for the sitting accommodation, except for the choir stalls. The pulpit will be of stone, carved and moulded. A porch will be placed outside the north entrance, and an interior porch at the west entrance, divided from the nave by a moulded partition of timber work. The east end of the chancel is to be formed as a portion of a regular octagon, and will be lighted by three open tracery windows. The architect is Mr. Henry M. Bennett, and the builders Messrs. E. Walters and Son.

CHURCH RESTORATION, GREAT STURTON.—The Bishop of Lincoln (Dr. King) reopened, on the 4th inst., after partial restoration, the village church of All Saints, Great Sturton, near Horncastle. It was found that the church, which dates back from the XIIth century, needed thorough restoration, being almost a ruin, but as this was impossible at the present juncture, it was decided to confine the work of restoration to the chancel arch and chancel. The architect in charge of the work was Mr. J. T. Micklethwaite, of London, and the contractor, Mr. Frank Bell, of Horncastle.

WEST HAM PARISH CHURCH.—The tower of the parish church of West Ham is in need of repair. It is a square embattled stone tower, 78 ft. in height to the top of the parapet, on which there is a turret 10 ft. high. It has been carefully surveyed by Mr. W. Weir, architect of the Society for the Protection of Ancient Buildings, who reported that, while the interior is in good condition and only needs to be kept weather-tight, the face of the tower is gradually perishing and many of the stones are loose enough to be dangerous.

ST. PAUL'S UNITED FREE CHURCH, CAMBS-LANG, N.B.—This church, the memorial-stones of which have just been laid, is situated between Bushyhill-street and Hamilton-drive. It is built of red sandstone, from Locharbriggs Quarry, in Dumfriesshire. The work is rock-faced rubble masonry. The building is of the Gothic style, erected from the designs by Mr. Alexander Petrie, Glasgow. The ground floor contains, besides a large hall, several classrooms, giving accommodation in all for 400 persons, also vestry, ladies' room, cooking kitchen, etc. Above the ground floor is the church and gallery (horse-shoe shaped), with sittings for 650, having an entrance door and staircase from both streets into a spacious lobby, the floor of which will be laid with marble mosaic. The pulpit platform is placed on the east of the church, with an organ recess at the back. The south or principal front faces Hamilton-drive, and has a porch projecting from the main wall of church. Above the porch is a large gable, having lancet-pointed windows and moulded niche between surmounted by a moulded cross. The other windows have stone mullions and transoms. The north-west and east fronts are treated in a simpler manner, being less exposed, and at some distance from either street. The interior of the church is divided into nave and aisles, the roof timbers being supported on columns having pointed arches between running east and west. The ceiling will be divided into panels having wood rib mouldings between the arches resting on corbels on the walls. It is estimated that the total cost of church and hall will not exceed 5,000 £.

WESLEYAN CHURCH, BEIGHTON.—At Beighton on the 11th inst. the memorial-stone was laid of a new Wesleyan church. The new building will provide accommodation for 350 worshippers. It is in the Gothic style, erected of Dunford-bridge stone, with Wingerworth stone dressings. The windows are of stained glass with leaded lights. At the rear are two vestries, for use by the minister and the choir, for whom accommodation is provided in a small chancel, instead of the usual gallery. At the sides of the chancel are the pulpit and the organ. The heating chamber is in the basement. The cost of the chapel is estimated at about 2,000 £, and the contract has been let to Messrs. Lund and Swann, of Ekeington. Mr. W. Cecil Jackson, of Chesterfield, is the architect.

WESLEYAN METHODIST CHURCH, LONG EATON.—A new Wesleyan church has just been opened at Long Eaton. It is built to seat about 700 persons, and has a tower at the south-east corner. The main entrance to the chapel is at the base of the tower, and leads into lobbies, which afford entrance to

the chapel itself. There is a central aisle, with pews on either side, and for convenience there are also side aisles to the same pews. The chancel is raised six steps above the level of the nave floor, with a pulpit on the right side and a dwarf screen on the left. The communion table is raised on three more steps. The back of the table is erected with alabaster, green, black, and yellow marble. The choir seats, the purling, 12 ft. high, and pulpit are in oak, with a tracered screen dividing the choir seats from the organ chamber. The length of the building is 150 ft., and the width 40 ft., and it has been erected at a total cost, with the school extension scheme included, of 11,000 £. The contractors for the building are Messrs. Pask and Thorpe, Nottingham, with the following sub-contractors:—Joiner, Mr. Appleby, Nottingham; heating, Messrs. Danks and Co., Nottingham; ventilating, Messrs. Ashwell and Nesbit, Leicester; marble mason, Mr. Gibson, Nottingham; brickwork, Mr. G. Yeung, Long Eaton, while the whole of the work has been executed from the drawings of Messrs. Brewill and Baily, Nottingham.

NEW BAPTIST CHURCH, SLOUGH.—The foundation-stones were recently laid of a new Baptist church at Slough. The building will be constructed of brick, with stone dressings, and will be 50 ft. long and 42 ft. wide. The plan provides for galleries on three sides with vestibules, a rostrum, and organ chamber, and two vestries which can be used as classrooms in connexion with the Sunday school. Accommodation is to be provided for a mixed congregation of 700, the seats to be of pitch-pine, and arranged in circular form with side aisles. The windows will be of stone frame work, with tinted glass. Provision is made for ventilation, and the heating will be by means of hot-water apparatus, constructed beneath one of the vestries, whilst the lighting will be with the electric light. The work is being carried out, from the plans of Mr. R. W. Moore, Bexhill, by Mr. H. Flint, of High Wycombe, at a cost of 3,867 £.

RENOVATION OF CONGREGATIONAL CHURCH, GRANGE PARK, STRATFORD.—The Grange Park Congregational Church has been renovated. The work has been carried out by Mr. Clark, from the directions and plans of Mr. J. W. Dunford, architect, of Walthamstead.

NEW CONGREGATIONAL CHURCH, BOURNEMOUTH.—The foundation-stones were recently laid of the new Congregational church in Charminster-road, which is being built by Messrs. George Shears and Sons, at a cost of about 4,500 £, from the designs of Messrs. Lawson and Reynolds. There will be seating accommodation on the ground floor for 450 people, and provision for 250 in the galleries, making a total of 700.

WESLEYAN CHAPEL, LONGWOOD, YORKSHIRE.—A new Wesleyan chapel has just been opened at Longwood. It is in the decorated Gothic style, with the roof half open, and is faced with Eiland Edge wall stones. The principal features in the front elevation are a doorway entrance, flanked with projecting pilasters and three two-light tracered windows. The church is 54 ft. 8 in. long and 30 ft. 6 in. wide, with transepts 11 ft. 6 in. deep, and will accommodate 700 persons. The body of the building is divided by two aisles, which communicate with a vestibule at the east end of the church. There are three entrances, one for the ground floor and two for the galleries, and also a side door for the use of the minister, choir, and scholars. There is a gallery on three sides containing two rows of pews. The internal woodwork is of pitch-pine, and varnished. The chapel is fitted throughout with open pews; the ceiling is boarded, and octagonal in shape; the windows are glazed with leaded lights, and the church is heated by hot water on the low-pressure system, and lighted by electricity. There are two vestries on the ground floor, and two classrooms in the basement, 32 ft. 5 in. by 20 ft., and 31 ft. 5 in. by 21 ft. 6 in. respectively, a bell-rooms, store-room, and underneath the latter is the heating apparatus room. There are two entrances to the basement and two flights of stairs leading to the ground floor. The church has cost 8,000 £. The plans were prepared by Mr. Joseph Berry, architect, Huddersfield, and the works have been carried out under his supervision. The following are the contractors:—Masons, Messrs. T. Bottomley and Sons, Lindley; joiners, Messrs. Wood Brothers, Huddersfield; plumber, Mr. Samuel Hale, Huddersfield; plasterer, Messrs. J. Robinson and Son, Marsh, Huddersfield; painter, Mr. Albert Wrigley, Longwood; slaters, Messrs. Thomas Allison, Ltd., Milnsbridge; ironwork, Messrs. Calvert and Co., Folly Hall, Huddersfield; electric lighting, Mr. Thomas Armitage, Huddersfield; heating engineers, Messrs. Tomkinson and Milan, Huddersfield; concreter, Mr. J. E. Dyson, Lindley, Huddersfield; gates and railing, Mr. T. H. Raynor, Huddersfield.

NEW WESLEYAN CHAPEL, LONGWICK, BUCKINGHAMSHIRE.—The opening of a new Wesleyan chapel at Longwick took place a short time ago. The building is of red brick, and will seat 120 persons. A couple of Boyle's ventilators are fixed in the roof, also several in the walls. The estimated cost is 5,000*l.*, and the architect was Mr. F. Taylor.

SCHOOL, SHIPMAN-ROAD, CUSTOM HOUSE.—The Shipman-road Council School was formally opened recently by the Deputy-Mayor. The hall is placed in the centre of the building on each floor at right-angles to the main axis of the building, and with a corridor 8 ft. wide to the right and left. Classrooms are grouped on each side of the corridor. The cloak-rooms and teachers' rooms are arranged at the end of the corridors, with staircases and entrances at the angles of the building. The school, which stands upon a site having an area of 1½ acres, consists of three floors. In each department there are eight classrooms, varying in capacity from forty-five to sixty school places. The heating of the school throughout is by low-pressure hot-water radiators, and provision is made for ventilation without mechanical aids. The contract for the building amounts to 25,763*l.*, and has been carried out by Messrs. W. Greger and Son, of Stratford, from the designs and under the supervision of Mr. William Jacques (Architect to the Committee).

NEW COUNCIL SCHOOL, LEYTONSTONE.—The new Council school in Norlington-road was opened a short time ago. The site of the structure has an area of 1½ acres, with a long frontage to Norlington-road, and a shorter return frontage to Pretoria-road. The main building of the school is arranged for three departments on three floors, each department occupying one floor. The infants' department, on the ground floor, has ten classrooms, with seating capacity varying from forty-four in the smaller rooms to sixty in the larger ones. Special provision has been made for very young children. The girls' department, on the first floor, and the boys' department, on the second floor, have eight classrooms each, the capacity per room varying from fifty to seventy school places. The total capacity for which the school is designed is:—Boys, 500; girls, 480; infants, 532; total, 1,512. Each department has, in addition, an assembly hall. The contract for the works amounts to 26,337*l.*, and has been carried out by Mr. F. J. Coxhead, builder, of Leytonstone; electric lighting by Messrs. Allin and Son; hot-water heating by the Lancashire Heating Company; terrazzo paving by the Mosaic Manufacturing Company; situ concrete paving by the Atlas Stone Company; to the designs and under the supervision of Mr. William Jacques, Architect to the Education Committee; Mr. G. W. Ramplin having carried out the duties of clerk of the works.

CHURCH HALL, STOKE NEWINGTON.—The foundation-stone of St. Andrew's Hall, Bethune-road, in connexion with St. Andrew's Church, Stoke Newington, has just been laid. The hall has been erected by Messrs. Sheffield Brothers, and the stonework and masonry has been carried out by Mr. C. W. Walters, of Lower Edmonton. Mr. Percy D. Smith is the architect. The dimensions of the hall are as follows:—The main hall (inside), 70 ft. by 36 ft. The front portion consists of a ladies' and gentlemen's cloak-room, a vestibule, lavatories, offices, in all 47 ft. by 17 ft. In the rear portion are ladies' and gentlemen's retiring-rooms, lavatories, offices, and a fireproof staircase leading into the hall above, which is 38 ft. by 20 ft. The main hall has an open-timbered composite roof, and the floor will be of polished maple.

TOWN HALL EXTENSION, KELSO.—At a meeting of Kelso Town Council on the 3rd inst. plans by Mr. Swanston, architect, of the proposed renovation and alteration of the Town Hall buildings were submitted. The total cost of the improvements, which include provision for a board-room and offices on the basement, which is at present an open space, also the renovation of the main hall on the second floor and the exterior facing up of the fabric, is estimated at 2,385*l.*

POORHOUSE, LEITH.—At a Dean of Guild Court held at Leith on the 3rd inst. warrant was granted to Leith Parish Council for the erection of the new poorhouse at Seafield, on the amendment of the plans to meet the Master of Works report. The site on which the poorhouse is to be erected is at the eastern extremity of the burgh, and extends to about 12½ acres. Accommodation will be provided for 659 inmates—364 from the main house, 203 in the infirmary, sixty-eight in the children's home, twelve in the married couples' quarters, and twelve in the probationary wards. There will also be accommodation for the members of the staff. The general division of the site aims at preserving the higher or south-westerly portion for the sick inmates,

the children, the officials, and the most deserving class of healthy inmates, while the undesirable class of healthy inmates and the labour department will be confined to the north-easterly portion of the site, the main house forming a screen between these divisions. The main house will be in the form of the letter H, the administrative department being in the connecting block, and the inmates' accommodation in the wings. The infirmary will consist of a centre block with four radiating wings, containing wards, and will include an operating-room and quarters for a resident medical officer and for a staff of nurses. In the phthisical block there will be accommodation for twenty-four patients. The plans are by Mr. J. M. Johnston, architect, Leith.

PREMISES FOR ST. GILES'S CHRISTIAN MISSION.—The foundation-stones of the new premises being constructed by the London County Council for the St. Giles's Christian Mission in place of the old mission buildings demolished for the purposes of the Holborn Strand improvement were laid on the 5th inst. The new buildings, which adjoin the site of the old premises in Little Wild-street, Drury-lane, are being erected from the designs of Messrs. Runtz and Ford, and consist of a chapel capable of seating 800 to 1,000 persons, with a schoolroom beneath.

LOUGHBOROUGH ELECTRIC LIGHTING STATION.—Although two or three weeks will probably elapse before Loughborough is supplied with electric light from a municipal source, the erection of the generating station and the laying down of the plant is rapidly approaching completion. The block comprises boiler-house, engine-room, battery-room, condensing-pit, and offices. The offices include the borough electrical engineer's room, general office, testing-room, workshop, and stores. The chimney shaft is 140 ft. in height. The buildings have been erected by Mr. A. Faulks from plans prepared by Mr. A. E. King, Mr. G. H. Saunders has acted as engineer's clerk of the works.

CONSTITUTIONAL CLUB, GAINSBOROUGH.—A new Conservative and Unionist club has been erected at Gainsborough from the plans of Messrs. Eyre and Southall, Retford and Gainsborough, architects.

BUSINESS PREMISES, BRISTOL.—New premises have been erected for Messrs. Lennards in White Ladies-road, Bristol. The total length of the frontage is 120 ft., and the warehouse of five stories reaches a height of 55 ft. Monks Park Bath stone has been used throughout. Messrs. R. Wilkins and Son, of Bristol, were the general contractors. Messrs. Dawney and Co., of London, supplied the steel work, and Mr. Smith, of Montpellier, undertook the carving. The premises were designed by Mr. H. Daro Bryan, architect.

EXTENSION OF THE VICTORIA HOSPITAL, DUNDEE.—A new wing of two stories, with the central portion raised to the height of three stories, is to be added to this hospital. The extension will abut on the west end of the existing buildings. On the ground floor the plan provides for a ward of ten beds. Adjoining is a ward kitchen and bathroom according to a dining-room for the patients. On the other side of the main entrance is an open verandah, which will form a resting-place for the sick. Adjoining is the nurses' sitting-room, and to the back is accommodation for napery and clothing. The first floor is similarly planned, on it also being a ward capable of accommodating ten patients. In the second story above the vestibule are two small wards of two beds each. The plans have been prepared by Mr. James Findlay, architect.

FREE LIBRARY AND LECTURE HALL, WORKINGTON.—The Workington new free library and Carnegie lecture hall, for which the Borough received 7,500*l.* from Mr. Carnegie, was opened on the 6th inst. by the Mayor. The building, after the Queen Anne style, has cost altogether 6,954*l.*, exclusive of furnishing.

NEW OPERATING THEATRE, QUEEN-SQUARE.—The Duchess of Albany attended at Queen-square on Saturday afternoon to open a new operating theatre at the National Hospital for the Paralysed and Epileptic. Mr. R. Langton Cole is the architect of the new building.

STANLEY HOSPITAL, LIVERPOOL.—On the 7th inst. two additions to the Stanley Hospital were opened; a new operating theatre, with rooms *en suite*, comprising anaesthetic and preparation rooms, and a vestibule formed for the isolation of theatre, and the withdrawal of patients. The several door openings are fitted with steel doors made by Milner's Safe Company, the window casements from the Crittall Company, the sinks and basins supplied by Messrs. Twyford and Shanks. All the walls are furnished in Parian cement on a Portland cement ground, the surface being painted with the Torbay Company's paint.

The pavements throughout are terrazzo. Other enlargement is an addition to patients' department, and consists of an operation theatre with male and female cover-rooms in direct communication with the theatre; new male and female rooms, and a surgeons' consulting-room approached from a central wide passage. The contractors are Messrs. Henshaw, Sons, and Messrs. Tomkinson and Co., respectively. The architect is Mr. Alfred Shaw, of Liverpool.

BATHS FOR CHELSEA.—The Baths Corporation of Chelsea Borough Council report Tuesday having adopted a scheme for building of the public baths. The main items are:—Building and engineering, 21,000*l.*; architects' and quantity surveyors' and clerk of works' salary, 1,530*l.*; swimming bath, 6,650*l.*; Turkish bath, 1,000*l.*; additional cost (over the 1,000*l.* already provided) for installing electric light, 5,520*l.*; artistic well and storage tank, 3,520*l.*; additional architects' and quantity surveyors' and clerk of works' salary, 1,000*l.* The committee have further decided (subject to sanction) to appoint Messrs. W. Anderson and the architects to carry out the scheme, and Mr. F. H. A. Harcourt, quantity surveyor.

NEW CO-OPERATIVE PREMISES, BURTON.—The new co-operative premises erected at Burnhope were opened on the 1st inst. The premises have been built to the designs of Mr. W. Forster, architect, at a cost of about 8,000*l.*

PUBLIC HALL, FOUR OAKS, BIRMINGHAM.—Four Oaks and Hill Public Hall, which has been erected at Meres Green, at a cost of nearly 600*l.*, was opened on the 1st inst. The building, which is situated on a site of 1½ acres, consists of a main hall, an assembly-room, 50 ft. by 25 ft., to accommodate 250 persons, a retiring-room, and several offices. It is built of Oldbury brick covered with Hartshill tiles. The building is lighted by both electric and gas. The contract amounted to 455*l.* Mr. Totley prepared the plans.

RESIDENTIAL FLATS, BIRMINGHAM.—A block of residential flats is about to be erected at Moseley. The plans for the work have been prepared by Mr. P. Stanley Dutton, architect.

MUNICIPAL BUILDINGS, TOTTENHAM.—The foundation-stones of the new municipal public baths, fire station, and coroner's building at Tottenham-green were laid recently. The general depot at the rear was first opened. Designs for the building have been obtained, these were submitted to Messrs. Taylor and Jennett, whose plan is now being carried out. Messrs. Lawrence and Son are erecting the new buildings.

regard to the general depot, the buildings were designed by the Council's Engineer, Prescott. The baths will cost 28,000*l.*, the fire brigade station 9,000*l.*, to 10,000*l.* the general depot has cost 18,000*l.* The depot buildings are divided up into fitting buildings—the offices, baths, fire station, coroner's court, and firemen's dwellings. The central block contains the Council offices, and the public offices, which have been placed on the ground floor, those for the engineer on either side of the entrance, those for the medical officer at the back, the principal staircase gives access to a corridor, from which open the chamber and committee-rooms, placed to look on to the green, and form the principal feature of the whole group of buildings on the public baths. This will contain swimming baths, first and second class, private baths for men and women, and a house for a superintendent with rooms overlooking the green. The first-class bath has been arranged so that it can be used in the summer swimming bath, and in the winter for entertainments or meetings, for which purpose a special entrance and cloak-rooms and exits in case of emergency. At the back of the baths are the boiler-house and lavatories with all necessary apparatus for heating the baths. A study has been made of the conjunction with the heating engineers' hope of obtaining the best and most economically-heated baths in the neighbourhood of London. The building on the south side of the site is the fire station. This will contain an engine-room for two engines, and a store-room facing the green. Above will be the fireman's house, a recreation room for the firemen, and some quarters for single men. At the back will be a cleaning yard, wash-stables, stores, workshop, etc. The court and fire quarters for married men are situated at the back of the site.

VED GLASS AND DECORATION.

ST. JOHN'S TOWN HALL, BIRKENHEAD.—A glass window, designed by Mr. Gilbert Gamon, of London, has been set in the main staircase of the town hall, which consists of three lights; the design depicts at hall of the Benedictine Priory of Ebury and James, at Birkenhead, and is dedicated to commemorate the judgment by Edward I. in 1277 of a dispute that had arisen as to rights of territory between King Edward III. of Scotland and Robert de Bruce, Prince Bishop of Durham. In the window are figures of the Bishops of Ebury and Dunblane, and Robert Bruce, Sir G. Garrick, and the Prior of SS. Mary and James, and the Chancellor of the Bishopric of Durham. In the middle light is King Edward I. seated, and habited in a costume upon that shown in his Great Seal.

FOREIGN.

PARIS.—The "Société Americaine des Beaux-Arts," composed of former American students of the Ecole des Beaux-Arts, has for the first time a competition for a "Prix de Rome," which will be to American students what the "Prix de Rome" is to students, and the winner will have a year of education at the Ecole des Beaux-Arts. A funeral chapel is being constructed in the crypt of Bourges Cathedral, to house the remains of the archbishops of Bourges. A monument to Talma has been inaugurated at Poix-du-Nord. M. Fagel, sculptor, has just completed the design for the Rhone connecting the department of Isère and l'AIN. There is talk of a new one over the Seine, between Boulogne-Billancourt. The clock at Gravelines, known under the name of the Bassin Vauban, is to be enlarged at a cost of 500,000 francs. M. Sanson, architect, has been commissioned by a wealthy individual to build a large chateau in Louis XV. style, on the estate at La Muette, between Avenue Raphael and the boulevard de la Chapelle. Six million francs are to be spent on the building. The Armenian chapel in Roubaix has just been opened. M. Guilbert, architect, and the decorative painter M. Leroy. The Government have commissioned M. Vernon, the medallist, to design a new Great Seal of France, to replace the present one from the Revolution of 1793. The Académie des Beaux-Arts has awarded the Felix Duban prize to M. Tony Garnier, architect of the Villa Mairea. M. Garnier, the sculptor, has just completed the design of the pediment sculpture of the new church of Arcis-sur-Aube, which has been assigned among the Monuments Historiques and is now to be restored at the expense of the State.

BERLIN.—The new "Kaiser Friedrich" at Berlin, designed and carried out by Herr Thine and Herr Hasak, is to be a model of the new style of building on an island formed by the Spree and the Havel, and consists of three stories; the top story, having a top light, is to be devoted to sculpture, the middle to sculptures, and the bottom floor to collections of coins, etc.

BRISTOL.—Herr Moses Burstyn, marine electrician, died on September 20, in his 67th year. A new asylum in Bristol was opened on September 27. The building is intended to accommodate 2,000 patients, with provision for further extension. The cost of the building amounts to £100,000. The building of the new hospital at Mattighofen, designed by Herr Bauer, is being superintended by Herr Josef Bauer. The work of the restoration of the cathedral at Parenzo has been entrusted to the architect, Herr Eduard Zotter.

RIO DE JANEIRO.—In August respecting the trade and industry of the capital of Brazil, Mr. Vice-Consul comments on the want of confidence in the fiscal policy of the country, and the consequent risks incurred by investors of foreign capital. For instance, attracted by the prospect of large sums, have been employed in the erection of flour mills throughout the State, and it would seem that the interests of the flour industry, in which British capital is largely invested, are somewhat jeopardised by the departure in favour of flour imported from the United States which is now exempted at 20 per cent. less duty than that on the like goods received from Brazil. Even building property has been found to be a safe investment in consequence of a law recently passed regulating the conditions for public purposes. This law provides that the old processes and basis of valuation, which indemnity prevailing when present conditions required their properties, and places them in the absence of mutual agree-

ment, in the hands of three arbitrators, one of whom is nominated by the authorities, the second by the owner, and the third by the judge in charge of the case. No doubt operations connected with the present city improvements have been much expedited by this arrangement, and, in fact, the law was passed with this particular object, but there is a feeling that the interests of proprietors have not always been adequately acknowledged. The extensive building operations which must ensue upon the present demolition of large areas of the city should afford an opportunity to the suppliers of builders' furnishings greatly to increase their sales. Suppliers of material for street paving should also keep themselves informed of the requirements of Rio, as new methods have for some time been under trial. As a result, asphalt paving is to be adopted over a section of about 30,000 sq. yds., and it has been decided to experiment over an area of some 1,200 sq. yds., with a description of bituminous bricks made in Amsterdam.

CITY IMPROVEMENT IN MEXICO.—A glowing description of the improved condition of Mexico City is given in the Consular report of Mr. L. J. Jerome, who writes:—"If there are signs of progress in almost every part of the Republic, it is in the capital that they are most marked. In the last five years the transformation has been complete, but in another five years it will be even greater. Already, people who have been away for a short period of three years hardly recognise the town, so great has been the change. Clean asphalted thoroughfares, brilliantly lighted at night, new handsome streets, a whole new residential quarter, the magnificent new general post office, the new general hospital, the imposing piles of the new poor houses on the most approved modern principles, the parks and public gardens in the best of order and brilliant with flowers, many other public buildings in course of construction, as well as private houses, residential flats, and American steel frames, business houses in every stage, with armies of masons and carpenters working to complete them, and still more being projected and begun, are to be seen on all sides. With all the building that has been done rents are not lowered, and from all appearances are not likely to be for some time, so great is the demand, alike for houses, shops, and offices. Moderate-sized unfurnished houses of ten or twelve rooms let for from 15*l.* to 30*l.* a month, and rents in the suburbs are almost as high."

Mr. Jerome adds that the British colony in Mexico City has considerably increased, and although their enterprises are not so much advertised as the Americans, they are of importance, notably in electric light and power. The Montreal (Canada) Mexican Light and Power Company has acquired a controlling interest in the German Electric Light Company, and the Mexican Gas and Electric Light Company of London has completed its new modern power station at San Lazaro. The street tramways (the Electric Tramways, Ltd., of London), which is not altogether British, as both Germans and Americans control much of the capital, may be called a British undertaking; then on a smaller scale there are Englishmen making harness, and building carriages, and engaged in numerous trades, all of which, so to speak, have been created in the last five years. Canadians have been even more active, and a Canadian Commercial Club has been formed.

MISCELLANEOUS.

GLASGOW TECHNICAL COLLEGE ARCHITECTURAL CRAFTSMEN'S SOCIETY.—At the opening meeting of the session the President, Mr. Wm. H. Baxter, delivered his opening address on "The Training of our Apprentice Craftsmen." He deplored the backward tendency and the declining skill on the part of the workman, which was causing quite as much concern in America and Germany as in this country, and emphasised the necessity of greater attention to technical education on the part of both workman and employer, quoting from the reports of the recent Mosely Commission in support of his views. Professor Gourlay moved a vote of thanks to the lecturer, which was seconded by Mr. C. Ernest Monro.

DEMAND FOR ROOFING TILES IN SOUTH AFRICA.—The *South African Trade Journal*, published at Cape Town, asserts that there is a constantly growing demand for roofing tiles in the building trade in South Africa. While objection is raised to their employment on account of the greater difficulty entailed in the matter of forming a water-tight roof, public taste is beginning to incline more and more in their favour. It is added that the manufacture of these goods has been entered upon in many quarters of South Africa, but that there is still ample scope for enterprise on the part of United Kingdom manufacturers. "In any case," observes the *Journal*, "the demand for

their manufacture in South Africa is likely to steadily grow for some considerable time to come, and this feature is well worth the attention of the manufacturers concerned."

SIAMESE TEAK.—In his report on the trade of Bangkok for the year 1903 Mr. Beckett, the British Consul, states that the teak export was a very large one. In fact, the export (53,146 tons, of which 1,508 tons were sent to the United Kingdom), valued at 439,675*l.*, was the greatest that has ever been recorded, the nearest approach to it being in 1894, when it was put down at 57,719 tons. According to the Consular Commercial Report for 1895, however, the export for that year, which was stated in the returns of the custom house to be 48,934 tons, really amounted to 61,823 tons, which, if correct, would leave the record with that year. At all events the increasing, and its total value more than 10,000 tons in excess of the average of the last five years. Prices of first quality teak logs remained fairly steady at from 9*l.* to 9*l.* 10*s.* per load f.o.b., and first-class teak planks from 10*l.* to 12*l.* 10*s.* per load, according to specification. Best second-class logs fetched from 5*l.* to 6*l.* per load. In India prices at Bombay advanced rapidly towards the end of the year, the highest levels on record for Siam teak being reached in January of this year. Calcutta prices only partially followed the advance in Bombay. The export of miscellaneous woods fell nearly 5,000 tons below the previous year. It is to be regretted, Mr. Beckett remarks, that more use cannot be made of the many valuable woods to be found in the forests of Siam. Cost of extraction and transport doubtless mainly accounts for this. The export shows no sign of a resumption of increasing, and its total value during 1903 was less than 20,000 tons.

PROPOSED REGISTER OF EDINBURGH HISTORICAL BUILDINGS.—Baillie Dobie brought before the meeting of the Lord Provost's Committee of Edinburgh Town Council on the 5th inst. a motion with regard to the advisableness of preparing a register of all the old buildings in Edinburgh of historical or architectural interest, and considering whether any steps should be taken for the preservation of those considered of sufficient importance to be retained or restored, and report. The matter was remitted to a sub-committee.

THE BEDE MEMORIAL AT MONKWEARMOUTH.—The national memorial to the Venerable Bede, "the Father of English learning," was unveiled by the Archbishop of York on the 11th inst. The memorial takes the form of an Anglo-Saxon cross placed upon a site in the Cliff Park at Roker, near Sunderland. The cross stands on ground which once was the territory of the twin monasteries of Monkwearmouth and Jarrow, and is near the supposed birthplace and the tomb of Bede. The actual work of designing the memorial was entrusted to Mr. Charles Hodges, of Hexham, and the cross has been sculptured by Mr. Geo. W. Milburn, York. It is 25 ft. high, and the stone for it has, by permission of Lord Armstrong, been taken from his private quarry at Craghead. The shaft on the west side is ornamented with scroll patterns from the Lindisfarne Gospel, and from the stones at Monkwearmouth, and contains, within a twisted loop of the duck-hilled serpent seen on the Monkwearmouth doorway, pictorial subjects from the life of Bede. On the east side are Roman letters, giving two extracts from Bede's works—one from the Ecclesiastical History, and one from his life of St. Cuthbert. On the south side, within a vine scroll, is carved in alto and bas-relief the heads and busts of the friends and associates of Bede. On the north side a scroll introducing birds and animals, springing from a harp, emblematic of his poetic gifts, shows Bede's love of nature. Beneath these four sculptured sides runs in a band the verse written by Bede on his death-bed, beginning "Eboracæ, in Latin, in Rune, in Minuscule, and in English. On the block out of which the cross rises is carved a short inscription as follows:—"To the glory of God and in memory of His servant Bede.—673-735." The foundation for the cross has been prepared under the supervision of Mr. J. W. Moncur, the Borough Surveyor.

HOSPITAL ACCOMMODATION AT CHELMSFORD.—A Local Government inquiry was held at the Corn Exchange, Chelmsford, on the 3rd inst., before Mr. W. W. E. Fletcher, Inspector to the Board, into the application of the Chelmsford Joint Hospital Board for sanction to borrow 2,800*l.* for the extension of their Infectious Diseases Hospital in Baddow-road. The Clerk (Mr. A. S. Duffield) stated that the Board proposed to erect on the land at Great Baddow an additional block, consisting of one building to contain on the ground floor one ward with six beds, one ward with four beds, and two further wards with one bed each, ward kitchen, etc. On the first floor, over the

centre of the building, it was proposed to have one ward with two beds and one day-room. The estimated cost, exclusive of architect's fees, and incidentals, was 2,224. Plans and estimates, prepared by Messrs. Pye and Bacon, had been approved by the Hospital Board. After further evidence the inquiry terminated.

APPOINTMENT OF SANITARY OFFICERS.—The Local Government Board has sanctioned appointments as follows:—Hackney—Mr. W. C. Vobe as an additional sanitary inspector; Lewisham—Mr. H. L. Hyde as sanitary inspector, in the room of Mr. A. J. Davis; Poplar—Mr. H. J. Langley as sanitary inspector *vice* Mr. E. J. Anthony, deceased; Southwark—Mr. F. Jenkinson as sanitary inspector, in place of Mr. H. Abson; Westminster—Mr. W. Williams as sanitary inspector, to fill the vacancy caused by transfer of Mr. T. G. Dea to a district in place of Mr. T. W. Calverley; Miss C. W. Byrne and Miss M. Carey as temporary female inspectors, from July 15, 1904, to January 17, 1905; Mr. A. L. Ware as temporary inspector, for a period of six months in the place of Mr. J. W. Kirk.

UNIVERSITY COLLEGE, LONDON.—Professor Simpson has commenced a course of instruction in Building Construction and Elementary Design. The system is that plans, sections, and sketch elevations of, say, a small country house are supplied to each student. On the next evening this design is presented drawn out in more complete form, with such modifications as each student may wish to make. This first design is in brick, with wood sash and casement windows. On subsequent evenings the different parts of the building are worked out to a larger scale. The first half of the evening is spent in criticising the drawings made during the previous week, the second half in lecturing on the particular subject for the ensuing week. The following are considered in detail, and exercises set on each:—Walls and bonding, footings and foundations, arches and offsets, chimneys and fireplaces, carpentry, roofs, floors and partitions, external plumbing, slating and tiling, drainage, joinery, skirting, windows, doors, staircases, etc. The result is a complete set of working drawings of one design. In the Spring Term one or more designs will be supplied as before in which various details of construction, such as stone walling, hollow walls, stone mullioned windows, steps, copings, structural ironwork, steel roofs, treproof construction, areas, etc., not previously considered, will be worked out.

Legal.

WHAT IS A "DANGEROUS" BUILDING? IMPORTANT CASE AT EASTBOURNE.

The Eastbourne Magistrates on Friday last week were asked to give their decision in a case which is of peculiar interest to owners and builders of household property. Some time ago a fire occurred at a large block of residential flats in that town. As a result it was discovered that the builder had used inflammable material beneath the hearths—a flagrant breach of the building by-laws—and the Corporation insisted that the defects should be remedied. The building having been taken over by mortgagees, a considerable hardship was placed on them and on the tenants of the flats. The owners undertook to carry out the work, and, in a majority of cases, met with no opposition. One of the tenants, however, Richard S. Topham, refused the owners, The Law Guarantee and Trust Society, Ltd., admission, and for that was summoned before the Eastbourne Borough Bench.

The Town Clerk (Mr. H. W. Fovargue), recalling the circumstances of the case, which had been before the Bench on several occasions, explained that there was a fire at Hartington-mansions, and it was discovered that it was due to improper material found at the back of one of the grates, and on examination every grate was found to be in the same defective condition. Notice was given to the mortgagees in possession giving orders that the defects should be remedied in accordance with the building by-laws. The work was promptly put in hand, but when the owners came to Mr. Topham's flat he refused to allow the work to be completed. The mortgagees offered to allow Mr. Topham to occupy an empty flat whilst the work was being done, but he declined to accept that offer. Mr. Topham contended that his agreement should be cancelled, but the owners refused to take that course. A sum of twenty guineas as compensation was suggested, but this the mortgagees declined to pay. Mr. Ronald, as representing the mortgagees, contended that the mortgagees were innocent parties, because the buildings were erected by the mortgagor, a builder named Ellis, and the mortgagees

now in possession were not responsible for the defects. It was therefore extremely hard on them to be called upon to execute the work, and they had alleged a negligence on the part of the building surveyors in failing to see that the work was properly done at the time the flats were erected. That, said the Town Clerk, was not an unreasonable complaint, but, speaking on behalf of the building surveyor, it was impossible for him to see every detail in every building which was erected in Eastbourne, especially when men were desirous of evading the by-laws. If it was incumbent on him to see every detail it would be necessary to have a building surveyor on every building from morning to night while building operations were in progress. The Corporation could not recognise any responsibility whatever in respect to any negligence made by their surveyor. He respectfully suggested that the Court was not one of equity, and therefore the question of compensation was not one for them to consider.

Mr. P. Lawson Lewis, on behalf of Mr. Topham, said that as the case had been adjourned to permit of a summons being served upon the owners, and as that had been done, the case against the owners should be heard before a decision was given in Mr. Topham's case. If the action failed against the owners, then, of course, it would fall against the tenants.

Mr. S. A. T. Rowlatt, who appeared on behalf of the owners, did not object to this course, and agreed with Mr. Lewis that if the application against the owners did not succeed, then the proceedings against the tenant must fail. The owners were perfectly willing to commence the work instantly, but they contended that the order could not be made against them.

Mr. Mayhew (one of the Magistrates) pointed out that the work could not be carried out without the consent of Mr. Topham, and counsel agreed with this view.

It was eventually decided that the case against Mr. Ronald should be taken before the decision was given in Mr. Topham's case.

Mr. F. J. Ronald, of Quality-court, Chancery-lane, London, was summoned in respect to Nos. 5, 15, 17, 18, and 20, Hartington-mansions for failing to carry into effect within forty-eight hours, an order made upon him by Mr. William Chapman Field, Building Surveyor to the Borough of Eastbourne. The Town Clerk admitted that the onus was upon him to prove that the building was dangerous, and the Borough Surveyor gave evidence that, in consequence of the fire, it was discovered that inflammable materials had been used in making the hearths, and that it was a source of danger to the occupants. The building was therefore dangerous.

Mr. Rowlatt argued at some length that the case did not come within the purviews of the "dangerous construction clauses," and should therefore be dismissed. The section, he said, was intended to apply to structures which were dangerous because they were insecure or ruinous, but it was ridiculous to say that a building was "dangerous" because it contained defects, and because one grate was defective it did not follow that all were.

The Bench, adopting this view, dismissed both summonses. They thought, however, that the work should be carried out, and that compensation should be allowed the tenant as suggested in the case. Defendants applied for their costs, but the Bench declined to make any order as to that.

EMPLOYERS' LIABILITY ACT.

"PACKING" AND "FENCING" SAW BENCHES. JUDGE STONOR, on Monday, at the Marylebone County Court, delivered judgment in the case of Smith v. Giles, which was fully reported in the *Builder*, July 25 last. The plaintiff was George Smith, a builder's machinist, 2, Chichester-road, Kilburn, N.W.; and he claimed damages, under the Employers' Liability Act, against Mr. William Giles, builder and contractor, 25, Macroom-road, Paddington, W.

Mr. Abinger was counsel for the plaintiff, and Mr. Shakespeare, counsel, appeared for the defendant.

The facts of the case are clearly stated in the judgment, as under. His Honour said:—In this action the plaintiff claims damages under the Employers' Liability Act for injuries sustained by him in defendant's employ—namely, the loss of a portion of the second, third, and fourth fingers of his left hand. . . . The plaintiff has been unable to work since the accident, and may continue so for some time longer. The accident occurred on December 12, the plaintiff's hand coming in contact with a circular saw whilst he was in the act of replacing a "slip" or board—which he was holding and guiding, to be cut by the saw—in consequence of the slip having fallen or rather shifted from what is called the "packing"—namely a piece of wood

placed on the saw-bench beneath the slip for the purpose of raising the same. The plaintiff contends that the accident happened in consequence of three defects in the machine and the consequent mode of working. The first of such alleged defects is that the saw was fixed and not raisable; the second, the saw was of too great diameter defects rendering the use of packing necessary to raise the slip. The third of such alleged defects is that there was not a guard in rear of the circular saw.

The issues in the present case appear, therefore, to be:—Whether the defendant is negligent in not having (1) a raisable, (2) a saw of loss diameter; or (3) a guard in rear of the saw.

It appeared by the evidence that first well as raisable, benches are very general and perhaps equally used by the trade it is obvious that the substitution of rails for fixed benches, and providing additional saws of various diameters, would present great trouble or expense, and would be open to practical objections; and it is not prepared to say that the defendant has been guilty of negligence within the Employers' Liability Act in continuing to work with fixed benches, not having saws of various sizes, and consequently using packing hitherto, which appears to be, roughly speaking, the course followed by half the trade at the present time. (See the case of *Whiteley v. McGregor*, Q.B.D., 376.)

With regard to the third issue, the fact that the defendant was not using guards on the saw-bench is quite obvious, and can easily be prevented by a trifling expense without further trouble or inconvenience. Guards also are very general in the trade at the present time, and only objection I have heard made to them is that the men cannot be got to use them. Upon the whole, however, having regard to the case of *Walsh v. Whiteley*, and cases bearing on the subject, I do not feel justified in finding for the plaintiff on this third issue any more than on the first and second issues. I should notice that the defendant, at the hearing, raised the defence of *volenti non fit injuria*, but the plaintiff proved that he had objected to the dangerous mode of working in question, remonstrated with the foreman, who proposed to get smaller saws. This defence consequently failed according to the case of *Holmes v. Clarke* (30 L.J.R., Exch., 15), the present action there must be a verdict for the defendant, but I think that it is a verdict which I ought not to give costs.

Judgment accordingly. It is understood that the man will claim under the Workmen's Compensation Act.

FAILURE TO DEPOSIT PLANS.

At Southwark, on Wednesday, Henry builder, of 81, Peckham-rye, was summoned before Mr. Baggallay by Sanitary Inspector Hoskins, on behalf of the Bermondsey Borough Council, for failing to deposit a plan of a building, the defendant's name being that of the Alma London County Council, Bermondsey, contrary to the London County Council by-laws. The defendant said that he had done a considerable amount of work for this school, for which he had given the principal authority the required plans, and before the men left the job the architect instructed them to put in a new gully in rear of an old one, and a new pipe. The defendant was away on his holidays at the time, and the men omitted to send a plan of this pipe and additional work before commencing it. Sanitary Inspector Hoskins, in reply to the defendant, admitted that plans had been deposited with regard to the other works. Mr. Baggallay: And do you say that another plan was required before this little extra pipe work was done? The witness: Yes, by the by-laws. Mr. Baggallay: This is an essential part of municipal terrorism. Here the man doing a lot of work and plans for a building have been deposited, because he has one in one pipe and one little gully you summon him for not giving another plan. Sir W. Grantham is indeed right. The summons is dismissed; it is perfectly preposterous.

BOROUGH COUNCIL AND DWELLINGS COMPANY.

At Southwark Police Court, on Wednesday, the National Model Dwellings Company were summoned before Mr. Baggallay by the Southwark Borough Council for failing to comply with notices requiring certain saw work to be done at Queen's-buildings, Borough. There were twenty-one defendants in all. Mr. Topham, who appeared for the Borough Council, said that Queen's-buildings, of which the defendants were the owners, comprised 670 tenements, eleven shops, and 3,000 persons. The defendants were very

plying with the Council's notices; some were for which these summonses had been served upon them last May. Mr. Wyles, secretary and manager to the City, said the defendants attended to the matter as rapidly as possible. When there was question of a nuisance the matter was put immediately, but in these cases, where construction of the lavatories was required owing to what might be called a "sanitary" some time was necessary in order to work. He had received altogether 101 notices this year requiring new work to be fitted, and he had complied with four. He kept two plumbers and a boy fully employed at the work. The Company not paying any dividend, and the repairs in 1903, this year. Mr. Baggally: That in 30s. a house. Many of us would be glad if you spent only that on repairs. Wyles: We are doing the work as fast as can. You see it is not as if these were temporary buildings; the death-rate is less than half of the rate for the whole of South London. Mr. Baggally said the defendant employ more men in order to get the work done more quickly. They would be 5s. 6d. and 5s. 6d. costs.

PATENTS OF THE WEEK.

APPLICATIONS PUBLISHED.*

1903.—M. N. RIDLEY and T. I. MILL: *Slabs, Blocks, Beams, Arches, Columns, Walls, Roofs, and the Construction of Concrete and Metal.* Blocks, beams, arches, flooring, columns, like, constructed of concrete and metal, taking the form of two or more dovetail sections, the grooves of the sheets being set transversely of one another.

1903.—J. DELASSEE: *Cork Matting Use as a Covering for Floors and Furnishings and for various other purposes.* Mat made from corks or pieces of cork are so united together by means of a passed therethrough, and attached to their framework that the corks lie either in rows or in decorative designs, for the latter object the corks may be coloured and finished.

1903.—P. E. J. A. CHAMPEME: *Refrigerating Chimney Cowl, Ventilators, Sky-lights, Turrets, and the like.* Directing chimney cowl for the purpose of facilitating draught, substantially consisting of a vertical spindle fixed upon a support mounted at the upper extremity of the chimney; the said vertical spindle being tapered at its upper portion and provided with a collar, which is rigidly connected with the upper portion of the chimney, and which receives a tapered lower aperture and internally with the lower portion of the sleeve being provided with recesses furnished with balls resting in place by a collar surrounding the

1903.—P. J. SADLER: *Brick Kilns.* Kiln consisting of an arrangement of flues and dampers between the top of one kiln and the top of another, chimney to each kiln with a main con- flue from each to a stack or fan.

1903.—W. LUCY AND CO., LTD., and LAWRENCE: *Means for Supporting the Sides of Bookcases, and the like.* A device for this invention a vertical rack or is, or are, formed on the uprights at the end of the shelf and the shelves are supported by bearers having formed on them a series of serrations which engage the racks. The bearers are of such a length that when in position they will not allow of movement of the bearers. Preferably the racks or bearers which may be of any convenient material are cast in one with the uprights, and the bearers is made in one with the

1903.—R. CHANTREY: *A Siphon Water-Preventing Apparatus.* The invention relates to the siphon portion of the apparatus. According to the invention the siphon is constructed of two tubes one above the other; the tubes being of such a diameter as to leave sufficient space between the flow of the water which is forced into a cylinder provided with a float, under being provided with a flat valve top. When the water reaches top said inner tube it passes down such

these applications are in the stage in which they are to the grant of Patents upon them can be made.

tube to the flush. The outer tube is covered over.

17,116 of 1904.—W. ECKSTEIN: *Means for Opening and Closing Fanlights, and the like.*

The object of this invention is to provide means for opening and closing a fanlight or the like by which the light may be held steady in any position. This is accomplished by fixing to the light a pin which enters a spiral groove in a disc pivoted to a bracket fixed to the frame at the side of the light.

17,235 of 1904.—C. ROBIN: *A Composition for the Manufacture of Ceramic Products.*

This invention relates to a composition for the manufacture of ceramic products such as bricks, tiles, pipes, and all kinds of earthenware. The new composition is characterised by a high ratio between the weights of the silica and alumina contained in it, which enables ceramic products of great lightness to be made from it. While in those clays the richest in silica which have heretofore been used for the manufacture of bricks and other earthenware products, the ratio of the silica to the alumina is not more than 3 to 3.5, and is generally 2 to 3, this ratio is increased to about 6 in this improved composition. A mixture which has been found to give good results in practice is composed of the following ingredients in about the proportion specified:—Silica, 60; alumina, 15; oxide of iron, 15; lime, 4.5; magnesia, 1.5; water, carbonic acid and organic matter, 12; total 100. This composition can be made either from suitable earth obtained directly from the ground, or by mixing several earths or substances of different origin.

19,644 of 1903.—F. J. TALBOT: *Means for Purifying Air.*

Means for purifying air, consisting in the combination of a fan, discs enclosing the sides of the vanes, a central air inlet opening, a permeable material around the outer extremity of the vanes or periphery of the fan, a casing enclosing said fan, a water tank at the lower part of said casing through which the periphery of the fan passes, a diaphragm extending from one side of the fan casing nearly to the periphery of the fan to form a water seal and an air delivery pipe or duct.

22,534 of 1903.—W. SHARPE: *Non-slipping Segmental Wood-paving Block.*

A wood-paving block made up of segments compressed together, the segments being held in position by stout wires running in grooves cut in each of the two sides of the block. The ends of the wires (the points of which are barbed) are bent at right angles and pressed into the end segments of the block. The segments vary slightly in length, the top of the block presenting an uneven surface.

22,597 of 1903.—T. WATSON: *A Fixing Brick.*

The bricks are made from blast furnace slag, run into water when in a molten state (and known as slag sand) or mixed with cement lime, sand, and like substances, made into bricks by mechanical pressure sufficiently dense to hold nails driven into them. These bricks are intended to be built into walls and chimney breasts of dwelling-houses, and other buildings for the purpose of holding and fixing the woodwork in the desired position, and as a substitute for wood plugs and wood blocks, thus reducing the risk of fire.

6,925 of 1904.—D. D. MCBARN: *Devices for Removing and Excluding Water while Constructing or Repairing Subaqueous and other Masonry.*

A device for sealing locks in masonry, comprising an impervious flexible sheet covering the opening, its extended edges being sealed in to the adjacent material, and being adapted to receive a layer of superposed masonry, and means for draining off the flow of water from underneath the sheet until the superposed masonry has set and afterwards closing the same.

17,015 of 1904.—C. H. GRAY: *India-rubber Tiles for Flooring, and the like.*

The present invention relates to improvements in india-rubber tiles for floor coverings, and the like and is particularly applicable to floorings of the kind described in the British Patent No. 6,339 of 1903, granted to Sir E. J. Harland and C. H. Gray, the object being to provide antiseptic india-rubber tiles suitable for use on ship board, in lavatories, and the like. According to the invention an antiseptic such as carbolic acid, chloride of lime, or the like is incorporated with the india-rubber of which the tile is formed, and the resulting tiles may be laid down separately, or may be combined into sheet and laid down in that form. Conveniently from 1 per cent. to 10 per cent. of the antiseptic may be used, but this proportion might be largely increased if desired.

ROTHERHAM.—For alterations and additions to St. Ann's Boys' School and alterations to out-offices at Ferham-street Schools, for the Education Committee. Mr. J. Platts, architect, High-street, Rotherham. Quantities by architect:—

Table with 2 columns: Name and Amount. Includes St. Ann's Boys' School, G. Saul, T. Green, R. Snell, J. W. Bygate, J. Cooper*.

Perham-street Schools. J. Cooper* £75

SALISBURY.—For erecting the Carnegie Free Library buildings in Chipper-lane, for the Free Library Committee. Mr. A. C. Robbans, architect, 32, Chipper-lane, Salisbury. Quantities by architect:—

Table with 2 columns: Name and Amount. Includes J. Long & Sons, Vincent & Fol-land, Bailey & Marlow, T. Dawkins, Webb & Co., W. Webb, E. Hale.

Accepted subject to certain variations.

SOUTHWOLD.—For erecting sixteen workmen's dwellings, for the Corporation. Mr. T. E. Key, architect, 5, Bloomsbury-square, W.C., and Aldeburgh, Suffolk:—

Table with 2 columns: Name and Amount. Includes C. Gimson, C. W. Fowler, J. C. Smith, E. Willmott & Sons, H. Thompson, A. G. Beckett, J. Wales, Lowes-tott*.

STRABANE (Ireland).—For erecting two cottages, Main-street, for Mr. J. M. Kane. Mr. Wm. Stuart, B.E. Men. San. Inst. Quantities by architect:—

Table with 2 columns: Name and Amount. Includes S. Donnell & Co., J. McGrath, Danl. M. Cafferty, Strabane*.

TAMWORTH.—For erecting two cottages, stabling, store-rooms, and sheds at Kettlebrook, for the Rural District Council. Mr. J. W. Goodridge, architect, Belvoir-street, Tamworth:—

Table with 2 columns: Name and Amount. Includes H. Clifford, G. Emery & Co., Watson & Sons, H. Bouson, B. Musson, Glas-cote*.

TOTTINGTON (Lancs).—For making-up part of Sobell-street and Holly-street, for the Urban District Council. Mr. L. Kenyon, surveyor, 33, Chapel-street, Tottington:—

Table with 2 columns: Name and Amount. Includes J. A. Greenhalgh, Radcliffe & Woodhead, Mosley-street, Bury*.

WALSALL.—For erecting a public library in Lichfield-street, for the Corporation. Mr. J. S. Gibson, architect, 5, Old Bond-street, London, W. Quantities by Messrs. Young and Brown, London:—

Table with 2 columns: Name and Amount. Includes H. Willcock & Co., Wolverhampton*.

WALTHAMSTOW.—For warehouse, Somers-road, Walthamstow, for Mr. A. G. Bean. Plans and specification by Mr. H. W. Oxley, surveyor, 4, Addison-road, Walthamstow:—

Table with 2 columns: Name and Amount. Includes E. Fuller & Son, J. A. Reed, J. & J. Dean, West Bros., Pettet, H. W. Stone, D. Fairhead, W. Mess, Green*, T. Stinfield & Co.

B. NOWELL & Co., Stone Merchants & Contractors. Chief Office, Warwick Road, KENSINGTON. Norway, Guernsey, and Leicestershire Granite, Kerb, Pitching, and Yorkshire Stone.

ESTIMATES GIVEN FOR EVERY DESCRIPTION OF ROAD MAKING.

WALTHAM.—For the erection of an isolation hospital at Waltham Holy Cross, Essex, for the Waltham Joint Hospital Board:—

Table with 2 columns: Name and Amount. Includes Keen & Sons, Shurmur & Sons, Ltd., Richardson & Bros., A. W. Robins, Perry & Co., Kirk & Randall, Martin, Wells, Clark & Sons, G. Munday & Sons, J. MacManus, C. R. Price, Conson & Lotts, Thomas & Edge, Allen, Fairhead, J. & Son, Johnson & Co., H. Wells & Sons, C. Wall, Ltd., A. W. Nash, Sands & Burley, S. L. Grist, F. & T. Thorne, J. Bondy, Waltham Abbey*, Almond & Sons, Ltd., [Architects' estimate, £8,243.]

WATFORD.—For the extension of the electric lighting station, for the Urban District Council. Mr. C. P. Ayres, architect, Watford:—

Table with 2 columns: Name and Amount. Includes W. & D. Wilkins, W. Judges, Parnell & Sons, J. L. Tyler, G. Wages, Oak Building Co., Ltd., Clark Bros., Goodfield & Jeffery, W. H. L. Leu & Son, G. & J. Waterman, C. Brightman, Hockley & Co., H. Martin, H. Brown, H. B. Watkins, C. H. Ford & Co., Watford*.

WICKLOW (Ireland).—For sewerage works, Bridge-street, Wentworth-place, and South Quay, for the Urban District Council. Mr. J. Pansing, C.E., Town Surveyor, Wicklow:—

Table with 2 columns: Name and Amount. Includes W. Rose, G. Dixon, Georges-street, Kingsdown, co. Dublin*.

WINDSOR.—For alterations and additions to Clewer Mead, Windsor, for Mrs. Franklin Taylor. Messrs. Law & Allen, architects, Dacre House, Arundel-street, Strand, W.C.:—

Table with 2 columns: Name and Amount. Includes J. Perrin, E. R. Willett, Hollis & Sons, W. Beauchamp, England & Green*.

Heating by Hot Water.

LONDON is a smoky city. It is a strange delight to see the dome of St. Paul's clearly defined, even from Hungerford Bridge, a short mile away; there are many days on which it is impossible for the clearest-eyed to see across Oxford-street or the Strand; and this opacity of the air is almost wholly due to sheer waste of household coal. After all these years of Smoke Prevention Acts, it is idle to lay the whole blame on factory chimneys. Domestic fires are the chief offenders. It is not our purpose at present to consider whether the open fire-grate can be so constructed as to prevent the formation of the greater part of its smoke, although this would be an interesting topic. We are merely concerned to say that the number of such fires would be greatly reduced if a supplementary method of warming were installed in every house containing, say, more than eight or ten stoves. There are many days in spring and autumn when the single fire of such a heating apparatus would render the lighting of three or four open fires unnecessary, and the furnace of the heating apparatus would probably yield less smoke than any one of the open stoves.

The subject is of so much importance to the community as well as to the individual that we gladly welcome a new and

greatly enlarged edition of a work* dealing with it in a practical and comprehensive manner. It is not our custom to devote much space to reviews of new editions of books, but in this case an exception to the rule may well be made. The third edition differs so much from the second, both in form and matter, as to be almost a new work. The size of the page has been increased from 7½ in. by 5 in. to 9 in. by 6 in., and the number of pages from 220 to xvi., plus 344. In the second edition there were ninety-six illustrations and twenty-four chapters, in the third there are 142 illustrations and thirty-seven chapters. Much of the old matter has of course been brought forward into the third edition, but the figures given above show that much new matter has also been introduced.

The only alteration of any moment in the first chapter (on "The High-Pressure System") is in Table L, which is extended to give in greater detail the lengths of ¾-in. radiating pipes and the heating surface of the boiler coils required per 1,000 cubic ft. of air space for temperatures ranging from 55° to 300° Fahr. Chapter II. deals with a modification of the high-pressure system, in which a supply cistern with relief valve takes the place of the sealed expansion tube, and here, again, with the exception of one illustration and half a page of text, the matter remains as in the second edition. The chapter on bread-baking

* "Heating by Hot Water, Ventilation and Hot Water Supply." By Walter Jones, M.I.M.E. Third edition. London: Crosby Lockwood and Son. 1904.

by hot water or steam includes three new illustrations with accompanying descriptions, but still remains inadequate. Chapters IV., V., VI., and VII. are reproduced verbatim, but some additional memoranda of a simple arithmetical nature are inserted in Chapter V., and a new table on the conducting and radiating powers of various materials is substituted for the old table in Chapter VII. There is also a new paragraph of merely historical interest on thermometers. Keith's automatic air valve is the only novelty in the next chapter.

The subject of boilers is now discussed in two chapters (IX. and X.) instead of one, and it is in these that we find the first new matter of any real importance. Illustrations of some modern sectional boilers of cast-iron have been obtained from the American Radiator Company and the Beeston Foundry Company, and the new hints on "Selection of a Boiler" are good, but nothing is said about the advantage which some sectional boilers possess in being easily extended, when, in consequence of additions to the building and for any other reason, more heating surface is required. It is not uncommon to find in a building to which additions have been made one or more supplementary boilers used in conjunction with the original inextensible boiler; if a sectional boiler had been used in the first instance, new sections could have been added, and the result would have been more economical in fuel and labour and more satisfactory in

heating. Chapters XI., XII., and XIII. contain no new matter, and the old "rules" for ascertaining the velocity of air currents "in chimneys or ventilating flues" remain as before; they do not include any allowance for friction or bends, or take into consideration the effect of winds and other disturbing influences, and are, for all practical purposes, as unreliable as those formulas for calculating the amount of radiating surface for heating rooms, which the author criticises so severely. In Chapter XIV. the table giving the diameters of main pipes for various quantities of radiating surface has been altered, the quantities being less than in the older table; thus, for 1½-in. horizontal and 1-in. vertical mains the maximum radiating surface has been reduced from 100 sq. ft. to 80 sq. ft.; for 2-in. horizontal and 1½-in. vertical mains the radiating surface has been reduced from 600 sq. ft. to 300 sq. ft.; and for 3-in. horizontal and 2-in. vertical from 1,000 sq. ft. to 700 sq. ft. A table, copied from a report of Professor Ordway, has also been introduced, in which the relative efficiency of non-conducting materials is given; of the non-carbonising materials, loose calcined magnesia is accorded the first place, and "best slag wool" the second. Other tables relating to the areas and circumferences of circles have been extended, a new table giving the head and pressure of water inserted, and also a table giving the metrical equivalents of English sizes and weights of cast-iron pipes. The last contains a curious column of figures, stating the weight of pipes in kilogrammes per yard; to have been of service in foreign trade the equivalents of the weights in pounds per yard ought to have been given in kilogrammes per metre.

So far, it must be confessed, the third edition of Mr. Jones's book does not differ materially from the second, but the next two chapters, which together occupy forty-nine pages, now appear in the work for the first time. The first of the two is entitled "Radiation of pipe-surface as provided by different authorities for various buildings critically examined," and is an interesting piece of work, although it is questionable whether the criticism is always entirely fair. Hood's rule, for example, was not intended for extraordinary temperatures, but, as Mr. Jones himself points out on page 122, for the moderate temperatures required in "habitable rooms and public buildings" and also "for horticultural work," and it is therefore somewhat unfair to apply it for high temperatures from 90° to 120°. We hold no brief in favour of Hood's rule, which bears on the face of it every mark of empiricism and necessitates a good deal of guesswork on the part of the engineer when dealing with conditions in any way abnormal. Mr. Jones has done good service in pointing out the great discrepancies between the amounts of radiating surface obtained by this and other rules, and in comparing the theoretical results so obtained with the amounts of radiating surface which are required, as ascertained by careful tests, to heat a certain room to different degrees of temperature. In the comparative table (No. XIX.) the test results are not given, as the temperatures

of the external air and of the radiating pipes were not uniform. We presume that they are those numbered 14 to 20 in Table XXX., page 163, and if this is the case they certainly approximate closely to the theoretical results calculated according to Mr. Jones's new method and given in the first column of the comparative table.

Chapter XVI., which deals with the amount of "radiation or pipe surface" required in buildings of different kinds and for different temperatures, must be read in connexion with Chapter XV., as it is merely a continuation of the same subject. In passing, we may note that Chapter XVI. is a revised reprint of a paper read by Mr. Jones at a meeting of the Institution of Heating and Ventilating Engineers, and, as the author states in the preface, the members of the Institution "showed their appreciation of this work by awarding the first prize (silver medal) for the best paper read at their meetings during the year 1903." The chapter contains additional examples of the discrepant results obtained from some of the best-known formulas, and of the difference between these and the results obtained from tests. The recorded tests cannot be described as exhaustive; there are eight tests of horticultural buildings, one of a dining-room, six of a large office, one of a church, and two of drying-rooms. Of these the six tests of the room described on page 163 as an office, and on page 130 as "a room on the first floor over my offices," are the most interesting. The room had a capacity of 23,500 cubic ft., an exposed wall surface of 1,540 sq. ft. (p. 130, or 1,530 sq. ft. p. 163), and a glass surface of 370 sq. ft. Around this room seven rows of hot-water pipes were fixed, having a total surface of 1,278 sq. ft., and so arranged that any number of rows (from one to seven) could be in use. The first row had a radiating surface of 168 sq. ft., and each of the other rows a surface of 185 sq. ft. With the first row only in operation, the mean temperature of the water being 171° and the external temperature 20°, the temperature in the room was 44°; with two rows (mean temperature of water 167° and external temperature 20°) the internal temperature was 56°; with three rows (water 175°, external temperature 22°) the internal temperature was 68°; with four rows (water 167°, external temperature 16°) the internal temperature was only 70°; with five rows (water 161°, external temperature 30°) the internal temperature was 76°; with six rows (water 161° external temperature 42°) the internal temperature was 87°; with seven rows (water 157°, external temperature 48°) the internal temperature was 96°.

These results are very instructive, but, in order to render them more easy of apprehension, we have worked out the square feet of radiating surface per 1,000 cubic ft. of space in the room, and thus obtain the following figures:—7.1 sq. ft. of radiating surface per 1,000 cubic ft. gave an internal temperature of 44°, when the external was 20° (an increase of 24°), but 15 sq. ft. were required to give an internal temperature of 56° (an increase of 36°), and 23.7 sq. ft. to raise the temperature from 22° external to 68° internal (an increase of 46°). In

other words, one unit of pipe show difference of 24° between the internal and external temperature, but two were required to raise the internal temperature 12° higher, and three (with the water at a higher temperature to raise it an extra 10°. Four (30.7 sq. ft. per 1,000 cubic ft.) gave a difference between internal and external temperatures of 54° (namely, 70°—16°); five units (38.6 sq. ft. per 1,000 cubic ft.) a difference of 46° only (namely, 30°); six units (46.5 sq. ft. per 1,000 cubic ft.) a difference of 45° (87°—42°); seven units (54.3 sq. ft. per 1,000 cubic ft.) a difference of 48° (96°—48°). The tests and those of the two drying-rooms show clearly that every increase of internal temperature requires a greater increase in the amount of radiating surface, if the other conditions remain constant.

Mr. Jones has not, however, been content to give the results of his tests has based on them a new method of calculating the radiating surface required under different conditions. The method is somewhat complicated, and takes into consideration the cubical contents of the room to be heated, the exposed surface, and the area of glass, in addition to these, the allowance made for every increase of internal temperature. By means of elaborate tables and diagrams, the difficulty of calculation has been greatly simplified. With the tests on which Mr. Jones's method is based were sufficiently exhaustive to only be proved by experience, but the method seems to us to be without comparison in advance of any of the formulas now in general use, and to be one which the heating engineer cannot afford to ignore.

We can only briefly indicate the features in the remaining chapters. Chapter XVII. some hints are given on the defect known as "short circuiting," which is often found in systems containing a number of radiators. An interesting account of the method adopted for preventing draughts in the tower at Stonbridge is given in Chapter XVIII. A new and useful chapter, entitled "Mansions, Villas, or other Buildings," contains valuable information on the methods of connecting radiators. Chapter XXVI. on "Ventilation" also appears for the first time.

The last portion of the volume, which in the second edition, is devoted to water supply, and contains a new chapter in criticism of the ordinary method in which the heat is obtained from the kitchen range, and also additional notes on the subject of indirect heating means of double cylinders, or cylinders containing coils of pipes—a method which is particularly advantageous when the water is of such a nature as to deposit in the apparatus. Chapters XXXI. to XXXV. are also new, and bear the following titles:—"Ventilation Analyses," "Explosion of Theories to Have Been the Cause of Boiler Explosions," "Domestic Boiler Explosions," "Experiments with Red-hot Boilers and 'Safety Valves.'" We have repeatedly pointed out that nearly all boiler explosions are due to the circulation pipes being blocked with ice, and that by far the greater number of

have been prevented if proper safety valves had been fitted to the boilers, and Mr. Jones in these new chapters expresses the same opinion. As a sign of the times, it may be noted that the author is in favour of the metric system, and devotes the final chapter to the subject.

The misprints in the volume are not numerous, but we may point out that "390" on page 130 should be "370," and "1,530" on page 163 should be "1,540." "Verticles" on page 152 is an obvious printer's error, but the word "data" followed by a singular verb occurs so frequently that we are loath to lay all the blame in this case on the much-abused and long-suffering compositor.

We have pleasure in recommending this edition of Mr. Jones's book to architects as well as to heating engineers. It can scarcely fail to command a wide circulation.

NOTES.

At a time when the adoption of the metric system is persistently advocated, interest may certainly be taken in reasonable criticism of such proposals. An organisation has recently been formed, under the style of "The British Weights and Measures Association," with the primary object of combating the metre, and the secondary object of standardising and simplifying British Imperial weights and measures, so as to make them more useful than at present. A small pamphlet published by this association sets the adverse case in exceedingly simple terms, and the arguments raised are based on essentially practical considerations. For instance, it is pointed out that the metre is unsuitable for navigators and for those engaged in the textile industries. Also, that in navigation, in the measurement of shipping, and in the manufacture of cotton woollen, linen, jute, and hemp, British standards are practically universal, even in France and other strongholds of the metric system. Some striking estimates are given of the heavy cost to engineering firms of any radical change in the present Anglo-Saxon units, the outlay being computed at 100,000,000*l.* for British, and 200,000,000*l.* for American manufacturers. These figures may seem absurdly high, but they are supported by the testimony of prominent engineers in both countries, as well as by calculations made on behalf of the Franklin Institute of America. It ought not to be overlooked, however, that metric units are already much used by both British and American engineering firms, and that the change to the metric system could certainly not be made suddenly. In any event it is not likely to be made in many years, and in the meantime things but good can result from attempts to simplify the use of British weights and measures, and to abolish the unnecessary and meaningless variations now attending their application to many departments of commerce and industry.

ADVOCATES of the proposed barrage at Gravesend present glowing accounts of the advantages to be derived from the realisa-

tion of the scheme. According to Sir Thomas Brooke-Hitching, who recently delivered an address on the subject, the barrage would give London a clear water free from smell and pure enough for drinking in case of need. Launches, house-boats, and palatial steamers are among the concomitant delights he anticipates, and "London-on-the-Lake" is to become another Windermere or Geneva. Statements of such roseate hue are not altogether wise, and may tend to obscure the real merits of the project. As the width of the Thames will not be increased, its appearance will never resemble that of a lake, and, although the water in the enclosed river might probably be rendered purer and clearer, we should never want to use it for drinking purposes. For sanitary reasons houseboats would be distinctly undesirable, but to pleasure launches and steamboat services there could be no objection. One of the most valuable results to be obtained, however, would be the encouragement of commercial activity on the great natural highway. The establishment of permanent high-water level so as to facilitate the conduct of shipping business in the Port of London could alone justify the heavy expenditure involved by the Barrage Scheme. In some respects the proposal seems worthy of most serious consideration, but satisfactory answers must be given to several most important questions before approval could be given, even in principle, to the claims of the promoters.

ALL round the coast object lessons are to be found at the present moment demonstrating the relentless activity of the sea on the one hand, and the negligent sloth of man on the other. We have already commented upon the case of the Dee embankment, which, since our recent "Note" was written, has been almost destroyed and will entirely disappear before long. At one time the expenditure of a few pounds would have saved the embankment if the parties concerned could only have been reasonable. As things now stand the landowners have lost their property and the railway company are committed to an outlay that will probably amount to many thousands of pounds. In the Isle of Wight, again, the authorities at Yarmouth continue to play with danger in the hope of avoiding necessary expenditure. We recently pointed out that there was imminent danger of an incursion by the sea down the Yar valley. Since then a local inquiry has confirmed previous statements as to the serious disaster threatening the western portion of the island, and it is by no means improbable that the next severe south-westerly gale may sweep away the only barrier remaining between the sea and the river Yar. In spite of this urgent situation nothing is being done in the way of protective works, as the local council decline to move unless with the co-operation of other councils and private owners. Sheerness is another place threatened by the sea, from which it is protected merely by sea-walls. Two years ago the defences were damaged on the most exposed part of the foreshore, and although the cost of repair was estimated at less than 200*l.*

the Urban Council declined to sanction the necessary expenditure. About a year afterwards the defences were so much injured by heavy gales that the estimated cost of reconstruction involved no less a sum than 2,000*l.*, which has now to be provided perforce by the dilatory and pennywise authorities. Other examples of the kind could be quoted, but we have said enough to demonstrate the spine folly of some bodies upon whom devolves the defence of the coast line.

A CORRESPONDENT signing "F. R. S." has made a plea in the *Times* against the ruin of Philæ from the proposed further raising of the Nile, and is answered by Sir W. H. Preece in a letter which shows more candidly than usual the typical attitude of the engineering mind towards questions of the preservation of architectural beauty and of monuments of archæology. All the talk against the heightening of the dam is, in Sir W. Preece's view, "sentimental rot." It is not often that we have it put in such plain terms, but that is the general mental attitude of engineers in respect of all accusations that in the course of their schemes they are destroying objects of beauty in nature or in art; and it is well to have this frank and typical confession kept in mind. According to Sir W. Preece, the destruction of the Philæ temples matters nothing because they are only Ptolemaic. If Karnac stood in the way of an engineering enterprise, we have no doubt some argument would be found to prove that Karnac was of no real value.

THOUSANDS of Londoners daily subject themselves to the depressing and noxious atmosphere that flows along the tunnels and through the carriages of deep-level electric railways. Fortunately for them, the period of immersion in this poisonous bath is of short duration, and means of escape occur at frequent intervals. Hence the only immediate effect in those of strong constitution is a temporary reduction of vital energy, which appears to be cheerfully suffered in return for the benefit of rapid transport from place to place. In long railway tunnels where steam locomotives are employed, far greater risks await the adventurous traveller. Only a few days ago five railway employees, including members of a rescue party, lost their lives in the well-known St. Clair tunnel between Canada and the United States, owing to the breakdown of a goods train amid the deadly fumes with which the tunnel is always filled. What would happen if a passenger train were disabled in similar fashion is too terrible for contemplation, but it is well that attention should be called to the grave risks attending railway journeys below the surface of the earth. The St. Clair tunnel is only 2½ miles long including the approaches, a short distance as compared with some modern European tunnels. Discomfort is experienced in the latter, even during the fairly rapid passage of passenger trains, and the result of any stoppage would be truly disastrous. This consideration alone is

The Thames Barrage.

sufficient to negative any lingering feeling in favour of the Channel tunnel, the construction of which has been discussed in France since the happy restoration of cordial relations between the two countries concerned.

Trade Drawbacks. IN the list of barriers to business enumerated by the President of the South Staffordshire Iron and Steel Institute at Dudley on Saturday last the subject of high railway rates occupied a prominent place. This matter is already engaging the attention of the Government, owing to the persistent complaints made by agriculturists of undue preference in favour of foreign produce. Figures have been quoted in support of their contention which, in view of the Act called forth by a similar agitation a few years back, seem almost incredible. At the Dudley meeting it was stated that the unfair advantages which railway companies offered to our foreign competitors tended more to create unfair competition than was generally known. If this be so, the sooner the Government are put in possession of the facts the better for all the industries concerned. The sidings owners received active parliamentary sympathy this last session, and effected a satisfactory compromise with the railway companies with respect to some of their grievances. Unfortunately for themselves, the South Staffordshire manufacturers labour under the disadvantage of being situated very far from the seaboard, and the incidence of railway carriage may quite conceivably tend to the removal of works from that district, even in the absence of any discrimination in favour of foreign competitors. We were certainly under the impression that "undue preference" had been effectively dealt with by legislation; but such abuses have a tendency to creep in again. If they are found still to exist, the law should be strengthened, for relief in the direction of reductions in rates will otherwise be found difficult, if not impossible, of attainment. Better results may be looked for from a more thorough utilisation of canal transport—a subject we have recently dealt with—for just now every railway manager has "economy" in large letters in the forefront of his programme.

The Mersey Railway. THE paper on the electrification of the Mersey Railway, by Mr. H. L. Kirker, which has just been published in the *Journal of the Institution of Electrical Engineers*, is of considerable interest to engineers at the present time. The whole work of electrifying the line was completed without interrupting the ordinary traffic, and an instantaneous change over from steam to electric working was made. The speed of the trains on the line is increased from fifteen to twenty miles an hour, and the train mileage per week has been increased from 6,000 to 15,000, a three-minute schedule being maintained all through the day. In order to avoid the loss incident on running lengthy trains during the times when traffic is light, "multiple control" has been adopted. On this system the electric motors are distributed amongst several cars of the train, and electric locomotives

are used only on special occasions: Instead of having two controllers, one at each end of the train, to regulate the total current required, a number of smaller controllers are put on several of the motor cars, and they can be operated from several points on the train by means of an auxiliary control system which is worked by a small battery. The change to electricity has effected a very considerable saving in the cost of ventilating the tunnel. With steam the average cost was nearly 5,000*l.* per annum, while with electricity the total cost is less than 400*l.* In electrifying the line great difficulty was experienced in retaining workmen, as the work on the permanent way was of a highly disagreeable nature owing to the vitiated atmosphere. The actual working hours were from 12.30 a.m. to 4.30 a.m., except on Sundays, when the men worked till noon. As the greater part of the cable work was in the ventilation headings, where, in addition to the smoke, there was a seventeen-years accumulation of soot to contend with, the working conditions were very trying. One highly satisfactory feature in connexion with the change over to electric working is that of the 250 men employed in operating the trains over 90 per cent. are old steam employes. This speaks well for the simplicity of electric traction.

The Sandby Bequests. MR. WILLIAM ARNOLD SANDBY, who died in last May at an advanced age, leaving numerous bequests to the Council of the Royal Academy and to public Art collections in this country, was a nephew of Thomas and Paul Sandby, natives of Nottingham, and foundation members of the Royal Academy. Thomas, the elder brother, was first Professor of Architecture to that body, from 1768 until his death in 1798. Many of his architectural drawings, in water-colour, were then sold, and are preserved in Windsor Castle, the Soane Museum, and the National Collections. When twenty-two years old he was, in 1743, appointed military draughtsman to the staff in Scotland, and, having accompanied in that capacity the Duke of Cumberland in Flanders, was made deputy-ranger of Windsor Forest; during his fifty-two years' tenure of that office he effected many improvements in the park, and laid out the lake of Virginia Water. Paul Sandby, one of the earliest English artists who engraved in aquatint, first found regular employment in the drawing-office at the Tower of London. In 1748, being then twenty-three years of age, he joined the staff for making a survey of the Scottish Highlands. His prints and tinted drawings of scenery in Scotland and Wales, and a set of seventy etchings of the Windsor and Eton country, brought him great reputation. In 1778 he published "The 'Virtuoso's' Museum," a series of 150 engravings by him of views in England and Wales. He was appointed drawing-master to King George III's children, and from 1768 to his decease in 1809 was chief instructor of drawing at the Royal Military Academy, Woolwich. Paul Sandby's popular "tinted drawings" were done with a reed-pen, the tints being obtained with thin translucent washes. Mr. W. A.

Sandby bequeathes a capital sum of 1,000*l.* to the Royal Academy for annual "Sandby Gift," in his undying memory, to be awarded to an architect and a landscape painter, alternately, or to the families of such artists under certain conditions. His other bequests comprise his MS. copy (to the Academy) of Thomas Sandby's lectures on Architecture, autograph letters (to the British Museum) written by his two uncles, and specified examples of their drawings to the Universities of Oxford and Cambridge, the National Gallery of Scotland, the City of London Art Gallery, and Art Galleries of Manchester, Liverpool, Glasgow, and other provincial cities.

The Autumn Salon at Paris. THE "Salon d'Automne" which has succeeded in emerging from the basement of the Petit Palais, and secured footing in the main galleries of the Grand Palais, is to a great extent consecrated (as might have been expected) to Impressionist School. It may be said once that good pictures are few, and good taste (on the part of the public) somewhat outraged by the fantastic character of many of the works. It may make an exception in regard to Carrière, whose exhibits have really qualities in spite of his prejudicial favour of a melancholy monochromic colouring and an effacement of outline. M. Besnard on this occasion has abstained from exhibiting, but his wife and daughter have taken part in exhibition, the general arrangement of which is carried out; but to place in juxtaposition to the room consecrated to drawings of Puvis de Chavannes works as those of MM. Odilon Redon, Cezanne, and Toulouse Lautrec, is a poor compliment to pay to the memory of a great artist. Amongst architectural designs the façades of houses by M. Phmet, and the costumes by M. Sézille, are worth mention. Sculpture is worse than mediocre; short, this attempt at a third Salon, which no one wanted, may have a healthful result of disgusting the public with the eccentricities which a clique of dealers endeavour to force upon them, to the prejudice of the true art.

Mr. C. W. Furse. THE death, at so early an age, of Mr. C. W. Furse, a great loss to English art, is not only for what he had achieved, perhaps even more for what he might have been expected to achieve. He has always shown original style in his treatment of portraits, but he would not have been only feeling his way in the last year or two, when his large picture of "The Return from the Regiment" suddenly gave an entirely new idea of the breadth and power of style which were within his grasp; and his beautiful "Diana of the Uplands," in this year, Academy, showed again a new power of movement, and life, and energy, and all who saw it to feel that henceforth Furse's picture would be among the pictures of interest in each Academy exhibition. It is sad indeed to think of that joyful vision of life and health, and of an author cut off in the full vigour of his artistic power and promise.

again drawn to the publication of the Sketch Book, which represented the work of some of the finest architectural draughtsmen of the day, and, he believed, needed only to be better known to secure much wider support. In this year, however, by far the most important item concerned their capital account in respect of the new premises which they now occupied. Very generous donations had been made by members and friends, for which the Committee was most grateful. The Council of the Institute of Architects had most liberally voted 500*l.*, and several manufacturers and merchants had contributed in kind, the total representing 5,633*l.* in all, but their indebtedness to the building contractors still amounted to some 4,000*l.*, and a further sum of about 1,000*l.* was requisite to complete the reinstatement of the museum and efficiently equip the classrooms, reading-room, and library. Towards this 1,000*l.* had been promised by a valued friend conditionally upon the balance being secured during this session, and Mr. Aston Webb, R.A., another tried friend, had offered 500*l.*, in addition to his former donation, upon similar terms. The Architectural Association was doing work for its members and students which was increasingly recognised and appreciated, and, in addition to this, it was pledged to maintain the Royal Architectural Museum for the public benefit. The Committee, therefore, confidently hoped that a generous response would follow the publication of a statement of the present financial circumstances from that ever-widening section of the community which was interested in the advancement of art generally, and of national architecture in particular.

The report and balance-sheet was then adopted.

The President announced the following further donations to the New Premises Fund:—Messrs. W. A. Aickman, 5*l.* 5*s.*; A. S. Gover, 2*l.* 12*s.* 6*d.*; T. L. Dale, 1*l.* 1*s.*; and T. R. Hooper, 1*l.* 1*s.*

Mr. L. Ambler, Hon. Sec., announced that the Conversazione would be held on Thursday, October 27, at 8 p.m., at 18, Tufon-street.

Photography as Applied to Architecture.

Mr. E. Dockree then read the following paper:—

If I commence my paper this evening with a few remarks on the ethics of "Photography as Applied to Architecture," or, in other words, architectural photography, I must at once disclaim any intention of raising that wearisome and unprofitable controversy over the respective merits of sketching and photography as a means of depicting buildings. I recognise that very exhaustive claims have been made on both sides—claims not supported by any substantial basis of fact; and while my personal sympathies naturally tend towards work with a camera, I am quite willing to grant that the use of the pencil by the architect and student is a very necessary and proper thing.

But architectural photography has its field. The late John Ruskin, no enthusiast concerning photography in general, said "it was the foremost means of translation or reproduction in a graphic form of architecture." I do not affect a belief that by this utterance the great art critic excluded all other methods of depiction; his own exquisite drawings of architecture would at once dispel such a claim. But I do believe that by this utterance he recognised the supreme claim of the architectural photograph—its impersonality. A drawing must necessarily be tinged with the individuality and perception, or want of perception, of its author; in short, you do not receive an impression of the building through your own eyes, but through the eyes of the artist—may, it is but an impression of his impression. So that, whatever pleasure you derive from the drawing as a drawing, you do not necessarily receive from it the impression of the building that would result from a sight of it in the substance. Some medium is therefore required for affording an impersonal depiction of a building from which each beholder can draw his own deductions and impressions. Such an impersonal basis is afforded by the photograph, which I claim is the only effectual means for the exhibition of architecture; and by exhibition I not only mean a public display of architectural views, but also their publication in books and magazines, or any other method intended to appeal directly to the criticism and judgment of the individual. The first case is even more important than the second, because if ever an

impersonal basis is needed, it is required by a judge who has to decide the merits, not of drawings or photographs, but the buildings depicted in them. That I am not alone in my contention is shown by the efforts that have been and are still being made by some of the leading architects to obtain a revision of the Royal Academy rules with regard to architectural exhibits; a revision that would permit architects to show their work by means of photographs, geometrical drawings and models, as well as, or instead of, perspective drawings, to which they are at present practically restricted. My claim for the photograph as the best means of exhibiting a building will doubtless be met by two objections:—

(1) That the photographs can be "faked."
(2) That buildings seen in photographs are frequently distorted and are not truly represented.

Both these objections must be admitted; in regard to the first, I might rest content to say, so can drawings. One has only to study perspectives at the Royal Academy for this fact to be self-evident. But if absolutely sharp, clear detail be insisted upon in a photograph, it will be exceedingly difficult, if not impossible, to fake it without detection. Only fuzziness or impressionism will disguise the efforts of manipulation. And architectural photographs in general cannot be too sharp. In regard to the second objection, the fault lies entirely with the operator; if you see a distorted building or one in impossible perspective, blame not the science but the photographer.

For the benefit of architects employing professional photographers, I should mention that many of the monstrosities in architectural photography that one sees are due entirely to the architect, whose orders the photographer is naturally obliged to carry out, however much they go against his better judgment. The most common causes of failure are:—

(1) The architect desires to get too much in one plate; he wants "to look over his head" or "round a corner"—in short, tries to achieve the impossible—in which amiable endeavour the photographer collaborates. Occasionally, for a special purpose, it may be necessary to take a somewhat distorted view. For instance, one of the photographs of Westminster Cathedral which is hung on the wall to-night is a very sharp perspective of the campanile from the roof of the nave. This photograph, which took me three hours to focus and get into position, was specially asked for by Professor Lethaby, who selected all the points of view. In general, the photographer should resist a request for a view he knows will appear distorted.

(2) The operator receives instructions to do "the best he can" (a favourite form of request), and with some operators the best does not amount to much. In this case the photographer goes blindly to work, never pointing out drawbacks or defects (from a photographic standpoint) in the views suggested or offering a workable alternative.

I am tempted to add a third reason—a want of knowledge on the part of the operator of either the science of optics or the laws of perspective, or both.

I do not wish to pose as an authority on architecture; there are too many already; but in more than one instance I have succeeded in bringing the architect round to a point of view widely differing from his original idea, although still retaining the same angle of the subject that he required to be taken.

Some subjects are quite impossible to render in a pleasing way, and unless they are required for litigation purposes, I strongly urge that they be left alone.

Concerning size, the larger the photograph of an architectural subject can be made, the better in every respect: the details and the proportions of the structure are shown to a greater advantage. A small picture may be a gem of photography in its way, but you instinctively feel you would like to see it done larger. Of course, you can enlarge by means of one of various apparatus on the market, but why make two hits at a cherry? The resulting picture lacks that "quality" and "vim" only to be obtained by working direct. An enlarged negative is another alternative, but that requires a skill and power of manipulation far beyond the average amateur, who only requires one or two prints of the subject he is interested in.

Again, small plates are "small" in price and tend to carelessness and slipshod work; whereas

a large plate and its after manipulations enable you to walk round and study your subject, consider every standpoint—the final one selected only after mature deliberation.

I would like, while still speaking generally, to say a word about artificial light. For architectural work artificial light should never be resorted to if it can be avoided. Though an interior appear absolutely dark to the naked eye, there are always rays sufficient to act upon a sensitive plate if time be given. Thus, my friend of the Chester crypt had to be focussed by torch, consisting of a newspaper rolled up and held a certain distance in front of the camera. The plate was exposed five hours, and a slide of the result only you will see later. Such prolonged exposures are not always possible, and one is frequently forced to employ some sort of artificial light. Though I have never employed it, I believe acetylene gaslight is the best for photographic purposes, as the spectrum of this light closely approximates to that of the sun, and have invariably used electric arc lamps for photographing the auditoriums of theatres and other dark interiors. In the case of the Hallows Church, Lombard-street, the very interior of which I photographed in February last year, the building was wired for electric light and electric lamps could not be utilised. I therefore employed six lime boxes, using the oxy-hydrogen light, the gas being contained in polyethylene cylinders. The resulting photographs are on the walls this evening. One light I was not to use for architectural purposes, and is the one most commonly resorted to—light magnesium. Its use results in a glare over the objects nearest to the camera, and the elimination of detail in the foreground, so that delicate undercut carvings look as flat and formless as a stencil pattern on a wall.

Unfailing patience and effort are required to obtain success in architectural photography. One must be prepared to work at it all hours of the day and night. I have secured excellent negatives by exposing plates in subdued light between 3 a.m. and 7 a.m., as the fascination of the work gets a firmer grip of the worker, so the various difficulties are overcome and in the end practically disappear, the intervening stages serving to encourage the earnest enthusiast. There are obstacles to be overcome undoubtedly, but none of a magnitude as cannot be surmounted by careful application.

Apparatus.

In dealing with my remarks on photographic apparatus and photographic processes, I include in this paper for the benefit of those who are or intend to become architectural photographers, I have endeavoured to eliminate as far as possible technicalities or technical terms, hoping that my lay hearers may understand and join in the discussion which hope will arise.

The Camera.

Bearing in mind my remarks as to size, I do not recommend anything less than a whole plate camera. Personally, I use a 12 by 10, and a 15 by 12 if I could get about with it and in a comfortable manner. A camera should possess double extension; the "front" and "back" should be capable of being adjusted by means of a pinion and worm-work, the bellows slightly tapering; and the "front" carrying the lens should have a "rising movement" and, better still, a "sliding movement" in addition. All up-to-date cameras have a "swing-back" capable of two movements, "to" and "from" the lens, a "reversing back" to carry the dark slide that oblong and upright pictures can be obtained. Some workers find fault with "turntable"; they say that "focussing" is difficult in a dark interior—what light there coming up through the same from the ground floor and detracting from the visibility of the image on the "focussing screen." This is so, but personally I have found no inconvenience of any moment up to the present.

To my mind the turntable has advantages over the solid base board; it reduces the weight of the camera, it facilitates your movement in finding the desired view, and gives rigidity to the whole apparatus, the latter a very important feature when working with long focal and in exposed positions. The turntable, or tripod used with the turntable

ould be folding, with a sliding leg—two or ee-fold, if of the right weight, is immaterial; camera and tripod when set up for use ould not exceed 5 ft. 6 in. to 5 ft. 10 in. ght, this being an average sight-line. A slow ving spirit-level, circular in shape, should eed on the "base board" of the camera just he side of the front; on the front itself at e side of a "plumb index" should be eed, and another one on the side of the wing-back." These three working together urately place beyond dispute the absolute ticality of the resulting photograph.

Lenses.

he next thing to be considered, and certainly most important one concerning architecture, he lens or lenses. One lens will not do rthing required of it; and, before deciding at to get, I would strongly urge the enthusiast consult someone well versed in the matter. f, if the pocket will allow, to purchase the t make possible. Then, should your results not satisfactory, blame yourself and not the s. I hold no retainer, so cannot advertise, whatever make is selected let it be a lens ng no wider angle than 65° for an interior ect, whereas 60° to 65° is a very pleasing ge for exteriors of buildings.

I quote "focal lengths" of lenses it will ibly only tend to confuse, so I will merely e that lenses for architectural work must of the rectilinear type and possess great ering power and marginal definition; those the genuine "anastigmatic" series are hately the finest procurable for the purpose. an afraid I must depart from my original ntion to avoid "technical terms," but e n alternative in giving the following eiculars. Where the purse will allow, I ngly recommend the earnest worker to ure a "battery" of lenses for his use; instance, for a whole-plate camera, a 6½-in., and 12-in. focal lengths; for a 10 by 8 era, an 8-in., 11-in. and 14-in. focal lengths; for a 12 by 10 camera, a 10-in., 13-in. and n. focal lengths. And to the last-named I dd add an 8½-in. lens.

Focussing.

he apparatus complete, the first operation r the selection of your view is the "focussing," e screen upon which this is effected should ruled into small squares, say, of an inch; will facilitate the worker in composing picture. In "focussing" get your subject sharp as you can, roughly so at first; ee r vertical lines are vertical, and not, as sometimes sees, converging to meet at some t. Your "uprights" not being true, the era must be generally "levelled" and the wing-back "manipulated until the said lines vertical, the levels all working true to e each; your picture should then be dead "up-t." Now re-focus, fixing upon some object way between the camera and the middle your subject; note the appearance of the e at the top, bottom, and sides of your en, using the lens's stops to bring the whole y into general sharpness—and in archi- tural work I have already said it cannot be sharp.

Exposure.

he knowledge of the exposure to be n is only gained by experience; and there e no fixed rule, subjects, light, and shade ing to an enormous degree. But bear n mind—always give plenty; look after shadows, the "high lights" will look themselves. Better "over-exposure" than nder-exposure"; the former can be modified evelopment, but no amount of development ve detail which through "under-ex- ure" is not in the plate. Bear in mind e each consecutive stop requires twice as h exposure as the one immediately pre- ging it.

Plates.

those having a medium rapidity will be d the most serviceable, satisfactory, and y to work. Some workers like one e of plate, others prefer another; personally, ink the Imperial Company's or Elliott's et give all that is required of them; but ry plate used must be "backed." The eence in the resulting picture obtained a "backed" and an "unbacked plate" ost marked; in fact, in some cases, especially e windows assert themselves in an in- or, a "backed" plate is an absolute nec- s, otherwise "halation," the beggar of

photography, will be so evident as to quite nar the picture, though everything else is quite satisfactory.

Developer.

One composed of pyro, in combination with potash or soda as the accelerator, is, to my idea, the best for the class of work under consideration. It yields, if properly adjusted in its components, a negative soft but vigorous, the class best suited for printing in either "silver" or "platinum." In development the watch-words should be "Detail first, density afterwards," not the reverse. To obtain the correct gradation, keep your pyro down to a minimum to start with; it can easily be increased as development proceeds.

All detail out and the desired stage of density reached, rinse the negative well and fix in the usual manner—say, for ten to fifteen minutes—in hypo 1 oz. to each 4 oz. of water; remove, well wash under running water for forty minutes to an hour, drain, and stand to dry in a place free from dust and draught.

The negative now obtained, when dried should be carefully examined, and the various defects, such as pin-holes, etc., remedied, and the shadows, if too pronounced, should be strengthened by one of many devices, such as papring, etc., on the glass side.

Prints.

I have no doubt that the numerous printing processes are known to you; each one has his own particular idea in that direction. But a note on prints intended for reproduction by the press may not be amiss.

A print to give the finest block for reproduction is the "silver print." By that I mean that done on one of the various P.O.P. papers and toned with gold. I prefer that "toning" which includes the "sulphocyanide of ammonium"; the range of tones and the latitude it gives is excellent. The "process worker"—by that I mean the "block maker"—likes a good, plucky "blue-black" print full of "vim" and "contrast"; it yields a block far superior to any other class of print.

In bad or dull weather one of the numerous "gas-light papers" must be employed; no toning is required, the image being developed by one of the various "Metol" formula.

For framing and keeping for show purposes there is no process equal to the "carbon" or "platinum," but suitable negatives are required to give the finest results—any class of negative will not do; for carbon a strong, plucky negative, and for platinum a soft but vigorous one.

My paper is now ended. I am aware that on many points I have only been able to touch briefly; but I shall be most happy to answer any questions or explain any matters arising out of the subject. I will now submit for your inspection some of my slides from negatives by Mr. Ashton and myself. They comprise views of buildings in England, Italy, France, etc., and will, I hope, show what can be done in the way of architectural photography without either "faking" or "distortion."

[At the conclusion of his paper Mr. Dockree exhibited 166 slides, selected out of over 3,000 made by him from negatives taken by himself and Mr. Ashton. They illustrated some of the possibilities of architectural photography and included also sculpture and metal-work subjects. The views were splendid examples of the photographer's art, many of them, as explained by Mr. Dockree, being taken under very difficult circumstances.]

Mr. A. C. Bulver Booth proposed a bearty vote of thanks to Mr. Dockree for the very interesting paper, and also for the splendid photographs. What struck one so very much was the wonderful way in which the different substances of the object photographed were rendered. One could see at once whether it was brasswork, stone, or bronze, and so on in every case; but beyond that they could see the texture and the material in the way of marbles. The views did not want much explanation, for one saw at once what the substance photographed was. Perhaps what were especially interesting to them were the photographs of interiors. Mr. Dockree had spoken of the photographing of interiors where there was little or no light, and he had an instance of that early this year, when a friend of his and a member of the Association—Mr. Hemmings, who was a very enthusiastic photographer—went to Abbots Langley. The church there was very dark, and, in addition, it was a dull day; but Mr. Hemmings wanted to photograph

a Jacobean pulpit. They got there about a quarter to one and obtained the keys of the church, and, having set up the camera, left it whilst they went to lunch. They returned in an hour and a quarter, but the light was so bad that they could see none of the detail of the pulpit with the naked eye. When, however, the photograph was developed the amount of detail to be seen was wonderful; one would have supposed that the interior of the church was flooded with sunlight. He was not sufficiently acquainted with the art of photography to know how that came about, but certainly the print gave the appearance of sunlight, for, instead of having a dull interior almost black, it appeared to be almost in sunlight.

Mr. Dockree: That shows its truthfulness. That opens up another question as to whether photography can lie. It does not.

Mr. Booth said it was certainly a revelation to him to see what could be done in the way of the details of an object in a dark place being reproduced by the camera.

Mr. C. H. Freeman, in seconding the motion, said that one remarkable thing about Mr. Dockree's work was the amount of detail he managed to get in the shadows. Mr. Dockree told them to do so, but he really did not give much information as to how it was done, and that was the sort of thing many of them would like to know. Another thing which struck him was the reference to long exposures, which was a thing many people seem to be very much afraid of. He himself had never given such a long exposure as five hours, but he had given an hour. He had been photographing interiors when people had asked him how long an exposure he was giving, and when he told them about an hour they seemed quite alarmed at the idea of giving more than about ten minutes' exposure. He remembered seeing some photographs taken by Mr. Sandell, who said he had left the camera up all day and night, and there was no trace of over-exposure on his plates. A little while ago these plates seemed to be recommended a great deal for architectural work, but Mr. Dockree had not mentioned them in the course of his paper.

Mr. Ambler read a letter from Mr. S. P. Bolas, who had been invited to attend the meeting. Mr. Bolas said he had read an advanced proof of Mr. Dockree's paper, and sent a number of photographs of Westminster Abbey for inspection. He apologised for his inability, through illness, to be present, and said the whole of the views of the Abbey were made from points selected by his firm; but the main difficulty was the general view, which took them three-quarters of an hour from the time they arrived in the street and got to the top of the roof and back again. The detail of the campanile was a telephoto, and the interiors were troublesome and tedious. The building was dark, but even then the longest exposure did not exceed one and a half hours. Again, they found that the most handy flashlight was magnesium, but the lamps one bought in the shops were absolutely useless. The one they used was made to their own design, and was got out of a solid block of metal. In light interiors, etc., they frequently only required a puff or two to illuminate dark corners and get their correct shadows. As regarded the focal length of the lens, everyone knew the 18° was most satisfactory to use, but ninety-nine times in a hundred one had to use a 9°, which covered an angle of about 120°.

The Chairman said he was sure they had all had a most enjoyable evening, and on the wings of his camera Mr. Dockree had taken them to some of the most beautiful places in Europe. They could heartily congratulate him on the excellent series of modern work that he had shown that night. Apart from anything else, he thought the clearness and brilliancy of the detail and the selection of the points of view in all of them were worthy of high commendation. If this was the result of architects telling Mr. Dockree "to do the best" he could, they had not very much to complain about. Mr. Dockree had touched upon a point which was a very debatable one—whether we should illustrate our work by photographs or drawings. He thought that executed work was better shown by photographs than by drawings. Of course, there was no comparison between the two—they were so absolutely distinct—and Mr. Dockree was very wise in not pitting one against the other, as so many people did. From his own personal point of view, he must admit that a great part of the paper was beyond him. It was an excellent paper for those who took

photographs, but, so far as the technical part was concerned, he was rather lost. He felt that there was no doubt that the perfection which photography had reached in the last ten or twenty years, and to the way in which architectural subjects had been treated, was to be attributed in no small degree the interest which the public took nowadays in architecture. The illustrated papers gave photographs of country and town houses in a way that fifteen or twenty years ago was absolutely unheard of, and to the professional photographers a debt of gratitude was owing for the way they had popularised architecture amongst the people. He had never seen a better collection of lantern slides than those shown, and the way in which absolutely black interiors had come out was simply marvellous. With the vote of thanks he would also couple the name of Mr. Ashton, who had worked the lantern.

The motion having been carried,

Mr. Dockree, in reply, said the question was whether he had succeeded in persuading them of the impersonality of photograph? That was the point—that it could not be faked, or, if it was faked, it was open to detection. That was really the purport of his paper—as to whether photography was impersonal. Nobody was more sorry than himself that Mr. Bolas was not present, for there was no lens made which would take 120°. He was asked how they got the details, and he could only say that it all came back to the one point—detail first, density afterwards. As to the question of why the pulpit came out, it was one of those things they could not understand. The plate itself was more sensitive than the eye; if they could get something to focus and sufficient exposure, and proper development, they would find something there. He was disappointed that the paper had not produced some discussion. He came down there to learn something about architecture and to teach something about photography, but he was afraid they had both failed. If he could help anyone out of a difficulty, he would be glad to.

A member remarked that, whilst the slides were being shown, a gentleman asked how the colouring was produced, and Mr. Dockree did not answer.

Mr. Dockree said that had nothing to do with the negative. He had not come to teach slide work, but some day, when the Association had a strong body of photographers, and wanted to learn something about slide work, then he would be glad to touch upon that.

The Chairman announced that the next meeting would be held on November 11, when Mr. Henman would read a paper on "Ventilation."

THE ARCHITECTURAL ASSOCIATION: VISIT TO CHARING CROSS HOSPITAL.

AN unusual opportunity of viewing an important London hospital induced the Committee of the Architectural Association to arrange a special Saturday afternoon visit on the 15th inst., and a very large attendance of members, combined with what proved to be a deeply interesting subject, more than justified the experiment.

Charing Cross Hospital, like kindred Metropolitan institutions, has found it necessary to enlarge its accommodation to cope with increasing demands; but instead of removing to a more spacious site, the Governors elected to acquire surrounding property, in order to extend existing premises, and it was of these recently completed additions that an inspection was made, under the guidance of the architect, Mr. A. Saxon Snell. In an early stage of the new work we gave a historical "note" of the site,* but, in order to convey a more comprehensive idea of the completed scheme, it may be interesting to recall that the hospital now occupies almost the whole of the triangular plot bordered by Chandos-street, Agar-street, and King William-street. Amongst many buildings cleared away was Toole's Theatre, latterly the home of the Beef Steak Club, at which time the hospital stood principally upon the Agar-street front. The new buildings on the Chandos-street, or north, front chiefly consist of a large nurses' home, whilst the old and new blocks fronting the remaining two thoroughfares, comprise wards, administrative and other hospital departments. The central part of the site is occupied by a large tower, containing the main

staircase, automatic electric lifts, chimney shaft, and isolation wards. Cross ventilated bridges give access to the respective floors of the surrounding blocks, which are again connected with one another by iron stairs and landings at the ends of the wards, thus producing a ready means of escape from fire.

The greater part of the basement accommodates the out-patients' department, conveniently arranged and satisfactorily lighted. More accident cases are treated here than at any other London hospital, and ample provision is now made for their reception and rapid disposal. The casualty department is entered at the south-east angle facing Strand, and is so sited that a cab can draw up at the doors of two top-lighted theatres, which are in close touch with the surgeons' consulting rooms, and with the central stairs and lifts. Baths of various kinds are also found on this floor, the practical details of which are well considered.

The ground floor, generally speaking, consists of staff quarters and administrative departments. The next three floors in the new, and four stories in the old, building contain wards which are planned very much in the usual way, with scullery and small ward in the middle and sanitary annexes at each end. The maximum number of beds is 265, of which 100 are located in the extension. On the fourth floor of the new building the operating and lecture theatres, clinical laboratory and X-ray rooms are well placed. The fittings throughout these, and, indeed, in all departments, are of tank, very suitably designed. In the operating theatre the students are located in a balcony surrounding the working table, and yet are in closer touch with the actual operation, leaving the floor space clear for surgeons and assistants. This is the suggestion of Mr. Stanley Boyd, one of the chief surgeons of the institution.

In the matter of details very great thought and attention has been given, and, in many instances, departure made from the usual forms of construction. Foremost of these is the ward floors, where a boarded finish is dispensed with, and a linoleum laid direct upon the concrete. The windows on the King William-street front are glazed with an opaque material, set in a series of louvred casements, controlled and regulated by a simple mechanical contrivance, specially devised by the architect to prevent overlooking from the windows on the opposite side of the street. The ventilation, although occasionally in the nature of experiment, is on simple, natural lines; no mechanical system is provided.

It was generally observed that, considering the drawbacks of such a site, the architect has produced a very successful scheme, making full use of the limited area at disposal. The general information which he willingly gave to the members, and the opportunity of studying the hospital buildings, were much appreciated.

MANCHESTER ARCHITECTURAL SOCIETY.

ON Thursday, the 13th inst., Mr. J. W. Beaumont, the President of the Manchester Architectural Society, delivered an address at the opening of the present session. A considerable portion of the address was occupied with points of local interest; but we print those portions of the address which referred to subjects of more general interest. In the course of his address, referring to the possibility of interesting persons outside the profession, Mr. Beaumont said:

"Many advantages are offered, as I said in my address last year, to members joining our Society, but I think it is well worth considering whether we could not make our Society still more useful by extending its advantages and trying to interest those who although not members of a profession, yet take some interest in our art. The more the public are induced to take some interest in architecture, the better, I am convinced, it will be for our profession, and I do not see why we should not invite men outside our members to attend our meetings when papers are read. Judging by the success which has attended Professor Capper's excellent public lectures on architecture at Owens College, I feel sure that if a really interesting series of papers could be arranged for our sessional meetings, or we could organise a series of lectures on architecture similar to the 'Addresses to Craftsmen' being given by Mr.

Glazier at the Municipal School of Art, people invited to attend them, we should be doing a useful work. It is to societies like this that the public should be led to look for information in architecture and the allied arts, especially in provincial towns where facilities for study of architecture are not easily obtained elsewhere; and if we could offer them means for the study of these arts I believe these means would be taken advantage of, and the public would be led to an appreciation of our profession. It would be a great public benefit if, in all towns possessing an art gallery, the municipal authorities devote a portion of it to the formation of an architectural gallery or museum, where means of casts and drawings and reproductions of examples of the various styles of architecture of the history of architecture might be seen from its earliest days. In such a museum there might be a collection of building material where the art student and workman would be able to study the characters and methods of such materials, and more especially specimens of those materials the most suitable for the locality. It should also be preserved means of drawings and models, a record of ancient buildings which in so many towns in the course of events to be cleared a make room for town improvements and improvements.

"There are very few places outside London where the art student has facilities for studying his art from actual examples, and it is few who can spare the time and expect frequent visits to London for this purpose, is only by enlisting the sympathies of the public in matters of art that we can expect to see such a museum successful, and it should be the duties of our society to make the art gallery I feel sure that in making such an attempt should have the sympathy and hearty cooperation of the members of the Committee of the Municipal School of Art. This Committee have taken an excellent step in forming a collection of architectural subjects at the end of Art in Cavendish-street, but to be of use to the public it should be on a large scale and housed in a more central position.

"In Dublin there is an excellent collection in the Art Gallery of examples illustrating only of early Irish architecture, but also of some of the finest buildings in Europe.

"It is to be hoped that when a new gallery is built in Manchester, our Corporation will be able to provide for an architectural gallery and museum. At the right time it will be the duty of our Society to take the matter and to persuade the authorities of the necessity of carrying it out.

"A subject which has again received considerable amount of attention from the profession during the last twelve months on which I spoke pretty fully in my address last year. I refer to the question of registration of architects, or, I would call it, the compulsory qualification of architects.

"The question of the meaning of the term 'qualified architect' was brought up some few months ago. A young architect practising in Manchester, came to tell me he was applying for a public appointment, and that one of the conditions of the appointment was that the applicant should be a 'fully qualified architect,' and he wished to consult me as to what that meant. I told him there was no such legally recognised term. I supposed that he must be a member of the Institute of British Architects; but that certainly not confer upon him any legal qualification as a qualified architect; if it would exclude a very large number of men occupying the highest positions in our profession but who are not members of the Institute.

"I frankly confess that my feeling on this matter is that any man before he is allowed to call himself a qualified architect should have passed compulsory examinations which would show that he is entitled to use the term, and no architect should be eligible for an appointment until he is duly qualified.

"During the past year alterations have been made in our Articles of Association with a view to facilitating the alliance of neighbouring societies of architects to our own society under those new provisions the Blackpool and Fylde Architectural Association have allied to our society. This is a most important event in our history, and it is to be hoped it will lead to further alliances. The architects bind themselves together for

* November 9, 1901.

port and assistance, the stronger they will come as a profession. There must be a large number of architects practising in towns com- posed in our district who would for many reasons find it beneficial to belong to a society such as ours. I feel convinced that before many years are passed Manchester will become a very important centre for the education of architectural students, and that the training which will be given at the Manchester School of Architecture will draw students from all parts of the district. It is most encouraging to learn that a very fair number of students have entered this session for the degree course as well as for the ordinary classes. There is no doubt in my mind that, for a student who can afford it, the best course he can take is to enter the degree course; this will take him three years after he has passed his matriculation. He should be articled from the commencement to the practising architect, and during the time he is studying at the university he should pass his spare time in the office. The first year's time will be taken up very largely with his studies, but during the second and third years he will have some time to spend in the office; if he articled for four years, his last year will be spent entirely in the office. Such a course as will be an excellent training, combining both theoretical and practical teaching. At the end of his four years' course, he will be able to take his B.A. degree, and will be exempt from passing the Intermediate examinations of the R.I.B.A. The range of studies through which he will have passed will help him very considerably in preparing for the final examination of the R.I.B.A. When one sees the enormous advantages in the matter of education which are now open to architectural students, one cannot help feel a strong feeling and a strong feeling of regret that such advantages were not to be obtained by one's younger days. It is a perfect treat to go through the curricula of the Architectural Association and to see the variety of subjects which instruction is given—perspective, descriptive and solid geometry, Greek and Roman architecture and classic ornament, principles of building, construction, mediæval and renaissance architecture, elementary physics as applicable to building, drawing and design, and application of materials, construction, hygiene, ventilation and heating, professional practice, land surveying, quantity surveying, modelling, water colours, sketching and painting, etc., etc. This long list shows that an enormous variety of subjects are taught and it is expected to have some knowledge of all makes one think that this life is almost short to acquire all the knowledge requisite to make a successful career in our profession.

An excellent line of the Association is that its members may send in designs to classes of design by post, and the visitors to their criticisms upon the drawings. This, I think, would be a useful line for our Education Committee to take up in respect of our country schools.

The Council of the R.I.B.A. have had under consideration for some time a scheme for extended architectural education, and a very interesting committee has been engaged formulating a scheme; no doubt, before very long we shall have an official intimation of this.

A very important resolution, and one that should be generally known by architects, was passed this year by the general body of the R.I.B.A., that after December 31, 1906, entrance to the Fellowship of the Institute should, except under special circumstances, be confined to Associates or those who have passed an examination qualifying for Associateship.

No doubt, this decision will materially help to increase the numbers of the Fellows, for there must be many practising architects who are put off joining the R.I.B.A. till a more convenient or less busy season, knowing that the probability they would be accepted on probation. It will, however, be a very serious matter if a man is obliged to pass an examination before being admitted. How many of us who are busily employed in our office could find time or be disposed to prepare and pass an examination?

During the last year many important architectural schemes have been decided upon throughout the country; the commencement of the building of the cathedral at Liverpool has been made, and during the next few years we shall be able to watch the growth of a great church under the hand of one of the greatest of our church architects, in conjunction with a

young architect who bears the honoured name of his grandfather, Sir George Gilbert Scott. The appointment of an architect to carry out important extensions to the national building, the British Museum, has been decided, and, in connexion with this appointment, it is interesting to remember that the assistance of the Royal Institute was asked by the Government.

“But more closely concerning ourselves, the long-discussed question of a new infirmary for Manchester has been decided upon. We congratulate our colleague, Mr. Brooke, on his success in the competition which took place.

“Many of us, no doubt, will see with regret the removal of the old infirmary from the central position in our city which it has for so many years occupied. Its black and grimy walls have been known to most of us all our lives, and we shall miss them when they have gone. Despite its blackness, there is a dignity in its design which, favoured by a splendid situation, has endeared it to all of us, but, independently of the question of convenience or inconvenience of working, we shall all, I think, agree that it is better to have the infirmary built in the comparatively healthy air of Oxford-road.

“An important question which will before long have to be decided is what is to be done with the site when the old buildings are removed. My own feeling is that it should be left as an open space entirely unbuilt upon, possibly laid down partly with grass and planted with trees which, if the air of Piccadilly is so good as some of the doctors have told us it is, should thrive well there. On this space I would reserve positions for statues of those of our townsmen who are considered worthy of this honour and of other public men. If this large space were left open, and much of the surrounding properties rebuilt, Manchester would possess one of the finest squares in the world.

“Our old city certainly wants some brightening up; it has in many parts of it only a second-rate appearance, its streets are mostly too narrow, and although during the last few years a large part of it has been rebuilt, yet for the most part, especially in our principal street, with a few exceptions the buildings are old and dirty. It is a very serious question what materials should be used for new buildings in such an atmosphere as we have in Manchester, although this atmosphere has doubtless improved immensely since the use of hydraulic and electric power took the place of steam power, which required boilers and large chimneys belching out their black smoke continuously. All materials get dirty, and I cannot help thinking that in streets such as Market-street the best materials to use for facing the buildings is cement, on condition that the Corporation have authority to compel owners to paint them every two years. It would, no doubt, be objected that this would be very expensive to owners, but I do not think so; the interest on the difference in the initial cost between a stone front or a brick and terra-cotta front and a cement front would go a long way towards paying for the painting. I am afraid I shall be considered rather a heathen for suggesting this, but I believe if it were carried out our streets would be lighter and brighter and cleaner and healthier than they are at present. Cement, if properly used, is a perfectly legitimate material, though generally not a very desirable material for building purposes. It should be treated as a plastic substance and not used as a mere imitation of stone. Mouldings should be small and refined, and ornamental panels and decoration can be freely used if not made to look constructional; a great drawback to the use of it is that by continual coats of paint the mouldings get distorted and destroyed.

“The narrowness of our streets is becoming a very serious matter now that they are so much used by electric trams. It often strikes me, when standing at some of the busy crossings—as, for instance, where Corporation-street and Cross-street meet Market-street—whether light bridges for foot passengers could not be erected, which, if well designed, might be picturesque objects in our streets.

“A deplorable cause of ugliness in some of our streets is the necessity for many of the buildings having to be kept low or mutilated on account of owners on the opposite side of the street being possessors of certain rights of light. The difficulties in connexion with this matter have been very great in the past, but, since the judgment in the Colle's case, I think the difficulties will be minimised in the future. Probably before long the Bill promoted by the

Surveyors' Institute and the R.I.B.A. may become law, and we shall then have some definite points to work to.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.

THE following is the greater portion of the opening address delivered last week by Mr. Thomas Winder, the President of the Sheffield Society of Architects and Surveyors:—

“There are at present no burning questions affecting us professionally; registration, having been taken up by the Royal Institute of British Architects, should, I think, be treated by us as *sub judice*, especially as most of the allied societies have expressed their opinions upon it, and have nominated representatives upon the Committee which the Institute has formed to consider it.

“I would take this opportunity of impressing upon our members the importance of loyalty to the principal representative bodies of our profession. I believe, however, such loyalty would be better assured were we properly represented on the councils of these institutions. For some years past our Society has not been represented on the Council of the Royal Institute of British Architects—a state of things which, we feel, should not continue.”

“The Institute is capable of even greater usefulness than at present. I cannot understand why it leaves the Competitions Reform Association to do work which I think should be done by the Institution. It is now many years since our then president, Mr. Reginald Fowler, expressed the hope that we might soon be allied to the Surveyors' Institution, but this desirable alliance is still unaccomplished. We could be of mutual assistance to each other, and at this time we need to stand shoulder to shoulder to resist encroachments which are being daily made upon our duties by members of other professions—witness the fearful and wonderful plans recently drawn and deposited by a judge, whose own profession is protected by law against amateur encroachments.

“Last year I expressed my views upon the administration of by-laws by local authorities, and the experience of the past year has in no way modified such views. A suggestion was recently made that the Corporation should nominate a Court of Appeal, to which aggrieved property owners could have easy access. If such Court were properly constituted it might do valuable work. It should, however, consist of sensible men who would not take the usual official and erroneous view that property owners, builders, and even architects and surveyors, are continually attempting to evade the law and to scamp their work. What we ask is that councillors should make themselves acquainted with the true facts of the case, and that common sense and uniformity should be exercised in the administration of the by-laws.

“We have heard nothing more of the proposed new by-laws, but we have the assurance of the Town Clerk that we shall be consulted before these are finally put forward.

“Has not the time fully arrived for the consolidation of by-laws and of local and other Acts of Parliament relating to new streets and buildings? At the present time one's knowledge needs to be as extensive as that of the daring property owner who attempts to take advantage (save the mark) of the London Lands Registration Act of 1899, with its three hundred and odd rules. Why, for example, should Chapel-le-Frith, which embraces an extensive country district, require rooms of greater height than Sheffield, with its slums and smoke? It is with grim satisfaction that I have read the remarks of urban and city officials upon the administration of the Model By-laws by the Local Government Board; an application which we are told renders it impossible for urban authorities and corporations to compete with builders and private enterprise in the erection of artisan dwellings; a result which, I am sure, none of us regret, professionally or as ratepayers. It is to be regretted that a section of the Sheffield Corporation still adheres to the policy of providing artisan's dwellings, but I am thankful to see that this question has

* Presidents of allied societies are, *ex officio*, eligible as members of the R.I.B.A. Council if they are Fellows of the Institute, but the number of seats available (by the constitution of the council) is not equal to the number of the allied societies, consequently it is to some extent a matter of majority votes. This, we think, might and should be altered. But if a society elects a President who is not a Fellow of the Institute, it debars itself from representation by its own act.—Ed.

been taken out of the arena of party politics, and that those men of each party whose opinions we value most highly are giving the subject careful and fair consideration, apart from party interests. The provision of dwellings for artisans by corporations, as at present carried out, is totally unnecessary and extravagant. The private capitalist does, and will, if given fair play, provide more than enough of such dwellings at a reasonable cost, as witness the ridiculous *fiasco* at a Local Government inquiry held in a neighbouring town. After the inspector had been assured of the great need for corporation-provided artisans' dwellings, evidence was given that something like four hundred of the cottages in that town were unoccupied.

"The provision of cottages for the extreme poor is quite another matter, and none of us will grudge those even if provided at an apparent loss. Ordinary cottages are completely worn out in less than one hundred years. This is fortunate, as long before that time has elapsed most of them are out of date, sanitarily and otherwise, and very many of them are then in the wrong part of the city. This will be even more so in the future, as the extension of rapid transit in, around, and (I hope before long) far outside of our towns and cities will solve the artisans' dwellings question. I would suggest that the extreme poor should be catered for by the erection of one-story wood and galvanised iron huts upon land to be purchased by corporations. These have a life of twenty to twenty-five years, and I am assured by those who have lived in them that they are very comfortable. If properly-protected wood is used, the fear of fire should be almost nil, and, if fire did occur, there would be little danger with single-story buildings. At the expiration of twenty to twenty-five years these huts might be destroyed and new ones erected in more convenient positions. The increased value of the sites would often show a good profit on the transaction.

"Last year I drew attention to the danger of the heavy trades being driven from Sheffield through the administration of the by-laws, but a far more probable cause of this is the awful increase in our rates; an increase largely consequent upon the reckless manner in which Sheffield is keeping ahead of most other towns and cities in the amount to which its rates are mortgaged. A further loan of 270,000*l.* is to be asked for in addition to the five and three-quarter million pounds we already owe. The President of the Auctioneers' Institution in his very able address informed his hearers that Sheffield is indebted to about 10*l.* per head of population, but it perhaps puts it more graphically to say that it is indebted to the extent of probably 50*l.* per ratepayer, and the Corporation is asking for power to increase that indebtedness by another 6*l.* or 8*l.* per ratepayer. The payment of interest and sinking fund upon these loans constitutes a very serious burden upon property, and although we are constantly told that part of this debt has been incurred for profit-earning concerns (profits, by the way, to be earned from the unfortunate debtors, the ratepayers), we know that other parts are for work which has since become more or less obsolete, and some of which has actually been replaced by work paid for out of later loans. Those of us who are daily dealing with values of property are only too well aware of the seriousness of the position which is being created throughout England and Wales by this second national debt, a debt which now amounts to almost three hundred and forty-three millions. It is satisfactory to see that the Public Loan Commissioners are making a decided stand against further increases. I believe the present 'slump' is largely due to the fact that for some years past we have, in addition to our incomes, been spending vast sums of borrowed money, thus creating an artificial prosperity; and whilst perhaps delaying the periodical visit of bad trade, leading to a far greater depression in the end. In proof of this the demand for building land is less at the present time than I have known it during an experience of a third of a century.

"Last year I suggested the desirability of the Sheffield Society of Architects and Surveyors undertaking the chronicling of the names of architects of old and new buildings in Sheffield. I am the more convinced of the desirability of this being done from noting how seldom the architect's name appears in notices of new buildings in the daily press, even where such notice is illustrated by the architect's own drawings;

I also mentioned the work which we might do towards the preservation of archaeological facts and drawings, and although our Society has done nothing towards this, I am pleased to see that a local branch of 'The National Trust for Places of Historic Interest or Natural Beauty' has been formed.

"A question which concerns us as surveyors and valuers is that of street dedication charges, and of the costly way in which road-making is done, in cases where it can be imposed upon the owner. During the past year I have come across the two following cases. A person paid 700*l.* for an old property abutting upon two streets—he received an account from the Corporation for 217*l.*, or almost one-third of the price he had paid for the property, this being dedication charges upon one of the streets. Another owner with four cottages showing a gross rental of 70*l.* per annum, was mulcted in about two years' gross rent. Each street was made upwards of twenty-five years ago, at a cost of probably 3*l.* per lineal yard, and has since been maintained by the owner. These are but two out of scores of cases, but they are particularly hard upon the owners from the fact that each property abuts upon two streets. It is patent to every one that cottage properties do not require frontages to two streets, and that the second street in each case must have been provided for the benefit of the public. Unfortunately there is an idea amongst certain of our citizens that the ownership of property is a crime to be punished wherever possible by the infliction of charges in one form or another, but we, as experts in property, should do our best to educate them out of this, remembering that those who are most hardly hit by these grossly extravagant dedication charges are the thrifty lower middle-classes, and the careful working-man, who has often invested the whole of his savings in the purchase of a home, only to find that his thrift has landed him in serious financial difficulties.

"The Bill recently before Parliament for the taxation of ground values deserves careful consideration by us. Its supporters claim that it is needed to counteract the holding over of ground by land-owners price. This is fallacious, as such holding over seldom occurs. The greatest difficulty in the administration of the Bill, should it become law, will be the determination of what is building land. Six years ago a client of mine was compelled to pay Succession Duty (in itself a heavy tax on land) at building land valuation upon ten or twelve acres of land, which my brother and I rightly contended was merely agricultural land; and although I have advertised this land, I have not received half a dozen applications for building plots upon it, and more eligible land abutting and near it has just been sold by public auction at about one-third the value put upon mine by Somerset House. Had this Bill become law six years ago my client would by now have paid six years' rates, at building land value, for land for which there is no demand, and which is let at about twenty-six shillings per acre per annum. Any legislation which tends to reduce the open spaces in and around our centres of population will be as injurious to public health as Pitt's Window Tax, and such must be the result should the Bill become law, as the authorities must in fairness tax all open land which the ingenuity of the rating surveyor can possibly ticket 'Building land,' including commons, parks, recreation grounds, squares, and those valuable adjuncts to our large towns and cities, the old-fashioned gardens of mansions.

"As architects and surveyors we should be interested in the question of the universal adoption of the metric system. This has been largely adopted in other countries, and although strongly recommended by our Chambers of Commerce, we are too conservative or too conceited to follow suit. Our commerce is suffering in consequence, and all who have to make much use of figures lose valuable time by the present system. Our valuations, estimates, and quantities would be more readily calculated in decimals. The Ordnance Surveyors have recognised this, and have adopted decimals in showing the contents upon the new ordnance maps. I think we should support the Bill which is being promoted to introduce the system universally.

"Attention should be drawn to the acceptance by Somerset House of valuations for probate made by persons who are totally incompetent to make a fair valuation, but who do this work

at prices which a properly qualified man can possibly afford to do.

"In conclusion, I had intended to say something upon the valuations submitted by valuers in arbitrations, etc., but after a careful comparison of the reports of numerous cases find umpires and juries have discovered the fair value can generally be arrived at by taking the average between the amounts given by valuers on each side; and as the figures in which I have arrived at this conclusion can be such examples as the following, taken all at random—

Valuation on behalf of Vendor.	Purchaser's behalf.	Valuation on behalf of Purchaser.
£20,108	£13,808	
1,801	387	
3,125	900	
12,594	950	
4,392	1,562	
3,008	251	
2,786	1,129	
20,228	13,122	

figures which were supported on each by well-known competent professional men, I have come to the conclusion that the question is far too vast for my comprehension and that whatever one may think, it is perhaps best to say little, beyond asking, is this the reason why Somerset House does accept valuations from men who are not known as competent valuers?"

SEWAGE PURIFICATION WORKS FOR SMALL POPULATIONS.*

It is often assumed that the design of sewage purification works for a private house or small institution is a much simpler matter than where the sewage of a large town has to be dealt with; but the author's experience with a large number of sewages of both classes, some of which, as at Yeovil, Manchester, and Leeds, have been highly charged with manufacturing refuse, points to the conclusion that the sewage from a single house is often more difficult to treat than that of a large town. There are several reasons for this.

In the first place the amount of work to be done in a town can generally be ascertained beforehand with some degree of exactness. The present population and the rate of increase are known, accurate information as to the volume of the water supply is often available, and many cases the sewers are already in existence so that the flow therefrom can readily be gauged.

In a private house, on the contrary, especially if it is a new one, it is often a matter of greatest difficulty to ascertain even approximately how many people are likely to inhabit it, and it is seldom that any reliable information as to the amount of water consumed can be obtained.

Furthermore, the population of a town is generally fairly constant, or, if it varies, as in the case of a watering-place, the limits within which such variation takes place are known and the resident population usually forms a considerable proportion of the whole. Variations in the number of occupants of a country house are often much greater, and do not take place with anything like the regularity.

The designer of a private sewage purification plant must, therefore, run the risk, on the one hand, of making the works too small, or, on the other, of spending money unnecessarily, providing more accommodation than is actually required.

The sewage of a single household, moreover, presents wider differences in composition and strength than that of a larger population, which tends more nearly to an average; in the case of a town a representative sample of the sewage can more often be obtained for analysis than in that of a private house.

From houses of the class for which private sewage disposal works are most often required very large amounts of grease is usually washed down the drains. This occurs also at certain public institutions, more particularly at asylums. At one institution with which the author has dealt the waste of fat was enormous, and great difficulty was experienced in inducing the authorities to take proper measures for its interception.

It is to be feared that cases in which it is present to such an extent as to exert a marked effect on the purification of the sewage are no means uncommon. The difficulty was

* A paper read before the Institute of Sanitary Engineers at a meeting on the 6th inst., by Mr. Arthur Martin, A.M.I.C.E., Mem. San. Inst.

causes is often aggravated by the fact that it reaches the purification works in a liquid state, its sojourn in the drains being too short to allow it to cool and solidify. The consequence is that it forms a coating over their solid matter, thus to a great extent hindering it from effective bacterial action.

It may be noted in passing that grease traps, where they occur, are generally too small, and in too many cases they are not properly looked after. Their action would be greatly assisted by allowing the scullery waste to run for a short distance in an open channel before it enters the trap.

Another substance which is sometimes present in sewage in such quantities as to cause appreciable difficulty in its purification is soap. In the sewage from a private house the amount is rarely so great as to give any trouble; but in institutions which take in washing, or in asylums where a great deal of foul linen has to be washed every day, very large quantities are often used. In one case which came under the author's notice recently the amount of anhydrous soap found in an average sample of tank effluent was no less than 32 parts per 100,000. This is, of course, irrespective of the quantity destroyed by use and in the preliminary treatment, and takes no account of the proportion of moisture which soap always contains. The difficulty caused by soap is due partly to its intractability, and to the large amount of oxygen which it absorbs, and partly to the greasy and offensive slime which it forms on the surfaces of the filtering material.

That fat and soap are by no means the only enemies with which the engineer has to contend in dealing with the sewage of public institutions is shown by the revelations made in connexion with a case which recently came before the magistrates at Epsom. It was stated in the course of the trial that sugar, margarine, and even bacon, were melted and sent down the drains, and that pepper, mustard, and condensed milk were got rid of by the same channels. The effect on the sewage purification works was not stated; but there is little doubt that the manager must occasionally have had a very trying time.

The sewage of private houses and of infectious diseases hospitals often contains large quantities of disinfectants; and while these, if used in season, should not interfere to any serious extent with its purification, certain kinds, such as bichloride of mercury, when present in a too large a proportion, are very inimical to bacterial action.

A further illustration of the difficulties which are met with in dealing with sewage of small communities is afforded by the case of a small installation which was laid down under the author's advice some years ago. As a rule it did its work satisfactorily; but occasionally there was a marked falling off in the results, and the liquefying action of the septic tank seemed to be temporarily suspended. Inquiry disclosed the fact that the drains around the house were subjected to a quarterly cleansing, hydrochloric acid being used for the purpose. Under these circumstances it is hardly surprising that the purification works were subject to recurring and severe attacks of indigestion.

Cases are occasionally met with, more often in connexion with a village than with a mansion or public institution, in which, for want of an adequate water supply, the sewage is excessively strong. It is generally believed that bacterial purification processes are inhibited when the sewage is concentrated beyond a certain point; and evidence was given before the Royal Commission on Sewage Disposal to this effect. While it is probable that the limit in question is seldom reached in practice, and that any sewage can be effectually dealt with in suitably designed works, a real difficulty is presented by the practical certainty that sooner or later a proper water supply will be provided. A purification plant designed to meet the present need will, therefore, in all probability become inadequate in the course of a few years, while works for the ultimate duty are laid down at the outset, they will not only be far too large or the immediate requirement, but will be incapable of effecting the high percentage of purification which the concentrated sewage requires.

Apart from all differences in the original composition or strength of the sewage, there is a further consideration which is too often lost sight of in the application to small installations of the data obtained from works on a larger scale. The sewage of a city or large town is

generally collected at a considerable distance from the outfall. During its passage through the sewers the solid matter is subjected to a process of continuous disintegration, so that it reaches the purification works in a more or less finely divided state. This is particularly noticeable where pumping is resorted to. Over and above this mechanical breaking down of the solid matter, the sewage undergoes in the sewers a preliminary bacterial action, which is of great importance in its subsequent treatment. In particular, the whole of the urea, containing a large proportion of the nitrogen in the sewage, is often decomposed before the latter arrives at the outfall. The purification works of a large town are thus relieved of an important part of the work which would otherwise fall to them, while smaller installations, which, as a rule receive their sewage in a comparatively fresh condition, have this work still to perform. This consideration has often been lost sight of in the design of small septic tanks, the duration of stay provided for in them having been only the same as was found to suffice in larger works, with the result that the tanks have sludged up in a surprisingly short space of time, and large quantities of undigested solid matter have passed on to the filters.

There is another circumstance which leads to the escape of solid particles from a small septic tank, and which often does not receive the attention which it deserves—namely, the disturbance caused by the inflow. In tanks of considerable length there is ample room for the incoming sewage to come to rest, even where the inlets are not arranged to the best advantage. In a small tank, on the other hand, the inlet and outlet are so close together that the disturbance caused by the one is communicated almost immediately to the other, with the result that appreciable quantities of organic matter are washed out of the tank. This tendency is aggravated by the fact that the sewage comes down in flushes, which, where the drains are short, arrive at the works in something like their full force. The emptying of a bath or washtub causes an enormous disturbance in a small tank, to the contents of which the discharge even of a water-closet bears a greater proportion than that of a large flush tank to those of the septic tanks serving a town.

Passing on to considerations of a broader nature, we come first to the question of choice of site. For dealing with the sewage of a town or village a suitable site can generally be found somewhere in the neighbourhood, and the Local Authority can obtain compulsory powers for acquiring it, which are denied to private owners and to the governing bodies of many public institutions. The latter must therefore, as a rule, deal with their sewage on their own land, which generally means that the sewage works have to be in fairly close proximity to the house or other building. In such a case the utmost care must be taken to prevent smell from the works, in addition to which it is sometimes necessary to render the latter invisible.

Where, on the other hand, a site can be obtained at some distance from the house, its utilisation often involves a difficulty of another kind, namely, lack of the fall, which is absolutely necessary for any complete system of purification. Of this, as little as 9 in. or 1 ft. may be made to suffice, while from 4 ft. to 6 ft. is desirable; undue limitation in this respect involving a material increase in the extent and cost of the works.

In dealing with the sewage of a town, where it is possible to use gradients of 1 in 1,000, or even flatter in case of need, a thousand yards of outfall sewer, more or less, do not entail any serious loss of fall; but to convey the sewage of a single house to any such distance, at the flattest gradients which it is considered safe to use in such cases, some 30 ft. or 40 ft. of fall is required. It is often impracticable to obtain anything like such a fall, except by pumping. The construction and operation of a pumping plant involve more expense and trouble than most private owners are willing to face, and are no light matter for an Institution or good-sized village.

The difficulty of lack of fall has been met with in several cases with which the author has recently had to deal. He has overcome it by liquefying the sewage at the head of the outfall drain, whereby he has been enabled to carry the effluent to filters at any desired distance in a sealed main without appreciable fall. Unnecessary difficulty is often caused by postponing the question of dealing with the sewage until after the drains have been laid, and using

up in the latter the whole of the available fall, leaving none for the outfall drains and purification works. Gradients of 1 in 40 and 1 in 60 are very desirable for house drains where the necessary fall can be spared; but where their adoption involves difficulties in the disposal of the sewage, flatter gradients should be used, which, with due care in laying the pipes and proper means of flushing them, may quite safely be done.

The difficulties inherent in the purification of small quantities of sewage are enhanced to no small extent by the limitations under which one has to work in dealing with them. The restrictions imposed by proximity to buildings have already been referred to. Not less important are those due to the scale of the works. In treating sewage in large quantities the engineer may avail himself of every device whereby labour can be saved or the efficiency of the treatment enhanced. In a small installation, on the other hand, such elaboration of the design would be quite out of place, partly on the ground of cost, but chiefly because the refinements which are natural and proper in large works involve undue complexity when reproduced on a small scale.

There is yet one other disadvantage under which the small installation labours as compared with larger works. The latter are almost invariably placed in charge of an attendant, who may or may not devote his whole time to them, but who does, at all events, pay them a visit every two or three days. The small domestic installation also has its nominal caretaker, who is generally a gardener, or other functionary about the place; but his interest in his charge and manner of performing his duties only too often present a marked contrast to those evinced by the trained sewage works manager. The fate of the small installation is well illustrated by a case which came under the author's notice a couple of years ago. The works comprised a septic tank and three filters, two of the latter constituting the working set, and the third being held in reserve. In order to bring the spare filter into use, it had to be connected with the supply and discharge pipes respectively, a very simple operation for which plain printed instructions were provided. After a time complaint was received that the filters were not working properly. It would have been a miracle if they had been, for the author, on proceeding to the spot, found filters Nos. 1 and 2 connected with the supply pipe, and Nos. 2 and 3 with the discharge. The mistake was pointed out and duly rectified, and for a while everything went smoothly. At the end of a few weeks, however, more complaints were received, when it was found that precisely the same mistake had been made as on the former occasion. The caretaker was an intelligent man, whom it would be an insult to describe as incapable of understanding his duties; and the author has little doubt that had there been more for him to do about the installation the work would have engaged his more serious attention. In other cases works have been left absolutely without attention for months at a time. Experiences such as these pointed unmistakably to the necessity for making these small works as far as possible independent of attention, and so laying them out as to leave no loophole whatever for error to creep in. The author has accordingly in his later work kept this consideration steadily in view.

He has set forth the difficulties met with in the design of small installations in considerable detail, not because they are insuperable, but because he believes that they do not, as a rule, receive the attention which they deserve, the rules which apply to larger works being followed without due regard to the differences in the circumstances. In other cases little or no care is taken in the design of the works, the owner merely telling his builder to put in a "tank," and leaving it to his imagination to supply the necessary directions. A "tank" of a kind is accordingly laid down, bearing a more or less distinct resemblance to something which the owner or builder has at some time or other seen or heard of. It may happen by good luck that the "tank" meets the case, no actual nuisance being caused, and the effluent being discharged into a body of water which is not under the charge of a Rivers Board or other vigilant authority. In other cases trouble is experienced, and after a certain amount of fruitless tinkering a professional man is at last called in. By this time so much money has been wasted that the owner is reluctant to spend more, and especially loth to give up the "tank" upon

which so much has already been expended, and with which the engineer has accordingly to do the best he can, when it would be true economy to start *de novo*.

It will now be convenient to sum up the requirements to which a sewage purification plant for a mansion or public institution ought to conform.

It should be unobtrusive, and capable of ready concealment in case of need.

It should give off no perceptible smell.

It should be simple, automatic, and as far as possible foolproof.

For obvious reasons automatic working is particularly desirable in the case of hospitals in which infectious diseases are treated. In this connexion it should be distinctly understood that no amount of skill in the design of an installation will remove the need for reasonable attention to cleanliness in its management. Inattention to this point has been the cause of the greater part of the nuisance which has been experienced from works of the kind.

In view of the fresh condition in which the sewage arrives at the outfall, the necessity for some form of preliminary treatment will be generally conceded. Mere screening will not, as a rule, suffice; and the frequent attention required by screens, and the liability to nuisance therefrom, render it undesirable to use them in such cases as those under consideration.

A defect of screening, as compared with more thorough modes of preliminary treatment, is that it does not effect that blending of the sewage which is desirable, especially in small installations, where its composition varies so greatly at different hours of the day. Some form of tank treatment may, therefore, be regarded as absolutely necessary in such cases. Such treatment may be either chemical or bacterial; but chemical precipitation, while undoubtedly efficient for the removal of suspended solid matter, has certain drawbacks which will prevent its general adoption for small installations. Of these drawbacks the cost of the chemicals must be regarded as the least, the chief being the necessity for frequent attention, the difficulty of disposing of the sludge, and the risk of nuisance from the latter and from the tanks, which must of necessity be open.

It may be added that the chemicals commonly used for precipitation, unless their addition to the sewage is regulated with a precision which it would be hopeless to expect in small works, are found in practice to be inimical to the purification of the liquid. The preliminary treatment will, therefore, as a rule, be bacterial, and will take place either in cultivation tanks or septic tanks. Of these the author personally prefers the latter, largely for the reason that a septic tank, which may be completely hidden, can be used in situations where any open tank would be inadmissible.

In this connexion it may be remarked that a great deal of nonsense has been spoken and written as to the alleged "enormous cost" of arching over septic tanks, and a roof of peat litter has been suggested as being permeable by the tank gases and at the same time deodorising them. Inasmuch, however, as these gases will diffuse freely through concrete, and the overlying soil constitutes an excellent deodorant, a peat roof possesses no advantage over the more substantial covering, which will in most situations be preferable; and everyone who has any practical acquaintance with the subject knows that a concrete arch is in reality a comparatively inexpensive item.

One great practical advantage of covering a tank in this way is that it admits of the latter being placed on any site on which room can be found for it, not only without risk of nuisance, but without giving the slightest indication of its presence on the surface. It will, moreover, in no way interfere with the utilisation of the ground over it.

In view of the variations which take place in the population of a country house, which may at one time be crowded with visitors, and at another be occupied by only a few servants, it has been suggested that the septic tank therefor should be in duplicate, so that the working capacity may be made to conform in some measure to the flow. The same consideration applies to an infectious diseases hospital, which may be empty, except for a small staff, for months together.

Regarding the matter from a purely theoretical point of view, it is possible that for certain sewages an excessive stay in the septic tank may be in some degree disadvantageous. The author's own experience shows that

any difficulty consequent thereon can in most cases be overcome without going to the expense of duplicating the tank. He is also convinced that in small works, at all events, there is nothing to be gained by sub-dividing the filter, and that the smallest flows which are met with during slack seasons will suffice, if properly utilised, to keep a full-sized filter in good condition.

The great practical objection to duplication, apart from its cost, is that it renders the working of an installation dependent on the judgment and vigilance of the attendant. From a long experience of the way in which these small works are looked after, the author has little doubt that one tank or one filter would often be found at work when both are required, and *vice versa*.

Although some septic tanks seem to go on indefinitely without requiring to be cleared, it is not safe to reckon on this; and facilities should always be provided for removing any residuum which may accumulate in them without first drawing off their liquid contents. The reason for this is twofold. In the first place, the emptying of the tank destroys the septic condition therein, which may take some weeks, or even months, to re-establish; and, secondly, the process of emptying, especially in inexperienced hands, is liable to be a very offensive one. The removal of the mineralised residuum, on the other hand, may, if proper means are provided for the purpose, be effected expeditiously and without nuisance.

The final treatment of the sewage may be effected either by irrigation or in bacterial filters; but the treatment of sewage or sewage effluent on land in the neighbourhood of a house or public institution is liable, unless under exceptionally careful management, to give rise to nuisance. Under favourable circumstances the tank effluent may be got rid of by means of a series of open-jointed agricultural pipes laid just under the turf; but scrupulous care must be taken in the execution of the work, or failure is bound to result.

It will generally be found best to complete the purification in a bacterial filter or filters, and this course has the important advantage of placing the whole of the treatment of the sewage under ready control.

A sprinkling feed to the filter is an important aid to purification; but, inasmuch as the showering of tank effluent through the air is liable to give rise to a certain amount of smell, this method should not be used unless the filter is at a safe distance from the house. The exposure of the tank effluent may be avoided by the use of a contact bed, either alone or as a preliminary to a trickling filter. Whatever method of filtration is employed, the tank effluent should not be allowed to run into the filter continuously, but should be ponded until the proper charge has accumulated. By utilising the upper part of the septic tank for this purpose, the expense of a separate ponding chamber will be saved. For the ponding and release of the tank effluent the author uses a very simple automatic gear, consisting merely of a supply valve, a discharge valve, a weighted lever, and a float on each of the valve rods. The working is as follows—As soon as the proper quantity of effluent has accumulated, the float on the supply valve rod rises, opening this valve and closing the discharge valve. The tank effluent is then delivered to the filter, either through a series of perforated distributing pipes, or below the surface of the material, as the circumstances of the case may render advisable. If sprinklers are used, means should be provided for freeing the tank effluent of any suspended matter which it may contain, and which would otherwise choke the perforations. The author prefers fixed sprinklers to moving ones, especially in small installations, where the attention required to keep moving distributors in order would constitute a serious drawback to their use. A perfect distribution of the tank effluent over the surface of the filter is secured without movable distributors by simply varying the head on the orifices.

The weak point of the trickling method—namely, the tendency, which has been pointed out by several experimenters, for the effluent to find short cuts through the filtering material—is overcome by the use of a contact layer in the bottom of the bed, wherein every part of the liquid is held for a short but sufficient period in contact with the filtering material. On the expiration of this period the discharge valve is opened, releasing the filtered effluent.

In dealing with an ordinary sewage, a simple filtration, conducted as above described, with a filter of adequate depth, will, in the majority of cases, effect sufficient purification; but concentrated sewages of, say, two or three gallons per head, a second filtration is sometimes desirable. In such cases the depth of the liquid in the first filter will be the necessary head for the sprinklers.

For filling the filters the author has found it better to beat ordinary furnace clinker broken to a small gauge and freed of dust, in some localities there is a difficulty in obtaining clinker, but in no case within his experience has the difficulty proved insuperable, and is generally worth while to pay the cost of carriage from a distance for the sake of obtaining a material which can be relied on to give satisfactory results.

As it is customary for writers who have used the particular process of purifying sewage to claim that their process is the best, if not the only which should be employed, it may not be amiss for the author, while expressing his belief in the method which he has described as simple and effective a solution of the problem under consideration as can well be found, to state that he is fully alive to the possibility that other methods, properly applied, may yield equally satisfactory results. His main object in this paper is not to inculcate any particular mode of purification, but to lay stress on the method whatever method may be adopted, for careful collecting and checking the data required in the design of the works, and especially for the utmost vigilance in watching for any circumstances which may by any possibility interfere with the process employed.

It may not be out of place to utter a word of warning as to the laying down of the works. Where these are small, and at a considerable distance from the office, there is always a temptation to save the owner's pocket by relying upon local supervision of the construction. In nine cases out of ten possibly this is safely done; but in the tenth all concerned may find abundant reason to regret that the designer did not keep the superintendent of his own hands, even at the cost of what he might like a disproportionate expenditure of time and money in travelling to and from the works.

The care of these small installations deserves more attention than it sometimes receives. In particular, written instructions should be provided, clearly and explicitly setting forth what the caretaker has to do, and what is not less important, what he should abstain from doing. In the absence of written instructions, there is always the risk of the caretaker in charge leaving and his place being taken by another who has not the faintest idea of what he is required to do. Many breakdowns and much disappointment would undoubtedly be saved—especially where the owner himself does not take an active interest in the works—if these are periodically inspected by the designer. In saying this, the author wishes to avoid any reflection on the large number of caretakers whose performance of their duties leaves nothing to be desired. There is, unfortunately, a minority who seem to be under the impression that the microbes does everything, leaving nothing to be done by the man with disastrous results to the installation. Caretakers such as this an occasional surprise visit from the designer of the works will be a wholesome stimulus.

In the foregoing remarks the author has endeavoured to show that the efficiency of a sewage purification plant, on the smallest scale as well as the largest scale, is dependent on a number of factors, namely, its design, construction, and management, inattention to any of which will almost certainly result in failure, but that the exercise of reasonable care in each branch of the work success may be assured.

PARISH CHURCH RESTORATION, STENNINGTON, YORKSHIRE.—The ancient parish church of Stennington was reopened recently after restoration, costing about 1,300*l*. In addition to this a stained-glass window has been inserted in the east end, a new oak pulp lamp for the interior of the church, and lectern from the old oak of the church. A Hodgson Fowler, of Durham, was the architect for the work, and Mr. Alfred Barnes, of Malton, the contractor. A new heating apparatus has been inserted by Messrs. Richardson and Co., of Bridlington; the bed has been rebung by Messrs. Malaby and Son, Masham; and the east window is the work of Mr. Knowles, of York.

Venetian Needlepoint Lace. (From an illustration in the "Burlington Magazine.")

VENETIAN NEEDLEPOINT LACE.

As an example of decorative work produced, by permission, from one of the illustrations to an article in the *Burlington Magazine* on the examples of old lace in the collection of Mr. Arthur Blackborne. It is called as "flat Venetian needlepoint," but the name is not given.

As a beautiful example of the application of design to lace work, it cannot fail to be of interest to architects and decorative designers. The size of the original piece is 58 inches by 26 inches. We are indebted to the *Burlington Magazine* for kindly lending us the photograph of which their illustration was produced.

MEETING OF MEDICAL OFFICERS OF HEALTH.

At the annual meeting of the Incorporated Society of Medical Officers of Health was on Friday last week at the Rooms of the Royal Statistical Society, No. 9, Adelphi-ice. Dr. J. F. J. Sykes (Medical Officer of Health for St. Pancras), the President, in the chair, and a vote of thanks was accorded Dr. Groves (Isle of Wight), the retiring president.

Public Health and Architecture.

Dr. Sykes then delivered his presidential address, in the course of which he said that the chief object of the officer of health is constantly called upon to express opinions as to constructive architectural conditions in buildings, old and new.

He should have a knowledge of the construction of dwellings and be familiar with the various methods of construction and arrangement of buildings as affecting health. He should be able to follow an architect in his suggestions for amelioration of unhealthy conditions and to grasp the relative hygienic value of the various alternatives upon which the architect may seek his opinion. His work should be complementary to that of the architect, the two must harmonise for the benefit of the public. In prehistoric dwellings would be the first rudimentary shelters, subject to the grosser unhealthy conditions under which primitive man must have suffered. The types for temporary use were not unknown to us in this country to-day. In nomadic life the picturesque forms of construction were varied, together with the elements of the decorative arts; but, whereas the occupants of the movable dwellings escaped some con-

ditions inimical to life, they incurred other risks. Some types of these dwellings still wander through our land. Early fixed dwellings foreshadowed later types, by illustrating the experiences later gained by man in regard to site, materials, form, and arrangement; experiences that made towards permanency, defence, greater dryness, warmth, cleanliness, and other improvements to better life and health. Dwellings of this rough class, and even rock-dwellings, we also knew in this country at the present time. From these early forms it was not difficult to reconstruct the main outlines in the evolution of the dwelling, generally, and of the English dwelling in particular. Each nation had evolved its own type of building according to time, place, and tradition, and each type showed the attempts to cultivate or avoid conditions favourable or inimical to health according to the exigencies of climate, soil, habit, and other influences. In historic times we found the elements of architectural construction proper commencing in the houses of the Pelasgians. Cottages of similar picturesque, but insanitary type, were still extant, varying only in details. Timber houses were adopted mainly by peoples north of a line drawn across the Eurasian continent through the Aryan centre from south-east to north-west. Abundance of forests facilitated their construction; and they afforded warmth and dryness, and in the east more security during earthquakes. The Mohammedan nations suited their architecture to tropical heat and sandy desert winds by contracting the size of the openings, seeking coolness in darkness, stagnant air, and dirt. The Mediterranean civilisation passed through several stages of architecture, extending over various non-contemporaneous periods—Assyrian, Phœnician, Egyptian, Hebrew, Greek, Etruscan, Roman, Mediæval, and Renaissance. Of the earlier of these we judge the architecture by the remains of palaces, but the common people still dwelt in mud huts, clay-brick cabins, or cobblestone cots. And even down to the spacious days of the Tudors in this country, history tells us of the unhealthy dwellings of the common folk—the flimsy shanties, with clay floors, and hearth in the centre, with smoke-hole above and wind-hole at side. Passing onwards to the present day, the conditions in cities and towns were much ameliorated by Building Acts and By-laws, but a large number of questions are still in a state of flux, and the increasing pressure of buildings one upon the other in

crowded centres was continuously raising fresh questions as to unhealthy influences and physical degeneration. The width and formation of streets, so as not only to subserve traffic requirements, but also to secure circumflation, and the relationship of the height of buildings were in a fair way towards settlement. The adoption of angles of light was simplifying the problem; and attempts to deal with ancient lights by legislation in a more reasonable manner was making slowly towards the solution of the very troublesome question of open space about buildings. But we were still far behind the Continent in neglecting to adopt a system of "zonification" and "stratification" of our buildings in our cities, a system that had become highly developed in German cities and towns, preventing their extension in the haphazard manner permitted in this country, by which endless difficulties as to light, air, and open space were created. The regulation of the construction of courts within buildings was still very unsatisfactory, and the possibilities of creating unhealthy conditions threaten us with disastrous effects in the future. With regard to the movement of air in relation to buildings, we did not sufficiently differentiate between circumflation about a building, perfilation through a building, ventilation within a building, and aerial disconnection from a building. The first had been previously explained. The second was becoming more important now that the vertical perfilation and ventilation of a dwelling-house through the staircase-well is disappearing with the reconstruction of houses in flats, in which only the horizontal movement of air was possible, and emphasised the imperative necessity for preventing the obstruction of perfilation or through-ventilation in these apartments. It was easy to convert flat dwellings into cave dwellings and to create a new generation of troglodytes, if a sufficient proportion in a degenerated condition survive the process without the saving grace of wild or country life. It was too often forgotten that the origin of the word window is wind-hole, and that glass is impervious to air. The ventilation of an under-crowded dwelling-room and of a temporarily excessively over-crowded place of assembly required totally different treatment. The provision of open areas to sunken parts of buildings was much neglected, and they were permitted to disappear in a manner little conducive to produce healthful results. The exclusion of wetness and dampness from

buildings had in recent years received beneficial attention; but some of the regulations for excluding effluvia were very trying to the architect, and equally good results might be obtained by less onerous conditions, especially with regard to the excessive requirements for sanitary conveniences external to buildings, as compared with the less sufficient for those inside. The dwelling requires to be made the principal sanitary unit in legislation and administration on the lines of the precedent set for the regulation of underground dwellings. There should be a limit to the extent to which domestic and sanitary conveniences may be combined, together with regard to health and architectural possibilities. Different classes of dwellings require different regulation, but those of the working classes require most consideration. "There is more hope for the country from the improvement of our homes than from any other source," said the Bishop of Manchester recently. In the centres of our large cities flats for all classes appear to be a modern necessity, and they are increasing in numbers. There was no reason why none but perfectly healthy flats should be constructed, but we had not reached that stage yet. The details and possible hygienic errors of arrangement and construction were numerous, and require fuller consideration than had hitherto been paid to them; and this applied not only to those intended for the working classes, but also to those for the well-to-do. The duties of the medical officer of health in certifying certain of these composite buildings were very important, and would influence the future health conditions of English homes for better or for worse, according to the seriousness with which they were regarded, and the thoroughness with which they were performed. The sub-let tenement house, in its unadapted original architectural arrangement, was also their serious concern. The present legal provisions and by-laws as to this class of house did not sufficiently differentiate between constructive arrangement, fitting, and usage; and the first two of these were lamentably uncontrolled. The provisions for underground dwellings had much improved since 1891, but it was easy to evade them, and there were no provisions for regulating certain unhealthy conditions in dwellings partly underground, but not technically within the legal definition. The improvement of underground hakehouses must have brought home vividly to many medical officers of health the importance of studying structural conditions and architectural alternatives for reducing the unhealthiness of such places; and the feeling that underground restaurant kitchens require similar treatment was testimony to the increasing attention paid by medical officers to the architectural side of their work. The same applied to other premises where food was prepared, and also to other work-places. With the improvement of transit, the erection of suburban dwellings was engaging more attention, but the possibilities in suburbs and more open country were much greater and much simpler towards healthful arrangements, although two-flat cottages and similar erections were becoming numerous. Building regulations in rural districts were engaging particular attention at the present moment, with a view to simplifying them in some directions and strengthening them in others; and it was a hopeful sign that medical officers of health advising rural district councils were taking such deep interest in the framing and modification of such regulations. Perhaps too many details had been entered into, but many more remained to be considered, and the accumulation of these details showed how wide and complicated was the architectural side of the duties of a medical officer of health. One of the fundamental errors of administration at present was that the medical officer was called upon to certify after construction, and had no opportunity of advising before, and of suggesting improvement and simplification, often with the saving of considerable expense. As curative medicine was followed by preventive medicine, so curative sanitation was impatient to be followed by a new era of preventive sanitation.

In the evening the members dined together at the Trocadero Restaurant, Piccadilly-circus, the President occupying the chair. Among those present were:—Mr. Alderman Idris (Mayor of St. Pancras), Dr. Whitelegge, Dr. Pye-Smith (Vice-Chancellor of London University), Dr.

W. A. Bond, Sir T. Stephenson, Dr. G. Millson, Mr. Courthope Munro, Dr. Brown, Mr. T. W. Cutler, F.R.I.B.A., Dr. Shirley Murphy, Dr. Groves, Dr. Newsholme, Mr. Andrew Clark, Dr. Priestley, Mr. I. Young, and Mr. W. A. Lawton (Secretary).

The loyal toasts having been honoured, Dr. Whitelegge proposed "The Municipal Authorities," remarking that the Municipal authorities of this country had a great and increasing burden cast upon them, because the tendency to decentralisation increased as time went on. One thing no public authority could hope to escape, and that was occasional Acts which were mistakes, or which looked like mistakes. One of the mistakes a Municipal authority could least afford to commit was a mistake in the selection of a medical officer of health.

The Mayor of St. Pancras, in responding, said it was difficult to realise the importance of the position of the medical officers of health. Their duty was not only to prevent disease among those who had every possible opportunity of repelling diseases, but their mission was the still higher one to give equality of opportunity to the poor and rich alike of our great city.

In proposing "The Incorporated Society of Medical Officers of Health," Dr. Pye-Smith said it was due to their untiring efforts, prolonged for several generations now, that this country had taken the lead in all the great improvements and reformations which had turned a fever-stricken, foul, and unhealthy country into one of the most wholesome in the world.

The President, in replying to the toast, said the Society had progressed considerably. From eighty all told in the year 1870 their numbers had risen to 937, and he hoped that before his year of office was concluded they would number 1,000. A society which numbered 1,000 members was a society of some weight, especially when they remembered that the majority of those members were Fellows and acting medical officers of health. He held it to be essential that in the course of their duties they should make themselves acquainted with those branches of architectural construction which were so important at the present time, for in these days the tendency was to pack the populations of towns in a manner that was injurious to public health and led to that physical deterioration of which so much was heard. In all classes of society there was this tendency to overcrowd, and the medical profession should join hands with architects and agree among themselves as to the limits of aggregation of population. There was a limit beyond which we could not go without danger to the health of the whole community. We do not want to be decimated by disease; that sort of thing happened in days long past, and it would be a general discredit if it were to happen again.

Dr. W. H. Roberts, President of the Metropolitan branch, and Dr. E. Davis, President of the Western branch, also responded.

Dr. Grove, J.P., then proposed the toast of "Other Kindred Societies," and in response Mr. Andrew Clark said the British Medical Association were endeavouring to forward a Bill in Parliament to get rid of the insecurity of tenure of office of which medical officers complained, and he hoped that during the coming session that Bill would become law, and medical officers would no longer be under liability to removal from office in consequence of doing what they considered to be their public duty. The matter not only concerned medical officers of health; it seriously affected sanitary inspectors.

Other toasts were "Our Guests," proposed by the Chairman and acknowledged by Mr. Cutler and Dr. Beaton, and "The Officers," proposed by Dr. Newsholme, F.R.C.P.

LECTURE HALL, SOLDIERS' HOME, SPITAL TONGUES, NEAR NEWCASTLE-ON-TYNE.—A new lecture hall has been provided at this building, to seat 300 people. In the side overlooking the grounds in Hunter's-road, two stained-glass windows have been provided by Sir Henry H. Scott, illustrating Tennyson's "Idylls of the King and the Holy Grail." The wall behind the platform is prepared as a lantern screen. The old lecture hall has been divided by a passage-way leading to the new hall; and two rooms have been made in the area, one for billiards and the other for devotional meetings. The building was designed by Mr. J. W. Taylor, and has been erected by Mr. Craven, of Newcastle. The exterior is of red brick, with a square tower.

Illustrations.

TOWER, ST. JOHN'S, COWLEY.

THE Church of St. John at Cowley, Oxford, has recently been completed, as regards the interior by the erection of a tower at the west end, shown by the illustration.

The tower is large, being the full width of the nave. It is of low, massive proportions. Like the rest of the church it is simple and indeed, severe in character, as was especially desired by the Cowley Fathers, for which the church was built.

It is entirely of Bath stone ashlar except internally the wide space of this tower, considerably to the effect of the building, and tower are the design of Mr. F. L. Bodley, R.A.

REREDOS, ALL SAINTS, MAIDSTONE.

The scheme of the reredos is suggested by the "Te Deum." It is divided into main compartments, the centre of which contains a panel representing Our Lord in glory surrounded by adoring angels. The side compartments contain each two figures, those on one side representing Apostles and martyrs, and on the other prophets of the Holy Church. The main compartments are divided and flanked by clustered pinnacles, niches containing figures representative of the English Church. The whole is surmounted by a group of angels.

The work has been carried out by Mr. Hitch in Chilmark street, under the direction of Mr. F. L. Pearson.

ENGLISH CHURCH, ENTebbe, UGANDA.

This church was designed for the purpose of the English officials and commandants, Entebbe, the seat of the British Government in Uganda.

The only materials available are sun-dried local bricks, with a small quantity of kiln-burnt bricks and tiles which have to be imported. The timber is cut and worked locally.

After the working drawings had been prepared and forwarded the prevalence of "sleeping sickness" caused a postponement of the commencement of operations until the advisability of continuing Entebbe as the seat of the Government had been determined.

The drawings exhibited at the Royal Academy this year, and now published, are working drawings. Professor Beresford is the architect.

HOUSE, "GWYSANEY"; AND SCOTT'S HOUSE, AT KNOWLE (BRISTOL).

THESE two illustrations are from the designs of two architects no longer living, Mr. J. Baker and Mr. J. D. Sedding. They were awaiting publication at the time of the late decease of their respective authors, but they were put aside at the time; and they have consequently no information about them beyond that conveyed in the drawings, which are them as a memorial of men whose work is much valued.

Judging from the brief inscription on the plan, Mr. Baker's drawing appears to have been a restoration of an old house from sketches of the portions remaining.

NEW CO-OPERATIVE PREMISES, OLDHAM.—The new central premises of the Oldham Co-operative Society at Greenacres Hill, recently opened. The work has been carried out from plans prepared by Mr. T. J. architect.

Lor's Eyot, Kew.—We recently came upon the intention of a firm of barge builders and repairers to build a large covered pier for their business, on the island which lies between Kew Gardens and Brentford. The Board of Trade, as custodians of the shore, have refused to sanction the project. The Thames Conservancy to grant them for the construction of the covered dock, it appears that the refusal does not in itself prevent projectors from building upon the Eyot, as their own property, but only prevents them from reclaiming the foreshore in its view. So some danger remains that the beauties of the river at that spot will, in the end, suffer more damage than might be caused if the Conservators' consent had been obtained, for it enforced certain restrictions as to building works which now no longer obtain.

New Tower, Church of St. John
Cowley Oxford.

SCHOOLS AT KNOWLE, BRISTOL: INTERIOR VIEW OF REFECTORY.—THE LATE JOHN D. SEDDING, ARCHITECT

**THE INSTITUTE OF BUILDERS:
ANNUAL DINNER.**

The annual dinner of the Institute of Builders was held on Wednesday in the Whitehall Rooms, Hôtel Métropole, W.C., Mr. C. H. Mansley, President, presiding. There were present Mr. John Belcher, A.R.A., President of the Royal Institute of British Architects; Mr. H. T. Steward, President of the Surveyors' Institution; Mr. E. Guy Dawber, President of the Architectural Association; J. Carmichael, President of the London Master Builders' Association; Mr. F. A. Crisp, Master of the Carpenters' Company; Mr. G. J. Swson, Master of the Tylers' and Bricklayers' Company; Colonel G. Haward Trollope, V.D., Colonel J. Barnsley, V.D., and Messrs. E. W. Mansley, H. H. Bartlett, J. Bell, J.P., J. Ward Colls, Max Clarke, F. L. Dove, Basil Ellis, A. R. G. Fenning, T. Gregory, Benjamin I. Greenwood, Woodman Hill, F. B. Ellis, W. J. Hardcastle, G. W. Humphreys, H. Holliday, T. Holloway, W. Higgs, A. S. Hassall, A. Harrison, W. E. King, Walter Lawrence, W. J. Locke, F. M. May, G. Minter, R. W. Neill, J.P., W. Nicholson, Wlad Plumbe, H. Carter Pegg, A. E. Parker, Joseph Randall, E. R. Robson, T. F. Rider, W. Sphard, E. Selby, C. J. Smithem, W. W. Mas, E. J. Turnbull, A. W. Turnbull, T. B. Minney, C. Wall, J. Sharman Wood, W. F. Ellis, Morgan H. Young, T. Costigan (secretary), and others.

The loyal and patriotic toasts having been poured (Mr. T. F. Rider proposing, and Colonel G. Haward Trollope responding to, the toast of the "Imperial Forces"). Mr. F. A. Crisp proposed "The Institute of Builders and its President." He referred to intimate association between the Carpenters' Company and the Institute of Builders, and that the objects of the Institute were so numerous and their field was so wide that the Institute could not fail to commend itself to all those who were connected in any way with the building trade.

The President, in reply, said the Institute formed for the benefit not only of the London builders but of all those engaged in the building trades throughout the United Kingdom, he thought that his position that evening would remove any idea that there was anything on the part of his London colleagues for consideration of their exclusive interests. The Institute was the trunk, and it was the wish of the provinces to become important branches. The objects of the promoters of the Institute were, among others: the mutual and general benefit of its members and of all those who were engaged in building in the country; to protect the highest interests and welfare of a great and ancient industry, and further to exercise surveillance over matters which from any source might be detrimental to the welfare of the building trade. The existence of the Institute had been justified many ways, and it was never needed more at the present time, when there exists such a desire by public bodies to municipalise the work of the country. Such a desire he regarded as an evil, and it was very necessary to be thoroughly alert and carefully to guard their interests in the matter. If they did not do so in the initial stages of the movement it would become a much more serious matter in the future. He wondered how this tendency could be justified; if it could be shown that the work was undertaken by municipalities was better or cheaper than by private enterprise there might be some reason for it, but experience showed that work was much more properly when executed by a public body, and he being so he was sure that the Institute would welcome the co-operation of architects, surveyors and of others in checking such matters. The Institute was seeking to use its influence in removing, or in seeking to mitigate, growing and arbitrary restrictions which were contained in the building by-laws of local authorities and district councils. This was a very important matter. These by-laws cause irritation and militated against the interests of all concerned, and were responsible to a large extent for the costly execution of many important contracts. Before concluding his remarks, he would briefly refer to a matter which was exciting a good deal of controversy among regarding the actions and the character of working men. As the builders of this country were by far the largest proportion of working men he thought they were well fitted to express their opinion in the matter, though he did not

desire to add any fuel to the fire. Trades unionism was a necessary thing, and in many ways it could be justified; but when it did not inspire workmen to be anything but slothful in business, or when it in any way justified his limitation of output and energy—in effect, to give as little as he could for his money, and consequently lowered his ideal to the standard of least efficiency, thus crushing out his individuality and the opportunity for the development of everything which was best in man—then it became a curse to the country, and its actions demanded to be made public. We were told that work is only well done when done with a will, and be thought that many would agree that that was where the working men of this country were lacking—they were lacking in will and in interest in their work. It had been well said by Emerson that:—

"He who worketh high and wise,
Nor pauses in his plan,
Will take the sun out of the skies
Ere freedom out of man."

The fault he had been referring to did not, in his opinion, rest with the workmen in general; very many of them were true characters, and to know them was to respect them; the fault was largely the workman in his official capacity, and the great trouble which all of them experienced more or less was with the officials of the unions. Officially, the working men were doing themselves a great deal of harm. All employers desired to work harmoniously with their men, and, generally speaking, and especially lately, they did so; and all they asked was that they got a fair return for the outlay. In conclusion, the President referred to the work of their Secretary, Mr. Costigan, which, he said, the Institute greatly appreciated. They greatly admired their Secretary's unflinching energy in anything he could do to forward their interests.

Mr. W. F. King, past President, then proposed "The Architects and Surveyors." As builders, they desired to congratulate the architects on the honourable position to which the profession had attained within living memory. Remembering the character and attainments of the men who had honoured them on such occasions as the present, it was no wonder that the profession had attained to its present position; it would be a matter for wonder if it had not. As to the surveyors, they knew them as men who did their duty without fear and without favour. With the toast he coupled the name of Mr. John Belcher, A.R.A., President of the Royal Institute of British Architects, and Mr. H. T. Steward, President of the Surveyors' Institution.

Mr. Belcher, in response, said that architects were dependent on builders for the realisation of their dreams. Architects recognised that in the evolution of their calling builders preceded architects, and that their business was to build well, as they generally succeeded in doing; but subsequently there rose up a new race, which they knew as the jerry-builder, and then, it was said, the architect came into existence because of the transgressions of the builder, and he acted as a sort of building inspector and policeman. There was a little experience of his own he might mention. When he was very young he thought he would do everything himself, even to settling the builders' accounts—he left that to the quantity surveyor now—and he called the builders' attention to one item, which was obviously two-thirds more in quantity than it should be, and outrageously high in price. The builder was an old man, and he said:—"It is on account of your youth and inexperience that you have made this great mistake, for you have not taken into consideration the many points which, as a builder, I am bound to take into consideration, and which have caused this to be rather high priced; but it is not possible to reduce it." The matter was argued at length, and suddenly the builder gave in and reduced the item at least two-thirds. Some time afterwards he saw the same builder about another job, which he (the speaker) had been able to obtain for him because of the builder's consideration for him, and he asked the builder to be careful about his account, and remembering the little incident he had referred to, that his prices should be moderate. The builder smiled, and said: "Well, I'll tell you how that happened with you. I knew you were a young man, and that you would be glad to point out to your client how much you had been able to reduce the rascally builder's account. Moreover, I always make a similar account, because I find that the architect is so much engaged with this particular item that he always neglects to look at the others."

That was ancient history, and things were not done like that now, and architects and builders understood one another better, and they regarded one another with proper respect. Architects were grateful to builders for their care and attention in carrying out designs, and they acknowledged that the interests of those engaged in the building trade were considered and advanced by them. He might speak of one of their members—i.e., Mr. Howard Colls, a gentleman of light and leading, to whom they all owed a great debt of gratitude for his pluck in resisting the terrors of light and air claims; who, by his appeal to the House of Lords, had obtained a judgment which had placed the whole matter on a proper footing. He hoped that between architects and builder there would always be mutual consideration, respect, trust, and confidence, so that in carrying out work it might be brought to a successful and perfect finish.

Mr. Steward, in responding for the surveyors, said that the profession of surveyor was a very comprehensive one, but in his own case he had been somewhat intimately connected with the trade of builders and contractors for a period extending over very nearly half a century. In his opinion the builders and architects of the present day were very worthy successors of the eminent men of the past generation. He feared that the building trade was suffering in conjunction with other businesses in the general depression of the trade of the country. From his experience, the building trade was one which was the last to feel, but was the last to recover from, bad times, and though some with whom he had been speaking on the subject lately were disposed to think that the building trade would never be what it had been, he ventured to predict that history would repeat itself, and that when the trade of the country had generally recovered, soon afterwards the building trade would be going again with all its force and power, and that there would be, as there had been after every depression he could think of, new and profitable channels for its enterprise. There was a close connexion between builders and surveyors—not only in that good and bad times affected them alike, but in the friendly intercourse and respect and confidence which must exist between them, and he trusted that as between the Institute of Builders and the Surveyors' Institution that good feeling would be maintained and strengthened in the future.

Mr. Neill then suitably proposed "The Visitors," coupled with the names of Mr. G. J. Newson, Master of the Worshipful Company of Tylers and Bricklayers, and Mr. Thomas.

These gentlemen having replied, the proceedings then terminated.

USE OF ELECTRICITY IN FACTORIES.

THE Home Office is about to issue the following draft Regulations to be observed in the use of electricity in factories and other places under section 79 of the Factory and Workshop Act, 1901:—

"DRAFT REGULATIONS FOR THE USE OF ELECTRICITY IN FACTORIES AND OTHER PLACES UNDER THE FACTORY AND WORKSHOP ACT, 1901.

"Whereas the generation, transformation and use of electricity in electrical stations and in any factory, workshop, dock, wharf, quay, warehouse, or other place to which section 79 of the Factory and Workshop Act, 1901, is applied by that Act has been certified in pursuance of the said section 79 to be dangerous:—

"I hereby in pursuance of the powers conferred upon me by that Act make the following Regulations and direct that they shall apply to all places named above, other than electrical stations, in respect of the distribution and use of electricity where the normal working pressure is greater than 250 volts and less than 650 volts between any two conductors:—

"1. All wires in connexion with the supply shall, where practicable, be completely enclosed in strong metal casing, and where this is not practicable they shall be so arranged that there shall be no danger of any shock or of fire.

"2. All main and branch circuits shall be protected by switches and by fuses or other automatic cut-outs.

"3. The supply to every motor or arc lamp shall be controlled by means of an efficient switch, so placed as to be easily handled by the person in charge of the motor or arc lighting, and connected so that by its means all pressure can be cut off from the motor or arc lamp and from any regulating switch resistance or other device in connexion therewith; provided, however, that where the arc lamps are connected in series across the outer conductors of a three-wire system and the pressure cannot exceed 250 volts from earth, it shall be sufficient if one

such switch be provided for each series of arc lamps.

"4. All switches and cut-outs shall be so enclosed and protected or be in such positions or of such construction that there shall be no danger of any shock being obtained in the ordinary handling thereof, or of any fire being caused by their normal or abnormal action.

"5. All metal holders for incandescent lamps, the frames of all motors, and the metal casings of all wires, switches, fuses and cut-outs, shall be efficiently connected with earth.

"6. Where the electricity is derived from a public supply the following conditions shall be observed:—

"(a) A suitable safety fuse or other automatic cut-out shall be inserted in each service line, as close as possible to the point of entry into the premises, and contained within a suitable locked or sealed receptacle of fire-proof construction, except in cases where the service line is protected by fuses in a street box, but no fuse or cut-out shall be inserted in the intermediate conductor of a three-wire system.

"(b) All service lines and apparatus shall be highly insulated and thoroughly protected against injury to the insulation and against access of moisture, and any metal forming part of the electric circuit shall not, unless efficiently connected with earth, be exposed so that it can be touched. All electric conductors shall be so fixed and protected as to be free from risk of electrical discharge to any adjacent metallic substance.

"Provided that in regard to service lines and apparatus under the sole control of a person other than the occupier of the premises to which the supply is given it shall be a sufficient compliance with Regulation 8 on the part of such occupier if he obtains from such person in the month of January in each year a certificate that the Regulation is fully observed in regard to the said service lines and apparatus. Such certificate shall be produced at any time when required by H.M. Inspectors of Factories.

"These Regulations shall come into force on January 1, 1905.

"Home Office,
"Whitehall, 1904."

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, S.W., Mr. J. Williams Benn, M.P., presiding.

Loans.—On the recommendation of the Finance Committee, it was agreed to lend Battersea Borough Council, 10,637*l.* for paving works; Islington Guardians, 6,500*l.* for poor law purposes; Kensington Borough Council, 9,525*l.* for paving works; and Stepney Borough Council, 2,150*l.* for street improvements.

The Port of London.—The Rivers Committee recommended that:—"Notice be given by public advertisement of the intention of the Council to consider at its meeting on November 8, 1904, a proposal that it shall take the necessary measures for promoting in the next session of Parliament a Bill for and relative to the transfer to a public authority to be constituted by the Bill of the undertakings of the London and India Docks Company, the Surrey Commercial Dock Company, and the Millwall Dock Company, and of the powers, rights, duties, property, and liabilities, or some of them, of the Conservators of the River Thames, and of the Master Wardens and Commonalty of the Watermen and Lightermen of the River Thames, commonly called the Watermen's Company, and of the Court of Master Wardens and Assistants of the Watermen's Company, and for conferring on such public authority various rights and powers for the management of the undertakings proposed to be transferred, and of the Port and Docks of London and any other matters proposed to be transferred or vested in such public authority under the Bill, and for making the necessary financial provisions in connexion therewith, and for defining the Port of London for the purposes of the Bill."

The recommendation was adopted.

Housing of the Working Classes.—Mr. Bruce, the Chairman of the Housing of the Working Classes Committee, informed the Council that accommodation had been provided during the last six months for 3,502 persons of the working classes.

Main Drainage Extension: Southern Outfall and High Level Sewers.—The Main Drainage Committee reported that they had considered tenders for the construction at Plumstead of a portion of the new southern outfall sewer

No. 2, and of a portion of the new high-level sewer No. 2. The following are the tenders:—

J. Smith & Co.	£119,136	14	10
J. Watt	115,515	3	6
S. Pearson & Son	114,010	1	3
Price & Reeves	113,946	12	9
R. McAlpine & Sons	107,440	3	0
Bentley & Lock	106,474	13	4
A. N. Coles	93,661	4	8
J. Bentley	93,157	17	5
J. & T. Bians	92,455	19	1
J. Mowlem & Co.	89,907	16	6
J. B. Squire & Co.	85,711	12	3
W. Kennedy, Ltd.	84,607	15	9
Muirhead, Greig, & Mathews	83,306	15	7
J. Cochran & Sons	82,344	7	8
Westminster Construction Co.			
London*	81,285	19	0
J. D. Nowell & Son	68,377	17	7

(Chief engineer's estimate of the cost of the work was £91,727 7s. 2d.)

Sir W. Collins said he thought some explanation should be given as to why the lowest tender had been passed over, especially as Messrs. Nowell were already carrying out a contract for the Council.

Colonel Rotton moved that the recommendation be referred back, and stated that, if they were to give up accepting the lowest tenders, they might just as well give up calling for tenders.

Mr. Harris wanted to know why the job had not been offered to the Works Department, who would, of course, be able to do it cheaper than contractors.

Mr. Ward urged the Council to adopt the Committee's recommendation, on the ground that next week the Committee would propose that Messrs. Nowell should be given another job.

Mr. McKinnon Wood considered that there should be some very strong reason given why the lowest tender should be passed over.

Mr. Goodman, the Chairman of the Committee, said the engineer had advised that the job was a very difficult one, and the Council must take upon itself the responsibility of interfering with the Committee's recommendation.

The amendment was, however, carried, and the matter was referred back.

The Council, having transacted other business, adjourned.

APPLICATIONS UNDER THE LONDON BUILDING ACT, 1894.

The London County Council at their meeting on Tuesday dealt with the following applications under the London Building Act, 1894. The names of applicants are given between parentheses:—

Lines of Frontage and Projections.

Kensington, South.—Retention of an iron and glass covered-way in front of No. 20, Bolton-gardens, Walsley-road, South Kensington (Mr. W. Hancock).—Consent.

St. George, Hanover-square.—Buildings upon the site of Nos. 44, 45, and 46, Old Bond-street, and Nos. 57, 58, 59, and 60, Piccadilly, St. George, Hanover-square, of projecting shop fronts and two three-story oriel windows on the Bond-street frontage, and projecting shop fronts, balconies at the second and third floor levels, and three-story oriel windows on the Piccadilly frontage (Messrs. Read and MacDonald) for Messrs. Callard, Stewart, and Watt, Ltd.).—Consent.

Fulham.—The retention of projecting porches and balconies at Nos. 2 to 48, Finlay-street, Fulham (Mr. R. B. Mason).—Consent.

Fulham.—The retention of projecting porches and balconies at Nos. 1 to 47, Finlay-street, Fulham (Mr. H. Terry).—Consent.

Greenwich.—Buildings on the southern side of Kidbrooke-gardens, Kidbrooke-grove, Blackheath (Mr. A. Mitchell Torrance for Sir John McDougall).—Consent.

Hampstead.—An iron and glass shelter at the front entrance to "Eagle's Nest," Haverstock-hill, Hampstead, an iron and glass shelter at the side entrance in England-lane, and an iron and glass roof in front of the coach-house at the rear of the building (Mr. L. Sharp for Mr. G. Munro).—Consent.

Marylebone, East.—A projecting clock in front of No. 138, Oxford-street, St. Marylebone (Mr. C. H. Mead for the Alexander Clark Manufacturing Company).—Consent.

Paddington, South.—An addition to the existing one-story shop at No. 95, Westbourne-grove, Paddington, to abut upon Monmouth-road (Mr. G. Neal for Mr. J. Harries).—Consent.

Southwark, West.—A two-story building, and the raising of a boundary wall on the south side of Southwark-street, Southwark (Mr. J. T. Woodard for "Chocolate Menier").—Consent.

Wandsworth.—A projecting angle buttress No. 10, Balham-park-road, Balham (Mr. J. Tarrant for Mr. W. Borders).—Consent.

Wandsworth.—Houses on the north side Church-lane, Tooting (Mr. W. Bartholomew).—Consent.

Holborn.—An open letter sign at No. 71, High Holborn (Mr. L. Freedman).—Consent.

Hampstead.—Enclosures to the porch No. 25, Langland-gardens, Hampstead (Mr. J. D. Hunter for Mr. A. Drew).—Consent.

Hammersmith.—Certain woodwork in erection of bay windows at the "Nelson" beer-house, Masbro'-road, Hammersmith (Messrs. N. Parr and A. E. Kate for the Royal Brewery, Brentford, Ltd.).—Consent.

Hammersmith.—Retention of a wood glass showcase at No. 248, King-street, Hammersmith, abutting upon Ravenscourt-avenue (Mr. G. Trotman for Messrs. Kennedy Clarke).—Refused.

Marylebone, East.—A porch and an iron and glass enclosure to the area steps at No. 8, Cavendish-square, St. Marylebone, to abut upon Cavendish-place (Mr. W. H. White for Dr. H. Morris).—Refused.

Width of Way.

Hackney, Central.—That the application of Mr. G. H. Lovegrove for Messrs. J. King & Co., Ltd., for an extension of the width within which the erection of a warehousing building on the site of Nos. 74 and 76 Beauvoir-crescent, Kingsland, with external walls at less than the prescribed distance from the centre of the roadway of Hertford-road, was required to be commenced and completed, be granted.—Consent.

Hackney, North.—A building on the north side of a roadway leading out of the north side of Farleigh-road, Hackney, between Nos. 3 and 5 (Mr. G. H. Capper for Mr. A. Jackson).—Refused.

Width of Way and Lines of Frontage.

Greenwich.—A one-story addition to a coach-house and stable building at the rear of No. 1, Shooter's-hill-road, Blackheath, abut upon Vanbrugh-terrace, and the leading therefrom (Mr. A. W. Watkins for Mr. E. Wisler).—Consent.

City.—A building on the site of Nos. 4 and 6, Copthall-avenue, City (Messrs. E. Rantall for Messrs. J. Chessum and Son).—Consent.

Hammersmith.—A parish hall, on the east side of Great-church-lane, Hammersmith (Mr. W. D. Caroe for Rev. J. Parry).—Refused.

Width of Way, Line of Frontage and Construction.

Hammersmith.—A gangway over Wood-lane, Hammersmith (Mr. I. Kirally for the British Empire Exhibition).—Consent.

Uxton.—Iron balconies connecting premises at Merritt's-buildings and Clarendon, Hoxton (Messrs. Gale, Durlacher, Emmett for the Home and Colonial S. Ltd.).—Consent.

Lines of Frontage and Deviation from Lined Plans.

Strand.—Buildings upon the site of Nos. 36 and 36A, St. James's-street, and 64, Jervis-street, St. James's (Mr. W. Woodward for L. Thomas).—Refused.

Space at Rear.

St. George, Hanover-square.—Deviation from the plan certified by the District Surveyor so far as relates to the proposed erection of a building on the site of No. 23, Bolton-street, of an addition to the Curzon Hotel, Curzon-street, Hammersmith (Messrs. S. J. Waring and Son).—Consent.

Formation of Streets.

Hampstead.—A deviation from the plan sanctioned on September 3, 1903, for the formation or laying-out of new streets for carriage traffic upon the Burgess estate, Finchley-road, Hampstead, so far as relates to an alteration in the gradient of certain of the streets (Messrs. Brown Barrow).—Consent.

Cubical Extent.

Hammersmith.—A subway being formed at the basement level to connect Nos. 2 and 5 at the Manbré charine Works, Brandenburg-road, Hammersmith (the Manbré Saccharine Company).—Consent.

Southwark, West.—Additions to a building on a site on the east side of Hatfield-road, Southwark (Messrs. E. Matcham and Co. for Messrs. Hudson and Kearns).—Consent.

The recommendations marked † are contrary to the views of the local authority.

ARCHITECTURAL SOCIETIES.

GENERAL INSTITUTE OF ARCHITECTS OF IRELAND. Annual meeting of members was held in the Institute Rooms, 20, Lincoln-place, Dublin. George C. Ashlin, President, occupied the chair.

A letter was read from Mr. Pinkerton, Secretary, having reference to the existing state of professional charges and suggesting alterations in it. The Chairman explained the meeting was not competent to adopt a resolution relative to such proposed change, and invited a general consideration of the subject. An animated discussion followed, in which Mr. James H. Webb, Mr. George L. Nor, Mr. Murray, Mr. Allberry, and others took part. It was alleged that the rules laid down in the Institute schedule governing members' charges were constantly transgressed, and that it was not absolutely in letter, at any rate in spirit. The speakers called upon the members to take vigorous action in this matter, and to protect those, especially the younger architects, who were loyal to the Institute, and the best traditions of practice. The Chairman announced that, in his opinion, the present constitution of the committee of the Institute of British Architects, having regard to the proposed scheme of registration of architects gave good hope of a speedy and successful conclusion of this most important question.

COMPETITIONS.

STEVENS HALL, WESTMINSTER.—We are informed that 122 sets of plans have been received for this competition.

BOOKS RECEIVED.

THE STABLE: THE DOWNS AND THE DISTRICT. By W. G. Worthington & G. Smith. (The Homestead Edition, 1s.)

HISTORY OF ENGLISH FURNITURE. By Macquoid. Part I. (Lawrence and Co. 7s. 6d. each part.)

TECHNICAL AND WAGES. Part I., Foreign and Domestic. By Sydney J. Chapman. With introduction by Lord Brassey. (Longmans, Green & Co. 1904.)

ESSEX COLOUR PRINTS. By E. F. Strang. Edited by the Board of Education.

STREETS: LAYING OUT AND MAKING UP. By Taylor Allen. (The Sanitary Publishing Co. 1904.)

Correspondence.

LIABILITY OF COUNCILS FOR SANITARY INSPECTORS' ERRORS.

Your correspondent, Mr. Hudson, was very laudable in his remarks on the injustice of the decision arrived at by Judge Addison, in the case of Johnson v. Bermondsey Sanitary Authority.

The general principle involved in the decision is that the accredited agent of a public body has power to put property to an indefinite expense simply if he is of opinion that the sanitary arrangements of the premises are defective; and that he should have made a mistake, and that he must pay for it.

The power such as this can only be justified by the demoralisation of those who are entrusted with it. J. A. GLAZIER.

GREENSTEAD CHURCH.

The interesting article on Greenstead Church (The Builder, October 8) suggests that the church was erected by the bearers of the relic of St. Edmund as a suitable resting-place, because it was out of the way and in the woods.

Studies of the course of ancient Essex roads to a contrary conclusion. I am sure, however, that one may be easily traced, and offer my views for what they are worth.

Rev. J. B. Mackinlay, in his book "St. Edmund and Martyr," 1903, speaks of the relic of the saint's remains as a "relic of great progress to Beodricsworth," and that it was no longer necessary to keep the relic by roads to avoid observation, and, owing, apparently, to the annals of Hermonk of Bury, he says "the body of St. Edmund [at Greenstead] for some days in the woods to satisfy to devotion of the faithful."

I am inclined to agree with him as to the date of the site, because, if I read the account of the relic, Greenstead, a not inconsiderable village, was situated on the King's road from London to Suffolk and Norfolk means secluded from observation, and that the period in question (A.D. 1015)

Greenstead was of some importance, Ongar was of none, and was approached by a side road branching from the King's highway at Greenstead. (You may follow its course now by the pretty footpath between the two places.) Ongar, if I am right, and I judge partly by Domesday evidence, was but a poor place till Count Eustace obtained it from William I., and probably continued so till Richard de Luci made it the caput of his Honour of Ongar when he was allowed to create his great castle there in the XIIIth century.

Probably the market was established by him, and gave the old, but still current, name of Chipping to the place.

I fear to make this letter too archeological for your columns, but must add that the place now called High Ongar was, and is, territorially of far more importance than Chipping Ongar, and may well have given the name to the Saxon Hundred, though not the Norman Honour.

I trust you will permit me to express my sense of the obligations to you that archeologists are under for the admirable studies of Essex churches recently published by I. CHALKLEY GOULD.

THE STUDENT'S COLUMN.

The Chapter XL, in our last issue, of "Notes on Portland Cement" concluded the series of articles on this subject. The "Student's Column" articles will recommence at the commencement of the next half-yearly volume with a new subject.

METROPOLITAN ASYLUMS BOARD.

The usual fortnightly meeting of the Managers of the Metropolitan Asylums District was held on Saturday last week at the offices, Victoria Embankment.

A communication was received from the Local Government Board assenting to the alterations and additions which it is proposed to make to the Medical Superintendent's house at the North-western Hospital. The work will cost some 230l.

North Eastern and North Western Hospitals.—On the recommendation of the Finance Committee it was agreed to apply to the Local Government Board for an order authorising the Managers to incur an expenditure, not exceeding the sum of 1,120l., on the erection of engineers' cottages at both of these hospitals.

Southern Hospital.—The Works Committee reported that they had approved of the proposal of the architects to construct a rain-water reservoir at this hospital to hold about 175,000 gallons, at an estimated cost of about 1,600l., as against 500l. in the contract, which provided only for a reservoir to hold 40,000 gallons and to receive a portion only of the rain-water.

The approval of the Committee was endorsed.

Leicester Asylum.—The Asylums Committee recommended, and it was agreed, that certain alterations to windows at this asylum should be carried out, with the idea of providing means of escape in case of fire. The number of windows to be altered is sixty-four, the estimated cost being 346l.

Joyce Green Smallpox Hospital.—On the recommendation of the Hospitals Committee it was agreed to carry out internal painting works at this hospital. The portions of the building to be treated are the staff blocks and the pavilions. The cost is estimated at 3,600l.

OBITUARY.

Mr. FURSE.—We greatly regret to announce the death on Monday last, in his thirty-seventh year, of Mr. Charles Wellington Furse, A.R.A. Mr. Furse, the third son of the late Canon C. W. Furse, Archdeacon of Westminster, and of Halsden House, North Devon, was educated at Haileybury College, whence he proceeded to the Slade School, under Professor Legros, where he won the Slade Scholarship; he then went to Paris, and afterwards to Munich, where he gained the gold medal. Until the opening of the Royal Academy Exhibition in 1903 Mr. Furse was but little known beyond the limits of the New English Art Club and a comparatively small circle of fellow-artists and art-lovers. In that year he contributed portraits of Lieut.-Colonel Sir J. J. White-Jervis and Lord Charles Beresford, and the portrait-group, "The Return from the Ride," of Mr. and Mrs. Aubrey Waterfield, to which the hanging committee had accorded a well-deserved place of honour. His success on that occasion was followed by his election to the first vacant associateship of the Royal Academy. Last summer he exhibited "The

Lilac Gown," a study of colour in the picture, half-length, of a lady (Miss Mabel Terry-Lewis) with a sunshade, and "Diana of the Uplands," a girl clad in a grey silk dress, which is blown by the wind, and holding two hounds by a leash, in the midst of a wild landscape, with wind-driven clouds. In last June Mr. Furse was commissioned to paint a portrait of Dr. Daniel for presentation to him in commemoration of his accession to the Provostship of Worcester College, Oxford, and was recently engaged upon a portrait, which he leaves unfinished, of Mr. Joseph Chamberlain, M.P. Four years ago Mr. Furse married a daughter of Mr. John Addington Symonds, of Clifton Hill House, Bristol, whose likeness is depicted in "Diana of the Uplands." Of his other principal works should be mentioned a half-sized equestrian portrait of Field-Marshal Lord Roberts; the presentation portrait of Professor Skeat; and a portrait of the late Bishop Stubbs.

Mr. DAVISON.—The death has just taken place at St. Peter's Hospital, London, of Mr. Thomas Vincent Davison, C.E., from the effects of a painful operation after much suffering. Mr. Davison was the late Borough Surveyor of Windsor, to which post he was appointed in March, 1871, by the Town Council. In March, 1897, he retired from the Borough Surveyorship and retained the appointments of Inspector of weights and measures, foods and drugs, and workshops and factories, down to his death. Before coming to Windsor Mr. Davison was formerly a surveyor in the Royal Engineers on the civil staff. He was an Associate Member of the Institution of Civil Engineers, London. —*Windsor and Eton Express.*

GENERAL BUILDING NEWS.

LIVERPOOL CATHEDRAL.—It is stated that the contract for the foundations of Liverpool Cathedral has been secured by a local firm—namely, Messrs. Morrison and Sons, of Warrington.

CHURCH, CURRAHA, COUNTY MEATH.—The new church at Curraha, near Ashbourne, Co. Meath, is in Gothic style, and has been built by Mr. James M'Adorey, of Dundalk, from the designs of Mr. G. C. Ashlin, R.H.A. The high altar and two marble side altars were erected by Messrs. Early. The altar railings and sanctuary lamp are the work of Mr. John Kane. There are five stained-glass windows.

CHURCH, NEWTON ABBOT.—The foundation-stone of a new church for the parish of Highweek, Newton Abbot, was laid on the 13th inst. The new church will be erected on the spot on which Abbotsbury House formerly stood, and it will consist of nave, north and south aisles, and chancel, and seating accommodation is to be provided for 750 persons, including the choir. The main walls are to be of Stoneycombe limestone. The windows and tracery will be of Bath stone. The Nine buttresses will support each of the main walls, and the two aisles will be lighted by six windows. Of the three windows to be placed in the east end, the centre one will be that containing the allegorical work now in St. Mary's chapel-of-ease. There are also to be three windows in the west end, besides several smaller ones in different parts of the church. The roof is to be of Delabole slate, and ridge tiles of slate colour, and the main ribs are to be of Baltic pine. The two main entrances will be through porches on the north and south sides, with granite steps and stonework similar to that in the main building. The font is to stand in the baptistry between the two entrances. The nave and north and south aisles will be 96 ft. 6 in. long and 59 ft. 9 in. wide. The dimensions of the chancel will be 35 ft. by 31 ft., with a 4-ft. passage at the back giving access to the vestries. The clergy vestry is to adjoin the supplementary choir, and the choir vestry is to be opposite, both 11 ft. 6 in. by 20 ft. The heating chamber, 11 ft. 6 in. by 9 ft., is to be under the clergy vestry, and it will be entered from the exterior of the church. The interior lining of the main walls will be of Bath and Beer stone. The piers, the seven pillars on either side of the nave, and other work forming the arcades, will likewise be of Beer stone. The nave, aisles, and vestries are to be of wood-block flooring of Oregon pine, and the chancel floor is to be concreted preparatory to being laid with tiles. The piers include a tower with spire, which is to rise to a height of 200 ft., but its erection is not contemplated for some time. Mr. E. Sedding, Plymouth and London, is the architect.

SCHOOL, SHEFFIELD.—On the 14th inst. Lord Londonbury declared the new Council school, in Hammerton-street, Stanforth-road, open.

The school is in two departments. The infants' block, for 340 children, faces Hamerton-street, and the building for the senior mixed department fronts to Ouseburn-road, and has accommodation for 540 children, excluding the floor area of the central hall. The infants' school has six classrooms arranged round a central corridor, four of the rooms being separated from the corridor by movable partitions. The senior school has a central hall, 66 ft. by 35 ft., with nine classrooms grouped round it, each for sixty children; there are glazed movable sashes between the hall and classrooms. The walls are faced externally with coursed Bole Hill rock, with dressings of Stoke ashlar, and the roofs are covered with dark Westmorland slates. The work has been carried out within the amount of the contract—15,939. The architect was Mr. W. J. Hale, of Sheffield.

SCHOOLS, BOURNVILLE.—A tender by Messrs. J. Bowen and Son, of Balsall Heath, of 19,500l., has been accepted for the erection of elementary day schools for Bourneville. The schools are designed by Mr. Alexander M. Harvey, the Consulting Architect to the Bourneville Trust, and the style is a free Gothic treatment. They will stand in 2½ acres of ground in the centre of the village, with the triangular green in front. The park is on the one side, Thorn-road on the other, and village gardens at the back. A tower will rise to a height of 60 ft. Special accommodation is provided for instruction in laundry work, cookery, carpentry, and other handicrafts, and, in addition, a library and laboratory are to be provided. The number of school places which will be provided is 540, and eventually another school for 270 infants is to be erected. The main block, for boys and girls, will be completed, however, before the erection of the last-named school is entered upon.

SUNDAY SCHOOL, BRADFORD.—The foundation-stone has just been laid of a new Sunday school and parochial hall in connexion with St. Clement's Church, Bradford. The total estimated cost of the school is 3,500l., but it has been decided to proceed with that portion of it which is most urgently needed—namely, the assembly and classrooms. This is estimated to cost about 2,400l. Plans by Mr. Horace E. Priestley, architect, Bradford, were accepted. The building will be Gothic in style, and one story high, the main features being an assembly hall and a smaller room to seat 200 children, sixteen classrooms, and a basement available for gymnasium.

TECHNICAL SCHOOL, TYLDESLEY.—A new technical school has just been opened at Tyldesley, Lancashire. The principal elevation fronts Upper George-street and is Renaissance in style, the material used being pressed red stock facing and stone dressing. The floors are of concrete, and the gymnasium and classroom floors are finished with wooden blocks. In the basement are a gymnasium, 54 ft. by 26 ft., ambulance-room, 59 ft. 6 in. by 24 ft., store-room, 25 ft. by 14 ft. 6 in., heating chamber, 12 ft. 6 in. by 13 ft., and coal store, 10 ft. by 13 ft. Access to this floor is provided by a main staircase built of stone and by a ward entrance. On the ground floor are five classrooms, 26 ft. by 26 ft., 26 ft. by 16 ft., 26 ft. by 26 ft., 26 ft. by 26 ft., and 24 ft. by 21 ft. respectively, secretary's office, 15 ft. by 11 ft., and waiting-room, 11 ft. by 7 ft. Gentlemen's cloak-room and retiring-rooms are provided. The first floor extends the whole frontage to Upper George-street, and contains a lecture hall, 61 ft. by 27 ft., a classroom, 26 ft. by 16 ft., chemical lecture theatre, 26 ft. by 27 ft., and ladies' cloak and retiring rooms. The corridors are finished with mosaic. The woodwork and the internal finishing are of pitch-pine. The heating is by hot water. The contractor for the building is Mr. J. H. Wilson, and the brickwork has been executed by Mr. J. Bridge, of Walkden, the lighting and plumbing by Mr. H. Baxendale, Tyldesley, and the block floors by Messrs. R. Lowe, Ltd., Farnworth. The architect was Mr. J. Holt, C.E., of Manchester.

PUBLIC HALL, THURNSCOPE, NEAR DONCASTER.—A new public hall has been erected in this village. The body of the hall is 55 ft. long by 33 ft. wide and 15 ft. 6 in. high. It is built of brick, relieved with stone, and in the front there is a porch and a lobby. Inside there are two classrooms situate at the rear of the building, and a scullery. The classrooms and hall can be divided by movable partitions; whilst there is also a movable platform. The classrooms are heated by fireplaces whilst the heating apparatus for the hall is on the low-pressure system, with pipes and radiators, which have been fixed by Messrs. Wright Brothers, of Sheffield. The building is lighted by gas throughout, and accommodation is provided for 400 people. The contractors for the work are Messrs. Thornton and Sons, of Rotherham, and Mr.

R. Higginbottom, of Thurnscoe, has been the architect.

THE CITY CREMATORY, LONDON.—The crematorium at the City of London Cemetery will shortly be opened for use. The building has been erected from plans and designs made by Mr. Andrew Murray, the late Surveyor to the Corporation, and approved by the Home Secretary. The civic authorities will submit their proposed regulations and charges for approval by the Local Government Board; they also propose to take powers under the Cremation Act of 1902 for disposing of the remains of persons dying of plague, cholera, or yellow fever within the limits of the Port of London, and to appoint Dr. Collingridge and Dr. Gordon Browne as honorary medical referees.

WESLEYAN MISSION HALL, SEATON HIRST.—A new Wesleyan mission hall, to accommodate 400 persons, is being erected at Seaton Hirst at an estimated cost of 1,925l. The front (and larger) portion of the site is being reserved for the erection of a church, the whole scheme costing 3,500l. The plans of the proposed edifice have been prepared by Mr. J. Walton Taylor, architect, of Newcastle, the present contract being let to Mr. T. A. Turnbull, of Rowlands Gill. The buildings are Early English in style, and comprise a mission hall with transepts capable of seating 650 persons, the main entrance to which is Milburn-terrace. The building not being proceeded with is the schoolroom, and adjoins the hall. It will accommodate 350 persons, and the principal entrance is in Seventh-avenue, connected to the hall by a corridor from which access is gained to a minister's vestry and lavatory. At the rear of the schoolroom are kitchen, vestry, and classroom, with heating chamber under. These are to be used in conjunction with the caretaker's house, where religious services have for some time been conducted. The walls are to be built of selected facing bricks, with stone dressings. The heating will be by hot water on the low-pressure system.

NEW MARKET, OLDHAM.—The new market at Oldham, the foundation-stones of which were laid a short time ago, will comprise a market hall and shops surrounding, and on two sides occupies a site aligned by Albion and Henshaw streets and the old market ground. It has been designed by Messrs. Leeming and Leeming, architects, of London, based upon measurements and particulars supplied by the Markets and Baths Committee of the Corporation. Mr. David Blunn, Oldham, is clerk of the works. The measurements of the building will be 169 ft. by 109 ft. 4½ in. The surrounding shops will be arranged with frontages and windows in the hall. The new structure will be put up in two portions, so as to allow of the present old Victoria Market to remain standing until the first half of the new building has been completed. There will be three entrances to the market, one each from Albion and Henshaw streets, and one from the market ground. The interior of the building will be fixed with glazed bricks, and will be ornamented with the iron and glass fronts of the shops. The roof will be of iron covered with slates of imperishable glazing, the latter having lead coverings. The work will be carried out in Accrington brickwork, with Yorkshire stone dressing. Mr. Edward Stephenson, of Oldham, is the chief contractor.

MUNICIPAL BATHS, CAMBERWELL.—On Tuesday last week, at the invitation of the Mayor of Camberwell and the members of the Public Health Committee, a party of visitors inspected the Old Kent-road Public Baths, which are now approaching completion. The building, which faces the main road, is being built by Mr. A. N. Coles, from the designs of Mr. Harding Payne. Two large swimming baths will be provided, and slipper baths, and a Turkish bath, and a Russian vapour bath.

AYR WORKING GIRLS' INSTITUTE.—An institution intended for the use of working girls in Ayr was opened on the 11th inst. by Sir James Fergusson, M.P. The institute, which is a three-story building, was designed by Mr. William McClelland, architect, Ayr, in James-street, at its junction with George-street, is intended for the board and lodging of twenty-eight girls, and otherwise as a club for any working girl who chooses to join it, there being a dining-room, drawing-room, boarders' sitting-room, and hall on the ground floor, with the sleeping accommodation on the two upper floors.

COUNTY COURT BUILDINGS, MIDDLESBROUGH.—The business of the Middlesbrough County Court has been transferred from the old premises in North-street to new buildings in Wilson-street West, in the centre of the town. The new structure, which has cost 12,000l., has been erected to the designs of Mr. H. N. Hanks, of H.M. Office of Works. It is con-

structed with Accrington brick, with facings. On the ground floor are the offices, fireproof storeroom, and the assistant registrar's rooms, etc., and the first floor are the registrar's and courts, with retiring-rooms, solicitors' etc., whilst above these accommodations provided for the caretaker. The contract was given to Mr. J. Davidson, Stockton, Mr. J. sons, of H.M. Office of Works, being the works. The work has been carried out by the undermen firms—Plumbing, J. Cuthrie, S. painting, Jordan and Adamson, S. plastering, Bolton and Mawson, West pool; heating, W. Richardson, Dan fittings, Fielding and Bottomley, J. electric lighting and ventilating, Methuen, and Co., Manchester; st. Dorman, Long, and Co., Middlesbrough, fixed by Baker Bros., Middleborough.

LAING ART GALLERY, NEWCASTLE-ON-TYNE.—Lord Ridley opened, on the 15th inst. Laing Gallery, Newcastle. The building is two stories in height, forming a square, the ground floor consisting of entrance and sculpture hall, and three museum galleries extending throughout the public library, and lighted from a court; the upper floor being entirely up with top-lighted art galleries, number, and averaging in size about 27 ft., by 27 ft. up to the top of the ceiling. The main façade is to Highgate, and the corner formed with the library south-east angle, is occupied by a tower square and 112 ft. high, which contains grand staircase. The staircase is from the sculpture hall, the main entrance which is about the centre of the Highgate front. The floors throughout are composed of concrete, in the case of the upper combined with expanded metal on steel. The surface of the floor of the entrance is of polished marble pavement, and of the galleries is of polished oak block. The north end of the buildings are receiving-rooms, a private staircase, picture hoist. The design externally, out in ashlar, is Renaissance in style, the ground floor forming a rusticated pilaster same height as the library. Upon detached Ionic columns projecting either flank and carrying the entablature, semi-circular arched pediment, in which sculptured niches. The main entrance wide, flanked by double detached columns with pedimented entablature with sculptured figures on either side tower has a band of sculpture on the faces, immediately under the latter latter being octagonal and supporting dome about 20 ft. in diameter. The decoration is on the plenum system. The architect of the new gallery were Messrs. C. Burns Dick, and the contractors were J. and W. Lowry, Newcastle.

COUNTY ASYLUM, LANCASHIRE.—The Lancashire Asylums Board has for some time been considering the provision of an asylum, capable of accommodating 2,000 persons. The scheme has been drawn up "colony" system, which is expected to cost a saving of 20,000l. on the "corridor" system. We are informed that the Lunacy Commissioners have given their sanction to the scheme, which will be proceeded with by Mr. Littler, of Preston, is to be the asylum is to be erected at Lang Blackburn.—*Manchester Courier.*

Y.M.C.A. BUILDINGS, BIRMINGHAM.—The 13th inst. the Duke of Argyll opened a building which has been erected by the Men's Christian Association in Dalmeida-street, Birmingham. The five-story terra-cotta building includes a hostel with forty bedrooms, lounges, and dining-halls, and the hall is to be available for the use of the public. Educational classes and halls for religious purposes are provided and there is a gymnasium, with plunge, and spray baths. The youths' club at the rear of the principal building, is complete in itself. The cost, costing 6,500l. gift from Mr. George Cadbury, and the architect was Messrs. Ewen Harper and Sons, of Birmingham.

MEMORIAL INSTITUTE, WALKERBURN.—On the 1st inst. the new Ballantyne Memorial Institute at Walkerburn was opened. The building comprises a lower story with a reading-room and two tables, reading-games-room, etc., for males, and an upper story for ladies, which contains a reading-room, sewing-room, cooked food, etc. Mr. Dunn, architect, Edinburgh, prepared the plans for the building.

NEW LIBERAL CLUB, KEIGHLEY.—A Liberal club for the North-East of England, was opened recently. The club is situated in Bradford opposite

a Park entrance, and has been erected on plans prepared by Messrs. John Haggas and Keighley.

N HALL, STROCKPORT.—The Mayor of Strickland (Alderman Giles Atherton) on Monday last week laid the foundation-stone of the new town hall for the borough. Mr. Drumwell Thomas, of London, was awarded the first premium of 100*l.* for designs, and was subsequently appointed architect of the building, whilst the contract was let to Messrs. Briggs, whose tender amounted to 10,000*l.* The site of the new town hall is in the town-road. The building will be of red stone, and will rise in the main to a height of 40 ft., and the clock tower to 110 ft. The site of the Council suite of apartments is placed in the one centre block surmounting a spacious ante-room, including the Council chamber, 56 ft. by 30 ft., and a coming-out suite of committee-rooms, the total area being 54 ft. by 30 ft. One of the main rooms of the building will be a large hall on the upper ground floor to accommodate 1,500 persons. All the hall corridors are to be paved with marble and mosaic; other floors with wood.

N HALL, HIGH WYCOMBE.—The opening of the new town hall at High Wycombe took place recently. The building has been designed from plans by Messrs. Bateman, Hunt and Son, of Birmingham, and was selected in competition by Mr. Collcutt, the assessor. The architects were instructed to prepare the necessary plans for the first portion of the scheme to be executed and the tender of Messrs. Hunt and Son, High Wycombe, was awarded, the works being commenced in May, 1903. Mr. Joseph Fishburn has acted as clerk of works. Owing to the death of Mr. Bateman soon after the commencement of the work, Mr. C. E. Bateman, his son, has since been in charge of the building work. The general dimensions of the building are 81 ft. 6 in. long, by 53 ft. wide, with a central hall, stage, dressing-rooms, etc., are provided. The elevation of the building facing Queen Victoria-street is of red bricks and Portland stone. There is a stone up to the first floor level, and the two end portions are carried right up to the roof level, terminating with carved panels beneath the eaves. The outside of the first floor are red bricks, with a stone reveal and heads to the side of five of which light the supper-room. There is a cornice of Portland stone between the first floor and the second floor window, and stone cornice to the eaves. The roof is covered with Colley Weston stone slabs, and is topped with a turret painted white, and is finished at the apex of copper. The approach to the building is by three entrances, through which give access to the entrance lobby; beyond them are oak screens with leaded glass. From the entrance hall, which is 52 ft. by 30 ft., is a staircase leading to the upper part of the building. The staircase is a feature of the new building, being of Hopton Wood stone; the spandrels are of polished stone. The upper portion is carried by polished Hopton Wood columns, whilst the fireproof floor is supported by girders. The floors of the entrance hall are of the same stone. Lead-in the entrance hall, on either side, are ladies' and gentlemen's cloak-rooms, and these staircases run down to the ladies' and gentlemen's lavatories in the front base. The main or grand hall is laid with wood and secret nailed boards. At the end of the building there is a stage, fine proscenium arch. The ceiling of the hall is in the form of an elliptic arch, divided into seven panels, with cornices decorated with floral enrichments. Underneath the hall there is a large accommodation for the storage of chairs and other purposes. On the first floor is a supper-room, at the end of which there is a "servery," whilst at the other end is "the Mayor's ante-room." At the east end of the building there are oak benches. On the second floor are the caterer's kitchen, larders, etc., and are the caretaker's suite of rooms. On the other side of the front portion of the building is a lift running up from the basement to the second floor. The corridor throughout is of mosaic with borders in original designs, whilst in the centre at the end are arranged in mosaic fashion the visitations of the Borough Arms. The lighting apparatus has been supplied by the High Wycombe Gas Light and Coke Company, and is capable of burning 100 per cent. in the cooking-room is one of David's Patent Company's gas ranges. The heating arrangement, which is a low-pressure system, surrounding the entire building has been carried out by Messrs. C. N.

Haden and Sons, engineers, of Birmingham and Trowbridge. The electric light fittings are by Mr. J. Fletcher, of Key Hill, Birmingham. The wiring has been carried out by Messrs. Higgins and Griffiths. At each side of the hall there are ornamental iron gates, opening between Portland stone pillars, with arched heads, finished at the top with protecting columns. The iron gates, etc., have been supplied by Messrs. Hart, Son, and Peard, of London and Birmingham.

NURSES' HOME, ROCHDALE.—The Countess of Derby has just opened a new Nurses' Home at Rochdale, built as a memorial of Queen Victoria. The building is faced with Huncote plastic bricks, relieved with polished stone dressings from Stancliffe Quarry, Darley Dale. The roofs are tiled. It is fitted throughout for electric lighting. The floors are boarded, with the exception of the entrance hall and a portion of the corridor on the ground floor, which will be done in oakwood block flooring. Messrs. Woodhouse, Willoughby, and Langham, of Manchester, are the architects.

COUNCIL BUILDINGS, KEMPSTON, BEDFORDSHIRE.—Built by Messrs. B. Litchfield and Son to the design of Mr. E. H. C. Inskip, the Surveyor to the Council, these offices have a frontage of some 40 ft. The red-brick front is surmounted by ornamental stone-work bearing the words, "Kempston Urban District Council, 1904." The entrance is on the left. There is a vestibule with double doors, while the floor is of tessellated pavement. On the right is the surveyor's room, 14 ft. by 18 ft. Behind it is a room of similar dimensions, which is the clerk's office. Between this and the surveyor's room is a strong-room has been constructed. Upstairs there is a small landing with a cloak-room, and another room, both opening into the Council Chamber. This hall occupies the full length of the building. It is 35 ft. long and 18 ft. wide, the height being 12 ft. up to the slope of the roof, which ends in a flat 10 ft. wide.

PROPOSED NEW THEATRE IN BOTCHERGATE, CARLISLE.—Plans of a proposed theatre in Botchergate are being drawn by Messrs. Owen and Ward, of Birmingham. The theatre, which it is proposed shall be built on the site of the Old St. Cuthbert's Vicarage, is to have entrances from Botchergate through the Arcade, from King-street, for which purpose a block of cottage property has been purchased, and from Lancaster-street, to which the site extends backward.

NEW INSTITUTE BUILDINGS, CLAPWELL, DERBYSHIRE.—The new premises of the Clapwell Institute, which were opened a short time ago, have been erected at a cost of 2,500*l.* The original architect of the structure was the late Mr. Wild, of Sharrow, Sheffield, and upon that gentleman's decease the work was taken up by Mr. Beale, Mr. C. Oakley, of Hill-street, was the contractor.

HOSPITAL SCHEME, LEEDS.—The Workhouse estate in Beckett-street, Leeds, is undergoing a transformation. In the main building there are a hundred more inmates than the authorities have proper accommodation for, while the provision available for dealing with the sick and infirm poor has long been inadequate to meet the requirements of the Union. This has caused the Guardians to embark on a scheme of hospital extension. Plans have been approved by the Local Government Board for the erection of a new kitchen and general stores, receiving and serving rooms, sick wards for males (186 beds), sick and venereal wards for females (183 beds), maternity wards (twenty-six beds), infectious diseases wards for ten males and a similar number of females, and children's wards containing sixty-six beds, together with an operating theatre and a mortuary. Altogether accommodation is provided for the treatment of 500 cases. The old industrial schools, which are thus being first adapted to fresh needs, are intended to form one of a series of several new blocks which are to be built on the Beckett-street estate. They are undergoing entire reconstruction, and new wings are to be added for the purpose of dormitories. The remaining blocks will be proceeded with in sections as soon as the one in hand is completed, so as to allow of the removal of patients from the overcrowded old buildings that have to come down to make the necessary room. Part of the scheme is the extension of the nurses' home, which was built about a dozen years ago to accommodate forty trained nurses. The number of nurses engaged in the institution is now sixty, and to meet the general requirements of attendance upon the sick cases under the care of the medical staff further provision is, of course, needed. Mr. T. Winn is the architect.

HOSPITAL, BIRMINGHAM.—A sub-committee of Birmingham Health Committee recently in-

spected, at Little Bromwich, the hospital extensions which have just been carried out at a cost of upwards of 20,000*l.* These extensions comprise the provision of three permanent pavilions, an isolation pavilion, and a large block of buildings for the accommodation of nurses. It is proposed to devote the three pavilions, which, in the aggregate, will provide accommodation for about seventy-two additional patients, to the treatment of typhoid and diphtheria patients, and the "separation pavilion," if necessary to the reception of infectious cases, concerning the definite diagnosis of which there is some doubt. The three new pavilions, which have been erected from plans by Mr. W. H. Ward, are of one story, similar in design and plan to those erected some few years ago, with the exception that in each of the new pavilions there are two small separation wards, with the nurses' duty-room so placed as to command a view of all the four wards. A leading feature of the new wards, which are 72 ft. long by 30 ft. wide, is the addition of a glazed wall fitting, forming a dado 5 ft. in height. The new home, which will accommodate fifty nurses, comprises bedrooms, large recreation-room, kitchen, etc., with an escape staircase from the upper rooms. The isolation pavilion includes four small wards.

BATHS, WAVERTREE.—The foundation-stone has just been laid of the new Picton-road building for the Baths Committee of the City Council of Liverpool. The plans of the establishment, which is estimated to cost 26,000*l.*, were prepared by Mr. W. R. Court, and Messrs. Waring and Sons, of West Derby, are the contractors. The site has a frontage to Picton-road of 70 ft., and to Clyan-street of 200 ft. Provision is made for two swimming baths, one 75 ft. by 35 ft., and the other 50 ft. by 27 ft., and fifty-five private baths. The buildings are set back 45 ft. from the line of the street, and space is reserved for additional private baths when required.

STAINED GLASS AND DECORATION.

MEMORIAL WINDOW, ST. STEPHEN'S CHURCH, BELFAST.—A stained-glass window has been unveiled in this church in memory of the late Rev. Canon Irvine. The memorial has been designed and executed by Mr. W. E. Roberts, of Belfast.

APPOINTMENTS.

DURHAM UNIVERSITY COLLEGE OF SCIENCE.—Sir Isambard Owen has been elected, vice the late Dr. H. Palin Curney, to the Principalship of Durham University College of Science, Newcastle-on-Tyne, the governing body of which have just resolved that the name shall be in future the Armstrong College of Science in the University of Durham. Sir Isambard Owen is Vice-Dean of the Faculty of Medicine in the University of London, and has played a conspicuous part in the advancement of higher education in Wales.

ROYAL COLLEGE OF SCIENCE.—The Marquis of Londonderry, President of the Board of Education, has nominated Mr. W. Gowland, Professor of Metallurgy at the Royal College of Science, to succeed the late Sir Clement Le Neve Foster, F.R.S., as a member of the Examination Board of the Department of Technology of the City and Guilds of London Institute, Kensington.

BATTERSEA POLYTECHNIC.—The Governing Body of the Battersea Polytechnic have appointed Mr. H. A. Colding, A.M.Inst.C.E., to be assistant in mechanical engineering for the Drawing Office; and Mr. John Hurst (assistant-instructor in woodwork under the London County Council) to be assistant-instructor in carpentry and joinery and manual training in woodwork.

SANITARY AND ENGINEERING NEWS.

SEWERAGE SCHEME FOR BOUGHTON.—On the 14th inst., in the Council Chamber, Chester, Mr. M. K. North, M.Inst.C.E., an Inspector of the Local Government Board, held an inquiry into the Chester Corporation's application to the Local Government Board for sanction to borrow 4,000*l.* for works of sewerage at Boughton. The Town Clerk said the population of the city was 56,500, and the rateable value was 2,125,157*l.* 5*s.* 10*d.* The City Surveyor (Mr. I. Matthews Jones) explained the scheme in detail, together with particulars of his estimate of cost.

SEWERAGE OF SKEGNESS.—The Skegness Urban District Council have received sanction from the Local Government Board to borrow the sum of 10,500*l.* for improvements to the sewerage system, which includes a new sewer

along Dummond-road, construction of new pumping station, pumping main and ejector chamber, also septic tank and bacterial filters on the existing sewage farm. Messrs. Elliott and Brown, the engineers to the scheme, have been instructed to make the necessary arrangements for the work to be started as soon as possible.

PROPOSED SEWERAGE SCHEME, ASKERN, NEAR DONCASTER.—The Rural District Council of Doncaster have applied to the Local Government Board for sanction to borrow 3,843*l.* for purposes of sewerage and sewage disposal for the township of Askern, and Colonel A. G. Burnford, R.E., Inspector under the Local Government Board, recently held an inquiry into the matter. The scheme, which has been prepared by Messrs. D. Balfour and Son, of Newcastle-on-Tyne and London, provides for the main sewerage of the whole of the village, and collecting the sewerage at a pumping station, where it will be lifted by oil engines and pumps and discharged at a site of disposal works some 1,000 yds. distant, and then treated in septic tanks followed by filtration in continuous filters, the effluent being then distributed over 2 acres of land. The estimated cost of the works is 2,890*l.*, the land will cost 400*l.*, and the clerk of works, engineers, wayleaves, etc., 553*l.*, making a total of 3,843*l.*

NEW BRIDGE, SMALL HEATH, BIRMINGHAM.—The new bridge connecting Sparkbrook with Small Heath was opened on the 8th inst. The structure has been erected under the superintendence of Mr. John Price, the City Surveyor, and the cost has been 49,000*l.*

HARBOUR IMPROVEMENTS, PETERHEAD, N.B.—The negotiations which have been in progress for the purpose of securing funds for the carrying out of a scheme of harbour improvement at Peterhead have been completed. The scheme involves an expenditure of 54,000*l.*, and has been planned by Mr. William Shield, C.E., London.

FOREIGN.

FRANCE.—At the Petit Palais, Paris, there is now being organised a collection of sculptures and ceramic work by Carriès, presented to the City of Paris by M. Heintschel, and which will be opened in the course of November. —M. Guillaume has definitely resigned his position as Director of the Villa Medici. —The works are shortly to be commenced for a new bridge over the Seine, between the communes of Issy and Boulogne. —At Lyons a historical exhibition has been opened of the works of painters and sculptors who were natives of that city. —The Municipality of Quimper have commissioned M. Ramonatas, the architect, to make plans for an asylum for old men, at an estimated cost of 300,000 francs. —A hospital is to be erected at Béthune, at an estimated cost of 300,000 francs. —A committee has been formed at Rocroy for the erection of a monument to the memory of General Moroa.

—The Government has established a District School of Architecture at Rennes; and the new School of Architecture at Nantes has just been opened. —A competition has been opened for architects of the departments of Meurthe-et-Moselle, Meuse, Vosges, and Ardennes, for a large group of buildings to be erected at Nancy, to accommodate a Bourse de Commerce and various industrial societies of the district. —A large group of new schools has just been opened at Saint-Ouen l'Aumône, from the designs of M. Léon Mériot.

PUBLIC WORKS IN GENOA.—We learn that building in Genoa continues at a great pace, especially on the outside of the town, where houses (principally flats) are springing up in all directions. The new large station at Brignole is nearly completed, and the enlargements and improvements at Principe are progressing rapidly, as is also the marshalling station at Campasso. The question of connecting by a tunnel the eastern portion of the port with the new station at Brignole is still under consideration; though the difficulties of construction are great, it is believed they will be overcome. It is also believed that the proposed new tunnel through the Apennines will be a necessity when the new harbour works are undertaken, as the two existing tunnels through the Giovi are considered inadequate for the anticipated increase of traffic. The tunnels reached from Sampierdarena by opposite sides of the Polcavera valley join the main line again at Ronco, but, notwithstanding recent improved ventilation, the smoke that collects limits the number of trains that can be run through them, and unless electric traction be adopted from Sampierdarena to Ronco, or further improvement in ventilation is found possible, it is probable that the new tunnel will be made. The new harbour works just referred to are to be begun this autumn. The estimated cost

of them is about 2,400,000*l.*, and is to be raised by a loan. The works will include new docks and a general extension of the harbour and quays in the direction of Sampierdarena.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—The Civil and Mechanical Engineers' Society has changed its offices from 47, Victoria-street to 25, Victoria-street, Westminster. —Mr. A. S. E. Ackermann, consulting engineer, has removed his offices from 47 to 25, Victoria-street, Westminster.

THE BUILDING BY-LAWS, CARDIFF.—A deputation representative of the building trades of Cardiff waited upon the Cardiff Public Works Committee last week to protest against the strict enforcement of certain building by-laws which are at present in operation in the borough. Mr. George David, solicitor, who had been selected to head the deputation, said they represented not only the Master Builders' Association, but the whole of those who were engaged in the building trades in Cardiff, and it also included architects. The enforcement of certain by-laws had had the effect of putting a stop to the erection of small houses in the town, because the expense of building in accordance with the strict letter of the by-laws made it prohibitive. Two concessions which the deputation asked were that they should be allowed to erect the walls of domestic buildings in accordance with the graduated scale, and that they might be permitted to build all party walls of two or three story houses of 9-in. brickwork, instead of 1½ in., and that they should be allowed to insert plugs and plates in a party wall. They also asked to be allowed to measure the height of stories from floor to ceiling, instead of from floor to floor. The speaker did not think the Committee was absolutely bound to enforce the by-laws, because, acting on the advice of the Town Clerk the other day, one of the committees of the Corporation resolved to leave the enforcement of a by-law to the discretion of the Chief Constable. He thought the builders would be quite content if that Committee adopted the same course in regard to the building by-laws by allowing the Borough Surveyor (Mr. Harpur) to deal with such matters. Mr. E. W. M. Corbett said he had for a number of years dealt with similar by-laws as were in operation in the Borough of Cardiff in another district, and they had found that to enforce these by-laws in their entirety was absolutely impossible. The strict enforcement of the by-laws could not fail to drive people away to districts where the by-laws were not so strictly enforced. With regard to fires being communicated from one house to another through plugs and boards being inserted in party walls, he personally had never heard of a fire spreading from one house to another in that way. Mr. Hoare said several letters had been addressed to the Master Builders' Associations of Newport, Swansea, Bristol, Birmingham, and Liverpool on the questions mentioned that day, and in each case the builders were granted the concessions for which they were now asking. —Alderman Aldison: Supposing Mr. David, we thought fit to wink at certain clauses in our by-laws, and in regard to others we thought fit to go to court, what would be our position? Mr. David replied that it would not make any difference. They could wink at one clause and prosecute in another. The Chairman (Alderman J. Ramsdale) promised that all the points put before the Committee that afternoon should receive their fair and honest consideration. —*Western Mail.*

LINOLITE LAMPS.—We have received from the Linolite Company, of 47, Victoria-street, Westminster, a copy of a report they have received from Mr. Dow, of the Central Technical College, on twelve lamps which they submitted to him for a life test. One of the lamps failed after 650 hours, but all the rest successfully completed a 1,200-hour run. The lamps were for 100 volts, and the efficiency, assuming that "candle-power" is "mean horizontal candle-power," and that this forms a fair basis for comparison, are comparable with those obtained with the best glow lamps. The conclusions arrived at are that the decrease in the candle-power during the first 1,000 hours is about 15 per cent., and that the reflector does not exert a prejudicial effect on the life of the lamps.

HANOVER-SQUARE, W.—Under the directions and superintendence of Mr. T. H. Watson some improvements and alterations, comprising an additional story, are being carried out by Messrs. James Smith and Son, contractors, at the Oriental Club. The clubhouse was erected in 1827-8 after plans and designs made by Benjamin Dean Wyatt in conjunction with his younger brother Philip;

in 1871 a wing was added by Henry Burton, nephew and successor of the late Burton. On October 9, 1897, we adverted to a structural change that had then been made at No. 17, at the corner of Teatree and the square, which consisted in altering the appearance and character of the house, which, known as "Sweet Serp" was formerly the home of the Art Union. We now observe that No. 17 has been demolished, and that two or three of the houses on the north side of Pentecote opposite the Oriental Club, have lately rebuilt.

THE LAW AS TO COMBINED DRAINAGE.—The Public Health Committee of the Borough Council reported on Monday that it had decided to ask the London County Council to endeavour to get the law as to combined drainage altered as follows:—The construction of the Metropolitan Management Act, 1855, and the Acts amended the same, the word "drain" shall be deemed to apply to and include the subject specified in the interpretation of the word "drain" contained in the 250th section of the Metropolitan Management Act, 1855, the 121b section of the Metropolitan Management Act, 1862, and also any drainage construction of which a sewer has not been approved as a sewer by the Metropolitan or other Commissioned Sewers, or by the Metropolitan Board of Works, or the London County Council, at any time hereafter approve as a sewer drain for draining a group or block of houses, in the opinion of the local authority of the district, it is desirable that such drains should be cleaned, repaired, and maintained at the expense of such local authority, and such drains shall thereupon become drains and be vested in such local authority. Any local authority may recover any expenses incurred by them after the passing of this Act in cleansing, repairing, or replacing a drain for draining any group or block of houses from the owner or owners of the premises for the drainage of which such premises, or any part of such premises, there be more than one such owner, shall be determined by the surveyor of the authority, or in case of dispute by the County Council. Any such expenses recovered from the present or any former owner of the premises, either by action in High Court or before a Court of Sessions.

ST. THOMAS'S HOSPITAL.—The Treasurer reports of the progress of this hospital that during the year No. 6 block has been taken in hand, both the wards have been arranged, the sanitary details of the premises have been completely overhauled and the warming of the wards has been proved. Much consideration has been given to the question of what is really the most useful hospital flooring. In two wards a trial has been given to linoleum covering, whilst in the third ward, which is now in hand, a trial is being made of parquet laid on the existing boards, it is felt most desirable to preserve as far as possible the old oak floors or to lay them when the hospital was built, which have become too rough and uneven the surface.

CAPITAL AND LABOUR.

EMPLOYMENT IN THE BUILDING TRADES.—According to returns supplied by eight Employers' Associations, whose members are estimated to employ about 90,000 operatives of all classes, and by trade unions with an aggregate membership of 1,185,000, employment in the building trade continued dull during September, and was a whole was rather worse than in August, and was also worse than a year ago. With layers employment was dull, and about the same as a month ago and a year ago. Masons' employment was moderate in England, but in Scotland. Employment with carpenters and joiners was bad generally, and worse than a month ago and a year ago. The percentage of unemployed trade union carpenters and joiners was 7.0 at the end of September, compared with 5.9 at the end of August, and 6.0 at the end of September, 1903. With plasterers employment was bad, and rather worse than a month ago and a year ago. With plumbers employment was dull, and about the same as a month ago, and a year ago. The percentage of unemployed trade union plumbers was 9.5 at the end of September, compared with 8.9 at the end of August, and 6.4 a year ago. Slaters and tilers employment was dull, about the same as a month ago, and a year ago, rather worse than a year ago. —*Lancet.*

PATENTS OF THE WEEK.

APPLICATIONS PUBLISHED.*

9 of 1903.—F. BLACKBURN, A. DELL, J. P. MOH, and R. H. BELL: *Mechanism for Raising and Lowering Window Sashes, and the like.*

Means for automatically raising the sashes by way of carriages, and the like, with a rolled movement, consisting in the engagement of a spring barrel and a train of desired number of wheels with a flyer flyer catch, a ratchet wheel, and pawl antageously placed to release the train or of the train of wheels from action in one tion.

1 of 1904.—J. BURNS: *Mechanical Sliding oor for Shop Windows.*

relates to a mechanical arrangement that enable a salesman at all times to gain ase to window area, without the disarrange- of the goods displayed therein. The of window space is sunk 4 in. below the e height, and, extending back into shop beyond window space, on this level floor placed a duplicate sliding floor, fitted beneath with four sets of 1-in. metal rs running on bands of 1-in. ribbon iron wed into bottom floor and rubber coated ure silent movement. On this movable is placed a set of four wire stands 8 in. e, stepped and rising from front to back proportion to depth of window area. These ort strips of plate glass, on which the s are displayed. To gain access to the s in the window, a wheel attached to, hinging at the back, is revolved by hand, acts upon a screw mechanism hoisting, and floor, with stands, shelves, and goods, is ntly rolled back, leaving a clear space e from front trimmer to window.

5 of 1904.—CONDUITS AND FITTINGS, LTD., M. EDWARDS, and E. A. BROWN: *Bends, ows, and other Angle Pieces for Electric nduits.*

vided bend, elbow, or other connecting or conduits, the sockets of which are ed with bridge pieces between which the mediate portion of the fitting is jointed. ds of the said intermediate portion h form parts of the sockets being screw- ed to joint upon the pipes or tubes ed into the sockets.

2 of 1904.—G. C. BROWN, JUN.: *Window nd Furniture.*

otch" window blind furniture, having rackets and pawl so constructed and igned that the brackets may be fitted in the vertical or horizontal position, when in the vertical position the blind e made to run either next to the glass or y from it, whilst when in the horizontal ion the blind can be made to run next to glass.

7 of 1904.—H. J. SALTER: *Pipe Joints.*

ipe-jointing device, consisting of a nut eg within it a thimble, the flange of which against a shoulder in the nut, the said having also screwed into it a socket, the ble and socket being destined to receive opposing ends of the pipes to be joined, ds of which pipes are flanged over the ing ends of the thimble and socket.

3 of 1904.—M. HERSCHMANN and C. ALCHNER: *Windows.*

ows, consisting in the combination of r two casements adapted to be opened rly or outwardly, being provided on the e with hinges, and on the outside with es, which hinges are of such construction when the pins of the inner hinges are ed in their sockets those of the outer s are disengaged, and *vice-versa*, when pins of the outer hinges are engaged in sockets those of the inner hinges are engaged; a rail adapted to lock said nents, and a top sash adapted to be ed directly by the casements in their d position, and slidable in the window e when the casements are open.

8 of 1904.—C. H. RANG, JUN.: *An Appa- ratus for Use in Constructing Concrete or ular Partition Walls.*

pparatus for use in constructing concrete ular partition walls, comprising two ds, uprights for guiding the boards ed to the floor or to the ceiling joints, ed together by means of cramps or the and screw-bolts which run through the ds for the purpose of facilitating the ng up of the device, and preventing any ng of the boards when the plaster sets.

9 of 1904.—R. KLINGER: *Ball Joints for rtical Piping.*

oints for vertical piping, which consists rring an annular duct, for the recep-

l these applications are in the stage in which ion to the grant of Patents upon them can e.

tion of viscid lubricant, in the ball casing n the same level as the end of the joint head for the purpose of enabling the lubricant to be introduced into the ball casing from the top, and thereby ensuring the lubrication; and tight jointing of the ball head at all places on its spherical surface.

18,171 of 1904.—T. POTTERTON: *Hot-water Apparatus, and Boilers Connected therewith.*

This relates to an arrangement of hot-water apparatus in which the boiler is connected a series of vessels constituting the hot-water tank by pipes having stop-cocks, so that the circulation can be caused to heat the water in one, two, or more vessels.

22,429 of 1903.—A. M. LAMBERT: *Manufacture of Building Slabs or Bricks.*

A mould for forming building slabs or blocks, consisting of a base, side frames hinged to the base, and adapted to open outwardly, and end pieces locked to the sides when the mould is closed, tight joints being formed between the sides and base, and a separate closing top.

23,778 of 1903.—W. G. MOORE: *Disinfection of Urinals, Water-closets, Baths, Lavatory Basins, Kitchen Troughs or Sinks, and like Vessels and Places.*

A mode of, and means for, disinfecting urinals, closets, baths, lavatory basins, kitchen troughs or sinks, and the like, and which may be fixed in vehicles, ships, buildings, hospitals, railway carriages, sea-going vessels, and the like, characterised by a vessel for containing disinfectant material and having perforated sides, in combination with means for suspend- or supporting or fixing same in the required position.

24,741 of 1903.—R. A. HADEFIELD and P. B. BROWN: *Temporary Tracks for Railway and Tramway Permanent Way.*

A tramway or light railway ramp made so as to prevent its thin end from being turned up by the action of wheels rolling over it, with a thicker portion extending longitudinally from the thin end of the ramp and arranged at one side of the ramp so as to be clear of vehicles running therealong.

24,869 of 1903.—J. SHANKS: *Pipe Joints.*

Pipe joints, consisting of a fitting formed with a sleeve of rubber, or other compressible material, having ribs, corrugations, serrations, or projections on its outer or inner surfaces, or on both surfaces, and with or without a flange at one end.

25,437 of 1903.—E. HOMAN: *Partitions Employed in Fireproof or other Buildings.*

A partition, consisting of a series of bricks or blocks, grooves in the meeting edges of the bricks or blocks, short tie bars or rods within the channels formed by the grooved meeting edges of the bricks or blocks, and so arranged that their ends break joint with the courses of the bricks or blocks and with one another, and a filling or grouting of suitable cement.

5,440 of 1904.—A. SALTER, JUN.: *Apparatus for Joining and Repairing Drain Pipes.*

An apparatus for joining and repairing drain pipes, consisting in the combination of two rubber discs, plates arranged on each side of said discs, holes in said discs and plates, chains, or other flexible connexions passed through the said holes, each chain being fixed to one disc and passing loosely through the holes in the other disc, and a spring arranged between said discs having a normal tendency to draw the discs together.

10,227 of 1904.—A. T. MIRZA: *Automatic Sluice Gate.*

The invention consists of a sluice gate swinging in a suitable sluice way upon horizontal gudgeons. The axis of the gudgeons is somewhat below the centre of the surface of the gate, so that up to a certain height the pressure of the water tends to close the gate and to keep it closed. As the water rises above a certain point the superior pressure on the upper part of the gate will cause the latter to turn on its axis, opening the sluice, and allowing the water free flow both above and below the gate.

15,554 of 1904.—S. F. K. ALBERTSEN, J. M. MADSEN, and J. C. MADSEN: *Ball Valves for Water-closet and other Cisterns.*

Ball valves for water-closet and other cisterns, consisting of a cylinder or hollow plug formed with openings through which the supply water passes to and through a perforated cover or plate at the top of the same, and thence down a central tube to the bore or outlet forming the seat of the ball-lever valve or plug.

16,383 of 1904.—J. THOMSON: *Machines for Laying Bricks in Building Walls.*

A brick-laying machine supported upon the wall by means of trucks near each end of the

machine, one of the trucks being adapted to rest upon the course of bricks which are in process of being laid, and the other truck being adapted to rest upon the prior laid course of bricks, and the trucks being vertically adjustable so that the machine may be made level no matter which end of the machine is in advance of the other.

17,485 of 1904.—T. QUADRI: *Facing and Paving Tiles, Blocks, and Slabs.*

A method of manufacturing facing and paving tiles, blocks, and slabs, consisting in mixing sawdust with magnesia, of binding the same with sodium chloride solution, or the like, shaping the sterilised wood pulp so formed into tiles, blocks, or slabs, and impregnating the said tiles, blocks, or slabs with tar.

17,968 of 1904.—S. F. PREST: *Manufacture of Various Articles, such as Bricks, Paving Flags, and Artificial Stone.*

The manufacture of various articles, such as bricks, paving flags, artificial stone from slag removed from Bessemer converters or Siemens' furnaces, consisting in grinding or crushing the said slag, separating the magnetic or metallic from the non-magnetic or non-metallic portion, adding slaked lime to the latter, then forming or shaping the same by pressure, and finally hardening the articles by subjecting them, in a closed chamber, to the action of steam at a suitable pressure.

TO CORRESPONDENTS.

NOTE.—The responsibility of signed articles, letters and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications, and the Editor cannot be responsible for drawings, manuscripts, or other documents, sent to or left at this office, unless he has specially asked for them.

Letters or communications (beyond mere news items) which have been duplicated for other journals are NOT DESIRED.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

We are compelled to decline pointing out books and giving addresses.

Any communication to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

Research in Early Christian Architecture.

IN the field of architectural inquiry a constantly increasing interest is centring round Rome, the Byzantine Empire, and its provinces in nearer Asia. In this, as

many other branches of inquiry, the specialist must as yet be dominant.

In some future time we may hope to have a well-balanced and comprehensive survey of the entire subject of Early Christian architecture, a survey which should include Georgia, the shores of the Red Sea, and Abyssinia. We already possess a brilliant occasional work in pure descriptive criticism. Meanwhile, the recent work of accumulating claims our attention.

The second volume* of a series dealing with the results of a privately organised American expedition to Syria which was as recent as 1899-1900 have now got the entire ground covered. De Vogüé in his great work, "La Syrie Centrale," presented in a thoroughly understandable form.

A folio of some 400 pages full of interesting matter, interspersed with photographic illustrations, plans, and diagrams of text, we are better able to appreciate the work which De Vogüé depicted.

Part II. of the Publications of an American archaeological expedition to Syria in 1899-1900. "Architecture and Other Arts." By Howard Crosby Butler, A.M., Boston. (New York: The Century Co. 1903.)

And the work is of very great interest, being, as it is, a most important outcome of the earlier Roman art isolated in a province of the Empire where Christian influences could be built up untrammelled by the conventions of the capital; a province, too, subject to the powerful Greek influence of Antioch, and always susceptible to transient ideas from Persia and the East.

Little wonder then that here and in Asia Minor, the perpetual bridge between East and West, the battlefield of empires, are to be found the steps which disenfranchised the Christianity of the East from the ever-growing Frankish dominion of Christianity in the West. The architectural results in Syria during the first five centuries A.D. are in the highest degree important, largely out of contrast to the beautiful style which seemed suddenly to emanate from Constantinople under Justinian and find its consummation in Santa Sophia. In Syria we find buildings which have some affinity to that style, but the peculiar position of the province, beset by all the influences of the extreme Eastern church, involved it in a style which is peculiar to itself, and which is associated with the lonely hermits and anchorites of the Syrian desert rather than with the pomp of Alexandria.

First and foremost, it must be noted that the prevailing character is strongly Roman, though it is the Roman of Baalbek and Palmyra and Spalato, a distinct provincial style of which hardly a trace remains in Rome itself. But mixed up with this thoroughly

Roman background are other influences about which we know little—influences which produce such an ornamented door-head as is illustrated on p. 374 of Mr. Butler's book, which contains the germ of all future round-arched detail in the West; or, to take another example, the apse at Kalb Lanzeh (p. 223), so strongly reminiscent of IXth and Xth century apses decorated with pilasters in Apulia, Lombardy, and afterwards France. Other examples could be pointed out by the score, which confirm the impression of one great Roman style, found, in the first few centuries of the Christian era, in Syria, Asia Minor, Salonika, and Dalmatia—a style which even existed side by side with the true Byzantine, and survived it in perpetuating the true Romanic style of Italy.

All the work of this period, in Rome itself and in the provinces, was very strongly Hellenised; to what extent exactly requires close attention, and even minute scrutiny, in each individual case. It appears, however, that the severity of the Greek general form with regard to buildings was more appreciated in Syria than in Constantinople, at Justinian's time. This is suggested by Mr. Butler when he points out, with some slight inconsistency, that the arch of the Romans, "a concrete shell," never succeeded in dominating Greek lands, but there became a dry, cut-stone arch, as in Syria. Yet Constantinople (where the vaulted arch prevailed), if not perhaps wholly Greek, was certainly no more Roman than Athens itself in the days of the Empire under Justinian.

Granting, however, that Syria was more Greek, it cannot be admitted that it was architecturally more interesting in the VIth century than Constantinople, as Mr. Butler argues. The statement on p. 183 that the architects of North Central Syria in the VIth century show "far higher achievements in the field of art" than Justinian's architects will not be accepted by most readers. To call Santa Sophia only a great effort of engineering venerated with art will not satisfy when we consider the marvel of its beauty as a space creation. To us, Mr. Butler is merely in love with his subject to suggest such a thing, and, to do him justice, his ideas on the place and influence of his style are discerning enough, though rather thinly introduced.

With one point we are entirely in sympathy, and only regret that he does not call attention to it more systematically, that many forms and details in Syria are suggestive of the Romanesque and early Renaissance architecture of later times. One reference in this connexion is particularly valuable, where the author points out (p. 143) the wall responds to the columns, very rarely met with at this date, in a Basilican church at Dānā.*

In some respects of get-up this book is a model, but in others it is distressingly unscientific. Most of the plans, for example, have no scale attached, and, though in this field it is evidently intended that the book should merely supplement De Vogüé (in so far as he has covered the ground), it is a pity that it should not have been rendered so far independent of the work of the Frenchman. Then, also, though the subject is divided up in a most praiseworthy way, so as to elucidate the styles in three different regions of the country, we are not provided with a map, and, therefore, cannot properly appreciate this division. In points like these we perceive an instance of the tendency (most common in America) to portray archaeological research without the necessary architectural grip which renders it complete.

The specially welcome feature in the volume is the series of photographic illustrations, which enable us most vividly to realise the extraordinary variety of ornament and form in these early buildings in the Romano-Christian (or, as the author would rather call it, the "Greco-Syrian") style. Photographs cannot lie, and, moreover, they alone can give the accurate texture of material. From this volume we are enabled to appreciate more than ever before the sober grace of detail and astonishing originality of plan in such a building as the church of St. Simeon Stylites at Kal'at Sim'an—erected, it is interesting to note, in the VIth century, and, therefore, roughly contemporary with Santa Sophia—from its plan alone almost justifying Mr. Butler's encomium of it as "the most magnificent early Christian ruin in the world." Very acceptable, too, is the division of buildings according to centuries, with the pages clearly headed to this effect.

The last part of the book is perhaps the most valuable, treating of the Pagan architecture of the Haurān as

* Illustrated also in Texier and Pullan's *L'Architecture Byzantine*. Notes LIX.-LX.

opposed to Northern Central Syria. Some examples from this district are truly wonderful as exhibiting the eclectic nature of the ornament employed and the sweeping aside of the conventions of the orders to produce effects which resemble the creations of Renaissance times. The architrave of the order of the temple at Sawdā, for example (illustrated on p. 329), is decorated with a diamond or double zig-zag ornament which suggests at once the Norman chevron; yet it belongs to the century before the Christian era.* The illustration on p. 364, showing a restoration of the gateway at Si, is an anticipatory, by some twelve centuries, of the purest Renaissance style in Italy, as exemplified in the Porta San Pietro at Perugia. We gather from the author's notes on this restoration that enough material was found of fallen blocks and ground plan *in situ* to make the representation tolerably certain. Everywhere we see evidence of the same peculiar fact, a Roman style growing up side by side with the Byzantine, which latter, strange to say, was evolved under apparently similar conditions in an adjacent part of the Empire. Which of the styles was the more Hellenised? Which, even, was the more Roman? Which exercised the greater influence on the subsequent architecture of the West? A glance at some other books recently published may help to clear our minds with regard to these questions.

The third volume of the series, *Storia dell'Arte Italiana*† is akin to the subject matter of Mr. Butler's book, as it deals with the later developments in the West which have just been mentioned. It is by A. Venturi, that very prolific writer on Italian art history. The whole series, along with G. T. Rivoira's *Le Origine dell'Architettura Lombarda*‡ (Part I), published in 1901, and Adolfo Avena's *Monumenti dell'Italia Meridionale*, published in 1902, shows the interest now taken by Italians in their early Christian monuments. Venturi's latest volume deals with Romanesque art, or the development of the Roman style in Christian Italy, as opposed to the Byzantine. From this point of view, perhaps the chief interest of the volume centres in Piedmont and the French borderland beyond Aosta. A chapter is devoted to the developments in South-Eastern France and the similarity between these and the art of Piedmont. The extraordinarily Roman character of portions of the church of S. Trophime at Arles is rightly brought to notice. We see, indeed, from such examples, how near this Franco-Italian art of the XIth century approached the pure Roman style of Alberti in Renaissance times, as exhibited in the façade of S. Francesco at Rimini. The more Gothic part of the cloisters at S. Trophime is well-known, but the delicate and semi-classic luxuriance of such a corner of them as is here

* Another interesting ornament is the cusping formed by a series of semicircles which is so frequently used in outer arch-tines. Cf. also this ornament as a panted border in a plate fragment found at Pergamon. *Mitteilungen des K.D.A. Instituts* (Athenische Abteilung). Band XXIX, *Zweites Heft*, p. 206.

† *Storia dell'Arte Italiana*.—III. L'Arte Romanica. By A. Venturi. (Milano: Uscio Hoepli, Editore Libraio della Real Casa, 1904.)

‡ See the able review of this and other books by Mr. Reginald Blomfield entitled *Byzantium or Ravenna?* in the "Quarterly Review" for April, 1903.

illustrated suggests much more than akin to earlier buildings in Syria and Minor, as well as to the beginning of the Renaissance art.

Turning to Piedmont, a very parallel to the cloister caps of S. Trophime is to be found in the cloisters of Orso at Aosta. Little-known buildings such as S. Benigno in Fruttuaria, S. Stefano, Ivrea, show fine dignified towers. The early parts of the cathedrals at Modena are described in some detail and work at Piacenza, Como, Mantua, and Spalato is noticed. But the volume is more useful in its record of interesting buildings in out-of-the-way places which are entirely unknown to the ordinary traveller, such as S. Secondo, Cortazze, Santa Fede, Cavagnolo al Po; San Giacomo Isola del Lago d'Orta (which exhibits an extraordinary pulpit); and the Madonna della Neve, Castel Aosta. It is in such work that the Italian specialist is best able to take advantage of his intimate knowledge of the country.

The last book to be noticed, Mr. Strzygowski's work dealing with the art of Asia Minor,† is undoubtedly the most important of the three, since Asia Minor is, to a large extent, an unworked field—a fact which is suggested in the title of this volume. Mr. Strzygowski also is a great authority on his subject, and the numbers of the German periodical, *Byzantinische Zeitschrift*, show his scholarly persistence in the study of Byzantine art origins, as reviewer and author. Such books as Wood's *Ephesus* and Texier's *Asie Mineure* deal with the pure classic art of the later Roman work. Mr. Pullan's *L'Architecture Byzantine* and Pullan's *L'Architecture Byzantine* gives some of the work of the Chaldean period, especially the fine lot of churches at Salomika. Hübsch's *L'Architektur der Christen* also touches on the Byzantine field. The interesting Mohammer work of later times has hardly been touched with at all. Texier gives some of the buildings of the Seljuks and the Osmanlis has still to be written.

The part taken by British scholars is chiefly based on the immense research of Professor W. M. Ramsay. *Historical Geography of Asia* has acquired a world-wide reputation in time when very few other scholars were in the field. Mr. Hogarth and Headlam followed Professor Ramsay's lead, and the latter has achieved a thing definitely architectural in his description of a very interesting little-known church (Koja Kalesi). What further research will be undertaken by these and by others in this country remains to be seen, but meanwhile we can be glad that an Englishman has contributed to the volume at present under notice. Mr. Crowfoot's notes, plan and photographs of the churches at Kilise and Utschajak are particularly valuable, as coming from a true archaeologist who is able to take the full architectural data.

* For general history of the Xth and XIth centuries see a French volume just issued, *L'Unité Méditerranéenne Byzantine*, A.D. 867-1071. (Paris: Fontemoine, 1904.)

‡ A well-illustrated little book, *Reise in Kleinasien* by Sarre (published, we believe, about 1839), describes Seljuk work in a sketchy way.

§ *Ecclesiastical Sites in Iasuria*. By A. C. H. (Hellenic Society Supplementary Papers, No. 1)

Mr. Strzygowski and his collaborators here dealing chiefly with some hitherto unpublished Byzantine churches. The thing noticeable in the illustrations is the extraordinary diversity of type the buildings presented, a diversity which is quite bewildering unless some definite analysis of the various forms attempted, but which is quite sufficient to point to Asia Minor as the very clash meeting point of Christian art origins. He goes to prove one of the author's standing theories, namely, that it is Asia Minor that the true origins of the Byzantine style must be looked for. He is very persistent, however, in stating the two distinct varieties of type—Hellenistic and the Byzantine—must not be confounded; the first being dome-basilica and the latter a cruciform one. He also quotes a French author, who, to show that Asia Minor was much Hellenised in the early centuries, either Egypt or Syria.

Of the works represented (dealing first with Mr. Crowfoot's notes, which begin the book), one of the most remarkable is the church at Utschajak already mentioned. The photograph (p. 32) it appears as a simple, arched ruin, built in Roman brickwork, ascribed to some period between Constantine and Justinian. It belongs to the two-domed, basilica type. Mr. Crowfoot points out the very interesting detail, though the outside walls are clad with "long, thin tiles laid in beds of mortar," the hidden walls "built of rubble . . . held together by wooden beams, which were fixed round the building, at levels not more than 2 metres apart," the beams being 15 cm. square and still perfectly sound. If this is not later rebuilding, we must suppose that bricks were difficult to get and an older and more primitive method of building was resorted to for the internal wall-work in this church, and that at Tschardagh (p. 69) have apses finishing polygonally and round internally, but the general form of the first-mentioned is interesting. The apse of the latter church in detail has an extraordinary resemblance to Turkish work in fountains, seen at Stamboul and elsewhere.

From an architectural point of view, the most interesting church in the volume is undoubtedly that at Kodscha Kalessi, from Mr. Headlam's work, which is well illustrated by careful plan, section, and elevation, with a photo also of the interior. Generally speaking, this church appears to be thoroughly Roman in plan and detail, but, though at first sight the plan appears to be a three-apsed basilica, it really resolves itself into the cruciform type, the angles being filled up by two side compartments at the apse end and four smaller ones at the entrance end.

The further confirmation of the Byzantine character of this church is found in the details of the upper transept galleries, which suggest the style of Ravenna and Constantinople. At the intersection of the transept there was evidently an interesting roof, shown by the corbelled-out pendentives, supported on little pillared columns. The peculiarly Roman stamp is given to the building by the entrance porch and in the engaged columns which mark the division of the bays in

nave and transepts. The entrance front, as shown in the elevation of it, resembles the work of Roman Syria, and the central door is in the style of those at Baalbek. But a still more notable resemblance is that of the general character of this façade to the entrance front of the Roman basilica of S. Salvatore (Chiesa del Crocifisso) at Spoleto. In both we see the sense of plain wall space grandly broken by doors below and windows above in a manner which must have been the very grammar of the first Italian Renaissance architects.

Mr. Strzygowski divides these Asia Minor buildings into four types—basilica, octagon, dome-basilica, and cross-dome-church (*Kreuzkuppelkirche*). On the whole, he is perhaps justified in placing Kodscha Kalessi among the dome-basilicas, though the only radical difference between it and the western part of the double church at Ephesus (p. 142), which is quoted as a cross-dome church, lies in the finish given to the ends of the aisles. The same applies to the underground church at Chrysokephalos (p. 153). The plan-type of these churches was afterwards used in Italy, perhaps by Greek builders, notably in San' Nicola at Bari.

Turning to the cruciform churches, the most complete example given is the small church at Aladscha Kisle (p. 139), though the much ruined church at Philippi is more important from its size. In this connexion it is interesting to note two aspects in the origin of the cross, one presented from Asia Minor and the other from Syria:—(1) In successive attempts to partition up a single chamber, and to diversify the plain basilican type. (2) In the frank acceptance of a great cross form obtained by conglomerating four basilicas, as in the Syrian church of St. Simeon Stylites.

But we must hasten to conclude this survey of an extremely interesting book. After referring to the pronounced cross form of the church at Rocella di Squillace, in Italy, a short chapter on the dates of the various buildings presented is followed by another on the "Syrian façade-type," in which the west front of Kodscha Kalessi (before alluded to) is duly brought in. Then follows a chapter entitled "Asia Minor between the East, Greece, Rome, and Byzantium," dealing with the influence of Asia Minor on Byzantium, owing to its unique position between the three great sources.

Mr. Strzygowski may possibly be right in claiming that Asia Minor was not only more saturated with Hellenism in those times than either Syria or Egypt, but was the parent roof from which the art of Byzantium sprang. We are principally indebted to him, however, for his scholarly arrangement of architectural facts, many of them new, in a book which is the first definite attempt at anything like a complete survey of the lesser-known Byzantine ground in Asia Minor. The arrangement of the buildings in their various sections is admirable, a contrast to the terrible jumble of matter presented in some Italian histories. Some such arrangement as this is indeed necessary, when we already have a bewildering list of books dealing with various branches of this subject, many of them having the record of facts so

saturated with discursive critical matter that their definite value as scientific acquisitions becomes doubtful. We are at present only in a preliminary stage. The fact that so many interesting buildings as yet remain undiscovered, or at least unpublished, is a warning against much theorising.

More and more, however, we are arriving at what is wanted—the careful presentation of actual buildings, considered as such, and as telling each its own structural and architectural story; and not as abstractions in bygone styles.

NOTES.

WHATEVER opinion may be entertained as to the policy of the London and North-Western Railway Company in connexion with recent abortive negotiations, it must be admitted that the energy displayed by their engineers for the protection of the line has been beyond all praise. Owing to successive inroads of the sea, two great breaches have been made in the sea wall—one about 250 yds. wide and the other from 30 to 40 yds. wide—and it seems probable that nearly a mile of the Dee embankment will be swept away. At the point where the sea first broke through, the land has been eaten away, to a depth which is said to be from 15 to 20 ft. lower than the foundations of the permanent way. Quarry stones, slag, and clay have been delivered in enormous quantities and deposited in the breach and in the newly-formed lake. Material continues to be received at the rate of 3,000 tons daily, part being conveyed on temporary lines to the foreshore for filling the breach, and part to the land behind, where it is employed in the construction of a new stone embankment. The magnitude of the operations may be gathered from the statement that more than 50,000 tons of stone and 6,000 bags of sand have already been used on the site. It is satisfactory to find that the high tide of Saturday last, while causing further damage to the sea wall, had no effect upon the new stone embankment. All the work to which we refer constitutes no more than a temporary protection to the railway, and when immediate danger has been averted a massive sea wall will have to be built for a considerable distance along the shore of the estuary. Preliminary borings are being made with the object of ascertaining the character of the subsoil and the depth at which bed rock occurs for the foundations of the new work. The expenditure to which the railway company are now committed will be enormous, and the recent history of the Dee embankment strikingly demonstrates the wisdom of the adage that "A stitch in time saves nine."

A LETTER addressed by Mr. Pretynan, M.P., to a committee of local authorities and others in Norfolk, comes as a confirmation of the idea contained in our "Note," of October 15, relative to coast protection. The writer says that no one

knows better than he the heavy cost of sea defence work falling upon local authorities and private individuals who own sea frontages on the east coast. But, he continues, "although the burden is heavy, it only bears a small proportion to the increase in value which sea frontages in these districts have acquired in recent years." That was just our point. Owners of property on the coast have the remedy in their own hands, and if they will take measures to prevent inroads by the sea the value of their lands will be vastly increased, and their native land will be conserved. The worst of it is that property owners are not only unwilling to execute protective works, but continue the suicidal practice of removing beach material, which cannot possibly be replaced save by further destruction of the cliffs.

The State of the Rhine. WE are accustomed to look upon Germany as one of the European countries where inland navigation is conducted in a manner that puts to shame our puny efforts in the same direction. Therefore it is surprising to note the unsatisfactory condition of the river Rhine at the present time. Although a sum of 300,000, has been spent by the authorities of Strasbourg in improving the port, the upper reaches of the river are in such condition that navigation is impossible for ships of any size, and sundry German steamship companies are now suspending their services. An important part of the trade of Strasbourg depends upon water transport, and the existing state of things is naturally causing much anxiety. Some pessimists allege that a period of fully fourteen years must elapse before the Upper Rhine can be made suitable for the larger types of vessels hitherto used. We cannot believe this estimate to be a correct one, and as various associations interested are taking the matter up, it may be hoped that prompt action will effect a speedy improvement, although the consequences of past neglect may not be entirely removed for some years.

Another Railway Accident in Glasgow. GLASGOW seems to be rather unfortunate in the way of accidents at railway stations, for last week another train ran violently into the buffers at the end of a platform—this time at the Central Station—with the result that one van jumped over the buffers and demolished a newspaper stall, sending the roof flying across the station. Four men were injured, but fortunately there was no loss of life. The mishap was due to the unexpected failure of the brakes, a type of apparatus upon which railway companies appear to place an implicit confidence which is scarcely justifiable. No doubt traffic is facilitated by running trains into the docks of a station at fairly high speed, but the practice ought not to be allowed unless powerful hydraulic stationary buffers are provided to safeguard passengers and others against the consequences following any failure of the brakes. Independent provision of the kind would still be necessary even if the brakes adopted by British railway companies were of the most modern and improved types, for the most perfect mechanical appliances will go wrong at times.

The Structural Design of Buildings. An excellent paper on this subject was read recently before the American Society of Civil Engineers. The object of the author, who is an engineer, is to submit a series of specifications for the structural work of buildings, these specifications being intended to cover only the structural features of modern buildings in which steel forms an essential part. Hence it may be said that the paper is addressed more particularly to engineers than to architects and builders. For this very reason we think it should be appreciated by the last-mentioned classes, who may learn from it many things likely to be of service in their everyday practice. The discussion of loads on floors, columns, and foundations is in some respects novel, and will well repay study. A useful appendix contains, in tabulated form, extracts from the building laws of ten large American cities, but we may observe that the most striking feature about these is the lack of uniformity with regard to the specified live load, the variations being accentuated by the fact that some of the laws permit a reduction on the permissible live loads for columns and foundations, while others do not allow any such modification. No reference is made in the specifications to concrete-steel, an omission which the author justifies by the consideration that it is better not to include specifications for work executed in this material before the Report of the committee appointed by the Society to investigate the subject has been compiled. Bearing in mind the large share taken by American engineers in building construction, we anticipate that a most instructive discussion will follow the reading of this paper.

The "King's Board," Tibberton. WE have received from the author, Mr. W. H. Medland, an interesting and well-illustrated pamphlet on "The so-called King's Board at Tibberton Court, near Gloucester," reprinted from a paper published in the Transactions of the Bristol and Gloucestershire Archaeological Society. It is a building decagonal on plan, five sides closed with solid masonry, the other half open with delicately cusped arches of apparently XIVth century date, between which are elaborately carved spandrels with sacred figure subjects, among them the Entry into Jerusalem, the Scourging, the Last Supper, and the Crucifixion. This interesting little building, which is but 12 ft. in diameter, formerly stood in Westgate-street, Gloucester, and was taken down in 1749, and rebuilt in the grounds of Tibberton Court. Although described by writers at that period as a "market" Mr. Medland suggests that it was more probably used as a preaching cross, and the Biblical subjects of the sculptured spandrels seem to point certainly to a sacred use. A ground plan and conjectural restoration is given in one of the plates, and a capital series of small photographs illustrate the carved detail. Paul's Cross and the Market Cross at Malmesbury are also illustrated, and mention is made of the very beautiful little preaching cross in the churchyard at Iron Acton in the southern part of the county.

The Memorial to John of Dunstable. THE memorial which the London Section of the Incorporated Society of Musicians has had placed in the Church of St. Stephen Walbrook, consists of a tablet of Hed Wood stone, in which the inscription is incised, within a simply designed frame of Beer stone, and having two panels of glass mosaic, executed by Messrs. Powell and Sons, of Tudor-street. The upper panel represents three musicians against a background of deep blue and starry sky, emblematic of the attainments of Dunstable, whilst eminent as a mathematician and an astronomer, also enjoyed European fame as a musician. He died on December 24, 1453, and is buried in the former church built on the east side of the Wall Brook in 1412 by Alderman Robert Chycheley. The original inscription on his tomb, transcribed in Weever's "Fulham Monuments," is now reproduced on another epitaph by John de Wheathurst, Abbot of St. Albans, is given in Fuller's "Worthies." Dunstable played a chief share amongst the musicians in the development of music in the XVth century, and his learned treatise, "*De Mensurabili Musica*" is quoted by Franchinus, Ravenscroft, and others. Examples of his works are preserved in the British Museum and Lambeth Libraries, also at Rome, Dijon, Bologna; Franchinus printed his "*Sancti Spiritus*." In the Bodleian Library is a collection of tables of longitudes and latitudes calculated and written by him in 1438.

The Goupil Gallery. THE Autumn Exhibition at the Goupil Gallery includes as its principal feature a collection of eighty-nine pencil sketches of architectural subjects by Mr. Fulley. While we are great admirers of this artist's oil and watercolour paintings, we are not sure whether he is not seen to more advantage in his pencil sketches than in any other of his productions, and we are therefore much pleased to see a collective exhibition of them. The special value of these works is that they are pure drawings of architectural subjects by an artist who has made a special study of architecture and understands it, and at the same time they have the freedom of an artist's touch and style, and are not to be ranked with what are ordinarily called "architectural drawings." They illustrate a good many different localities—churches and street scenes of various places in England and on the Continent. There is no necessity to particularise, for all are equally good, and should excite much interest to architects. One of them, the Clarendon, Oxford, has been reproduced in our pages; and there is a small sketch of St. Peters which was the origin of the larger water-colour drawing which was also reproduced in this journal, and arranged with the artist. The outer room, and the inner room of the Gallery is occupied by a miscellaneous collection of oil paintings. These, taken as a whole, that rather too great liberty towards what is called breadth, sometimes degenerates into "sloppiness," which is more or less the case in the Goupil Gallery exhibitions. Jures' picture, "Delivering Joseph's

acob" (18), is so sketchy as to be almost unintelligible—what the French call a *pochade*, more like an artist's rough sketch of composition and effect than a drawing with any claim to exhibition; and the same artist's big sketch of "The Prodigal Son" (44) we had to give up after a vain attempt to find out which was the figure of the prostrate figure. Among the landscapes are two or three beautiful ones by Mr. Leon Little, whose collection at this gallery we noticed some time back; we may mention especially "The Stream, Autumn" (24), a beautiful little landscape. Several other landscapes by Mr. Weiss have a somewhat gloomy power; Mr. W. Lewis has two or three bright little sketches in which buildings are prominent; there are two or three works by the Sidaner in his usual style. Mr. Henry's "Goldfish" (5), an engraving with the figure of a lady, is a real work of art with a consistent style in every part. M. Aman-Jean's lifesize group, "Confidence" (33), looked better in the large spaces of the New Salon at Paris; but out of scale for so small a gallery.

THE pencil drawings of architecture by Mr. Haig, in one of the rooms at the Fine Arts Society, are more specially architectural drawings than those of Mr. Love above referred to; architectural drawings of the first order as such, beyond praise in clearness and accuracy of drawing, and (in many cases) in the way and finish of execution; but they are not the same artistic spirit and quality as the drawings at the Goupil's. Among the very best are two views of the exterior of St. Mark's, numbered 71; beautiful little drawings. Architects the collection is specially interesting not only for the excellence of drawing but for the amount of detail and faithful illustration of architectural monuments in various parts of the room which is here collected. The room contains a collection of Mr. Lewis's well-known etchings of architectural subjects, for many of which the drawings in the other room seem to have been first studies. As we have mentioned on other occasions, we do not sympathise with the use of line in very highly worked drawings, but we have more the character of engraving in feeling being that the special value of etching lies in a freedom of line which engraving cannot imitate. If, therefore, etching is to be used in this engraving style, it is impossible that it will be used with more patient finish or more power of effect than in these sketches, a class of work in which there is in fact no equal at present.

At Mr. Van Wisselhegh's Gallery in Brook-street is a collection of portraits, drawn and etched by Mr. Strang. That room full of powerful work marked by strong originality, goes without saying, but the satisfaction one derives from it is somewhat discounted by the leaning towards ugly and grotesque subjects, among the etchings especially. Such works as "Billiard" and "Evening" (39 and 40) are one with the idea that the artist

finds a kind of satisfaction in studies of the most ugly and unattractive types of humanity; the power of treatment is unquestionable, but why waste it on such subjects? "Mourners" (32) is a pathetic study, and "Death and Doctor Hornbook" (36) a piquant illustration of a poem the grotesque humour of which is quite in Mr. Strang's own vein. The class of portraits founded on Holbein's manner of execution, to which special attention is directed in Mr. Binyon's preface to the catalogue, are very interesting as to execution; but when Holbein's name is mentioned in this connexion, one cannot but feel that they are very deficient in the character and dignity which belong to the great Dutchman's portrait studies; whether or no it be that the artist has not been fortunate in his models, there seems a great want of life and expression in these heads. Among the drawings "Jacob and the Angel" (1) is a poor conception of the subject; "The Creation" (8) has a curious touch of the naïveté of Blake about it; "Hagar" (27) is a very fine composition, though we certainly never gathered that poor Hagar was turned adrift without even clothes to cover her. Two drawings to which we can give unrestricted admiration are the two gold-point studies of partially draped figures. These are exquisite, and show that Mr. Strang can do perfectly beautiful things when he chooses, in spite of his too frequent adoption of unpleasant and grotesque subjects.

THE Late Professor Kerr, of whose life a brief notice will be found in our

Obituary column, had for some years been prevented by ill-health from taking an active part either in the practice of his profession or in attendance at architectural meetings. Those, however, who were in the habit of attending the meetings of the Institute of Architects previous to that period will remember very well what a large place Professor Kerr filled in them by his energy and vigour, his fighting capacity in discussion, and the possession of a gift of fluent and effective oratory which would have been regarded as exceptional in any gathering of Englishmen. He may not always have made the most judicious use of this gift, but he kept things alive at the meetings, and he was always worth hearing. He was also a frequent and able contributor to the discussions at the Architectural Association meetings. This kind of personal power enabled him to fill a larger place among the architects of his generation than he might otherwise have done; for he never had an extensive practice, nor can he be said to have accomplished much in actual architecture. But his little book "Newleaf Discourses," published as early as 1846, was really a remarkable one for its period, anticipating some ideas in regard to modern architecture which are common-places now, but were not so then. It is in the form of conversations between two architects, representatives of what he regarded as the Old and New School, and is very well done; indeed, it is a question whether its literary and critical merits would not justify its republication; we believe it is long ago out of print.

NOTES AND SKETCHES IN SOUTHERN ITALY.—IV.

TRANI.

THE city of Trani was at the height of its prosperity at the period of the Norman dominion, although it had existed for some centuries before that time, since several small Roman remains still exist (such as the lower stones of military columns of the Emperor Trajan, which are in the Via Duomo), and the acts of the martyrdom of S. Magnus, Bishop of Trani in 195, and the Tavola Peutingeriana, of the period of the Antonines, show that it existed at those times. It belonged to the Duchy of Beneventum in the VIIIth century, having been taken from the Greeks. The Saracens devastated it in 840, and again in 1009. It was the last Apulian city to yield to the Normans, having been conquered by Pierre de Hauteville on the octave of the Epiphany, 1073. It made itself a free commune, and, with Bari, Troja, and Melfi, defeated the army of Roger, Count of Sicily, at Bisignano, in 1137. Two years later it capitulated and became part of the Norman kingdom. The castle (now a prison) was re-built by Frederick II. on the site of one of King Roger's, which the citizens had destroyed in 1137. An inscription gives the date of 1233 as that of his restoration, but it was a good deal altered by Charles I. of Anjou, and again subsequently. Three of the four towers remain, with connecting curtain wall, which defended Frederick's Royal residence. In it Manfred celebrated his marriage with Helena, his second wife. In the wars between Giovanna I. of Anjou and Lewis of Hungary, it was held by Alberico da Barbiano until the battle of 1344, which gave the kingdom to Charles of Durazzo and to Barbiano the lordship of the city and the title of Grand Constable. Giovanna II. gave the same rights to Sforza Attendolo, and to his son Francesco, who became Duke of Milan. It remained constant to the Angevins during the war between Alfonso of Aragon and Lewis and Giovanna of Anjou, but later, when Ferdinand the Catholic was fighting with Lewis XII., called in the Venetian republic to liberate it. Till the rout of Agnadello in 1509 they occupied it for twelve years, and again had it twenty years later, when, after holding it a few months, they ceded it to Charles V. Its importance ceased with the establishment of the Spanish vice-royalty.

It had a walled-in port in Norman times, and the maritime regulations, published by the consuls of Trani in 1063, form the most ancient mediæval commercial code known. In Charles II. of Anjou's time the port was re-constructed (1272), and eight years later it had a chain to close the mouth 340 ft. long. In Giovanna II.'s time (1372) the Venetians damaged the structure of the port, and a great tempest finished what they had begun. The present quays and piers are of the XVIIIth and XVIIIth centuries. Trani fishermen frequent the islands of the Greek Archipelago and even go as far as the Black Sea and the Sea of Azov. During the XIVth, XVth, and XVIth centuries it had a flourishing commerce. There were two Venetian Consuls, quarters belonging to Genoa, Ravello, Amalfi, Pisa, and Florence, and a Giudecca, which was so full of Jews as to require two synagogues. In the peace between Ferdinand of Aragon and the Prince of Taranto (1403) one of the articles was "that the city of Trani shall not be given in feud to anyone."

The cathedral stands upon the site of a much older church near the sea. Beneath it are crypts upon two levels, the lower being merely rough construction, without mouldings or ornament, except some traces of painting. Cavaliere Sarlo thinks it as early as the VIIIth century, the crypt of S. Leucio, in which his body was deposited in that century. Sig. Carabellese, however, believes it to be later, either the VIIIth or IXth century. The church, which is now the crypt under the nave, was always sunk somewhat beneath the surface. It was dedicated to the Virgin, and has a nave and two aisles separated by two rows of eleven antique columns, some of granite and some of oriental marble, with bases of antique form, but with rough caps of limestone, except in two cases, where marble caps, which were probably imported from Constantinople, remain. Some of the columns have been cut up to make them fit, and they generally have a cross carved on them. The nave roof is a wagon vault, and above a side altar or tomb is a painting on the vault, the figures of the

The Cathedral, Trani.

Evangelists. In this cathedral the Bishops of Canosa sat, after the destruction of that city in 813 by the Saracens, till the see was transferred to Bari. Towards the end of the XIIth century a young Greek pilgrim arrived in Trani, who carried a cross, and marched, singing "Kyrie Eleison" without ceasing. His acts of charity and the statements which he made to Bisanzio the bishop, caused the citizens to look on him as a messenger of God, and, after his death, Urban II. canonised him in 1090, and he was accepted as patron saint of Trani under the name of S. Nicola Pellegrino. An addition had been made to the cathedral in the shape of a transept with an eastern apse, in which his body was deposited. On the north and south two corridors were added, and on the enlarged site the present cathedral was raised towards the end of the XIIIth century. Work went on until the middle of the XIVth, when the Campanile was finished. The eastern portion of the crypt, called the Soccorso di S. Nicola, is divided by a wall from the other crypt. The vault (which is quadripartite) is supported by twenty-eight slender columns of Parian marble, in three rows of eight each, with four in the apse, eighteen pilasters on the walls, and two engaged columns at the angles of the apse. The capitals are also of marble, and carved with different designs, Romanesque based on the Corinthian. The date of 1094 is given by an inscription near the principal door as that when the cathedral was commenced, and, if that is so, it is due to Bishop Bisanzio, who lived till 1126.

The upper church is entered from the west only, and is approached by a double flight of steps leading to what was once a portico before the doors. This portion was completed in the XIIIth century under the Hohenstaufen, and served as a meeting place for the council of the city, as in so many other Italian cities. Between the columns seats were built for their accommodation. The parapet which surrounds three sides has a richly-carved cornice. The central door is linked with the side doors by a wall arcade, with sharply cut foliage, etc., surrounding the architrave and well-designed caps, as shown in the drawing. It has a very richly-carved archivolt and side posts, in which figures and animals struggle through the interspaces of scroll-work, and a second projecting arch, which rests on two slender marble columns, borne by figures of lions, one of which holds a struggling man in his claws and the other a serpent. A block upon which human figures are carved as if supporting the column is between it and the lion. In the central doorway are the celebrated bronze doors made by Barisano of Trani for Sergius Muscettola, which contain many of the same panels and ornaments as those which he used at Monreale and Ravello; above it the wall formed a kind of pediment, now much ruined. Above this is a two-light window with corbels at its side, ornamented with broad flat leaves; on these elephants stand half-sunken in the wall. On their backs colonnettes rest on the caps of which are lions devouring men, also partly sunk into

the wall. Over the window sits a figure which holds a man in its claws. There are smaller two-light windows above the doors with ornamented facias surrounding them. All these are walled up, their columns being absent. The great rose window above the central window has lost its tracery; it are six corbels on which are figures of animals; and higher still in the gable is a little round-headed window. The side windows have a round-arched wall arcade, with windows of the same shape beneath them, which light the *matroneum*, and similarly in the wall as clerestory. The end of the tower has the arcade continued but with double arches beneath each arch, a cornice, and small two-light windows, and then a further heavily-carved cornice, and a little window above in a low gable. The apses are simple in design externally. The central being more important, is larger than the others and has the usual Apulian window with colonnettes at the sides with apses below, and an oculus above projecting from the wall. The top of the window arch is a griffin, the crypt window below has been altered. The building of this upper church went on till 1140, certainly, with the assistance of subsidies from the citizens. The interior is finely proportioned. The nave has twenty-four columns of Numidian granite, marble of Hydruntum, breccia and cipollino arranged in pairs transversely to the axis, the arches are supported with larger voussoirs to the upper part, containing arch, and the triforium, or *matroneum*, has groups of three small arches, the columns sometimes plain and sometimes ornamented beneath a larger round arch without impost or caps. In 1837 the Archbishop of Trani, Maria de Franci covered the whole interior with stucco, and the columns and capitals were hammered over to afford a key. Since that time the two-light windows had been partially walled up in the XVIIth century at the expense of repairing the wooden case. The triforium was also walled up in the XVIIIth century because the church was draughty in the winter, but these walls have been removed, and the original caps and columns are now again visible. The choir stalls are of 1439, and appear to have been paid for by Archbishop Latino Di Ursino, whose arms appear inlaid on the upper stall on the Epistle side. The roof was painted, the date upon it is 1713, and an inscription records that it was paid for by subscriptions. The two side apses had been walled up in their lower parts to accommodate organs. In the right aisle is an altar, which is thought to be that placed in the tomb of Philip of Anjou, Prince of Taranto, and Achaia, son of Charles II., who died in the Castle of Trani, March 24, 1271. Charles I. and Beatrice were also buried in the castle. The lower church was lighted by circular windows in the pavement of the nave until 1791, when a choir near the archbishop's throne a series of mosaic pavement remains, a figure of Solomon riding a beast, and inscribed "1791."

The campanile, at the south-west angle of the church, appears to have been an addition since the cornice of the west front is carried down to the same level on both sides, and the tower is built close against it, and present pierced by a pointed arch one which abuts on a structure which is in connection with the church, and the other on a mass which is arcaded round with niches, and supported by little columned arches. It has five stories, and its height to the summit of the spire which terminates it, is almost exactly equal to the length of the cathedral. It is a square. The design is shown in the illustration. The construction shows different epochs. The first includes the basement, with the second story, and this part is signed in the first story letters, "Nicolaus sacerdos magister me fecit," under the cornice, probably the same man who signed the altar at Bitonto as simple "magister" in the third story is the work of another, and the fourth and fifth of yet another, and the highest portion was completed between 1305 and 1365 by Archbishop Jacopo Tura. During this time Trani possessed several eminent designers and craftsmen, whose names come down to us. Besides prot. Nicola, there was Anseramo da Trani, the chorium of the Cathedral at Bari, the chorium of the Cathedral at Bari, the chorium of the Cathedral at Bari, called Riccaccio da Foggia, Tranes called Comacine in a deed of the archbishop Terlizzi, and Barisano.

The next most interesting building in Trani after the cathedral is the church called by Schulz and Avena "Ornissanti," in the Via Ornissanti, but known also as Ss. Annunziata, and once known as "delle anime in Purgatorio." It is the only Apulian church which retains its triumph, or porch. It existed in 1170, when the avellane Orso Rogadeo left it property in his will. Avena says it shows a pre-Romanesque type of church, but it has a wooden roof over nave and barrel-vaulted aisles in the usual manner. Externally the side apses have only slight projection, each has a little window ornamented with a pearly band, as at the cathedral, and a very beautiful band of elaborate ornament surrounds that of the central apse, with a lion and griffin holding beasts in their claws at its springing; below is a lion on each side with a figure in its claws, on his back is a slender colonnette with a Norman cap. Above the porch the wall is raised so as to form a wall-like building above the aisle, terminating in a gable with a two-light pointed opening with a central shaft, a bell turret. The atrium is quite Byzantine in style. It has in front of it three doors two free columns and one engaged in the wall at each end (on the left cased up by a pier), the façade of the portico having three arches, one pillar with a cap and a rather broad pier between two pilasters. Each side of the central door is a pillar with top of figures above a row of acanthus leaves and a cable moulding. Corresponding columns are sunk in the angles without figure sculpture. Around the central door the wall is sheathed with marble, and above it Byzantine reliefs of the munciation in two panels are inserted in the same manner as at S. Mark's, Venice. The arch is richly carved with arabesques, dissimilar on the two sides. The side doors have arched archivolts, their tympana are curiously divided—two small portions of circles rise from the lintel, and they and the space between them and the arch have bestial subjects carved on them, peacocks and monsters. The arches below the vault have their voussoirs thicker towards the top. This atrium is defended by a heavy iron grille towards the street. The exterior has been paganised, the eight arches are blind, with mouldings in stucco, but the original slim granite columns remain, and the caps, though whitewashed, with the engaged shafts at the end of the nave arcade and in the aisle walls. Some of the columns are larger than others, but the caps all fit. The mouldings are of classical generally, though the bases are most of them Attic. The moulded abaci are composite, and show so much diversity in outline that they must be original. On the lintel of the principal door are carved five shields of founders, described in an inscription which terminates as follows:—

AB HIS CAV LAM BER
TINO RVM SAM HABVL

Another interesting church is that of S. Francesco, which was founded by the Benedictines of La Cava in 1176. In 1184 it was consecrated by Bishop Bertrand II., and then called S. Trinità. Much of the façade (which is in the playground of the Communal schools) is of the early XIIIth century, the interior is earlier. There are four piers, which have been modernised, and a circular drum, upon which the central cupola is raised, preceded and followed by two flatter ones. To these piers half-piers on the interior wall of the façade correspond to the entrance to the square apse, which is under a quadripartite vault. The principal cupola is octagonal externally, with a fine ornamented band and a pointed roof. The whole design resembles the Cathedral of Mola, the aisles, with their half-barrel vaults, being the thrust of the domes to the outer walls. The façade has a door with a decorated projecting hood on slender columns, supported on carved corbels at about 4 ft. from the ground. The tympanum is a slab pierced with double quatrefoils, as if a square and a trefoil overlay each other. Two arches, one on each side, flank the doorway, rather sunk into the ground. The aisles have square-headed windows, and a corbelled cornice with lions' heads, etc., runs along the gable. The nave wall is a small round-headed window with a slab pierced with simple circles. This is the church described in Schulz as S. Maria macolata; it was given to the Franciscans in the XVIth century, and then took the name of S. Francesco.

The church of S. Giacomo, formerly S. Maria, said by Schulz (and local tradition) to have been the mother church of Trani, and the place

in which S. Nicholas Peregrinus was buried. Cav. Sarlo, however, says it was not S. Maria, but S. Maria de Russis. It is a square church, with angle pillars bearing quadripartite vaulting, the caps of which resemble those at Cefalù and other Norman churches, and a round apse. The interior was burnt out last year, and contains nothing else noteworthy. The drawing shows the exterior with the characteristic Apulian beasts projecting from the walls and the remains of a corbelled cornice at the top of the wall; the door has a decorated moulding round it and pillars at each side supported on what look like hippopotami, but are said to be elephants; on the caps above are a griffin and a lion, the last with a smaller beast in its claws. Another church, S. Antonio, is square, with four thick middle columns, which carry a cupola on round arches. Between them and the engaged columns in the wall are arches and a vault. The exterior is whitewashed, and the door is approached by a double flight of steps meeting on a landing. Against the next house a half-round turret runs up, and the whole appearance is quite eastern, notwithstanding the pyramidal roof over the cupola. Outside the gate, on the way to Bisceglie, is a basilica with nave and side aisles, with half-wagon vaults called S. Maria della Colonna.

There are some very curious relief patterns on house walls, consisting of oblongs and diamonds, etc. In the Gindecca are several elegant two-light windows with slender central shafts, and near the harbour is the building now called the "Seminario," once the official residence of the Venetian Consuls. It has a curious mixture of details, the building being oblong in plan, with lofty walls unbroken by any considerable projection. The entrance door has a round head

with a carved moulding over it, which is square in general form and supported on colonnettes. On the first floor are two two-light windows, one with tracery and one without, also a square-headed window with four lights divided by three shafts and a large pointed one with a great Norman zigzag round it, like the big window in the campanile at Girgenti. A string course divides this story from the top one, and is depressed to run round the bottom of two other windows which have been altered in later times. The building appears to be of the XIVth century, and the street in which it stands is so narrow as to make it almost impossible to see any details of the upper stories. F. H. J.

THE ARCHITECTURAL ASSOCIATION OF IRELAND.

On the 18th inst. the President of the Architectural Association of Ireland, Mr. James H. Webb, delivered the opening address of the Session. This was the first meeting in the premises now specially acquired for the use of the Association. After mentioning the reasons which induced the Association to take this step, and the circumstances under which the new premises were acquired, Mr. Webb continued:—
"Having provided ourselves with a home, what do we intend to do with it? Of course we will carry on our classes and lectures as heretofore, and I do not think it can be imputed that the members who may be said to run the Association have ever been behindhand in their duty. It sometimes occurs to me, why do they go to all the trouble, and give up all the necessary time to furnish practical instruction to their younger brethren who will in a very few years be competing with them in the battle of life,

Principal Door and Arcading, Trani Cathedral.

S. Giacomo, Trani (see page 437).

and altogether without fee or reward? But, as a matter of fact, I think it will be found that, apart from the innate pleasure of doing your duty and benefiting mankind in any way that lies in your power, the instructor or lecturer derives as much, if not more, benefit than the student. It has been said that to perfect one's self in anything it is wisest 'to first read it, then write it, and then teach it,' and I am sure that such of you as have made up a subject for a lecture will agree with me that they got to know more about it than they could have done by simply reading for their own instruction.

We hope shortly to form a museum in one of the rooms on the lower floor; in fact, some specimens of timbers and stones were gathered together some years ago by the then secretary—we have been very fortunate in our secretaries—which I believe will be forthcoming, and the committee have also many ideas to work out.

I do not intend to enter into a long dissertation on things in general, or to detain you with an address on nothing in particular; but it is our custom at the beginning of a session to review, as it were, the position we stand in, and also perhaps the general situation, with regard to architectural education. Of course, primarily, we exist for the purpose of architectural education. Our mission is to endeavour to implant in every student a knowledge of what in past ages, and from period to period up to the present, have been considered the best methods of constructing and adorning the houses the people lived in and the temples some of them raised to the Deity, together with any other structures erected by man. If we can get that into a youth's head we are satisfied to let him go on his way and try to do better, if he can.

I often think that we ought to be proud of our mission. We are endeavouring to teach the coming man to do good to his fellow-man. The first two things a human being wants are food and shelter, and it is the architect's province to provide the latter in the best known form. Therefore, if he wishes to become an architect the student must learn what is good and proper, and what is not; or else, unless a man is a heaven-born genius, he is sure to mix his styles or perpetrate those horrors that are so injurious to the health of our good friend, Mr. Orpen. Now, I want to again reiterate and to impress on you students and younger members that this Association is primarily for you, that all the trouble taken by the committee and others is for you, and that it is their hope and wish that we may be able to establish a school, here in Ireland, in which a student will be able to obtain that necessary supplemental education which it is universally acknowledged is necessary if he is to become a really qualified architect. Students, it lies with you if our dreams are to be realised. There is no use our having premises and curricula of instruction, be they ever so perfect, unless you are willing and anxious to make use of them. I know there are difficulties in the way of the boy who is resident in the neighbourhood. He has counter attractions, such as outdoor games and social engagements, which do not affect in so great a degree the provincial who has come to the city for the purpose of serving his time or earning his living; and I think it will be found that the 'foreigner,' if I may so call him, is therefore often found to be the more diligent worker, simply because he has not the home attractions that weigh so much with the city lad and occupy so much of his time. But whether

countryman' or 'Duhliner' it behoves you second the efforts of your elder brethren, benefit yourselves.

At the present time, on the other side of the Irish Sea, they are trying to formulate a scheme by which all existing schools of architecture will be brought under the superintendence of a head board or governing body, which board will be in close alliance or affiliation with the Royal Institute of British Architects, and as a matter of fact will consist mostly of Fellows of that body (at least that is the proposal of the Royal Institute of British Architects). As President I was nominated, by the Royal Institute of the Architects of Ireland, to attend a preliminary meeting of the Board in London which I did. I think it may be possible that some benefit may accrue to the English student—even possibly the provincial English student—by the operations of this Board, but it is not than doubtful that it will be of benefit to us. Our circumstances and surroundings are entirely different to those across the water in any set of conditions or requirements suitable for England would be altogether unsuitable for us. No, what we want is a little self-reliance and not to be afraid of a little trouble. It is a matter of common knowledge that we lack the ability, but we want a little more conceit. We are too modest and inclined to think that others can manage our affairs better than we can ourselves. What I consider we ought to do, and I know there are others who think with me, is to follow up our policy of last year and endeavour to persuade our Institute, the Royal Institute of Architects of Ireland, to formulate a proper and suitable examination, an examination based on the knowledge required by an architect practising in Ireland, such an examination as could be passed by one of our leading architects without it being necessary for him to read up a lot of extraneous subjects, and certainly an examination without catch questions. I think it is no body fitted to draw up and work such an examination but an Irish body; and no body in Ireland so fitted as the Council of the Royal Institute of Architects of Ireland.

Then we have to do our part. It is for the Association to teach the student and prepare him for that examination. Mind, I do not mean to cram him; far from it. If the examination is such as I hold it should be, he will acquire at our classes and lectures the knowledge requisite for the practice of his profession, and it should be our aim to see that our lecturers present the subjects in such a way that not to be retained for a little while and then forgotten. Do not think that this is the dream of an enthusiast. The principle of having an examination has already been agreed to and passed by a general meeting of the Institute, which action, as we know, has placed that body in rather a difficulty with the British Institute to which it is affiliated, but I think our Institute ought to be encouraged by the means in our power to establish an examination of its own. Until that is done our young members have not got any special target to object to work for, and, like school-boys, I am afraid, it is no use preaching to them; it is for their eventual good to work. There are many things that cannot be learned by going through the routine of an architectural office which it is, nevertheless, necessary to know; such as the history of architecture, facility in sketching. As was pointed out by the former President, there is nothing so good as teaching design and construction as sketching; you look at a building or a window, or some object, and then go away and try to reproduce from memory, you will find you have forgotten many of its most necessary features; but if you sit down and try to draw it, no matter how badly, you will find long afterwards you will remember the outline and details quite readily. That, I think, to an architect, is the real test of sketching, apart from the record which such a drawing gives for future reference. I have rather an objection to an architect posing as a third-rate artist as far as the hand or pencil goes; for, after all, with us drawing is only a means to an end, and not, as in the case of an artist, the end itself. If you can imagine it possible for a man to so describe or specify a building as to make it capable of being erected, and the building when erected was suitable to its purpose and pleasing to the eye, and if he could do this without a sketch, drawing of any kind, surely that man would be as great an architect as he who would describe a building by means of the most beautiful

drawings? But, be that as it may, there is no doubt that you can impress an object much better in your memory by drawing it than by merely gazing at it and trying to recollect its peculiarities; and it follows that if you can wield the pencil with facility and ease you are much more likely to spend your spare time sketching than if your efforts have to be labelled to tell that they are. It is surprising how quickly we can get into the way of it, and what a pleasant occupation it is, especially if you are accompanied by kindred spirits such as one meets on the little excursions organised by this Association. Also a friendly hint sometimes saves one much tribulation, and I may say all you that amongst our members there are not a few who can hold their own with the best. Another thing I would like to warn the student against is the danger of becoming a superficial, flashy draughtsman. I have known some who could make a beautiful perspective or sketch, but if required to draw a detail for practical working drawing were quite out of it. There is no use trying to draw a thing that you don't understand; it is necessary to understand first and draw it afterwards—that is, you must learn your building construction before you design. Just as a musician has to learn his harmony, etc., before he can compose.

Students are often shy about joining a class or design club, or even don't like to show others their attempts at sketching; and, of course, it is only natural that they should be, especially at first; but if they once take the plunge they will very likely find that they are just as good as the next man, and perhaps better.

We who have had the privilege of being born in this city have been brought up as it were in an architectural atmosphere; we are conversant from our babyhood with fine examples of classic work, erected, I believe, mostly in the time of Grattan's Parliament. Surely, therefore, we ought to have it in our blood to do good work if we get the chance. Unfortunately, it seems to be the opinion of not only our neighbours, but of our own public, that there is not such a thing as an architect to be found in this country, so that whenever a building of any style or magnitude is to be erected a foreign expert is employed, and sent touring the Kingdoms and the Continent examining examples of the work he is supposed to have at his fingers' ends. It is far for us to make such a state of things impossible by using every ounce in our power to perfect ourselves in our art, and then showing our countrymen, by means of competitions or otherwise, that there are men practising here equal to any.

If the public only knew and understood, even now things would not be so. I fully believe that a client will get better and more loyal service from a qualified local architect than from one who has been imported; so the practice of the profession is purer in this country than elsewhere, and that is one of the things for you coming men to look to—to uphold that standard of upright fair dealing and honesty, that incorruptibility which has been established by our seniors, especially in this city. An architect is employed by his client and is paid by his client to give him the benefit of his technical knowledge and experience and to protect him from those who might take advantage of his inexperience. Sometimes even you have to protect him from himself. The days when an architect made a catch and had finished are gone. Now he has to be half a solicitor with a knowledge of the law, so as to keep his employer out of difficulties. He often has to practically arbitrate between the proprietor and the builder; therefore unless he is an honest, trustworthy man he is worse than useless.

Now I know there are some, even in this country, who do not see eye to eye with me on these matters; who are inclined to think that we are a very small community, and that we are altogether overshadowed by our larger neighbour, and that therefore it would be foolish and almost presumptuous for us to endeavour to establish a regular school of architecture in this country. With regard to such points we stand here in rather a peculiar position, and it is most necessary to take into full account such opinions, especially when they are held by members of this Association. We know that they are honest opinions, and that those who put them forward wish us nothing but good, and are as anxious as ourselves to see this Society successful, and therefore we must give such arguments our full and open consideration. This Association is

made up of men of all shades of political and religious opinion, and I think as far as that goes we are a model that our countrymen would do well to follow. Each one is equal in all respects to the other, and no man thinks of questioning his fellow's right to be heard on any subject within our scope. Therefore what I say is a personal opinion.

I do not see why Ireland can have schools of medicine, a school of law, schools of divinity, schools of engineering, dental schools—in fact, schools of everything, and not a school of architecture. I do not think it can be said we have not enough students; their number makes me quake. We cannot expect to commence in the position that has been reached by others after half a century, but surely we can make a beginning? Cannot we make a start and leave it to our successors to carry on the work from generation to generation, if necessary? Great things have small beginnings. We can hardly expect to be recognised at first throughout the world as a first-class educational body, or that the diploma given by the Institute will be taken as an absolute guarantee of competency; but we can look forward to such things coming to pass in the future, and I fully believe that that future will not be found so far ahead. Let us have a little belief in ourselves; let us strive to better the condition of architecture in this country; let us look forward to that time when the profession of architecture will be on the same footing as medicine or law, and the unqualified, incompetent practitioner unknown in the land. Why cannot we try to do these things for ourselves, instead of waiting with our hands folded until others give us a lead? I believe we can do a great deal to improve our position, and that if we hold up our heads and have a little self-respect, we will be supported not only by our fellow-citizens but by the public of Ireland."

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, Mr. J. Williams Benn, M.P., Chairman, presiding.

Loans.—On the recommendation of the Finance Committee, it was agreed to lend Camberwell Guardians 1,420*l.* for poor law purposes; Hackney Borough Council, 15,000*l.* towards the acquisition of Springfield Park estate as an open space, and 15,182*l.* for contribution towards Mare-street improvement; Guardians of Poplar Union, 65,000*l.* for poor-law purposes; and Islington Borough Council 160,959*l.* to repay outstanding balances of loans. Sanction was also given to Islington Borough Council to the borrowing of 240*l.* for electric light installation and street lighting purposes.

Addition to Selected List of Contractors for New Schools, etc.—On the recommendation of the Education Committee, it was agreed that the name of Mr. H. L. Holloway, of Union Works, Church-street, Deptford, be added to the selected list of contractors to be invited to tender for the erection of new schools and additions to schools.

Lambeth Bridge.—The Bridges Committee recommended that application be made to Parliament in the Session of 1905 for powers to enable the Council to undertake the reconstruction of Lambeth Bridge. The suggested design for the bridge shows a steel structure on granite piers. With a bridge 60 ft. wide it will be possible to obtain gradients of 1 in 30, which compare favourably with the present gradients. The estimated cost of the scheme is 872,000*l.*, of which 410,000*l.* is for the acquisition of property.

Mr. Strauss (Chairman of the Committee) urged that in the present dangerous condition of Lambeth Bridge the Council should take action, and in the opinion of the Committee the existing bridge should be replaced by a structure worthy of London.

Lord Welby, on behalf of the Finance Committee, moved that the recommendation be referred back to the Committee. He said that, in view of the large amount to which the Council was committed on capital account, further extensive liabilities should not be incurred at the present time. The Council had already undertaken an expenditure of about 2,000,000*l.* for works which were being carried out by the Bridges Committee. During the current and the two following years an annual expenditure of approximately 450,000*l.* would have to be met, and, until these schemes

were nearing completion, the Council should not commit itself to further capital expenditure for bridges and tunnels.

Mr. Bruce seconded the amendment, and showed that the scheme had already been before the Council, when, at the Finance Committee's suggestion, it was referred back. He declared that Lambeth Bridge was only used by local traffic.

Mr. S. Collins and Mr. Burns, M.P., supported the recommendation of the Committee.

Mr. Beaulcroft said that it was scarcely creditable to London that its bridges should be allowed to get into disrepair. If Lord Welby's amendment meant that the subject would be shelved for some years, he should find some difficulty in following him into the lobby. He hoped they would do something. If they could not see their way to reconstruct the bridge, it should be immediately put in a proper and safe condition to meet the needs of the people who lived near it.

Colonel Rotton said that no doubt Lambeth Bridge was in a dangerous condition and required attention, but whether they could spend some 900,000*l.* upon it was a matter which required consideration. He should support the amendment on the condition that when the character of the Westminster improvement was decided upon the improvement of Lambeth Bridge should be discussed.

Mr. Ward was surprised that Lord Welby had brought up no alternative scheme. Some years ago they had called in Sir Benjamin Baker, who told them that the bridge was dangerous. It was then patched up. Now their engineer came to them again and said that the bridge was dangerous. It was the duty of the Council to say that the bridge should be constructed as soon as possible.

After further discussion, the amendment was, on a show of hands, carried by 60 votes to 37.

The recommendation was accordingly referred back to the Committee.

New Lodging-house, Kemble-street.—The Housing of the Working Classes Committee brought up the following report:—

The scheme for rehousing persons to be displaced by the formation of the proposed new street from Holborn to the Strand requires that the Council shall provide on a central site a lodging-house for the accommodation of 610 men, and a site on the cleared area at the corner of Kemble-street and Drury-lane has accordingly been allocated for that purpose. As regards the amount of accommodation which can most advantageously be provided on the site, we are satisfied, after conferring with the officers, that a building to accommodate 699 men can most conveniently be placed thereon. Plans of such a building have accordingly been submitted to, and approved by, the Secretary of State for the Home Department, and the Council on June 21, 1904, gave authority for tenders to be invited from a number of selected firms for the erection of the building in accordance with the approved plans. Ten tenders for the work were received during the recess and opened by our Chairman under the authority given by the Council on July 26, 1904, and the particulars thereof are as follows:—

H. L. Holloway, Union Works, Deptford, S.E.	546,100
Charles Wall, Ltd., Uperene-road, Chelsea, S.W.	47,000
Kirk and Randall, Warren-lane Works, S.E.	48,237
John Mowlem and Co., Grosvenor Wharf, Westminster, S.W.	48,241
F. and H. F. Higgs, Station Works, Loughborough-junction, S.E.	48,400
Leslie and Co., Ltd., St. James' House, Kensington-square, W.	49,130
Holloway Brothers (London), Ltd., Belvedere-road, S.E.	49,300
Foster and Dicksee (Rugby)	49,576
Lawrence and Sons, 14-16, Wharf-road, City-road, E.	49,972
Henry Lovatt, Ltd., London and Wolverhampton	51,600

The estimate comparable with the tenders is 46,250*l.* Provision has been made in the form of contract for certain portions of the work, such as the installation of steam and hot-water services, to be carried out by approved sub-contractors. The house will be similar in character to Carrington House, although slightly smaller in size, accommodation being provided for 699 men, as compared with 802 at the latter. A part of the building, with a separate entrance from Drury-lane, will be set apart for the purposes of a dispensary, for which rent will be received, as it is necessary that the Council should provide such accommodation within the parish of St. Clement Danes in lieu of a public dispensary to be demolished under the Clare Market scheme. By making such provision the payment of compensation in respect of the loss of an annuity will be avoided. The building has been arranged in such a manner as to obtain the maximum amount of sunlight in the internal courts, and uninterrupted light will practically be secured to every room in the building. The disposition of the principal rooms in the house is as follows:—

The entrance is central from Kemble-street, and gives access to the dining-room on the left and to the smoking-room and reading-room on the right. The office commands the entrance for lodgers and staff, and is arranged close to the superintendent's quarters. The dining-room is approached from two main corridors, and is designed to have a central area for light and air to the basement. A hot plate about 20 ft. long is arranged near the centre of the room, with lodgers' sculleries attached, and the lodgers' crockery store and lockers are in close proximity. The shop for sale of hot and cold viands is placed in a convenient position in the dining-room, and has communication with the kitchen in the

basement by means of a lift. The smoking-room is arranged on the Kemble-street and Drury-lane frontages. It is well-lighted and has cross ventilation. The reading-room is approached from two main corridors, and has central area, which is accessible to lodgers. This room is also well lighted from sides and roof and has cross ventilation. The amount of accommodation provided in the dining, reading, and smoking rooms is shown in the following table, and similar information with regard to Carrington House has, for the purposes of comparison, been included also.

Rooms.	Total area.		Area per lodger.	
	Kemble-street House.	Carrington House.	Kemble-street House.	Carrington House.
Dining-room	sq. ft. 4,827*	sq. ft. 6,067*	sq. ft. 6.91	sq. ft. 8.4
Reading-room.....	2,722	3,057	3.89	3.80
Smoking-room	1,904	2,031	2.72	2.53
Total	9,453	11,155	13.52	13.87

*Inclusive of area around hot plate.

"The lavatories, bathrooms, washhouse with drying chamber, shops for shoemaker and barber, and crockery stores, larder, and linen-store are all placed in suitable positions in the basement. Two principal staircases are provided leading to the dormitories, and an emergency staircase with exit to Drury-lane, so that it will be practically impossible for all means of exit to be blocked in case of fire. Each cubicle is about 4 ft. 10 in. wide and about 7 ft. 4 in. long, and is provided with a window, ample means of through ventilation being thus secured. The cubicle corridors are 4 ft. 6 in. wide. Two cubicles on each floor will be occupied by the resident male porters.

"As the Council is aware, the charge for accommodation at Parker-street House and Carrington House is 6d. per cubicle per night, but, in order to make the new house self-supporting, we regret that it will be necessary to make some variation in the charges. We understand that during the past year the Rowton House Company has also raised the charge from 6d. to 7d. in the case of lodgers who take a cubicle for one night only, while the old rate of 6d. still holds good for lodgers taking a weekly ticket. It appears to us desirable that a similar course should be adopted with regard to Kemble-street House rather than that the charge should be increased to 6d. per night for each person and the estimate of receipts and outgoings, as submitted by the Finance Committee, has accordingly been prepared on that basis. We have forwarded to the Finance Committee an estimate of 50,920, in respect of the cost of the building, and have included therein, in addition to the amount of the lowest tender, a sum of 3,920, in respect of the supply and fixing of the necessary apparatus for lighting and ventilation and other extra work, as well as expenses in connexion with the preparation of bills of quantities, lithography, printing, professional charges, and digging of trial holes. The provision of furniture will form the subject of a further estimate at a later date. We recommend—

"(a) That the estimate (No. 4,253) of 50,920, submitted by the Finance Committee be approved, and that expenditures not exceeding that amount be sanctioned in respect of the erection of the proposed lodging-house at the corner of Kemble-street and Drury-lane, to be known as Kemble-street House.

"(b) That the tender of Mr. H. L. Holloway, amounting to 49,100, for the erection of Kemble-street House be accepted; that the solicitor do prepare, and obtain the execution of, a contract to give effect to the tender; and that the seal of the Council be affixed to the contract when ready."

Dr. Cooper moved that the recommendation be referred back to the Committee. The lodging-house would not cater for the poorest class of workers near the Strand, who most required accommodation. These people had previously been paying only 4d. and 5d. a night, and they could not afford to pay the new charges. He doubted whether the house would be a success.

Mr. Jephson seconded the amendment.

Mr. Burns, M.P., said that the "dossers" of London were yearly increasing, and deprecated any attempt to increase their number by providing them with accommodation. The aggregation of large numbers of celibate vagrants in one spot was not desirable. He was strongly against big lodging-houses. The Council had gone too far already in that direction, and they were finding that their Carrington House in Deptford was not paying.

After some further discussion, the amendment was rejected.

The recommendation was adopted, and Mr. Holloway's tender for the erection of the house was accepted.

Shelters over the Public Way.—The Building Act Committee reported as follows, the recommendations being agreed to:—

"We have before us at the present time several applications for permission to erect glass and iron shelters over public ways. The number of such applications received during the year is considerable, and we feel that it would be much to the public advantage if the Council would indicate the line of policy which it desires to follow with regard to them, so as to save applicants the trouble and expense of making applica-

tions which the Council might feel bound to refuse. We do not think that any objection can be taken to this course, provided that it is at the same time made perfectly clear that the Council reserves to itself the right to deal with any application as it deems fit. The Council has, in dealing with the question in the past, jealously guarded the public interests, and has not allowed shelters except where it has been shown that they are for the public benefit. The applications for shelters at places of public resort which have been dealt with by the Council between January 1, 1899, and July, 1904, are as follows:—

	Consents.	Refusals.	Total.
Theatres and music-halls ..	36	3	41
Public halls	15	5	20
Hotels	21	22	43
Restaurants	10	13	23
	84	43	127

"The few applications made with respect to flats, offices, and club buildings have been refused, and in the cases of business premises and private residences only six have been granted. It is, we think, an absolute necessity to afford some protection from inclement weather to the persons frequenting places of public resort, and in the large number of cases where the Council has refused permission for a shelter to be erected some special reason has existed for its action. For example, the position proposed for any such shelter, its mode or mode of construction was unsatisfactory, or the amount of projection over the footway was too great. In all applications sanctioned in recent years the Council has refused to allow a shelter to be erected by pillars or lamp-posts, and has insisted upon the shelter being supported on cantilevers. In several cases where the design was of an objectionable character the Council has required it to be removed. We think, however, that in future the Council should in all cases insist upon the design of the shelter being artistic and in harmony with the architecture of the building. The desirability of the Council insisting upon the shelter being erected in accordance with definite principles to guide applicants and to secure general uniformity has been emphasised by the recent action of the Council with regard to the proposed shelter at Lyons' Temperance Cafe. We recommend—

"That it be referred to the General Purposes Committee to bring up an addition to the order of reference to the Building Act Committee, to provide that—

"(a) That the Council, when considering any application for permission to erect a shelter over the public way, will bear in mind that the Council, while reserving to itself in all cases the right to deal in such manner as it may think fit with any such application, is not disposed to sanction the erection of any such shelter which does not comply with the undermentioned conditions:—

"(a) That the building to which the shelter is to be attached be either a theatre, music-hall, or public hall, with seating accommodation for at least 150 persons, or a restaurant or hotel, with seating or sleeping accommodation for at least 200 persons.

"(b) That the street in which the shelter is proposed to be erected be at least 40 ft. in width if used for vehicular traffic, and at least 20 ft. in width if used for foot traffic only.

"(c) That the design of the shelter be to the satisfaction of the Council.

"(d) That the shelter be supported on cantilevers; that there be no obstruction to the public way; that no part of the shelter or of the supports thereof be at a less height than 8 ft. 6 in. above the pavement level or at a less distance from the outer edge of the kerb than 18 in.; and that no advertisement, sign, lettering, or device other than the name of the premises be placed over or upon or affixed to the shelter.

Rules as to Theatres.—On the recommendation of the Theatres and Music-halls Committee, the following rule was added to the rules to be observed by the licensees of premises licensed by the Council:—

"Whenever it is desired to make use of any portable or temporary steam-boiler on or about the stage, for scenic effects or otherwise, not less than twenty-one days' notice must be given to the Clerk of the Council, and the fittings and arrangements in connexion with the boiler must be inspected and passed by the Council's officers before the boiler is used.

"All boilers, pipes, radiators, etc., used for heating purposes must be equipped and maintained in accordance with the Council's regulations, copies of which may be obtained on application to the Clerk of the Council. Supply tanks must be covered and protected from frost, and the pipes and radiators must be protected where necessary by properly secured guards.

"The owner of each boiler, whether for hot water or steam, must always be prepared to exhibit to the Council's officers a certificate, dated within the previous twelve months, from some recognised insurance company or qualified firm of engineers, showing that the boiler is in condition to safely carry the pressure to which the safety valve is loaded."

A City Improvement.—The Improvements Committee recommended, and it was agreed, that the estimate of 2,000, submitted by the Finance Committee be approved; that a contribution be made on the usual conditions of half the net cost of the widening of Old Broad-street at London-wall, proposed to be undertaken by the City Corporation.

Houses of Historic Interest.—Upon the recommendation of the Local Government and Records Committee, it was agreed to affix a memorial tablet at No. 23, Suffolk-street, W., where Richard Cobden lived. The Committee reported that the Duke of Bedford had fixed tablets at his own expense at the following houses on his estate:—65, Russell-square (Sir Thomas Lawrence); 11, Bedford-street (Henry Cavendish); 6, Bloomsbury-square (Isaac D'Israeli); 28 and 29, Bloomsbury-square (Lord Mansfield); 43, King-street, Covent-garden (Admiral Lord Orford); 27, Southampton-street, Covent-garden (David Garrick).

The Council adjourned at seven o'clock.

APPLICATIONS UNDER THE LONDON BUILDING ACT, 1894.

The London County Council at their meeting on Tuesday dealt with the following applications under the London Building Act, 1894. The names of applicants are given between parentheses:—

Lines of Frontage and Projections.

Wandsworth.—A building on the south-west of West-hill, Wandsworth, at the corner of Ringford-road (Messrs. Palgrave and Co. Mr. R. Le Butt).—Consent.

Hampstead.—Additions to All Souls' Church, Loudon-road, Hampstead (Messrs. Nichol and Corlette for the Rev. G. F. Terry).—Consent.

Clapham.—Eight houses, with bay-window on the east side of Park-hill, Clapham, northward of "Lyndhurst" (Mr. H. J. Capell, Mr. A. Peacock).—Refused.

Lewisham.—Houses with bay-windows on north side of Belmont-hill, Lee, westward, "Moray House" (Messrs. H. and G. Taylor).—Refused.

Woolwich.—A projecting one-story shop building, to abut upon the south side of Cordite-street and west side of Basildon-rd, Plumstead (Mr. J. O. Cook for Mr. A. Beard).—Refused.

Width of Way.

Southwark, West.—A two-story building, a site abutting upon King's Head-yard, White Hart-yard, Southwark, with external walls at less than the prescribed distance from the respective centres of the roadways of the streets (Messrs. Barlow and Roberts).—Consent.

Width of Way and Line of Frontage.

Peckham.—The rebuilding of the "Nun's Head" public-house, Nunhead-rd, Peckham, abutting also upon Scylla-road, May's-place (Mr. J. Hamilton for the London Brewery Company, Ltd.).—Refused.

Width of Way and Space at Rear.

Hampstead.—Three shops, with dwell-houses over, on the north side of West Hill-lane, Hampstead, westward of Finchley-rd, with a forecourt boundary at less than the prescribed distance from the centre of roadway of West End-lane (Mr. R. L. Peck for Mr. E. J. Cave).—Consent.

Width of Way and Construction.

Limchase.—A wood and iron addition to a building on the west side of Kidney-street, Narrow-street, Limchase (Mr. E. Gregg Pintes's Patent Lighting Company).—Consent.

Formation of Streets, etc.

Kensington, South.—That an order be issued to Messrs. T. Holloway and J. Douglas, sanctioning the formation or laying out of a street for carriage traffic to lead out of east side of Church-street Kensington, and in connexion therewith the erection of buildings.—Consent.

Hammersmith.—That an order be issued by Mr. A. Young sanctioning the formation of a new street for carriage traffic to lead from Ducane-road to Old Oak Common-lane, Hammersmith, and in connexion therewith the widening of a portion of Old Common-lane (for the Housing Committee of the Council).—Consent.

Lewisham.—A deviation from the plans sanctioned in 1899, for the formation or laying out of new streets on the Belmont estate, Belmont-hill, Lee, so far as relates to alteration in the formation of Caterham-rd (Mr. W. P. Neal for Messrs. H. and Taylor).—Consent.

Lewisham.—That the application of Messrs. Eastman Brothers for an extension of the period within which a new street for carriage traffic to lead from Dartmouth-road to Sydenham Hill-road, Lewisham, was required to be clearly defined throughout by posts and gates or otherwise as the Council might permit and thrown open to the public as a highway be granted.—Consent.

Space at Rear.

Hammersmith.—A modification of the provisions of section 41 with regard to open spaces about buildings, so far as relates to the erection of a one-story building at the rear of No. 66, Ilfley-road, Hammersmith, to abut upon Adre-road (Mr. C. Butterill for Mr. Hanks).—Consent.

Lewisham.—A modification of the provisions of section 41 with regard to open spaces about buildings, so far as relates to the proposed erection of five buildings, with a stable at rear, on the north side of Marischal-rd, High-road, Lee (Messrs. D. Smith, Son, & Oakley for Earl St. Germans).—Consent.

Means of Escape from the Top of Buildings.

Strand.—Means of escape in case of fire proposed to be provided in pursuance of

on 63 of the Act, from the fifth (top) and sixth stories of Nos. 1 and 11, Cockspur-st., and Nos. 18 and 19, Pall Mall East. The upper surfaces of the floors of the two stories are above 60 ft. from the street level for the persons dwelling or employed therein (Mr. H. Tanner, jun.).—Consent.

ENTRANCE GATEWAY TO ST. DAVID'S CHURCH, PADDINGTON.

The gateway, the gift of Mr. H. Powell-Cotton, has been recently erected in memory of the late Canon Edwards of Llandaff. It is built of Bath stone (fluated). A ribbed iron roof, terminating in a hood, covers the passage for a short space behind the arch, which is like a lych-gate. An old high wall

at one side of the forecourt has been pulled down, and new wrought-iron railings, gates, and lamps erected, the main object being to give greater importance to the church entrance, as the church itself stands back from the road, at the end of a long passage.

The work has been carried out by Mr. J. Casé, of Hampton Wick. The architect is Mr. John P. Seddon.

THE ARCHITECTURAL ASSOCIATION DISCUSSION SECTION.

The first meeting of the Architectural Association Discussion Section, being a joint meeting with the Camera and Cycling Club, took place at 18, Tufton-street, on Wednesday,

the 19th inst., when Mr. G. H. Smith read a paper upon Canterbury Cathedral.

Commencing with the erection of the first church, he traced the gradual development of the building until the present day. His description was illustrated by a series of drawings, which materially assisted those present in understanding the various points touched upon. Among those emphasised were the similarity of the crypt to that of St. Peter's at Rome, the occurrence of disastrous fires at various intervals in the history of the building, destroying, among other parts, Conrad's "Glorious Choir," injury at the hands of vandals as exemplified by the introduction of panelling in the choir and Renaissance stalls, together with the demolition of St. Andrew's

ENTRANCE GATEWAY, ST DAVID'S (WELSH) CHURCH, PADDINGTON. J.P. SEDDON ARCHT.

Tower owing to its not harmonising with that dedicated to St. Anselm, and the narrow escape from the sacrilegious hands of Wat Tyler's mob. The cost of the south window in St. Anselm's Chapel was also mentioned, as showing the small sum expended in carrying out the work in 1336 compared with the cost of similar work to-day. In concluding, Mr. Smith referred to the large number of tragic occurrences which had taken place in the building, the murder of Archbishop Beckett paramount amongst them, and marking, as it did, an epoch in the history of the development of this cathedral, owing to the pilgrimages which set in and the consequent necessity of dealing with great crowds.

Mr. J. D. Crace, in opening the discussion, pointed out in regard to the crypt at Canterbury being based upon that of St. Peter's at Rome, that this was generally admitted to be in its turn copied from the Church of Constantine at Jerusalem. In the course of his remarks, he noted the fact of extra-mural burial, which was strictly adhered to until the death of Lanfranc. Continuing, he regretted that no view of the doorway leading from the north-west transept into the cloisters had been shown upon the screen, as such would have indicated that the present door had been cut into a previous one of a different style, which doorway in its turn replaced a still earlier example; he added that the cathedral was full of examples where new work had been either grafted on to or replaced work in an earlier style, and suggested this as an opportunity for camera work, which would prove of greater value in such instances than sketching. He wondered if Mr. Smith could inform the meeting if any remains existed in the so-called lavatory as showing its original use. A point he thought of interest to present-day architects was that a large part of the original monastic water supply—as shown in the drawings now in Clare College Library—is still in use to-day. Concluding, he said he was struck by the similarity of the capital of one of the crypt columns shown on the screen to that of the Towers of the Winds at Athens.

Mr. H. H. Statham, who spoke briefly, said that the cathedral was interesting from the point of view that it was a building which

afforded so many opportunities for the study of the gradual change from one style to the next in proper sequence. He also noted the marked French feeling running through the earlier portions of the building. In concluding, he expressed his great pleasure in being present that evening to see so fine a collection of slides.

The Chairman (Mr. H. Gregory Collins), in his remarks, regretted that he had only a slight acquaintance with the building. One of the points he noted when going over the cathedral was the great similarity in the work of William de Sens and William the Englishman. The Cathedral appealed to him as belonging to a class of building which stimulated the imagination, recalling the stirring events which went to make history in bygone times.

Mr. A. H. Belcher offered the suggestion that the *Builder* should start a new series of views of the cathedrals from fresh points of view.

Mr. Louis Ambler, in voicing the thanks of the meeting to Mr. Smith and the members of the Camera and Cycling Club for the trouble they had taken, called to mind the sketches, etc., of the cathedrals published in the *Builder* some years ago, and regretted that those of Canterbury were not on view that evening, for, no matter how excellent slides might be, they had not the same architectural and individual charm such as sketches possessed.

Mr. G. H. Smith, in replying, said that his paper was intended more as a description of the slides than aught else. In answer to a query, he described the frescoes under the Chapel of St. Anselm, a somewhat amusing point being that the artist, evidently desiring to be thorough in his work, and wishing to portray a man stricken dumb (Zachariah), had painted him without a mouth. In conclusion, Mr. Smith gave in detail the cost of the window before alluded to, and pointed out the relatively high cost of the metal as contrasted to the stone and glass work.

PROPOSED CANCER HOSPITAL, DUNDEE.—A new hospital for cancer patients is shortly to be erected in Dundee. Plans for the work have been prepared by Mr. James Findlay, architect.

Illustrations.

MONUMENT TO ALFRED DE MUSSET, PARIS.

THE sculptural monument to Alfred de Musset, here illustrated, was presented to the city of Paris by M. Osiris, a wealthy donor, who, as our readers may remember, had been an artistic benefactor to Paris in other important matters. He gave the commission for the monument to M. Mercié, the sculptor, some years ago.

The work was exhibited at the Salon of 1887, under the title "La Nuit de Malherbe," the heading of a well-known poem by de Musset. The sculptor represents the poet seated at a table, an attitude expressive of melancholy and sadness; the lyre, which he was wont to carry about with him, is lying at his feet. The figure behind, seen in profile, represents the poet's Muse, endeavouring to rouse his hopes again, in the hope that she will be once more her companion:—

"Poète, prends ton luth; c'est moi, ton immortelle.
Qui t'ai vu cette nuit triste et silencieux,
Et qui, comme un oiseau que sa couvée appelle,
Pour pleurer avec toi descends du haut des cieux."

Partons, nous sommes seules; l'univers est à nous.
The monument itself is still in the Musée des Beaux-Arts at Autenil, but is to be erected in Paris, in the first instance, in a planted space in front of the Théâtre Français. As this space is rather restricted, it is probable that ultimately it will be placed in a position, against the wall of the theatre, at the angle of the colonnade where the Rue Richelieu meets the Place du Théâtre Français.

Those who are familiar with the spirit of Alfred de Musset's poetry, its combination of melancholy with a spiritual refinement and passion, will recognise how remarkably Mercié has expressed this spirit in his sculpture.

ST. JOHN'S CATHEDRAL, UMTATA, SOUTH AFRICA.

Some six years ago the work of designing the proposed new cathedral for the Diocese of Umtata was commenced.

London, W.C.

John, Kaffraria, South Africa, was placed the hands of Mr. Geo. H. Fellowes Pryne by top Key.

Following to the death of the Bishop, considerable work was caused in commencing the work, the building has now been taken up by the late Bishop, although funds will only allow the western portion being put in hand at present.

The new cathedral when finished will be like a large parish church, accommodating some 1,500 people. The plan shows a uniform church, with a nave 147 ft. in length, 36 ft. in width, divided into seven bays, chancel is 67 ft. long by 30 ft. wide. The north and south transepts form chapels accommodating 189 and 146 people respectively. The east and west chapels are the vestries and organ chamber, the latter being over the clergy house, and speaking into the south chapel and east. The chapter house is in the crypt of the sanctuary.

The plan was unfortunately sent to us too late for illustration.

DESIGN FOR A CRESCENT.

The treatment of a crescent road forms an interesting subject for architectural study. This was suggested by Nash's method of laying Regent's Quadrant (illustrated in the *Builder* of January 2 in the present year), a colonnade of which ceased to exist in 1850. The ground floor of the buildings on either side of the curve of the crescent shows an arcade supporting a colonnade above, the height of two stories, the facade being divided into three blocks intermediate radial roads, bridged across to breaking the main horizontal lines of the facade, and to preserve the continuity of the terraces. It was thought that to get best effect from the curved plan the horizontal lines were better kept unbroken as far as possible. The open central space of the crescent is treated as an architectural garden with water surfaces to reflect the buildings and terraces, the monumental column emphasising the centre of the composition. The material used was Portland stone, including the pediment with an "eye" in the crown of the latter, and with plate glass, for lighting a hall below.

F. R. HIGGINS.

HOUSE OFFICES, Nos. 20 AND 21, QUEENHITHE.

The ground floor and basement of this building are used for a show-room and warehouse, the ground floor carrying heavy pieces of machinery. The upper part, entered by a separate entrance, is set off for offices. The building is built of fire-resisting materials throughout. The front elevation has a Portico base up to the sills of the second windows, above which are red brick facings and Portland stone dressings. The building is heated throughout with hot water, and hot air is laid on to the lavatories. The building is supplied with an electric lift to all floors. Among the greatest difficulties to be overcome in the construction were the foundations, as the building is close to the river, a great deal of work had to be contended with. Beams were 7 ft. wide and 5 ft. deep, strengthened with three strands of wrought-iron chain cable in the concrete, were placed under the foundations. The building has been finished in a little time, but no settlement has occurred yet. The general contractors were Messrs. Grover and the heating work was done by Messrs. Crittall and Co., the steel construction by Messrs. G. Aston and Son, The B. and S. Gate Co. supplied and erected the electric lift. The work was erected under the supervision of the architect, Mr. F. E. Williams.

INTERIORS, PALACE GATE AND STRATTON STREET.

Two pages represent interiors designed by Mr. C. J. Harold Cooper in the Palace Gate and two rooms in a house in Stratton Street.

At WEST HOATHLY, SUSSEX—Memorial-stones of the new Sunday school which is being erected in connexion with a Countess of Huntingdon's Chapel recently laid. The building will accommodate 150 children. The architect for the school is Mr. Hooper.

ARCHITECTURAL SOCIETIES.

LIVERPOOL ARCHITECTURAL SOCIETY.—The first members' meeting was held on the 17th inst., in the Society's rooms, 13, Harrington-street, Mr. Alfred Culshaw, F.R.I.B.A., presiding. A paper was read by Mr. G. H. Morton on "Modern Decoration." In the course of his remarks, the lecturer pointed out that modern decoration was not confined to one particular style, but had many phases, and included at least three main characteristics—first, that based on the styles of the XVIIIth century, under the names of "Queen Anne," "Georgian," and "Adam's"; secondly, that of the so-called "Modern English" school; and thirdly, the "Early Victorian" or naturalistic. Mr. Morton argued that so long as the XVIIIth century furniture was so eagerly sought after, so long would the decoration of that period be required; and he further pointed out the increasing tendency to adopt contemporary French decoration. As regarded "Modern English" design, the lecturer said that it had so frequently been carried to excess, and had in many cases developed such eccentricities, as to make it conspicuous even to vulgar eyes—so much so as to cause a reaction that had brought about a revival of its opposite in the realistic representation of flowers and other objects peculiar to the decoration of about fifty years ago, and not inaptly named "Early Victorian." The lecturer referred at some length to the importance of colour in decoration, remarking that colour was not only an aesthetic gratification but a physical necessity, and should be studied scientifically. The excess of one brilliant colour, especially red, was injurious to the eyes; and an overpowering quantity of white was also undesirable, because it gave the retina no rest. In conclusion, the lecturer again referred to "Modern English" design and its infinite superiority over the so-called "Early Victorian," probably the worst period of English decoration. "Modern English," Mr. Morton said, "was original, quaint, and picturesque; it took into account the capabilities and nature of the materials it employed; it was not extravagant, but suited to the requirements of most of us, and if kept within proper limits should prove most suitable to the present day, and be the distinguishing mark of modern decoration."

COMPETITIONS.

TOWN HALL AND MUNICIPAL BUILDINGS, PRETORIA.—A young Glasgow architect, Mr. John Ralston, has been selected to carry out the erection of the new Town Hall and Municipal Buildings for Pretoria. Mr. Ralston was trained in the office of Mr. Crawford, in Dumbarton, and of Mr. Cullen, in Hamilton; but he was for a number of years a student and latterly an assistant in the Architectural Department of the Glasgow Technical College.—*Glasgow Herald*.

Books.

Michael Angelo. By LORD RONALD SUTHERLAND GOWER. London: Bell & Sons, 1903.

To do anything like justice to such a man as Michael Angelo, in all his versatility as sculptor, painter, architect, and poet, in a book of 131 pages (including a defective index) must, on the face of it, be an utter impossibility. But this, apparently, is what Messrs. Bell commissioned the author to do. In any case, to put it plainly, there is enough in the style and manner of the book before us to raise doubts of Lord Ronald's ability for such a work, however planned.

Since the publication of John Addington Symonds's "Life of Michael Angelo," there could be little excuse for any inaccuracies as to the artist's personal history, and to do the author of the book under review every justice, this part of his task he has done well enough. But from the lips of a practical sculptor, as he tells us he is, and a friend of Watts, the painter, as he appears to be, we have a right to expect something more. In fact, we look for evidence of insight into the reasons for the master's success, as well as a just appreciation of, and intelligent sympathy with, his eccentricities to a degree not given to the ordinary layman. We are, therefore, heartily thankful for the quotation from a letter of Watts to Lord Ronald, which the latter prints by way of preface, and which constitutes the only bit of

interesting criticism in the book. The letter is charmingly written, but too long for quotation here; in it Watts gives it as his opinion that Michael Angelo was a better painter than sculptor. He cannot resist commenting on the ill-proportioned extremities in the David and others of the later sculptures. This, an eccentricity which many besides Watts have considered a fault, is, however, not so apparent in the early as in the late work of Michael Angelo. And it may be noted that his drawings and his clay studies fall naturally enough into two groups or divisions—those which are drawings or models done from the life, and those which are studies made directly for a large work in painting or sculpture. The former are nearly always delicate, refined, truthful; the latter perhaps more vigorous, but infinitely more exaggerated in pose and in detail. Certain considerations relative to the master's attitude of mind may, in some measure, account for this noticeable difference. He shows far greater sympathy for the male than for the female nude. The subtle transition from the round to the square, which is the great charm of the male form, was evidently the characteristic which he mostly insisted on, and which, when exaggerated, leads to great dignity and significance in the mass and "skyline" of a statue. To a student working with this in his mind, the extremities of the figure afford the most interesting examples of this ever-changing line, and the danger of over-emphasising its phases is one which every student is told to guard against, and it certainly is the fact that Michael Angelo only gave way to it in his later life.

The publishers have allowed the book before us to be disfigured by an advertisement for a picture-dealer, introduced in so misleading a manner as to appear like a subsidiary note to the volume. This is hardly creditable to Messrs. Bell's judgment and taste.

Haddon Hall: An Illustrated Account of the Fabric and its History. London: Sherratt & Hughes, 1904.

It is very seldom that an essay of 147 pages, designed to cover the history and antiquities of an old, notorious, and romantic habitation, can be justly described as comprehensive, interesting, and thorough. Mr. Cheetham has, however, written a book of which this can be said. The author, too, evidently loves his subject, but this love of his cannot altogether atone for the somewhat halting diction and an almost total lack of style, which disfigure part of the writing. The preface is exceedingly modest, and claims for the book little more than the position of a *guide* to Haddon Hall. The work, however, is in most respects admirable, and worthy of a larger and more pretentious volume; and ought, guide or no guide, to be printed on better paper, and, above all things, to contain an index.

Haddon Hall is so beautiful an example of an old English house, and so agreeably planned and situated, that it is matter for astonishment that its present cultivated owner, the Duke of Rutland, finds it possible to leave it uninhabited. Yet there it is—gardens, terraces, dutifully tended; its window-panes glistening with delightful old glass; its rooms well-lined with decent wainscot; but never a puff of smoke from aught but the custodian's chimney gladdens the eye of the traveller along the valley. Family life still centres round the hearths of Penshurst and Hever, and why not of Haddon? Rich in historic association, Haddon bears the traces of almost every style of English domestic building from the Norman days to the more peaceable XVIIth century. Curiously enough, however, the owners of Haddon were never allowed to make it a regular castle, and it is a credit to its lords, therefore, that it survived the lawless and irresponsible behaviour of the English nobility during the reigns of Henry VI, and his successor.

Mr. Cheetham's work is thoroughly well illustrated with photographic views of the house and its surroundings, and contains a set of very well executed plans. If the publishers are wise, they will make this volume the first of a thoroughly comprehensive series of monographs on the older and finer English houses; but they should spend a little more money and trouble on the "set up" of such books, which would then, we think, command a satisfactory sale.

European and Japanese Gardens: Papers Read Before the American Institute of Architects. Philadelphia, 1902.

A book without an index is, in one respect at least, like a servant without a character,

for it sets up an attitude of mind in the possessor which, on the detection of the least fault, will prompt him to discard it for ever. If these papers by eminent hands were worth collecting and editing at all, they were surely worth indexing when printed. As a matter of fact, these particular contributions are peculiarly good, and put to shame many an essay read before the more distinguished architectural societies of England.

The paper on Japanese Gardens (by Mr. K. Honda) is perhaps the most attractive and, in many respects, the most important to the modern architect, because Japanese gardens are beginning to find favour in the South of England, and prove to be perfectly capable, within certain limits, of adaptation to English scenery and to English architecture. The writer has just lately visited such a garden near Salisbury, where a Japanese gardener came down from London, examined the site, settled his design, made a drawing, and was away within two hours of his arrival. In due course came plants from Japan and directions from London, whereby the local gardeners were enabled, without the least trouble or misunderstanding, to produce a most charming and successful effect entirely on Japanese lines. As may be seen by reference to a short paper at the end of the volume before us, experiments in Japanese gardening conducted in California have proved in the highest degree successful. The appropriate plants, shrubs, and trees are, of course, at present very expensive, but now that we know that many of them can be grown with comparative ease in England, it will soon be possible to purchase seedlings from English specimens, instead of importing from Japan.

Historically, the series of papers before us emphasise the fact that English gardeners alone seem to have been able to design well without water effects. The French, like the Italians—their masters—could only deal formally with water. The Japanese are the great masters of informal water treatment.

The plates which ornament and enhance the value of the book are all of them excellent, but are printed, as is the text, on the worst possible leaved paper—a material which it is high time for all good publishers to discard.

The Principles of Architectural Perspective.

By G. A. T. MIDDLETON, A.R.I.B.A. London: B. T. Batsford.

This is a small book, prepared "chiefly for the use of students"; and containing, in addition to general principles, chapters on Isometric drawing and on the preparation of finished perspectives.

As far as explaining the manner of working out a perspective this is a very useful book, and has the merit of brevity and of not confusing the student with examples showing an immense complication of construction lines, by which we believe many beginners are alarmed at the outset of their study, and conceive of perspective as a science of great and abstruse difficulty; whereas in fact the principle of it can be very simply stated, and once grasped, its application to any special subject to be drawn is only a matter of practice combined with care and attention.

We do not know however that here, any more than in most other instruction books on perspective that we have encountered, we find what we should call an ideally clear setting forth of the theory of perspective at starting—of what the science actually is and on what method it proceeds. The author employs in the preface the illustration, which is a very good though not a new one, of the lines of a building being supposed to be traced on a pane of glass between the eye and the object, as representing the projection of a solid upon a picture-plane; but what we want to see in a perspective book is a brief and clear definition, for the beginner, of the mental process and the geometric principle on which a projection of a solid in lines on a flat surface is carried out; keeping clearly before the reader's mind that this process is the converse of the imagined projection of the image of the solid object on an interposed pane of glass. Mr. Middleton, in his explanation of the vanishing points, comes a little nearer to an explanation of the "why" of the thing than we generally find in books on perspective; but still we do not find that clear and rounded statement of the theory of perspective which we think ought to precede all diagrams of construction. The student should be told clearly what he is aiming at before encountering any details as to the method of putting the

theory into operation; and this we cannot remember to have found in any instruction book on perspective. The student is instructed to work on the lines of certain diagrams and certain results will follow; but he is too much left to deduce the theory from the examples.

The chapter on Isometric drawing shows, on page 65, one very practical use to which this form of perspective drawing may be put, in rendering a plan of a building intelligible to those who do not understand it as a flat geometrical representation; (the editor of this journal, indeed, made that very use of it to explain the meaning of plan, in a diagram in "Architecture for General Readers"). The reduced illustrations from finished perspectives by some accomplished draughtsmen are a very useful addition to the book. In the chapter on "Finished Perspective Drawing" there seems to be a mistake, by implication, in regard to the reproduction of drawings: after observing that drawings for reproducing must be in black ink, the author says—"where reproduction is not the object, there is much more freedom of choice, and many prefer to use brown ink," etc.; as if this would not do for reproduction; whereas, in fact, brown ink reproduces just as easily as black.

TRADE CATALOGUES.

MESSRS. YALE AND TOWNE have sent us a small catalogue of locks and builders' hardware. In addition to a great variety of "Yale" locks and latches, the catalogue includes mortise-locks and latches of more ordinary type; a special feature is made of the furniture for upright mortise-locks, many of the sets being very well designed with oval plates to receive both the knobs and the escutcheons. Padlocks, bolts of various types, and other kinds of builders' hardware are also shown. The catalogue is admirably illustrated, and the descriptions are clear and concise.

The Eclipse Copper Company, of York, send us a small catalogue containing descriptions and illustrations of their "Siamese" circulating water-boilers for restaurants, etc. These are such marvels of economy and utility (if we may believe the high-flown descriptions given by the makers) that we are at a loss to understand why any other apparatus is ever used for boiling water. Twopennyworth of gas, we are told, will boil sufficient water for 900 pints of tea, "after boiler has once been warmed up." There is no danger, no necessity for a fire-pipe, no visible steam, no smell, no noise, no trouble, and the apparatus is not a geyser. The materials are all of the best—"solid copper, brass, or German silver" (no "compound" or alloyed metal used by us). What, pray, is brass? And what is German silver? In the absence of sections it is impossible to understand clearly the construction of the "Siamese" apparatus, but we take it to be approximately as follows:—It consists of two cylinders, under one of which the gas-jets are placed; the cylinders are connected by a large pipe near the top and by a small pipe near the bottom, so that the water circulates through the two cylinders; the water-service is connected to one of the cylinders, and the dual arrangement allows an ordinary long-lever ball-cock to be fixed, so that the water is maintained at one uniform level; the taps have long outlets or nozzles to prevent the exit of steam. Certainly the apparatus has some interesting and useful features.

Messrs. E. H. Shorland and Brother, of Manchester, have sent us their catalogue of warming and ventilating appliances. The first place is given to the various types of their well-known "warm-air ventilating Manchester grate with improved projecting back." Some of the designs are a great improvement on the original, glazed bricks and faience being introduced with good effect, and copper canopies being in other designs substituted for the older form of iron canopy. The ventilation section of the catalogue has been extended, and includes inlet and outlet ventilators of different designs and types. The third section contains complete particulars of the "Manchester" stoves, which have been largely used in hospitals and schools, and supply warmed fresh air in addition to radiant heat. The stoves are made with open or closed fires and with ascending or descending flues, and may be obtained with a simple iron casing or with tiled panels in an iron framework or entirely encased with faience. The catalogue is fully priced and illustrated, and the three sections are printed on paper of different colours to facilitate reference.

Messrs. Hodkin and Jones, of Sheffield, send us a circular describing their "corrugated bar system" as applied to fire-resisting design. The system in question is virtually an approach to concrete-steel construction (thin steel bars of corrugated section are on edge in concrete, displacing ordinary girders or joists). Throughout the circular comparisons are made with joists of the section, and the superiority of the corrugated bar system is demonstrated by illustration, records of tests. In our opinion, the advantage to be expected from the employment of it in the manner described are greater than following the use of I-sections and less than those offered by true concrete-steel.

Messrs. Hall and Pickles, of Manchester, send us their "stock" catalogue of iron steel bars, plates, and girders, an excellently printed, well-bound book of convenient dimensions. Details are given of almost all commercial forms of iron and steel in general use by architects and builders, and we draw particular attention to the bright-rolled steel bars catalogued, these bars being round, square, flat, and hexagonal cross-section suitable for use as shafting, for making and for other purposes. Lists are also included of rolled steel joists and broad-flange beams kept in stock, the information supplemented by tables showing the safe load on the same sections used as beams and columns. While not doubting the accuracy of the figures in the tables, we must point out that the values have to be taken either on trust, and in the case of beams it is not clear whether calculations are based on the assumption that the ends are fixed or merely supported. The book concludes with tables of compound girders, cast-iron columns, and number of tables giving the weights of sections mentioned in the preceding pages.

Messrs. Henry Hope and Sons (Birmingham) send us a very finely printed and illustrated catalogue of their metal casements and wrought-steel sashes. The firm have now produced three new ranges of sections—Nos. 1, 2, and 3, each of which can be supplied either upwards hung at side or top, or inwards at side or bottom. The carefully selected sections of these windows seem to be a thing that could be wished in regard to proper design. The appearance of the finished window is illustrated in each case by a photograph from the actual work. The catalogue also includes hopper casements and cheeks; wrought-iron and gun-metal hinges, bolts, and stays, wrought-steel sashes, gears, etc. Photographs of a good number of buildings which have been fitted with sashes by this firm are given, and serve to show the appearance of the sashes is quite in harmony with buildings of specially artistic character, as indeed plain but solid and well-executed work generally is. The decoratively wrought-iron and gun-metal casement sashes are of good design; but in other respects the work shown is entirely plain, and it is in the preface that highly elaborated ornamental detail has been avoided, not because we think it undesirable, "but because we are convinced that such work must be so produced for its position if it is to be tolerated. We wish all manufacturing firms had sound and sensible ideas on the subject, what is often mis-called "ornament."

FIRE DETECTOR.—We had an opportunity last week of inspecting a fire detector, invented by Mr. Leslie Walker. The principles on which it works are the expansion of mercury heated and the fact that mercury is a conductor of electricity and so can be used to close an electric-bell circuit. These principles have already been applied in many fire detectors, but Mr. Walker's is the first one we have seen that gives a certain amount of a sudden rise of temperature of 3 degs. Fahr. This is effected by means of a compensating chamber to which the detector has access by means of a capillary tube. We were shown that merely setting a thermometer on fire in the middle of a large room about 25 ft. high was sufficient to produce a gradual warming of the ceiling works, the effect on it until the temperature rose to about 170 degs. Fahr. In our opinion the device is thoroughly practical, and is a most improvement on the ordinary types of fire detectors. The official title of the company is "The Leslie Walker Instrument Fire Detector and Fire Indicator Company, Ltd."

SANITARY OFFICIALISM.

"If I have been 'too moderate' in the you did me the honour to publish, it because I did not feel strongly on its matter.

country where precedent and law are terms, inquiry and comparison form a more effective instrument moving injustice and inaugurating reban declamation or invective. Yet it is admitted that the grievances of the through the official administration of the relating to public health are strong tempta-hot-blooded reprisals. When officials the protection of a body corporate in a way that to a common-sense *ultra vires*, if not *ultra licitum*, the opened to petty tyranny by useless re and in forcing to absurdity the of the law. In opposing such the inll has to combat forces which his mone maintain. He has to employ counsel, use of the most expensive character, to is case (as I know to my cost), and is very little less costly than defeat. not get a tenth of your costs allowed. again, a body corporate is an intan- ing. A common definition notifies that no physical part to kick, and no al part to damn. The London County By-laws, 1903, are witness. Whoever them up took care that other officiate should not in this respect find safety m. Section 5 carefully defines "as including 'any body of persons corporate or unincorporate.'" Yet this is not admitted. Judge Addison of the Bermondsey Borough Council radiating liability for the act of its If it "heads I win, tails you lose."

of the other sections give opportunity and requisitions in the hands of un- dard fussy officials, and the committees to time, and often no inclination, to appeals. The London County Councils are overworked, and are forced more to leave the administration of city affairs to its 5,000 officials. It is erience that, having advised proceed- cials force them to an issue with that which I can find no other word but e to describe, notwithstanding the evidence brought against them, I should suppose they had a heavy personal in the result. This was not so under Metropolitan Board of Works and ury administration. The pettiness of their proceedings is shown by such a the Bermondsey Borough Council v. ported *Builder*, p. 598 ante), and dis- by Mr. Baggeally as "preposterous," her described as "the essence of munici- orism." Many people are too timid not the means to fight a corporation, suffer the injustice inflicted in its Combination is the only method pos- sible strong enough to contest every or strained proceeding by officials. multiplicity of detail on drain plans on by some officials is quite uneces- is not only plans by amateurs like rants Craunham that are rejected. Archi- d builders have their plans sent back, e for schemes not acceptable, but for detail absolutely unnecessary on a eord, but sometimes with assertions by le plumber raised to the dignity of a inspector that they are not to scale in ects. Borough engineer, medical sanitary inspector all sit upon our schemes, and weeks of delay ensue age to foundations accrues from want ege. I admit that fifty years ago the n was not "text" on drainage, e the general practitioner to-day the on does not apply. I do not admit ment that this particularity makes work profession. For a poor man who has paid 250l. for a house, and has, by notice, to lay out 40l. on up-to-date to have to pay for an elaborate to last straw of the burden.

to rich client it does not matter so at it is often an unwarranted burden her class. "A detailed description in (section 4) of the intended mode of in- joining, and fixing any such anhole gully, pipe, bath, water-closet s, sink, urinal, lavatory basin or s or trap," if given in advance, can- ys be adhered to when carrying out Yet before one ventures to depart work, or a risk of summons in- and, unfortunately, all upstarts the fairness or common-sense of Mr. y. *Trade Owners' Protection Association* meet with general support. Mean-

while the advantage of ventilating the subject in a journal like the *Builder* is very considerable.

Apologising for the length of this letter, E. W. HUDSON, F.S.I.

October 22.

COURT OF COMMON COUNCIL.

The Lord Mayor presided over the fortnightly meeting of the Court of Common Council held at the Guildhall on Thursday in last week.

Liver Embankment.—The Streets Committee submitted the duplicate licence of the Thames Conservancy to the construction of an embankment on the land purchased at Hornchurch in accordance with the arrangement agreed to on July 23.

Congress on Drainage, etc.—The Streets Committee further reported that they had appointed their chairman, Mr. A. C. Morton, as one of the representatives of the Corporation at the First International Congress of Drainage and House Sanitation to be held in Paris on November 1.

Carriage-way, Lower Thames-street.—A report was read from the Improvements Committee submitting a tender from Messrs. Mowlem and Co. at 5,380l., for repairing the carriage-way and footways of that portion of Lower Thames-street between Fish Street-hill and Monument-street included in the contract with Mr. Woodhouse for constructing a subway in that street, and recommending that the engineer be authorised to have the work carried out by Messrs. Mowlem and Co. The recommendation was agreed to.

Streets.—It was resolved that no steps be taken to effect any improvement in connexion with Nos. 4 and 6, Copiah-avenue, now being pulled down, or in respect of Nos. 171, 172, and 173, Fenchurch-street. A return was submitted of buildings extending over streets, courts, and alleys in the City of London, and the Improvements Committee stated that when opportunity occurred by the pulling down of the premises the question of dealing with the archways would be duly considered.

Tramways.—A letter was read from the London County Council asking the Corporation to agree to a proposal for connecting up the present tramway termini in Blackfriars-road and Westminster Bridge-road by the construction of tramways between those points, *via* Blackfriars Bridge, Victoria Embankment, and Westminster Bridge. The County Council proposes in a Bill next session to ask from Parliament powers to carry this out. Mr. A. H. Barber, the Streets Committee, with instructions to confer with the Bridge House Estates Committee. He urged that the question was important in view of the probable recommendations of the Royal Commission on London Locomotion. Mr. W. Cooper seconded the motion and it was carried.

The City Surveyor.—The Officers and Clerks Committee submitted a report on the retirement of Mr. Andrew Murray from the office of City Surveyor, and also with reference to the suggestion to amalgamate the office with that of the City Engineer. The Committee recommended:—(1) That the offices of City Surveyor and Engineer should be amalgamated; (2) that a City Surveyor be appointed; (3) that the salary of the office be 1,000l. per annum, rising at the discretion of the Court, to a maximum of 1,500l. per annum; (4) that the age of candidates shall not exceed fifty years on the day of election; (5) that the position be advertised; (6) that it be referred back to this Committee to receive applications and select five candidates for final election by the Court. The recommendations were adopted, and the Court adjourned after transacting other business.

WESTMINSTER CITY COUNCIL.

The fortnightly meeting of this Council was held on Thursday last week at the City Hall, Charing Cross-road, W.C.

The Finance Committee submitted a long report on the subject of the increase in the expenditure of the Council over the expenditure of the authorities which it superseded. From this report it appeared that whereas the outlay on the work under the control of the Works Department was 76,453l. in the year 1889-1900 (when the City Council came into being), the estimates for 1904-5 amounted to 106,406l.—an increase of 29,953l. On the other hand the capital expenditure on new paving or repaving works which is not included in the foregoing figures was 28,720l. in 1889-1900. During 1902-3 it had fallen to 17,708l. In the next twelve months it had risen to 26,462l., but the provision in the estimates for 1904-5 was only 18,000l. The Vice-Chairman of the Committee made a long statement on the matter. The Mayor (Councillor Emden) observed that the report was a very long one, and suggested

that the discussion of the matter be postponed until the next sitting. This was agreed to.

Picturesque Westminster.—The offer of the Mayor to present to the Council the blocks used in the production of his portfolio of sketches, "Picturesque Westminster," was accepted, and thanks tendered to Mr. Emden.

China Gun Trophy.—On the recommendation of the General Purposes Committee it was agreed to place the China Gun Trophy, allotted to the Council by the military authorities, upon the triangular refuge in St. St. Martin's-place, opposite the City Hall.

The same Committee submitted a list of by-laws, made under the Public Health (London) Act, 1891, section 94, with regard to houses let in lodgings. The seal of the Council was affixed.

Street Improvements.—The Improvements Committee submitted a report containing a number of recommendations with regard to street improvements. Among those agreed to was one offering the sum of 105l. for certain land and required for straightening the street frontage of Portsmouth-street, Lincoln's-inn-fields.

Spread of Smallpox by Vagrants.—On the recommendation of the Public Health Committee, the Chairman of the Committee and the Medical Officer of Health were appointed delegates to the Conference on this subject, convened by the London County Council for November 10 next.

Street Lighting.—The Works Committee reported that the Engineer of the London County Council had made inquiries as to the system of public lighting to be adopted in the new streets leading into Aldwych and Kingsway. The Council agreed to comply with the suggestion contained in the letter that the streets (which are from 40 ft. to 50 ft. wide) should be lit by incandescence gas lamps of 700 candle-power on 20-ft. columns. The City Engineer was instructed to report on the number of lamps required.

Baths and Washhouse.—On the recommendation of the Baths and Washhouses Committee it was agreed to carry out certain structural alterations at the Buckingham Palace-road Baths, at an estimated cost of 127l.

OBITUARY.

PROFESSOR KERR.—We regret to announce the death, on October 21, in his eighty-second year, of Professor Robert Kerr, of Berwick House, No. 139, Oxford-street, W., and of No. 31, Cathcart-road, Kensington, S.W. Professor Kerr was born on January 17, 1823, at Aberdeen, where he had his education. He was elected a Fellow of the Royal Institute of British Architects in 1857, and has served as member of the Council; he was one of the original founders of the Architectural Association, of which he was the first president, in 1847-8, on the establishment of the Association at Lion's-inn, W.C. He was for many years Professor of the Arts of Construction at King's College, London, and a Fellow of the College; and retained the title as Emeritus Professor after his resignation of the office. Forty-two years ago Professor Kerr was appointed District Surveyor for St. James's, Westminster, and he continued to discharge the duties of that office until the autumn of 1902, when, by reason of the failure of his health, the London County Council nominated Mr. H. N. Kerr to act as deputy district-surveyor, on November 9, 1902. At their meeting on July 19 last the Council resolved, in view of Professor Kerr's declining powers and of his physical inability to tender a formal letter of resignation written by his own hand, that his appointment as District Surveyor should terminate as on November 9 of the current year. Of Professor Kerr's architectural works and designs we have published illustrations, with plans of the following:—Portion of his designs for a range of buildings, on the Whitehall and Horse Guards site, to receive the War and Foreign offices, with residences for the two Secretaries of State, as submitted by him in the competition held in 1857 (September 26, 1857); the National Provident Institution, in Gracechurch-street, at the corner of Eastcheap, E.C. (January 3, 1853); "Dunsdale," at Westerham, Kent, for Mr. Joseph Kitchen (June 20, 1863, the doorway); his designs, for which he won the second premium, for a National Museum of Natural History, at South Kensington (June 25, 1864); Ascot Heath House, Berkshire (December 19, 1868); and Ford House, at Lingfield, Surrey (December 25, 1869). He was the architect of Bearwood, in Berkshire, for the late Mr. Walter, of the *Times*. Amongst his literary labours connected with the study and practice of his profession we may instance the remarkable little book published in 1846, under the title, "Newspaper Discourses on the Fine Art Architecture"; the volumes

entitled "The English Gentleman's Country House," first published in 1865; "The Consulting Architect," published by Belknap, in 1894; and "Town Houses." He brought out an edition of "Fergusson's History of Modern Architecture," of which a third edition appeared in 1891, and he contributed the chapters upon "Plan," and "Thoroughfares" to "The Principles and Practice of Modern House Construction," written by various specialists, and edited by Mr. G. Lister Sutcliffe, 1900. Professor Kerr was the author of many pamphlets, essays, etc., upon professional subjects; we may cite his paper, read in 1866 to the Institute, upon the problem of providing dwellings for the poor, which was reported, together with the long discussion thereupon, in our XXIVth volume of that year.

GENERAL BUILDING NEWS.

CHURCH EXTENSION, DORCHESTER.—The memorial-stones were laid recently of the additions that are being made to the Wesleyan church in South-street, and Durngate-street, Dorchester. Mr. R. Curwen, architect, of London, has prepared the plans for the improvements, the cost of which is estimated at about 3,000*l.*

CHURCH, SPIDDAL, GALWAY, IRELAND.—The foundation-stone has just been laid of the new Church of St. Enda, at Spiddal. The style of the new building has been described as Irish Romanesque, and the work of carrying out the design of the architect, Mr. Scott, has been entrusted to Mr. Griffin, builder. The church will be 88 ft. long and 30 ft. wide, having small transepts and a round chancel to the eastern end. In the angle of the north transept will be a square tower 60 ft. high running boldly up with sloping walls to the top. An offset occurs at the bell-chamber stage, which is marked by recessed spaces. The tower is roofed transversely, the points of the gables showing over the parapet. The north transept is roofed in two spans, and has a parapet returned against the tower. The sacristy is situate on the other side of the transept, and is entered by a door from it. The south transept contains a small gallery for the choir, reached by stairs from the outside. The chancel arch will be semi-circular in two orders, the inner one springing from corbels. It will be constructed in limestone, and provision will be made for Celtic carving. The roof will be of open timber, displaying all the constructive timbers and will be covered with Killaloe slates. The ridge covering will be of sandstone. The pillars dividing the transepts from the nave will be of Galway marble. The principal entrance will be through the porch of Irish character near the end of the nave. The doorway will be ornamented with round arches recessed in three orders, and left plain for future carving. The quoins, stones, doors, windows, and arches will be of limestone.

ROMAN CATHOLIC CHURCH, MURROE, IRELAND.—The foundation-stone of the new parochial church at Murroe, Co. Limerick, was laid recently by His Grace the Archbishop of Cashel and Emly, the Rev. Dr. Penneley. The building will be of the Romanesque style, and will consist of a nave, transepts, chancel, and sacristy, underneath which is to be a heating chamber. The total length of the interior is 120 ft. The width of the nave is 36 ft., width of transepts 33 ft. by 25 ft. in depth. The arcade across the transepts consists of three bays of circular-headed arches, supported on columns of polished granite. Two doorways give entrance to the sacristy—one from the transept, and the other from the apse. The position of the altar will be at the junction of the nave and chancel, over which will be an archway. The nave is to be spanned by a barrel vault, with principals resting on well-projecting corbels. The front of the building is pierced by a deeply-recessed doorway, situated in a projecting porch, of chiselled limestone, and carrying a pediment with frieze and weathering. The nave is lighted by eight windows with sunk jambs, and over which circular heads are carried, and the transepts have twelve of the same pattern. The cutstone dressings are of Limerick limestone, while the masonry of the exterior is taken from the Moher quarries. The main portion of the walls behind the face work is built out of the Glenfall quarries. The contractor was Mr. Thomas Williams, of Borrisoleigh, and the architect Mr. Joseph O'Malley, of Limerick. It is estimated that the cost of the work will be about 7,000*l.*

METHODIST CHURCH, SEAHAM HARBOUR.—The foundation-stones of the new United Methodist Free Church and Schools at Seaham Harbour were laid recently. The new church and schools will be erected on the site of the old buildings in Church-street, and will be built by Mr. Arthur Errington, of Metton-le-Hole,

from the plans of Messrs. Wm. and T. R. Milburn, architects, Sunderland. The church will be capable of seating 782 persons, and a choir of fifty-two. The school will accommodate 400 children, divided into fourteen classrooms. There will also be a lecture hall in the rear, together with vestries and conveniences. The contractors' price is 3,500*l.*, and, with heating apparatus and organ, the buildings will cost about 4,700*l.*

St. CYRUS U.F. CHURCH, ABERDEEN.—The new U.F. Church at St. Cyrus, Aberdeen, is built at the junction of the Station-road with the Montrose and Aberdeen highway. The church is seated for about 280, and consists of a nave and two small transepts with an arched recess in the south gable. At one side of the recess is placed the pulpit, and in front is the choir, surrounded by a rail with corner posts finished with a brass rail, and seated with cathedral chairs. The plans were prepared by Mr. Robertson, Newtyle, while two of the office-bearers—Messrs. James Lyall and Andrew Wishart—undertook the duties of clerks of works. The following tradesmen were engaged on the work:—Mason work, William Greig, Lauriston; carpenter and joiner work, and the pulpit, John Rait and Sons, Montrose; plumber work and gas piping, R. and W. Peter, Bervie; slater work, Alexander Ramsay, Johnshaven; plaster work, David Masterton, Forfar; painter work, Alexander Clark and Son, Montrose; heating, James L. Gorden, Montrose; glazier, John H. Douglas, Montrose; gas fittings, James Milne and Co., Edinburgh. It is intended to hang a bell in the tower.

NEW METHODIST CHURCH, KINGSTOWN, IRELAND.—The opening of the new Methodist church, which has been erected in Northumberland-avenue, took place a short time ago. The building has been designed in the Early English style, and is of cut stone, capable of seating 250 persons. It has cost 5,500*l.*, including expenditure on an alteration in the school-house, and the cost of the organ, 500*l.* Messrs. J. and P. Good, Dublin, were the contractors for the building, the architect being Mr. G. F. Beckett.

WESLEYAN CHAPEL, CHESTERTON.—On the 13th inst. a small chapel was opened in Church-street, Old Chesterton. The building is constructed of red brick, has a red-tiled roof, and is in the Queen Anne style. There is seating accommodation for about 200 persons, and light is supplied by incandescent burners. The architect is Mr. W. Wren, of Cambridge; Messrs. Kerridge and Shaw were the builders, and the cost is about 1,100*l.*

SUNDAY SCHOOL AT WHITTINGTON MOOR, DERBYSHIRE.—The United Methodist Free Church Society opened, on the 12th inst., their new Sunday school, off St. John's-road, Whittington Moor. Mr. Willis Glosop, of Chesterfield, is architect, and Mr. J. Stubbs is the contractor.

NEW SCHOOL, WESTEND, SOUTHAMPTON.—A new school has been built and recently opened at Westend. The total cost, including the site, has been about 2,750*l.* The builders were Messrs. H. and W. Haines, Mr. Gutteridge being the architect for the work.

NEW SCHOOL, CAIRNE, N.B.—The opening of the new public school at Shenwell, Cairne, took place a short time ago. Mr. Thompson, of Fife-Keith, architect to the Cairne School Board, designed the building. The work has cost about 800*l.*

LIBRARY, HARTLEPOOL.—The new public library at Hartlepool, for the building of which Mr. Andrew Carnegie granted a sum of 5,000*l.*, was opened on the 12th inst. The new library is of red brick, with carved stone-work, and has been built from the plans of the Borough Engineer, Mr. H. C. Gummack. The entrance is from Milbank-crescent, approached direct from the street into an open porch, on either side of which a space is provided for the storage of cycles. The hall, to which admittance is gained through folding doors, is 18 ft. long, by 13 ft. 6 in. wide, and the lending department is 52 ft. long by 20 ft. wide. Shelving is provided for about 24,000 volumes. On the left of the hall is a ladies' room, with seating accommodation for twenty-four persons. The news-room is on the right of the hall, and is 59 ft. long by 25 ft. wide, with stands for thirty newspapers and tables for thirty-six readers. On the upper floor, which is reached by a staircase from the hall, is the committee-room and reference and record department, which is about the same size as the news-room. A caretaker's residence is also attached. The internal work is of pitch-pine, and the floors of the entrance hall and staircase are laid in mosaic, whilst that of the lending library is in terrazo. The building is lighted throughout by electricity.

BUSINESS PREMISES, LONDON.—At the corner of Beak-street and Regent-street Messrs. Robinson and Cleaver have just opened a

portion of their new premises. The front of the shop and show-rooms is constructed of polished Swedish red granite, with green bases, the height of the granite from the ground being 53 ft. The doorway in Regent-street is under a porchway, 15 ft. wide, paved with white and green Connemara marble cut. Over the doorway, as well as on the floor, there are balconies of wrought-iron. The second and third floors facing Regent-street are of Portland stone, recessed a pediment with carved tympanum, supported by engaged rustic Doric columns surmounted by a stone attic with balustrade in the flanking by two carved lions of Portland over 6 ft. high. The building at the end is circular, and is 90 ft. high, the second and third floors being recessed with columns, while the upper story is a circular tower, which is finished by a dome and flagstaff above a carved frieze. The entrance in Regent-street is a shop, 95 ft. long, and nearly 15 ft. wide, the floor of which is of oak. There is a central hall, with a decorated skylight. All the columns and apartment are of veined alabaster, to that used in the construction of the ways. From it an alabaster and staircase leads to the show-rooms on floor. At the foot of the stairway are five statues in white alabaster of British origin. At the top of the first flight of stairs is a landing which faces a stairway window of three lights, divided by piers. The architects of the new premises are Messrs. Crickmay and Sons.

PUBLIC LIBRARY, LEEDS.—The Lady's opened recently the new branch library in York-road, East Leeds. The building fronts of 100 ft. to York-road. The library portion is entered from that side through an entrance hall and vestibule. The exterior is faced with Accrington bricks, with Morley stone dressings, and the main entrance being surmounted by two carved figures. In the panel of the vestibule windows are carved stone-bearing the names of Chaucer, Shakespeare, Milton, and Macaulay. The lending news-room, and ladies' reading-room are on the ground floor, while a juvenile reading room is provided on the first floor. The exterior is surmounted by a surmounting juvenile entrance and contains an ornamental fan. The floors are of fireproof concrete paved with maple blocks. The entrance is paved with marble mosaic conformed to the design of the Leeds City Arms. The building is heated throughout by hot water low-pressure system and is lighted electrically. Mr. H. Asougou Chapman, of Leeds, is architect, his design and plans having been awarded the first premium in connection with the public competition in which Mr. J. Stokes, of Westminster, acted as judge. The whole scheme has cost over 20,000*l.* The contractors for the various works (which have been carried out under the supervision of the architect and the clerk of works, F. W. McInnes) were as follows:—Mr. Rhodes, bricklayer and mason; Messrs. Dawson, joiners; Messrs. Pickles, slaters; Mr. Geo. Thompson, plumber; Theo. Moore, plasterer; Messrs. Pennington, ironfounders; Messrs. Royal Horsman, painters; Mr. Dixon Powling; Messrs. Wallis and Watson, electricians; Mr. Alfred Whitehead, painter; and Messrs. T. Hirst and Sons, fitters and plumbers.

CONSUMPTION HOSPITAL, LIVERPOOL.—The work of rebuilding the consumption hospital in Mount Pleasant, Liverpool, is finished, and the building will shortly be opened. The old house belonging to the hospital at the corner of Roscoe-street, Mount Pleasant has been overhauled, brought pretty well up to date internally, a new block has been built, which from the corner of Rodney-street, east gable of the old house mentioned above, which is fireproof throughout, lighted with electricity. It is intended for patients and the other for additive purposes. There is accommodation for fifteen males and fifteen females. The patients' department will retain its position in the old block, which has been altered and modernised. On the ground of the main building are a day-room for a day-room and smoke-room for medicinal purposes. All these rooms have a view of the sea. Besides these there are on the ground floor doctors' rooms, lavatories, etc. On the first floor are two dormitories and two rooms leading on to a flat roof, on which a cot may be wheeled in the open air. The nurses' duty-room is placed on the second floor, which contains eight sleeping-rooms, from nearly all of which

communication with the airing flats. Administrative block provides apart-sleeping and otherwise, for seven as well as the servants' room. The are ranged round the building. The structure is of terra-cotta and iron bricks. Messrs. Grayson and Ould architects.

ADDED ADDITION TO WOODBRIDGE HOSPITAL.—Dr. S. Monckton Copeman, Local Government Board Inspector, at the Guildford Rural District Offices, on the 6th inst., to inquire re application by the Guildford, Eng., and Woking Joint Hospital to the Local Government Board for a borrow 3,650*l.* for extension of infectious disease hospital at Woodbridge. Mr. E. L. Lunn, the architect, said proposed additional buildings comprised scarlet fever pavilion, having two each with ten beds, two single-bedded nurses' duty-room, and a sanitary at either end. The addition to a would provide for a new scullery, the first floor three nurses' bedrooms, one over the kitchen. With reference to the existing balance shed was partly converted into a stall for a and the remainder thrown into the room. A van shed would be added at end, so that the stabling would now date two horses, the ambulance, the ring-van, and would give sufficient store and clean the harness. The having suggested an alteration in the of the baths among one or two alterations, the inquiry closed.

WORKS ON THE STANLEY HOSPITAL, LIVERPOOL.—The new operating theatre and outpatient department of this were recently opened by the Countess y. The walls and ceiling of the are finished in Parian cement on a cement ground. The basins and are supplied by Twyford's and Shanks, fitted throughout with knee-action the pavement is terrazzo. The heating on the low-pressure system. The on is by direct inlets and a large shaft, the latter being worked by an fan. The extension to the outpatient department consists of a surgeon's room, two dressing-rooms (male and female) and a theatre for minor operations, adjoining recovery-rooms. The contractor for the extension were Messrs. James and Co., Messrs. Joshua Henshaw being the contractors for the operating theatre. Mr. Alfred Calshaw was the architect.

PROPOSED ALTERATIONS AT THE VICTORIA BIRMINGHAM.—The question of in the accommodation at the Victoria for the magistrates' clerks and the in their department was brought before Watch Committee at their last meeting on the 19th inst. a sub-committee to inquire into the matter made an of the building in company with Messrs. E. H. Webb and F. H. Bell, for the purpose of ascertaining in any additional provision can be made unduly interfering with the architectural character of the interior.

NEW OFFICES, ABERCORN.—The new of the Abercorn District Council were on the 17th inst. The premises, which are erected at a cost of 1,500*l.*, are g to designs of the surveyor, Mr. J. S., and were erected by Messrs. D. W. S. and Co., Newport. The first floor collector and assistant-overseer's clerk's office, and caretaker's apartment bedrooms, and dining-room. A ade station has been erected at the is intended to erect workshops and ouse also. The second story consists er and surveyor's office, with a draw- at the back, and sanitary inspector's a members' retiring-room.

BATHS, LEAMING.—The new baths which eds Corporation have erected in were opened on the 17th inst. The is situated at the junction of Broad- Calverley-lane, and has cost 10,600*l.* it was Mr. J. Lane Fox.

STAINED GLASS AND DECORATION.

NEW, ST. SAVIOUR'S, WALTON-STREET.—A ined-glass window has been put up avioeur's, Walton-street, Sloane-street. ndow consists of five lights, with a tracery above. The centre light Our Lord with the right hand raised g, the left holding the orb. Seated ches in the shafting are four figures Evangelists and the four Doctors of ch. The other lights are fitted with gures of St. George, St. Paul, Isaiah, Augustine of Canterbury. All the

figures stand under canopies of XVth century tabernacle work. The tracery contains emblems of the Evangelists in four of the openings, I.H.C. and X.P.C. in two others, angels holding scrolls in three others, and cherubs in the smaller openings. The work is from the studio of Messrs. Taylor and Clifton, and will be dedicated on the Harvest Festival, October 30.

MEMORIAL WINDOW, BELFAST.—A stained-glass memorial window was recently unveiled in St. Stephen's Free Church, Millfield. The window consists of two lights, separated by a shaft of masonry, and has been designed and executed by Mr. W. E. Roberts.

SANITARY AND ENGINEERING NEWS.

ELECTRIC POWER STATIONS.—The electrical equipment of the large power-house in Lot's-road, Chelsea, belonging to the Underground Electric Railways Company, of London, is now fast approaching completion, and in a few months it will be supplying the power required to work the Metropolitan District Railway. It is the largest power-station in Britain, and it will supply the power for the Great Northern, the Piccadilly and Brompton, the Baker-street and Waterloo, the Charing Cross and Hampstead, and the Edgware and Watford Electric Railways. The electrical design of the station is similar in its main features to that of the Carville power station of the Newcastle Electric Supply Company, and to several power stations in America. The power is transmitted at a pressure of 1,000 volts by three-core lead-covered cables, which are in some cases heavily armoured with galvanised iron wire, to the distributing-stations. There are eight three-phase alternators, each of which is directly coupled to an 8,000 h.p. Westinghouse-Parsons turbine. These machines can be run on an overload of 50 per cent. safely for two hours. It is stated that the "neutral" point of the winding of the armature of each of the alternators will be connected to earth through a resistance so that the current flowing to earth can never be greater than 1,000 amperes. We suppose that this is done as a compromise between safeguarding the lives of the employés and safeguarding the gas and water mains in the neighbourhood. The currents flowing between the neutral points of three-phase systems are often of very considerable magnitude, and the damage done by the electrolytic corrosion produced by alternating currents is sometimes serious. When the station is working, therefore, it will be important to record the magnitudes of these currents. The boilers, sixty-four of which are already in position, are arranged on two floors, and the stoking will all be done automatically. From the engineering point of view the situation is ideal, as the station is bounded on one side by Chelsea Creek, and on the other by the Thames. The coal can thus be brought by barges, making the company independent of the railways, and the large quantity of water required for the surface condensers can be got from the Thames. The diameter of the pipe required for the circulating water is 66 in. The coal handling, stoking, and ash removing plant is almost entirely automatic, and as 800 tons of coal daily will be required when the station is fully loaded, the coal bunkers have been made sufficiently large to store 15,000 tons.

FOREIGN.

FRANCE.—The Conseil Supérieur des Beaux-Arts has furnished the Government with a list of artists from whom to select a successor to the late Joseph Blanc as Professor of Drawing at the Ecole des Beaux-Arts. The choice, it is expected, will fall on M. Raphaël Collin.—The new buildings of the Ecole Spéciale d'Architecture, No. 254, Boulevard Raspail, have just been opened.—Five architects, MM. Bossard, Coutan, Camille Lefèvre, Gabriel Ferraud, and Henri Ebrard, have been admitted to take part in the competition for the Chenavard Prize for 1904.5.—The new church intended to replace a place of worship, the ancient church of St. Pierre at Montmartre, has just been opened. The church, which is situated in the Rue des Abbesses, has been entirely built in armoured cement. It is the work of M. Baudot, Inspecteur-Général des Edifices Diocésains, and has been carried out for the sum of 450,000 francs.—An art exhibition is to be opened at Albi on November 6, to remain open till December 4. The special exhibition of the artists of the Gironde will take place during the months of November and December. The Thirteenth International Art Exhibition at Monte Carlo will be held from January to April next year.—M. Lucien Magne, Inspecteur-Général des Monuments Historiques, has been appointed architect to the work at

the church of the Sacré Cœur at Montmartre, as successor to M. Rauline.—The death is announced, at the age of eighty-one, of M. Le Couteur, architect, of Saint L6.

SWITZERLAND.—The new Botanical Museum at Geneva, designed by Hery Juvet, was opened last month.—The Orphanage at Lucerne, which was partially burned in May, 1903, has been rebuilt and restored under the direction of Herr Müller.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—The Linolite Company have removed their offices from 47 to 25, Victoria-street, Westminster.

BUILDING BY-LAWS.—The Chislebury Rural Council again refused, on the 21st inst., to pass the plans of a model workman's cottage at Barcombe, drawn by Mr. Justice Cranham. At the instance of the Local Government Board he had made certain additions to the original plans, but the Council contends that they are still unintelligible, and do not conform to the by-laws. The Plans Committee is considering the advisability of asking the Local Government Board to modify the by-laws so as to make them suitable for rural districts.

YORKSHIRE BUILDING TRADE EMPLOYERS' FEDERATION.—The monthly meeting of the Council of the Yorkshire Federation of Building Trade Employers was held at Hull on the 20th inst. Mr. E. Good, Hull, the President, occupied the chair, and, after the business had been disposed of, the Mayor of Hull (Alderman Jarman), at the request of Councillor Forsdike, Sheffield, placed round the neck of the President a gold chain, which henceforth is to form the badge of that office. Each link of the chain is a gift from a past president, while the medallion has been presented by the President himself. The Mayor congratulated the Federation upon the high position it had attained, and he appealed to the members to miss no opportunity of relieving distress among the skilled operatives in the building trades, suggesting that it would be a good thing if labour could be more widely distributed by giving men, say, four days' work a week where they could not be given six.

EFFECT OF SILVER STAIN ON GLASS.—In reference to the designs for stained glass illustrated in our issue of the 8th inst., Mr. Horace Wooller, the author of the design, writes that the words at the close of our description as to experiments with silver stain and its application in the production of white and coloured glasses "did not exactly represent his meaning; the words should rather have been silver stain and its application to various white and coloured glasses. He adds:—"The experiments were in connexion with the varying intensity of colour that could be produced by varying the amount of yellow stain on a soft white glass such as 'double-rolled.' Also with the possibilities of staining flashed blue and flint, or ruby glass, portions of which have been exposed to hydrofluoric acid."

GREY FRIARS, LINCOLN.—Messrs. W. Watkins and Son, of Lincoln, have been appointed architects to carry out, at a cost of about 2,000*l.*, a restoration of Grey Friars, on behalf of the Corporation. The building consists of a large oblong structure, situated on the west side of Broad-gate. The lower story, now lying at some depth below the surface of the ground, has a groined vault supported by eight octagonal columns, with plain bases and capitals. A curious covered staircase, of wood, gives access from without to the upper story, which has a mullioned window at the east end, and a coved ceiling of wood, worked in herring-bone fashion; a small room at the west end serves for the school library. The windows along the south side are interspaced with the wall buttresses. The Franciscan Friars were established in Broad-gate by William de Benningworth in the first half of the XIIIth century. The Friary chapel—being the building we mention—was conveyed to the Corporation on December 13, 1574, by Robert Monson, Chief Justice of Common Pleas, and until the erection of the new buildings in Lindum-terrace, designed by Mr. W. Watkins, was used for purposes of the Free Grammar School, founded in 1553. In 1833 the Charity Commissioners made a scheme for administering the endowments on behalf of the Lincoln Grammar School and the Middle School, whereupon the Middle School, for day scholars only, was established at Grey Friars.

PROPOSED MUNICIPAL BUILDINGS, GUILDFORD.—At the meeting of the Urban Council held on the 12th inst. the Surveyor (Mr. Wooldridge) submitted a written report upon the plans which he had prepared for the erection of municipal buildings, which are to be of red brick, with white stone facings. This report

stated that the amount of 5,000, is fixed as the cost of the building. On the ground floor accommodation is provided for the clerk, surveyor, and overseers. On the first floor are the sanitary inspector's office, committee-room, waiting-room, cloak-room, and Council-room, the last-named being placed at the rear of the building to obviate any inconvenience which might be caused by the railway. Provision has also been made for utilising the space in the roof, which is of considerable extent, and can be made available for many purposes. The details of the accommodation are as follows:—Basement floor, 7 ft. 6 in. high—store-room, 21 ft. 6 in. by 17 ft. 9 in.; other rooms, 17 ft. 6 in. by 15 ft., and 16 ft. by 11 ft.; coal cellar, 13 ft. by 8 ft., and store for cycles, etc., approached from outside, 11 ft. by 6 ft. Ground floor, 11 ft. high—entrance hall, 16 ft. by 7 ft. 6 in.; overseer's office, 18 ft. by 13 ft.; clerks' general office, 22 ft. by 18 ft.; clerk's private office, 17 ft. by 16 ft. 9 in.; surveyor's general and drawing office, 24 ft. by 16 ft. 6 in.; surveyor's private office, 17 ft. by 15 ft. 6 in.; sample and store rooms, lavatory, and pay office, the last-named adjoining the surveyor's office, and approached from the store-yard at the rear of the building. First floor—Council chamber, 39 ft. 6 in. by 30 ft. by 12 ft. high; committee-room, 21 ft. by 18 ft. by 10 ft. 6 in. high; sanitary inspector's office, 18 ft. by 18 ft. by 10 ft. 6 in. high; cloak-room, 18 ft. 6 in. by 6 ft. 6 in.; lavatory, etc. The report and plans were approved.

MEMORIAL TO QUEEN VICTORIA, KENSINGTON.—On the 19th inst. Princess Louise unveiled a column which has been erected in the open space in Kensington High-street, opposite St. Mary Abbot's Church, by the inhabitants of Kensington as a memorial to the late Queen. The monument consists of a curved pedestal, 8 ft. 6 in. in height, in fine axed Corrennie granite. Affixed on the principal face is a bronze tablet bearing an inscription. The pedestal, which is surmounted by a bronze wreath of olive leaves, supports a column 22 ft. 9 in. in height, composed of a base, annulet, and cap of white Pentelicus marble, the intermediate shafts being in polished red Corrennie granite. The annulet in the centre of the column has carved on it a portrait bust of the late Queen, and is connected with the column by a band of ornament encircling the words "Victoria, Queen and Empress." The capital is a variation of that of the Ionic order, carved in large angle volutes and surrounded above the necking with a band of acanthus leaves. This cap, which is 3 ft. 3 in. square, is carved out of one block of Greek marble. On the square abacus stands a bronze terminal containing a vase and flame in red polished granite, the flame being gilded. The total height of the memorial is 35 ft. 9 in. above the street refuge on which it stands. Mr. H. L. Florence, architect, designed the monument.

NEW ALTAR, ST. EDMUND'S CHURCH, MILES PLATING, LANCASHIRE.—A new high altar is being erected in this church, and will shortly be unveiled. The whole work, including decorating and oak flooring of the sanctuary, is being executed under the direction of Mr. E. Gunson, of Messrs. Telford, Gunson, and Sons, architects, of Manchester, and will cost about 900l.

THE LAW AS TO COMBINED DRAINAGE.—In a report circulated on Monday, the Public Health Committee of Battersea stated that in June, 1903, a deputation from the several Metropolitan Borough Councils waited upon the President of the Local Government Board and presented a memorial praying that the Government would introduce a Bill to amend the law on the subject of combined drainage. Mr. Long would not, however, make any definite promise with regard to legislation, but promised to give his careful and earnest consideration to the solution of the difficulty. Up to the present no action appeared to have been taken by the Government, and as, in the opinion of the committee, it was important that the matter should be reopened before Parliament reassembled, it had been decided to ask the President of the Local Government Board to receive a further deputation upon the subject, and to ask the several Metropolitan Borough Councils to each appoint three delegates to form, with the London Members of Parliament, such deputation.

DISCOVERY AT PETERBOROUGH CATHEDRAL.—A discovery has been made in the precincts of Peterborough Cathedral. In the passage leading from the cloisters to the old monastic kitchens a number of arches have for many years remained bricked up. One of these was opened this week, and was found to contain a complete window with late Gothic tracery. The window measures 10 ft. 6 in. by 5 ft. 9½ in. The sill of the window is almost on a level with the present path. This, coupled with the fact that the door leading to the old

kitchens, part of which remains intact in the Palace gardens, is much smaller on the outside than on the inside, seems to show that the surface of ground has risen 3 ft. or 4 ft. since the passage was patrolled by monks. There are, it is believed, several similar windows in the adjacent arches, which are at present blocked up.

NORTHAMPTON MASTER BUILDERS' ASSOCIATION.—The annual dinner of the Northampton Master Builders' Association was held at the Grand Hotel, Northampton, recently, the President, Mr. H. W. Hanwell, presiding. The loyal and patriotic toasts having been honoured, Mr. T. Ashdown proposed "The Mayor, Magistrates, and Members of the Corporation," coupled with the names of the Councillor Henry Martin, J.P., Councillor H. Green, Councillor T. L. Wright, Councillor R. Finnegan, and Councillor J. Porteous, all of whom replied. Councillor Henry Green proposed "The Architects," and in so doing said that we had heard a lot about people going from our towns back to the land, but how could they live in. Under the present restrictions the builders could not build houses in the country, which they would be able to let at a moderate rent, so it was no good talking of people going back to the land.—Mr. W. Hull, in response, said that he believed that very shortly we should see a change in the building restrictions in Northampton. They had many builders on the Council, but no architects to look after them. Speaking of the Association, he thought the Builders' Association was one of the best, and one which had carefully looked after their interests. Mr. J. T. Ingman, Mr. W. Shaw, Mr. E. May, and Mr. S. H. Harris also replied, and the last-named touched upon the difficulties placed in the way of builders by the by-laws in many places. It was, as Mr. Hull had said, impossible to build houses in the country for artisans which would pay a fair return for their money. Mr. Harris went on to speak of the present cutting of prices which was made necessary by the depression in trade. He looked forward, however, to the time when a new Government would be in power—not necessarily a Liberal Government—and when the clouds of war had passed, for then we might expect a return of the good times which we had previously enjoyed.—Mr. J. J. Hart proposed "The Northampton Builders' Association." In doing so he said that the Association was one which had for its object the amelioration of the working classes, the protection of the builders, and the good of both. The Association had been in existence for thirty-six years. Mr. F. W. Ains, the secretary, was one of the promoters of the Association, and he had devoted himself entirely to the Association. They owed to him a very deep debt of gratitude for the very flourishing condition of the Association. They had an Association which had a good foundation. It had done a very good work, and so long as it existed the building trade could not help but flourish. In looking round the room he found that with hardly one exception most of the builders present were men who had risen by their own perseverance and energy to the proud positions that they occupied to-day. He coupled with the toast the name of Mr. H. W. Hanwell, the President. Mr. Hanwell, in reply, said the building trade was an important one, and he could endorse the statement that it was for the good of all, particularly for the working classes, that it was flourishing. Speaking of the by-laws as to building in Northampton, the speaker said it did not matter how big the house the architect was asked to build, he could not build one with better sanitary arrangements than those insisted upon by the by-laws of the town for all houses. Mr. Redwood (Luton) proposed "The Town and Trade of Northampton," and Mr. George Wilkinson replied. Mr. W. Higgins proposed "The Visitors," and Mr. S. B. Wilkinson replied. The Chairman proposed "The Wellesborough Builders' Association," and Mr. H. Newton and Mr. T. H. Pound responded. Mr. J. J. Martin submitted the toast of "The President." The toast was received with musical honours, and Mr. Hanwell made a brief response. Mr. W. Heap proposed "The Vice-President," a toast which was also received with musical honours, and Mr. G. W. Souster replied. The Chairman proposed "The Secretary," and Mr. F. J. Ains briefly replied.

SALE OF ARCHITECTURAL AND ARCHAEOLOGICAL WORKS.—Messrs. Sothby, Wilkinson, and Hodge, at their rooms in Wellington-street, Strand, sold by auction, on October 20/25, a large collection of books and manuscripts from various libraries. Among the prices realised were the following:—Ruskin's "Seven Lamps of Architecture," first edition, 2l.; "Architectural Sketches from the Continent," by R. N.

Shaw, 1872, 100 plates, "Album du G. with twenty etchings, and two other 12s.; P. F. Robinson's "Rural Architecture," 1856, ninety-six plates, and T. F. "Exemplars of Tudor Architecture, to Modern Habitations," 1836, 2s.; "for Architectural Ornaments, Canopies, Friezes, Fountains, Clock Cases, etc., seven plates, beautifully engraved, similar collection of forty-three plates in old calf, with the Royal Arms of France on the sides, 25s. 10s.; P. De Lorme "Premier Tome de l'Architecture," in woodcuts (Paris, 1568), 10s.; "Les Antiques de Rome," by A. D. numerous plates, Paris, 1622, 7s. "Architettura," by G. A. Rusconi, in woodcuts, Venetia, 1590, 11s.; "V. Britannicum, or the British Architect," Campbell, two volumes, numerous (1745-17), 10s.; "Plans of Labourers," by J. Wood, thirty plates, 18s. "Transactions of the Kent Architectural Society," from 1858 to 1892, 6l. "Journal of the British Archaeological Association," 1845 to 1887, 3l. 3s.; another 1845 to 1903, with indices, etc., 5l. "Sure Guide to Builders," by B. plates of doors, ceilings, etc., 1729, and "Practical House Carpenter," by W. plates (1799), and four other volumes, 9s. kin's "Elements of Perspective," first 1859, 4s.; "City and Country Building Workmen's Treasury of Design," Langley, with numerous plates (1775), "Select Architecture," by R. Morr fifty plates (1757), 5s.; "Monuments of Moderns, Collection formant une de l'Architecture des différents Peuples les Epoquees," by J. Caillabaut, numerous plates, Paris, 1870, 6s.; "Architecture," a lecture for the A. Crafts Exhibition Society," by W. K. Kilmecost Press, 1893, 15s.; "Reminiscences of Secular and Domestic Architecture," G. G. Scott, "Notes and Sketches of Architecture," translated from Narjoux Peto, 1876, and "Materials of Construction," by W. C. Unwin, 1890, 5s.; "Glossary of Terms used in Grecian, Roman, Italian Gothic Architecture," by J. H. Park, 1,700 woodcuts, three volumes, fifth 1850, 1l. 17s.; "Some Account of Architecture in Spain," by G. E. Str numerous illustrations, second edition 2l. 6s.; "The Churches of London," Godwin and J. Britton, with numerous illustrations after Mackenzie and Billing, and "Handbook to the Cathedrals of England," parts I. and II., with numerous engravings, 1861, 11s.; "Lectures on the Origin and Development of Medieval Architecture," by Sir Gilbert Scott, two volumes, with illustrations, 1879, and "Gothic Architecture," T. Rickman, sixth edition, with numerous additions, by J. H. Parker, numerous illustrations, 1862, 3l. 2s.; "Exemplars of Architecture, Adapted to Modern Buildings," by T. F. Hunt, with plates, 1s. "Examples for Builders, Carpenters, Joiners," with fifty plates, 1857, 1s. "Architectural and Picturesque Illustrations of the Cathedral Churches of France and Wales," numerous plates, 1836; Winkles' "French Cathedrals," numerous plates and plans, 1836, 13s.; "Ecclesiastical Architecture of Ireland, with Essays on the Origin and Uses of the Round Tower," G. Petrie, numerous illustrations, vol. 1 (1845), 1l. 14s.; "Dimensions, Plans, Sections, and Sections of the Parochial Church of Sir Christopher Wren," by John with sixty large plates (1848-9), 5s.; "Elevations, Sections, and Details of Alhambra, from Drawings by Jules with Owen Jones, numerous large and small plates, chiefly in colours, heightened in gold, with a complete translation of Arabic inscriptions, etc. (1842-5), 3l. "The Ancient Architecture of England," J. Carter, with notes by John numerous large and fine plates (1837); Ruskin's "Examples of the Architecture of Venice, Selected and Drawn to Measure the Edifices," India proofs of the large beautiful plates, with descriptions in folio (Oxford, 1837), 18s.; "The Cabinet-maker's Director," a Collection of Useful and Elegant Domestic Household Furniture in Gothic, Chinese, Modern Taste," by T. Chippendale, edition, 160 fine plates (1754), 3l. The given for some of the old standard work extraordinarily low, and would lead us to suppose that the auctioneers had succeeded in collecting the right kind of stuff for such a sale. The idea of a copy of a haberdashery's fine work going for 6s. seems unless we suppose that there were no a present.

APPOINTMENT OF SANITARY OFFICERS.—The Local Government Board has sanctioned

inments as follows:—Bermondsey, M. Jones as sanitary inspector in the place of W. Williams; Islington, Mr. C. J. Bridal sanitary inspector.

THE SANITARY INSTITUTE.—The King has conferred the title of "Royal" upon this important and valuable institution, which will henceforth be known as "The Royal Sanitary Institute."—At an examination in Practical Science, held in Nottingham on October 21 and 22, 1904, two candidates presented themselves, and of these Mr. James Hall (Manchester), was granted a certifi-

BUILDING AND SURVEYING WORKS, SHEFFIELD.—C. F. Wike, M.Inst.C.E., issued, on the 18th inst., his annual report as Sheffield City Engineer. The expenditure in his department for the year (March, 1903 to March, 1904) was £177,100, as compared with £139,266, in 1897.

Highways cost 245,708*l.*, against 239,915*l.*; sewers 46,545*l.*, against 36,923*l.*; and water works 11,536*l.*, against 11,955*l.*, and was expended on account of the Tramways Committee, in special highway track 25,438*l.*, against 32,602*l.*. In addition, 5*l.* was spent on private street work, in view of the amount spent on reconstruction of defective sewers at the ratepayers' expense. The laying of brick or pipe sewers in place of the old rubble sewers is being carried on as quickly as the amount granted the department will allow, and nearly 10 miles of sewer were converted during the year. The length of carriage ways paved during the year is 37.31 miles, and of footpaths kerbed 13.17 miles, and footpaths paved and asphalted, 18.32 miles; the total paved cost of this work being 180,387*l.*

In the sewerage department, twelve miles of sewers have been completed during the year, which four miles were in connexion with the street works. The total estimated cost of this new sewerage work was 34,566*l.* In streets, twelve miles of sewers have been laid or flushed, at a cost of 2,546*l.*; and on farms have been reported for sending water or steam into the sewers. At the sewage works 6,498,534,000 gallons of sewage were treated, of which quantity 380,000 gallons were treated by bacteriological processes, and the rest by lime precipitation. Over 53,000 tons of sludge have been sent to Kilmhurst. The purification obtained by the lime process has maintained the standard of previous years, but the difficulties are caused by trade wastes, have a tendency to increase, these wastes causing much trouble and expense in treatment. In biological treatment the experimental work of the past years has been continued, with encouraging results, the large settling tank and single-concrete beds constructed two years ago have worked satisfactorily. Schemes have now been prepared for the bacteriological treatment of the whole of the Sheffield sewage works, sections and estimates having been got.

The estimated cost of a scheme, including sixty contact beds of 4 acres each, sixteen storm beds of 1 acre each, with sumps, conduits, roadway, bridge over the Don, etc., is 270,000*l.*, but the Local Government Board inquiry has not yet been completed.

In the architectural department the important works completed, or in course of completion, during the year are the Park baths and library (15,600*l.*), Crofts dwellings. Area 1 (23,000*l.*), Penistone-road destructor (100*l.*), and Queen's-road car-shed extension (50*l.*).

In the building department 2,338 houses shown on plans were approved, an increase of 44 per cent. over the number in 1903. Other buildings sanctioned, 894, including churches, chapels, schools, hotels, shops, salerooms, additions to works, stables, sheds, stores, etc.

During the twelve months the 2,051 new houses were certified for occupation, which number is 328, or 14 per cent. fewer than the average number of new houses certified in each of the preceding five years. The total number of houses in the unincorporated city is believed to be 94,385. For Framways Committee the City Surveyor's department has laid two miles one-furlong of new tram track, and three furlongs of new single track during the twelve months, and in addition there has been a good deal of renewal

SPANISH TRADE MARKS.—The notable example of industrial enterprise which has developed in Spain during the last few years has not unnaturally led native traders and manufacturers to adopt measures to advertise their special class of merchandise, and to new fields of enterprise to meet the fast-growing competition. One of the effects of this movement has been largely to increase the demand for Trade Mark registration, which, however, is not confined to native goods, but is extended to the pilfering of well-known foreign marks, to the disadvantage of foreign trade in Spain.

These applications are in many cases successful, owing to the fact that the legitimate owners have neglected to secure prior protection, either by registering their mark direct in Spain or by having it registered in Berné under the terms of the International Convention. The only means of counteracting this illicit practice, which is prejudicial to British trade, not only in Spain, but in other countries on the Continent, is to effect timely registration of the marks in the countries in which British goods are imported.

Legal.

BRISTOL BUILDING DISPUTE.

The case of *in re* an arbitration between Shepherd and Smart came before the Court of Appeal, composed of the Lord Chancellor, and Lords Justices Stirling and Mathew, on the 25th inst., on the appeal of Mr. J. W. Smart against a judgment of a Divisional Court, consisting of the Lord Chief Justice, and Justices Wills and Kennedy.

Mr. Foote, K.C., and Mr. Weatherley appeared for the appellant; and Mr. Clavell Salter, K.C., and Mr. Macnaughton for the respondent.

Mr. Foote said that this was an application to set aside part of an award. The Divisional Court refused to affirm part of the award, but as to the other part they declined to interfere, and it was with regard to the latter part that Mr. Smart was now appealing. The point raised was a short one, and turned upon the construction of the contract between the parties. It was a building contract, Mr. Shepherd being the builder, and Mr. Smart the owner. The contract related to the alteration of certain premises in Bristol belonging to Mr. Smart. At the conclusion of the work three points of dispute arose. One was as to the amount to be deducted from the builder's account for omissions. The builder had sent in a claim for extras. The architect had examined it and settled it at his prices. He allowed the extras, and made out the certificate for the amount of the omissions at the same prices as the builder had charged for the extras. The amount allowed by the architect for omissions was 150*l.* The builder claimed that that, and the two other disputes, should be referred to arbitration, and although the building owner contended that there was nothing to refer, the matter went to arbitration. The arbitrator reduced the 150*l.* allowed by the architect for omissions to 119*l.*, and that sum of 31*l.* carried with it the whole cost of the arbitration, which lasted three days, and prevented the building owner getting his costs in the Divisional Court. That was the main dispute, and the only real dispute before their lordships. The second dispute arose through the builder contending that there was a contract to give him undisturbed possession of the premises while he did the work, and the arbitrator found such a contract, and gave him 3*l.* damages on that head, but the Divisional Court set that aside, and there was no appeal on that point. The third head of dispute was as to some bits of lead-eistern heads—valued at 2*l.* 10*s.*, and there was a question whether the builder was entitled by custom to take them, but it was not worth while occupying the time of the Court about that matter. Therefore, the only point was, whether, under this contract, the architect's decision was final as to the amount to be deducted for omissions, or whether the builder was entitled to go to arbitration on that matter.

Mr. Clavell Salter, having supported the decision of the Divisional Court, their lordships held that on the true construction of the contract the decision of the architect on the question in dispute was final, and that the matter was not one for arbitration. The award of the arbitrator was therefore set aside, and the appeal allowed, with costs.

BLOOMSBURY ANCIENT LIGHT DISPUTE.

Mr. Justice Farwell, in the Chancery Division, on the 25th inst., concluded the hearing of the case of *Eason v. the Syndicate of Electrical Engineers*. The hearing of the action was commenced in July last, and adjourned over the long vacation.

This was an action for relief in respect of the alleged obstruction to ancient lights of property belonging to the plaintiffs in Gloucester-street, Bloomsbury. The property was purchased in 1899 by Mr. Eason and his then partner, Mr. Reynolds. Mr. Reynolds died, and there was a partition deed between members of the family, and one of the plaintiffs, Miss K. Reynolds, had a share in the property in question. The windows alleged

to be affected were those at the back of the houses which were opposite to the backs of the houses in Southampton-row. The defendants were the owners and lessees of three houses, Nos. 66, 68, and 70, Southampton-row, and these houses had been rebuilt to a greater height, the result of which, it was alleged, was to render the rooms in the plaintiffs' houses unfit for the purposes for which they had been used.

The evidence called on behalf of the plaintiffs included that of Mr. E. H. P. Eason, Mr. E. W. Eason, Mr. A. J. Gale, and Mr. A. W. Murray; the expert evidence given on behalf of the defendants being that of Mr. E. A. Cruning and Mr. Chatfield Clarke.

In the result his lordship dismissed the action, with costs. He said that the sole question he had to decide was one of fact, and he had directed himself in deciding the case in accordance with the principle laid down by the House of Lords in the case of the *Home and Colonial Stores v. Colls*.

Mr. C. E. Jenkins, K.C., and Mr. Percy Wheeler appeared for the plaintiffs; and Mr. W. H. Upjohn, K.C., and Mr. Colifax for the defendants.

PATENTS OF THE WEEK.

APPLICATIONS PUBLISHED.*

20,567 of 1903.—W. P. THOMPSON (Dimitar A. Popoff): *Water-closets*.

A water-closet in which, simultaneously with the delivery of a measured quantity of flushing water, a motion of the closing flap is caused, characterised by the arrangement that an upper flap is opened by a hand lever whilst a lower flap remains in a closed position under water seal, whilst, after use of the closet, on turning back the said hand lever the lower flap is opened, and, after the discharge of the excreta, returns automatically to the closed position so that when the closet is not in use both flaps are water sealed.

25,686 of 1903.—R. STANLEY and E. JEFFCOATE: *Process and Apparatus for Applying Glazes, Enamels, or Bodying Material to Bricks, Tiles, and other goods*.

A process of applying glaze, enamel, or bodying material to bricks, tiles, and other like goods, consisting in allowing a stream of the said material to flow from an outlet and dispersing or atomising the same by a jet or jets of steam, air-gas, or other fluid playing across it, thus scattering it upon the goods.

26,090 of 1903.—J. H. THOMPSON and F. W. PORTER: *Folding Partitions and Doors*.

Means for supporting and retaining removable or folding partitions and doors either in a straight line or on a curve, consisting of a shoe secured in a central position to the underside of each section or alternate sections of a partition or door, and swivelling on a block supported on rollers; a roller path, with a longitudinal slot therein, a guide uniting the aforesaid shoe and block, and its lower end inserted in the slot in the roller path so as to slide therein; a cap fixed in a central position on the top of each section or each alternate section of a partition or door; a vertical stud in said cap with a channelled or grooved head; and a plate fixed to the ceiling on each side of said stud with their inner edges inserted in the channelled or grooved head of the stud.

26,195 of 1903.—W. S. MCLENNAN: *Tables, Trays, or Reading Desks, or Combined Tables and Reading Desks, for Use in Bed or Elsewhere*.

A piece of furniture, comprising leg-carrying frames connected by lattice work, extensible sides, with or without connecting bars at intervals, boards hinged to bars on the frames and having spring clips and pins enabling them to be adjusted in various positions.

15,903 of 1904.—J. ANDERSON: *Saw Benches*.

An automatic saw bench, consisting in the combination of a frame having an abutting portion or stop, a tilting feed table adapted to move downward in contact with said stop and allow the work to engage and square itself thereby, and then be raised to be engaged by the feed mechanism, and means for tilting the table.

17,557 of 1904.—G. T. PIGCOTT, A. H. ROAD, and A. H. ADCOCK: *A Clip Socket for Shop-Window Fittings*.

This invention relates to a clip socket for shop-window fittings, and the mode and means of manufacturing same, and refers to the clips used on the standards or pillars for supporting the brackets or rods, and which clips are

* All these applications are in the state in which opposition to the grant of Patents upon them can be made.

adjustable and detachable from the pillars, and can be attached thereto anywhere desired without threading it over the end of the pillar as is usually necessary.

17,948 of 1904.—J. H. LANE: Door Stops or Checks.

A door stop, consisting of a bent lever attached to the spindle of the handle so as to move therewith, to which lever is attached one end of a wire or equivalent which passes down a tube fastened to the door and opens into a casing near the bottom of the door in which casing is free to slide up and down, a rubber or other faced plunger.

17,964 of 1904.—R. W. H. RODNEY: Door Furniture.

This invention relates to door furniture, the object being to obtain a better bearing for the spindle in the knob. In carrying the invention into practice a square metal tube is brazed, soldered, shrunk, or sweated into the square hole in the socket or neck of the knob. The usual hole is drilled and tapped and provided with a grub screw. It will be seen that when the loose knob has been pushed on to the spindle, and the screw tightened up, a secure hold is obtained in the knob, and on the spindle. In an ordinary knob the grip on the spindle is only the interior length of the socket or neck, while with the tube a grip is obtained right through the hollow knob.

18,179 of 1904.—E. ROLFE: Apparatus for Veneering or Coating Bricks, and the like.

An apparatus for veneering or coating bricks, and the like, consisting of a clay bar-forming machine, combined with a slicker, rods projecting from said machine, supporting said slicker, perforated flanges on said slicker through which said rods pass, and bolts threaded in said flanges bearing against said rods.

24,822 of 1903.—THE NEW EXPANDED METAL COMPANY, LTD. (J. F. GOLDING): Construction of Walls, Floors, and Similar Structures.

This invention relates to the construction of walls, floors, and similar structures. According to the invention, the bar may consist of longitudinal portions which are severed and bent outward from it so as to form loops into which the cement or concrete will enter and firmly lock the bar and the cement together. The said bar may be formed of flat metal and severed longitudinally at intervals and between such points that the portions at the divisions may be bent outwardly. The said portions are preferably bent alternately in opposite directions from the plane of the bar. The bar is preferably arranged in the concrete with the bent portions extending horizontally. In this manner a series of bends or loops are formed in the bar which are adapted to admit the cement so that the bar and the cement will be locked firmly together, and the weight-resisting strength of the bar will be transmitted to the concrete.

25,492 of 1903.—H. H. HODKIN: Construction of Concrete Floors and Ceilings.

This invention relates to the construction of concrete floors and ceilings, and refers more particularly to the metallic girders or supporting bars which are built in the concrete; the object being chiefly to obviate the cracking of the concrete in line with the supporting bar, and also to prevent the dropping of the bar. It consists in making the supporting bar or girder of longitudinally corrugated iron or steel, and supporting the ends and junctions in bearings preferably made by punching out a wavy slot to receive the end of the bars and bending the foot to shape so as to support the bars upon their edges. The wavy form of the corrugations avoids the formation of hollows which occur with the use of ordinary forms of girders.

25,676 of 1903.—O. IMRAY (Firm of Herren, Graubner, and Scholl): Method of and Apparatus for Measuring the Surfaces of Flat Objects.

A method of measuring the surfaces of flat objects at a single operation, whereby the object, the surfaces of which is to be measured, effects the closing of electric contacts which are distributed over the whole surface to be measured, the closing of such contacts being made to effect the decrease or increase of the resistance or the current strength in an electric circuit, and thereby to vary in a corresponding manner the indications of a measuring instrument included in such circuit.

26,115 of 1903.—W. R. HODGKINSON: Wood and other Porous Materials to Protect Against Damp, Fungus, or Insects, or other Colouring.

This consists in the introduction into woods and other porous substances of dyes, waxes, and the like, by means of a volatile solvent, and the employment of a vacuum or partial vacuum, and atmospheric pressure.

27,358 of 1903.—A. D'ARSONVAL, G. E. GAFFE, and G. GALLOT: Apparatus for Ozonising Air for Disinfecting Purposes.

A process of ozonising air for disinfecting purposes, which consists in cooling and humidifying the air or oxygen, and then passing it through an ozonifer.

12,105 of 1904.—E. STOFFLER: Manufacture of Recessed or Perforated Bricks or Blocks.

A method of manufacturing recessed or perforated bricks or the like, consisting in lightly moulding the brick by smooth top and bottom dies, subjecting the moulded brick which remains in the mould to the action of a second pair of dies having pins or rods which finish the moulding operation, bringing the mould with the brick or the like under or above a third plain die or the like to eject the brick from the mould.

SOME RECENT SALES OF PROPERTY.

ESTATE EXCHANGE REPORT.

Table listing property sales including dates, locations, and prices. Examples: October 11.—By DUNN, SOMAN, & Co. (at Tonbridge) 137, High-st. (s.), f., e.r. 422l. 137, High-st. (s.), f., e.r. 422l. 137, High-st. (s.), f., e.r. 422l. 137, High-st. (s.), f., e.r. 422l.

MEETINGS.

Table listing various meetings and events. Examples: SATURDAY, OCTOBER 29. Junior Institution of Engineers—Visit at 3 p.m. of the National Physical Laboratory, Bushy House, Brighton. SENIARY INSTITUTE (PROVINCIAL SEASONAL MEETING SOUTHAMPTON)—Discussion, to be opened by Dr. Lander, on "Infectious Fever Hospitals." 11 a.m.

TO CORRESPONDENTS.

J. L. (Amounts should have been stated).—G. T. (Below our limit).—T. D. and Sons (We cannot supply your letter). NOTE.—The responsibility of signed articles, letters and papers read at meetings rests, of course, with authors. We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, manuscripts, or other documents sent to him at this office, unless he has specially acknowledged them. Letters or communications (beyond mere news items which have been duplicated for other journals) are not DESIRED. All communications must be authenticated by name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications. We are compelled to decline pointing out books giving addresses. Any communication to a contributor to write an article or to execute or lend a drawing for publication, is subject to the approval of the editor, or drawing, if received, by the Editor, who retains the right to refuse if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply acceptance. All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER and not to the Editor.

CURRENT OF MATERIALS.

Our aim in this list is to give, as far as possible, the true prices of materials, not necessarily the lowest, and quantity obviously affect prices—a fact should be remembered by those who make use of information.

Table listing various materials like Bricks, Tiles, and Stone with their prices per 1000 or per yard. Includes sub-sections for Bricks, Tiles, and Stone.

Table listing Stone materials such as Portland Cement, Blue Lias Lime, and various types of Stone (e.g., Bath Stone, Portland Stone).

Table listing Slaters materials including various types of slates and their prices per 1000 or per 100 sq. ft.

Table listing Slates (continued) with prices per 1000 or per 100 sq. ft. for various grades and colors.

Table listing Tiles with prices per doz. or per 1000 for various types like roof tiles, ornamental tiles, and floor tiles.

Table listing Woods with prices per standard unit for various types like Fir, Deal, and Pine.

Table listing Joists and Girders with prices per ton for various types and sizes.

Table listing Metals with prices per ton for various types like Iron, Steel, and Lead.

Table listing English Sheet Glass in Crates with prices per ft. delivered for various sizes and weights.

Table listing Wood (continued) with prices per square for prepared flooring and various types of wood.

Table listing Joists, Girders, &c. with prices per ton for various types and sizes.

Table listing Metals with prices per ton for various types like Iron, Steel, and Lead.

Table listing Oils &c. with prices per gallon for various types like Linseed Oil, Turpentine, and Lead.

Table listing Varnishes &c. with prices per gallon for various types like Pale Oak Varnish, Copal Varnish, and others.

COMPETITIONS, CONTRACTS, AND PUBLIC APPOINTMENTS

(For some Contracts, &c., still open, but not included in this List, see previous issues.)

PUBLIC APPOINTMENTS.

Table with 4 columns: Nature of Appointment, By whom Advertised, Salary, Applications to be in. Includes entries for Surveyor and Structural Assistant.

Those marked with an asterisk (*) are advertised in this Number. Competitions, — Contracts, iv. vl. viii. x. Public Appointments, xviii.

TENDERS.

Communications for insertion under this heading to be addressed to "The Editor," and must reach later than 10 a.m. on Thursdays. [N.B.—We publish Tenders unless authenticated either by architect or the building-owner; and we cannot accept announcements of Tenders accepted unless the name of the Tender is stated, nor any list in which the Tender is under 100l., unless in some exceptional cases and for special reasons.]

Notes accepted. † Denotes provisionally accepted.

GRHAM.—For new workhouse infirmary, for the year. Mr. H. Bech, architect, Chesham:—

GRHAM.—For the supply of 5,000-ft. run 12 in. granite flat kerb, and 5,000-ft. run 12 in. granite flat channel for the Town Council, J. C. May, Borough Engineer and Surveyor, Hali, Brighton:—

GRHAM.—For the supply of 1,900 tons of granite or other hard stone, for the Town Council. Per ton, s. d.

GRHAM.—For the installation of electric lights, and fire alarms in diphtheria pavilion, Sanatorium, Bear road, for the Corporation:—

GRHAM.—For cast-iron pipes and work, for the Messrs. S. Edmondson, Surveyor, 18, Nicholas-lane, London. Mr. W. Hargreaves Bourne, architect, Darlington:—

GRHAM.—For new drainage scheme, "Almond" in the town of St. George, Brighthelm, Mr. W. Harlow, architect, Darlington:—

GRHAM.—For erecting a coker and laundry centre at Avenue-road School, for the Education Committee. Mr. G. J. Brown, architect and surveyor, Cathedral-offices, The Close, Norwich:—

EALING.—For the erection of suburban villas in Graham-avenue and Northcroft-road. Mr. L. A. Tyler, architect, 10, Melody-road, Wandsworth, S.W.:—

EATON BRAY.—For sewerage works, for the Rural District Council. Messrs. Elliott and Brown, engineers, Burton-buildings, Parliament-street, Nottingham:—

HATTON.—For construction of a sewage tank, etc., in connection with the Hatton sewerage works, for the Rural District Council. Mr. J. T. H. Richardson, engineer, Hatton, near Rugby:—

ILFORD.—For making up roads for the Urban District Council. Mr. H. Shaw, Engineer, Town Hall, Ilford:—

LEEK (Staffordshire).—For sewerage and other works at the workhouse, for the Guardians. Mr. J. T. Drealley, architect, Piccadilly-buildings, Hanley:—

LEIGH (Lancs.).—For the erection of new Municipal Offices, from ground floor upwards, for the Corporation. Mr. J. C. Prestwich, architect, Leigh:—

LONDON BOARD OF EDUCATION TENDERS. Camberwell, N., Cradon-road (additional works). [Rebuilding the boys' school at the Cradon-road school, and rebuilding them with iron standards and glazed divisions. The cost of this extra to be calculated as a variation upon the contract of Mr. A. Porter for carrying out sanitary and drainage works at the school.]

W. Downs, £3,370; W. Smith & Son, £2,861; F. G. Minter, £1,190; J. & C. Bowyer, £2,847; J. F. Ford, £3,182; T. D. Long, £2,820; R. A. Jewell, £3,068; Lathey Bros., £2,687; Rice & Son, £3,038; Wor. Ltd., £2,028; W. Akers & Co., £2,028; E. P. Bulled & Co., £2,917; W. J. Mitchell, £2,570; Turnbull & Son, £2,903; Son, Dulwich, £2,548.

Stepney, Dempsey-street (Partitions, etc.). E. & F. J. Wood, £1,900; W. Shurmer & Parrott & Isom, £1,894; Sons, Ltd., T. S. Elkington, £1,012; Sons, £700; A. J. Sheffield, £700; E. Lawrence & Sons, £698; 0.

Bethnal Green, S.W., Somerfield-street (Partitions, Staircases, etc.). A. Porter, £3,461; W. Shurmer & Sons, £2,707; Ltd., £2,394; E. & F. J. Wood, £2,724; J. Grover & Son, £2,382; G. Mundav & Sons, £2,629; G. S. S. Williams & Son, £2,365; E. Lawrence & Sons, £2,595; General Builders, £2,475; Limited, Wharfedale, £2,455; Willmot & Sons, £2,454; McCormick & Sons, £2,454; Hill, £2,297.

Fulham, Finlay street New School (Heating Apparatus). J. Fraser & Son, £838; Macintosh & Sons, Ltd., £702; J. Richmond & Co., Ltd., 760; Z. D. Berry & Sons, 752; J. & F. May, 745; Victoria-street, 689.

Walworth, Flint-street Improvements (Heating Apparatus). Wenham & Waters, Ltd., £502; Brightside Foundry & Engineering Co., Ltd., 493; Davis & Bennett, £490; B. Harlow & Son, 467; J. & F. May, 33; Whetstone-park, 435.

LONDON.—For erecting engineer's workshop, etc., at the Infirmary, Lambeth, for the Lambeth Guardians. Messrs. Woodward, Brooks, & Lattar, surveyors, 65, Kennington Oval, S.E.:—

LONDON.—For the construction of a relief sewer, in the metropolitan boroughs of Wandsworth and Battersea, in connection with a new pumping-station at the junction of York-road and Crook-street, Battersea, for the London County Council:—

S. Pearson & Son, Ltd., £71,133 16 5; R. Malpas & Sons, £60,636 13 6; J. Watt, £57,886 17 9; Pethick & Johnson, £56,008 0 0; J. Dickson, £55,564 5 11; Leach, £53,336 4 9; J. Mowlem & Co., Ltd., £50,874 0 0; J. Moore, £50,600 6 0; Muirhead, Greig, & Matthews, £50,572 9 5; J. B. Squire & Co., £50,011 13 11; Langley, £40,409 14 8; W. Kempney, £39,128 10 3; A. Woodhouse, £47,531 4 10; J. D. Nowell & Sons, £40,978 13 6; Lopinot, £40,978 13 6.

† Recommended for acceptance. (The chief engineer's estimate of the cost of the work was £53,968 0s. 1d.)

LONDON.—For the reconstruction of Miter-bridge, carrying Scrubs-lane over the Grand Junction Canal, for the London County Council:—

E. Miskin, Ltd., £9,925 7 4; Greig, & Squire & Co., £9,922 15 6; Matthews, £6,105 0 6; Westwood & Co., Ltd., £6,565 18 11; Pethick Bros., £6,075 16 6; A. Pacey & Son, £5,970 11 3; W. Jansy & Son, Ltd., £5,978 1 7; Perry & Co., £6,335 7 3; J. Dickson, £5,890 10 10; W. Jansy & Son, Ltd., £5,723 0 0; Mawoh & Sons, £5,723 0 0.

MIDDLEHAM.—For alterations and additions to the White Swan Hotel, Middleham, near Leuburn, for Messrs. P. Plesch & Sons, Mr. W. Hargreaves Bourne, architect, Darlington:—

C. Bushby & Sons, £1,059 13 0; R. G. Smith, Darlington, £1,045 10 0; J. P. Johnson & Son, £1,030 12 2; Chaplro & Pearsons, £89 15 0; Richardson & Robson, £93 3 1.

NEW BARNET.—For making-up Middle-road and Shaftesbury-avenue and tar-paving the footpaths, for the East Barnet Valley Urban District Council. Mr. H. York, surveyor, Station-road, New Barnet:—

Notes on Naples.

FIFTY years ago the once splendid mediæval city of Naples had become a filthy agglomeration of tenement houses, harbouring the most degraded of civilised beings. A sort of magnified London Seven Dials in its worst aspect. Amongst endless courts and alleys of this most pleasurable human community of the Nineteenth century rose a few old palaces of a decadent nobility, culminating in the Royal Palace designed by Domenico Fontana in 1600, a huge uninteresting mass, sufficiently expressive of the Bourbon style of government and the rule of tyrants which built and inhabited it of luxurious superfluity. On one side of this huge pile stands the ancient castle of the Anjou kings of Naples, founded by their Bourbon successors as a memorial in XVIIIth century fashion, and on the other side is the huge opera house of S. Carlo, one of the largest in the world. The kings of the period seem to have appealed to the fears, as well as to the well-known love, of their poorer subjects for the theatre, by surrounding their palace with such accomplishments. Fortunately, the Bourbons and all that their name suggests have long since utterly disappeared, and Naples exhibits an instance of that marvellous assimilation of modern ideas and improvement,

both moral and physical, which is the happy characteristic of Modern Italy.

The great cholera outbreak of 1884 may perhaps be credited with having brought about a great part of the rebuilding of the city; at least, the principal impetus towards that result was probably the well-founded fear of another such terrible visitation. During the last twenty years the greater portion of the filthy old *Fondacci* or enormous tenement houses, which were the perennial hot-beds of diseases of all kinds, have been removed, and the old mediæval portion of the city has been cut through by two main streets of great width, forming a cross, at the centre of which is an octagon piazza with a statue (not yet finished) of the prime minister Depretis, to whom the scheme seems to be attributed. The extremities of this cross plan are united by a circular system of tramways. The plan is distinctly successful and ingenious. By this means several ancient public buildings, such as the cathedral, some of the more interesting Renaissance palaces, and several new edifices, such as the railway station, university, and Ministry of Marine, have been brought into prominent positions and freed from the squalid surroundings which formerly rendered them unknown to the general public.

The disappearance of XIXth century Naples may perhaps be regretted by a certain class of pictorial artists, who must now search in remote corners for the umbrella-covered booths in dirty old back streets, where the *lazzaroni* and

monelli still feed on macaroni in a primitive way with their fingers, affording subjects for pictures of a very squalid state of society in the past. But to the student of art in its interesting developments in Southern Europe the removal of all this very uninviting squalor is more of a gain, and the artistic treasures which are now being laid bare in the *sventramento* of the city are of particular interest. As time goes on many more traces of the mediæval architecture of the city must come to light—it is, as a general rule, smothered in the preposterous plaster and whitewash of the past three centuries, and it is surprising that so much should evidently remain beneath the surface.

The plan of the mediæval city is still well defined by remains of the walls, round towers, and gates which were built by the first Spanish conquerors of the kingdom, and which probably follow, to a great extent, the original lines of the Angevin city: These remains are embedded in the old houses which line the modern boulevards on the south and east of the city occupying the sites of ancient moats. Naples seems to have been very much rebuilt by the Angevin kings on the transference of the capital of the Sicilian kingdom from Palermo, and it is to this period that most of the more important and interesting architectural monuments belong (Charles I., 1266—Joanna II., 1414). The Angevin dynasty may be considered to represent the pointed-arch period in Neapolitan history: With the Spanish despotism began the period of decline, and few

Fig. 1. Sketch Plan of Santa Chiara.

monuments of the Renaissance or Pseudo-Classic are worthy of note in Naples in comparison with similar work in the northern cities of Italy.

Like a vegetation, the pointed-arch style of mediæval Europe (which, by the way, has so often been compared to the

Fig. 2. East side of Santa Chiara.

natural growth of forest glades) seems to follow the lines of latitude and climate in a very remarkable manner. From the Canary Islands to Cyprus, through all the Mediterranean lands, the same methods of design and workmanship mark the development of the pointed

arch. French architectural writers endeavour to maintain that all this vast region once owned the influence of French artists; but how is it conceivable that the thinly-populated France of those days could have supplied the regular armies of architects and masons which must have been employed in Portugal, Italy, or Cyprus during the XIVth century to allow of Frenchmen building the immense cathedrals, castles, palaces, not to mention smaller buildings, which still stand in ruins all round the Mediterranean? In the case of the Neapolitan kingdom such a French influence may more easily be admitted, in consequence of the political history of the period. But, as a rule, the architecture of the Mediterranean littoral has a character quite its own, and betrays hardly more French than English or German influence. Wherever there was a distinct colony of northerners established on these southern shores, there one may trace some evidences of a desire to reproduce the features of the national style; elsewhere the local character asserts itself.

Some of the more salient features of the pointed style of the Mediterranean are a regularity of plan, adherence to a columnar method of construction (which with the flat-pitched roofs recalls the older Romanesque), and that constant evidence of a struggle in principles between the terrace roof of the South and the aspiring tendencies of the pointed design. Many minor peculiarities rarely seen in the pointed architecture of the North may be attributable to differences in materials employed, as much as to the artistic character of the southern races. The tufa, lava, and other building materials peculiar to the volcanic regions of the South naturally influence the style of

Fig. 3. North Porch, Santa Chiara.

architecture to a very appreciable extent. The elaborate sculptured foliage a delicate details of the North, executed the abundant limestone of England a France, is absent, and the Gothic architects of Naples were content with painted mouldings as a relief to the white walls of their vast public buildings.

Fig. 4. Detail of Centre Arch to Porch, Santa Chiara, Naples.

A striking peculiarity in the great doorways of the early XIVth century is the design of a number of receding arch mouldings much like those of the English "Decorated" style, with deep hollows and boldly-projecting mouldings, but with a large outer order in addition, sometimes in the form of a dripstone, on the underside of which

Fig. 5. A Palace Doorway.

vine or acanthus leaves are carved. The outer order or arch springs from the side capital of the doorway, unless it forms a dripstone, and then it finishes on an elaborately-carved bracket. Square-headed windows—common everywhere—are treated with this same sort of dripstone, which always finishes on a bracket and not, as in the later styles of Eng-

vaulting (Fig. 4) illustrates many of the peculiarities of southern mediæval art.

Within its vast interior Santa Chiara still enshrines many sumptuous tombs of the Angevin kings and princes of Naples, hut the frescoes of Giotto—said to have been painted under the advice of Dante—have disappeared for ever; at least, it is not likely they can be traced beneath the plaster alterations of the Pseudo-Classic style. The monument of King Robert, founder of the church, still dominates the high altar in the curious way in which princely tombs seem to have been usually arranged in the XIVth century in Naples. The king is represented in a lower compartment, as dead, in the dress of a Franciscan; whilst above, in a canopied tabernacle, he sits in royal state; the figures are, of course, life-size. Other examples of this very singular form of tomb occur in Naples; the tomb of King Ladislaus and Queen Joanna in S. Giovanni a Carbonara is a remarkably fine specimen. In Santa Chiara the Gothic tombs, with their pointed arches and bizarre decoration of mosaic inlaid twisted columns, etc., have a most weird, incongruous effect, imbedded as they are in the gilded plaster of modern times.

The doorways of old palaces which we illustrate (Figs. 5, 6, 7) are singularly characteristic of mediæval urban architecture in south Italy. They are marked by a bold simplicity in outline and detail, and they were evidently designed for the special purpose of forming imposing entrances from narrow streets where architectural display would have been thrown away. The street fronts of these palaces are absolutely plain and unadorned, rows of square window openings on one side of a narrow lane confront equally uninteresting rows on the other side. Piazzas of any size were evidently unknown in mediæval Naples, and only within the last twenty years has the great *piano regolatore* of the city been formed with the ideas current all over Italy at the present day, wide streets and large open spaces letting air and sunshine into crowded localities.

We give two plans of Naples, mere rough sketches based upon an old plan of the city made for Murray's "Guide" of fifty years ago. At the period when a certain Mr. Blewitt (who, by the way, seems to have been a very learned and capable man) wrote this book for the great publisher, the traces of the ancient city (Fig. 8) were wonderfully preserved. The fortifications on the peninsula between the Castel dell' Oro and S. Elmo had, however, disappeared, as no gate on that side is mentioned. The Chiaja or esplanade fronting the sea had come into existence and the modernisation of the city had commenced; the railway was being carried to the north, and a few years later the enormous increase in the population—chiefly amongst the poorer classes—took place.

Our second plan (Fig. 9) gives a rough idea of the *piano regolatore*. The roads marked on it show the principal tramway routes and modern means of communication; the new streets and roads are on a fine scale of an average width of more than 200 ft. The general idea is to give a principal road, or "viale," encircling the main portion of the town and its

western suburbs, of about ten miles in length, connecting together the railway station and the distant Posillipo, with its famous tunnel, which opens up the attractive district of Villanova and its villas.

In the middle ages, under the Angevin dynasty, Naples was a city of perhaps more imposing architectural character than is generally recognised. Then ensued a period of decline and squalid decay, from which the great city has suddenly awakened under the influences of a united Italy, and now its future seems one of an enlarged life, commercial prosperity, and, above all, greatly improved hygienic conditions, both moral and physical, the credit for which must be given to an enlightened government, assisted by capable architects and engineers.

NOTES.

Engineering Works in India.

IN the course of his Presidential address at the opening meeting of the eighty-sixth session of the Institution of Civil Engineers, Sir Guilford Molesworth referred at some length to the Public Works Departments of India and Ceylon, with which he was connected for a period of more than thirty years. It is undoubtedly the fact, as the speaker remarked, that the Indian Empire owes much to the vigorous policy pursued in the execution of irrigation and railway undertakings. Owing to climatic conditions the inhabitants are very largely dependent upon artificial irrigation, the extension of which during recent years has done much for the prevention of those calamitous famines which periodically spread devastation through many districts of the country. Next to irrigation, railways represent the most important means for the welfare of the people, and Sir Guilford believes that the time has now come when the vast mineral and other resources of India might be usefully employed in the manufacture of steel rails and other permanent-way materials, as well as in the building of bridges, locomotives, and rolling-stock generally. The application of a similar policy to every department of public engineering work would certainly assist very materially in opening up the immense but hitherto undeveloped wealth of India.

The Simplon Tunnel.

RECENT reports relative to the latest difficulties encountered in the Simplon tunnel works seem to show that no doubt need be entertained as to the successful completion of the tunnel, although no correct estimate can be formed of the time that may elapse before the work is finished. Everything possible is being done to facilitate progress, but the difficulty of the present situation is increased by the fact that the cooling plant in the Italian workings is of comparatively small capacity. As the headings approach the Swiss workings, which were closed in a submerged condition some four or five months ago, the danger and difficulty of the work will materially increase. The crown of one Italian tunnel will come out at the floor level of the corresponding

Swiss advance drift, which for structural reasons is not in true alignment. At the moment when the barrier of rock is removed there undoubtedly is a great rush of water from the Swiss side, unless adequate measures be taken to pump out or drain away the water accumulated in the workings. The Swiss pumping plant may be found sufficient to cope with work, but it is not improbable that a second Italian heading will be advanced so as to tap the impounded water at a higher level, and so to facilitate junction between the two first-mentioned workings. When the critical point arrives, the extensive cooling plant on the Swiss side will be of great assistance to the Italian workmen. Through the progress of the undertaking, a second or auxiliary tunnel has been the greatest service as a drain, operations could scarcely have continued without its aid.

The Isle of Wight Coast Question.

MORE than a year ago applied to the Board of Trade for an order prohibiting removal of beach material from the shores and banks of the Isle of Wight. An inquiry was held last autumn by Commander Frederick, R.N., who subsequently presented a report on the question raised. This document appears to have been consigned to a pigeon-hole quite recently, for the first indication of any action is to be found in an announcement made on Monday that the Board of Trade have written to the Isle of Wight Rural District Council stating that orders would be issued prohibiting the removal of shingle and ballast from the shores and banks of the island between Shanklin head and the southern boundary of Old Sandown, and from a small bay at Freshwater-gate. A period of twelve months can be allotted to the consideration of a single resolution in the Board of Trade offices, and it is a truly idealistic existence for those who have a constitutional aversion to work and worry. Official labour would be still further reduced if, in cases like the present, the Inspector were authorized to make the necessary order immediately on the conclusion of his inquiry for greater advantage, from the standpoint of the public, would be prompt prohibition of the indefensible practice of removing beach material from places where it forms the best protection against inroads by the sea. But existing inertia of the Board of Trade might be brought into useful operation if an Act of Parliament were passed making the removal of beach material illegal along the whole coast-line, except by a special authority from the Board issued after the holding of an inquiry. Reverting to the case of the Isle of Wight, it is satisfactory to note that the local authorities will no longer be allowed to assist the sea in its attack to break through Freshwater-gate into the valley of the Yar. We are glad to observe that the Rural District Council have actually nerved themselves to undertake the consideration of the Report from the County Surveyor, and recommends the raising of the high water mark along the shore at Freshwater-gate.

construction of a concrete apron to the sea at bay. Whether the Council will take any action after their consideration," we cannot say, but they do not the sea certainly will.

A CURIOUS contention was raised by the Metropolitan Electric Supply Co., Ltd., week in the Law Courts, and one which, if successful, would have created an uncertainty in the powers of companies carrying on undertakings under statutory powers. The company was incorporated under the Companies Acts 1887, and possesses general powers to acquire land, erect electric plant, and produce and supply electric energy. In 1889 the company, under the Metropolitan Electric Lighting Act, became "undertakers" within the meaning of the Act to supply certain metropolitan areas, which are limited areas defined in the Act, and various orders were made under it. In 1898, owing to lack of powers by Act of Parliament were defined for erecting generating stations outside the area for supplying the area, these were erected at Willesden. Subsequently the company supplied the London and North-Western Railway with electric current outside the statutory powers and the Attorney-General, at the instance of the Willesden Urban District Council, sought to restrain them by injunction. The contention of the company was that under their Memorandum of Association they possessed general powers which were only limited by the Act of Parliament as regards the specified areas and their neighbourhood; but the Council held that as long as they were carrying the undertaking under their statutory powers they were restrained from supplying electricity outside the statutory areas. In these days when companies under statutory powers work as monopolies of a public nature, it is impossible to imagine the confusion which would arise had the defendants succeeded in their contention.

THE case of Millard v. Balby, with-Hexthorpe Urban District Council, commented on by us in our issue for March 12 has come before the Court of Appeal, and the decision of the Divisional Court has been reversed. The facts may be recalled. A certain street, being a highway repairable by the proprietors at large, required paving and was laid. On June 8, 1899, the District Council, acting under the Public Health Act, served notices on the proprietors requiring the work to be done; but as the notices were not complied with the Council exerted their powers of stopping the work themselves. The work was completed December 4, 1901, and the apportionment of the expenses not served under section 257 until November 24, 1902. Millard was the owner of certain premises when the notice was served, and also when the work was completed, but on November 20, 1902, and between the time of completion of the work and the service of the apportionment he sold the premises. A demand for payment under section 257 was made on Millard, May 20, but he contended he was not liable to

pay, since he was not the owner both at the time when the work was completed and at the time when the demand was made. The Divisional Court, feeling itself bound by an old decision, *Reg. v. Swindon Local Board*, decided in 1879, upheld this contention, but the Court of Appeal have reversed this decision, and have held that section 257 clearly defines the person liable to be the person "who is the owner of such premises when the work is completed." The Court pointed out that in the case of *Reg. v. Swindon Local Board* the person on whom the demand was made had ceased to be the owner at the time the work was completed, and they gave no decision on a case where such were the circumstances. The decision obviates an injustice which we have before pointed out would otherwise arise. The purchaser of a house which he buys, because he finds it abutting on a street properly paved and drained, might be saddled with a liability which he had no means of ascertaining, and which arose solely from his predecessor's default.

In May, 1902, negotiations "The Armoury," were opened between the Candia. Cretan and Italian Governments with a view to preserving the so-called "Armoury" at Candia, the most important Venetian monument of the Renaissance period in Crete. The Italians sent over an engineer and submitted a scheme of renovation, and also took steps to aid the Cretan Government financially in the undertaking. The latter, however, abandoned the scheme, ostensibly because of its cost, and put the matter into the hands of a Greek engineer, whose first step was to gut the entire building, leaving the walls (not over strong before) in a rather hazardous state. The work, however, except for covering the building with scaffolding, was subsequently abandoned altogether; and recently the Minister of Public Instruction in Crete ordered the upper story of the building to be demolished within 48 hours—which has accordingly been done. The story is recorded in the *Gazetta di Venezia*, and this barbarous proceeding has aroused indignant protests in the Italian press. It is hoped that the Italian Government will take the matter up. A small view of the building was given in a plate in our issue of February 16, 1901, from which it will be seen that the upper story (the most important part in an architectural sense) was an extremely graceful piece of Renaissance architecture. No words can be too strong in condemnation of such a piece of vandalism.

At the annual meeting of the British School at Athens, on the 27th ult., Sir R. Finlay, who occupied the chair, commented (as others have done before him) on the historical value of studies of the remains of Greek architecture and other arts, in assisting us to realise the facts of Greek history and the nature and aspirations of the Greek mind, to a great extent illustrated for us in literature, to which the knowledge and study of art is, however, a most important assistance. Literature gives us the thoughts of the Greeks

of the classic age, but in architecture and vases and gold work we seem to be in even closer touch with them; we can handle their very handiwork; and familiarity with the remains and the sites of important buildings throws a new light on literary testimony in regard to the period. All this has been said before; but seeing that the British School at Athens needs more public support it is well to repeat and enforce an argument which every educated person, whether an archaeologist or not, can understand and appreciate. In regard to all that has been said, on this and other occasions, about the recent discoveries of a great civilisation much older than the Athenian, we would observe that these discoveries ought in no way to lessen our estimate of the greatness of the Athenian period in art. We have found art, of a kind, where we once believed there was but barbarism; but has anything been discovered that can really compare with the creations of what Tennyson called "The supreme Caucasian mind"? We, at all events, have seen no evidence of it.

As we have before mentioned, a memorial to Mr. Penrose has been in process of formation at Athens, in the shape of a library, to be called the Penrose Library, attached to and forming part of the Students' Hostel in connexion with the British School at Athens. The new building, of which Mr. Heaton Conyn is the architect, is now complete except the interior finish and fittings, which are at present under consideration. The total cost, it is expected, will not exceed 1,150*l.* (building work is cheap in Athens), of which the greater part has been subscribed and collected; but 150*l.* has still to be raised to open the building free of debt. Those of our readers who are desirous to contribute to a memorial to Mr. Penrose, to whom architects and students of architecture are so much indebted, are invited to send their subscriptions to Mr. G. A. Macmillan, Martin-street, Leicester-square, or to the account of the "Penrose Memorial Fund" at the London and County Banking Company, Henrietta-street, Covent Garden.

IN transferring its headquarters to the more commodious premises of the Royal Architectural Museum, Westminster, it was generally anticipated that the Architectural Association would largely develop its influence and take a stronger position as the premier educational body for architects in this country. That this is in process of realisation may be inferred from the excellent display of students' work which constituted one of the subjects of interest at the annual conversazione on October 27, the first social function held in the new buildings. Some 600 guests, amongst whom were numbered many of the more eminent members of the profession, were received by the President, Mr. E. Guy Dawber, and Mrs. Dawber, and the

"Nor these alone: but every legend fair
Which the supreme Caucasian mind
Carved out of Nature for itself, was there,
Not less than life, design'd."

The Palace of Art.

scene—which was enhanced by some tasteful decorations—was one of great animation, and proved conclusively that the Association is a healthy, progressive institution. As is well known, the premises have undergone considerable alteration and adaptation to the dual working requirements, and it is further interesting to observe that they are equally fitted for the entertainment of a large gathering of this nature, although the unexpected numbers taxed the ingenuity of the cloak-room attendants. A small collection of water-colour drawings by architects claimed much attention. Works of students in the evening school also were prominent, and a strong show of drawings made in the day-school showed the comprehensive nature of the aims of the Committee. We understand that the day-school, having reached its fourth year, is now firmly established and found to be a great success. The exhibits of works in handicrafts by various firms took the form of general advertisement rather than of objects of instruction. The specimens of domestic furniture, however, were free from this objection, having considerable interest in design and execution. The occasion synchronised with the completion of the re-arrangement of the original collection of casts, so that the Museum is now reopened to the public. The arrangement of the central hall with its two tiers of galleries proved very effective for an occasion of this kind.

At Messrs. Dowdeswell's Gallery is a collection of "Old English Gardens" water-colour drawings by a new and (we are glad to hear) a young artist, Miss Beatrice Parsons, which, as a first exhibition, may be considered to be remarkable. These are water-colours showing the most conscientious and careful execution, without any hardness, and a most delicate feeling for colour and aerial effect; and considering how often one has been invited, of late years, to admire drawings which are mere splashes of effect with no recognisable detail, it is a pleasure to come across a new artist who seems to recognise that accuracy and finish of representation are qualities worth cultivating. The general excellence of the drawings is so well maintained that it is difficult to select special examples; but among those which we should class among the best are "A January Moonrise, Golder's Hill" (4; the moon is rather too large); "A Plum Orchard in Cuckoo Time" (28), with a shimmer of light about it; "Morning after Rain, Sedgwick Park" (31), shewing a curious kind of fort of clipped tree masses flanking the edge of the pond; "Rockingham Castle" (32) and "Under the Yew-trees, Rockingham Castle" (34); "Irises, Sedgwick" (39), a remarkable bit of composition; "Woodside, Chenies—L'Allegro" (43) and "Woodside, Chenies—Il Penseroso" (46), two treatments of wooded scenes which answer well to the suggestive titles given them. Miss Parsons does not at present do much with figures; if she can treat figures in her landscapes with the same delicacy and finish as in the details of her flowers and birds, she may become a second Mrs. Allingham.

MR. ABBEY'S picture of the King's Coronation, which is on view at the Hanover Gallery, in New Bond-street (but under the auspices of Messrs. Agnew & Sons), has received the praise usually given in the general press to pictures of this class, which it is regarded as an act of loyalty to admire. To those who "look upon it with considerate eyes" it can hardly be reckoned as one of Mr. Abbey's successes; perhaps it was hardly possible that it could be, seeing the extreme difficulty of combining a number of individual portraits into a picture which shall be a comprehensive whole. There is a fine colour effect and a great deal of excellent painting of faces and of the rich detail of the dresses, but the artist has somehow got wrong in the perspective effect of the scene. The King was actually seated much more in an open space than appears here, where his throne seems to be close up to one of the piers (if we remember right, the thrones for the King and Queen were close together on each side of the axial line of the building); and some of the principal figures seem to have got out of plane; that of the Archbishop of Canterbury, about to place the crown on the King's head, does not look as if standing in line with the King at all. The sloping line of the spectators in the transept gallery is too steep—the effect of perspective would be to make it appear less steep than reality, not more so, as the lines are receding from the eye. The result of this is that the space looks cramped, and the picture does not convey the true impression of the scene as a whole. Perhaps this drawback is almost inevitable in a picture which must necessarily have been painted piecemeal, so to speak; the total effect had to be sacrificed to the necessity for individual portraits, and it must have been very difficult in such a case to keep a grasp on the main lines of the composition. After all, it is hardly the kind of work to employ an artist like Mr. Abbey on. It is possible that an inferior painter, with some special experience in internal perspective, would have produced a more correct picture of the scene.

THE Winter Exhibition at Messrs. Tooth & Sons' Gallery is worth a visit if only to see Troyon's "Le Ruisseau" (63), the most beautiful and complete work by Troyon we have ever seen. On either side hang two beautiful small Corots. Bouguereau's "Ora pro Nobis" (67), which was in the Academy, is to be seen here again; it is curious that a picture with which it is impossible to find a fault should yet be so totally uninteresting. M. Cavé's "Innocence" (96) is an attempt to do Bouguereau at second hand. Mr. David Farquharson's "Dartmoor" (95) is a really fine landscape; and Mr. Peter Graham's "Down to the Stream" (70) one of the best of his works of that type. Some small pictures crowded with figures—church festivals and other functions, by M. Garcia Y. Ramos, are very clever and worth attention. Mr. Adrian Stokes, in "Autumn" (101), repeats a combination of colour which we have seen in other recent productions of his, and

M. Lhermitte (103) shows us how to use free and broadly-treated landscape with Raffaelli colours; it is a fine landscape but looks like a pastel, and has not force and depth of tone of oil paint. The small room contains a collection of water-colours of some variety and interest; old and new productions. Among the latter M. Groenowegen's small landscape and cattle scenes are very good. The collection includes works by Cox, Chevillier, W. Hunt, G. Fr. Duncan, Sutton Palmer, Mr. The Waite, and other well-known water-colour artists, living and dead.

THE central point of interest at Mr. Maclean's Gallery is a landscape by M. L. Pignies, not a large but a very good one in the painter's most typical style of composition—silvery distance, central area of water, and framework of foreground trees. A beautiful landscape by Cox and a small one by Diaz, are among other attractions of the gallery. Mr. Luke Fildes is a life-size figure entitled "Lydia Languish," but which cannot accept as representing Sheridan Lydia; and we are surprised by the apparition of a large painting by Bill Poster, "Strasbourg," an architectural scene treated on a large scale and of great breadth of style; showing, if this artist could, when so inclined, produce something very different from the prettily finished little drawings which were so popular in his lifetime.

ONE of the rooms at the Leicester Galleries is occupied by a collection of water-colours by Mrs. Stanhope Forbes, under the general title "Model Children and Other People." All these are inscribed with artistic vitality, though we do not always sympathise with the style; for instance, the rather conventional treatment of landscape in some of the "May Evening" (35) among others, which gives one the idea of having been painted with a view to reproduction in chromo-lithography. A good number of the figure subjects, too, have a suggestion about them; strong colour in flat tints and very little effect of distance; one called "The Book" with the hanging forming vertical line behind the seated figure, is practically a piece of wall decoration. But there are most poetic suggestions in many of these slightly executed combination figures and landscape, such as "Home Field" (14), "The Mill Street" "On the Sea-wall" (25), where the effect of wind is delightfully conveyed, and "By the Light of the Moon" (27) where there is a moon that really seems to shine with a mild radiance.

ARCHITECTURAL ASSOCIATION CAMERA CLUB. Mr. Chas. B. Howdill's paper on "Photography" will be read on November instead of November 8, as previously notified. This paper will be of special interest to those studying colour decoration of buildings. STORAGE OF TIMBER IN LONDON.—It is reported at the meeting of Fulham B.C. Council on Wednesday that, in reply to an inquiry from the Law and Parliamentary Committee, a letter had been received from the London County Council stating the question of the necessity for obtaining powers with regard to the storage of timber under consideration.

LETTER FROM PARIS.

The venerable M. Guillaume has now resigned his position as Director of the French School at Rome, his great age rendering him unable any longer to fulfil the duties of the office, which is at present vacant. He has not been much competition for it, persons most prominent as possible successors to M. Guillaume being M. Carolus-Duran, M. Saint-Saëns, and M. Pascal. One unexpected candidature is that of M. Dard, the painter, which has been received with surprise owing to his recent eccentricities of art, and a supposed leaning towards the impressionist School and the Salon d'Automne. He is, however, a real artist with perfect technique and faultless as to drawing; he is an old Prix de Rome man, and may perhaps have a disposition to return to his former principles and practice. His candidature there is not, as some appear to think, a paradox; it would probably make a very good Director, he is still young enough to be able to take an active part in assisting and directing the work of the students.

The ruins of the Exhibition of 1900 are, to some extent, still standing, and the Champs-Élysées and the river banks still encumbered with its wreckage; and yet people are already talking of the next Universal Exhibition, the subject being discussed even in the higher circles of government. If Parliament, with which the final decision will rest, does give its approval to the idea (the advantage of which seems doubtful), it would be in celebration of the fiftieth year of the Third Republic. The same site is already discussed, and it is supposed that it would neither be the Champs-Élysées nor the Cours la Reine, but the space now occupied by the fortifications, which it is supposed will at all events have disappeared in the course of ten or fifteen years from now. There is an immense zone of ground from the north to the north of Paris, only a portion of which will be reserved for building land. This course all in the air at present, but a great many interests are concerned in it, and the subject is being already considered in official quarters.

The scheme really comes about, it may be said, as events are promised that, if the future exhibition is a long way from the centre of Paris, it will be much better furnished with means of transport and access than its predecessors, for by that time metropolitan railways will have spread its network all over Paris. The 3rd Line, though some of the stations are not quite finished, has been in operation for some days, between the Avenue de la République and Père Lachaise. It is already found to be a great public convenience, and will become still more so if a branch line should be established between the Bourse Station and that of the 1st Line at the Palais Royal.

Schemes for new lines have now been submitted for approval. The most important of these is the "Circulaire Intérieure," which would do the same duty for the centre of Paris as is done by the "Grande Circulaire" for the outlying districts, though a portion only of the latter is at present in operation. The new circle will start from the Place de la Concorde, reach the Opéra by way of the Rue de la Harpe, and thence follow the line of the Grande Rue towards the Place de la Bastille; descending thence by the line of the Avenue Morland passing to the left bank opposite the Arsenal. From this point, after skirting the Jardin des Plantes and the Halle aux Vins, it will follow the line of the Boulevard St. Germain, the rue de la Harpe, the Université, and the Esplanade des Invalides, rejoining the Place de la Concorde after a distance of rather more than 12 kilometres. The cost is estimated at 45 million francs.

The second proposed new line under consideration, 11 kilometres in length, is to run from the Porte de Montreuil to the Place d'Italie, in order to put the inhabitants of the twelfth and thirteenth arrondissements in direct communication with the centre of Paris. The cost of this line is estimated at 40 million francs. The third proposed line, only 3 kilometres long and to cost 8 million francs, would run from the church of St. Augustin to the Opéra. The fourth, 4 kilometres in length, and costing 12 million francs, would run from the Opéra to the Place des Terres. Like the others, it would be entirely in tunnel.

In this connexion, it may be mentioned that a curious piece of work is in progress at the Gare d'Orléans, the object of which is to raise the high-level portion of the metropolitan

railway on the left bank of the river across two blocks of houses and the large hall of the Gare d'Austerlitz. The crossing will be made in an oblique line at a height of 5 to 6 metres; and the railway, still at high level, will traverse the quay to rejoin the right bank by means of a new bridge which is being built above the Pont d'Austerlitz.

These lines will be of unquestionable utility; nevertheless, there are strong protests against them in the commercial world, which is apprehensive of a long duration of work, disturbing the street traffic and interrupting business, and maintains that the public requirements are already sufficiently served by Line 3, which is almost parallel between the Place de l'Opéra and the Place de la République.

The Musée des Arts Décoratifs has organised in the Pavillon Marsan an interesting exhibition of the gifts and legacies which it has received since the beginning of the year. These include the pictures and enamels of Claudius Popelin left by the Princess Mathilde; the curious collection of faience given by M. Fitz-Henry; the collection of Chinese cloisonné enamel of M. Rochard; the velvets and embroideries of the XVth and XVIIth centuries given by M. Boissy; the Japanese ceramics of M. Hayashi; furniture of the Louis Seize and Empire periods given by Mademoiselle Fournier; and the French and Flemish tapestries given by M. Maciet. There is little doubt also that to the Musée des Arts Décoratifs will ultimately come the great collection left to the City of Paris by M. Peyre, consisting of wood carving, tapestry, furniture, and pictures.

The question of the copyright in the works of painters, sculptors, and architects will shortly come before Parliament, which will be asked to pass a law giving to such artists a profit on the successive sales of their works. This will be, in fact, the application to works of art of a principle which has long been recognised in France in regard to literary and dramatic work.

M. Tony Robert-Fleury, the President of the Société des Artistes Français, is occupied, in conjunction with the Department of l'Assistance Publique, in an endeavour to establish in Paris a "maison de retraite" for artists who are old, infirm, or without resources. The Société can dispose already of a fund of 600,000 francs for this purpose, added to which is a legacy for the same purpose of 400,000 francs, making a total of a million. With this sum it is expected that the building may before long be carried out and opened, in the first instance, for twenty pensioners.

The Committee formed to erect a monument in Paris to Waldeck Rousseau, has selected M. Marquette as sculptor and M. Rives as architect, to design and carry out the work. The monument will be erected in the "jardin réservé" of the Tuileries, near the roadway which connects the Pont Royal with the Rue de Rivoli.

A School of Arts and Industries is to be formed at Paris. The building will stand in the Boulevard de l'Hôpital, on the site of the former abattoirs of Villejuif. The cost is estimated at 6 million francs.

The death is announced, at the age of 50, of the painter Léon Gustave Ravanne, who had made a special study of marine subjects. He was a pupil of M. Bonnat and M. Busson, and had obtained medals at several Salons, as well as a silver medal in the Exhibition of 1900. He was an artist of great talent, and exhibited at every Salon works which were highly appreciated.

Mme. Paul Jullierat, who was the oldest French painter, has just died at the age of 98. She was a pupil of Delaroche, and exhibited for the first time in the Salon of 1833. She obtained medals in the Salons of 1834 and 1836, and a "première médaille" in that of 1841. She had for a long time past ceased to exhibit.

The death is announced, at the age of 40, of M. Paul Amédée Barigny, architect, and member of the Société Centrale. He had been a pupil of M. Raulin, at the Ecole des Beaux-Arts, and had carried out a good many business buildings in Paris, as well as villas in the outskirts of the city, more especially at Eshly and Meaux.

MEMORIAL TO JOHN LATIMER, BRISTOL.—A tablet has been placed on the west wall of the north transept of Bristol Cathedral, in memory of John Latimer. Mr. H. Dara Bryan designed the tablet.

EARLY GREEK ART AND THE ELGIN MARBLES.

In connexion with the University Extension Guild, Dr. Emil Reich delivered a lecture at the British Museum on Saturday afternoon on "Early Greek Art as Illustrated by the Elgin Marbles and the Latest Excavations."

Dr. Reich said that, as they knew, the Elgin marbles were part of the Parthenon which Lord Elgin, in the beginning of the XIXth century, brought over to London, very much against the wishes of the Government of the time. They formed part of the most famous temple of all times, for the architecture of the temple in itself was the most perfect piece of work. He wished to speak of both the beauty and the importance of the temple, but it must be remembered that the word "beauty" in our modern times had taken a meaning entirely different from the meaning the Greeks attached to it. The word beauty in our modern times meant largely harmony of lines, but the Greeks did not think beauty consisted only in lines. In fact, they were somewhat adverse to beauty of features, and, like modern Frenchmen, were evidently more impressed by beauty of movement—that was to say, grace. Grace really was beauty in movement, and the great sculptors excelled more in grace than in beauty proper. They could easily find in the pictures, especially of the Venetian school, and the Umbrian school of the age of Raphael himself, lines which were as a whole much more beautiful than any line they found in any of the Greek statues. They had the chryselephantine statue of Minerva, which was in the very interior of the Parthenon, and of which a beautiful replica was at Vienna. This was exceedingly beautiful and powerful, yet it might well be doubted whether some of the pictures of the Renaissance and later on did not make the face and the outline far better than the Greeks had ever done. The Greek aim was a mixture of grace and dignity, and he would add a third quality—repose. What struck one so much in Greek statues was the calm, or, as we call it, serenity. It meant that the nation which felt that realised that what had to be done was done; that they had done the great and the small, and that there had come over them that repose which was only possible in men and women who had brought about a perfect harmony in themselves. In mediæval and the Renaissance and modern times they found in the statues and paintings that which was fascinating, or whatever they liked to call it, but the wonderful serenity which existed in Greek statues, even down to the minor details, was gone, because art stood in so close relation to the very soul of a nation. If that soul was unduly undulating, then, of course, the repose could not be serene and calm. It was in art that the vices and virtues of a nation came out so clearly, and he would be a blind man who would not see that. Of course it took eyes to see, and it would be a wonderful advantage if history were written by artists. They would not care for documents or inscriptions or any other so-called source, but they would simply care for art, and would look into the moving lines and expression and colour, and would say, "What does it mean?" By art he meant not only sculpture in marble, but art generally speaking. It was thus that Greek art gave us the expression of absolute serenity; the impression of people who had gone through fights for 800 or 1,000 years, and finally by vanquishing their enemies had reached that repose and serenity that individual people could reach very rarely. It was this expression of serenity that made Greek art so different from anything we had. He would like to say much about the excavations of Dr. Arthur Evans, a man whom they appreciated very much in England, but far less than he deserved. Dr. Evans went to Crete and found a number of old buildings. Last century it was evident that the really great finds would not be in Greece proper, or even in Asia Minor, but in Crete. It was felt that Crete must have had a civilisation 4,000 if not 5,000 years B.C., but there was a far cry between wish and realisation. Dr. Evans, very largely at his own expense and only very insufficiently helped by contributions, went out to Crete, where also an Italian Commission was working, and they found there the beginnings of Greek art. They had in the publications of Dr. Evans and the Cretan Exploration Fund a very clear idea of what really happened in Crete, at least 3,000

years B.C. He found that what the Frenchman Rabel said was true, viz., that there must have been a civilisation of very great importance long before the historical Greeks, and long before the historical Romans. Long before the foundation of Rome there were in Italy hundreds of towns surrounded by cyclopean walls. At Mycenæ, Knossos, and many other towns in Crete, are these huge square stone walls, and on top of them they saw the brickwork of a later age, and thus they could see the historical sequence. These great walls were evidently built first for defence, but the excavations of Dr. Evans had proved more. He found a palace at Knossos three times as big as the Houses of Parliament in London, with hundreds and thousands of rooms; with great yards and cellars, and—more astonishing—entire streets. Still more astonishing, the buildings had French windows, just as in modern times. But if Dr. Evans came across architecture 6,000 years B.C., he (Dr. Reich) would consider it quite natural; there was no reason not to expect it. Homer spoke of the 100 towns of Crete, but there must have been several hundred, and a high degree of civilisation. It was when we traced Greek history that we could tell where Greek ideas came from. The Greeks found themselves being pressed in by the Great Empires, and as they could not beat their enemies by placing in the field masses of men they had to beat them by intelligence. What happened in the Western portion of Asia in so-called prehistoric times, was being enacted in Eastern Asia at the present time. Japan, an island power, saw herself in danger of being attacked by two great Empires, the Russian and the Chinese, and when she found that she could not hope to defend herself unless she tried to be more civilised, she sent her men to Europe to learn. This process of intellectualism had happened in our own isle, and it was what happened 3,000 or 4,000 years B.C., and more especially 1,000 years B.C., on the western shores of Asia. The Greeks say that they must succumb to their enemies unless they looked to their intellectual development, so that by sheer force of intellect they could beat them down. This gave rise to a greater expression in art. Where there was a greater life there must be art. This was the true origin of Greek art. They did not take it from the Egyptians, for art could not be given. People say, "It all comes from Egypt or Assyria," but the Greeks did not get it from the Egyptians or the Assyrians. They fought for it, and in fighting the powers which make for art were born in them. We had an example of that in Shakespeare. The men who fought the Spaniards never wrote a line of Shakespeare, or at least that theory had not yet been advanced; but it was a certain fact that had it not been for Drake and Frobisher and others beating the Spaniards, and arousing the powers in the nation, there would have been no Shakespeare. People said, "Here is a column or pillar; it is just like one in Egypt," but that did not prove that the Greeks took it from the Egyptians. The Italians never took Gothic architecture, because they did not want it, for the same reason there was no Gothic architecture in Eastern Germany. Art could not be given any more than love. There must be powers aroused in one which produced it. They could not go to a firm like Whiteley's and say, "Give me 2*l.* worth of artistic capacity." In the last 200 years all the great musicians of the world had given concerts in England, but where was the English Beethoven? The fact was that they did not want him, because the powers which made for music had been sterilised in England. There must be hundreds of men in England in whom was the genius of Beethoven [? Ed.], but their forces were driven in other directions. The excavations of Crete showed clearly that Greek art was really of their own growth. It was stimulated by the fighting against great empires—it was war and conflict which was the father of all nations. These cyclopean walls indicated that there must have been fighting of the most gigantic kind, and that was what made the art. Evidently for 1,500 years before the Parthenon was built, the Greeks had prepared themselves, and it was from 490 to 449 B.C. that the Greeks, in a series of most wonderful engagements, in which their intellect did more than their physical vigour, defeated the biggest Empire in the world, and those who were left felt that they had reached the summit of their life, and the great and final expression of that

feeling was the Parthenon. Could we wonder that the Greeks felt it, for did not we feel it after so many years? The finest architecture of the Middle Ages and of modern times might give them a shiver; they felt after a time there was something not quite complete, but the Parthenon never gave one a shiver; the real beauty of the thing entered one's soul, and became a principle of one's life. One felt that he had not only seen a fine thing but that he had seen the whole of human life—the whole of what they called human life in marble. It was totally different from anything else. They saw that everything most beautiful, except the statue of Minerva, was outside. In a Christian or Mahomedan church the outside was only the introduction—the real church was inside. It was in the inside they saw the wonderful architecture and found the beautiful paintings, and heard the fine music, and finally assisted at the great service, which more or less filled them. With the Parthenon everything was outside; the wonderful columns, metopes, pediments, and frieze. The movement of their souls and the whole change of the inner man was not given inside, because no one ever entered. But the temple could be seen from an enormous distance, and the people were constantly in the presence of this expression of the greatest and deepest religious ideas. The man who in modern times was Schopenhauer, and he gave the idea very simply that a column, for instance, was meant to express gravitation, and that anything which went against this principle, such as a column very thin in the middle, was silly. It must express support in the first place. In the modern church they found that idea of support exaggerated; in Gothic churches they found the buttresses very elaborate, but in the Parthenon they found two rows of columns—that was all. Each column was the same—each was a simple Doric column. The architrave was as simple as it could be. It plainly said, "I am here to support this big building; that is all I have to do." But there was one thing which gave them the idea that the columns were more than a support. It had long been noted that not only did these columns swell in the middle but they twist round, and gave the column a sort of human force—they saw the effort of the column to support the building. It did not strike them like the buttresses in Gothic architecture. He was not opposed to Gothic architecture, and when they saw the work on the buttresses of St. Ouen, at Rouen, for instance, they were overwhelmed with the beauty; but if their eyes were accustomed to Greek architecture they asked, "What does it all mean?" It meant the support of a very high, thin wall, and it was too much. The Greeks did not do it, but they had the outside as simple and chaste as possible. They did not try and take the infinite into their pocket, but they said, "Here is our earth, we have done what we have; we have reached our maturity." And so instead of attempting to go up into the infinite sky they gave an expression of calm repose. The Greeks were profoundly religious; we are religious on the seventh day, but the Greeks were religious every day of the week. And so in their temple their ideas of religion were outside, and shone down on Athens always. Nowadays, our religion being rather of an intermittent kind, we wanted music; we wanted an intense shiver and at once. The Greeks did not want anything of that, they were intensely attracted by music, but they would not have it as part of their services. They wanted sculpture, which was more permanent, more intense—was always there. The Parthenon was erected in honour of Minerva, the goddess of war and wisdom, of virginity and holiness, of irreproachable severity, and they might have expected the great temple to have reminded everyone of the great contest with the Persians. But there was not a trace of that. The temple must have cost millions of money, but it never entered their minds to have the slightest allusion to any of their immortal fights. Their idea was to show that they believed the gods helped them, and were willing to help them in the future. There were any number of figures round the frieze, but no representation of any of their heroes. The feeling left was that the Greeks had found the art of proportion. They saw the procession of the Panathenæic festival portrayed, and it was really a story of man's life. It was not only a pageant but told everything that happened. That procession was not only a

spectacle, but was a lesson in art, politics, and everything. The Parthenon only the same idea expressed in marble if ever the time came when the world had had its Parthenon, that simple old would be the model.

THE HELLENIC SOCIETY.

The first meeting of the present of the Hellenic Society was held at the room of the Society of Antiquaries on Tuesday afternoon. The meeting, which was well attended, was devoted to a summary by Dr. Arthur of his last season's work at Knossos. The following *resumé* of his address from *Times* report:—

"Dr. Evans said that on the palace site this year's excavations had thrown much light on the stratigraphy of the so-called 'Minoan' constructions dating from the Neolithic period onwards. In the wing of the later palace the original plan was clearly distinguished from the scheme, which was shown to be the result of subsequent remodelling. Fresh storerooms belonging to its first period—found in 1903 containing the faience figure of a snake goddess, but less rich in relics found to extend north of the others beyond the later stepped portico which here opened to the central court. A whole line of gypsum walling facing this court could be made out, a little within the late facade. This original facade was seen to have been incorporated in the later construction partly to have been broken through by the west wall of the palace itself. The adjoining magazines belonged to the earlier work, but the entrances to the magazines found to have been altered. Originally they were provided with comparatively small doors appropriate to the valuable contents of the cists along their floors. The entrances were widened, the cists reduced to mere shallow cavities, and the whole fitted for the reception of huge oil jars. From the official deposit of some of these cists belong to the second period of the later palace brought out a variety of painted stucco ornaments which had fallen here from a higher level above. Among these were illustrations of a hull ring, together with other frescoes, larger than the 'miniature' paintings in 1900, showing part of the facade of a shrine, with the 'fetish' double-axe into its columns. Dr. Evans also exhibited a scheme devised by him for the arrangement of the scattered fragments of the earlier covered miniature frescoes as part of ceiling designs. Two panels were thus reproduced. M. Gillieron under his direction, one of a small temple and halls on either side of ladies seated or standing in the foreground, and the other of a group of men behind. The other of the walled enclosures with trees and similar figures overlooking a court where gaily-dressed women were engaged in a mazy dance. Interesting fragments had also been discovered of the painted reliefs exhibiting parts of a figure, with a *fleur-de-lys* crown, and the admitted the restoration of the entire of what was not improbably one of the kings of Knossos. The centre of the wall was found to be adorned with peacocks." A clay sealing of still earlier date supplied appeared to be an actual portrait of a monarch associated with his son, but in the head was crownless. A section cut in the pavement of the west court had laid remarkably complete evidence as to the fixation and comparative chronology of characteristic stages of Minoan culture preceded the construction of the later palace. The foundation of the later palace was to have been posterior to the great Minoan age of polychrome-potted second period, as appeared from E. associations, did not come down later than about 1500 B.C., but there were now to be six distinct periods of culture that set the initial stage of the later palace in the latest Neolithic deposit. Below this age Neolithic stratum which was itself placed on the virgin rock, attained a depth of from 6 to 8 metres. On the western border of the palace the total depth of the human occupation was from 12 to 14 metres. A Minoan pavement was opened out leading directly west of the 'theatral area' discovered last year, and this, towards the close of the present excavation,

...to light what appeared to be remains of the Royal arsenal. A large hoard of clay tablets was found here relating to chariots, arms, and near one of these—enumerating of over 800 arrows—lay the remains of two well-sealed chests containing the bronze-headed arrows themselves. A principal work of the year was the exploration of an extensive series dating from the last days of the palace to the immediately succeeding period. Over 100 tombs were opened, containing bronze vessels, arms, jewellery, and other typically Mycenaean remains. Of still greater interest was the discovery of what appears to have been a mausoleum occupying a commanding position overlooking land and sea. It was built on a different plan from those of Mycenaean times, the principal chamber being square with a flat roof. Most of the metal objects had been abstracted in ancient times, but magnificent examples in the later palace style were found, together with Egyptian alabastra of the beginning of the XVIIIth Dynasty."

Plans and sections of the so-called "mausoleum" (we fear we cannot accept all these conclusions as certain and proven) had been made by Theodore Fyfe, and were exhibited on the occasion along with a section of the Treasury of the temple, in order to compare the two examples of the use of the arch in horizontal courses. The objects of which illustrations were given on the screen the most interesting and valuable from the artistic point of view were those of the decorated vases of what is now called the "Middle Minoan period"; two of which were equal in design to any of the best classic Greek work of the same period. We think the interest, or at all events the artistic value, of the figure-painting and the vase found at Knossos has been a good deal exaggerated.

The succeeding meetings of the Hellenic Society are fixed for February 21, May 9, and July 27, 1905.

THE POWELL WOOD PROCESS.

Yesterday last a demonstration was given at the office of a new method of treating timber which is now being introduced by the Powell Process Syndicate. The procedure may be thus briefly described:—The timber for treatment is first placed on trucks packed in such a manner that the surfaces are separated one from the other. These trucks are then run along rails into a cylinder, long by 6 ft. 6 in. diameter, furnished at one end with a hinged cast-iron door, which can be secured so as to make a water-tight joint, and fitted inside with a network of pipes for heating by steam and cooled by water. When the trucks have been lowered into the cylinder they are fastened down and the timber from floating in the liquid, which is added after the door has been closed. The liquid employed is an aqueous solution of sugar molasses for the heavier descriptions of timber, and of raw sugar for hard woods. Open tanks are provided in the vicinity of the cylinder for the different qualities of solution suitable for each class of timber for treatment, these being connected with the cylinder by pipes each controlled by valves. Steam and water pipes are connected with the coils of the cylinder, and two centrifugal pumps are provided, one for dealing with the saccharine solution and the other for circulating cold water through the coils. The timber is first immersed in the solution by the admission of steam to the pipes mentioned. This has the effect of forcing out air contained within the wood, and at the same time it serves to coagulate the mucous constituents of the sap. It is claimed by the patentee that timber has so great an affinity for saccharine matter that it soaks in a solution of sugar the air contained in it is given up far more readily than when immersed in water only. It follows as a matter of course that the voids left by the displacement of air must be occupied by the solution, from which the water is evaporated in the subsequent process of drying. This process is performed in a series of three drying-rooms adjacent to the cylinder. All the rooms are heated by means of a 48-in. fan through a network of special construction, and in connection with which hot air ducts and cold air ducts are arranged so that the temperature of each chamber may be regulated at will to suit the nature of the wood to be dried. A 36-in. fan is provided for each chamber to make the circula-

tion of air thoroughly efficient. After the process of drying is completed, a current of cold air is passed through the chamber to cool down the material. It should be observed that neither pressure nor vacuum is necessary for the method here briefly outlined, and, as a matter of fact, the employment of a closed cylinder has been shown by practical experience to be unnecessary, for the results following treatment in an open tank are said to be perfectly satisfactory.

The feature distinguishing the process from others of somewhat kindred character is to be found in the employment of sugar in place of creosote or mineral salts. We were informed by Mr. Powell, the patentee, at the close of the demonstration, that he first discovered the value of sugar as an impregnating material when conducting some investigations into the causes and prevention of dry rot. Observation showed him that this particular form of decay was very unusual in sugar refineries and factories, and he was led to make experiments which ultimately resulted in the elaboration of the process described in these notes. An important claim made is that the newer the timber the better it is for treatment, and it is said that timber felled in the forest may be made ready for commercial use within a fortnight, being rendered stronger, firmer, tougher, less porous, and more durable than in its natural state, whether seasoned naturally or artificially. It is obvious that we cannot, after a mere inspection, personally vouch for all statements made in favour of any system of the kind, but judging from the examination of various specimens of treated timber, we can substantiate in a general way some of the claims put forward. For many purposes we think the addition of a vegetable product such as sugar is likely to conduce to more thorough impregnation than the similar employment of a mineral salt, but so far as concerns resistance to fire, the latter is certain to be more efficacious, and in point of fact non-flammability is not claimed by the patentee as one of the benefits to be derived from the adoption of the process. So far as relates to the question of penetrability by water, it is scarcely to be expected that a substance of such solubility as sugar can offer the same resistance as creosote and other insoluble products, unless some chemical action altering the character of the material takes place during the course of the process.

BETHLEHEM HOSPITAL, SOUTHWARK.

In order to provide a much-needed open space for recreation ground in that part of South London, a proposal is under consideration for acquiring the site and grounds of Bethlehem Hospital, between eleven and twelve acres, in St. George's Fields. The land comprises the gardens of the former Dog and Duck tavern, taken in 1799 for the School for the Indigent Blind, and three acres appertaining to the House of Occupations (a branch of Bridewell). It formed part of the Bridge House Estates of the Corporation of the City of London, with whom the hospital governors exchanged in 1810 the site, about two-and-a-half acres, of the hospital in Moorfields just outside the City Wall, where is now Finsbury Circus. Contributions to the building fund were made by the Government (in respect of criminal lunatics), the Corporation, the City companies, and private individuals. A Parliamentary inquiry held in 1815 resulted in the adoption of a humane treatment of the insane. The new hospital was begun in April, 1812, and completed in August, 1815, for 184 patients, and 66 in the criminal cells, at a cost of 122,572l. 8s., James Lewis being superintending architect, and Repton assistant architect, of the work. Lewis had been appointed surveyor to the Bridewell and Bethlehem Hospitals in 1793; in the competition for the new hospital in Southwark the first and second premiums were awarded to Joseph Henry Good and W. C. Lochner jointly, and John Adey Repton, respectively. It seems that the building erected by Lewis embodies the designs of those three architects. It comprises the middle order with hexastyle Ionic portico, and parts of the east and west wings, and of the wings extending southwards; having a front 569 ft. long, and an altitude, disposed into four galleries or floors, of 60 ft. to the parapet, the wings being 45 ft. in depth. Some additions were made by Lewis's successor, Philip Hardwick, R.A., and afterwards by Sydney Smirke, R.A., who in 1838 was appointed

architect to the governors. To Smirke are due the cupola (1844), which has a diameter of 37 ft., and rises to about 150 ft. above the ground, in place of the former copper-covered dome, the projecting parts of the east and west wings, and the completion (1852-3) of the south wings. The exercise-courts, or "green-yards," were re-arranged, new workshops and other subsidiary buildings were erected, so that in 1868 Smirke had increased the accommodation to receive 376 inmates. The two figures which C. G. Cibber carved in Portland stone for the gate-way of the former hospital, and Bacon restored in 1820—"Εικόνα των εντός χώ λίθος έκτός έχει"—were removed some years since from the hall to the Museum at South Kensington, and thence to the Guildhall Museum; the entrance-gates are shown in Hayley's picture, 1746, at the Foundling Hospital. In the outer face of the wall of the hospital grounds is embedded the carved sign of the Dog and Duck, with the Bridge House Estates device and date "1716."

THE SANITARY INSPECTORS' ASSOCIATION.

The annual meeting of this Association was held on Saturday last week at Carpenters' Hall, London Wall, E.C., Sir James Crichton Brown presiding.

The annual report, read by Mr. Young, stated that in the last year's report attention was called to the progress made towards the securing of one association for the whole of England, to which end the Articles of Association had been so altered as to render them not only acceptable to those associations they desired to become affiliated with, but also at the same time to secure to those who were members of the Incorporated body that they should be in no wise prejudiced by the alterations. At the date of the last annual meeting a copy of the amended articles had been deposited, in accordance with the Companies Acts, at Somerset House. Up to that time no official correspondence had taken place with the outside organisations, but immediately following the meeting referred to correspondence was entered into between the Chairman and the officials of the National Union and the South Wales and Monmouthshire Associations. By the end of November an agreement had been prepared between Mr. Spears and their Chairman for the approval of the Council of both associations, which was subsequently ratified, and formed the basis upon which, coupled with the amended articles, affiliation was to be secured. The object of the agreement was to secure certain rights and privileges to the National Union of Inspectors, and also the Lancashire and Cheshire branch, the area and interest of which would be affected in the event of amalgamations taking place. In December the Chairman attended, at their desire, a meeting of the National Union at Manchester, when the amended articles and agreement were considered and provisionally approved. The members of the Union were subsequently furnished by the secretary with voting circulars, and were asked to vote for or against amalgamation, and also to state their willingness or otherwise to be transferred to membership of the Incorporated Association. In February they adopted the Chairman's reports and the agreement, and conferred with the National Union and the South Wales and Monmouthshire Associations. It was understood that the membership of the National Union exceeded 350, and their financial year ended on March 31, by which time it was hoped arrangements would be sufficiently advanced to enable a large proportion of their members to be elected at the April meeting. Success attended the efforts of the Council of the Association, and, on April 9, 116 members of the National Union were enrolled members of the Association. The South Wales and Monmouthshire Association also unanimously decided in favour of amalgamation under the revised articles. Considerable correspondence had taken place upon the question since that day, and strenuous efforts were made by their South Wales friends to secure, in the words of Mr. Towy Thomas, the first autumn provincial meeting of the Amalgamated Association at Cardiff in August of the present year, but the Council regretted that that was not possible. The Council's report upon that portion of its work would be incomplete were it not to record the fact that as between April and August last there were elected 204 members of the National Union. The total effective membership of

the Association was never so satisfactory as at present. Including those elected at Bourne-mouth, it had approximately 900 members allocated to the six established centres. The South African centre of the Association would most probably commence with a membership of forty inspectors. Continuing, the report referred to the Permanent Tenure of Office Bill. The measure, promoted in 1903 by the British Medical Council to secure permanent tenure and superannuation for medical officers of health and sanitary inspectors, did not, unfortunately, meet with the success which they had anticipated. The Council, however, believed that a large measure of support would attend the efforts to be put forth in connexion with the introduction of the amended Bill into the ensuing session of Parliament. On behalf of the Council, the Chairman and secretary had had interviews with the Parliamentary Committee of the British Medical Council, and their secretary. The Council had approved their action in agreeing to that portion of the Bill relating to superannuation being dropped, so that the measure would, therefore, be for tenure of office alone.

The report was adopted. Other business having been transacted, Sir James Crighton Brown delivered a short address on the position of sanitary inspectors in New South Wales, based on information supplied to him by Professor Andrew Stewart, of Sydney. In Sydney the salaries of those officers ranged from 150*l.* to 400*l.* per annum, but in the smaller towns the salaries were smaller and the duties of the inspectors included rate collecting, &c. The Sanitary Institute of Sydney held examinations at various periods, the first having been held in January of 1901, when fifty-one candidates entered. In connexion with these examinations courses of lectures were held, part of the proceeds of these lectures and examinations being devoted to the acquiring of models, &c. Visits to various interesting works, &c., were arranged, and everything done to evoke an interest in sanitation. He thought that England might learn something from her Colonies, and profit by their experience.

THE VENTILATION OF SEWERS.

In a Report recently circulated the Works Committee of Lewisham Borough Council stated that the ventilation of sewers in the district had received attention from time to time, owing to complaints received from residents as to smells emanating from surface road ventilators. In this connexion they had received the following communication from the Borough Surveyor:—

"The whole question of the ventilation of sewers is surrounded by difficulties, and unfortunately we hold very different opinions as to the best means of dealing with the matter. In many places the surface gratings are closed and columns erected in order to ventilate the sewers, but this, in my opinion, and I have made many tests in connexion with the subject, simply means that the nuisance is removed from the road surface, and that the sewers are very inefficiently ventilated, unless some artificial means of forcing a draught up the columns is adopted. The air which does find its way out of the top of the columns is far more foul than that which is emanated from the surface gratings; this is caused by the more sluggish current which is always found in a deep sewer, and my opinion of columns is that you practically deepen your sewer by the height of your column, that is to say, if a sewer is 10 ft. deep and you erect a 30 ft. column you are practically converting that sewer for the purposes of ventilation, to a sewer 40 ft. deep, and I think that whatever different opinions engineers may hold on the subject of ventilation generally, they are agreed that a deep sewer is more difficult to ventilate than a shallow one. A very good example of this exists in this borough. The old sewer in Stanstead Road averaged about 10 ft. deep, it was in a very defective condition, the gradients were irregular, in places flat, and in other places steep; the bottom, also being defective. This sewer was reconstructed in 1893 at an average depth of about 25 ft. It is one of the best laid sewers in the borough, and is at an even gradient the whole way. During the time the old sewer was in existence we very seldom had complaints of smells from it; since the new sewer was constructed we are continually receiving complaints. Of course there are many ways of inducing an artificial current up the column ventilators, but they are all attended with serious drawbacks. The most common form of inducing a current is by means of heat, but it is a very expensive method and is attended by some danger. If a small jet of gas is burnt in the column and any coal gas leaks into the sewer, which it frequently does, there is very great danger of an explosion. The other method of applying jets of gas are practically adaptations of the Davy lamp, by which the gas is burned inside a wire gauze; but this unfortunately seems to considerably reduce the efficiency of the heating power and also further increases the cost. Another method of inducing a draught is by means of a cow with an Archimedian screw; but this, in my opinion, is a complete failure, and is worse than useless, because the time when sewers most require an artificial means of ventilation is on dull, still days, when there is no wind, and then, of course, the cows do not revolve, and the Archimedian screws practically block the columns and prevent the little ventilation which one might get

without an induced current. I some time ago tried an experiment with a revolving fan fixed in a column, the fan being driven by a jet of water under pressure from the Water Company's main. I utilised the water afterwards by conveying it into a flushing tank, where it flushed the sewers. This was effectual to a certain extent, but it was too expensive to adopt generally. The complaints of smells from sewer ventilators have largely increased since the coming into operation of the London County Council's by-laws as to drainages, which necessitate the use of interceptors to block the house drainage from the sewer; under the old system each house was compelled to have a ventilating pipe from the highest point of the drain, each one of these pipes acted as a ventilator to the sewer and the surface gratings in the road in most cases acted as fresh air inlets; this theory of mine is borne out by the fact that on the St. German's Estate, which has been laid out nearly entirely since interceptors have become compulsory, we have more complaints than from any other part of the borough. This may appear to be somewhat of a contradiction to my condemnation of column ventilators, but the one thing is very different from the other; column ventilators are, as a rule, erected about 100 yds. apart, whereas house ventilators are, of course, erected to each house, and in the 100 yds. there would probably be on the average about twenty-two separate house ventilators, and also with the old system we still had the open surface gratings in the roadway. I would suggest as a partial mitigation of the nuisance that the sewer ventilators should be put much nearer together; at present when sewers are sanctioned we ask for about 100 yds. apart, and also that efforts should be made by combined action of the borough councils to obtain the repeal of the London County Council's by-law with reference to interceptors. I am afraid this would still leave a considerable amount of difficulty, as the majority of the medical officers in London are in favour of interceptors, and will advise their councils against the repeal of this by-law. I should like to point out that although the sewerage is not made compulsory until the passing of the London County Council's by-laws in 1900, many of the boards of works and vestries in the metropolis insisted on their use, whereas in Lewisham we not only do not insist on them, but we advised builders not to use them; and I think that this action has been justified over and over again by the low death-rate in the parish of Lewisham. My idea of an ideal sewer is a trough of the necessary depth to drain adjoining premises, flushed off level with the road surface with a continuous open grating. If such a thing were constructed I firmly believe we should never have a single complaint."

Continuing, the Committee in its Report went on to say that the London County Council in October, 1900, made drainage by-laws under the provisions of Section 202 of the Metropolitan Management Act, 1855. No. 5 of such by-laws provides as follows:—

"Every person who shall erect a new building shall provide in every main drain or other drain of such building which may immediately communicate with any sewer, a suitable and efficient intercepting trap at a point as distant as may be practicable from such building, and as near as may be practicable to the point at which such drain may be connected with the sewer. He shall, except in cases where the means of access to be provided in compliance with the preceding by-law shall give adequate means of access to such trap, provide a separate manhole or other separate means of access to such trap for the purpose of cleansing it."

And this by-law, so far as practicable, is made to apply to the reconstruction of drains as well as to drains of new buildings.

In conclusion, the Committee state they concur with the views expressed by the Borough Surveyor, and have decided to send copies of his communication to the other Metropolitan Borough Councils, and ask them if they would be willing to co-operate in requesting the London County Council to take the necessary steps to repeal the by-law made by them requiring the fixing of intercepting traps.

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, Mr. J. Williams Benn, M.P., Chairman, presiding.

Loans.—On the recommendation of the Finance Committee, it was agreed to lend Battersea Borough Council 11,314*l.* for electric light installation and meters; Finsbury Borough Council 9,244*l.* for improvements; and Woolwich Borough Council 16,000*l.* for the erection of municipal buildings.

Thames Steamboat Service.—On the recommendation of the Rivers Committee, the following was agreed to after a long discussion and the defeat of an amendment to refer the matter back to the Committee, on the ground that the lowest tender had not been recommended:—

"That the capital estimate of 297,530*l.*, submitted by the Finance Committee, be approved and that the tender of Messrs. John L. Thorneycroft & Co., Limited, for the supply of ten steamboats at the price of 5,950*l.* per boat, the tender of Messrs. Napier & Miller, Limited, for the supply of ten steamboats at 6,000*l.* per boat, and the tender of the Thames Ironworks, Shipbuilding, Engineering Company, Limited, for the supply of ten steamboats at 6,500*l.* per boat be accepted, subject in each case to the submission of satisfactory working drawings for approval before the work is commenced, and that they be allowed to sublet such portions of the work as are approved by the engineer."

Mr. A. R. Owen was appointed in the Engineer's Department as Manager of the Thames

Steamboat Service, at a salary of 500*l.* annum.

Tramways in Rosebery-avenue.—Upon recommendation of the Highways Committee the sum of 22,500*l.* was voted in connexion with the construction for electrical tramways along Rosebery-avenue.

Main Drainage Extension: A Question of Tenders.—The Main Drainage Committee recommended that the contract for the construction at Plumstead of a portion of the southern outfall sewer should be given to Westminster Construction Company at 8*l.* in preference to the lowest tenderer who to do the work for 68,377*l.** When this recommendation was before the Council a fortnight ago it was referred back to the Committee. The chief engineer's estimate of the cost of this work was 91,727*l.* In making their recommendation the Committee justified their action in passing over the lowest tenderer on the ground that the firm had not yet done work for the Council and the job in question one of exceptional difficulty.

Mr. Torrance now moved for an amendment that the work be given to the lowest tenderer.

Mr. Beachcroft seconded the amendment, which was rejected on a division by 63 to 44.

The recommendation of the Committee was then adopted.

Theatre, Commercial-road.—On the recommendation of the Theatres and Music Committee, plans submitted by Mr. B. of a theatre proposed to be erected at the junction of Commercial-road and Myrtle-road were agreed to. The theatre will have an accommodation for 1,887 persons.

The London Building Act Amendment Bill.—Mr. Radford asked the Chairman of the Building Act Committee as to the present position of the Building Act Amendment Bill introduced by the Council.

Captain Hemphill, Chairman, said the Committee proposed to bring up next week full details of the Bill, and they hope the Council would support the general principle when they were then set forth.

Precautions Against Fire in Underground Electric Railways.—The Fire Brigade Committee reported as follows, the recommendation agreed to:—

"We have had before us a letter from the Metropolitan Railway Department, stating that in order to promoters of underground electric railways requirements in certain matters which will be the officers of the Board when such lines are submitted to the department for inspection, that has included a notification that "efficient fire hose, and fire-prevention appliances are to be provided and mentioned that the Board proposes if the promoters call upon promoters of such lines for inspection, to produce for the information of the Board an expression of opinion on the part of the officer of the Council's Fire Brigade, as to the sufficiency of the provision made in compliance with this notification."

"After careful consideration, we informed that the Council would raise no objection to the proposal, but that it was very desirable that they should make certain demands relating to fire-appliances and issue them to the promoters of the railways. We forwarded certain minimum requirements and recommendations on the subject. These have been embodied in a circular letter issued by the Board to the promoters of tube railways, and they are as follows:—

(a) The following are the minimum requirements as regards fire-appliances, provided the station is of reasonable dimensions:—

(1) A hydrant of the fire brigade pattern fitted at each end of each platform, and a hydrant to be provided with sufficient hose and nozzle to reach the whole length of the platform and of the longest train in use at a particular line.

(2) At least six buckets of water and a sand-bag to be available on each of the service platforms.

(3) An extinguisher to be supplied in each carriage and to each lift.

(4) It is recommended that provision should be made for:—

(1) Some experienced person responsible for the owners of the railways to periodically examine and test the extinguishers, and the owners responsible for the good order of all such appliances and for seeing that the railways are stationed and drilled.

(2) All waste and dirt to be removed daily.

(3) It must be clearly understood that uncrowding in the lifts and carriages is prevented by the owners of the railways keeping the exits in such lifts and carriages will probably prove useless in case of fire.

(4) It should be borne in mind that in the event of fire obtaining any hold in a "tube" railway fire brigade could be practically of no avail, and therefore the railway authorities must rely upon their own resources.

"We are of opinion that, provided the station is of reasonable dimensions only and the trains and stations are constructed in accordance with

* See the full list of tenders on our Tender page.

ments of the Board, dated May, 1904, the appliances mentioned above could be accepted as sufficient if installed efficiently and used promptly by the railway staff. It is of course understood that the question for consideration has relation only to railways connected in accordance with the Board's requirements dated May, 1904. Moreover, the minimum requirements as to fire-appliances set out above relate only to the trains, the platforms, and the booking-offices, and do not extend to that level, and do not of course apply to the booking-offices and other parts of the railway above the line level for which special arrangements could be made.

We have called the special attention of the Board to the question of over-crowding. It is obvious that, however perfect might be the fire-appliances in the places, disaster would probably follow if the gangways were not kept clear so as to admit of the extinguishers being got to work readily and expeditiously. We suggested to the Board that it should make a requirement that the motors should be contained in separate compartments made of non-combustible material, and be underneath carriages, but the Board has replied that its advisers are of opinion that the requirement stated is hardly practicable. We have settled the plan in which the chief officer of the fire brigade should express his opinion as to the sufficiency of the fire-appliances, and this form has been approved by the Board. It is proposed that the requirements and works included in (a) to (d) in the second paragraph of his report shall be set out on the back of the form. We recommend—that the checks taken by the Fire Brigade Committee with regard to the precautions against fire in underground electric railways be approved.

Tramways: Re-building of First Portion of Car-shed at Streatham.—It was agreed, on recommendation of the Highways Committee—(a) That expenditure, on capital outlay, of sums not exceeding 19,280*l.*, in all be authorised, in respect of (i.) the erection of superstructure of the first portion of the tramway in the electrical working of the London County Council Tramways, and (ii.) the execution of paving works, the laying of rails, and the construction of conduits in, and in connection with, the car-shed. (b) That the portion of the first portion of the Streatham car-shed be carried out without the intervention of a contractor; and that the drawings, specification, and estimate of 16,180*l.* be accordingly referred to the Works Committee that purpose. (c) That the paving works, the laying of the rails, and the construction of the conduits required for the first portion of the Streatham car-shed, be carried out by the Council's permanent way staff, under the supervision of the chief officer of tramways.

Housing.—The Housing of the Working Classes Committee reported as follows:—We report that Raleigh-buildings, the third block of dwellings on the Hughes-fields estate, Oxford, are practically completed.

It will be remembered that the site on which the buildings have been erected consists of a plot of land which was acquired under the Hughes-fields scheme, 1885, and appropriated to the Council, with the consent of the Local Government Board, for the purposes of Part III. of the Housing of the Working Classes Act, 1900. The buildings will contain accommodation for 280 persons in 18 tenements of two and three tenements of three rooms, and 8 tenements of four rooms.

Proposed Japanese Exhibition: Holborn to Strand Improvement.—The Improvements Committee recommended that a site bounded by the Strand, the Strand, and Newcastle-street, should be let for temporary purposes until December 29, 1905, at a rental of 7,500*l.* The Committee reported that they had been advised that this would not delay any possible letting of the land for permanent building purposes. In answer to a question by Mr. Sharp, Mr. Davies (Chairman of the Committee), said that the land would be used for the purpose of holding a Japanese Exhibition.

Mr. Sharp thereupon moved that the recommendation be referred back to the Committee. Mr. Burns, M.P., seconded the amendment, and it was pointed out that the land might suffer in value from having upon it a Japanese Bazaar, which might be a very objectionable affair. Mr. Cornwall hoped the Committee would not insist on this matter. He thought the Council should be very sorry for it if they allowed such a bazaar to be held on a fine and central site. The amendment was rejected.

After further discussion the Chairman of the Committee consented to postpone the matter in view of bringing up a full report as to the purposes for which the land would be used. Other business was transacted, and the Council adjourned.

METHODS OF CONSTRUCTION, RAVENHILL, BELFAST.—The preliminary drawings have been laid out of a new church on the Ravenhill-road, Belfast, by an architect is Mr. Thomas Houston, and the builder is Mr. Robert Corry.

APPLICATIONS UNDER THE LONDON BUILDING ACT, 1894.

The London County Council at their meeting on Tuesday dealt with the following applications under the London Building Act, 1894. The names of applicants are given between parentheses:—

Formation of Streets.

Chelsea.—That an order be issued to Messrs. Bouchier, Burnester, & Galsworthy, sanctioning the formation or laying out of a new street for carriage traffic to lead out of the south-eastern side of Fulham-road, and in connexion therewith the widening of Little Keppel-street, and of a new street for carriage traffic to lead from Draycott-place to Keppel-street, Chelsea (for the Cadogan and Hansplace Estate (No. 3), Ltd.). That the applicants be informed that the Council regrets that they have not seen their way to make College-street or Marlborough-road 60 ft. in width.—Consent.

Lines of Frontage and Projections.

Kensington, South.—A hood and a two-story bay-window in front of No. 6, Pelham-street, South Kensington (Mr. A. Roberts for Mr. Phelps).—Consent.

Lewisham.—Porches at Nos. 87 to 101 (odd numbers only) inclusive, Longhurst-road, Lee (Mr. A. J. Wood).—Consent.

Lewisham.—One-story shops upon part of the forecourts of Nos. 86, 88, 90, and 92, Brownhill-road, Catford (Mr. T. A. Boughton for Mr. J. Allen).—Consent.

Rotherhithe.—The retention of two show-cases in front of No. 253, Southwark Park-road, Rotherhithe (Mr. E. Hoar).—Consent.

Strand.—Two projecting signs in front of No. 26, Charing-cross, Strand (Mr. J. N. Taylor for the Great Western Railway Company).—Consent.

Westminster.—A block of office buildings on the north side of Tothill-street, Westminster, eastward of the "Imperial" theatre (Mr. J. S. Gibson for Messrs. Holloway Brothers (London) Ltd.).—Consent.

Westminster.—A two-story oriel window in front of a block of office buildings on the north side of Tothill-street, Westminster, eastward of the "Imperial" theatre (Mr. J. S. Gibson for Messrs. Holloway Brothers (London) Ltd.).—Consent.

Marylebone, West.—An iron and glass covered way in front of No. 29, Abbey-road, St. John's Wood (Mr. W. Wallace for Mr. A. P. Watt).—Refused.

Paddington, North.—A covered way in front of No. 19, Clifton-villas, Paddington (Miss Magnus).—Refused.

St. George, Hanover-square.—A projecting sign at No. 171, New Bond-street, St. George, Hanover-square (Mr. P. M. Herder for Messrs. Esné Collins).—Refused.

Strand.—Permission to retain a wooden advertising enclosure in front of Nos. 5 and 5A, Coventry-street, Haymarket (Mr. R. H. Kerr for Mr. H. Appenrodt).—Refused.

Width of Way.

Brixton.—A dwelling-house on the southern side of Bloomgrove-road, Stockwell (Mr. H. Poston for the London Parcels Delivery Company, Ltd.).—Consent.

Kensington, South.—A one-story addition at the rear of No. 34, Addison-road, Kensington, with a boundary fence at less than the prescribed distance from the centre of the roadway of Holland Park-road (Mr. W. Callingham for Mr. S. Lee).—Consent.

Line of Frontage and Construction.

Kensington, North.—A cycle shed at the Edinburgh-road school, Kensington, to abut upon Branstone-street (Mr. T. J. Bailey for the Education Committee of the Council).—Consent.

Width of Way and Construction.

Brixton.—A wood, iron, and slate "loading bank," in a yard on the southern side of Bloomgrove-road, Stockwell, and with a boundary fence at less than the prescribed distance from the centre of the roadway of the street (Mr. H. Poston for the London Parcels Delivery Company, Ltd.).—Consent.

Width of Way, Line of Frontage, and Means of Escape at Top of High Buildings.

St. George, Hanover-square.—A building at Nos. 25 and 26, Berkeley-square, to abut upon Jones-street and Bourdon-street, St. George, Hanover-square (Mr. F. T. Verity for Mr. E. W. Whitehead).—Consent.

St. George, Hanover-square.—Means of escape in case of fire proposed to be provided in pursuance of section 63 of the Act, on the fifth and sixth stories of a building at Nos. 25 and 26, Berkeley-square, to abut upon Jones-street and Bourdon-street, St. George, Hanover-square (Mr. F. T. Verity for Mr. E. W. Whitehead).—Consent.

Means of Escape at Top of High Buildings.

Kensington, South.—A deviation from the plans approved in respect of the means of escape in case of fire proposed to be provided in pursuance of section 63 of the Act, at blocks Nos. 1, 2, 3, and 6, Oakwood-court, Addison-road, Kensington, so far as relates to alterations at block No. 3 (Messrs. Rolfe & Matthews).—Consent.

Cubical Extent.

City of London.—The erection on the west side of Broken-wharf, Upper Thames-street, City, of a building to exceed in extent 250,000 cubic ft. (Messrs. H. F. Tasker & Slater for Messrs. Lever Brothers).—Refused.

Space at Rear.

Lewisham.—A modification of the provisions of section 41 with regard to open spaces about buildings, so far as relates to the proposed erection of two houses on the east side of Buckthorne-road, Crofton Park, Lewisham (Messrs. Tomkins and Connew).—Consent.

Wandsworth.—A modification of the provisions of section 41 with regard to open spaces about buildings, so far as relates to the proposed erection of two houses on the western side of Eswyn-road, Tooting (Mr. W. Bartholomew).—Consent.

Wandsworth.—A modification of the provisions of section 41 with regard to open spaces about buildings, so far as relates to the proposed erection of a building upon a site abutting upon Okburn-road, at the corner of Chertsey-street, Wandsworth (Mr. W. Bartholomew).—Consent.

Buildings for the Supply of Electricity.

Westminster.—Additions to a generating station and works at Milbank-street, Westminster (Mr. C. S. Peach for the Westminster Electric Supply Corporation, Ltd.).—Consent.

Dwelling-houses on Low-lying Land.

Greenwich.—A dwelling-house on low-lying land situated at Christchurch-street, East Greenwich (Mr. G. Atkinson for Mr. J. R. Piper).—Consent.

The recommendations marked † are contrary to the views of the local authority.

ARCHITECTURAL SOCIETIES.

SHEFFIELD SOCIETY OF ARCHITECTS.—A meeting of this Society was held, on the 27th ult., in the Society's rooms, Leopold-street, when a lecture was given by Mr. C. F. Innocent on "Romanesque Architecture in England." Mr. Innocent said the architecture of the western provinces of the Roman Empire was much freer and less refined than that of the city, and Romanesque architecture was that which the Teutonic invaders of Western Europe developed from the specimens of Roman architecture which they found. There were two varieties of Romanesque architecture in England—Saxon and Norman. Such energetic builders were the Normans that very few examples of Saxon architecture remained, and those were nearly all of the century immediately preceding the Norman Conquest. There were within the Sheffield district forty-eight ancient churches which contained Norman work, but only two which contained Saxon work—viz., Langton-en-le-Morthen and Carlton-in-Lindrick. After discussing the formative elements in English Romanesque the lecturer went on to describe Saxon architecture in detail. He then considered the question of the origin of our Norman architecture, and showed that the early Roman cathedrals in design were based on the church of St. Stephen, at Caen, which William the Conqueror built as an offering for his victory at Hastings. Blythe Church, near Worksop, was an interesting example of the influence of the Caen church in this district. Then the lecturer described the features of Norman style in detail, and traced their development. He considered that Conisbrough Castle was the finest and most interesting example of the perfect Norman style in the district. Steeley Chapel, near Worksop, was also a most perfect and beautiful example. The lecturer showed how the demands of the church authorities for a fireproof roof led to the use of stone vaults, and he pointed out the various difficulties of construction which the medieval builders had to contend with, and which were successfully met by the invention of pointed arched vaulting. The lecturer finally showed what architecture owed to the Romanesque designers. The lecture was illustrated by lantern slides. On the motion of Mr. Mitchell Withers, seconded by Mr. E. M. Gibbs, and supported by Messrs. T. R. Wigfall and W. T. Hall and the President (Mr. T.

Winder), a vote of thanks was accorded to Mr. Innocent for his lecture.

BIRMINGHAM ARCHITECTURAL ASSOCIATION.—Mr. T. Cooper, President of the Birmingham Architectural Association, delivered his presidential address on the 28th ult., before a large attendance of members at the Norwich Chambers. He stated that it was not the architectural seed they had to fear so much as the barrenness of the soil in which it had to grow. Architecture was by no means an altogether lost art, and there was a sufficiency of the true artistic spirit to be found could it only meet with a suitable environment to aid its growth. But in these days all the conditions seemed adverse. The increase of luxury and the almost universal indulgence in ostentatious display had necessarily led to the cheap and nasty, and vulgarly pretentious erections of the jerry builder. Mr. Cooper spoke of the prospect of a scheme for architectural education being formulated—an education that might foster the artistic instincts, while it did not lose sight of the many-sided responsibilities that crowded in upon the architect in the carrying out of the multifarious duties that modern custom had allotted to him. Touching upon local topics the President remarked that recently a letter appeared in the local press asking how it was that the Birmingham Architectural Association, with others, had not come forward to prevent the erection in so important a street as Stephenson-street of such a front (to be ultra Irish) as the back of the New Theatre Royal. The reply was obvious. The Association had no means of knowing before it was erected what manner of building was proposed, and secondly, that if it had that knowledge it would have no power to enforce its views. They could not but regret that the promoters of the scheme in question should, in providing a home for the drama, have thought fit entirely to disregard another art, and thrust such a purely utilitarian erection as a plain brick wall and a plumber's trophy before the gaze of those entering the city by its most important gate. The object should be to try and educate and lead the public as to what the requirements of good architecture were; and so in time to obtain a measure of that civic pride combined with a true feeling for art, which produced such glorious results as those that still remained to us, in fading splendour, in the great cities of the Middle Ages.

"DESIGN FOR A CRESCENT."—In printing Mr. Hiorus' description of this drawing last week, we should have added that the drawing was accepted and exhibited at the Royal Academy this year.

Illustrations.

PART OF CARTWRIGHT MEMORIAL HALL, BRADFORD.

THIS drawing, which was exhibited at the Royal Academy this year, shows a portion of the exterior architecture of the Cartwright Memorial Hall. The massive rusticated basement contrasts very well with the columnar order above, and the whole makes an effective picture.

We may be able to give on a future occasion a complete view and a plan of the Hall, of which the present illustration may be regarded as a kind of architectural extract.

DECORATIVE DESIGNS BY STUDENTS OF THE ROYAL COLLEGE OF ART.

The designs numbered 1 to 5 form part of a set which gained for their author, Mr. E. Walker, the Travelling Studentship in design for 1904 of the Royal College of Art, South Kensington.

Nos. 1 and 2 are designs for large ecclesiastical tapestries. No. 1 is of gold strapwork on a red and blue ground. The sub-divisions are filled with symbolical foliage and contain the words "*Ave Maria gratia plena*," and the monogram of the Virgin, "M.R." No. 2 is in a scheme of gold, red, and green. The large horizontal bands of blue circles contain the monograms of Christ in gold letters whilst the circle between bears the emblem of everlasting life.

No. 3 is a design for a heraldic tapestry for the hall of a large house. The shields, mantlings, helms, and crests are those of the owner and his wife, falling into vertical strips. The general colour is a quiet scheme of grey-green, red, blue, and gold.

No. 4 is a design for an embroidered altar frontal cloth. The central figure is that of Christ surrounded by adoring angels, and on either side two figures, St. Paul, St. James the Greater, St. Peter, and St. John the Evangelist. The band bears the inscription, "I am the vine, ye are the branches," and the vine springing from behind the central figure and branching round the figures of the saints is intended to typify the words. The cloth colour is a dark blue, and the figures and foliage are embroidered thereon in quiet tones of green, purple, and brown.

No. 5 is a design for a large heraldic wall painting, the motive being the British lion with the motto "*Dieu et mon droit*" upon a label issuing from its mouth. The background is red and the lions gold.

The decorative design by Mr. Lancelot Crane (No. 6), "St. John," is really a design for a

compartment of a ceiling. The student was asked to make designs for a vaulted ceiling; the subject to be "The Four Gospels." Small scale models were constructed to show the general scheme, colour, et cetera, afterwards a full-size cartoon was made of the figures. The photograph reproduced on the plate was taken from Mr. Crane's model which was done in black and white on paper. The chequer pattern shows the effect of the vaulting. The design was intended for mosaic, but might be treated in tempera fresco painting. The colour scheme is simple—mainly two tones of yellowish green against a background of warm white, the black with the emblem in gold, and the black, white, and gold.

PREMISES, 91 TO 99, OXFORD-ST.

THESE are some new premises on the side of Oxford-street, which attracted their original and pleasing treatment of the architects, Messrs. Read & Macdonald, kindly assented to our request for photographs of them.

The building, which is built of rubble and Portland stone, has been carried out by Messrs. Walter Holt & Sons, of Croydon. The architects observe that the design is a result of the inevitable calamity of the requirements of modern shopkeepers with large sheets of glass with no piers. But is it inevitable that we should get shopkeepers (and the public) to see that a shop front designed with truth and effectiveness of design is superior to, and is more attractive than, an erection appearing to stand on plate glass? It might find that there would be a move on the part of tradesmen to secure good architectural fronts, as a trade advantage worth such a little light for. In every architect who has his best to explain and enforce that in time a reform in shop architecture has been brought about, though it will no doubt rather long business.

PRIORY COURT, WEST HAMPSHIRE.

THIS block, containing twenty-eight contained residential suites, faces Marlborough Avenue with a frontage of 250 ft. The building is well set back from the road, the front being laid out as an ornamental garden. The flats contain six and seven rooms each, with usual offices. The elevation is carried out in red brick and rough cast, with green slated roofs.

The architects are Messrs. Palgrave & Chesbarn, and the contractors Messrs. Mead & Bates. Mr. J. Farrell was the clerk of works.

Priory Court, Hampstead. Plan.

PRORY COURT, HAMPSTEAD, N.W.—MESSRS. PALGRAVE & Co., ARCHITECTS

THE BUILDER, NOVEMBER 5, 1904.

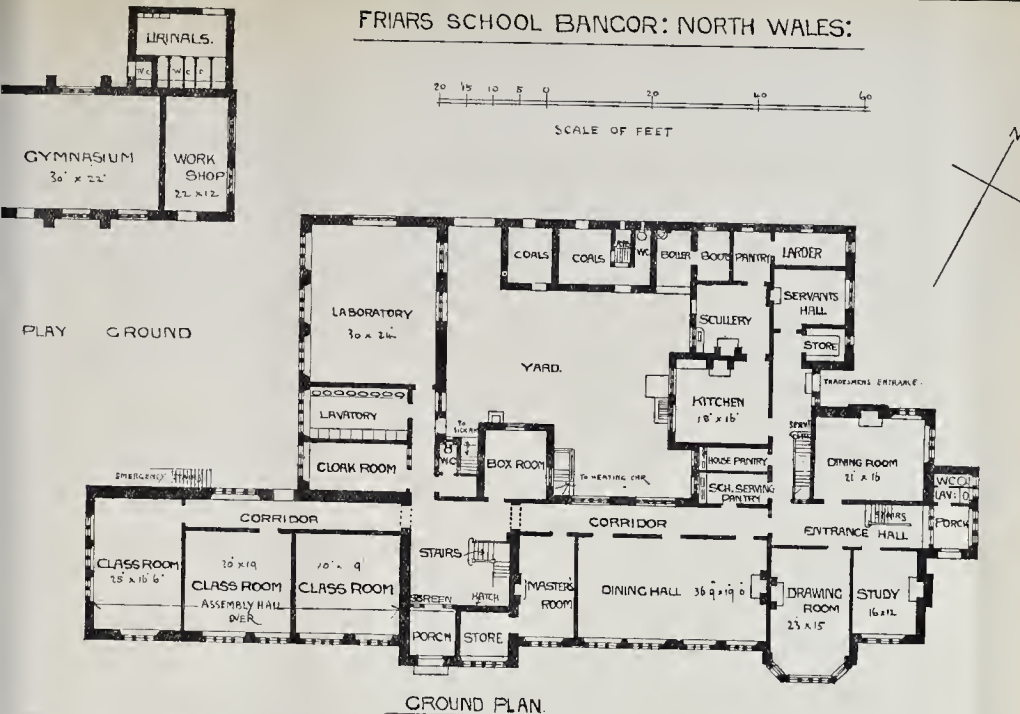

100, 102, 104, 106, 108, 110, 112, 114, 116, 118, 120, 122, 124, 126, 128, 130, 132, 134, 136, 138, 140, 142, 144, 146, 148, 150, 152, 154, 156, 158, 160, 162, 164, 166, 168, 170, 172, 174, 176, 178, 180, 182, 184, 186, 188, 190, 192, 194, 196, 198, 200, 202, 204, 206, 208, 210, 212, 214, 216, 218, 220, 222, 224, 226, 228, 230, 232, 234, 236, 238, 240, 242, 244, 246, 248, 250, 252, 254, 256, 258, 260, 262, 264, 266, 268, 270, 272, 274, 276, 278, 280, 282, 284, 286, 288, 290, 292, 294, 296, 298, 300, 302, 304, 306, 308, 310, 312, 314, 316, 318, 320, 322, 324, 326, 328, 330, 332, 334, 336, 338, 340, 342, 344, 346, 348, 350, 352, 354, 356, 358, 360, 362, 364, 366, 368, 370, 372, 374, 376, 378, 380, 382, 384, 386, 388, 390, 392, 394, 396, 398, 400, 402, 404, 406, 408, 410, 412, 414, 416, 418, 420, 422, 424, 426, 428, 430, 432, 434, 436, 438, 440, 442, 444, 446, 448, 450, 452, 454, 456, 458, 460, 462, 464, 466, 468, 470, 472, 474, 476, 478, 480, 482, 484, 486, 488, 490, 492, 494, 496, 498, 500, 502, 504, 506, 508, 510, 512, 514, 516, 518, 520, 522, 524, 526, 528, 530, 532, 534, 536, 538, 540, 542, 544, 546, 548, 550, 552, 554, 556, 558, 560, 562, 564, 566, 568, 570, 572, 574, 576, 578, 580, 582, 584, 586, 588, 590, 592, 594, 596, 598, 600, 602, 604, 606, 608, 610, 612, 614, 616, 618, 620, 622, 624, 626, 628, 630, 632, 634, 636, 638, 640, 642, 644, 646, 648, 650, 652, 654, 656, 658, 660, 662, 664, 666, 668, 670, 672, 674, 676, 678, 680, 682, 684, 686, 688, 690, 692, 694, 696, 698, 700, 702, 704, 706, 708, 710, 712, 714, 716, 718, 720, 722, 724, 726, 728, 730, 732, 734, 736, 738, 740, 742, 744, 746, 748, 750, 752, 754, 756, 758, 760, 762, 764, 766, 768, 770, 772, 774, 776, 778, 780, 782, 784, 786, 788, 790, 792, 794, 796, 798, 800, 802, 804, 806, 808, 810, 812, 814, 816, 818, 820, 822, 824, 826, 828, 830, 832, 834, 836, 838, 840, 842, 844, 846, 848, 850, 852, 854, 856, 858, 860, 862, 864, 866, 868, 870, 872, 874, 876, 878, 880, 882, 884, 886, 888, 890, 892, 894, 896, 898, 900, 902, 904, 906, 908, 910, 912, 914, 916, 918, 920, 922, 924, 926, 928, 930, 932, 934, 936, 938, 940, 942, 944, 946, 948, 950, 952, 954, 956, 958, 960, 962, 964, 966, 968, 970, 972, 974, 976, 978, 980, 982, 984, 986, 988, 990, 992, 994, 996, 998, 1000

FRIARS SCHOOL, BANGOR, NORTH WALES.—MESSRS. DOUGLAS & MINSHULL, ARCHITECTS

FRIARS SCHOOL BANGOR: NORTH WALES:

GROUND PLAN.

FRIARS SCHOOL, BANGOR, N. WALES. This building, replacing the former school in the lower part of the city, stands on a fine site in Upper Bangor, commanding a view of the Snowdonian mountains and the Irish Straits.

The fact of the new school being the outgrowth of one of the old foundation grammar schools was taken into consideration in designing the new buildings, and to some extent influenced the general disposition and also the treatment of the exterior, the aim being to perpetuate the old school origin and character.

In addition to the school accommodation the headmaster's house, which occupies the main wing on the ground floor (see plan), is on the first floor an assembly hall 58 ft. ft. and dormitory space for forty boys.

Quarters are provided on the upper floor for the tower and their isolation secured by a staircase access and stairway from the outside. The materials employed are:—Walling, Llystone; window dressings, etc., red sandstone covering, green slates.

Pressure heating with radiators has been provided, and adequate ventilation provided. Messrs. James Hamilton, contractors, Bangor, carried out the work at a total cost of about 10,000l., the architects being Messrs. G. S. & Miushull, of Chester.

HOUSING QUESTION, BRISTOL.—On the 4th ult. Mr. W. O. E. Meade-King, M.C.E., one of the inspectors of the Local Government Board, held an inquiry at the request of the Bristol City Council for the approval of the Board to a scheme for the provision of workmen's dwellings to provide accommodation in lieu of that displaced by improvements. Mr. W. H. Wise conducted the case on behalf of the Corporation. Yabbicom, Borough Engineer, gave evidence as to the buildings proposed to be erected. Each would have a frontage of 16 ft. on the main road, the fronts set back to a minimum of 15 ft. from the street line. The depth of the house and back space would be a total of 75 ft. from the street line to the back boundary. Each house would be on the ground floor a sitting-room, 10 in. by 10 ft. 3 in.; a living-room, 10 in. by 12 ft. 7 in.; a scullery, 10 ft. by 10 in.; and larder and lavatory. The upper floor would contain three bedrooms, 10 in. by 10 ft. 3 in., 12 ft. by 9 ft. 10 in., and 8 ft. by 6 in. The four houses would accommodate twenty-eight persons.

ENGINEERING SOCIETIES.

THE JUNIOR INSTITUTION OF ENGINEERS.—The annual general meeting of this Institution was held recently at the Westminster Palace Hotel, when the council's report, balance sheet, etc., were presented. The number of members is now nearly 800. Mr. Samuel Cutler, jun., M.I.Mech.E., was re-elected chairman. During the evening two of the past chairmen, Mr. W. J. Tennant and Mr. Percival Marshall, gave an account, illustrated by lantern slides, of their visit to the United States and the St. Louis Exhibition. On Saturday afternoon, October 22, the members paid a visit to Messrs. Stuart's Granolithic Stone Works at Millwall Dock, Mr. Peter Stuart showing them over. He had considerably kept the machinery running, so that all the processes in the manufacture of the stone could be seen. Electric power is used for the crushers and grinders, current being obtained from the public supply. There is also an electric elevated transporter running on a rail for conveying finishing blocks between different parts of the works. Some striking examples of the strength of the material were shown, and tests were conducted on some of the specimens. Another visit occurred on the following Saturday afternoon, when an inspection was made of the National Physical Laboratory at Bushy House, Teddington. For upwards of two hours the members, under the guidance of Dr. Glazebrook, were kept interested examining and listening to the explanations of the uses and modes of manipulation of the many beautiful instruments and appliances to be seen throughout the various departments of the laboratory, including thermometric, electrical, photometric, metallographic, metrologic, photographic, optical, chemical, and engineering (wind pressure testing, alternative stress testing, insulating material testing, temperature distribution in field coils, etc.). Mr. S. Cutler, jun., in moving a vote of thanks to the director and his staff at the conclusion of the visit, alluded to the great practical utility of the work carried on in the laboratory, which afforded an excellent illustration of the application of science to the solution of the everyday problems which confronted the engineer, chemist, and other commercial men in their work. The opening meeting of the new session is to take place on November 18, when Mr. W. H. Lindley, M.Inst.C.E., F.G.S., of Frankfort-on-Maine, is to deliver the presidential address, his subject being "Municipal Engineering on the Continent."

COMPETITIONS.

WESLEYAN HALL, BIRKENHEAD.—In an open competition held recently for a new Wesleyan Hall, Price-street, Birkenhead, the design of Messrs. T. T. Rees and Frank Birmingham was placed first, and they have received instructions to carry out the work.

BRIDGE, AYLESFORD.—Twenty-eight sets of plans were sent in for the premium of 100 guineas offered for the selected plan. The Maidstone Town Council associated with their Committee the governing body of the Lower Medway Navigation Company, and also had the assistance of an assessor (Mr. A. V. Nurtzig, M.Inst.C.E.) nominated by the President of the Institution of Civil Engineers. Messrs. Dodd & Dodd, of 37, Waterloo-street, Birmingham, were awarded the premium. The estimated prices for the new structure are as follows:—Bridge, 20,950l.; approaches, 6,935l.; contingencies, 10 per cent., 2,788l.—total, 30,673l. The material for the construction will be Kentish rag and granite. The width of roadway over the bridge will be 30 ft., with a footpath of 5 ft. on each side.

AIDS TO THE STUDY OF SANITARY LAW. By H. Critchley, M.D. (Baillière, Tindal, & Cox. 2s. 6d.)
THE MECHANICAL WORLD POCKET DIARY FOR 1905. (Emmot & Co., Manchester. 6d.)

Correspondence.

RECOVERY OF OUTLAY UNDER SANITARY ORDERS.

SIR,—The desirability of obtaining expert advice before complying with written notices or verbal instructions issued by sanitary officials is not sufficiently recognised by property owners. Otherwise, with the best of cases for recovering outlay which has been improperly forced upon them, there is no chance of success against a local authority which meanly repudiates the acts of its officials. In the case of *Klett v. Camberwell Vestry* (1896), plaintiff sought to recover for reconstructing a combined drain. Vestry's counsel admitted it was a "sewer," and the point was whether the notice given by the sanitary inspector was, in fact, a "request" to do the work. Judge Emden said "it must be shown that there was an expressed or implied

request from the vestry, or, in the alternative, that the plaintiff suffered damage through the neglect of the vestry to carry out their official and public duties—i.e., to have done the work themselves. It seemed to him impossible to construe the notice given by the defendant vestry into a request. It was a mere intimation by an officer" (1) This, in face of an order in writing under an Act of Parliament, signed by a responsible and recognised official, whose act in an ordinary way, would be that of an agent for his principal.

An opposite judgment, so far as one gathers from the reports, was in North and Another v. Walthamstow Urban District Council (1893). Here the pretext of defendants was, that the notice was not given by them, but by the sanitary officer on his own responsibility. Mr. Justice Channell said: "The question is, what degree of compulsion is necessary to entitle the plaintiffs to recover? The compulsion need not be irresistible. If a public body comes to a person and either commences or threatens proceedings, such person is no longer a volunteer. A person in such a position is under an obligation to do the work. A mere indirect compulsion is sufficient. Judgment must be for the plaintiffs." As the notice given was by the official only, the responsibility of his employers, therefore, is duly recognised by this verdict, contrary to Judge Emden's decision, before cited, that such a notice was "a mere intimation by an officer." It may have been this case that the Walthamstow Urban District Council relied on to shirk their responsibility. An owner employing a builder to open up a drain under such a notice should stop the work immediately a combined system is found to exist, and take proper advice as to his liability to complete, or to call upon the local authority to do so, and refund his outlay. Builders go on and finish the work by verbal instructions of these officials without regard to the rights of the matter, and then, if the owner is bold enough to take proceedings afterwards, the difficulty and expense is greatly increased, and the defendants get behind their officers for shelter. By insisting on an order by the board or council before proceeding, this would be obviated. E. W. HUDSON, F.S.I.

CLOCK TOWER.

SIR.—As the architect of a clock tower recently erected for a public body, I shall be glad to hear from other architects who have carried out such towers under 1,000*l.* in value.

ROBERT HEMBROW,
Architect.

174, Queen's-road, Hastings.

OBITUARY.

MR. C. FOULSHAM.—We have to record the death of Mr. Chester Foulsham, which occurred on the 23rd ult. Mr. Foulsham was born October 26, 1837. In 1874 he was appointed by the Metropolitan Board of Works, District Surveyor for St. Leonard, Bromley, and he retained that post to the time of his death.

METROPOLITAN ASYLUMS BOARD.

The usual fortnightly meeting of the managers of the Metropolitan Asylums District was held on Saturday last week at the office, Victoria Embankment, W.C.

Tooting Bee Asylum.—Among the correspondence received was a communication from the Local Government Board sanctioning the proposal to enter into a contract with Messrs. C. P. Kinnell & Co. for the revision of the heating arrangements of the administrative block and the staff blocks at this asylum, at a cost of 480*l.*, without first advertising for tenders. The Finance Committee reported having considered in its financial bearing the following estimate of the Works Committee of the cost of additional building which it is proposed to erect at the asylum:—New buildings, 29,500*l.*; alterations to existing buildings, 500*l.*; drainage and water supply, 700*l.*; heating and lighting, 2,350*l.*; laying out grounds, etc., 450*l.*; quantity surveyor's charges, 600*l.*; clerk of works' salary, 300*l.*; contingencies, 1,750*l.*; total, 36,250*l.* On the recommendation of the Committee it was agreed to apply to the Local Government Board for an order sanctioning the incurring of this expenditure.

Joyce Green Hospital.—It was agreed, on the recommendation of the Finance Committee, to apply to the Local Government Board for permission to incur an expenditure of a sum not exceeding 7,000*l.*, the balance of the estimated cost of executing certain internal painting work at Joyce Green Hospital.

Belmont Asylum.—Messrs. R. L. Curtis & Sons were appointed to measure up the

variations of Messrs. Enness Brothers' contract for alterations and addition at this asylum. The amount of the contract was 15,750*l.*, and the Works Committee reported that the sanctioned variation which increased the amount by 144*l.* 7*s.*

GENERAL BUILDING NEWS.

CHURCH, PRESTWICH.—The Bishop of Manchester (Dr. Knox) consecrated, on the 18th ult., the new Church of St. Hilda, which will form a chapel-of-ease to Prestwich Parish Church. It is in Whitaker-lane, Prestwich. The new church, as it stands at present, forms only part of the complete design, which aims at a westward extension, lengthening the nave and increasing the accommodation. There are now seats for about 350, including the choir, and, by the extension, room will be made for about 200 more. The portion built consists of the chancel and three bays of the nave and its aisles, leaving the completion of the latter and other portions to be carried out when the needed accommodation is required. The oak altar is by Mr. Bridgeman, of Lichfield, from the architect's design. The cost of the church has been about 3,700*l.* The architect is Mr. Frank P. Oakley, of Manchester.

CHURCH, BYKER HILL, NEWCASTLE-ON-TYNE.—On the 17th ult. the foundation-stone was laid of the new Church of St. Mark, Byker Hill, Newcastle. St. Mark's Church is designed in the XVth century style, the plan being in the form of a parallelogram with nave and chancel, aisles, vestries, and organ chamber. The total length from east to west is 117 ft. 6 in., the nave and chancel being 27 ft. 6 in. wide, and the total width of the church being 63 ft. 6 in. The nave and chancel are somewhat lofty, the height from the nave floor to the apex of the roof being 54 ft. They are lighted by a range of three-light, square-headed, traceryed, clearstory windows. At the east end there is a seven-light window. The church is to be built externally of stone from the Windy Nook quarries, the pillars and inside stonework being of Denwick stone. The roofs, which are all of the open timber type, are to be of pitch-pine, as well as the whole of the seats, screens, pulpit, wall panelling, etc. Provision is made for two bells in a bell gable over the chancel arch. Sitting accommodation for 300 adults is provided. The contract for the building has been let to Messrs. J. and W. Lowry, and that for the chancel fittings to Messrs. Robson and Sons, both of Newcastle. Messrs. Hicks and Charlewood, of Newcastle, are the architects.

CHURCH RESTORATION, CUDWORTH, SOMERSETSHIRE.—The reopening of Cudworth parish church, after having undergone restoration, took place recently. A new oak ceiling has been placed in the chancel, the foundations of the walls have been attended to, the stonework has been pointed and repaired where necessary, and the whole building inside and out put in a state of repair. The stone floor has been relaid, and the roof made watertight. The work has been carried out by Mr. C. A. Hain, Beamister, under the supervision of Mr. E. Buckle, the Diocesan Architect.

LECTURE HALL AND SCHOOLROOMS, BELMONT, SHREWSBURY.—The foundation-stone was laid recently of a new Presbyterian lecture hall and schoolrooms at Belmont. The contract for the work amounts to 1,190*l.*, and Messrs. R. Price & Son, of Coleham, Shrewsbury, are the builders. The architect is Mr. G. Dickens Lewis.

CALVINISTIC METHODIST CHAPEL, PENMAENMAWR.—The erection of the new Jerusalem Chapel at Penmaenmawr has been completed. The building occupies a position adjoining the main road, on the Bryn Môr Estate, and is planned with nave and transepts. Accommodation is provided for 650, which includes 130 places in the gallery. The pewing and other fittings are of selected light-grained varnished pitch-pine. The floors throughout have been laid with wood block, by Messrs. Burgess and Co., Liverpool. The glazing throughout is of lead light, and manufactured by Turner and Co., St. Helens. The ceiling work was done by Messrs. E. Cross and Sons, Liverpool. The external walls are faced with picked and selected local stones, from Messrs. Darbishire, Ltd.'s quarries. The dressings and weathering are of Lintwaite stone. The roof is covered with Dinorwic slates, and two roof extract ventilators have been fixed. The ventilation generally has been done by Messrs. James Stott and Co. The heating of the whole premises is by the low-pressure system, and has been carried out by Mr. J. E. Miller, of Liverpool. The ornamental railings were provided by Mr. Walter MacFarlane, Glasgow. The joinery and carpentry work was executed by Mr. John Jones, Penmaenmawr, and the

masonry work by Mr. Erasmus Jones, Llanfechan. The tiling and faience work was by Mr. J. C. Edwards, Rubon; the painting work by J. Bealy and Co.; and the glazing and varnishing work by Mr. W. Pritchard, of Penmaenmawr. The school-mises consist of an assembly hall to seat scholars, with classrooms, vestries, kitchen, deacon's parlour, etc. The architect was J. S. Coverley, Penmaenmawr. The cost amounts to about 6,500*l.*

GIRLS' SCHOOL, LYNN.—The new Lynn School, adjoining Ferry-lane, was opened short time ago. The buildings form a block 150 ft. in length. They are constructed of red brick, having roofs covered with E tiles, and adjoin at their eastern end the boarding-house, a portion of which has been modified in order to effect a convenient junction. Electricity is used for lighting purposes throughout, and the main system is lighted with Nernst lamps. Ventilation is afforded by means of wall and Boyle's extractors. The architect was Mr. H. J. Green of Norwich and Lynn. Mr. J. Cracknell, of Peterborough, was the builder. The cost of the buildings was 3,500*l.*

NEW SCHOOL, THORNTON, N.B.—On the 18th ult. the opening took place of a public school at Thornton. The building which has been erected from the plans of Messrs. James Gillespie and Scott, architects, is of red brick, with red tile roofs. The site occupies 1½ acres of ground. There is a central hall, 50 ft. by 25 ft., which entrance is made to the various rooms, of which there are eight. There is also lavatory and cloak-room accommodation. The total cost of the building was a little over 5,000*l.*, and there is accommodated nearly 600 pupils.

SCHOOL, EAST LEEDS.—A new school has been erected in Leeds. The new building, which has been named the "Victoria School," has been erected on a site in York-road, containing about 7,650 yds., having frontages on three sides to streets, and access from streets on the remaining side. The site is in three blocks. The largest block, in York-road, provides accommodation for junior children on the ground floor and senior children on the upper floor.

The infants' school is a separate building, and provision has been made for 410 infants. The third block contains manual instruction department, laundry and cookery room, caretaker's house attached. Three halls are provided, the classrooms arranged on three sides of same, and each case directly entered from the hall. Classrooms are planned for sixty children in all cases except the babies' room, and entrances are provided to each department with cloak rooms immediately adjoining staircases and corridors are fireproof throughout. The manual instruction-room is placed between the laundry and cookery rooms. The fittings have been carried out in local brick stone, and were designed by the architect, the Education Committee, Mr. W. S. Waite. The works have been carried

out by the following contractors:—Brick and work, Messrs. J. H. Wood; carpenters and joiners, Messrs. Ledgard and Sons; plumbers, Mr. J. H. Crossland; slater, Mr. J. W. Mond; plasterers, Messrs. Pennington and ironwork and cloak rails, Messrs. L. and Sons, Ltd.; concreting, Mr. S. J. Lane; painting, Messrs. Roylance and man; heating, Messrs. Braithwaite and electric lighting, Messrs. Dixon and Ltd. The total cost of the site, building and fittings will be about 13,300*l.*

WESLEY MEMORIAL SCHOOL, LEATHERHEAD.—The foundation-stones of the Sunday school, erected adjoining the Wesleyan Chapel, Leatherhead, were laid recently. The work is being carried out by Messrs. Johnson, of Wandsworth, according to the plans of James Weir, architect, Victoria-street. The building is of red brick, with Bath stone dressing. The east end of the school is cut from the rear of the church, and has in the front a porch. On the upper will be a Wesley Hall, giving accommodation for 350 people. The total accommodation provided in the building will be 1,000 people.

HOTEL, ABERTRIDWRE.—The first instalment of the Glamorgan Public-house Company was launched on the 21st ult. Sir John T. D. Lewis, its chairman, formally opened the Windsor Hotel, Abertridwre. The exterior of the building is built on the ground floor with facings of Penmaenmawr dressed with red Mansfield stone, Bath and red brick, while the upper storey is faced with rough stucco, with dressed red brick. The entrance to the bars, on the corner, is beneath a portico of

stone columns and arches, while above it turret stands up from the green-slate roof. The interior on the ground floor are concrete, coffee, and smoke rooms, and the manager's office, besides two bars—one for inebriates and the other for non-intoxicants. There is a suite of rooms for the manager and his family on the first floor, together with guests' bedrooms and a billiard and club room, which has separate communication with the street. On the second floor are the manager's bedrooms, while in the basement kitchen, scullery, pantries, etc., and beer wine cellars. At the back is a yard, with a building for five horses, as well as harness-room, and covered sheds for vehicles.

The building is lighted with acetylene gas. The architect was Mr. H. Snell, of Penarth, and the builder Mr. W. T. Morgan, of Cardiff. The cost of the building, inclusive of furnishing and other expenses, is about 6,000.

OLYMPIAN HEADQUARTERS, LIVERPOOL.—The main opening took place on the 22nd ult. of new headquarters of the 8th (Scottish) Volunteer Battalion of the King's (Liverpool Regiment), in Fraser-street. The total length of the shed is 155 ft. by 60 ft., and there are three ranges in Fraser-street and Camden-street, as well as from the roofdrum block. The shed is fitted with a safety Morris tube range, and another open range is provided in the shed. The main entrance of the headquarters block is from Fraser-street. On the ground floor is a room, 55 ft. by 24 ft., as a men's canteen, and also the commanding officer's room, the sergeant-major's room, and medical officer's examining-room. There are two staircases in the building, one leading to the men's and the other to the officers' quarters. On the first floor is the sergeant's messroom, 55 ft. by 24 ft. The officers' messroom is also on this floor, with ante-rooms, billiard-room, and honorary members' room. On the second floor is the gymnasium, 100 ft. long by 24 ft. wide. The kitchen and lavatory, with lifts, etc., are also on this floor, and here is situated a room to be used as a band-room and store-rooms are also above, while in the basement is a billiard-room with two tables for the men, the laundry and repairs-room, and so on. Here is the men's dressing-room, fitted with lockers, lavatories, and private lockers. The contractors were Messrs. Haigh and Co., the architects being Messrs. Woolfall and Eccles.

NEW INSTITUTE, BOURNE, SURREY.—The new institute premises which have been erected at Bourne were recently opened. The building is of brick, which is whitewashed outside, and has Roman tiles and a games room, and a reading-room. There are also rooms for the caretaker and the usual offices. The work was carried out by Mr. A. G. Mardon, architect, of Farnham, in accordance with plans prepared by Mr. H. S. Sidebotham, architect.

NEW INSTITUTE BUILDING, WHITBURN, SUSSEX.—The foundation-stone of a new institute for the village of Whitburn was laid a short time ago. The architects for the work were Messrs. Joseph Peck and Sons, of Sunderland, and the contract has been let for 1,203.

DR. ROBERT PURVIS, WHITBURN.

ASYLUM, BIRMINGHAM.—The new asylum for Lunatic Asylums Committee of the Birmingham City Council are erecting at Hollywell, at a cost of a quarter of a million sterling, is being built from the plans of the architects, Messrs. Martin and Bowen, by the contractors, Messrs. Bowen and Sons. The asylum is situated within half a mile of Rubery Railway Station. The building is constructed of red bricks which have been made on the spot. The place has been divided into blocks, communication being made by corridors. The administrative block is in the rear, and comprises the engineering department, kitchen, bakehouse, laundry, a dining-room, and recreation-room. The patients' quarters, on either side of the administrative block, have day-rooms and dormitories for the insane and epileptic on the ground floor, the day-rooms for the ordinary inmates being on the first floor above the day-rooms. Altogether the building provides accommodation for 302 males and a like number of female inmates. A small hospital for the special treatment of cases of infectious disease will accommodate half a dozen patients. There are also arrangements for the reception of patients and the convenience of visitors. The building also comprises a series of workshops for painting, upholstering work, shoemaking, carpentry, etc. A modern bakery will provide bread for the establishment.

MRS. BALSALL HEATH, BIRMINGHAM.—New arrangements to be erected at Balsall Heath for the Birmingham Corporation, from the designs of Messrs. W. Hale and Son. The buildings will comprise a first-class swimming-bath, 100 ft. by 55 ft. wide, having a water area of 32 ft., and dressing-boxes all round,

with a spectators' gallery over the latter on three sides; a second-class swimming-bath, 85 ft. 6 in. by 43 ft. 3 in., with a water area of 72 ft. by 32 ft., and open dressing spaces around three sides, and sixteen first-class slipper-baths for men, and six for women, and sixteen second-class for men, and eight for women. There are also nozzle and foot baths, and the necessary attendants' and waiting rooms, with one ticket office, having a separate access from each of the three entrances. On the first floor over the larger part of the women's baths there are a large club or committee room, and a smaller room, with lavatory, etc., adjoining. The estimated cost of the buildings is 20,000L., and that of the boilers and engineering works generally, which will be designed and carried out under the superintending engineer (Mr. J. Cox), will be about 7,000L.

MASONIC HALL, AVONMOUTH.—The new Masonic Hall at Avonmouth was dedicated on the 18th ult. by Sir Michael Hicks Beach, Bart., M.P. The hall occupies a central site in Portview-road. The building is in the Renaissance style, and of Shortwood bricks, with freestone dressing and a tiled roof. Provision is made for future extension in the shape of a kitchen on the ground floor communicating with the dining-room. Messrs. W. and J. Bennett, of Bristol, were the contractors, and the architect was Mr. J. A. Wright, of Bristol. The cost of the hall is estimated at about 2,000L.

LIBRARY, HARRGATE.—On the 17th ult. the Mayor (Alderman H. Milling) laid the foundation-stone of the new free library which is to be built at Harrogate at a cost of 8,000L. The free library is the first portion of the municipal buildings, and forms the western end of the frontage to Victoria-avenue and Raglan-street. The entrance is from Victoria-avenue into an entrance hall, which also forms the space for borrowers from the lending library. Leading direct from the entrance hall is the news-room, 50 ft. square, and lighted both by windows and from the top. This room will afford accommodation for about 200 readers. The lending library will provide shelving for about 40,000 volumes. In the half-basement is a large boys' reading-room, 30 ft. by 22 ft., also book stores, heating chamber, etc. On the first floor there are a reference library and magazine-room, 44 ft. by 22 ft., book stores, and librarian's room. The latter has been so arranged as to be suitable for a committee-room. The elevations of the building are to be faced entirely with stone from the Pateley Bridge quarries. This, however, does not apply to the walls on the eastern side of the building, which, when the municipal buildings are erected, will become an internal wall, and is, therefore, of plain brick. The floors and staircases throughout are of fireproof construction. Mr. H. T. Hare is the architect.

WESLEYAN CHURCH, GILLINGHAM, KENT.—The opening services of the new Wesleyan church in Byron-road took place recently. Mr. Nash was the architect for the work, the builder being Mr. Woodard.

HOSPITAL, DENBY MAIN.—On the 22nd ult. the foundation-stone of a new accident hospital was laid at Denby Main. The plans were prepared by Mr. H. L. Smethurst, and the work of erection is in the hands of Messrs. B. Wortley & Sons, builders, Doncaster. The contract has been divided into two parts, so that the hospital may be utilised as speedily as possible. The first erected will have accommodation for six to eight beds, with usual offices, etc., connected. The contract price for the whole is 2,447. 11s. Wards, nurses' room and observation chamber, recreation-room, board-room, operating theatre, and usual accessories will be provided, and in addition a caretaker's and nurses' home adjoining. The hospital will be warmed by Shorland's patent Manchester stoves, the floors throughout of marble mosaic, with adamant plaster and walls, with the exception of operating theatre and bathrooms, which will be covered with glazed tiles.

TOWN HALL, LEIGH, LANSHIRE.—The foundation-stone for the Town Hall for Leigh was laid on the 24th ult. by the Mayor. The site which was acquired by the Corporation some years ago in connexion with an improvement scheme, is in the centre of the town. The building will be English Renaissance in style. The main entrance to the hall will be in Market-place, and the building will have frontages in Market-street and Newton-street. The total cost is estimated at 40,000L., and 10,000L. of this represents the cost of the site. Mr. J. C. Prestwich, of Leigh, is the architect.

EXTENSION OF DUMBARTON COTTAGE HOSPITAL.—On the 21st ult. an extension to this hospital was opened, and a bust to the late John MacAusland, of Kirktonhill, which has been placed in the corridor, was unveiled. The

extension was designed by Mr. James M. Thomson, the architect of the original building, and includes a ward for children, two wards for cases of serious injury and private patients, and an operating-room. The cost has been something like 2,000L. The bust of Mr. MacAusland, who was the founder of the hospital, is by Mr. W. G. Stevenson, architect, Edinburgh. It is in bronze.

TRAMWAY OFFICES, GLASGOW.—On the 25th ult. the Tramways Committee inspected their new offices, situated at the corner of Kenfield-street and Bath-street. The area occupied by the building is 609 sq. yds., the building itself being 93 ft. high. The architect was Mr. John Baird, Glasgow.

HOSPITAL, AUCKLANDS, DURHAM.—Mr. W. Perkins, the architect for the Helmingrow Hospital, reported to a meeting of the Auckland, Shildon, and Willington Joint Hospital Board recently, that that building had cost a total of 9,034L.

INFIRMARY FOR CHILDREN, LIVERPOOL.—The foundation-stone has just been laid of the new Liverpool Infirmary for Children. The main structure will occupy the site of the old infirmary at the corner of Myrtle-street and Mulberry-street. Messrs. Haigh and Thompson, architects, of Liverpool, have designed the new building. In all there will be accommodation for 100 cots in five wards, three of which will be for medical and two for surgical cases. The ward pavilions are planned to recess and radiate to a centre, to which will be joined a department to be utilised for facilitating supervision and observation. The triangle formed by this recessing and radiating of the ward pavilions will front to Myrtle-street. Internally, accommodation will be provided for three resident medical officers, with the customary sitting and dining rooms. Suitable quarters will be set apart for the matron. Provision is also to be made for a small observation block, where doubtful cases can be treated until they have been diagnosed with certainty. In this section there will be three wards, each capable of accommodating two cots, with separate bedrooms for the nurses. The kitchens and larders are arranged on the top floor, to which access will be obtained by an electric lift. In connexion with each ward there will be a clinical-room. In another part will be located a pathological-room, an operating theatre, sterilising and anaesthetic rooms, and a photographic studio, and also, in the basement, an X-rays room. In convenient situations, also, are the dispensary and the porters' quarters. The ward pavilions are rectangular in form with rounded ends. The floors will be paved with terrazzo. All the internal angles of the building will be rounded, and the walls of the wards will be tiled dado high. The building will be of common bricks with red Ruabon brick bands and window jambs, and stone heads and sills.

FREE LIBRARY, NEWBURY.—A new free library is to be erected at Newbury from the plans of the Borough Surveyor, Mr. S. J. Lee Vincent. The façade will be built in red bricks, with Monks Park stone dressings, and roofed with Broseley tiles. The entrance lobby will allow of three or four newspaper stands. The lending department will be screened from the hall or corridor by a screen of Muranes glass, and accommodation will be afforded for 10,000 volumes. The reading-room will be 45 ft. by 30 ft., and will be lighted by an east window and clerestory windows.

COUNTY BUILDINGS, MID-LOTHIAN.—The new buildings which have been erected in Parliament-square, Edinburgh, by Mid-Lothian County Council on the site of the old building were opened on the 26th ult. by Sir James Gibson Craig. The council chamber is 45 ft. long by 30 ft. wide. Mr. J. Macintyre Henry, Edinburgh, is the architect.

BUSINESS PREMISES, DUBLIN.—New premises have been erected in Suffolk-street for Messrs. Walpole Brothers, Ltd. The work was designed by Mr. Charles H. Ashworth, architect, and the general contractors are Messrs. J. & P. Good, Ltd.

BARRACKS, BORDON, HAMPSHIRE.—The new barracks which are being erected at Bordon for the Royal Field Artillery are now nearing completion. The buildings comprise six brick-built battery barrack blocks, each to accommodate 156 men, and severally connected by a covered way to their own dining-hall, cook-house, wash-up, bath, stores, etc. There are eighteen troop stables, each to accommodate thirty horses, with harness-rooms, etc. There are also two blocks of gun and wagon sheds, each 350 ft. long and 40 ft. wide. Other buildings, all brick built, are the forage barns and corn stores, mobilisation equipment stores, etc. A riding-school and adults' and infants' schools are also provided, besides the recreation establishments. In addition, there are quarters for 105 married soldiers' families.

The officers' quarters are all detached, as also is the officers' mess establishment, which has a frontage of over 200 ft. The contractors are Messrs. T. J. Hawkins & Co., and the work has been carried on under the supervision of Colonel W. Staveley Gordon, C.R.E. Longmoor, Mr. A. C. Gillman acting as clerk of the works.

HOSPITAL, CREWKERNE.—The Crewkerne Hospital, erected to the memory of her late Majesty, was opened on the 19th ult by Sir Frederick Treves. The building has cost about 3,500l. The architects were Messrs Young & Hall, of London.

STAINED GLASS AND DECORATION.

WADSWORTH CHURCH, DONCASTER.—A three-light stained-glass memorial window has been erected in this church. The subject illustrated is the Ascension, which occupies the three openings, while in the tracery above appears the Hand of God, the Holy Ghost as a Dove, Cherubim, and the Martyr's Palm Branch and Crown. The work has been designed and executed by Messrs. Powell Brothers, of Leeds.

PROFESSIONAL CROSS FOR NEWCASTLE CATHEDRAL.—A new professional cross has been presented to Newcastle Cathedral by the Rev. T. E. Crawhall, Vicar of Tynemouth, in memory of his parents and other members of his family. The gift consists of a Latin cross of solid silver, with a trefoil at the end of each arm, and a quatrefoil at the crossing. In these five spaces are the usual emblems of Our Lord and the Evangelists. The arms of the cross are covered in front with a simple pattern in cloisonné enamel, in which the cross form recurs. Around the edge are small Wadsworth crystals, projecting outward, and set in foliated settings. At the top of the staff is a hexagonal knob, and above that a figure of St. Nicholas under a canopy, supported on six columns. The canopy is roof-like, with open tracery and pinnacles all round. St. Nicholas, who holds the crozier, and is in the act of giving the Benediction, has before him the three children in the tub—his usual symbol. The work was executed by the Handicrafts Company, Newcastle, an offshoot of the Newcastle School of Art.

APPOINTMENTS.

BIDEFORD.—On the 28th ult. the Bideford Town Council met for the purpose of confirming the appointment of Mr. R. E. L. Hookway as Borough Surveyor. After some discussion the appointment was confirmed. There were two other candidates for the post.

SANITARY AND ENGINEERING NEWS.

SEWAGE DISPOSAL WORKS, HALTON.—An application by the Rural District Council of Hunslet for the sanction of the Local Government Board to their borrowing 2,500l. for extending and improving their sewage disposal works at Halton, in the parish of Temple-newsam, was the subject of an inquiry which took place on the 25th ult. at the Halton Institute, by Mr. H. Percy Boulton, M.Inst.C.E., an Inspector of the Local Government Board. In February, 1903, the Sanitary Committee instructed their Engineer, Mr. S. Shaw (of Messrs. C. H. Marriott, Son, & Shaw, Dewsbury), to prepare plans and estimates for extending the works. The scheme consists of provision for storm water and for precipitation of the sewage in settling tanks, then for bacteriological treatment of primary and secondary beds, the effluent afterwards passing over about 4 acres of land.

MANCHESTER WATER SUPPLY.—It is announced that the testing of the second pipe from Thirlmere has so far been completed that it will be brought into use at once. The full service of 10,000,000 gallons a day will not at first be available, but it is hoped that before long this quantity will be placed at the service of the citizens.

EXTENSION OF PAISLEY WATER SUPPLY.—The inauguration of the completion of the additional water pipe laid between the burgh of Paisley's waterworks at Camphill, near Largs, and the Rowbank reservoir, and which also marks the completion of the burgh's water scheme, took place on the 29th ult. The piping from Camphill is capable of delivering 20,000,000 gallons of water every twenty-four hours, and the daily consumption in the town is, 8,000,000 gallons, though the existing pipes between the town and the filters can deliver 25,000,000 gallons in the twenty-four hours. The total cost of the work in connexion with the new piping is 290,000. The work has been carried out under the direction of Mr. James Lee, C.E., the burgh master of works.

SEWAGE DISPOSAL.—The Royal Commission on Sewage Disposal on Friday, the 28th ult.,

paid a visit to Market Drayton, where the system in use for part of the town of Market Drayton (about 1700 population) is continuous filtration by means of Ducat's Aerating Bacterial Filter. This is the only filter of this description in the country which has been constructed beyond the experimental size of those at London. It was installed about a year and a half ago for the Rural District Council of Drayton by Mr. G. A. Craig. Up to date it has done its work well.

FOREIGN.

GERMANY.—The new Technical Schools at Dantzig were opened on October 6; the building has been designed in the style of the ancient architecture of Dantzig, by Herr Egger and Herr Thür, and under the direction of Herr Carsten. The new theatre at Thorn, by MM. Fellner and Helmer, was opened on September 30. The Castle Vaduz at Lichtenstein, which was utilised as barracks until 1866, is to be completely restored. The Court Theatre at Brunswick has been rebuilt, and is now again in use; the work has been entrusted to Herr H. Seeling. Professor Gabriel von Seidl has been commissioned to design the new Historical Museum at Speyer. The buildings for the Art Exhibition of 1905 at Cologne are to be designed by Professor Hermann Billing, of Karlsruhe.

AUSTRIA.—The new homes for students in connexion with the High Schools at Vienna are now in use. The new baths at Karlsbad are being erected according to the plans of Professor Ohmann and Herr Hoeheder, and will cost 1,500,000 kronen. The memorial to the Empress Elizabeth at Kahlenberg was unveiled on October 13; the work was executed by the architects, Oskar and Engel, Felgel, and the sculptor, Rudolf Bachmann. The architect, Josef Prokop, died at Weidlingau, near Vienna, on October 8, in his sixty-fifth year. The new Botanical Institute, in connexion with the Vienna University, is completed; the building was designed and carried out under the direction of the engineer, A. Falkenau. Professor v. Zumbusch, of Vienna, has been commissioned to execute a memorial to Gottfried Schimper, which is to be placed in the Historical Museum at Vienna.

BELGIUM.—Tenders have been invited for the construction of two bridges over the river Dyle, at Malines, for the use of the railway from Malines to Antwerp. The estimated cost is about 14,500l.

MISCELLANEOUS.

BETTERMENT.—Mr. James Green (of the firm Weatherall & Green), who was appointed by the Local Government Board to make the necessary initial valuation of the property scheduled by the London County Council and alleged to be benefited by them, situated at the junction of Hampstead-road and Tottenham Court-road with Euston-road, has published and duly lodged with the Council his award pursuant to the Act of Parliament.

HADDON.—H. Cheetham, the author of the excellent little book on Haddon Hall, reviewed in our last issue, writes that the reviewer of the book seems to imply that it had no index, whereas the author had taken a good deal of trouble in supplying an index. We have not the book before us at the moment, but we have no doubt Mr. Cheetham is correct, and that the reviewer either overlooked the index, or inadvertently implied what he did not intend to imply.

GLASGOW BUILDING TRADES EXCHANGE.—The annual meeting of the Building Trades Exchange of the City and District of Glasgow, Ltd., was held in the Exchange, Hope-street, on the 26th ult. Mr. James Goldie presiding. Mr. David Cook, secretary, read the report of the Executive Council, which stated that there had been a profit of 42l. 7s. on the year's working. The chairman, in proposing the adoption of the report, remarked on the increase of unoccupied houses in Glasgow. Last year the number was 3,600, while in the latest return the empty houses were given as numbering 8,300, which meant the housing of about 40,000 persons. Referring to the report of the Housing Commission, he drew their attention to the fact that the result of the recommendation of the Commissioners to the Town Council was that their building operations should be restricted to building an experimental tenement for what they called respectable poor people, and also for building a shelter for "undesirables." They (the Trades Exchange) recommend that, if these buildings are gone on with, that no money should be borrowed, but that the money at present borrowed which was being spent on building warehouses and shops should be used. He warned them that although the City Improvement Trust was checked in the meantime from building, as

soon as they exhausted the money they would be at it again. They seemed to be like with a building fever—nothing would do them if they had money. Colonel Be seconded, and the report was adopted.

ARBITRATION CASE: BARRY LIBRARY DISTRICT.—Mr. Edwin W. M. Corbett, surveyor, District Council, at the Park Hotel, Cardiff, recently arbitrated, to hear evidence in the dispute between the Barry District Council and the Libraries Committee, on the one hand, and Mr. Watkin Williams, builder, on the other, as to alleged faulty construction of the foundations of the Carnegie Public Library buildings at Barry Dock. Mr. B. Francis Williams, K.C. (instructed by Mr. T. B. To clerk), appeared for the District Council Libraries Committee; and Mr. Abel Thomas, K.C., M.P. (instructed by Messrs. W. Davies & Co., solicitors, Pontypridd), Mr. Watkin Williams, Mr. C. E. Hutchings, London, one of the architects, was examined at considerable length to show that in instances the concrete foundations of building were laid on loose made earth, not sunk to rock bottom. The building far as it had proceeded was about 1 ft. square, and this disfigurement and the natural defects in the foundations were his opinion, sufficient justification for carrying down, carry out the foundations as specified, and re-erect the structure. The afternoon sitting was taken up by the contract cross-examination of Mr. Hutchinson, but the conclusion of which the inquiry was adjourned till November 10.—*Western Mail.*

THE PARISH CHURCH, PORTSMOUTH.—The parish church dedicated to St. Thomas Becket, in the High-street, which has been closed during some while past for repairs, improvements under the direction and superintendence of Mr. T. G. Jackson, R.A., was reopened on November 8. Mr. Jackson has made the designs for a sounding-board for the old pulpit—a structure after "three-decker" type—which is being made of old oak from the timbers of H.M.S. *Tremendous* that played its part in Howe's victory on June 1, 1794, and was subsequently renamed the *Granada*; the mounted portions of the sounding-board consist of wood from other famous ships, including the *Victory*, *Chesapeake*, and *George*.

THE BRADLEY MEMORIAL, WESTMINSTER ABBEY.—The memorial to the late Dean Bradley which the Dean and Chapter placed in the Abbey consists of a brass upon his grave at the west end of the choir of the nave. The brass was executed by Messrs. Barkinton & Krall, from a design by Mr. John Clayton, who followed, for general conception, the brass of Dean 1560-1, who was buried in the Chapel of Benedict. The late Dean, wearing a mitre with the chain and jewel of the Order of Bath, is depicted as holding the Coronation chalice; in the four corners are the heraldic shields of St. Peter's Collegiate Church, Marlborough College, University, Col. Oxford, and St. Edward the Confessor. The inscription beneath the figure commemorates Dr. Bradley's tenure of, in succession, headmastership of Marlborough, 1853-72; mastership of University College, 1872-81; the Deanery of Westminster, 1881-1902.

SCOTTISH BUILDING TRADES' FEDERATION.—The annual meeting of the Scottish Building Trades' Federation was held on the 28th ult. in the Imperial Hotel, Aberdeen. Mr. J. Morgan, builder, Aberdeen, presided, and delegates were present from Edinburgh, Inverness, and other parts of Scotland. William Macdonald, builder, Inverness, appointed president of the Federation for the year; Mr. Patrick Knox, Edinburgh, president; and Mr. Frederick A. Inverness, Inverness, secretary and treasurer. It was resolved to hold the next meeting of the Federation at Inverness.

MEMORIAL STATUE, BRIGHTON.—On the 21st ult. the memorial to the officers and men of the Royal Sussex Regiment, who fell in Africa during the late Boer War, was unveiled at Brighton. The monument, which is situated at the south side of Regency-square facing the entrance to the West Pier, is 10 ft. in height. It is composed of Portland stone and the badge of the Royal Sussex Regiment, the memorial tablets and the railings to enclose the whole, are of bronze. The statue is surmounted by a bronze statue, 7 ft. 6 in. in height, of a bugler of the Regiment. The bronze figure is by Mr. G. Hartwell. The monument has been carried out from the drawings of the architect, John W. Simpson, of Gray's-inn, London, W.C.

OLD LONDON.—The Essex House Press about to issue monographs on two fine London buildings:—Brooke House, Hack-

itten by Mr. Ernest A. Mann, and illustrated with reproductions of engravings of the use by W. Hollar (1642), Chatelain (1750), and Malcolm (1797); and St. Dunstan, Stepney, illustrated by the Hon. Walter C. Pepsy, with designs by Mr. Ernest Godman, architect, and illustrated with photographs, drawings, and hand-coloured prints of the more important heraldic shields in the church.

EDMUND KEAN MEMORIAL TABLET, RICHMOND, SURREY.—This was recently removed from its position on the outside of the west wall of St. Dunstan parish church owing to the dilapidated state it had fallen into through exposure to the weather. It is now to be re-erected in the interior of the church on the west wall, and as far as possible on the same site. Before the tablet is re-erected it will be cleaned and restored under the direction of Thomas Brock, R.A.

MEMORIAL WEST SMITHFIELD.—At the church of St. Bartholomew the Great, on the north side of the church, a tablet was unveiled in the late Mr. Joseph Grimshiro. The memorial consists of a stone tablet designed by Mr. O. Webb, R.A., bearing an inscription.

STREET IMPROVEMENTS, RICHMOND, SURREY.—A special meeting of the Richmond Town Council was held on the 21st ult., to consider the recommendations of the Street Improvement Committee as to the proposed Red-Lion-street area improvements. After some discussion it was decided to apply for a provisional order.

BRITISH STANDARD SECTIONS OF RAILWAY TIES.—A report issued last week by the Engineering Standards Committee contains the British Standard Specification and Sections of "Headed Railway Rails," drawn up by the committee of the Committee on Rails appointed in October, 1901.

In commencing this sub-committee wisely sought the assistance of the chief railway companies of the United Kingdom and were thus enabled to obtain particulars with regard to the sections favoured by modern practice. After full consideration of the data collected, the committee prepared a series of tentative drawings, which were submitted to the principal railway companies for comment. After receipt of all the replies, the preliminary standards were finally settled, a work in which much valuable assistance was given by Mr. C. Inglis, chairman of the sub-committee, and Chief Engineer of the Great Western Railway. A similar course was adopted with regard to the specification for the same class of rails, but in this case it was necessary to consult the leading manufacturers, as well as the various railway companies. The specification, which consists of nineteen clauses, appears to provide fully for insuring the use of suitable steel, for the adoption of the correct methods of manufacture, and for the proper finish of the completed rails. While the interests of the purchaser are adequately considered, we are glad to say that the results will be obtained without any vexatious regulations of the kind which have too frequently been imposed in the past by some speculators. In clause 14 provision is made for impact test of one rail from each cast, the test to comprise two blows from a one-ton weight, the drop ranging from 5 ft. to 7 ft. for the first and from 10 ft. to 20 ft. for the second blow. These blows must be sustained without fracture and without exceeding certain defined limits of deflection. The next clause specifies the required tensile test, in which the steel must show an ultimate strength equivalent to not less than 38 tons per sq. in., more than 45 tons per sq. in., with an elongation of not less than 15 per cent. upon a new standard test piece "C" or "D."

The rails are to have a brand rolled on the end of the brand including the distinctive mark of the Engineering Standards Committee, the number of the "B.S." section initials denoting the process of steel manufacture, the maker's name, initials, or mark, and the date of manufacture, and the number of the cast is stamped in 2-in. letters at the end of the rail. Further, after acceptance, all rails to be stamped in the presence of the inspector or his engineer. The brand marked above will no doubt be found very useful for the purposes of identification and the stamped inscription as a lasting proof that the rail has satisfactorily passed all required tests. At the end of the pamphlet there are plates giving full dimensions of the rails, a diagram, and nine full-sized drawings representing the new sections, which range in weight from 60 lb. to 100 lb. per yard, with rails of 5 lb. between each size. An appendix at the end of the report illustrates the British Standard tensile test pieces. The size in number, and are designated by letters. Thus, "A" with a total length of 8 in., and a gauge length of 8 in., is intended for plates and other structural material; "B" with enlarged ends and parallel for a length of not less than nine times the

reduced diameter and a gauge length of not less than eight times the diameter, is designed for bars, rods, and stays; "C" and "D" are for tyres, axles, forgings, and castings, the gauge length of "C" being 2 in. and of "D" 3 in., and the sectional area $\frac{1}{4}$ sq. in. and $\frac{1}{2}$ sq. in. respectively; "E" is similar to "C" and "D," but of larger dimensions. As in the case of all the previous publications of the Committee, this report is distinguished by the admirable lucidity of the phraseology employed, and the excellent manner in which the drawings are reproduced.

THE MANCHESTER INFIRMARY.—The Board of Management of the Manchester Royal Infirmary met on the 21st ult. The minutes of the Building Committee stated that the Committee had been in consultation with the architects for the new infirmary (Messrs. Hall & Brooke) as to the suggestion made by Sir James Hoy that, in order to expedite the payment of the Corporation's instalments of the purchase-money for the Piccadilly site, the contracts for the new buildings at Stanley-grove might be so let that vacant possession of the old site could be given to the Corporation when accommodation for 300 beds had been provided and before the completion of the whole of the new buildings. In reply to the Committee's inquiries as to whether some portions of the buildings could be postponed without increasing the cost or seriously delaying the completion of the whole, the architects pointed out to the Committee that, owing to the fact that the new hospital will consist of forty buildings, the mere postponement of some of them would not expedite the completion of the remaining buildings. They suggested that the most practical and practicable course would be to let the contract for all the buildings, and while stipulating that they should all be completed at the earliest possible date, to lay down the condition that all the Oxford-road blocks, the casualties, patients', and laundry blocks, and all the surgical side should be finished at a given date, and the remainder at a later date. In this way it might be found possible temporarily to use some of the surgical pavilions for medical cases.—It was also reported that Mr. A. Simpson, a member of the Board of Management, had written urging the Committee to consider the advisability of delaying the contracts except those for the buildings which were essential for providing for the three hundred patients now in the infirmary. As the Corporation would press the Board to vacate the present site at the end of three years, Mr. Simpson suggested that only the surgical blocks, the administration blocks, the nurses' home, and the laundry should be completed, and that the remainder of the work should wait.—The Committee resolved, however, that in view of the architects' belief that the completion of the new infirmary would be expedited by proceeding with the whole of the buildings, and their assurance that the infirmary could be completed within three and a half or four years from the date of commencing the foundations, the preparation of the contracts for the foundations should be proceeded with.

CANALS.—The Mansion House Association on Railway and Canal Traffic has arranged to convene a meeting of traders early in December for the purpose of considering the proposals of its executive committee for placing canals and inland navigations under the control of one authority and the advisability of seeking legislation to that end in the next session of Parliament.

PROPOSED MUNICIPAL BUILDINGS, GUILDFORD.—In our last issue, page 447, we refer to "Proposed Municipal Buildings, Guildford." We are informed that this is an error, and that the municipal buildings in question are those for Woking, the plans being prepared by Mr. G. J. Woodruff, Surveyor to the Urban District Council, Woking.

CEMENT FOR NATAL AND CAPE COLONY.—An official return shows that during the year 1903 cement was imported into Natal from the United Kingdom to the value of 26,100*l.*, and from Germany to the value of 32,300*l.* Respecting the first shipment of American cement to the South African market, the late correspondent of the Board of Trade at Port Elizabeth, Cape Colony, now reports that the importer of this cement has written to him as follows:—"The American cement has arrived and is all right. If freights continue as at present, we shall get some more."

FIRE TESTS WITH PARTITIONS.—No. 83 of the publications of the British Fire Prevention Committee contains the statistics of a test on a "Kulm" partition, formed of slabs tested by the maker to be composed of pumice stone, volcanic sand, and Portland cement. The partition was built of slabs of this composition 21 in. by 11½ in., and 2½ in. thick, the horizontal joints grooved and tongued, the vertical joints merely butting. On the side next the

fire the partition was plastered with a mixture of fireclay, sand, and plaster of Paris. After exposure to a two hours' fire some of the plaster was damaged—this appears to have been done mainly by the force of the water which was turned on immediately after the fire; but the joints were perfect.

Legal.

CASE UNDER THE PUBLIC HEALTH ACT.

THE case of Millard v. Balby-with-Hexthorpe Urban District Council came before the Court of Appeal, composed of the Master of the Rolls and Lords Justices Stirling and Mathew, on the 23rd ult., on the appeal of the District Council from a decision of a Divisional Court of King's Bench, consisting of the Lord Chief Justice, and Justices Wills and Kennedy, on February 29 last, reversing a decision of the Justices of the West Riding of Yorkshire on a complaint preferred by the Urban District Council for non-payment of paving expenses under the provisions of the Public Health Act, 1875, in respect of premises in Carr Hill-road, Balby. (The case was reported in the Builder of March 5, 1904.) The facts of the case were as follows:—In June, 1899, Carr Hill-road, not being a highway repairable by the inhabitants at large, the Council served on Millard, and all the owners of premises fronting such parts of it as required to be paved, notices requiring them to have the work done. The owners not doing the work the Council did it, and completed the work on December 4, 1901, at which date Millard owned premises on the road which required to be paved. On March 20, 1902, Millard sold his premises, the conveyance to the purchaser being executed on April 25, 1902. The Council's Surveyor apportioned 45*l.* as the proportion due from Millard for the work on his premises, and notice of apportionment was duly served on him on November 24, 1902. On May 20, 1903, a formal demand in writing was served on Millard for payment of the 45*l.* Millard contended that he was not liable because he was not the owner of the premises both on December 4, 1901, when the work was completed, and also on May 20, 1903, the date of the demand. The district Council, however, contended that Millard was the person liable for the apportioned expenses as he was the owner of the premises at the time when the works were completed. The Justices held that Millard was liable to pay the 45*l.* to the District Council, and made an order accordingly. The Divisional Court, however, on appeal, in deference to the decision in the case of the Queen v. the Swindon Local Board, reversed the decision of the Justices. Hence the present appeal of the District Council.

Mr. Macnaghten, K.C., and Mr. Joshua Scholefield appeared for the appellants, and Mr. Israel Davis for the respondents.

At the conclusion of the arguments of counsel the Master of the Rolls, in giving judgment, after stating the facts, said that the Court below had held, following the observations of the Court in the case of the Queen v. the Swindon Local Board, decided in 1879, and in deference to the opinion there expressed, though contrary to their own opinion, that Millard was not liable to pay the sum apportioned on him. In deciding the case it became necessary to consider sections 150 and 257 of the Public Health Act, 1875. Section 150 provided for the giving of notice by an urban authority to owners of houses fronting on streets not properly paved, requiring them to do paving works, and section 257 introduced the specific provision under which an owner came under liability, if he was liable at all. That section, in absolute and unambiguous language, defined the person who was the owner of the premises when the works were completed. In the present case Millard was the owner of the premises when the works were completed, and, on the language of the section, he fulfilled the conditions of liability. It was not necessary to decide the question whether, if a man who was the owner at the time of the notice made default, and then before completion of the work sold the premises to someone else, both would be liable. But it was clear that in the present case Millard was liable. Referring to the decision in the case of the Queen v. Swindon Local Board, his lordship said it must not be forgotten that there was an important distinction between that case and the present, for in the former case the person on whom the demand for payment was made ceased to be the owner before the completion of the works. He, therefore, clearly

did not come within section 257 of the Act. Therefore, the facts in the case of the Queen v. the Swindon Local Board did not raise the point involved in the present case. He thought the appeal should be allowed.

The Lords Justices concurred.

HERNE BAY DRAINAGE DISPUTE.

The hearing of the case of *Graham v. Ramuz* concluded in the King's Bench Division, before Mr. Justice Phillimore and a special jury on the 23rd ult.—an action by the plaintiff for damages against the defendant for alleged breach of contract.

The facts of the case were as follows:—The defendant, the owner of a building estate at Herne Bay, in October, 1893, sold by auction to Messrs. Nott, Cartwright, & Eccles some lots of land on the estate. On the front page of the catalogue were the words "Roads made, drained, and kerbed," and the catalogue contained the conditions of sale. No. 6 of the conditions of sale provided that 50s. per plot should be paid by each purchaser for the connexion of the drains with the sewers when the roads were made, and the sewers laid. The conveyance, which was dated October 1, 1900, contained no stipulations as to drainages, but it recited the agreement of sale. The roads were not included in the conveyance. The purchasers, in the following December, assigned their interest to the plaintiff. The plaintiff's case was that, by the terms of the conditions of sale, there was an agreement by the defendant to lay sewers for the proper drainage of the lots. Pipes for sewers had been laid, but no outfall had been provided owing to differences between the Urban District Council and the defendant. The plaintiff alleged that he was entitled to recover damages for the loss he had suffered by reason of his being unable to drain houses erected and to be erected on the plots, and to get the plans passed by the local authority.

Mr. Hohler and Mr. G. W. Ricketts appeared for the plaintiff, and Mr. H. F. Dickens, K.C., and Mr. C. Herbert Smith for the defendant.

In the result his lordship held, on the construction of the documents, that there was a warranty that there should be sewers, but left it to the jury to say whether they found it as a fact. The parties also agreed that the jury should be asked to assess the damage (if any) on the assumption that the sewers should be completed at once.

The jury found that there was a warranty in fact, and assessed the damages at 500l.

Judgment accordingly.

A stay of execution with the view to an appeal was refused.

THE BUILDING BY-LAWS, LEATHER-HEAD.

JOHN THORN, of Poplar-road, Leatherhead, was summoned at the Epsom Police Court recently for two breaches of the building by-laws in erecting a building not in accordance with plans sent to the Urban Council and approved by them, and also in building the walls not of the proper thickness as required by the description of the building erected. Mr. W. J. Hodges appeared on behalf of the Leatherhead Urban Council, and Mr. R. J. Clark, of Croydon, defended. Mr. Hodges said that the defendant submitted plans to the Council in May or June, showing that two stories were to be erected above the cellars, with the walls of the thickness of 9 in., as required. The plans were approved, but when the surveyor (Mr. Salkield) inspected the building he found that a room not shown in the plans had been constructed in the roof, and a staircase to it from the other stories was about to be erected. The room had windows, chimney, and fireplace, and a third story of which there was nothing shown on the plans was thus constructed. That addition, according to the by-laws, necessitated a thickness in the walls of 13½ in., whereas the thickness was only 9 in. The surveyor wrote to Mr. Thorn, asking him to state his reasons for departing from the plans, but no reply had been received, and the only course open to the Council was to take these proceedings. Mr. Clark said that defendant admitted the offences, but urged mitigation. When the erection of the house was almost completed, Mr. Thorn saw that some space had been wasted in the roof, and he decided to use it, without any intention to evade the by-laws, by constructing a room in which to store furniture and tools, as he proposed to occupy the house himself. He did not reply to the Council's letter, as he had previously written to the Council on another matter, and had received no reply. Defendant was perfectly willing to take down the staircase from the second story, so that the room could not be used as a bedroom or

living-room, and to give an undertaking to that effect. He asked the Bench to reduce the penalty considerably. Mr. Hodges said that that was the first time that any explanation of any kind had come from the defendant. He asked the Bench to impose the penalties as they thought fit, the matter of "taking down" to be considered by the Urban Council. It was for the Bench to deal with the two summonses before them. The maximum penalty for each offence was 5l. The Chairman (Mr. W. R. G. Farmer) said that it was a very serious case, especially in the varying of the plans. Defendant would be fined 4l. for departing from the plans, and 1l. for not erecting walls of the proper thickness, and all costs. Mr. Rostron said that such offences reduced provisions made in the interests of the public to a nullity.—*Surrey Advertiser*.

BOGNOR BUILDING BY-LAWS.

At Chichester County Bench on Saturday last, Charles John Mills, a carpenter and joiner, of Bognor, was summoned by Mr. H. L. Staffurth on behalf of the Bognor Urban District Council, for erecting on December 1, 1903, a wooden building without first delivering plans in accordance with the by-laws. Mr. Humphrys, barrister, instructed by Mr. Staffurth, prosecuted, and Mr. J. A. Morris Bew appeared for defendant, who pleaded not guilty.

Mr. Humphrys explained the case at length, and referred to the question of penalties, and he admitted, in reply to a remark by Mr. Bew, that if it were proved the building was erected more than a year ago he could not get any penalties.

Mr. O. A. Bridges (Surveyor to the Council) stated that the building was in course of erection in November last, but defendant, in evidence, said it was erected on September 19 and 21, 1903.

The Bench, however, thought there was not sufficient evidence that the building was erected on September 19 and 21, and the case must go on.

Mr. Bew then submitted that defendant was not charged with a continuing offence, and the limit of time to those proceedings being six months from the time the offence was committed, the case must on that ground be dismissed.

After considerable legal argument, Mr. Du Pre (Chairman) said the Bench thought the information did not sufficiently state the charge, and the present proceedings therefore failed. Replying to Mr. Humphrys, the Chairman said they would state a case if necessary.

The Bench proceeded to hear a summons against Arthur Davis, cycle agent, of Beach House, Sea-road, Bognor, for erecting and bringing forward an addition to a building beyond the front main walls of the houses on either side thereof at Bognor. Mr. Humphrys again appeared for the Council, and Mr. E. B. Wannop defended. It was alleged that defendant brought his shop windows out 2 ft. beyond the building line, and the verandah 2 ft. beyond the shop windows, making 4 ft. beyond the line.

The Surveyor and Mr. Staffurth having given evidence, Mr. Wannop submitted that the information was bad, because it did not disclose any offence whatever. It did not allege a continuing offence, and it was a continuing offence which brought it within the meaning of the Act.

The Bench decided that the information was good.

Mr. Wannop then contended that if the bays of the Beach Hotel next to defendant's building were taken as the building line, the whole of defendant's building was within the line.

Mr. Fletcher: The bays of the Beach Hotel do not extend to the ground?

Mr. Humphrys: No.

In giving the decision of the Bench, Mr. Du Pre said defendant was liable to a penalty of 2l. per day for 117 days, but they thought justice in the case would be met with a penalty of 6d. a day, and costs.—*Sussex Daily News*.

DISPUTE ABOUT A STONE CONTRACT IN BRADFORD.

Before his Honour Judge Bompas, K.C., at the Bradford County Court, on the 31st ult., an action was brought by Messrs. Parry & Proctor, quarry owners, of Bolton Woods and Eccleshill, Bradford, against Messrs. George Denham & Co., stone merchants, of Atlas Mills, Brighouse, for the value of stone supplied. The defendants set up a counter-claim on the ground that the goods supplied were not in accordance with contract, and that there had been a breach of a contract to supply 100 tons of stone cubes. Mr. Henry Waddington appeared for the plaintiffs, and Mr. G. F. Roberts for the defendants. In the

course of the hearing a question of course arose. On behalf of the plaintiffs it was contended that the general custom in the trade was for a contract to take a certain quantity of stone to be terminable on the customer taking what stone was ready at the quarry top. His Honour said that such a custom was absurd where there was a contract to take a certain quantity of stone. Eventually his Honour gave judgment for the plaintiffs on the claim, and for the defendant on the counter-claim, after reducing the amount of the latter.—*Yorkshire Daily Messenger*.

CLAIM AGAINST TIMBER MERCHANTS UNDER THE WORKMEN'S COMPENSATION ACT.

The case of *Middleton v. R. Wade & Co., Ltd.*, came before the Court of Appeal, composed of Lords Justices Stirling, Mathew, and Lord Macnaghten, on the 31st ult., on the application of the defendants that the plaintiff should be ordered to give security for the costs of an appeal from the award of the Justice of the Peace's Court of Kingston-upon-Hull, in a claim under the Workmen's Compensation Act, 1897.

Learned counsel, in support of the application, said that the County Court Judge had decided the case in favour of the defendant, and notice of appeal had been served, and had an affidavit in support of the application, sworn by a member of the defendant firm, in which he said that he believed the plaintiff in the case had no visible means of support, and therefore there was no prospect of the defendants getting their costs of the appeal proved unsuccessful. In the circumstances he asked for an order of security for the costs of the appeal. The learned Counsel for the plaintiff, in resisting the motion, said the accident was admitted, the defendants were timber merchants, and had contracted with the post office to supply telegraph poles, and dress them with creosote. Defendants had two yards, one yard connected with the other by a footpath, and in one yard there was machinery driven by steam, which made it a factory within the meaning of the Act. In the other, where the machinery was put on, there was no machinery. The point taken by the appellant was that the two yards were held by the defendant worked together as one business, and the whole had to be taken as one factory, that the accident occurred "in or about a factory," or within the curtilage of a factory. The learned County Court Judge held the place where the accident happened was not a factory because the two yards were contiguous, although connected by a footpath. A second point was that the learned Judge held that the yard where the accident occurred was not a warehouse within the meaning of the Act, because there was no roof. Those were the two points which the plaintiff wished to bring before the court, and he submitted they were substantial ones. He did not dispute that the plaintiff had no means of support, but he said that the plaintiff's husband, and the widow, were suing on behalf of herself and her two children for compensation under the Act. He should ask their lordships to make no order on the motion, or if they felt obliged to make an order for security, that they should do so on a small sum only.

Lord Justice Stirling said he thought an order for 10l. was enough.

Lord Justice Mathew concurred. Order accordingly.

WORKMEN'S COMPENSATION ACT.

At the Birmingham County Court, on the 27th ult., his Honour Judge Whitehorn gave judgment in the case of *William Henry Plumber, of 221, Malmesbury-road, Heath, against J. S. Wright & Co., plumbers and painters, Moor-street, Birmingham*. The case was an application under the Workmen's Compensation Act in respect of the injury sustained by the applicant while employed by the respondents in doing certain measurements up on the completion of the building of a factory. The applicant fell over a rail, broke his shoulder, the result being, he was unable to follow his employment for a period of thirteen weeks. The respondents contended that the applicant was not employed by the respondents to work as a plumber at the time of the accident, but was employed as a painter, and that the work which had previously been executed by the respondents was not being incidental only to his work. His Honour, in giving judgment for the plaintiff, said the whole question depended on the right meaning of the word "constructive" in the Act, and he held that the necessary measuring up of constructive work on which the applicant was engaged was

... occurred was part of the construction, and therefore the case was within the Act. He had not forgotten that the measurement of the work was not done until a night after the completion of the construction. There might be cases in which the interval of time was so long as to make it just to regard it as part of the construction, but such cases would have to be considered on their merits. He did not regard a night as an unreasonable time, and therefore he gave an award for £17, the amount claimed upon by the parties. On an application by Mr. Walthall, his Honour said the respondents had a right to appeal.—*Birmingham Mail*.

WORKMEN'S COMPENSATION ACT: QUESTION AS TO "ARISING OUT OF," ETC.

The Marylebone County Court on Friday week, before Judge Stonor, Frederick Cris, a plasterer, 5, Desborough-road, Paddington, W., applied for compensation under Workmen's Compensation Act, from Messrs. Owen & Crawley, builders, Newton-road, Bayswater, and 3, Pickersmeads, Westbourne-grove, W. The application was made in respect of personal injuries sustained by the applicant whilst in respondents' employ.

Mr. Macpherson, counsel, appeared for the applicant, and Mr. Cairns, counsel, for the respondents. The applicant stated that in May last he was employed by the respondents, assisting in a building operation in Bayswater. On May 12 he had been working upon a portico, in order to descend to the ground he requested that Mr. Owen—one of the respondents—should hold a long pair of steps such a position that he (applicant) might have a foothold as he clambered over the top of the portico. He requested that no one but Mr. Owen should hold the steps, and he called out "Hold tight—are you there?" Mr. Owen replied, "Right." The applicant, however, applicant put his right foot on the top of the steps they swayed one way and he fell the other way to the ground. The back of his skull was fractured, and at present time he was unable to do his ordinary work.

On cross-examination, the applicant denied deliberately jumped from the top of the steps.

For the defence, Alfred Gibbs, a painter, admitted that he was holding the pair of steps and the applicant was getting down from the portico. The steps were quite firm, and Mr. Owen guided the applicant's foot to the top of the step, but the man appeared to leap out from the steps, and he fell 3 ft. 9 in. from them.

The Judge: He lost his balance. I suppose it appears to have been an ordinary accident. Mr. Alfred James Crawley, of the respondents' firm, gave evidence similar to that given by the last witness.

Counsel for the respondents submitted that the accident did not arise "out of and in the course of the employment," and that, therefore, the applicant was not entitled to compensation under the Act. Surely a master cannot be held responsible for such a foolish and foolish act on the part of a servant as the act of which the applicant was to be guilty, when he leapt from the top of the steps.

The applicant, recalled, said that had the steps been held firmly, the accident could not have happened.

His Honour found in favour of the applicant the award being at the rate of 15s. a week.

INJURY THROUGH FALL OF COPING STONE.

In a case of *Musson v. Mardell* came before Justice Bucknill and a common jury in King's Bench Division on the 31st ult., in which the plaintiff against the defendant an upholsterer, and the tenant of premises in Westbourne-grove, to recover damages for personal injuries which the plaintiff had sustained through the defendant's negligence.

It appeared that the plaintiff on January 14 last went to the defendant's premises in order to make a purchase, and whilst there a coping stone fell through a glass skylight, striking her on the head, and seriously injured her. One of the shop assistants was killed, and many other people were injured. The premises in question were built about seventy years ago, and then consisted of a three-story building set back some distance from the street, a garden being in front. The garden, however, had been since built over, and a shop, which was a one-story building with a skylight running back to the street building. To provide communication

between the shop and the rest of the premises a part of the original front wall had been cut away, and a bressummer inserted to support the wall. The plaintiff's case was that the premises were not in a reasonably safe condition so far as care and skill could make them. The defendant's case, on the other hand, was that if there was a defect it could not reasonably be discovered, and he pleaded in the alternative that the fall of the coping stone was caused by a storm, and thus occasioned through an act of God.

After hearing evidence the jury, in the result, were unable to agree, and were discharged.

PATENTS OF THE WEEK.

APPLICATIONS FOR PATENTS.

24,017 of 1903.—D. B. DONSON and A. J. H. MOFFAT: *Sash Fasteners and Lifts for Windows*.

A fastening device for windows, consisting of a lever having two arms of unequal length placed at an angle to each other, one arm weighted at its free extremity, attached to a turning piece pivoted to flanges rising from a sole plate, with screw holes, or other means of attachment, and an operating pin or other projection of metal, which, in its simplest form, consists of a screw with or without a surrounding piece of metal tubing.

24,997 of 1903.—A. ROBERTSON: *Raising and Lowering Mechanism for Window Sashes*.

Means for raising and lowering window sashes, consisting of a rack on the sides or edges of the sliding sash, and a toothed disc meshing therewith, said rack being composed of a series of concave faces having notches between the faces, and said toothed disc being composed of convex faces adapted to engage concave faces on the rack, and of projections or teeth arranged to mesh with the notches aforesaid.

26,141 of 1903.—F. J. GIBBONS: *Door Hinges*.

A ball bearing for a door hinge in which the two enclosing race rings for the balls are united by an internal or external ferrule or sleeve by deadening the ends of the latter, characterised thereby that a recess is provided on the external surface of one of the race rings, which recess is adapted to receive therein a portion of the boss of one of the leaves of the door hinge.

26,384 of 1903.—H. E. BADENH: *Water-closets*.

A water-closet, consisting of a pottery basin of the pedestal type having a metal socket secured to its discharge outlet forming the seat for a valve pivoted in the metal discharge pipe.

26,410 of 1903.—J. BRIGGS: *Domestic Fire Grates*.

This invention relates to domestic fire grates, and it has for its object to economise fuel and provide a brilliant and cheerful-looking fire with a comparatively small quantity of fuel. For this purpose what may be termed a false grate is employed inclined from the back downwards towards the front, and before reaching the front inclined upwards. The grate bars in the back part of the false grate may be formed from the back downwards, and a longitudinal slot or slots may be formed in the upwardly-inclined front part of the bottom or at the junction of the two inclined parts. Feet may be provided at the ends to support the grate. Slide or filling pieces may be provided adapted to more or less close any or all of the openings in the above-described grate. These filling pieces may be supported on upper flanges or projections.

26,757 of 1903.—R. NIEMANN: *Tables*.

A drawing table having means for adjusting same, comprising adjustable supports on the posts of an end frame, the supports belonging to one side of the table intersecting, their lower ends being adapted to be adjusted in vertical guides in the posts, their crossing point being adapted to be secured by means of a clamping screw, so that by loosening the clamping screws upon both sides of the table top its degree of inclination may be altered without loosening the end screws of the supports, whilst by loosening these end screws the height of the table top may be altered without loosening the clamping screws.

27,148 of 1903.—C. E. LONG and P. J. WARDON: *Fastenings and Means for Locking the same, Applicable to Doors, Gates, Boxes, and other Articles*.

Fastenings for doors, gates, boxes, and other articles, consisting of a pivoted arm carried in a suitable casing on one part of the structure, the said arm having a curved lateral projecting rib or ribs on its free end, and

means for operating the arm about its fulcrum, in combination with a latch plate fitted on the other part of the structure, the said latch plate having a slot to receive the ribbed end of the pivoted arm, and curved grooves in the side walls of the latch-plate to receive the lateral ribs, together with means operated by a key for locking the arm in its engagement position.

2,477 of 1904.—W. T. GIBBS and A. A. GIBBS (Trading as Walter Gibbs & Sons): *Leaded Lights*.

The object of this invention is to strengthen leaded lights for windows, door panels, skylights, lantern lights, and the like, whereby the unsightly system of iron bars and copper ties on the surface of the lead are dispensed with. For the purpose of this invention embedded or enclosed within the lead used for making the leaded lights is a rod, bar, or tube of iron, copper, brass, or other hard metal, and of a round, square, angular, hollow tee, double tee, or other shape, the whole or a greater part of the rod, bar, or tube being covered by the metal forming the lead, the method of enclosure or partial enclosure being by soldering the two ordinary cans of lead together or the lead can be drawn or cast over the rods, bars, or tubes, or the embedding or partial embedding of the rods, bars, or tubes can be effected by any other method.

9,076 of 1904.—G. F. GILLON: *Window Sashes*.

This invention relates to window sashes, and has for its object to provide simple means whereby the windows can be opened inwardly to facilitate cleaning. The inner or room side of each sash is formed with a recess into which is fitted a wooden frame which is hinged to the sash. The windows are glazed within the said hinged frames; the arrangement being such that the outside of the windows can be turned inwards for cleaning purposes, without sliding the sashes up or down. The windows and frames may be secured or locked to the sashes, at the opposite side to the hinges, by means of ordinary window snibs, the sashes being locked by the usual fasteners. Storm plates may be used at the middle sash joint also at the top and bottom of the sashes, if required.

10,188 of 1904.—E. H. LUNKEN: *Construction of Windows*.

This relates to a window construction, consisting of a main frame composed of two members, one of which is secured to the wall of the building and adapted to carry a window part or parts, said second member being preferably of angle iron.

18,478 of 1904.—I. H. RANSON: *Key Building Brick*.

This invention consists of forming, during the process of manufacture of machine-made "wire-cut or pressed bricks," of one or more dovetailed, or keyed grooves, in one or more of the vertical sides, and ends of the said bricks.

TO CORRESPONDENTS.

NOTE.—The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples, sent to or left at this office, unless he has specially asked for them.

Letters or communications (beyond mere news items) which have been duplicated for other journals are NOT DESIRED.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

We are compelled to decline pointing out books and giving addresses.

Any commission to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

TENDERS.

Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Thursdays. [N.B.—We cannot publish tenders unless authenticated either by the architect or the building-owner; and we cannot publish announcements of tenders accepted unless the amount of the tender is stated, nor any list in which the lowest tender is under 100l., unless in some exceptional cases and for special reasons.]

* Denotes accepted. † Denotes provisionally accepted.

Experimental Bacterial Treatment of London Sewage.

WE have at various times drawn attention to the Reports issued by the London County Council on the bacterial treatment of London sewage, and as these Reports are now being collected and published in a somewhat abridged form, we think it may be useful to summarise the results obtained during the long series of experiments from 1892 to the present time. The first experiments were commenced in May, 1892, under the direction of Mr. W. J. Dibdin, but since 1898 the work has been continued by Professor Frank Clowes, with whom Dr. A. C. Weston has been associated in the bacteriological investigations.

From May to August, 1892, experiments were made with different kinds of material for use in contact-beds, but as the experiments are now somewhat out of date, we need only say that Lowestoft pease of the size of peas yielded the best degree of purification; coke-ze, however, proved fairly efficient, as it is a cheap material, it was selected for the experiments on a larger scale.

In 1893 a large coke-bed (known as "the acre bed," although its actual area was 1,067 sq. yds.) was started, and has been in use ever since with but little modification; in 1898, however, its depth

was increased from 3 ft. to 6 ft. The first experiments on the bed 3 ft. deep were instituted for the purpose of ascertaining the rate at which the bed could deal with the effluent from the chemical precipitation-tanks. The rate rapidly fell from nearly a million gallons daily to one-fourth of this quantity; after the sixth week the effluent was putrid, and at the end of twelve weeks the bed was "quite useless, being putrid throughout." After a rest of three and a half months, which sufficed to bring it again into working condition, the bed was tested in a more reasonable manner, and succeeded in effecting a purification of 70 to 80 per cent. on 500,000 gallons of tank effluent per day. Towards the end of 1894, the periods of rest on the six working days were shortened, and work was suspended from 10 p.m. on Saturdays to 6 a.m. on Mondays. The bed was filled as rapidly as possible, allowed to stand full for one hour, and then quickly emptied. During a period of eight weeks the bed treated 1 $\frac{1}{8}$ million gallons on each working day, and effected an average purification of 78 per cent.

In 1897 experiments were made with sewage "which had undergone previous settlement without the aid of chemicals," and a purification of 81.5 per cent. was obtained. The coke used in this bed was not sifted, and after the depth had been increased to 6 ft., it was discovered that the lower or original portion had become very much consolidated. The deduction is that unsifted coke is quite unsuitable: All the fine particles ought to be removed by screening, and in addition to the

screening it is, we may add, a good plan to wash the selected particles thoroughly, so that all the fine dust adhering to them is eliminated.

The next series of experiments was on a smaller scale, and was somewhat unsatisfactory. Crude sewage was passed successively through an upper primary and a lower secondary bed, each of which was 6 ft. deep. Two pairs of beds were constructed, one pair being filled with Kentish ragstone and the other with coke. In each pair the material in the upper bed was passed by a 4-in. mesh and rejected by a $\frac{1}{2}$ -in. mesh, and that in the lower bed was passed by a $\frac{1}{2}$ -in. mesh and rejected by a $\frac{1}{16}$ -in. mesh. The ragstone did not give as good results as the coke, and in both cases the degree of purification was unsatisfactory—49 per cent. for the ragstone and 63 per cent. for the coke. In another series of experiments on similar lines the depth of the beds was increased to about 9 ft. 9 in., but in one pair the primary and secondary beds were filled with coarse material, and in the other pair the primary bed was coarse and the secondary fine. Coke was used throughout—that in the three coarse beds having passed a 2-in. and been retained by a $\frac{1}{2}$ -in. mesh, and that in the fine bed having passed a $\frac{1}{2}$ -in. and been retained by a $\frac{1}{16}$ -in. mesh. The pair with the coarse and fine beds gave much better results than the other pair (76 per cent. purification against 63), but all the beds were gradually being choked by the solid matters in the sewage, and in November, 1900, a new series of experiments was started. The

same tanks were used again, but the coke was removed from the upper tanks, and the crude sewage was allowed to settle in these before being passed on to the lower beds, which were as described above, but with the depth of the coke reduced to 6 ft. The settlement of the sewage was beneficial, but was not carried out in such a manner as to allow much septic action to take place, and the purification effected by the tank and coarse bed was only 51 per cent., and by the tank and fine bed 60 per cent.

All the experiments recorded above were carried out at the Northern Outfall Works, but in 1898 experimental work on somewhat similar lines was begun at the Southern Outfall Works, Crossness. Three tanks, each of which had an area of about 27 sq. yds., were used. In the first series, one of the tanks was filled to a depth of 1 ft. with coke of uniform size (each piece about as large as a walnut), and effected an average purification of 52.2 per cent. when fed with crude sewage twice daily, the tank standing full for three hours. The other tanks were filled to a depth of 6 ft. with similar coke, and were arranged as primary and secondary beds, the crude sewage being treated by contact in the primary bed, and the effluent from this being similarly treated in the secondary bed. The percentage purification effected by the double contact was 68.4. Better results would probably have been obtained if finer coke had been used in the secondary bed. Incidentally this series showed that contact beds must be treated with small doses of sewage until they have matured sufficiently to allow the normal quantity to be applied; otherwise the beds and effluent will become putrid, and the capacity of the beds will be seriously reduced by accumulations of sludge.

In 1899 the depth of one of the beds was increased to 13 ft., and was filled with crude unsettled sewage—once a day from February 27 to March 25, and generally twice a day from March 27 to October 9, except Sundays. The capacity rapidly diminished from 41 per cent. of the capacity of the empty tank on March 9, to 34 per cent. on June 8, and 28 per cent. on October 10, and the purification fell from an average of 53.3 per cent. for the first period to an average of 47.2 for the second. These unsatisfactory results led to a series of experiments, in which the sewage was "very roughly" settled in a wooden tank before being passed into the bed. From October 13 to December 22, 1899, the bed was filled twice a day, and from January 12 (when the capacity was only 31 per cent. of the capacity of the empty tank) to April 5, 1900, three times a day. The purification was 57.8 per cent. for the first period, and 52.2 for the second. The rough settlement of the sewage allowed the bed to treat a larger quantity than when the sewage was applied without sedimentation, and the degree of purification was also higher. A third series, in which the sedimentation was more thorough, did not produce a better effluent, but this was partly due to the fact that the bed was filled four times a day (except Saturdays and Sundays). The process of sedimentation was carried out in a tank, the passage of the sewage

through the tank occupying about five hours. The purification was 55.7 per cent. The air in the empty bed was tested, and the results showed that, "even in the case of the deep 13-ft. bed, the air at the lower part of the bed was not seriously deficient in oxygen."

Another interesting experiment with rapidly-sedimented sewage was also made. The whole of the sewage arriving at the Southern Outfall, during a period of three weeks (December 24, 1899, to January 13, 1900), was passed into settling channels 581 ft. long, along which the sewage flowed at an average rate of 7.4 ft. per minute; a portion of the sewage thus rapidly sedimented was then treated in a small coke-bed contained in a tank which had a capacity of 280 gallons. The bed was filled three times a day, and the liquid capacity did not diminish during the progress of the tests. The average purification effected by the whole process was 58.7 per cent.

All the experiments described above were carried out with contact-beds, but from November 7, 1899, to May 26, 1900, one of the old coke-beds, 4 ft. deep, was used as a continuous filter for the treatment of settled sewage. "Various methods of continuously feeding the bed" were adopted, but no details are given. The results were not satisfactory, and the quantity treated was not as great as by the intermittent system.

The last series of experiments at Crossness was begun on November 1, 1900, and differed from the others principally in the length of time allowed for the settlement of the sewage. One of the three brick tanks was used as a septic tank, through which the crude sewage was passed, each portion being about six hours in the tank. A certain amount of septic action took place, and the effluent was then treated in one of two contact-beds 6 ft. deep. The capacity of one of the beds was measured at intervals, and decreased gradually from 32.2 per cent. of the capacity of the empty bed on October 8, 1900, to 23.3 per cent. on January 21, 1901, the bed during this period having received four fillings a day (except on Sundays); on March 7, after a rest of seven weeks, the capacity had increased to 28.9 per cent., but on October 5, after receiving an average of two and a half fillings a day, it had decreased again to 24.2 per cent. The average purification was only about 54 per cent.

Among the conclusions based on the various experiments, the following may be mentioned:—That by suitable sedimentation raw sewage is deprived of matter which would choke the coke-beds, and the sludge which is deposited is reduced in amount by bacterial action to a very considerable extent; that the capacity of a coke-bed fed with settled sewage "fluctuates slightly, but undergoes no permanent reduction"; that the bacterial effluent from coke-beds fed with settled sewage "does not undergo offensive putrefaction at all, even in summer weather"; and that the use of chemicals is "quite unnecessary under any circumstances" when bacterial treatment is adopted. We have our doubts whether these conclusions can legitimately be drawn from the experiments at Barking and Crossness; experiments elsewhere

appear to us to have had some influence on the judgment of Professor Clowes.

We cannot pause to consider section of the Report which deals with the methods employed in making chemical examinations of the sewage effluents, and must only briefly indicate the suggested method of dealing with London sewage—namely, *first*, a preliminary screening to get rid of coarser matters only; *second*, settlement in detritus-chambers in which suspended mineral matter would be deposited; *third*, incipient septic treatment in tanks or channels for about six hours; *fourth*, aeration of the septic effluent, which "may be effected by allowing the liquid to fall through a perforated tray, so as to break it up into separate streams"; *fifth*, bacterial treatment in contact-beds.

Division II. of the Report is by Dr. Houston, and deals with the bacteriological part of the question, as distinguished from the chemical, which was discussed by Professor Clowes in Division I. I cannot review Dr. Houston's elaborate report in detail, but may repeat a statement that (in view of the results obtained from his tests) "until reliable evidence to the contrary is forthcoming the effluents from the bacteria beds should be regarded as hardly, if at all, safer in their possible relation to disease than the raw sewage before treatment." The italics are Dr. Houston's, but well to draw attention to a new note, in which he says that in his report he has confined his remarks "to results obtained with contact-beds at Barking and Crossness, and [has] not trusted these results, not with the bacterial processes, but with the results obtained from the existing chemical treatment at the Outfall Works." An effluent after chemical treatment "seemingly worse bacteriologically than the effluent from the bacteria beds, much more impure chemically, the inference is that the bacteria bed treatment is to be preferred." Dr. Houston therefore agrees with Professor Clowes in recommending the gradual adoption of the bacterial system for the purification of London sewage.

The third division of the volume contains tabulated information as to the bacterial treatment of sewage, either experimentally or otherwise, at different provincial centres, and eight short papers on the number of bacteria present in sewage and effluents, and on other related subjects, are given in an appendix.

The volume as a whole is interesting, but will not be as generally useful as reports issued by some of the provincial towns, such as Manchester. The London experiments were carried out solely for the purpose of ascertaining whether bacterial treatment would purify the sewage to a degree sufficient to prevent nuisance or danger arising from the discharge of the effluent into the estuary of the Thames. No systematic attempt was made to obtain the degree of purification required in the case of inland towns. Some of the experimental tanks and beds were makeshift character. Whether this is due to parsimony on the part of the Council or to the lack of an engineer's advice we do not know, but in any case it renders the experimen-

value. The tests of continuous sitters appear to have been entirely inadequate, and the results differ so much from those obtained in other towns that we are inclined to think that the methods adopted for feeding the beds were ineffective. It is certainly strange that this series of tests was concluded in May, 1900, and that no attempt has been made to test any of the apparatus designed during the last four years. We are not by any means convinced that the experiments as a whole are worthy of the importance and magnitude of the problem to be solved. No great harm will be done if bacterial treatment on the lines suggested in the Report is adopted tentatively for some portion of the cage, but, at the same time, the experiments ought to be continued, and an engineer may, with advantage, be appointed to work in conjunction with the chemist and bacteriologist.

THE NEW GALLERY.

THE New Gallery is at present occupied by the fourteenth exhibition of the Society of Portrait Painters. We have never been able to understand exactly what is the special object of this Society, unless to find opportunities for the exhibition of portraits which may not easily find room in general exhibitions. It does not specially represent the highest achievement in portrait painting, and certainly does not represent any guiding principle in the art; in fact (and this is perhaps one of its sources of interest) it merely serves to show how exceedingly various are the methods which may be employed and the aims which may be striven for in portrait painting, from the trait which is simply and obviously "likeness," to that which is just as obviously (in the artist's mind) an occasion for a study in colour or in the details of costume. Portraiture is capable, no doubt, of being regarded from all these points of view; the highest is that in which the portrait gives more than the outward semblance—gives a suggestion of the mind and character of the sitter, combined with a pictorial effect; but such portraits are among the rare productions of the greatest painters.

The special feature of the exhibition consists in some examples of the works of the late Herr Leubach. These certainly come under the head of portraits which are of intellectual interest as expressions of character; and they have moreover most distinct and remarkable qualities of style and execution, especially in the painting of the faces, in which modelling and expression seem to be produced by a kind of suggestion of brush rather than by any attempt at realistic execution. The most remarkable of them in this respect is the portrait of Moltke, in which the head is a masterpiece of characterisation. From the two portraits of Bismarck, one of them (that of Bismarck *en retraite*, his hands leaning on the top of his stick) well known through engravings, one may judge that Leubach, like some other great portrait-painters, was a shrewd critic of his sitters, and chose to convey his own impression of their character; perhaps to

a greater extent than the sitters sometimes realised, or would have approved if they had. In the two portraits of Bismarck be certainly, so to speak, sits in judgment on the great Chancellor; and it would not be difficult to conclude, from the evidence of the paintings, that he had more admiration for Moltke than for Bismarck. On the other hand, his feeling for colour is not unexceptionable. "Miss Peck and her Cat" (28) is a most remarkable picture in its way, the cat especially being a *tour de force* of brilliant execution (reminiscent of one of Millais' rabbit in a well-known girl's portrait); but the colour is yellow and unpleasing.

It is interesting to compare with Leubach's the portraits of another foreign artist, M. Gabriel Nicolet. No contrast could be greater. The Frenchman's portraits have not the intellectual force and interest of Leubach's; but they are examples of a style which is highly finished and consistent in every part, yet totally without hardness or mere prosaic realism. They are not the class of what we call "costume portraits" (of which there are examples in the gallery), in which the painting of the dress and accessories is the main interest, and apparently the main effort of the painter, and the face is of quite secondary value. M. Nicolet finishes every detail, but it is detail subordinated to the total effect, and every part treated in relation to that, and the greatest care is expended over the features and hands. These are not, it is true, what can be called powerful portraits; one cannot get rid of the impression of a certain "prettiness" of effect in them; but they are very consistent and highly finished works of art; none more so in the gallery.

The Society seem to have been obliged to depend somewhat on loans of old pictures; Burne-Jones' portrait of a little boy, "Philip Comyns Carr" (6) is an old friend, as well as some others. Among the most interesting of the new pictures—or what we take to be such—are Mr. W. Strang's "Portrait Study" (21)—apparently the head of Mr. Chamberlain, though not so stated—and Mr. Austen Brown's "A Musician" (34), really a study in colour, and a very interesting one, but the interest is certainly not in the head, which is a weak one and weakly treated. Mr. Richard Jack's "Woman in White" (33) belongs to the same class of studies of effect, in this case not of colour but of pose and composition of lines; a woman seated and nearly turned away from the spectator; a fine piece of drawing. Mr. Melton Fisher's portrait (38) of a young girl in a wide-brimmed hat seated in front of what may be called a Gainsborough landscape (indeed the whole picture is a kind of reminiscence of Gainsborough) is very graceful as a whole, but the face rather flat and deficient in modelling. Mr. Ellis Roberts's large full-length portraits of ladies are obviously and intentionally revivals of the old school of rather theatrical pose in the portraits of ladies, and for the present day have an air of unreality and affectation. Among others to be named are Mr. Collier's of Sir Charles Strickland (54), Mr. Kennington's "Miss Marjorie Close-Brooks" (72),

showing a charming head and admirable drawing of arms and hands; and a curious specimen of a full-length portrait by Corot (114): a very early work (we should imagine), a French lady in an astounding dress of the period. Perhaps Corot is the very last name that would occur to anyone on looking at it.

In the Central Hall is a collection of sculpture—not portrait sculpture except in a few instances—among which we are glad to see again Mr. A. G. Walker's beautiful group "Sleep," a nude woman and her infant, this time not with a sofa in front of it, as it was placed when exhibited (or concealed) at the Royal Academy. Mr. Derwent Wood exhibits a life-size bronze of "Dante at Ravenna," seated, with a symbolical group of Paolo and Francesca at his feet, and a line life-size figure of "Diana," described as a garden statue (plaster brouzed); a nude Diana, however, is not in accordance with the traditional presentation of the goddess of the chase, though we remember that Falguière has given a modern precedent for it. There are other interesting works, large and small, among the sculpture collection.

NOTES.

THREE important points are brought out in the report by Mr. Jackson, R.A., upon the condition of Bath Abbey Church. It will be remembered that during the early part of August last the central tower was attacked by lightning, and that Mr. Jackson was commissioned to inquire into the extent of the damage done. Fortunately this was far less than might have been expected, being limited to the upper portion of the south-east pinnacle. Referring to this portion of his inquiry, Mr. Jackson calls attention to the fact that the building is entirely without lightning protectors, and should be provided with a complete system of points and copper tapes in accordance with a scheme now submitted by him. We are really astonished to learn that the authorities have been contented to go on for so many years without taking precautions against lightning that are regarded as absolutely essential by all sensible men. The removal of the shattered masonry, however, revealed a serious structural defect, for it was found that the four pinnacles of the tower had been bonded with iron clamps, which, being exposed to climatic influences, had oxidised so seriously that in some places the clamps had expanded to double the original thickness, thereby causing a corresponding displacement of the masonry. Further examination of the building showed that the north-east pinnacle of the choir was in a particularly dangerous condition, the final having been broken across, and the two top courses displaced to the extent of 1½ in. on one side. This investigation serves to demonstrate once more the unsuitability of iron as a material for binding together stone-work, especially in exposed positions. All the pinnacles of the tower, and of the choir, will now have to be taken down and rebuilt with slate dowels and copper rods in place of the iron clamps and ties. A second structural defect discovered by Mr.

Jackson relates to the flying buttresses which, originally having no work to perform, were utilised by Sir Gilbert Scott for resisting the thrust of the nave vaulting added some thirty years ago during the restoration of the church. These buttresses are now being overpowered by the vaulting, and the walls are taking a perceptible outward inclination. Mr. Jackson considers it necessary that the walls should be shored at several points, and that the buttresses should be rebuilt in such manner as to afford adequate resistance. This is evidently a matter of extreme urgency, as the buttresses have been pushed out to a distance of some inches and are in imminent danger of failure. We cannot help feeling that the recent lightning stroke has turned out to be a most fortunate occurrence, for it has had the effect of directing prominent attention to three serious defects which, as decided as a public meeting held in Bath last Friday, are to be remedied without delay.

The Condition of Elementary School Buildings. THE Education Committee of the Anglesea County Council has addressed a strong circular to the managers of the "non-provided," or voluntary, schools in regard to the state of the school buildings, calling upon them to carry out all "the various alterations, improvements, and repairs" set out in the report of the County Surveyor. The County Council is doing good work in this matter, for every "voluntary" school building should be in a proper state before it becomes chargeable on the county rates. We have no concern with the general aspect of the Welsh education strife, but, as regards school buildings, the County Councils appear to be acting in a strictly legal manner, and the managers of the voluntary schools seem, on the other hand, to be shirking their legal obligations. We are inclined to think that there are a good many English County Councils who are letting the managers of voluntary schools escape their obligations. Bad buildings and insufficient ventilation are hindrances to proper education and conduce to illness and epidemics, and there can be no question that the County Councils should take care that all school buildings are up to a proper standard of construction and sanitation.

Manchester Water Supply. OWING to the extreme dryness of the summer and autumn of the present year, considerable anxiety has been experienced by the Manchester Water Committee, who have found it necessary to restrict supplies for several weeks past throughout the city boundaries. Very little water is left in the Longden Dale reservoirs of the old waterworks which are still used to supplement the Thirlmere supply. When we saw these reservoirs two or three months ago the water level was very low, and it has since fallen so much that the total storage is barely sufficient to supply the inhabitants of Manchester for eighteen days. Under these circumstances much satisfaction must be felt in that city that the second pipe line from Thirlmere is at last completed and in operation. The conduit in question was designed to carry an additional supply of from ten to twelve million

gallons daily. Its completion at the present time is most opportune, and it is clear that the Corporation were well advised in commencing its construction at a sufficiently early date.

Defacement of the Victoria Falls. ONLY a few years back the Victoria Falls were scarcely known, even by name, to the bulk of the English people. To-day almost everyone has heard or read of them, and since the opening of the railway in June last they have been visited by tourists and travellers from various parts of Africa, Europe, and America. We need not call to our aid the characteristic phraseology of the guide-hook for the purpose of reminding our readers of the magnificent scenery to be found at this part of the Zambesi River. Suffice it to say that the vicinity of the falls affords a series of pictures, each with its peculiar charm, probably unrivalled in beauty by any others in the world. The advance of civilisation into such a scene need not be regretted if the enterprising builders of railways, power stations, hotels, and other structures can be persuaded to keep the evidences of their activity somewhat in the background. The first intrusion was the steel bridge, now well on its way towards completion. In itself this structure may constitute no actual disfigurement, even though it will serve to suggest the presence of man in a place where Nature requires no artificial adornment. But the accompaniments of the bridge must be particularly objectionable, comprising as they will ugly embankments of red earth, signal-posts, and numerous unsightly accessories. Already a large hotel of timber and galvauised iron has been built close to the falls, and another of greater dimensions is threatened. What may happen when the utilisation of the falls for power is commenced we do not venture to predict, but unless a strong protest is made by the public against the further disfigurement of a place that will in due course become one of great resort by lovers of Nature, it is highly probable that the Victoria Falls will suffer severely under the ruthless hands of purely commercial pioneers.

Stability of Retaining Walls. IN a paper read before the Association of Yorkshire Students of the Institution of Civil Engineers, and now issued in pamphlet form, Professor Charnock considers the stability of retaining walls in relation to the overturning action of earth pressure. Various formidable mathematical processes have been devised for dealing with this point, but there are only two fundamental theories, both of them defective as generally enunciated. After pointing out the limitations of these two theories, due to Coulomb and Rankine, respectively, the author refers to a very simple construction published by Reblanu, of Vienna, for determining the position of the plane of rupture for any given inclination of the back of the wall, and for any slope of the upper surface of the earth supported. He discusses also an extension of this method, by Professor Haseler, of Brunswick, which has been largely adopted on the Continent with satisfactory results. Some further

modifications are suggested by Prof. Charnock, who gives full details of proposed method of procedure in pamphlet. Among modern research on the direction and magnitude of earth pressure, one of the most important mentioned by the author is the series of experiments conducted by Prof. Douath in 1891. These experiments, which were conducted with great care and accuracy, serve to show that Rankine's theory is not applicable to the case of a vertical wall with the upper surface of the ground horizontal, and that the magnitude of the earth pressure calculated by Rankine's formula, is at least 30 per cent. in excess of the actual pressure, whereas Coulomb's theory, due recognition be made of friction between the earth and the back of the wall, gives a value only about 6 per cent. in excess of the correct value. A calculation example in this paper shows that the method advocated by the author gives a result very nearly coincident with that afforded by actual experiment, and suggests its usefulness as a check on the empirical methods now generally adopted in practice.

Street Lighting in Manchester. MR. S. L. PEARCE, electrical engineer to the Manchester Corporation, presented a Report to the Electric Light Committee, which is of more than ordinary interest. The old arc lamps in Manchester have recently been replaced by new ones, and this has not only improved the street lighting, but has effected a considerable reduction in the cost of electricity consumed. The new lamps burn 120 hours without requiring new carbons, and it is stated that they give a uniform and steady light. A very extensive series of tests was made with a portable street photometer at a height of 4 ft. from the ground. The results are given in candle-feet, a candle-foot being the illumination produced by a standard candle at a distance of 1 ft. The illumination produced in ordinary street lighting varies from 0.03 to 1.5 candle-feet. An illumination of 1 candle-foot is considered to be of very good quality, and of 1.5 candle-feet very good. A maximum candle-power of a "standard" arc lamp was found to be 1,150, and of three burners in a lamp using intensified gas 525. It was found that the mean illuminating effect produced by the arc lamps was 2.03 candle-feet, as against a mean effect of 1.5 candle-feet produced by the intensified gas burners. The minimum illumination produced by the arc lamps was 1.08 candle-feet against 0.76 for the intensified gas burners. Interesting curves are given in the Report showing how the illumination varies at different distances from the lamps. The cost of 1,000 candle-power for 100 hours is given as 18s. when intensified gas is used, and 12s. 6d. when electric arc is employed. The distribution in each case is taken as 10 per cent. and the prices are the actual ones of the Corporation. Both the gas and electricity are very cheap, the cost of the latter being taken as 0.95d. per unit. It seems to us that Mr. Pearce's figures give a very fair comparison between the relative costs of the two systems of street-lighting in Manchester. It should be remembered, however, that too

ence must not be placed on photometric measurements even when only comparative comparisons are given, as the intensity of the light emitted is so different in the two cases. The distribution of light is better in the case of the electric arc. The Report would have been more interesting if it discussed the relative merits of arc lamps and Nernst lamps, as, in our opinion, the latter are very suitable for outdoor lighting.

ACCORDING to an estimate made by Mr. J. Arthur Reeve, a sum of 6,000*l.* is required for a reparation of the parish church. The buttresses of the tower, north clearestory wall, and the roofs need speedy attention. A restoration of the fabric was begun by Street in 1850. The Hoo chapel on the east side of the south transept was renovated in 1851. The east wall was decorated with a mosaic, and a reredos in mosaic by Street, representing the Last Supper, was set up. St. Mary's, one of the best of our country parish churches, built for the most part during the thirteenth and XIVth centuries, is cruciform in plan; and the massive and lofty western tower is constructed of flint and other materials laid chequer-wise; it has hexagonal buttresses, with doubled buttresses rising in stages and enriched in their upper parts with canopied niches. John de Beaufort, Abbot of St. Albans, was the patron of the church in the thirteenth century. The chancel *temp.* Edward IV.; the west tower and the south transept are of the reign of Henry VI., and contains the altar tomb of William de Wenlock, Bishop of St. Paul's and rector of St. Andrew's, Holborn, 1392. There are many interesting brasses of the period of the sixteenth century; the font stands within a double stone canopy or baptistery, decorated with the figure of the Virgin Mary. The canopy, of Anne Boleyn. The canopy is hexagonal on plan, has on each side an open arch surmounted with a crocketed gable filled with tracery and ending in a finial. Between the arches are slender buttresses merging into pinnacles; the ground is embellished with allegorical figures. The canopy, formerly gilded, is 20 ft. high, and has an internal diameter of 9½ ft. Whilst many of that kind are not infrequently seen in this country are the one at Trunch, in Norfolk, and the one at Trunch, containing the font, on the north side of the choir of Canterbury Cathedral, and there is some doubt whether the latter was originally intended for the purpose. The church measures 100 ft. by 57 ft., the transepts extending 20 ft., and contains 2,500 sittings.

NEXT week will be offered for sale, at the Mart, some relics of the church, containing the carved oak reredos or altar-screen 21 ft. by 12 ft., attributed to Gibbons, some oak-panelling, and carved fittings. The church was founded in the winter of 1883-4, and down of the benefice with the benefice of St. Vedast, Foster-

lane, and St. Michael-le-Queene. It was built in 1685 at a cost of 2,301*l.* 8s. 2d., after a simple design commonly ascribed to Sir Christopher Wren. The tower, of brick, rose in three stages to a height of 74 ft.; the body of the church, measuring 60 ft. by 33 ft., had a plain flat ceiling slightly coved at the sides. The east end, of stone, presented a row of six circular-headed windows, resting upon a lofty stylobate, and surmounted with a bold cornice and a balustrade. With the proceeds of the sale of the site and materials was built the church of St. Thomas, Finsbury-park, after Ewan Christian's designs; the carved oak pulpit, also the reputed work of Gibbons, was removed to St. Peter's, Fulham. The Myddelton family lived in the parish for a century or longer; amongst the many entries relating to them in the registers is one of a burial—"1631 December 10, Sir Hugh Middleton, Knight." Sir Hugh, who was made a baronet in 1622, was interred there in accordance with a direction in his will; he was knighted on the opening of the New River at Islington in 1613.

THE tenth annual exhibition of pictures of the English school, at Messrs. Agnew's Exhibition gallery, does not include any works so remarkable as those we have seen at some previous exhibitions there, but there are of course some very good pictures. There is Hoppner's portrait group of the Countess of Darley and her daughter, in a kind of theatrical cottager's make-up, but a very fine picture both in design and colour; Raeburn's Miss Ross of Balnagown, in the "grand" pose which was affected in aristocratic portraiture of the time, effective in its way, though it would be laughed at now; Gainsborough's fine half-length portrait of Miss Walpole, and "A Mountainous Landscape" by the same artist, in the old school of classical landscape, which, like the posed portraits, is rather *passé* now; and a portrait of Lady Milnes by Romney which is more powerful and full in colour than Romney's usual style, and in fact recalls Rubens. A "Wooded Landscape" by Crome is interesting not so much in itself as in the fact that it shows us an unusual side of Crome. Among the most interesting things in the gallery are Morland's two well-known little pictures, "The Farmer's Visit" and "The Visit Returned," which seem to bring us into the atmosphere of "The Vicar of Wakefield."

The Leicester Galleries.

At the Leicester galleries is a small collection of paintings by Mr. Lavery, the *raison d'être* of which is the exhibition here of his very charming portrait of a young lady carrying a great bunch of hawthorn blossom, formerly exhibited at the new gallery under the title "Spring," and now, we are glad to hear, to be placed in the Luxembourg. One can readily understand that it is a picture that would greatly recommend itself to contemporary French taste in art—which is saying much, but not everything. The rest of the works exhibited are small sketches and studies in oil, many of them very interesting, especially

two or three of "Ranelagh," and two or three heads all entitled "Mary," but under different numbers.

A New Knight.

We congratulate the Government on having at last done themselves the credit of

giving some recognition to an architect who has occupied for some time what may be called an exceptional position among contemporary architects, in conferring a knighthood on Mr. Webb, who is henceforth Sir Aston Webb. The honour is somewhat tardy, but it is an indication that the Government are at last awaking to the fact that there are architects who are worth honours, as well as politicians and Government officials.

MAGAZINES AND REVIEWS.

THE *Art Journal* commences with an article on Amersham by Mr. W. Monk (who has lately gone to live there), illustrated by many sketches which are equally interesting for their subjects and their admirable execution. The last one, "An Amersham Well," shows a most picturesque old timbered interior. Amersham street, with its quaint old market-house (of which there are separate sketches), fills the page over the heading of the article. A short article on Blake comments on the fact of the simultaneous exhibition in London of Lawrence's pictures at Burlington House, and Blake's at the small Curfax Gallery. What a contrast between the painter of Society and the painter of visions and ideals! Lawrence had the large and popular galleries of the Academy, yet what is his value to the world compared with Blake's? Albeit that there is—we cannot deny it—a strain of lunacy running through most if not all of Blake's work, yet is his lunacy a better and a higher thing than the drawing-room sanity of Lawrence. Etapes and its neighbourhood is the subject of an article and some good sketches by M. Gwit-Jolley. The Christmas Art Annual issued by the *Art Journal* publishers is devoted to the works of Mr. Boughton, a painter of many pleasant if not very strong pictures. Among the illustrations given here of his work are some which are in a more powerful vein—"A Village Below the Sandhills" for instance. During the last few years Mr. Boughton has taken to a class of subjects more idealised and imaginative than he painted in his earlier days; of these, "The Dark Waters of Forgetfulness" has a great charm. "The Tanagra Dance" is given in a colour print, in which form it comes out well enough, though the colour impression is rather at variance with our recollection of the original picture.

The *Nineteenth Century* contains a very interesting article on "Motor Traffic and the Public Roads," by Sir Walter Gilbey. A considerable portion of the article consists in a summary of the history of English roads in their different stages, from the time when the pebbly bed of a stream was selected by horsemen as affording the firmest ground, and when the main road at best was but a bridle-track, to the roads of Macadam and Telford, whose system of structure has, however, only been applied in the country to main roads, a number of country roads still remaining which have no "bed," and are unfit to bear heavy traffic. Sir Walter is adverse to the motor on ordinary roads, and points out that many country roads at this day are so narrow that ordinary vehicles have to pass each other at a walk for safety, and that the fast motor on such roads, with the increased width of build which is threatened, would practically close them to all but pedestrians; and, we may add, how are the motors of increased width even to pass each other? The relaying and widening of many roads will be a necessary preliminary to the extension of the use of motors. In regard to the question of speed, the writer observes that the argument of motor-builders seems to have been that as they can build motor-cars that will run at sixty miles an hour, therefore twenty miles an hour is a very moderate speed; whereas the question of maximum speed is one which should be decided, not on the capacity of motors for fast travel, but on the character of our high roads, and the use made of them by the public. He points

out, too, the important difference between fast motor racing on the splendid French high roads, "sixty feet in width, and running straight as a railway for miles," and the narrow English roads, "seldom running straight for a furlong" (that is a little exaggerated), and often having high banks or hedges, which prevent a sight of what is coming round a curve. The article is an eminently logical and sensible one, and very interesting reading as well.

The same issue includes an article on the "Exhibition of Early Art at Siena," by Mr. Langton Douglas, who has made the art of Siena a special study. The article is mainly concerned with the study and criticism of special works shown at the Siena exhibition. Mr. Douglas concludes by expressing a hope that this exhibition may lead to the formation at Siena of a permanent art museum illustrating the history of the sculpture of Siena and her triumphs in the minor arts.

In the *Fortnightly Review* Mr. W. M. J. Williams gives a summary, larding with figures, of the conditions of "The Transfer of the London Water Companies." We have neither time nor space to follow the writer through his figures. He is no doubt right in saying that the Metropolitan Water Board has a formidable task before it—more formidable than is perhaps at present realised; but we think he underrates the quality of the present supply. On the whole, London is supplied with wonderfully good water, considering the nature of its principal sources. It is quantity rather than quality that is deficient; and there is little doubt that, if the increasing requirements of the London public are to be supplied, the new Water Board will have to look for additional sources of supply beyond those at present available. We may add, as another reason, that it is highly desirable that the limit of the amount allowed to be abstracted from the Thames should be curtailed. To the same issue Mr. H. M. Paull contributes a short article on "The National Art Collections Fund," which has been formed to provide if possible, means for securing for this country works of art which otherwise, through the indifference and parsimony of our Government in such matters, would be lost to the country, as many desirable works have already been lost. We entirely agree with Mr. Paull that our National Gallery is "ludicrously deficient in pictures of the French School"; in fact, it would seem that the very existence of a French School has been all but ignored in the make-up of the collection. The roll of membership of the Fund has now reached nearly 500 names, including, we are informed, "the Directors of all the Museums and Public Galleries, many art-critics and experts, persons interested in every branch of art, and representatives of all ranks and professions." It is to be hoped that the efforts of the Fund may be successful in securing the purchase of works which might otherwise be sent out of England, as has been already the case in so many instances.

Harper includes a short article by M. Flammarion on the much-veiled and (we think) insoluble question—"Are the Planets Inhabited?" He sums up in favour of this conclusion, but on no scientific reasoning; the article, in spite of its coming from such an eminent astronomer, is one more of the fanciful reflections on the subject that are so common; the argument really only amounting to this—it would be so delightful and interesting to think that other planets are inhabited; therefore let us think so. An eminent novelist, Mr. W. D. Howells, in the same issue writes an article on the attractions of Folkestone—"In Folkestone out of Season"; attractions which we had not, we confess, been conscious of, but one never knows what scenes, in this country, will call forth the admiration of an American visitor. But as a matter of literary style it is a charming article.

An article by Dr. H. Smith Williams, on "Some Greek anticipations of modern Science," deals with an interesting and rather new subject, and shows how far some of the Greek thinkers and observers of two or three centuries B.C. were in advance of mediæval perceptors on the subject of the universe.

In *Scribner* Mr. Eaton's paper on the Royal Academy is concluded, and is a very interesting one, from its illustrations as well as its matter. One or two examples of letters received by the Secretary are delightful. Under the "Field of Art" Mr. Ransell Sturgis writes a paper on "Grass and Trees in Towns," in the course of which he objects to the present schemes in regard to Washington Park and the surroundings

as too formal and grandiose, and wishes for a less formal park, "laid out for the comfort and delight of the inhabitants of Washington." This is, apparently, one of the first notes of a reaction against the formal garden. As respects the Washington scheme, at all events, we cannot agree with it; the capital of a great country demands a stately treatment in its surroundings.

Longman's Magazine contains an article by Dr. Farquharson on "The House of Commons from the Inside," mostly of course, political and social, but to which we call attention in consequence of the testimony given by this member of the House of Commons, who is also a medical man by training and profession, in regard to the ventilation of the building, about which such exaggerated complaints are made from time to time. We have always maintained that these complaints are in the main either those of faddists or of nervous or discontented persons who must always have some grievance or other. This is Dr. Farquharson's testimony:—

"Every year, just before the meeting of Parliament, an agitation is started during the 'silly season,' when journalistic material is running short, about the ventilation of the House of Commons. It is the most all-embracing microcosm, and those who have never sat on the green benches gravely inform those who do that their health must seriously suffer from living in such an unhygienic atmosphere. Fortunately for the most credulous among us, this subject has been most carefully threshed out before three Parliamentary Committees, on all of which I sat, and which gave, on the whole, very encouraging reports. The situation of the Speaker's lobby is hardly to be doubted, for it is on the banks of a sluggish tidal river, the air from which must be relaxing in quality, and now and then broad reaches of slushy mud would soon to challenge the attention of the sanitary inspector. No doubt, in the Strangers' Gallery, and that study hole the ladies' case, and the quarters allotted to the fourth estate, the atmosphere, gas-heated, and breathed and rebreathed by crowds of legislators, can hardly be regarded as typically breeding. But down below, where we sit, it is wonderfully fresh and free from the faded stuffiness which makes itself painfully obvious in every other large public building with which I have any practical acquaintance, and the evidence of experts, taken before the House of Commons Committee, confirms me in my belief that, considering the sources of supply, the artificial methods of ventilation, the foreign material carried in by members' boots, and blown about by the currents of wind streaming through the perforated floor, and the habitual overcrowding of the House from time to time, the air is wonderfully pure and good, and cannot do harm even to the most lazzini legislator."

In the *Antiquary* we have the second portion of Mr. Bailey's article on "The Wynne Brasses at Llanwrst," the second illustration showing a remarkable and unusual example of a brass in an exceedingly florid style of rococo decoration, surrounding a realistic half-length portrait. Mr. Stevking's article on "St. Hild and her Abbey at Whitby" is a tribute to the memory of one who, even from the somewhat vague tradition history, was in her day a great spiritual power.

Good Words includes an article on the picturesque subject, "Sussex Striles and their Surroundings," by Mr. J. Harris Stone. The Sussex stile, however, according to the author, seems to lack decisive local character, and to be in fact of a very varied physiognomy:—

"Some are made of odd pieces of old wood—if near the sea, of wreckage. Others are constructed with concrete steps evidently made like a pudding in a zinc pail and turned out. Others again are made over flint-peg walls, by cutting away a portion of some 3 ft. run, lowering it by some 2 ft. and smoothing over the top of the indentation with cement. These latter are characteristically Sussex, and pebbly walls being naturally at least a foot thick, are not the easiest form of stile to surmount."

Notices on some other periodicals we are obliged to defer till next week.

SOCIETY OF ARTS.—The Society of Arts will commence its fourth half-century on the 16th, when Sir William Abney, as Chairman of the Society's Council, will open the 151st session with an address. The subjects on which papers will be read at the meetings before Christmas include British Trade, Canals, the St. Louis Exhibition, Patent Law, Burma, and Street Architecture. There will also be a course of lectures on wind instruments, with musical illustrations.

WESLEYAN SUNDAY SCHOOL, COTTINGHAM, NEAR HULL.—The new Sunday school in connexion with the Wesleyan church at Cottingham was opened on the 3rd inst. The architects of the new premises are Messrs. Gelder & Kitchen, of Hull, and Mr. F. Bilton, of Hull, was the contractor for the erection. It is a red-brick building, with stone facings. The interior consists of a schoolroom in the centre, which entrance is a gallery, of pinewood. Above the side are four classrooms, two of which open out of the upper gallery.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

The first Ordinary General Meeting of the Royal Institute of British Architects was on Monday evening at No. 9, Conduit-street, Regent-street, when Mr. John Belcher, A. President, occupied the chair.

The minutes having been taken as the following gentlemen were formally elected for the first time since their election: Mr. Frank Dicksee, R.A., Hon. Assn. Mr. H. L. Goddard, President of the Leicester and Leicestershire Society of Architects; Mr. John Keppie, President of the Glasgow Institute of Architects.

Statutory Examinations.

The Secretary, Mr. Locke, announced that the Statutory Examinations, held at the Institute on October 20 and 21, nine candidates were examined and the following passed: Mr. Percy John Black, Lambourn, Clayham, S.W.; Mr. John Moir Kerr, Railway-approach, London-bridge, S.E.; John Todd, Billericay, Essex.

He also read a list of gentlemen nominated for membership in the various classes.

Deceased Members.

Mr. Alex. Graham, Hon. Secretary, he had to announce the decease of members since the last meeting, *i.e.*, R. Freeman, of Manchester, Fellow, elected F. Manoah Kent, of Natal, Fellow, elected last March; Arthur Green, Fellow, 1879; P. W. Barrett, of Cape Colony, Assn. elected 1888; E. Simm, of Canada, Assn. elected 1902; W. Henry Arber, Assn. 1878, Fellow 1893; E. Baldwin J. Knox, Assn. elected 1877; J. Lewis Thomas, Hon. Associate, elected 1897; and Mr. Kerr, Fellow, elected 1857. Professor was a very conspicuous practising architect and as one of the founders and the first President of the Architectural Association he drew their gratitude for having initiated a movement that had been attended by such very success, especially in recent years. Mr. Kerr was a constant attendant at the meetings of the Institute until his health broke a few years ago, and he was one of those who was very enthusiastic in all he took to. On some occasions it might have been said that the Professor was a little too aggressive in some of the things he said in debate that was perhaps due, as was the case with many men of similar character, to a strong and very earnest thought, and beneath there was an under-current of good-will and good will towards everyone; and who knew him well realised the earnest motive in everything he took up. The profession was indebted to Professor for many things. Quite apart from his connexion with the Architectural Association the Institute was indebted to him a suggestion to found the Standing Committee of Art and Literature and Science and on those committees, as most men who aware, had done great service for the Institute; they had been indirectly great benefit to many members in all parts of the world, and they had also together hundreds of the members met to discuss matters of great importance not only to the Institute but to the public. In regard to the Architectural Association, which had just achieved marked success, he hoped that when it was written, a prominent place would be given to Professor Kerr as one of the pioneers of architectural education in this country (the speaker) desired to move a resolution which he knew would be accepted by a member of the Institute, that a letter to the relatives of their deceased sympathising with them in the loss sustained, and expressing the full approval of the Institute of the many services rendered by the late Professor Kerr during his life and of an active career in the cause of art and architectural practice.

The resolution was then silently agreed to.

President's Address.

The President then read the following address:—

COLLEAGUES, LADIES AND GENTLEMEN.

It has been the custom of the Institute as I dare say you all know, for the President to open the new session with an address in review the important events of the last session, and also to say a few words

existing condition of our national architecture as a whole. Before entering upon a task I desire to thank my colleagues for honour they have done me in electing me resident—an honour which, coming as it from my brother architects, I am sensible peculiar distinction. It is not without a feeling that I enter upon my duties, for the responsibilities attached to the office, I know how difficult it will be for me to discharge as President of such exceptional qualifications and ability as my predecessor, Mr. Aston Webb. We all recognise and appreciate that Mr. Webb has achieved during his office, but his colleagues on the Council know how greatly his work has been to the advantage of the Institute. His artistic attainments, his genial manner and ready tact secured for him the widest popularity and success of the President's "At Homes," inaugurated, has been most marked. We have afforded opportunities for social intercourse and the exchange of ideas, and on occasions on which the experience of riper years has been readily placed at the disposal of younger brethren. The designs and sketches also, which have been exhibited, proved both attractive and helpful. I hope, therefore, by your favour, to continue pleasant gatherings, from which "My Nicotine" will assuredly not be banished. Turning to matters of more general architectural interest, the past year has been distinguished by events of unusual importance. The laying of the foundation-stone of the Cathedral of Liverpool—probably the most Gothic cathedral to be built in our days—a unique occasion, and its significance recognised by His Majesty the King in attending the ceremony. The greatness of the work and the importance of the city, combined with the desire of the citizens that the work of their faith should dominate this centre of commercial enterprise, mark it as an event in the history of architecture but in our national life, and one which should materially improve the lives of the toiling masses. We have watched with interest every stage and every step in the growth and development of this important building. In the genius of Mr. Scott, who has inherited the traditions of a talented family, and in the supervising of that most learned and profound exponent of these methods, Mr. Bodley, R.A., we have assurance and guarantee that the beauty and excellence of the work will be complete. Another great undertaking which has been undertaken is that of the Memorial to our late Queen, designed by Mr. Aston Webb. Already the outline of the new road in the Mall, with its avenues of trees and approaches to the Memorial, is complete, and has been greeted with approval and commendation. The points which mark the points of divergence in the several roads and avenues show how well these are set out. Not only are the existing approaches—with Constitution Road brought into unity, but they are so arranged as to open up new vistas. At one point, for instance, a fine open turfed way leading across the Green Park will be viewed through elaborate iron gates and piers with effect. Mr. Webb has certainly made the most of his opportunities, and when all his plans, including the arching, is completed we shall anticipate a result of which we shall be proud. The present unfinished aspect of the work from which the main architectural features are lacking, can give the public but a faint idea of the beauty and harmony of Mr. Webb's entire scheme. In this connection I must say that the very commonplace exception taken, to which so much exception has been taken, are only temporary, and will, I soon be replaced by others specially designed by Mr. Webb himself.

The Indian Memorial to the Queen has also been taken in hand. Owing to the nature of the site chosen the foundations for the superstructure designed by Sir William Emerson have met many difficulties, which, however, have been overcome by methods of considerable ingenuity. We shall look forward to having the plans and description of this interesting building before us in due course.

The contemplated extension of the British Museum—so long needed—has been entrusted to J. J. Burnet, whose excellent Greek work so fully entitles him to this distinction. Amongst the events of the year must be remembered the bestowal of the honour of Knighthood on our colleague, Sir Henry Tanner, whom we sincerely congratulate on so well-deserved

a reward for his eminent services. A proof surely, this, of the awakening interest and increasing regard which our beloved art is beginning to inspire in the minds of those in authority.

Before passing on I desire to remind you of the great International Congress of 1906, which, as you are aware, is to take place in this city. The necessary preparation and organisation for this important event are already well in hand, and will continue to occupy the attention of your Council. I have the honour formally to announce that Sir King has graciously consented to be the Patron, and the Prince of Wales the Honorary President of the Congress. The occasion will be in the highest degree interesting and important—fruitful, too, we may well hope, in opportunities not only for advancing the true interests of our art, but also for drawing public attention to its value and importance as a factor in our national life and education.

It is to this end that our Institute should always be directing its efforts. We are something more than a Trade Union—we are a corporation whose members are called to rise above the differences which so often distract the artist, and to act harmoniously as from one centre, to the end that Architecture may flourish as a fine art. The Institute's growing influence brings, of course, distinction to its members, which distinction, however, must be honourably earned—won, in fact, by force of merit rather than demanded as a right. The increase in our numbers gives proof of vitality and vigour, but this involves greater responsibility, and an obligation to let the audacity of youth give place to the growing caution and dignity of maturer years and riper experience. We may, perhaps, differ among ourselves as to the true line of advance, but we are all, I believe, actuated by the same loyal desire, and all ambitions to see the Institute firmly established in the honourable position it has earned. We must see to it, then, that the foundation is secure before we attempt to add to the superstructure. We must, in other words, know something of our limitations as well as of our influence and power, bearing in mind the old lesson of the nut and the nutcracker—if the crackers are not strong enough to crack the nut, the nut will assuredly be hard enough to break the crackers. The purpose and work of the Institute are not limited to the great metropolitan interests. Unlike the Allied Societies which are represented on its Council, and which are mainly concerned with local and personal matters, the Institute as a corporate body has a duty towards the whole profession, and its Council, in weighing the many difficult problems that come before them for solution, have to remember this greater responsibility, this more extended obligation.

Registration.

One such subject before the Institute at the present time is the question of Registration. Registration is apt to be somewhat hastily regarded as a panacea for all ills, so that the very sound of it breathes comfort, like "that blessed word Mesopotamia" in the story of the old lady and the sermon. The simplicity, however, of the operation or process of registration must not be taken for granted. A clear definition of its practical working and effect will, no doubt, be elucidated in time; but as this is the task upon which the Committee specially appointed by the General Body are now engaged, I feel it would be better for us discreetly to keep silence until they have reported upon it. Moreover, as there is considerable diversity of opinion, it will be well to hear both sides before coming to a decision.

Architectural Education.

There is, however, one matter, affecting both ourselves and the Allied Societies, upon which we are all agreed—viz., the special education and equipment necessary for an architect. Some carefully-devised scheme of training is in reality that proper foundation to which I have alluded, and must have precedence of all other claims upon our time and attention. I congratulate the Institute that during the past Session an efficient "Board of Architectural Education" was established. This scheme was brought before you by my predecessor, under whose able guidance it has come to fruition, and I am glad to inform you that Mr. Webb will continue to act as Chairman of the Board. The distinguished men who are associated with him are in themselves a sufficient guarantee that the result of their labours will be far-reaching and beneficial. Several meetings of

the Board have already been held, and the business in hand is far advanced. Their scheme will shortly be before you and, I hope, in active operation before long.

The Public and Architecture.

Another cause for congratulation is the growing interest of the public in architecture—an interest evidenced in a variety of ways. It is obvious that side by side with a more systematic training of the architect, some attempt should be made to educate the public. At the very least we might set before them fundamental principles and elementary axioms, that they may know what to appreciate and what to avoid. This might be partially accomplished by lectures in the large cities and towns, under the patronage of the local authorities; also by the distribution of short papers or pamphlets on the subject for the use of schools, art teachers, and others. Unfortunately, at our great centres of learning, which should have given a lead in this matter, the study of architecture has been made subservient to archaeology; it has been a handmaid to other interests rather than a queen in its own right. The result is only what might have been expected—viz., that architectural work of all sorts, good, bad, and indifferent, has been judged and appreciated (or the reverse) not upon its merits but according to its antiquity. Archaeology has thus been an unconscious cause of the decay of architecture as a living art. But, it may be asked, are not the technical schools educating our people in a knowledge of architecture? Scarcely. They impart a knowledge of the methods and science of building construction, but what is needed by the general public is not so much a technical knowledge as a discriminating taste moulded and set upon elementary principles, a discrimination which will enable them to approve what is excellent and reject what is inferior. In the XVIIIth century the education of a gentleman was not considered complete unless he had acquired some knowledge of the rudiments of architecture, and a refined taste in the appreciation of its beauties. Too often, it is true, the dilettante thus inspired attempted to express his ideas without the aid, or with only the partial aid of the professional architect, and fell into the many errors and mistakes into which a little learning is always so apt to betray a man. Such rash experiments are to be deplored, but the interest in and appreciation of art which prompted them is one of which we might well seek to revive.

In this good cause I believe the power of the Press may be reckoned on. In an admirable and interesting article in *The Times* of 3rd September last, from which I should like to quote more fully, the writer, after stating that every Town and County Council is making effort to establish some kind of technical education among the people, adds: "The want of such an education in England, and of a rudimentary knowledge of design, has been matter of complaint during many generations, but until quite lately the complaints have fallen upon deaf ears." Again, after drawing attention to the general neglect of decorative artists in the past, who had to abandon their art because there was no demand for it, he writes, "Things have changed a good deal in the last forty years, and there is now, at least, no want of schools of art or of the encouragement that is given by an enthusiastic, if rather uninformed, public opinion." It is this uninformed public opinion which is the difficulty and the danger, and I hope a committee of the Institute may be appointed to consider the subject, and to suggest something that may be done by way of remedy.

L'Art Nouveau.

In these days, supply (of a sort) follows hot-footed upon the heels of demand, and the quickened public interest in art was promptly met by the abominable affectation (I should like to use a stronger phrase) of what is known as "l'art nouveau." A new art forsooth! A pernicious trick easily acquired and applied alike to buildings or jewellery, furniture or dress; no matter what the nature of the material, whether iron or wood, stone or glass, all alike twisted to curves representing the final stages of vegetable decay and animal decrepitude, in defiance of all true principles of construction and beauty. In *The Times* article I have quoted from, an incident is related of an intelligent French workman who, passing through a museum with an Englishman, after contemplating a Riesever cabinet, turned to an "art nouveau" chair (alas that it should have been there!), and delivered his soul as follows:

"In the old days they had ideas; but as for this chair—well, it is the art of fools suited to an age of fools." In correcting such false ideals as "l'art nouveau" holds up to the public admiration, the Press can render powerful aid, but we must do our part also by supplying principles to direct and mould the taste of the people in matters architectural.

Public Authorities and Architecture.

Fortunately, the County Councils and other public bodies acknowledge the advantage to the community of these artistic influences, and are able to their importance in trade and commerce, but have they ever yet regarded them from the point of view of the public health and morals? If legislation is necessary on sanitary matters that the public may be protected from insidious poisons conveyed through the senses of smell and taste and touch, may it not be equally important to protect the sight? Environment insensibly influences the development of all forms of life, and it cannot be doubted that the squalid conditions, horrid forms, inharmonious colours, and injurious sights amongst which such a large proportion of our urban population spend their lives, contribute their quota to the sum total of degenerate moral tendencies of which recurring acts of crime are the inevitable outcome. Even the untrained have sensibilities to be shocked and blunted, and if the effect of a gloomy and monotonous environment be bad, what shall we say or think about the cumulative moral effect of those wildernesses of mean streets and horrid buildings by which our great cities are disfigured? There must be no concession to what is bad or even mean in architecture if a healthy and manly condition of the people is to be maintained. This aspect of the functions of good architecture should be considered by the authorities who watch over the needs of the community.

And may it not be that many who do not live in mean streets are yet suffering, perhaps unconsciously, from the conditions by which they are surrounded in the public thoroughfares, their senses assailed by a multitude of petty annoyances amounting in the aggregate to a heavy burden from which they would fain escape? It is a well-known fact, for instance, that an ill-designed building looked at suddenly will cause an involuntary shudder in a man with a trained eye, while certain bad forms as well as bad smells will produce a feeling of actual nausea. Any and every enticement of the senses, in opening up hitherto unknown avenues of delight, brings with it also increased discomfort, for it reveals defects of which we were formerly unconscious. All forms of knowledge have this or a similar drawback. Rudyard Kipling puts it from the moral side in a very telling form when he makes our friend Tommy Atkins sing the praises of some place he had discovered (Was it Mandalay? At any rate it was "east of Suez"), "where there ain't no bloomin' ten commandments," or words to that effect. But seeing that we have our ten commandments, or our canons of art, as the case may be, our moral principles and our artistic tastes, every violation of which brings its fore-ordained penalty, surely we may look to the authorities to defend us from all the hideous sights and sounds and smells which force themselves upon us in our public thoroughfares, whether urban or suburban.

Architects and Buildings.

The object which business-men have in view in choosing or designing or rebuilding the frontage of their premises is to arrest the attention of the passer-by. To catch the eye—that is everything. They succeed sometimes, alas! too well by what is practically a severe shock to the nervous system of a man of taste. The buildings they erect are marked by such a vicious extravagance in material and so-called ornament, and display such an eccentricity of forms as will not only effectually catch the eye of the passing wayfarer, but will certainly also "land him in the interior"—if not in a physical, in a metaphysical sense.

The coarseness and vulgarity of these methods need not be wholly attributed to architectural design—though certainly once the author of a work of this class, when remonstrated with, did boast that he was a "commercial architect," and that his clients wanted "the most show for their money." This advertising mania is the cause of much which we deplore in our street buildings. If the law can restrain street cries and noises because they affect the nervous

system, surely it may well undertake to control the blatant architectural efforts which may truly be said to "cry aloud and shout" in our public ways.

Some effort has been made to control advertisement signs, those modern eyesores which, not content with disfiguring our good buildings and important places, have also intruded themselves upon the beauty and repose of the rural landscape. Heavy taxation is too mild a penalty for these, especially when they blink.

Then, again, the increased height of buildings contributes largely to that atmosphere of gloom which pervades some of our streets. I am not objecting to lofty buildings on special sites or where the road is wide enough, nor are architects to blame if they show a willingness to add as many stories as are required. The responsibility rests with the ground landlords, who insist upon raising the ground rents whenever the opportunity occurs, so that additional stories must be built to meet the increased demand. Owners who are privileged to possess land in important areas should be under special control. If certain well-defined rules were laid down applicable to all such places and sites, they would serve for the guidance of those who purchase property or obtain leases in those neighbourhoods, and freeholders would thus be restrained from demanding excessive ground rents.

Public Improvements and Artistic Control.

My predecessor in office strongly urged the need of some authority to whom schemes of public improvements might be submitted, not necessarily for sanction but for consultation and advice—a suggestion which Lord Windsor was good enough to endorse, and has since sought to get adopted. This is a great advance, but I should like to press the matter still further. Consultation and advice may be sufficient in many cases, but there are others where the First Commissioner should have power to decide and determine. Artistic needs must be insisted upon, more particularly where considerations of finance are likely to exercise an undue if not tyrannical sway.

Quite recently, when some important improvements were suggested in the Strand frontage of the new street, the members of the County Council appointed to meet the artists belonged to the Finance Committee of the Council, and, as was to be expected, showed but little sympathy with artistic ideals. Yet artistic treatment has a financial value of its own, as owners of property are beginning to find out—for where the requirements of art are listened to, property is more eagerly sought after, and its value correspondingly enhanced. Not long ago the *Globe* newspaper drew attention to this subject in a short article, *à propos* of a paragraph in Sir Arthur Conan Doyle's address to the Incorporated Society of Authors. Sir Arthur, while recognising the desirability, even the necessity, of a strain of artistic blood in the body corporate of the London County Council, did not seem very sanguine, for he calculated it would take a man with the talent of Michael Angelo, the despotic power of Napoleon I., and the all-round energy of the Kaiser Wilhelm to make this city of mean streets and of the commonplace to be what it should be—a fitting centre of the greatest empire that the world has ever seen. No doubt the qualities here so tersely epitomised would prove advantageous, but how much might be accomplished in this direction if only the First Commissioner of Works, acting as a Minister of Fine Art with the aid of an Advisory Committee, possessed the necessary despotic power to see the right proposals adopted. This is above all imperative in the treatment of our public places, in the formation of new thoroughfares, and in dealing with spaces and buildings around our public institutions.

Again, where buildings should be considered in relation to their surroundings, where they must be in scale, and accord in breadth of treatment, and where other similar claims of art must be considered if the proposed work is to be in due relation to and in harmony with the existing or determined general scheme, all these are cases where the power of authority may well be invoked and exercised on behalf of the best interests of the community. A Building Act is of little or no good here. The law can determine the height of buildings, fix the size of lighting areas, and so on, but no mere Act of Parliament can define the subtle qualities and delicate nuances which distinguish good art from bad, or rather shall we say which separate art from the lack of art. In France

and in the States, both of them lands of free some such exercise of authority as I am deating has been found necessary—why here?

Ancient Lights.

I am by no means suggesting a mechanical or despotic control such as would engender a monotonous uniformity and ultimately a loss of individuality, but a freedom of control—for freedom without control is licence and licence tramples under foot all consideration for others' rights. This is the one side, the other, so-called "rights" may be used and oppressively insisted upon. The terror for instance, of "Ancient Lights" has recently been prejudicial to architecture, a short time since it culminated in such reasonable demands as to paralyse all building operations.

We in this City, and indeed the country, owe a debt of gratitude to Mr. H. C. S. for boldly withstanding the legal op of the courts and appealing to the House of Lords. A clear and satisfactory judgment has thus been obtained on the question, establishing a principle of law which will remove both property owners and the public from formidable restrictions. To the architect must come as a relief, for the difficulties he has to encounter in the exercise of his art are harassing enough without the added litigation, which must necessarily hinder from giving that thought and devotion to art which the case requires. It will not be forgotten that an Easement of Lights introduced by Mr. Fletcher Moulton, K.C. on behalf of the surveyors and ourselves, has before Parliament the last two sessions steps will be taken to continue its progress when Parliament meets again. The Bill, believe you all know, covers the ground of Colls v. Home and Colonial Stores cases provides a simple machinery for arbitration.

The Growth of Suburbs.

Light and air have long been brought together, and, indeed, in most cases they go together. There is, however, one important respect, attention to which has been given in the columns of the *Times*, in which question of air calls for separate and independent consideration. In the extensive suburbs of cities and towns the public demands that the buildings should be far apart and the open spaces larger. In fact they are removed from the centre. In Germany the authorities regulate the growth of suburbs. Different heights and different degrees of proximity are prescribed according to locality. Towards the centre five stories the limit which the houses must be detached certain directions a larger area must be reserved for the wind to blow freely about the houses. Our London suburbs are becoming a source of considerable danger. Here the houses are smaller, but they are so closely packed crowded with unhealthy subjects that the air which passes over them to the centre is becoming denser and more impure every successive year, and should a serious epidemic spread of contagion to the great city and thence again outwards seems inevitable. The lungs of London, as they are regarded, must not consist solely of the open parks, which, after all, are now or less closed in, but of wide channels and for entrance of air to flow freely through. This is a matter I commend to the attention of our Town Councils.

Borough Surveyors and Architectural Work.

One of the questions raised by my predecessor, and still under the consideration of the Council, is the growing habit of employing a borough surveyor or engineer on what is professional architectural work. It is true official is usually a man of considerable capacity but the very nature of his ordinary work stands in the way of architects' artistic accomplishments. The Committee pointed to report upon the subject have shown in a very thorough and excellent way. They have ascertained the custom and conditions existing in other countries, a result of their labours will be condensed published in the *Journal*. It is proposed to take steps to bring the matter to the notice of the public authorities and others who are concerned.

It has been urged with much show of force that our Institute ought to afford legal protection to its members in legal

men these matters are wrongly forced upon them, and are of such a character as to prejudice the interests of the profession. The principle has been approved by the Council, and a Board established, called the Board of Professional Defence, which, under proper restrictions, will be empowered to deal with such cases as come within the above category.

The increasing usefulness of the *Journal* in dealing matters of importance to our notice leads me to suggest that this usefulness might be extended if members would more freely communicate matters of general interest—either in the form of letters to the editor or of short articles—drawing attention, for instance, to buildings or objects of interest seen during their vacation, that others may be led to visit the same locality. There is scope also for short descriptive papers on various subjects connected with our methods or work, and such papers would often prove of great value and interest to readers of the *Journal*. The opportunities afforded by the sessional papers for imparting information are necessarily few, but the *Journal* may to some extent make good the deficiency.

Condition and Prospects of Architecture.

These, gentlemen, are some of the minor matters which interest and concern us as architects. I should like to add a few words on the general condition and prospects of our art in this land.

Those of us who have watched the steady improvement in English architectural work during the last few years cannot but experience a measure of satisfaction and even of pride in the progress which has been made. Our liegemen on the Continent and in America do not have been inclined to regard architecture as a dead art in this country, are already awake to the fact that there is more vitality and advance being exhibited here than anywhere else. Many American friends who have been absorbed by the excellent French methods they have studied have recently expressed to me their admiration of certain hitherto unsuspected qualities and beauties in our English work. This is both gratifying and encouraging, especially as under our unfortunate climatic conditions we are constitutionally prone to little everything that is of us or around us. Do not imagine, however, that our friendly critics have not been discriminating. "A man," said Ruskin, "may hide himself from you every other way, but he cannot in his work; you have him"; and our critics have indeed us, sometimes, to our confusion of face for our shame.

We cannot however fail to observe that there is a growing demand for the best and best work, and as the appetite for what is good is whetted, all that is vulgar and bad will come repugnant and tend to disappear. As the sunshine of popular favour shines upon our art it must advance. Side by side with the good it will still flourish the ill weeds, those vulgar street buildings and fantastic fripperies which flaunt and force themselves to the front. Let us may take heart even from these, for they are a sign that there is something they are fighting against which will eventually be subdued at its true worth. Let them alone, they must come to grief. If "experience is the dress of thought," then a building is bound to reveal its true character at the last. If it litters for show it proclaims that which is false and weak. "To dazzle let the vain sign," said Pope; "to raise the thought and such the heart be thine."

Architecture must tell its tale; it has its message to deliver. Like a musical score it presses a great deal more than meets the eye. Its meaning is hidden behind the veil of outward symbol. It is a mystery whose voice is heard speaking according to each man's mood, capacity and temperament. Just as the words of genius have a profounder meaning than the actual thought that prompted them, true architecture possesses the power, as by magic wand, to "call up spirits from the vasty deep"—from the ocean of human thought and passion.

Art speaks in all its manifestations alike. Every picture, every group of sculpture, every unusual composition is a vehicle for the conveyance of thought in poetical form. Architecture is the prose of inarticulate but beautiful thought and feeling. Sometimes it tells of the commonplace in life; rising higher it speaks of domestic peace and happiness; and yet again more stately diction it sets forth the grander

and larger purposes of life. It recounts the past, records the present, and holds up ideals for the future. But only when it is enriched from the sister arts of sculpture and painting can it tell the tale with the fulness of eloquence and power—for then it speaks to the heart in tender and solemn tones of all that is most grand and beautiful in life and humanity.

It is a pleasure to see that such has been done in recent years to cement and confirm the alliance of the arts. The brotherly readiness of the sculptor to aid in the good cause should be recognised, and his name coupled with the architect's in all such work. If the building is to be harmonious in expression these two must work together from its conception, and the sculptor must have a fitting and honourable place assigned to him whence he may take up his parable with effective force. Not a new or separate *motif*, but the same with new progressions, a harmony with one delightful melody. When, further, the orchestra is increased by calling in the painter's art, then, like the vibrating strings with their soul-stirring chords, the refinements of tone and colour appeal to the heart with a new and higher power based upon the primal sympathies and emotions of the human breast.

Why, then, we may ask, have these arts so few opportunities of joint action? Is it not because architecture has forgotten her place and lagged behind? Is she not like Lot's wife, who, looking back, was stiffened into a pillar of salt? Looking back, there lies the explanation. The sister arts of painting and sculpture have been the while advancing; they have developed, but architecture has stopped short and been content to look back to the past, to draw upon old periods and reproduce "defunct" styles, so that the living arts of the present age could no longer associate with one that was a mere mouldering survival from bygone times. A special architectural carver had to be trained to forge or imitate archaic forms and reproduce the quaint and grotesque figures of almost forgotten centuries; while the painter has given place to the "firm of decorators," and his message to the dumb extravagance of mere costly material.

All this, I believe, will soon be past history, a vanished nightmare, for a new era has undoubtedly begun. May we not justly feel sanguine? After all, the great thing is not so much where we stand as in what direction we are moving. It is no question of style. Every period has contributed something to our art. Gothic, with its rich luxuriance, has been the foster-home of the crafts, and if the crafts themselves seem to have lost their independence and vitality, it is because having had a part in beautifying the "styles," they have, like them, been made to serve in the copying and forging of bygone examples. Without denying that in the hands of true genius these past types may be taken up and carried forward, yet it is rather with the Renaissance forms that modern sculpture and painting can best and most easily be associated. It is natural perhaps, that I should have this confidence in the development of the Later Renaissance. There, at any rate, it will again be possible to co-operate with one's brother artists, and that must be a step in the right direction. There is in its methods a freedom, a vitality, and a power of adaptation to modern requirements which surely stimulates conception and fosters growth. There is, too, a characteristic wealth of stateliness and grandeur fitting it for all high and noble purposes. The genius of Inigo Jones, and subsequently of Wren, taking it up, each at the point at which he found it, carried it on far beyond its huddling efforts, and established it as a great English tradition. Here is the "quarry," and, to quote the words of Goethe, "He does not deserve the name of architect except out of this fortuitous mass he can combine with the greatest economy, suitableness, and durability, some form the pattern of which originated in his own soul."

Let us be enthusiasts. Our national architecture is not dead; there are many signs of life and movement within it. The spark is there; let us blow upon it and the fire will burn. Let us encourage and stimulate the energies of those who, with the love of their art burning brightly, seek not arrogantly for something new, but to advance that which they have proudly inherited, and to make its influence for good ever more and more known and loved.

Mr. Frank Dicksee, R.A., said he had been

asked to propose a vote of thanks to the President for his very interesting and illuminating address, and he undertook the duty, though with no hope of adequately expressing either their pleasure or his own with the President's effort, but merely to express his own tribute of appreciation of what the President had said. He thought he ought to confine himself to this, for he had a little hesitation in approaching the subject of architecture. As a simple-minded painter, he might, perhaps, step in where architects fear to tread, because he knew there was such a difference of opinion and aim that it was rather risky, even if one had fixed opinions, to adopt a side. He had been much interested in the address, and to those who were not acquainted with all that was going on in the architectural world it was most edifying to be informed in that short and summary way of the chief incidents of architectural activity of the year. What interested us in London especially was the Queen's Memorial, and he had had the pleasure of seeing the model that Mr. Brock had elaborated, and he felt confident that it would be one, when the whole thing was finished, of which Londoners would very justly be proud. Another subject that interested him very much was that of the education both of the architectural student and the public—the one, perhaps, much more difficult than the other—and he keenly sympathised with the attitude that the President took up with regard to the interchange of the three arts. He did not think that anyone in the profession had been more influential than Mr. Belcher in associating sculpture and architecture, and it was no fault of his if painting had not been included. He was quite sure that when Mr. Belcher had the opportunity he would admit the painter to the same privilege of sharing his triumphs as the sculptor already possessed. He thought it would be a very good thing if in our schools there should be an interchange of study on the part of the students. It was a thing which they had to a certain extent initiated in the Academy schools, where facilities were given the architectural student to study in the painting school or at least in the drawing school and the modelling school—and sculptors in the Painting School and Architectural School, and so on, and he imagined that there would be a great gain brought about by such a change in the ordinary course of study. But the education of the public was, he fancied, a much more difficult matter, and when there was such uncertainty amongst the leaders—amongst those men who should lead activity of thought in this matter—it was a little difficult for a complete outsider to know what to do. We were told that the beautiful Gothic art was dead. Well, he was almost afraid that that might be so. There was no doubt that for architecture to be really successful in its aim it must contain within itself the spirit of the time, and also the spirit of these times was not that which would encourage Gothic art. What was the spirit of the time? Utilitarianism, science, and advertisement. Now utilitarianism was good; science was excellent—he did not think that that could be said of advertisement, but that was the most marked characteristic of the age, and any art expression we ventured upon had to fight this spirit of advertising, and it was a very serious drawback to the expression of any form of art, for instead of being helped by the spirit of the age it was hindered. He thought that if that were made clear to the public—*i.e.*, that it was not those who shrieked the loudest who were the most worthy of attention—it might lead gradually to the formation of better taste on the part of the public, for he was perfectly sure that there was an immense amount of talent in this country which needed only encouragement to fulfil all manner of enterprises which would strengthen and beautify the nation in every way. If we could so enlarge our sympathies that we were not bound to be only Gothic or only Renaissance, or only Classic, but to have a sufficiently wide sympathy for all these various expressions of art, to understand them all, and then in times of judgment to decide which was the best expression for the particular instance contemplated. He most bitterly regretted that Newgate Prison had gone, for it was a splendid bit of work, and you had only to look at it to know it was a prison; it bore the stamp of what it was. Of course he should be sorry to see many of those Newgates about. If we wanted to build something of the kind now, that manner of architecture would be out of date, but for that and some things it seemed to be the best possible. He hesitated to speak about Gothic art, for to

him in its day, when it contained within itself the expression of the life of the people, it was the most beautiful architecture of the world. The mystery of it and the religious sense which it awakened, and the way it gloried in the magic of colour and stained glass made it, take it all in all, the most beautiful expression of architecture that the world had ever seen; but to attempt any ambitious work in Gothic art now was risky, although in competent hands it was still possible to have a most beautiful expression of art conveyed even in modern Gothic. He desired to pay a tribute to the President, for it seemed to him that the essential principle that the President had placed before him was devotion to beauty. It was Emerson, he believed, who said that, "Though we travel the world over to find the beautiful—we must carry it with us, or we find it not." It seemed to him that that was what Mr. Belcher had done: he had carried the sense of the beautiful with him wherever he had gone, and that, combined with his loyal endeavour to combine the arts of painting and sculpture with architecture placed him in a position which commanded their greatest admiration and respect, and they were proud that such a man should be placed at the head of an Institute like that—with his great capacity in his art, his devotion to beauty, and his keen enthusiasm for the welfare and fame of a profession which in dignity and worth should be second to none.

Sir Benjamin Baker, K.C.M.G., said his only qualification and his only excuse in seconding the vote of thanks was that he was a very old and very appreciative friend of their President. He had watched Mr. Belcher's career, and he was especially pleased to see him in the position which he occupied that night, which would do honour to himself and be of great benefit to the Institute. The President had touched on many topics, and in his work he illustrated that he was not only a preacher, which was generally dull work, but he followed out his own maxims, and he thought that the works of Mr. Belcher would do more to educate the public in the way he desired than his address. He quite agreed with the vision of a wilderness of mean streets that the President had spoken of as a hopeless problem to attempt to solve. In connexion with the Traffic Commission he had lately been a good deal in the suburbs of London just to see where the people spring from and where they had to go to be accommodated. It was not that matter that had most interested him in the President's address, but rather what was said as to the vicious extravagance in material and so-called ornamentation, and that was most prominent in the extreme East End, and particularly near the Angel, Islington—an extravagance that dominates the whole world at the present time. How could they hope for art to be dominant when they saw women dress as they do in some parts of London, with their artificial pearls, for instance, which would be worth 10,000*l.* in individual cases if they were real. It made one shudder almost, and it was not confined to London and the cities of England. In Ireland some twenty-five years ago if one saw a donkey cart with a pretty girl in it the girl had no head covering at all; she had a shawl, and that was drawn up to cover her head if it rained. That was not the case now, and you never could tell what a girl would dress in, and all the joy was taken out of the thing. That being so, the problem of educating the public was a most difficult one. He could not imagine how Greek architecture or sculpture would have fared if the Greek women had dressed like that, and how the difficulty was to get over he did not know. He might paraphrase a remark he heard the Italian Ambassador say on a similar occasion: "Since my boyhood I have been married to science, but I am a lover of art, and that must be my excuse. The President happily occupied a middle seat between art and science, and in his work he combined both.

Mr. Graham then put the vote of thanks to the meeting, and it was very heartily agreed to. Mr. Belcher, in reply, said that they had heard two most distinguished representatives of science and art. He felt that as science and art formed the component parts of good architecture, all that those gentlemen had said had been most valuable and interesting. The President announced that the next meeting will be held on November 21, when a paper will be read on "Monolithic Constructions in Hennebique Ferro-Concrete," by Mr. L. G. Mouchel, and one by Mr. W. Dunn on "Construction and Strength of Reinforced Concrete." The meeting then terminated.

THE LONDON BUILDING ACT.

The General Purposes Committee of the London County Council brought up the following report at the meeting of the Council on Tuesday:—

Standing Orders and Regulations under the London Building Acts.

"We have had under consideration the desirableness of advising the Council to make certain alterations in the standing orders and regulations under the London Building Acts so far as they relate to the submission of applications under the Acts, and to street naming and numbering. The alterations have been suggested by the Building Act Committee, and the late Historical Records and Buildings Committee have also approached us on the matter. The alterations suggested by the Building Act Committee are not intended to introduce any new practice, but simply to make clear to applicants what is required of them in the way of plans, particulars, etc., with a view to saving delay in dealing with applications. Many of the alterations suggested by the late Historical Records and Buildings Committee, are of a minor, and, in some cases, of merely a verbal character, but where they are of a more important nature, we draw special attention to them. . . . The new matter is printed in italics.

"Regulations as proposed to be amended, with reasons for amendment.

1. The full name and address of the person on whose behalf the application is made, and the extent and character of the interest in the property, together any portion of the site on which the building is proposed to be erected forms part of a disused burial ground, and whether the property is freehold, leasehold, or copyhold, must be stated. Particulars must be furnished as to the nature of the application and the situation of the street, building or structure, and the purpose for which such building is required.

Formation and laying out of new streets—Adaptation of ways for streets and widenings of streets, etc., section 7 and section 10 of the 1894 Act.

2. Each street must be marked on the plans with a number, and referred to in the application as Street No. 1, Street No. 2, etc.

In the event of the application being sanctioned, two additional copies of the plans will be required, and the intended name of each street, identified by reference to the number of the street on the plans, must be submitted in accordance with section 32 of the Act of 1894.

[NOTE.—Having regard to the time limit of one month imposed by the Act, in which objections must be made to names submitted for streets, it has been decided to require applicants to defer formally submitting names for approval until the Council has sanctioned the formation of the streets. The alteration is made with a view to identifying the streets for which the names are intended.]

Buildings (a) within the prescribed distance, (b) in advance of the general line of buildings, etc., section 13, section 17, and section 22 of the 1894 Act, and sections 3 and 4 of the 1895 Act.

3. Plans must be to a scale of 22 ft. to the inch, and must show the situation of the building in relation to others adjacent, to a sufficient extent to show the frontage of either side of the street. The height and precise distance from the centre of the roadway of the proposed building and the width of the street are to be figured.

In the case of applications under section 13 (5), the extent and height of the old buildings on the site must be shown to the same scale, and a copy of the plans certified by the district surveyor, together with the originals, should be forwarded to the original certifier, and will be returned after being compared with the copy.

Recesses and openings in external walls and recesses in party walls, section 54 of the 1894 Act.

4. Plans of the floors of the building and an elevation of the wall in which the recesses or openings occur to a scale of one-eighth of an inch to the foot. The sizes of the recesses and openings must be figured.

Additional cubical extent, section 76; and buildings for the supply of electricity, section 203 of the 1894 Act.

5. The use to which the various parts of the building are intended to be put is to be indicated, also the positions and numbers of any hydrants or other fire-extinguishing appliances proposed to be provided, and any points bearing upon the question of liability to fire.

Naming of streets and numbering of houses—Part IV. of the 1894 Act.

6. In numbering houses the rules to be observed are as follows:—St. Paul's Cathedral is recognised as a central point; and the numbering of houses begins at the end or entrance of the street nearest that building, except where a street leads from a main thoroughfare to a less important street, and then the numbering starts from the main thoroughfare. Taking, therefore, the sides of a street as left and right (assuming that the back is towards St. Paul's) the odd numbers will be assigned to the left-hand side and the even numbers to the right-hand side.

Under section 36 of the Act, the Council has the power to order "that any houses or buildings in any street or way or any part thereof shall for the purpose of distinguishing the same be marked with such numbers as they shall deem convenient for that purpose." Great inconvenience and expense in renumbering would frequently be saved if the above rules were observed in the first instance.

7. No name is to be used for a street unless with the approval of the Council previously given. It should be a name consisting of one word or a few words, without the addition of "street," "road," "other like term."

[NOTE.—This alteration is necessitated by practice of the Council to approve the use of similar names (e.g., "Aldwych," "Kingsway," etc.) streets.]

8. Only such thoroughfares as may be deemed to be of sufficient length or importance may be designated roads.

The Council will be prepared favourably to consider the use of the terms "avenue" and "grove" conditionally upon the planting and maintenance of suitable trees in the streets in question; other descriptions, such as "gardens," "crescent," "square," etc., may be used only when the term seems appropriate.

[NOTE.—These alterations are made in order that the Council may have a wider discretion in allowing the use of such terms as "road," "avenue," which they seem appropriate.]

9. The name should be one that is not already in use within the county; it should, if possible, be some way associated with the locality.

The Council's list of streets and places in Administrative County of London, together with office list of available names, arranged under districts for which they are appropriate, may be consulted by applicants.

10. Applicants proposing names for large blocks of artisans' dwellings, mansions, manor-houses, etc., should have regard to the rules which apply to the naming of streets.

The Council should be notified of every name proposed to be used as a postal address.

[NOTE.—This alteration is made with a view to controlling, so far as may be possible, nomenclature of large blocks of buildings.]

Any person or persons setting up any name to be used within the county, or the expiration of any name after notice of the intention to set up the name has been given to the Council, or setting up any name objected to by the Council under section 32 of the Act, shall be liable to a penalty of 40*s.*, with continuing penalty of 40*s.* for every day on which the offence continues after conviction.

[NOTE.—This new paragraph is inserted for the purpose of drawing attention to the illegality of setting up names for streets other than those approved by the Council.]

Conditions upon which applications may be granted—Standing orders as proposed to be amended.

11. No building shall be commenced or erected upon either side of such roadway, or a site adjoining upon such roadway, unless a roadway shall have been and shall still remain defined and thrown open as aforesaid, and unless such roadway shall have been and shall still remain so made as regards levels, direction, width, and gradients throughout as to comply with the provisions of any statutes and by-laws in force in London regulating streets and buildings, and unless such roadway shall also have been so made as to comply with the provisions of any regulations made under the Act of 1894.

Sections attached to the application for the sanction of the Council, and unless the name of the street has been approved by the Council, and an approval shall have been affixed and shall be retained at both ends of the street.

[NOTE.—This alteration, to the need for which attention has been drawn by the solicitor, is made in order to ensure the approval of the Council to the suggested name is obtained, and that the name actually approved is affixed and retained.]

Naming and numbering of streets—Part IV. of the 1894 Act.

Names submitted for new streets are to be communicated to the local authority in whose district the streets are situated, with a request that they will inform the Council within fourteen days of their observations which they may desire to make thereon.

[NOTE.—New paragraph to give official sanction to the present practice.]

12. After the making of an order for the renaming of any street, an intimation thereof is to be sent to the Post Office authorities, and the superintendent registrars of births and deaths for the districts in which the streets are situated.

A notification of names approved for new streets, and of orders made by the Council for the renaming of streets and the renumbering of houses, also to be sent to the proprietors of Kelly's directories.

[NOTE.—New paragraph to give official sanction to the present practice.]

13. After the proposed alterations in the standing orders as to notice of a new name for a street (No. 7 in the table), the Historical Records and Buildings Committee considered it desirable that power should be delegated to them by the Council to enable them to make formal objections on behalf of the Council, under section 32 of the London Building Act, 1894, to any name intended to be given to a street. Section 32 of the Act is as follows:—"Before any name is given to any street, notice of the intended name shall be given to the Council, and the Council may by notice in writing set up any name to any street in London, until the expiration of one month after notice thereof has been given as aforesaid to the Council or to some other person named in the notice, if any name objected to as aforesaid."

It will be seen that the period within which the Council has power to object under this section is limited to one month. This period has in practice been understood, proved to be altogether insufficient, and in the great majority of cases, owing to the time occupied in bringing applications before the Committee and the Council, the time limit elapsed before the notice of objection could be given. The Council in the Committee's suggestion and have proposed a definite order of reference accordingly so as to provide that the Local Government Records and Museums Committee, who have taken over these duties since the reconstitution of the Committee in March, 1904, shall exercise the power

the Council under the section in question. We comment—

(a) That the regulations, rules, and standing orders under the London Building Act, 1894, and the London Building Act, 1894 (Amendment) Act, 1898, adopted by the Council on July 16, 1899, be rescinded.

(b) That by-laws, rules, regulations, and standing orders under the London Building Act, 1894, and the London Building Act, 1894 (Amendment) Act, 1898, set out in the appendix to the report of the General Purposes Committee, dated October 24 and 31, 1904, be made.

(c) That an addition to the order of reference to the Local Government Records and Museums Committee be made as follows:—The Committee shall exercise the powers of the Council under section 32 of the London Building Act, 1894.

The appendix and standing orders follow. The amendments were agreed to.—Ed.]

The Building Act Committee brought up a following report, the consideration of which, however, was adjourned until next week:

LONDON BUILDING ACTS AMENDMENT.

The Council on June 14, 1904, on the recommendation of the Building Act Committee, instructed the General Purposes Committee to prepare a Bill for introduction into Parliament in the session of 1905 to amend the provisions of the London Building Acts. It may be well to briefly indicate the steps which led up to this decision. The Council on November 4, 1892, resolved to introduce into Parliament a Bill to amend the provisions of the London Building Act, 1894, relating to safety from fire. Subsequently on March 3, 1893, the Council, on the recommendation of the Parliamentary Committee on the London Building Act, 1894, and Parliamentary Committees with a view to their advising the Council, after consultation with such persons and authorities as might be desirable, as to the ultimate form the Bill should assume. The Bill referred to dealt only with the question of safety from fire, and left untouched many other questions with regard to which the London Building Acts had been made, and to need amendment, and as the Council had decided that this Bill should not be proceeded with, the Session of 1893, we felt strongly that any Bill should include all the amendments and provisions required in the London Building Acts. It is not, however, found practicable for three Commissions to prepare the material for a Bill of this character, and the Council, on May 25, 1902, on the recommendation of the Commissions concerned, rescinded the resolution referring it to those Commissions, on the understanding that the Building Act Committee should proceed with the preparation of proposals for introducing all the amendments required in the London Building Acts. We accordingly devoted much time and attention to this task, in connection therewith, we have considered the proposals made by the Fire Brigade, Highway Improvements, Local Government, Main Drainage, Public Control, and Public Health Commissions of the Council, by the majority of the Metropolitan Councils, and by the Royal Institute of British Architects, the Institution of Civil Engineers, the Surveyors' Institution, the District Surveyors' Association, and many other bodies. We have also considered all the cases illustrating the defects pointed in the London Building Acts, as been dealt by the Building Act Committee since 1894, in addition, the by-laws and Acts in force in the principal provincial towns, and the by-laws in force in the principal districts of London, have been studied with a view to extracting any provisions therefrom of value in London. As the result, we have obtained valuable material for the amendment of the London Building Acts. On June 14, 1904, we submitted a report to the Council indicating the terms of the object of our proposals, and stating that we would submit details at a later date. We have now fully completed our proposals, and are in a position to recommend them to the Council. The greater number of our suggested amendments were communicated to the Parliamentary Committee on the 13, 1904, to enable the preparation of the Bill to be proceeded with, and the remaining suggestions have since been communicated. The draft Bill, embodying nearly all the suggestions put forward, is furnished to us at our request by the Parliamentary Committee immediately after the conclusion of the summer recess. We have completed our consideration of the draft Bill, and have submitted our observations thereon to the Parliamentary Committee. It therefore appears to us that, although the Bill is not perfect, the objection to the Bill is necessarily very great, there is no objection to the Bill introduced in the next Session of Parliament. The Council approves of the principles of the proposed amendments. We may remind the Council that the Bill of 1894 was introduced by the Hon. Secretary, who, in August, 1902, wrote the Council stating that, in view of the facts disclosed at the inquest on the Queen Victoria-street, he thought the Bill should be introduced in the next Session on the subject of safety from fire in high buildings required early consideration that, in his opinion, the matter could not be adequately dealt with by a mere extension of the powers of the Council under the Factory and Workshops Act, 1901, and he was therefore disposed to think that any legislation should take the form of an amendment of the London Building Act, 1894; that, as the Bill was a local Act, the amendment of its provisions would naturally be by a private Bill introduced by the Council, and that he would be glad to assist in any proposal that might be made in that respect, and that if it might be possible for him to do so, the Hon. Secretary subsequently informed the Council that he would have no objection to the extension to existing buildings of the clauses with respect to means of escape from fire, under proper conditions, and in certain cases, provided adequate provision were made for allowing the owners or occupiers of

existing buildings an appeal to an arbitrator or to some other tribunal. Our present proposals, which extend over the whole of the London Building Act, embody those contained in the 1903 Bill, with considerable modifications, which we have made with a view to meeting, as far as was reasonable, the criticisms which have been made. Before submitting details of the proposals it may be well to very briefly outline the more important amendments suggested by us:—

Outline of the most important proposed amendments.

Formation and widening of streets.—To give the Council greater powers with regard to the formation of new streets and the adaptation of ways to streets, with particular reference to restricting, except under certain conditions, the height of dwelling-houses erected in narrow ways and streets, and the height of buildings, erected on the site of previously existing buildings, within a certain distance from the centre of the roadway.

Building line.—To enable the Council to determine the future building line in any street, so as to facilitate the gradual widening of congested thoroughfares, and to make new streets, where necessary, to continue such widened thoroughfares, or to afford through communication.

Open space about, and lighting and ventilation of, buildings.—To increase the amount of open space required for new dwelling-houses; to improve the lighting and ventilation of habitable basements, and of rooms which derive light and ventilation only from a court within a building.

Means of escape in case of fire and reduction of risk of fire.—To require the provision of means of access to the roof in every building of more than one story, and exceeding 20 ft. in height; to reduce the height above ground level of the provision of means of escape can be required in the case of certain new high buildings, and, after a certain date, the application of similar provisions to certain existing buildings; to provide for means of escape from certain new, and, after a specified date, existing, buildings in which more than a certain number of persons are employed, or in which sleeping accommodation is provided for more than a certain number of persons; additional powers in regard to premises used in part for the purposes of trade or manufacture, and in part as dwelling-houses, especially where the part used for trade projects the frontage of the building (as, *e.g.*, in a grocery shop); to provide that consent shall not be given to the erection of a building to a greater height than 80 ft. unless the Council is satisfied that proper arrangements can be made and maintained for lessening danger from fire; powers to regulate the use of matched-board and panelling as an internal finishing to walls, etc., and the enclosing of lifts in buildings; and to protect in buildings of more than one storey class windows which are within 30 ft. of openings in other premises.

Construction of buildings.—To make certain amendments in the provisions of the Act relating to construction of buildings with a view to reducing risk of fire; to enable the Council to consent (a) to the cubical contents of buildings to be used for trade or manufacture, being of any dimensions that the Council may deem it expedient to permit (at present the Council cannot consent to buildings of greater dimensions than 450,000 cubic ft.); (b) to the uniting of buildings under proper conditions (at present buildings may not be united except where they are wholly in one occupation or are constructed or adapted to be so); and to make rules with regard to the use of iron and steel construction in buildings.

Buildings on low-lying land.—To strengthen the provisions of the Act relating to the erection of buildings on low-lying land.

District surveyors.—To amend the powers of the Council with regard to district surveyors so as to enable the Council to introduce a proper system of payment by salaries instead of fees at any time it should see fit to do so, provision being made for the continuation of any district surveyors engaged in consequence of the introduction of such a system; also to amend the fees payable in certain cases to district surveyors.

By-laws.—To enable the Council to make by-laws with regard to the demolition of buildings, the control of scaffolding and machinery, the use of iron and steel construction in buildings, and the erection of buildings on unsuitable sites.

Tribunal of Appeal.—To alter the constitution of the Tribunal of Appeal.

It is extremely difficult to give in a succinct form full details of every proposed amendment to an Act of such a technical character as the London Building Act, and we do not think the Council would desire us to attempt the task. The Parliamentary Committee have, however, informed us that they do not feel justified in proceeding with the introduction of the Bill until they shall have received detailed instructions as to procedure, and we therefore submit for the consideration of the Council the following particulars of our proposals:—

Details of proposed amendments to the London Building Acts.

Definitions.—To extend the application of certain expressions, and to define certain terms not at present defined.

Formation of streets.—To amend the provisions as to what constitutes a commencement to form or lay out, or adapt a way to, a street.

To enable the Council in the case of new streets or the adaptation of ways to streets:—

- (a) To require a greater width than at present; lateral communications; reservation of land to form street or formation of street for connexion with an adjoining estate; connexion with an existing street; protection of streets proposed to be formed on land at a different level to land immediately adjoining on either side.
- (b) To alter the position, direction, or level of any intended new street in order to make more direct communication.
- (c) To prevent the formation of *cuts-de-sac*.
- (d) To secure an equitable incidence of the cost of paving and making up streets.

To enable the Council to control the formation of back streets, and to require the formation of such streets where considered desirable.

Widening of streets.—To prohibit, except under certain conditions, the erection in ways laid out for foot traffic only of dwelling-houses of a greater height than the width of the way.

To enable the Council to require without payment of compensation a greater width than 20 ft. from centre of roadway where premises are to be used for business purposes.

To provide that in cases of rebuilding no increase in height over that of the previous building on the site shall be permitted unless the owner gives up to widen the road a strip of land of a width proportionate to the increased height of the building.

To prohibit the extension of any existing building within the prescribed distance without the consent of the Council.

To prohibit the erection without the consent of the Council of any dwelling-house within a distance of 20 ft. from the centre of the roadway to a height exceeding the distance of the front or nearest external wall of such building from the opposite side of such street. (At present this restriction applies only to "dwellings for the working classes.")

To make it clear that the existence of an irregular building or structure within the prescribed distance from the centre of the roadway does not confer a right to erect any building on the site thereof.

To require that certified plans of old buildings within the prescribed distance shall be made before demolition in cases where the owner demolishes the building, and that such plans shall show the extent and height and nature of construction of buildings or structures in their several parts.

General line of buildings.—To prohibit the extension or raising of any existing building, beyond the general line, without the consent of the Council.

To make the right to re-erect a building beyond the general line subject to plans being certified by the district surveyor, and to require such plans to be made before demolition in cases where the owner demolishes the building, and to show the extent and height and nature of construction of the old building or structure in its several parts.

To make further provision for securing the removal of buildings unlawfully erected in advance of the general line on the lines of the power now possessed by the Council with regard to prescribed distance.

To prohibit, without the consent of the Council, the erection of a building to the same line as that of a building previously sanctioned by the Council in advance of the general line, unless land, in a line with that required to be dedicated under the previous consent, be dedicated to the public use.

To enable the Council to control the line to which buildings may be erected where the general line has been destroyed by the demolition of buildings.

To make the Council the authority for giving the final permission for the erection of bridges and similar projections across public streets.

To provide that all retaining walls and buttresses of railways shall be set back to the general building line; and that in no case, except with the consent of the Council, shall there be less than 50 ft. in the clear between such walls or buttresses.

To make it clear that buildings erected under consents granted by the Council's predecessors shall not affect the general line.

Houses to define a building line.—To provide that the building line in any new street (not being within two miles of St. Paul's) shall not be nearer to the centre of the street than 35 ft. without the consent of the Council.

To enable the Council to define a building line on either or both sides of any important street or way, such building line not being at any point more than 75 ft. distant from the centre of the roadway of such street or way.

To provide that no building or structure shall without the consent of the Council be erected or placed either above or below the level of the highway adjoining the same beyond the building line defined by the Council.

To provide that the Council may upon payment of compensation require any building or structure projecting beyond the building line defined by the Council to be set back to such line, and that the Council may enter upon, take, and use the whole, or any part of any lands, buildings, or structures in advance of the line defined.

To provide that the land between the building line defined by the Council and the centre of the roadway shall, to such extent as the Council may by order declare, be deemed to have been dedicated by the owner thereof, and shall be left open for the use of the public and form part of the public way.

To provide that the Council may form, lay out, and construct any street as a continuation of any street or way, in respect of which the Council has power in force the powers of defining a building line for the purpose of affording through communication between different parts of the metropolis.

To provide for settlement of questions of compensation and for the necessary machinery for the Council to exercise the powers sought to be obtained.

Naming of streets and numbering of houses.—To enable the Council to give any name to, control the width of, and remove any way, street, or way, place, row of houses, or block of buildings.

To require the local authority and not the owner to set up the new name whenever the Council finds it to be necessary to change the name of any way, part of a street or way, place, row of houses, or block of buildings.

To require the occupier or owner to remove or obliterate any existing numbers or names abolished by the renumbering order.

To make various other minor and consequential amendments to facilitate the proper discharge of the Council's duties with respect to naming of streets and numbering of houses.

Open spaces about buildings, and lighting and ventilation of buildings.—To provide that factories, warehouses, etc., shall not be erected upon open spaces which are surrounded by dwelling-houses and upon which dwelling-houses would be prohibited on account of lack of air space.

To make better provision for the lighting and ventilation of habitable basements.

To require a certain amount of open space at rear to be provided to domestic buildings other than dwelling-houses at ground level in old streets when rebuilding.

To require provision of open space about all domestic buildings not abutting upon a street.

To provide for the maintenance of the open space provided in accordance with the Act.

To provide that open spaces behind houses shall be larger than the present Act requires.

To require that sufficient open space shall be provided to allow of the means of access to the inspection chamber required under the Public Health by-laws for the purpose of disconnecting the drain from the sewer being placed outside the building.

To require the space at the rear of all buildings used solely for dwelling purposes, in streets laid out before the commencement of the Act of 1894, to be provided at the level of the adjoining pavement.

To require that courts for providing light and air shall be provided in the centre or interior of new buildings exceeding 150 ft. in depth.

To amend the provisions relating to courts for admitting light and air to domestic buildings so as—

(a) To make a minimum provision for the ventilation to a court inclosed on every side.

(b) To make it clear that the window referred to in the provisions is intended to be a window provided to comply with the rules as to habitable rooms.

(c) To omit from section 45 of the Act of 1894 the provision that a court of which the greater dimension does not exceed twice the less dimension shall be held to comply with the section if a court of the same area, but square in shape, would comply therewith.

(d) To reduce the depth allowed for a court open on one side, and to make the rules as to windows to habitable rooms apply to any window to a habitable room, including a room in a basement.

(e) To limit the height of walls in which there are any windows, which are required to be provided by the rules as to habitable rooms, opposite to any land or building which is or is intended to be in a different occupation.

(f) To make the provisions relating to courts for admitting light and air to "domestic buildings" apply to offices and counting-houses.

(g) To make provision with regard to a window placed obliquely in a court or recessed.

Height of buildings.—To omit paragraphs 3 and 4 of section 47 of the Act of 1894, which provide that the prohibition against building to a greater height than 60 ft. shall not apply to the rebuilding to the same height as at present of any building existing at the passing of the Act of a greater height than 60 ft., or to the raising of certain existing buildings.

To provide that consents to the erection of buildings to a greater height than 60 ft. shall only be granted when proper arrangements can be made and maintained for lessening the danger from fire.

To provide that in new streets no building shall exceed in height the distance between buildings on opposite sides of the streets.

To make the provisions as to the height of buildings in streets of a less width than 50 ft. apply to streets formed before 1862 as well as to those formed subsequently.

To prohibit the erection and to control the height of buildings (other than domestic buildings) within a specified distance of buildings of the domestic class.

Means of escape in case of fire and reduction of risk of fire.—To provide that every building (both new and existing) of more than one story and exceeding 25 ft. in height shall be provided with means of access to the roof, and with a parapet or guard rail, where necessary to prevent persons slipping off the roof.

To alter the height above which stories have to be provided with means of escape in case of fire from 60 ft. to 50 ft., and to provide for the maintenance of the means of escape.

To require the provision and maintenance of means of escape from buildings (other than factories and workshops, coming within the provisions of the Factory and Workshops Act, 1901, common lodging-houses and dwelling-houses occupied by not more than one family) in which sleeping accommodation is provided for more than twenty persons or in which more than twenty persons are employed.

To enable the Council to revoke its certificate, if necessary, in the event of change of user or alteration of premises increasing the risk of fire or of failure to satisfactorily maintain the means of escape, provision being made for Council to attach conditions to its certificate and for the imposition of penalties for breach of such conditions.

To prescribe the method of constructing internal staircases provided as a means of escape. (The provision of an internal staircase as a means of escape will not necessarily be required; other means of escape may be adopted.)

To apply the above provisions to existing buildings after seven years; to provide for referring disputed matters to arbitration, for an equitable division of the cost of the alterations between the freeholders and leaseholders, and for requiring buildings already having the certificate of the Council under section 63 of the Act of 1894, and certificate was granted, to provide only such additional means of escape as may reasonably be required, having regard to the alteration of the limit of height from 60 ft. to 50 ft., and for the plans to be supplied to be only such (if any) as are necessary to show the additional risks.

To require owners to submit plans of new buildings before the erection of such buildings is commenced, and of existing buildings within three years from the passing of the Act and to provide for referring differences of opinion to arbitration.

To provide for the issuing of Orders by Petty Sessions Courts restricting the use of buildings or

portions of buildings from which it is impracticable to provide adequate means of escape.

To provide that in buildings exceeding ten squares in area and used partly for trade and partly as a dwelling-house:—

(a) The two portions shall be separated vertically and horizontally by, and all passages and staircases and other means of approach from the street to the part used as a dwelling-house shall be inclosed with, and constructed throughout of, fire-resisting materials other than wood. (Passages, staircases with access to the street, shall be provided, see paragraph (c))

(b) The passages, staircases, etc., referred to in paragraph (a) shall be of a prescribed width proportionate to the frontage of the premises.

(c) In cases where satisfactory means of escape are not provided from the sides, rear, or roof of the premises a staircase and, if necessary, a passage inclosed and constructed as described in paragraph (a) shall be provided to the street from the part used as a dwelling.

(d) No part of the premises shall be at a greater distance than 80 ft. from a satisfactory means of escape.

(e) Doorways in walls of staircases and passages referred to in paragraph (c) shall be fitted with doors of fire-resisting materials.

(f) The use of wooden joists in conjunction with concrete pugging shall be allowed for the construction of fire-resisting floors.

To prohibit the use as living-rooms or workshops of rooms above, or directly communicating with, oil-shops without (1) the provision of adequate safeguards to prevent the spread of fire from the oil-shops to other parts of the premises, and (2) the provision of means of ready escape from such premises.

To prohibit the division of one shop into two or more shops except in an approved manner by fire-resisting materials.

To require that in buildings used partly for shop purposes and partly for dwelling, where the shop portion projects more than 5 ft. beyond the main front of the building, the roof of the projecting portion shall be of a material of such fire-resisting means of escape are provided from the side, rear, or roof of the building, that a passage or passages inclosed in fire-resisting materials shall be provided from the street to the staircase or other approach to the part used for dwelling, etc. (the width and number of the passages being proportionate to the frontage of the building to the street) also to control the position and construction of lantern lights to the projecting portion, and to allow of ventilating cowls of satisfactory construction.

To provide—

(1) That separate sets of chambers or offices or rooms contained in one building—

(a) Shall not be deemed to be separate buildings, and that the district surveyor shall not be entitled to claim fee as such.

(b) Shall, if contained in a building exceeding 20 ft. in height and in an area less than one acre, be separated vertically and horizontally by fire-resisting materials other than wood.

(c) Shall also if contained in a building exceeding 25 squares in area have the floors of the lobbies, corridors, passages and landings, and the principal staircases of fire-resisting materials.

(2) That the principal staircases (in buildings with separate sets of chambers) shall be inclosed with incombustible material not less than 4 in. thick, or, if in brickwork, not less than 4 in. thick, and that the doors leading on to the staircase shall be fire-resisting, or, if of deal, solid and not less than 2 in. thick, and that all glazing, if any, shall be fire-resisting.

(3) That no building containing separate sets of chambers or offices, etc., shall, without the consent of the Council, extend to more than 50 squares in area.

To provide that no doorway to or from a staircase, corridor, or passage-way in certain new public buildings shall be less than the width required in the Act for such staircases, etc.; also that all exit doors and barriers having fastenings shall, if fastened during the time the building is in use, be fastened during such time by automatic bolts only, so as to open by pressure from the inside, and to provide that the requirements as to bolts shall apply to existing churches and chapels.

To provide that every lift, shaft, (except those in dwelling-houses) and hoist, (except those in a family) shall be constructed and inclosed to the satisfaction of the district surveyor in a prescribed manner, and that lift shafts reaching to the top of the building shall be protected in a prescribed manner with thin glass protected on the outside with strong wire guards, and those not reaching to the top or bottom, or in the case may be, with fire-resisting materials; also that the doorways to the lift shafts shall be fitted with fire-resisting doors, and that these provisions shall apply to existing lifts after seven years.

To provide that boarding and panelling shall be so fixed as not to allow of any space between it and the wall, etc., to which it is fixed, and that it shall be a work within the provisions of section 145 of the Act of 1894.

To provide that all windows of new buildings of the warehouse class which are within 30 ft. of openings of other buildings shall be protected in a prescribed manner so as to limit the danger of fire spreading, but so as not to prevent the entrance of firemen to any story above the ground floor.

To prevent the spreading of fire from the upper part of walls separating buildings within a certain distance above the roof of the lower building.

To provide that all constructional ironwork in buildings shall be protected by being encased to the satisfaction of the district surveyor in concrete brickwork, terra-cotta, or metal lathing and plaster or cement not less than 2 in. in thickness.

To empower the Council to require the maintenance of proper arrangements for lessening danger of fire in buildings of large cubical extent.

To prevent the use of wooden joists pugged concrete as a fire-resisting material for the structure of the floor over any room or enclosure in which a furnace is fixed.

Construction of buildings.—To provide for regulate the use of iron and steel construction buildings.

To provide for an appeal to the superintendent architect against the decision of the district surveyor on certain points of construction.

To provide that when two external walls above the roof are constructed next such walls without parapets, such walls shall be carried up above the roof as though they were party walls.

To provide that not more than two stories shall be constructed in the roof of any building, but that provision shall not apply to any story below a of 30 ft. above the pavement, one side only of story forms part of the roof.

To require that all staircases shall be adequately lighted.

To make the minimum height of habitable room (not wholly or partly in the roof) 9 ft., instead of 8 ft. 6 in. as at present, and the height of habitable rooms (wholly or partly in the roof) 8 ft. 6 in. instead of 8 ft., as at present.

To provide that the minimum space that shall be left between the ground and the underside of floor joists shall be 6 in., and to require the provisions of openings for ventilation, the minimum of such openings to be 5 in. by 6 in.

To provide that a habitable room constructed as a stable, coach house, or harness-room communicating therewith, shall be separated horizontally vertically from the stable by a solid concrete wall, and that the wall shall be supported, and of a minimum thickness 6 in.

To provide that if a construction under the pavement, etc., other than an archway, is constructed of brick or stone it shall be done to the satisfaction of the district surveyor, but to exempt arches, constructed by the Council in streets from the rule of the district surveyor.

To provide that outside stairs or steps to a dwelling-house shall be protected with a balustrade or handrail, where necessary.

To provide that horizontal separation as an alternative to separation by party walls.

To enable the Council to control the formation of openings in external walls closely abutting on other buildings.

To require that windows at a height of over 2 ft. above the ground shall be constructed in such manner as to admit of their being cleaned from inside.

Temporary buildings and structures.—To make clear what structures may be licensed, and to provide for the licensing of certain temporary buildings.

To provide that expenses incurred in causing the Council to secure the removal, after a certain date, of existing irregular buildings, and to make certain minor amendments in the provisions with regard to temporary buildings and structures.

Dangerous and neglected structures.—To empower for the Council to immediately shored up, pull down dangerous structures in urgent cases.

To provide that expenses incurred in causing the Council to secure the removal, after a certain date, of existing irregular buildings, and to make certain minor amendments in the provisions with regard to temporary buildings and structures.

To provide that every roof of a new or existing building, and every balcony, etc., intended for use for affording seating or standing accommodation for a number of persons, shall be safely constructed and secured, and provided with suitable access to the roof.

To prohibit the attachment of ropes, etc., across streets to buildings unless with consent of the borough council.

To prescribe that the period during which structures erected upon the public way shall be permitted to remain be limited to one year, unless the Council consent to an extension of this period.

Dangerous businesses.—To prohibit the carrying on of dangerous business except under licence of the Council, and to enable the Council to impose conditions, and to charge a fee for such licence.

Low-lying land.—To make the provisions as to building on low-lying land apply to buildings erected on land which is so situated that the buildings cannot be efficiently drained at all times into the existing sewerage system of the Council.

District surveyors.—To make various detail amendments to facilitate action by the district surveyor for breaches of the Act.

To give the Council power to proceed, should it desire to do so, in cases where it is the duty of the district surveyor to take action.

To make the necessary amendments in the Council powers with regard to district surveyors to enable them to introduce a proper system of payment of district surveyors by salaries.

To make certain modifications in the fees payable to district surveyors.

Tribunal of Appeal.—To increase the number of members from three to five.

To provide that one member (who shall not be a member of the Council) shall be appointed by the Council, that one shall be a barrister of not less than ten years' standing, shall be chosen by other four, and shall act as chairman of the Tribunal.

To provide that no architect or surveyor practising in London shall be eligible for membership of Tribunal.

To restrict the powers of the Tribunal to the limitations of the section under which the appeal is made.

By-laws.—To enable the Council to make by-laws with regard to—

The erection of houses on excavated sites and sites which are damp and have been heavily manured.

The nuisance caused by dust arising from the demolition of buildings.

the use of steel and iron construction, scaffolding and machinery.
 the mode of naming streets and numbering houses.
 exemptions.—To remove or modify certain of the provisions in the Act of 1894, and to add such as may be necessary.

Sanctions.—To enable the Council to sanction the cubical contents of buildings to be used for shops, or manufactories, or for any purpose which the Council may deem it expedient to permit, being such dimensions as the Council may consider necessary.

To enable the Council to consent to the uniting of buildings under proper conditions, and to make alterations in the requirements for doors and openings in party walls.

To enable the Council to require the removal of line signs, and to regulate the construction of boards, frames, affixed to external walls of buildings for the purpose of advertisement.

To control flags, cranes, etc., which only project from buildings when actually in use.

To provide that posts at the entrance to narrow streets shall be hinged so as to allow of the passage of carriages, and to apply this provision to existing passages.

To extend the time within which the Council can proceed to twelve months.

To provide machinery for enforcing the Act on unoccupied buildings when exempted from rates.

To provide that notice shall be given to the high council of intended building operations, and that the borough council shall be entitled to inspect plans of the works.

To provide that where an old building is taken down or destroyed for more than half its cubical contents, the remaining portion of the building shall be demolished or made in all respects to conform to the provisions of the Act.

To transfer to the borough councils the powers, duties, and liabilities of the district surveyors as regards the supervision of the construction and erection of the electric lighting boxes and similar structures under the public way, except in regard to property of Government and municipal authorities.

To make it an offence to use for more than three consecutive days or nights, or more than three single nights, in any one calendar month any building as a public place, or any building which has not been constructed in accordance with the provisions of the Act as to public buildings.

To prohibit the continuous employment of persons in rooms or basements not constructed in accordance with the rules of the Act as to habitable rooms or basements.

To prevent the use of a building for any purpose which would render it, while so used, not in conformity with the Act.

To provide that buildings which have been erected for one purpose shall not be used for any other purpose, unless, and until, the sanction of the Council is obtained.

To render void old "consents" and "orders" not in force upon the expiration of two years from the date of the Act.

To empower the Council to direct surveyors to cause the removal of improper building materials from a site, and to prevent the use of such materials in the erection of a building on such site.

To provide for the appointment of practical surveyors of all plans, machinery, and scaffolding in connexion with the erection of buildings, and to enable the Council to control such plans, machinery, and scaffolding.

To empower the Council to require the fencing of unoccupied land.

To provide power to secure the removal of any obstructions, obstructing communication between streets.

To require the sides of excavations to be properly and sufficiently shored up as the work is proceeded with.

To make additional provisions with regard to the use of timber.

To prevent any interference with the foundations of buildings after construction in such way as to alter the building.

To provide that for domestic buildings external walls may be constructed as hollow walls if such be constructed in accordance with certain rules, rates to be specified.

To make provisions for the construction of retaining walls and boundary fence walls and party fences exceeding 7 ft. to height.

To make it clear that in cases where the external or ground wall of a building is set back from the defined distance from the centre of the street, or where the Council has consented to the erection of a line upon condition that the land in front shall be given up to the public, the land separating the building from the public way is to form part of the public way.

To provide that the local authorities shall take care to make up roads and have snowsweeps within a reasonable time of the formation of the roads.

To provide power for local authorities to alter the level of the footway, and to prevent the obstruction of footways left open, but not dedicated to public.

To provide for registration at the Land Registry of covenants containing clauses as to giving up to the public.

To obtain power to prevent the erection of irregular structures, signboards, etc., on forecourts.

To revise the schedule of fire-resisting materials.

To make any amendments consequent on the foregoing proposals and certain other amendments of law, which have been sent to the Parliamentary Committee, but have not been specifically referred to.

To make an efficient amendment of the London Building Act in a matter which admits of no delay.

To provide that the vacant spaces remaining are being made up to the public, and the land separating the building from the public way is to form part of the public way.

rear of buildings insisted upon. The subjoined table, which has been compiled from the information given in the Council's statistical abstract as to the number of houses rated and from the annual reports of the Building Act Committee, shows approximately the rapidly with which building is proceeding, and, unfortunately, future slums are in many cases being created—

NUMBER OF HOUSES ERECTED AND TOTAL LENGTH OF STREETS SANCTIONED DURING THE YEARS 1897-8 TO 1902-3.

	1897-8	1898-9	1899-1900	1900-1	1901-2	1902-3
Approximate number of houses erected	4,774	3,507	5,287	The figures for this year are not comparable owing to the London Government Act, 1899, coming into force.		2,401
Length of streets sanctioned (in miles)	14	17	23	16½	9½	15½
	Houses.		Streets (in miles).			
Total	21,436		95½			
Average (per annum)	3,573		16			

RECOMMENDATIONS.

We recommend that in the Bill to amend the London Building Acts, which the Council, on June 14, 1904, resolved should be introduced into Parliament in the session of 1905, provision be made—

(1) To enable the Council in the case of new streets and adaptations of ways to streets—

- (a) To require greater width, lateral communications, connexions with existing streets, reservation of land for connexions to adjoining estates and the formation of such connexions when required; protection of streets proposed to be laid out at a level different from that of the land immediately adjoining on either side.
- (b) To alter the position, direction, or level in order to make more direct communication.
- (c) To prevent the formation of *cuis de sac*.
- (d) To secure an equitable incidence of the cost of paving and making up.
- (e) To control and require, where necessary, the formation of back streets.

(2) To facilitate the widening of existing streets by—

- (a) Restricting, except under certain conditions, the height to which dwelling-houses may be erected in narrow streets and ways.
- (b) Enabling the Council to keep back, without compensation, to a greater distance than 20 ft. from the centre of the roadway, buildings to be used for business purposes.
- (c) Restricting, except under certain conditions, the height to which any buildings within 20 ft. from the centre of a street or way, etc., may be re-erected, and prohibiting the raising or extension of any such building without the consent of the Council.

(3) To strengthen the powers of the Council with regard to the erection and re-erection of buildings in advance of the general line of buildings; to enable the Council to control the line to which buildings may be erected where the general line has been destroyed by the demolition of buildings; and to provide that the building line in certain new streets shall not be within a certain distance of the centre of the street.

(4) To enable the Council to determine a building line on one or both sides of any important street at a distance not exceeding 75 ft. from the centre of the street; to acquire any buildings, land, or structures in advance of the line so determined, or to require any such buildings or structures to be set back to such line on payment of compensation; to provide that after the determination by the Council of such a building line no building or structure shall, without the consent of the Council, be erected or extended in advance thereof; to enable the Council to make new streets where necessary to continue a thoroughfare widened as aforesaid, or for the purpose of affording through communication, and to provide for the settlement of questions of compensation and for the necessary machinery to enable the Council to exercise the powers sought to be obtained.

(5) For certain amendments in the provisions relating to the naming of streets and numbering of houses in order to facilitate the discharge of the Council's duties with regard thereto.

(6) (a) To enable the Council to require the provision of space at rear in certain cases where it cannot now require it, and increased space at the rear of dwelling-houses, and to prevent the erection of buildings which are not subject to the provisions as to space at rear on sites which are surrounded by dwelling-houses, and upon which the erection of dwelling-houses would be prohibited for lack of air space.

(b) For requirements as to open space with regard to all domestic buildings not abutting upon a street.

(c) For the maintenance at all times of the open space provided in accordance with the Act.

(d) For the better lighting and ventilation of habitable basements and of rooms which have no windows directly opening on to the external air otherwise than into a court inclosed on every side or open on one side only.

(7) For means of escape in case of fire and reducing risk of fire by requiring all buildings (new and old) exceeding a certain height to be provided with means of access to the roof (guard rails being provided where necessary) by reducing the height above which means of escape can be required in new buildings, and applying the amended provisions to existing buildings after seven years; by requiring means of escape to be provided from new buildings in which there is sleeping accommodation for more than a certain number of persons, or in which more than a

certain number of persons are employed (the provision to extend to existing buildings after seven years); by making provisions as to the construction of buildings containing sets of offices or chambers, and the size to which such buildings may be constructed; by requiring proper preparation to be provided between the two portions of premises used partly for trade and partly as dwellings where such

premises exceed a certain size, and the provision of means of escape (special provision being made in the case where the shop portion projects more than 5 ft.); to prescribe rules for boarding and panning and the construction of new lift shafts (except in certain dwelling-houses), the rules to apply to existing lifts after seven years.

(8) To enable the Council to consent to the uniting of buildings under proper conditions, and to the erection of buildings of such cubical extent as the Council may deem it expedient to permit, and to permit and make regulations for the use of iron and steel construction in buildings.

(9) For certain amendments in the provisions of the Act relating to the rights of building and adjoining owners.

(10) For wooden buildings of certain dimensions being licensed by the Metropolitan Borough Councils, and for enabling the Council to secure after a certain date the removal of existing irregular buildings.

(11) For certain amendments in the powers of the Council with regard to dangerous and neglected structures.

(12) To prohibit the carrying on of dangerous businesses except under licence from the Council, and to enable the Council to impose conditions, and to charge a fee for such licence.

(13) To make the provisions as to building on low-lying land apply to buildings used or to be used wholly or in part as dwelling-houses erected on land which is so situated that the buildings cannot be efficiently drained at all times by gravitation into an existing sewer of the Council.

(14) For increasing the number of members of the Tribunal of Appeal from three to five, for one member to be appointed by the Council, but not to be a barrister of not less than ten years standing, to be chosen by the other four, and to act as chairman of the Tribunal; also that no architect or surveyor practising in London shall be eligible for membership of the Tribunal, and that the powers of the Tribunal shall be restricted to the limitations of the section under which the appeal is made.

(15) For the necessary amendments in the Council's powers with regard to district surveyors, to enable it to introduce a proper system of payment of district surveyors by salaries, and to make certain modifications in the fees payable to district surveyors.

(16) For repealing, modifying, or adding to certain of the provisions in the Act of 1894, giving total or partial exemptions from the provisions of the Act.

(17) For the other amendments indicated in the foregoing report, but not specifically included in the foregoing clauses of the recommendation.

Notice has been given by Dr. Naper of the following amendment to recommendation No. 1 (to be recorded by Mr. Shephard):—

"That, whilst fully recognising the necessity of amending, at an early date, the London Building Acts in many important particulars, the Council is of opinion that, having regard to the number and magnitude of the proposed amendments, to the fact that they have not been submitted to and considered by the professional and local authorities (in accordance with the practice hitherto adopted, and which the Building Act Committee in their report to the Council on June 14, 1904, implied would be done) and to the further fact that the proposals of the Council for legislation in the next session of Parliament are already both numerous and important, it is undesirable to proceed with the proposed amendment of the London Building Acts in the next session of Parliament; but that such proposals be referred back to the Building Act Committee for further consideration with a view to legislation being sought in the session of 1906."

ARCHITECTURAL PICTURE POSTCARDS.—Mr. H. R. Allenson sends us four packets of six picture postcards each, two consisting of views of "Wren's City Churches," two of them labelled "Old London Churches." Among the many subjects now used for picture postcards we are glad that architecture is not forgotten.

Arcading over West Doorway, Ouistreham.

Illustrations.

OUISTREHAM CHURCH.

WE give a view of the exterior of the fine Romanesque church of Ouistreham, a small seaside place on the north coast of France, some nine miles from Caen; and also separate illustrations of the west doorway, and of the arcading immediately over it.

The west end shows a very simple but effective decorative treatment by means of wall arcading; and though these are details differing considerably from those common in Norman architecture as transplanted to England, one may imagine the arcading of the west front to be a fair indication of what may have been the treatment of the space within the great arch of Tewkesbury front, before it was cut out to introduce the large late Gothic window.

There is nothing about it, indeed, comparable in boldness to the Tewkesbury arch, but the successive masses of the perfectly plain buttresses, seen in perspective in the view, have a very striking effect.

The church was to have been the subject of a special article in this issue, which had been duly written and posted but, by some accident, has not reached us.

PUBLIC OFFICES, HENDON.

This building has recently been erected on the north-west side of the Burroughs, Hendon.

The subjoined plan shows the principal floor.

On the ground floor the engineer's department and drawing-office occupy the south-east portion under the clerk's department, while the rate collector and accountant and the education clerk occupy the north-east portion, under part of the Council Chamber and Committee-room No. 2. The medical officer's department is situated under the members' library and Committee-room No. 1. The building inspector's office and materials testing-room are under the waiting-room, and in a one-story building projecting towards the north-west of the principal staircase. The caretaker's rooms are in the attics over the clerks' inquiry-office and spare room.

The facing bricks are new heather red-pressed bricks, supplied by the Heather Brick & Terra Cotta Company, Ashby-de-la-Zouch, Leicestershire; while Beerstone is used for the window dressings, entrance, etc. Permanent green slates are used in the roofs; the roof of the ventilating lantern is covered with copper and finished with a wrought-iron vane.

The contractors were Messrs. Thomas H. Kingler & Son, Oxford. The heating arrangements were carried out by Messrs.

C. N. Haden & Sons, Cromer-street, W.C. The architect is Mr. T. H. Watson, and the drawing was exhibited at the last Royal Academy.

DECORATIVE DESIGNS FOR TEXTILES.

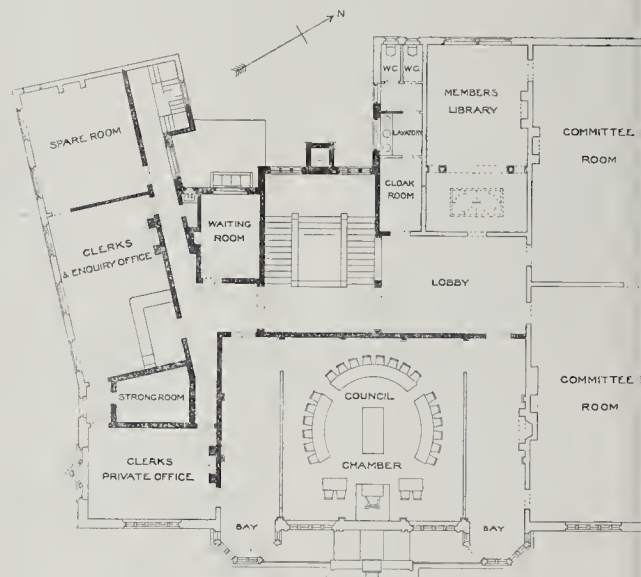

THESE four designs are by Mr. A. B. McDonald, a student at the Royal College of Art.

Of the two upper ones, that on the left-hand side is for a printed silk, having seven colours on a white ground; to be reproduced by block printing. That on the right is also for a printed silk, but for roller printing, in four colours on a white ground.

The left-hand lower design is for a chintz, acid printed on an indigo cloth; then five other prints, leaving long leaves, stems, and flowers

partially white: roller printed. That on the right is a chintz in six prints; cones and flowers on a white ground: block printed.

POST OFFICE BUILDINGS, AUCHTERARDE.—The new Auchterarder post office will have a frontage to High-street of 42 ft. It is three stories in height, the ground floor being utilised for the post office and a shop; the other two stories for a dwelling. There will be an entrance at the back for receiving and despatch of mails. The building will have a saloon at the back, and a dwelling-house will consist of eight apartments, with bathroom, etc. The plans have been prepared by Mr. James Macdonald, architect, Perth, and the whole work was carried out under his supervision.

NEW FLOORING METHODS AT BORDON CAMP.

As a generally applicable axiom, it may be taken that novelties are seldom, if ever, exemplified in the construction of buildings and other structures designed in the drawing offices of the various Government Departments, where old-established precedents reign supreme. Improvements can rarely enter until they come into universal favour in the outside world and have acquired respectability with time. Bearing in mind this peculiarity of official practice, we have additional pleasure in directing attention to two novel methods that are now being applied to floor construction at Bordon Camp, under the direction of Colonel Staveley Gordon, R.E., to whose courtesy we are indebted for the opportunity of obtaining the particulars given in this article.

The first of these systems is a type of concrete-slab floor construction of German origin, and which, so far as we are aware, has not been adopted elsewhere in this country. A floor of this system has just been completed by Messrs. Hawkins & Co., of Ashford, Middlesex, one of the barrack buildings at the Camp. The dimensions of the space covered being 10 ft. long by 22 ft. wide, and it is worthy of note that, although the floor is only 5 1/2 in. thick at the centre, no girders, joists, or intermediate supports are required. The concrete employed is mixed in the proportions of one part of Portland cement to four parts of ballast, and the reinforcement is applied to the tension area in the form of steel strips measuring 1 1/2 in. wide by 3/8 in. thick, the strips having quarter-twist at intervals, apparently with the object of obtaining a more secure bond between the concrete and the steel than would be given by using straight bars, and also for the purpose of affording ample support for the concrete along those parts of the bars which lie horizontally. To distribute this effect over the whole floor slab, the bars are twisted at regular intervals so that the horizontal portions of one bar may be opposite the vertical portions of adjacent bars. The bars are embedded at a suitable distance above the lower surface of the concrete, in order that the metal may be adequately protected against fire. The resistance of the floor is increased by adding to the thickness of the concrete near the walls, and in some cases round rods are used for reinforcement in addition to the flat bars. We are not present in a position to give the results of tests upon the floor, but may say that the calculated safe live load is stated to be 62 lb. per sq. ft. and the dead load, including the weight of the floor itself, 150 lb. per sq. ft., a factor of safety of 5. So far as first principles are concerned, there is nothing new in this system of flooring, the novelty being confined in the particular manner in which the reinforcement is employed. If accurately proportioned, any floor of the kind would be perfectly safe, and the facility it offers for forming comparatively large spaces without supporting ribs is a feature that will, no doubt, be appreciated by architects.

Another new method which has been extensively used at Bordon Camp is the "Stonwod" system. The materials of construction consist of a fine powder, produced in different ways, and a cementing liquid. As the composition of these materials is kept secret by the makers, we are only able to state the results of our recent examination, which extended over a course of being laid, to floors recently made, and to others that had been in use for several months. In the first place, we may say that the material can be laid as a covering on a concrete foundation, over a brick or stone floor, or upon any firmly-nailed wooden surface so as to form a perfectly jointless surface. After solidification—a process occupying about thirty hours—can be polished and oiled to a parquet floor. In contact with wood "Stonwod" adheres so firmly that it can easily be separated without bringing away any of the fibres, and it makes an equally satisfactory bond with concrete and other materials used for foundations. Some of the reasons that we had the opportunity of inspecting the construction were being laid with a "Stonwod" skirting, raised to the height of 2 or 3 in. all round the walls, to facilitate cleaning operations and to prevent any risk of leakage into the brickwork at the junction of the floor with the walls. One point that should always be borne in mind is to avoid any of the flooring until it has thoroughly

hardened, and for the same reason the work of laying should not be undertaken in a building before other workmen have concluded their labours. However, the only injury done by premature use is to scratch the surface, and this can readily be made good by rubbing and repolishing. In one building at Bordon, used alternatively as a gymnasium, a concert hall, and a church, the floor has been slightly scratched by the nailed boots of the soldiers. This represents the extent of the damage caused by several months of hard wear, and is attributed by the patentees to the fact that the floor was opened for use too soon after completion. A more favourable criterion for judgment is to be found in the floor of the sergeants' mess-room, where there are no perceptible signs of wear, although a wooden fillet in the doorway has been completely worn through by constant traffic. The same room permits the observer to test the different effects of the covering when applied to a foundation of concrete or of timber, the elasticity of the latter being very pronounced, as might be expected. It is claimed for "Stonwod" that its fire-resisting qualities are of a high order, but on this point we are unable to speak from personal experience. For the purpose of giving the maximum degree of security against fire, the covering ought certainly to be laid on concrete or some equally non-combustible material. It happens, however, that innumerable timber floors are in existence which the owners are not likely to replace by others of fire-resisting character. In such cases, "Stonwod" offers a ready and inexpensive means of securing protection from fire on the upper surface of the floor. It is warm to the feet, and very much resembles linoleum in appearance, as in its comparative noiselessness. We are certainly inclined to believe that a very considerable future exists for this material in connexion with the design and construction of public institutions of all kinds, as well as of factories, offices, buildings, and private dwellings, more especially as in many cases it will render the use of linoleum and kindred floor coverings quite unnecessary.

NOTES ON PERMANENT WAY FOR TRAMWAYS.

UNDER this title, Mr. A. N. Connett, M.Inst.C.E., read a paper on Thursday last week before the Tramways and Light Railways Association. The subject is engaging much attention at the present time, and, considering the large sums of money that are being expended all over the country in the installation and extension of municipal and other tramways, it is very desirable that full publicity should be given to the results of experience and observation. Taking up "rails" as the first item for discussion, the author found very little to say, alleging the very satisfactory reason that "one result of the Report of the Standardising Committee on tramway rails has been to cut out an immense amount of 'copy' in papers such as this." Consequently, he was able to devote ample time to the discussion of "joints," a detail of permanent way construction on which much thought has been expended, and, so far, without the absolute demonstration of an entirely satisfactory solution of the problem involved. It is certainly a most unfortunate circumstance that the life of rails is practically limited by the wear at the joints, and all true economists must feel grieved to know that miles of tramway rails have to be taken out and replaced every year simply because the metals are battered at the ends, although otherwise they have many years of wear in them. One serious difficulty experienced by the tramway engineer is, as stated by the author, "that the tram-joint is inaccessible for inspection and repairs." We have no doubt that if joints on tramways were sited so that they might have the same attention as on steam railways, the joint problem would be greatly simplified. Many varieties of mechanical joint have been tried, and of them the experienced engineer was said to believe that all "are bad, only some are worse than others." No doubt, this saying is an exaggeration, but the difficulties attending the employment of mechanical joints of all kinds have caused a good deal of attention to be paid to other methods. Among such, Mr. Connett dealt with cast weld, electric weld, and thermite weld joints. The first of these is satisfactory if made in the most careful manner by experienced men. Its disadvantages were said by the author to be

that the process of welding by using a large mass of molten metal changed the character of the steel rail ends, and that there was, in consequence, wear at the joints due to softer steel there than elsewhere. But the most serious objection is to be found in the large plant required, for, as the author remarked, "The transportation and use of a miniature blast furnace along a public road is a thing one would avoid if possible." The electric weld joint, at first a failure, was described as being in successful use although requiring a somewhat formidable plant. Of the thermite weld joint, which has previously been described in our columns, the author expressed a generally favourable opinion. We know that the results obtained at Leeds are satisfactory, and if they continue to be so in the future, this form of joint may become almost universal. In dealing with the question of "construction," Mr. Connett called attention to an interesting variation from the usual type of concrete construction. This system, adopted by Mr. A. E. White, M.Inst.C.E., city engineer of Hull, consists of a concrete foundation, between which and the rail is a cross-sawn Baltic redwood sleeper, 4 in. deep by 7 in. wide, the object of the timber being to provide some elasticity to the rail and, consequently, a more noiseless and more easy-running track. The paper concluded with some brief remarks upon paving, a subject on which very little need be said, as local conditions usually govern the adoption of the system that must be adopted.

BY-LAWS UNDER SECTION 39 (1) OF THE PUBLIC HEALTH (LONDON) ACT, 1891.

The Public Health Committee of the London County Council reported as follows at Tuesday's meeting of the Council, the recommendations being agreed to:—

On July 26, 1904, we reported further as to the necessity for an amendment of By-law No. 26, made by the Council under section 39 (1) of the Public Health (London) Act, 1891, and the Council, on our recommendation, gave instructions that copies of the by-laws proposed to give effect to the desired amendment should be again sent to the sanitary authorities pursuant to section 114 of the Act. This action was accordingly taken, and we have considered the further observations made by these authorities, but do not think it necessary to make any alterations in the amended draft. We recommend—
(a) That by-laws be made by the Council under section 39 (1) of the Public Health (London) Act, 1891, in the form set out in the appendix to this report, and that the seal of the Council be affixed to copies of such by-laws.
(b) That notice be advertised of the Council's intention to apply to the Local Government Board for confirmation of the by-laws, and that the other action prescribed by sections 184 and 185 of the Public Health Act, 1875, be taken.

By-laws made by the London County Council under section 39 (1) of the Public Health (London) Act, 1891, with respect to water-closets, earth-closets, privies, and receptacles for dung.

1.—The occupier of any premises shall cause every water-closet belonging to such premises to be thoroughly cleansed from time to time as often as may be necessary for the purpose of keeping such water-closet in a cleanly condition.

The occupier of any premises shall ensure that in every week cause every receptacle for dung belonging to such premises to be emptied and thoroughly cleansed. Provided that where two or more lodgers in a lodging-house are entitled to the use in common of any water-closet, or receptacle for dung, the landlord shall cause such water-closet to be cleaned, or receptacle for dung to be emptied and cleansed as aforesaid.

The owner of any lodging-house shall, subject to the provision hereinafter provided, give and maintain in connexion with such house, water-closet, earth-closet, or privy accommodation in the proportion of not less than one water-closet, earth-closet, or privy for every twelve inmates of such house.

Provided that proceedings shall not be taken against the owner of any lodging-house for an offence against the last-mentioned requirement of this by-law unless and until the owner, after service upon him of a notice in writing by the sanitary authority, requiring him within such reasonable time as is specified in the notice to comply with the by-law, has failed to comply with the by-law within the time so specified.

For the purposes of this by-law, a "lodging-house" means a house or part of a house which is let in lodgings or occupied by members of more than one family. "Landlord" in relation to a house or part of a house which is let in lodgings, or occupied by members of more than one family, means the person (whatever may be the nature or extent of his interest) by whom or on whose behalf such house or part of a house is let in lodgings or for occupation by members of more than one family, or who for the time being receives or is entitled to receive the profits arising from such letting. "Lodger," in relation to a house or part of a house which is let in lodgings or occupied by members of more

than one family, means a person to whom any room or rooms in such house or part of house may have been let as a lodging or for his use or occupation.

Nothing in this by-law shall extend to any common lodging-house.

Penalties.

2.—Every person who shall offend against the foregoing by-law shall be liable for every such offence to a penalty of five pounds, and in the case of a continuing offence to a further penalty of forty shillings for each day after written notice of the offence from the sanitary authority.

Provided, nevertheless, that the court before whom any complaint may be made or any proceedings may be taken in respect of any such offence may, if they think fit, adjudge the payment as a penalty of any sum less than the full amount of the penalty imposed by this by-law.

Repeal of By-law.

3.—From and after the date of the confirmation of these by-laws, the by-law numbered 26 (twenty-six) in the by-laws relating to water-closets, earth-closets, privies, ash-pits, cesspools, and receptacles for dung, and the proper accessories thereof in connection with buildings, which were made by the London County Council on the twenty-second day of June, in the year one thousand eight hundred and ninety-three, and were confirmed by the Local Government Board on the twenty-eighth day of June, in the year one thousand eight hundred and ninety-three, shall be repealed.

THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, S.W., Mr. J. Williams Benn, M.P., Chairman, presiding.

Loans.—On the recommendation of the Finance Committee, it was agreed to lend Bermondsey Borough Council 13,400*l.* for erection of working-class dwellings; Hammersmith Borough Council 6,690*l.* for street improvements; Hampstead Borough Council 900*l.* for office accommodation; Poplar and Stepney Sick Asylum District Managers 5,005*l.* for works at asylum; and Shoreditch Borough Council 925*l.* for pipe sewer re-construction works. Sanction was also given to Islington Borough Council to borrowing 3,950*l.* for asphalt paving works; and to Woolwich Borough Council to borrowing 330*l.* for advances under the Small Dwellings Acquisition Act, 1899.

The London Building Act.—Proposals by the General Purposes Committee and the Building Act Committee are printed on another page.

Avery-hill Mansion.—The Education Committee and the Parks Committee, each submitted a report dealing with the proposal to use the mansion at Avery-hill, formerly the residence of the late Colonel North, for the purpose of a training college for teachers. The park in which the house is situated was acquired by the Council in 1902 as an open space, and the Parks Committee recommended that Parliamentary powers be sought to authorise the use of the mansion and two acres of adjacent ground as a residential training college for teachers.

Sir W. J. Collins, on behalf of the Education Committee, moved an amendment to the effect that, instead of two acres of land, four acres of land should be utilised for college purposes.

After a long debate, the amendment was carried by 72 to 44 votes, and agreed to as the substantive motion.

Selected List of Contractors.—The following recommendations of the Education Committee were agreed to:

"That the names of the undermentioned firms be removed from the selected list of contractors to tender for works in connexion with L.C.C. schools:—(i.) Messrs. Couchman, Blow & Co., of Blackheath; (ii.) Mr. C. Humphrey, of Fulham; (iii.) Mr. E. Harmer, of Brixton; and (iv.) Mr. C. Foreman, of Plumstead.

That the name of Mr. John Peattie, of No. 18, Dorset-street, Baker-street, be added to the selected list of contractors to be invited to tender for carrying out structural alterations and repairs to school buildings to the value of 3,000*l.*"

Survey of Non-Provided Schools.—The Education Committee reported that:—

"The Council, on June 28, 1904, sanctioned expenditure not exceeding 1,794*l.* for making a survey of the 508 non-provided schools within the county, beginning with those schools which have been unfavourably reported upon by the Council's inspectors. Active steps are being taken to complete this survey and the form upon which the reports are being made by the architect (educational) provides for a description of the arrangements existing in regard to (i.) lighting, (ii.) ventilation, (iii.) heating, (iv.) cloak accommodation, (v.) lavatory accommodation, (vi.) teachers' rooms, (vii.) staircase accommodation and emergency exits, (viii.) area of playground. Particulars are also given of the office accommodation and the general condition of the building as regards structural repair, etc., together with the recommendations of the architect (educational), upon the various points. Up to the present time about 200 schools have been surveyed, and the architect (educational) reports that his survey will be completed by February, 1905. Following this paragraph will be found detailed recommendations dealing with the undermentioned twenty-nine schools:—

Battersea—St. Mary's (N.), Green-lane, Battersea.

Battersea—Christ Church (N.), Este-road, Battersea. Battersea—The Sacred Heart (R.C.), Trotter-street, Battersea.

Battersea—St. Peter's (N.), Plough-road, Clapham Junction.

Battersea—Wesleyan Model (Southlands Training College Practising School), Castle-street, Battersea.

Battersea—St. John's (N.), Usk-road, Battersea.

Battersea—St. Mark's (C.E. Infants'), Battersea-rise, Bethnal Green, W.—St. Matthias (N.), Granby-street, Bethnal Green.

Brixton—St. Andrew's (N.), Lingham-street, Stockwell.

Brixton—St. Mark's (N.), Bolton-street, Kenington.

Prefixes to the reports on each school are (i.) the official number of the school (Board of Education); (ii.) the late School Board division and sub-division; (iii.) the accommodation as recognised by existing managers (as far as such information is obtainable); (iv.) the accommodation as recognised by the late authority; (v.) the accommodation as recognised by the Board of Education; and (vi.) the accommodation now recommended to be recognised. In each case recommendations are submitted in reference to the character and suitability of the premises for purposes of elementary education. It should be added that, unless specially mentioned, there is a *prima facie* case that the drains are in a serviceable condition."

The report included reports from the educational architect (Mr. T. J. Bailey) on surveys he had made of the twenty-nine schools, recommending that in some cases representations should be made to the Board of Education as to the unsuitability of the schools from a structural point of view, and in other cases recommending substantial structural alterations.

Sir William Collins, the Chairman of the Education Committee, said he did not agree that this question of the state of the non-provided schools should be considered piecemeal, his contention being that these schools should be dealt with as a whole. He, therefore, declined to move the recommendation of the Committee.

The Rev. A. Jephson thereupon moved the recommendation dealing with the first school on the list, and stated that the managers of the non-provided schools were anxious to know their fate.

Mr. McKinnon Wood moved, as an amendment, that the recommendations be referred back to the Committee to complete their survey and inspection of all the non-provided schools as rapidly as possible, and to report to the Council, including as to the extra expenditure which would fall upon the rates before the close of the financial year. He said he could quite recognise that the managers were anxious to know their fate, and he could appreciate their anxiety, for they did not want this matter of the Voluntary Schools and Elementary Education to come before the people of London as one great picture.

After a discussion extending over three hours, during which it was stated that there are 508 of these schools to be reported on, the amendment was carried on a division by 72 votes to 45.

The Port of London.—The Rivers Committee presented their report, recommending that the Council should promote a Bill in the next session of Parliament, on the lines of the Bill introduced by the Government with certain modifications, for the purpose of establishing a Port Commission, which should purchase the undertakings of the three principal dock companies, take over the duties of the Thames Conservancy so far as they related to the Lower Thames, and carry out works for the improvement of the Port. The proposed Bill stipulates that the Commission shall consist of 40 members, 24 to be appointed by the Council and four by the City Corporation and Government

departments, the remaining 12 to be shipping representatives.

Sir T. Cooke-Hitching moved as an amendment:—"The having regard to the evidence before the Royal Commission to great effect if not insurmountable, difficulties connected with dredging the Thames, dredging is involved in the scheme for purchase of the docks and warehouses in Port of London, it is desirable before the Council commits itself to the principle purchase to refer back the report to the Committee, with instructions to take expert opinion on the question of the practicability of dredging the river by means of dredging, or alternative plan of obtaining permanent water by means of the erection of a bar with ship locks at Gravesend."

Mr. J. Brandon seconded the amendment. Mr. Bruce declared that a barrage would destroy the Port of London. If they stop the scour of the Thames, the sandbanks at Gravesend would flatten out and fill up existing channel.

The amendment was rejected. An amendment moved by Mr. Harris to effect that the representation of the Council on the Commission should be 15 and no members was also rejected.

Lord Welby, on behalf of the Finance Committee, moved the addition to the recommendation of words to authorise the Commission to levy dues on goods in accordance with schedule of *maximum* rates to be approved by the Board of Trade, provided that power was only to be exercised by the Commission in the event of the revenue of Port Fund being insufficient, after provision for working expenses and any prior charge to meet the interest on the guaranteed stock and the instalments payable to sinking fund for redemption of the stock which became payable.

Mr. Bruce seconded the amendment, which after some discussion, was rejected by a majority.

The recommendations of the Commission were then adopted.

Lewisham Palace of Varieties.—The Theatrical and Music-Halls Committee reported that they had considered plans submitted by Messrs. Owen & Ward, for Mr. W. Stephens, of a music hall proposed to be erected at the junction of Lewisham High-street and Limes-grove. The building will have seating accommodation for 1,642 persons. The application was agreed to on certain conditions.

Vauxhall Bridge—Designs for Panels.—Bridges Committee reported as follows:—

"The design approved by the Council on May 19, for the superstructure of the new Vauxhall Bridge, provides for sculptured panels over each of the piers, both the up-stream and down-stream sides. I estimate approved on that date, a sum of 1,000*l.* included in respect of each of the eight panels. The contract for the erection of the superstructure of the bridge. We have since had under consideration the question of the design of the panels, and have had the advantage of the assistance of Mr. A. Drury, A. Pomeroy on this feature of the elevation of the bridge. The original estimate of 8,000*l.* was in respect of iron panels with allegorical figures in low relief, but it is advised that, at an additional expenditure of 1,600*l.*, it will be possible to cast the figures in bronze. Sketch models have been submitted, and from them we have had an opportunity of judging the effect of different panels in colour and low relief. It appears to us to be so greatly superior to the latter that we have unanimously decided to adopt the proposed design. It will involve an increase of expenditure of 1,600*l.*, as above stated, a saving of a much-sum has been effected on other parts of the design of the bridge, so that the ultimate cost of the bridge will not be increased. We have given directions that the sketch models to be placed in the lobby of the Chamber."

Application under the 1874 Building Act.—That the application of Mr. E. Crosse for extension of the period within which the erection of a one-story cart-shed and stable, at No. 2, Bermondsey-wall, Rotherhithe, was recommended, be granted.—Agreed.

Fire Protection.—The following applications of the Fire Brigade Committee were agreed to:—"That the estimate (No. 4,250) of 4,000*l.* submitted by the Finance Committee in respect of the acquisition of three sites for additional fire-stations at B. Brookley, and Earlsfield (Wandsworth) be approved; and that the Fire Brigade Committee be authorised to make preliminary arrangements for the acquisition of such sites."

"That the estimate (No. 4,301) of 12,000*l.* submitted by the Finance Committee in respect of the acquisition of a site, and the erection thereon of a fire-station in substitution for the Shooter's Hill site be approved; and that the Fire Brigade Committee be authorised to make the necessary preliminary arrangements for the erection of the new station."

"That the solicitor do serve notices to

acquisition of the vacant site at the junction of Walsby-lane and Eaglesfield-road.

at the freehold of a piece of ground at the junction of Walsby-lane and Eaglesfield-road be acquired for £500; that the value do issue a draft contract, in addition to that amount, the usual surveyor's fee of 5s. 6d. for solicitor's preliminary costs; that the fee for do issue the matter; and that the seal of the Council be affixed to any necessary documents connected with the purchase.

at the freehold of Nos. 45, 47, 49, and 51, Calverley-bay, Upper Holloway, be acquired for 1,350; that the value do issue a draft contract, in addition to that amount, 21s. for a surveyor's fee and 4s. for the solicitor's preliminary costs; that the solicitor do issue the matter; and that the seal of the Council be affixed to any necessary documents connected with the purchase.

tramways.—The Highways Committee recommended, and it was agreed:—

(a) That the operation of standing order No. 363 relating to the time for the submission to the Council of schemes involving application to Parliament be amended, in order that the following recommendation be considered:—

That Parliamentary powers be sought, in the Session 1905, to enable the Council to construct tramways the boundary of the county of London in Church-lane, Upper Norwood, the site of the Crystal Palace, to a point nearly opposite the high-level to the Crystal Palace.

housing.—The Housing of the Working Classes Committee reported as follows, the recommendation being agreed to:—

We report that, in pursuance of the authority given to the Council on July 14, 1903, working drawings have been prepared of the buildings proposed to be erected on the site of the Royal Caledonian Asylum in Caledonia-road, Islington. The site, which will in future be known as the Caledonian estate, was acquired by the Council under Part III. of the Housing of the Working Classes Act, 1890, and has an area of about 2 acres, a frontage of 248 ft. to the east side of Caledonia-road, immediately north of Pentonville Prison. It is divided into the estate into five blocks of five-story dwellings, capable of accommodating 1,388 persons in tenements of one room, 110 tenements of two rooms, 144 tenements of three rooms, four tenements of four rooms, and four tenements of five rooms. The Housing of the Working Classes Committee have informed us that they are not prepared to undertake the erection of the buildings at the amount of the estimate, and we are of opinion, therefore, that tenders for the work should be invited from a selected number of firms. It is not desirable that the estimate of the cost should be published at the present time, and, as no liability will be incurred in making the estimate, we do not propose to submit an estimate of the cost of the buildings. We recommend:—(a) That the working drawings of the dwellings proposed to be erected on the Caledonian estate, Holloway, Islington, be approved; and that the Housing of the Working Classes Committee be authorised to invite tenders from a number of selected firms for the erection of the buildings.

the Gladstone Memorial.—The Improvement Committee submitted a report with recommendations to the allocation of a site for the proposed Gladstone Memorial. They recommended that the Memorial Committee be allocated a site to the west of St. Clement Danes Church in the Strand. The First Commissioner of Works has consented to the erection of the monument on this site. The monument will be of appropriate and important in character, and will, in the opinion of the Memorial Committee, be in every way worthy of the surroundings. It is designed by Mr. Hamo Thornycroft, R.A., and has a cruciform base measuring 26 ft. every way, with a pavement level at about 5 ft. wide. The superficial of the ground required for the structure will be about 500 ft. It is proposed that the memorial shall have an architectural base of sandstone, and shall be surmounted in the centre by a bronze statue of Mr. Gladstone. The robes of the Chancellor of the Exchequer, and statues or groups also in bronze will be placed on the projecting portions of the base, the height of the memorial will be about 100 ft. The proposed site, including the curving footway, is distant about 82 ft. from the buildings on the south side of the Strand, 51 ft. from the railings at the western end of St. Clement Danes Church, about 83 ft. from the north side of the Strand, and 139 ft. from the eastern end of the crescent site. This gives a width of about 60 ft. for the carriage-way to the south of the memorial, 46 ft. to the north, and 87 ft. to the west. The recommendation was agreed to.

being transacted other business, the meeting adjourned after a six hours' sitting.

ENT OFFICE.—An open competitive examination for not fewer than twenty situations of assistant examiner in the Patent Office will be held by the Civil Service Commission in January next. The examination will commence on the 2nd of the month, and applications for admission to it are ready for issue, and may be obtained on request addressed by letter to the Secretary, Civil Service Commission, Burlington-gardens, London, W.

THE ARCHITECTURAL ASSOCIATION DISCUSSION SECTION.

The second meeting of the session was held at 18, Tufton-street, on the 2nd inst., when Mr. A. H. Belcher read a paper entitled "Economies of Construction in Small Houses," the paper being illustrated by an interesting collection of drawings lent by Messrs. E. Guy Dawber, John Belcher, Arnold Mitchell, Needham Wilson, Curtis Green, and other gentlemen. Mr. Belcher divided his paper under heads as follows: 1. Site; 2. Aspect; 3. Special requirements; 4. Size and number of rooms; 5. Plan; 6. Elevation; 7. Materials; 8. Sanitary arrangements and drains; 9. Decoration; 10. Cost; and 11. Builders. Taking these in the order enumerated, he laid stress upon the following points: The selection, if possible, of a fairly level site to avoid expense in foundation work. The advisability of a south or south-east aspect, careful attention to the special requirements, a matter often overlooked. As to the size and number of rooms, this depended on locality, in London the houses being often divided up into separate tenements containing three or four rooms, with either a separate water-closet, or one used in common with the other tenements, whilst in the country and suburbs of London houses contain as a rule about seven rooms, including the bath-room and water-closet. In regard to plan, Mr. Belcher said that economically the square type, with the flues taken up in one central stack was that best adapted, but this could not always be followed, as, for example, in a row of terrace houses. As to the question of elevation, one could lay down no hard and fast rule, but simplicity should be the key-note, and local material made use of as fully as possible. Mr. Belcher then proceeded to "trounce" the speculative builder, and to illustrate his remarks, banded round some sketches made by himself of modern jerry building. "Materials," the speaker regarded as perhaps the crux of the subject, and a difficult one to deal with, but much could be effected by a judicious use of materials to hand. Decoration he took as including painting and papering; for the former any plain colour and surface except imitation wood graining—personally he gave the preference to white throughout, varnished—and for the latter either a plain coloured living paper or common brown paper, but better still for the first six months is to distemper the walls. The most important thing with regard to sanitary arrangements was to concentrate these as much as possible, but District and County Council regulations had to be followed, and he ventured to think that some of the requirements were ridiculous, and capable of revision. As to cost, the price per foot cube in the examples shown on the screens varied from as low as 57d. at Hildote, to 10d. at Hollingbourne, the price depending on a good deal on locality. Lastly concerning builders, this was, he thought, a much more important matter than a good many architects considered, for often the small builder was a "one-trade man," and work entrusted entirely to him often suffered adversely in the trades other than his own speciality; he therefore suggested the employment of a builder of known capability at a slightly higher cost rather than the type alluded to.

Mr. Arnold Mitchell, in opening the discussion, alluded to the great trouble in preparing such a paper as they had had the pleasure of listening to, and expressed the thanks of those present to Mr. Belcher. The question of small houses was, he (Mr. Mitchell) thought, the most important of any to a young architect, as it was from the carrying-out of his first small house that the majority of them hoped to build up a successful practice. He advocated the most careful attention to small matters of detail, and illustrated his remarks by some practical suggestions touching the domestic blackbeetle (often a source of great annoyance in new houses), the more important being the careful setting of the range, the elimination of wood skirting, casing to hot-water pipes, and the construction of solid floors throughout. For the sake of economy he advocated building of kitchens for 4 ft. in height with reconds salt-glazed brick, the remainder being carried out in plain brickwork with stuck joints. To avoid unsightly markings where pipes passed through ceilings a good way, costing about 5d., was to have circular pieces of metal cut through which the pipe could pass, having about 2 in. of metal round to act as a shield, and to keep them in position by means of the screw-nut connexions

of pipes. He could not agree with Mr. Belcher that 100 ft. super was enough for living rooms, his experience being that 120 ft. super was the least people would put up with. He did not personally believe in "the parlour," which was only used in general on Sundays, or "when the district visitor called," but if a house was to let at all satisfactorily, one must be provided. His advice to young architects was, build the rooms as low as by-laws would permit (to his mind 7 ft. 3 in. was ample and over), and not worry as to fresh air. Regarding chimneys, he advocated the central type as affording an opportunity of making this a feature of the design. He ventured to disagree with Mr. Belcher as to his remarks anent painting and graining, and mentioned some small houses of Mr. Leonard Stokes', the doors of which were first painted a bright apple green, and then combed, the effect being most pleasing, and having the advantage of not showing markings in the same way as a plain surface.

Mr. Louis Ambler differed from the previous speaker in regard to the provision of a parlour, and also as to the height of rooms, nothing under 8 ft. being, in his estimation, enough. Wash-houses built inside the house were objectionable on account of steam, and he had adopted a method, in some houses he had recently built, of building the copper outside the house, and continuing the roof down so as to cover it. He believed it gave satisfaction. He was not altogether a great believer in baths for very small houses, as the misuse of them was very common, and he knew of a case where one had been used for keeping chickens in. Anything under 14 in. for thickness of outside walls on ground was pretty well impossible on account of damp, but 9 in. was, he thought, enough for walls above, though often by-laws were prohibitive. In answer to Mr. Belcher's interrogative he had used reed-thatch and found it required renewing every two to three years. If straw were used wire netting was imperative on account of the depredations of birds. As to floors, he believed in solid floors throughout, and personally he did not see the necessity of putting in joists as, if coke breeze were used, the boarding could be nailed direct to it. He did not like the idea of kitchen walls being built in ordinary brickwork unplastered, and, added in refutation of Mr. Belcher's statement, that he found there was no difference between casement and sash windows. In concluding, he declared himself an advocate for combing as against plain painting for doors, as being more serviceable.

Mr. W. A. Forsyth, in continuing the discussion, agreed with Mr. Mitchell as to the height of rooms, and mentioned the case of a district council accepting the underside of a stable loft flooring, as the ceiling line of the room under. A good thing was to lay common linoleum immediately on top of the ceiling joists and the ordinary floor boards above it, as it completely stopped any smell and noise getting through, and it could be painted or papered to form ceiling. He suggested a thin wash of cement over the surface of brickwork to overcome Mr. Ambler's objection. As a comment upon Mr. Belcher's preference for paneled doors, as these were generally understood to come from "the Baltic," he fancied they might not be quite so much in favour just at present. Concluding, he expressed the belief that the use of earth closets should be encouraged.

Mr. W. Trant Brown, in taking up the cudgels for the speculative builder, said that curiously enough he knew one of the houses sketched by Mr. Belcher to have been designed by an architect. He thought the mistake of the speculative builder lay in putting all in the elevation, and the reason why so much was the outcome of the small tenants' desire to make his cottage look as much like a castle as money would allow.

Mr. H. Passmore said he was struck by the expression of Mr. Mitchell's, that an architect should live to please; he thought "educate" would have been a better word. It was not much good discussing questions of height of rooms as that was a matter depending on local regulations. As a further example of the small details in thinking out a building, he wished to ask Mr. Mitchell how to prevent the presence of moths, as in a recently-furnished house they had been greatly troubled by a swarm of these insects. His experience of nailing boards direct to coke breeze was that, after a time, the boarding squeaked when

trodden upon. He personally believed in 9-in. walls, from practical experience.

Mr. J. H. Pearson, in taking up the case for the small tenant, thought, on the other hand, that he took the house not from choice but of necessity. He believed in 9-in. walls, and 4½-in. for scullery and washhouse if built in cement, and also in placing foul and exhaust gratings at the floor level.

The Chairman (Mr. H. Gregory Collins), before calling on the Special Visitor, regarded the general run of by-laws as excessive. He held the opinion that ground floor and other windows in modern work were, compared with old examples, much too large, and ventured to differ from Mr. Mitchell as to the method of building kitchen walls. He thought that the question of blackbeetles was rather like making a mountain out of a molehill.

Mr. Guy Dawber, in summing up the discussion, said he had anticipated a paper with a wider scope, but there was time enough for that at a subsequent date. The two most important matters were planning and economy in building and fitting up. In regard to the former, the simple and economical working of the house was of primary importance; loss of heat was obviated in great measure by adopting central stack and building external walls of flues with 9 in. of brickwork. Centralisation of heating and drainage matters was another most important point. Hot-water cylinders should be placed as near the kitchen range as possible, and, by adopting a system of double casing, room could be provided for airing mattresses. He held the opinion that 9-in. walls, except under special circumstances, were impossible. Mr. Dawber showed how, by using brickwork for sills and thresholds, considerable economy could be effected in actual building and subsequent upkeep; in fact, this latter was the point he most wished to emphasise, for, as he showed by quoting several other examples, by exercising ingenuity at the outset much unnecessary expense could be saved afterward for repairs and decoration. The substitution of plaster for wood linings to windows was an excellent example, and offered no difficulty in the matter of papering or painting. He believed strongly in the use of glazed brick and tilework as adding immensely to the cheerfulness and health of the occupiers, and it repaid its extra expense over plaster by the fact of never wanting painting. An excellent thing was to paint the skirting black and carry this across the bottom of doors, as was done in holland. He was in accord with Mr. Mitchell with regard to the non-casing of pipes, and suggested keeping them away at least 1½ in. from the wall by means of a clip or wood blocks; he also agreed as to the building of kitchen walls, but added that he believed in limewhitening them for sanitary reasons. In conclusion, he pointed out that by substituting plasterers' battening, plastered between, for wood boarding, a considerable saving could be effected on the roofs.

Mr. Belcher, in briefly replying, said that he did not object to combing doors, but to the system of disguising deal doors under coats of paint applied in imitation of a more expensive wood. He thought that walls of two half bricks with hollow space were quite sound from weathering and constructional points of view, and added, in answer to a query from Mr. Pearson, that 5 ft., in his opinion, was a good height for the slope of a roof to start from above bedroom or attic floor. As to heights of rooms, he said that if clients would agree to 7 ft. or 7 ft. 6 in. so much the better, but he fancied they would stand out more often for 8 ft. or 8 ft. 6 in.

The meeting then terminated with a hearty vote of thanks to Mr. Belcher and to the Special Visitor.

ENGINEERING SOCIETIES.

SOCIETY OF ENGINEERS.—At a meeting held at the United Service Institution on the 7th inst., Mr. D. B. Butler, President, in the chair, a paper was read on "Recent Developments in Crushing and Concentrating Machines," by Mr. James Thame, and of which the following is an abstract:—In this paper the author dealt, firstly, with ore crushing machines; and, secondly, with ore concentrating machines from the earliest types to the latest improved forms, selecting for notice representative machines of the various classes. The problem to be solved was to mill ores at the lowest possible cost, and at the same time to crush them to the requisite degree of fineness so that

the after-process of extracting the metallic contents could also be carried out with the least expense. He then described the gravity stamp, which was the first and simplest form of crushing machine, and in Cornwall was more largely used than any other type of crushing machine. The pneumatic stamp mill consisted of a single stamp, weighing about 3 cwt., this mill being largely used in English tin mines and in the Transvaal. It had the advantage of great capacity and low first cost, but it required careful tending, and if any part broke the whole machine was thrown out—a great disadvantage as compared with the gravity stamp mill. Turning to rolls, the author observed that the Krom roll was probably the most generally used crushing machine of this type. In these rolls about 75 per cent. of the power used was employed in crushing, whilst the percentage of slimes produced was very low. The Huntington mill was the strongest competitor with stamps, and for the reduction of certain grades of gold and other ores it was a reliable machine. The Oliver mill was a combination of an impact and a grinding mill. Tube mills were next described. For many years past small machines of this type had been in use in England for re-grinding sand or tailings in mines, whilst an enlarged form was in use in Western Australia and South Africa for grinding partially crushed gold ore. His opinion was that tube mills bid fair to assume an important place in the future of ore crushing. Sectional or graded milling was now occupying attention, and it was not unlikely that in the near future the stamp mill would become a thing of the past. The standard system of milling of the future would probably be crushing by rock breakers and then by stamps, or by a mill to a one-eighth mesh, and then grinding to the final size in a tube mill.

ARCHITECTURAL SOCIETIES.

ULSTER SOCIETY OF ARCHITECTS.—A general meeting of this Society was held on the 31st ult. in the Society's rooms, Lombard-street. Mr. W. J. Gilliland, President, occupied the chair. Mr. W. J. Fennell proposed, and Mr. J. J. McDonnell, J.P., seconded, that the Council of the Society be instructed to take the necessary steps to obtain, if possible, the extension of the Arbitration Act of 1889 to Ireland. The Council of the Society submitted recommendations to the meeting that some explanatory clauses in the scale of architects' charges should be added, and some slight modifications should be made thereto to suit special circumstances. After discussion, the recommendations were adopted. The subject of the Belfast Corporation handing over to the staff of the City Surveyor important architectural works was discussed, and the view was very strongly expressed that the buildings so erected would suffer in architectural merit and convenience of arrangement without any corresponding advantage to the ratepayers, as such work carried out under the superintendence of an expert architect is likely to be more economically satisfactory than when he is not employed. It was decided that a deputation should wait on the Corporation at the quarterly meeting, and bring before it the views of the Society. The President reported that he had attended the meeting of the Registration Committee of the Royal Institute of British Architects in London on October 19, and that that meeting a sub-committee had been appointed, to which he was nominated, to report to the General Committee on the whole subject of the education, compulsory examination, and statutory qualification of architects. A meeting of this sub-committee was summoned for the 7th inst. in London, and that the whole subject was being considered with the greatest care, and, judging from the energy and enthusiasm exhibited in the promotion of a Bill to obtain statutory recognition, an Act of Parliament to secure same would be passed at no very distant date.—*Irish News.*

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.—The annual general meeting of the Leeds and Yorkshire Architectural Society was held on the 3rd inst. at the Society's rooms, in Park-street, under the presidency of Mr. G. B. Bulmer. It was announced that the Society had a total membership of 155, as compared with 152 last year. During the year three honorary members had been elected in Mr. R. H. Barran, M.P., Mr. W. D. Hollis, and Mr. E. C. Wallis. The officers for the year were elected at the

previous meeting. The balance-sheet showed a small balance in hand. The near drawings and architectural sketches sent for the students' competition were on view. Prize winners will be announced at the open meeting and smoker, at the Queen's Hotel November 17, when the presidential address will be delivered.

GLASGOW ARCHITECTURAL ASSOCIATION.—An ordinary general meeting of the Association held on November 2, Mr. James Duncan I heating engineer, Paisley, delivered a lecture on the "Reck" system of heating. Mr. Duncan claimed for the Reck system all the essential qualifications of a satisfactory heating apparatus. This system he defined as a circulator system of low pressure hot-water heating. Invented by Captain A. B. Reck, of Copenhagen, it was first used by him in Denmark eight years ago and was introduced into this country two years ago. The warming is done by hot water in a special manner by steam generated boiler working at a pressure of from 2½ lb. to 3 lb. The steam is applied in such a way that the circulation of the water is at least four times greater as in an ordinary hot-water system. The consequence of this increased velocity is possible to use piping one-fourth of the sizes, and the apparatus may be erected with consideration of levels. Further, there is no need that the boiler should be the lowest of the heating apparatus, and therefore heating chambers are not required. The application of the circulator to hot-water heating resulted in great efficiency at initial cost and expense in maintenance. The Reck system was now largely used throughout Europe, and Mr. Boyd described, with the aid of diagrams, several installations, illustrating the different methods used to suit the circumstances of each case.

COMPETITIONS.

PUBLIC LIBRARY, BENWELL, NORTHERN LAND.—The following is the result of competition:—First, premiated design, Vernon Hodge, 11, Grand-parade, Teddington; second and third, premiums added together, divided between Mr. C. Leslie Cox, Survey Department, Town Hall, Gosport, M. Davidson, Cratney, Central-buildings, Wake-on-Tyne, and Mr. C. H. T. Robinson, 27A, G. street, Wolverhampton.

WIGAN UNION OFFICES.—In a competition for new offices for the Guardians of the Wigan Union, limited to architects in the Wigan Union, the design submitted by Mr. H. Ogden has been accepted.

COADSEVEN BUILDING CLUB.—In the petition for the best designs for a pair of detached villas, to be sent in on the 12th ult. the Trustees have awarded the premium of one guinea to Mr. Basil C. Deacon, architect, Central-buildings, South John-street, pool.

BOOKS RECEIVED.

PRIVATE HOUSE ELECTRIC LIGHTING.—Frederic H. Taylor. (Percival Marshall Co. ls.)

Correspondence.

LIME ON BRICKS.

SIR,—I should be very much obliged if you could tell me how I can remove lime from a brick building caused by mixing against the bricks?—G. L. CRICKSHANK.

[*] The attached lime has no doubt been converted by atmospheric carbon dioxide into carbonate of lime, which is practically insoluble in water. If the bricks are probably the best method of removing lime would be to immerse the bricks in to which 1 per cent. of hydrochloric acid spirit of salts) had been added, until the dissolved, or until it could be readily rubbed off with the fingers. The bricks should then be immersed in running water for an hour to remove the acid. If they have already been laid and jointed mortar, this acid solution cannot be used as it would have a solvent action upon the carbonate of lime and the free lime mortar. Theoretically, a solution of caustic acid would be the best solvent for carbonate of lime attached to standing brickwork in practice it will probably be found that lime can only be removed by mechanical means.—ED.]

MINERAL OUTPUT FOR 1903.

In general report and statistics (of which the preliminary summary was issued a few days ago) relating to the output and value of minerals raised in the United Kingdom, amount and value of the metals produced, the exports and imports of minerals, for the year 1903, have now been published in detail, by authority of the Home Office, for presentation to both Houses of Parliament. It appears that the total value of the minerals raised amounted to 101,808,404*l.*, a decrease of 9,480*l.* as compared with 1902. This decrease is to be accounted for by the fall in average price of coal from 8*s.* 2*s.* 4*d.* per ton in 1902 to 7*s.* 7*s.* 3*d.* in 1903. The total output of coal was the highest hitherto recorded, 230,334,469 tons. The output of iron was 13,715,645 tons, showing an increase of 41 tons, though the value, 3,229,937*l.*, was less by 58,164*l.* than in 1902. The ore yielded 4,500,972 tons of iron, or about one-third of the total quantity of pig iron made in the country; 6,314,162 tons of iron ore were exported during the year, 73 per cent. of which came from Spain. As to the other metallic ores, copper, gold, lead, silver, and all showed an increase on the figures of both in amount and value of the metal mined, and in the case of tin, although the amount obtained was less, the value was higher. Subjoined is an extract of the particulars given in the report respecting certain of the mineral products:

Chalk.—A little chalk is raised from mines, but the total quantity is insignificant compared with the output of the open quarries; it is by far the most important chalk-yielding country, and many of its quarries produce more than 700,000 tons annually. Much of the chalk in Kent and Essex is employed in the manufacture of Portland cement at works on the banks of the Thames and the Medway. Total output in England in 1903 was 1,794,945 tons, value 132,527*l.*

China and Flint.—China is obtained principally from strata of carboniferous age in Yorkshire and Flintshire; both these counties supply the potteries with stones used for firing up the materials from which china is made. Flint is mainly obtained from the open pits. At Brandon, in Suffolk, there are a few shallow mines, worked in a most primitive fashion, which, with some small pits in France, suffice to supply the continually decreasing demand for the material. Total output in 1903 was 1,000,000 tons, value 15,036*l.*

Clay.—Many of the workings for clay and sand are less than 20 ft. deep, and so the operation of the Quarries Act, which returns are compulsory. It must, therefore, be understood that the figures given do not include the output of the shallow workings. There are a few counties in England which do not produce minerals employed in the manufacture of bricks, and the strata which they are dug belong to various geological ages. Beginning with the coal measures, we have mines and quarries producing fire-clay on a very extensive scale. Silurian strata are likewise largely worked, as well as various beds in the Triassic, Jurassic and Cretaceous rocks. The tertiary beds of the South of England afford much clay for making bricks, tiles, and pottery. The clay of Cornwall and Devon is derived from granite decomposed *in situ*. Surrey fuller's earth, which there occurs in the greensand. A like mineral is obtained in Wiltshire from beds of Jurassic age. Total output and value of clay in the United Kingdom for 1903, 16,198,021 tons, 1,767,981*l.*

Gravel and Sand.—Total yield in 1903, 1,757 tons, value 171,556*l.* These figures, however, must not be taken as representing total output, as these minerals are frequently dug from shallow pits less than 20 ft. which are not under the Quarries Act, which, consequently, furnish no returns to inspectors of mines.

Gypsum.—The principal gypsum deposits in the United Kingdom are those of Wiltshire, Nottinghamshire, and Staffordshire, where the mineral occurs in irregular beds, and in spheroidal and lenticular masses in the Keuper division of the Trias. The mines of Derbyshire and Westmoreland are in rocks of the same age, whilst the workings in Sussex is considered to belong to Purbeck beds. Total output in 1903, 97 tons, value 69,422*l.*

Igneous Rocks.—Under this head are included together various kinds of igneous rocks, such as granite, syenite, diorite, basalt, principally used for making road metal and paving stones. Leicestershire, with its quarries in Charnwood Forest, is by

far the greatest producer of granite rocks. Aberdeenshire and Cornwall are both remarkable for their granite, which is employed for building and monumental purposes. Carnarvonshire contributes important supplies of diorite, quartz-porphry, and argillite-porphry. Shropshire and Staffordshire have extensive basalt quarries at Clee Hill and Rowley Regis respectively. Warwickshire has a large output of diorite from quarries at Atherston and Nuneaton. Total output for the United Kingdom in 1903, 5,425,538 tons, value 1,508,054*l.*

Limestone (exclusive of chalk).—Limestone is very widely distributed throughout the United Kingdom; it is quarried in three-fourths of the counties in England, half the counties of Scotland, and in nearly every county of Wales and Ireland. Even without taking chalk into account, it is one of the most important minerals which is quarried in this country. Total yield in 1903, 12,222,911 tons, value 1,357,733*l.*

Ochre, Umber, etc.—Under this heading are placed the oxides of iron and manganese used as pigments, lubricants, etc. Some of the ochre of Anglesey is obtained from a native earth dug up from shallow pits, and a considerable amount is deposited by the ferruginous water from the copper precipitation pits, when exposed to the action of the atmosphere in shallow ponds. Total obtained in 1903 in the counties of Cornwall, Derby, Devon, Gloucester, Somerset, and Anglesey, 15,150 tons, value 17,045*l.*

Sandstone.—Under this heading are included all indurated sedimentary rocks which consisted originally of particles of siliceous sand, such as ordinary sandstone, grit, quartzite, "ganister," and also some "flagstone" and "freestone." They are obtained from strata of various geological ages, from the Cambrian period upwards. The counties of Lancaster, York, Glamorgan, Dumfriesshire, and Lanark are the chief producers. Total output in 1903, 5,409,502 tons, value 1,795,428*l.*

Slate and Slate Slabs.—North Wales furnishes most of the slate; speaking roughly, rather more than three-fourths of the Welsh slate was produced from open quarries, and nearly two-fifths from mines, that is to say true underground excavations. The two largest open workings are the Penrhyn quarry, near Bangor, and the Dinorwic quarry, near Carnarvon; the largest underground workings are those belonging to the Oakley Slate Quarries Company, Ltd., at Festiniog, with an output of 46,351 tons. Total yield of the United Kingdom in 1903, 531,612 tons, value 1,581,477*l.* These figures do not include argillaceous slate, nor the thin slabs which are sometimes split from certain limestones and sandstones for roofing purposes, and are known locally as "slate." These fissile stones are included under the headings "limestone" and "sandstone" respectively, as given above.

WESTMINSTER CITY COUNCIL.

The usual fortnightly meeting of this Council was held on Thursday last week at the City Hall, under the Chairmanship of Alderman Emden (the Mayor).

Expenditure of the Council.—The adjourned report of the Finance Committee dealing with the expenditure of the Council was again brought up. The report showed that the expenditure had increased by 37 per cent. over the figures for 1899-1900, and the Committee said it appeared to them to be clear that the cost of executing work by direct labour was considerably in excess of the cost under the contract system.

Mr. Everitt denied that direct labour was dearer than contract work, and said there were many works which could be done cheaper by the Council's own workmen.

Mr. Somers Coeks (Chairman of the Committee) said the Committee had no wish to enter into the controversy as to the cost of direct and contract labour. That was a matter of policy for the Council to decide. The duty of the Committee was merely to report the facts.

After considerable discussion the report was adopted.

Regency-street Dwellings.—The Housing Committee reported that the architect had returned the complete cost of the City of Westminster Dwellings, Regency-street, at 94,787*l.* 3*s.* 2*d.*, which was 21*s.* less than the sum authorised by the Council. The architects had made no charge for the troublesome negotiations with the owners of properties adjoining the dwellings in relation to the party walls and ancient lights surrounding the property. The architects' fees were 2,954*l.* 17*s.* 6*d.* The Committee recommended "That a letter, signed by the Mayor and countersigned by the Town Clerk, be forwarded to Messrs.

Joseph & Smithem, expressing the Council's thanks and satisfaction at the manner in which they, as the architects of the dwellings, have performed their professional duties."—This was agreed to.

Chandos-street Improvement.—It was reported by the Improvements Committee that a letter had been received from the London County Council with reference to the proposed widening of Chandos-street, stating that the Improvements Committee of the London County Council was unable to advise that the widening be undertaken as a County improvement, and suggesting that the work might well be undertaken as a local improvement by the City Council in the usual way.

Wardour-street Widening.—A report was brought up on the question of the widening of Wardour-street. The Council had called the attention of the London County Council to the demolition of certain properties in Wardour-street, and asked that they should undertake to widen the street as a County improvement. The County Council had replied, stating that the street was not a main thoroughfare, and that, as the City Council was already widening the thoroughfare at its southern end, they could not undertake the widening as a County Improvement.

Locomotives on Highways.—It was agreed to appoint Messrs. Tallonts, Dennis, & Payne to a conference at the County Hall, Spring-gardens, on November 18, on the question of the use of heavy locomotives on thoroughfares.

Reinstatement of Trenches.—The Works Committee reported that, with reference to the question of the serious effect upon the life and condition of the pavements of the City caused by the constant opening of the streets by the various undertakers under their statutory powers, a letter was addressed to the undertakers, stating that in order to prevent subsequent sinkage and permanently to restore the pavement as far as possible, to a satisfactory condition, the Council had decided to trim back the edges of the concrete foundation obliquely upon the solid ground on either side of the trench, in order to form a proper support and key for the new concrete, and also to bare a margin along the surface of the old undisturbed concrete on each side, for the reception of the blocks to be relaid. They recommended that it be an instruction to the City Engineer that in future all trenches in paved roads be reinstated in the manner described.—The recommendation was agreed to.

OBITUARY.

MR. HARDY.—Mr. Richard Hardy, who had practised during many years at Wheelersgate, Nottingham, died on November 1. Mr. Hardy was chiefly employed as an architect and engineer by brewers and maltsters; one of the largest works he executed in that capacity is the malting he built seven years ago for Messrs. Walker & Homfray, Ltd., at Retford.

MR. B. T. BATSFORD.—We regret to announce the death, at the age of eighty-three, of Mr. B. T. Batsford, the well-known publisher of architectural works, whose name is familiar to all our professional readers. Bradley Thomas Batsford was born in Hertford in 1821, and was left an orphan at the early age of thirteen. Three years later he bound himself apprentice to Mr. Henry Bickers, the founder of the firm still existing in Leicester-square, for a period of six years. He commenced business in 1837 in a small way as a general second-hand bookseller at No. 30, High Holborn, from which he moved a few years later to No. 52, and was surrounded by at least twenty other booksellers within a radius of a quarter of a mile. For some years he continued to occupy himself with books of a general character, but his proximity to Mr. John Weale, the well-known publisher of architectural and engineering books, who died in 1861, and the large number of architects who had offices in the neighbourhood, some of whom naturally made inquiries of him for professional books, led him to turn his attention to this class of publication, which he eventually made his speciality. It may be noted that for architectural publishers, High Holborn is quite a historic spot, as, within a few doors of one another, there has existed a succession of them for something like a century and a half, the most notable being Mr. John Taylor and Mr. Weale (already mentioned) with whom Taylor was for a time in partnership. Mr. Weale's business ceased to exist some three years after his death, when his stock was dispersed under the auctioneer's hammer by order of the Sheriff, and Mr. Batsford, securing part of the stock, continued to devote himself strenuously to the collecting of books upon architecture, engineering, etc., and soon was able to boast that he had a larger stock of them than had been held by any other London

bookseller. For many years he frequently sent out catalogues which made him widely known as "the architectural bookseller," both at home and in America and the Colonies. He was joined by his eldest son, Mr. Bradley Batsford, early in the Sixties, and some ten years later by his second son, Mr. Henry, who died in 1882. Mr. Herbert, his youngest son, then entering the business. A few years before this, Mr. Batsford had commenced the publication of professional books, amongst his earliest issues being the late Professor Banister Fletcher's Text Books for Surveyors ("Quantities," etc), Mr. Talbert's "Examples of Ancient and Modern Furniture," Mr. Colling's "Examples of Medieval Foliage," Mr. Cutler's "Grammar of Japanese Ornament," etc. This branch of the business was conducted by his eldest son, Mr. Bradley Batsford, as will be known to the many authors for whom the firm has published. Mr. Batsford continued to take an active share in the conduct of the business he had founded until some two years ago, when he relinquished it in favour of his sons, Mr. Bradley and Mr. Herbert, by whom it has since been carried on. His business career extended over a period of some sixty-seven years, and his buoyant spirit and kindness of manner endeared him to many who came in contact with him. He was very devoted to his business, fond of his books (shed tears when he saw the damage done to them when a fire occurred on his premises about twenty-five years ago), and proud of the cordial feeling shown him by many members of the architectural profession. He took an active interest in the Booksellers' Provident Institution, of which he was an early member, and sat on the Board of Directors for some thirty years, acting on the "Relief" and "New Members' Committees. Marrying in 1843 (the year in which he started in business) Mr. and Mrs. Batsford had the happiness of celebrating their diamond wedding nearly two years ago. He leaves, besides his widow, three daughters, and his sons mentioned above. Mr. Batsford not only had (naturally) an exceptional knowledge of architectural publications, but also a very shrewd estimate as to their relative value, as we have often had occasion to observe in conversations with him on the subject.

Mr. H. R. Gough.—We regret to announce the death of Mr. Hugh Roumieu Gough, who died at his London residence on Sunday, at the age of sixty-one. He was the third son of the late Mr. A. D. Gough, and, after serving his articles, he studied in France, Germany, Belgium, and Holland. In 1864 he entered the service of the War Office, being subsequently Chief Draughtsman at Woolwich Arsenal. He commenced practice for himself in 1870, and his subsequent works included St. Cuthbert's Church, at Kensington; the parish church of St. Paul, Hammersmith; the Pro-Cathedral at Bri-banc; the parish churches at Catford, Killamash, Kippax, etc.; and the Cemetery Chapel at Colombo. Mr. Gough had also been employed in the restoration of numerous churches, schools, and houses, and was responsible for the alteration and decoration of the Army and Navy Club in Pall-mall.

BUSINESS PREMISES, DERBY.—New premises have been erected at 37, Market-place, Derby, for Mr. T. Frost. The architects were Messrs. Naylor & Sale, Derby, and the contractor was Mr. Alfred Smith, Derby.

FREE LIBRARY, BROWNHILLS, STAFFORDSHIRE.—The new branch library and public reading-room at Brownhills was opened a short time ago. The building consists of two stories, and on the ground floor are reading and magazine rooms, each of which is about 20 ft. square, opening from central hall, together with the librarian's room for the issue of books. A staircase from the hall leads to the upper floor on which is an assembly or ward room over the reading-room with a platform, and a retiring-room adjoining. The assembly-room will accommodate 120 persons. In the basement there is a heating vault with low-pressure hot-water apparatus. All the rooms are artificially treated with green wood-work, and are furnished with reading tables from designs by the architect, and have terra-cotta walls and ivory friezes, and ceilings carried out in distemper. The exterior has red brick facings and stone dressings, whilst a feature is made of the turret with oriel bay on staircase over entrance. The general contractors are Messrs. Wm. Grant & Sons, Moorland-road, Burslem; the heating has been executed by Messrs. Tagg & Co., Newcastle; and the furniture has been supplied by Mr. W. Cook, Burslem. The whole work has been carried out from the designs, and under the supervision of the architect, Mr. Reginald T. Longden, Burslem, at a total cost, including the site, of 1,250*l.*

GENERAL BUILDING NEWS.

WESLEYAN CHURCH, KEMPSTON, BEDFORD.—A new Wesleyan church and Sunday school was opened at Kempston recently. The designs for the buildings were prepared by Messrs. Gordon & Gunton, architects, of London, and the builder is Mr. S. Foster, Kempston. The buildings are built of Weldon stone, rock faced, with red tile roofs. The elevation facing Bedford-road is the gable end of the nave, flanked by octagonal turrets, battlemented at the top, with a seven-light window in the wall between the turrets. On either side two porches open from the south end of the nave. Each side wall of the nave has three windows of three lights each. There are also two transepts, each with a double gable and possessing four windows of two lights each. The inside measurement of the nave is 70 ft. by 34 ft. 6 in., and the total width between the transepts is 73 ft. (outside measurement). Each transept is 20 ft. by 17 ft. inside. The height of the nave up to the apex of the hammer beam roof is 27 ft.; from the floor to the ridge the height is 36 ft. 6 in., and the height of the side walls is 17 ft. The chapel is built to seat 424 persons. There are open pews, which are fitted at each end with umbrella brackets and dishes.

WESLEYAN CHURCH, PLUCKLEY, KENT.—The opening of the new Pluckley Wesleyan church took place recently. The building will provide seating accommodation for between 100 and 120 persons, and is built of red brick, and has been constructed so that it may be extended if necessary by the addition of a Sunday school. At present it consists of a main hall, rostrum, vestry, porch, and usual out-houses. The windows have lead lights, the ceiling is matchboarded, and a Boyle's ventilator has been fixed. The work was placed in the hands of Mr. J. Day, builder, of Ashford, and it was designed and carried out under the supervision of Mr. A. E. Lacey, architect.

WESLEYAN CHURCH, RAVENSWORTH COLLIERY.—The alterations to the Wesleyan church at Ravensworth have now been completed, and the building was reopened on the 22nd ult. The extensions consist of an addition of 16 ft. to the west end of the original structure. A vestry, 16 ft. by 12 ft., has been added to the north side, separated from the church by a movable wood partition, the whole giving an extra seating accommodation for eighty persons. A stone portico has also been built at the entrance of the church, which faces the Durham-road. The builder was Mr. J. Goblin, Birtley, and the architect Mr. T. Reay, of Low Fell.

WESLEYAN CHURCH AND SCHOOLS, HIGHGATE.—On the 26th ult. the foundation-stones were laid of the new Wesleyan chapel and schools which are being erected at the corner of Jackson's-lane and Archway-road. The church will be of red brick, with stone facings. There is to be an end gallery, nave, side aisles, transept, and chancel, and accommodation will be found for 650 worshippers. The lecture hall and schools adjoining will be of similar design, with seating accommodation for 350, and besides there will be a church parlour, infants' school, and four or five classrooms. The contractors for the work are Messrs. Dorey & Sons, the architect being Mr. W. H. Boney. The total cost, including the site, is estimated at 11,514*l.*

CHURCH, HECKMONDWIKE.—A Consistory Court was held recently in the chancel of the Heckmondwike Parish Church. Mr. W. F. L. Herne (Diocesan Registrar), and the vicar (the Rev. E. E. Jones) laid before the Chancellor the proposed extension scheme. The stonework is perishing, and it is intended ultimately to rebuild the church, but the scheme, for which a faculty was granted by the court, comprises principally the erection of a new chancel and a side chapel. Mr. C. Hodgson Fowler, architect, Durham, has designed the proposed new chancel and side chapel at the parish church, and tenders for the work will shortly be invited. The side galleries will be removed altogether, but at the west end the present accommodation will not be abolished. The roof will be made water-tight. There is now accommodation for 440 persons, which will be increased by about forty-five sittings. It is estimated that the extension will cost 2,700*l.*

WESLEYAN CHURCH AND SCHOOL, HORDEN.—The foundation-stones were laid on the 5th inst. of a new Wesleyan church, with schools adjoining, which is being erected in Thorpe-street, Horden, near Castle Eden. The contractor for the building has been let to Mr. Henry Bell, of Ryhope, and Mr. Joseph Armstrong is acting as clerk of works under the supervision of Mr. J. Walton Taylor, architect, Newcastle, who designed the premises.

WESLEYAN CHAPEL, MILLBRIDGE, YORKSHIRE.—A new Wesleyan chapel has just been opened

at Millbridge, at the junction of the Hall and Leeds roads. An octagonal tower rises a height of 70 ft. at the south-east corner of the structure. The octagonal chancel contains choir stalls, in which two sets of seats will face each other. A communion table has been fixed at the extreme end. The seating accommodation for 300 persons, the floor is divided into centre and side aisles, and a gallery has been erected over a porch. The pews, which are all open, are of pitch-pine, and a wood block floor has been laid. In the chancel dark oak has been used and the pulpit is also of oak. Two vestries for the minister and the other for the choir, have been provided. Messrs. Th. Howdell & Sons, of Leeds, are the architect and the following the contractors:—Messrs. Mr. Allatt, Heckmondwike; joiners, Mr. M. Lazenby Brothers, Leeds; slater, Mr. A. Thompson, Liversedge; plumber, Mr. A. Jackson, Liversedge; plasterer, Mr. G. Wood, Heckmondwike; painter, Mr. Ramsden, Dewsbury; wood block floor, T. K. Yates, Leeds; heating engineer, George Tankard, Leeds; and ironwork, Messrs. B. Tordoff & Sons, Roberttown. WESLEYAN CHAPEL, BOWES, YORKSHIRE.—The 21st ult. new Wesleyan Methodist Sunday schools were opened at Bowes, near Barnard Castle. Mr. Robert Wilson, Barnard Castle, was the architect, and the contractors were Messrs. Masoury, Mr. Walker, Gilmonby; joiners, Messrs. Borrowdale & Sons, Barnard Castle; plumbing work and painting, Mr. C. R. heating apparatus, Mr. Sykes, Darlington. Considerable improvements have also been taken out and replaced on a sloping roof, and the choir stalls have been substituted with the old singing pew. The front wall has been rebuilt, and fitted with Gothic window harmonise with those of the school.

INDUSTRIAL SCHOOL FOR GIRLS, GILMER EDINBURGH.—A new school for girls at Edinburg, the latest addition to Dr. Guthrie's Industrial Ragged Industrial Schools, was opened on the 22nd ult. The structure forms three sides of a quadrangle and is two stories in height. The entrance front, which is 110 ft. 6 in. long, faces the road, and is recessed in the centre on the upper floor. Accommodation is provided for eighty girls. On the ground floor an entrance hall leading into a wide corridor extending nearly the whole length of the frontage, waiting-room, matron's office, officials' dining-room, girls' dining-hall, room with study-room, and other aid, and in the centre overlooking the quadrangle an apartment containing wardrobe for girl. On the south side of the quadrangle arranged the classrooms and the gymnasium and on the north side the kitchen and canteen, store-rooms, etc., and the laundry block. The upper floor contains the officials' bed-rooms and girls' dormitories, and the bath and lavatories are centrally placed between the dormitories. Two staircases give access to the upper floor, and fire escape stairs provided from the dormitories to the ground. All the external walls are constructed of hollow brickwork, with redstone dressing, and harled, tinted a greyish-white. The roof is covered with red tiles. The architects are Messrs. M'Arthy & Watson, Edinburg. WESLEYAN CHURCH, ABERDEEN.—The new school erected by the Aberdeen School Board site on the estate of Sunnybank will form a new road, which the Town Council are constructing. The frontage of the site is 300 ft. and the school building will have a frontage of 153 ft., and will be a three-story structure. Mr. J. A. O. Allan is the Board's architect. The plans provided for the accommodation of 1,169 pupils. On the ground floor is the department, consisting of five classrooms and total accommodation for 337 pupils, a study room, a hall and gymnasium, 49 ft. by 49 ft., and the usual rooms for the staff. On the same floor and at the end of the building near the boys' playground, is situated the boys' entrance and the headmaster's office. On the first floor there are six classrooms providing accommodation for 364 pupils, cloak-rooms and teachers' rooms, and a hall and gymnasium for the junior and senior pupils. This hall is the same size as that situated on the ground floor. On the second floor there are eight classrooms, with accommodation for 466 pupils, two of these rooms are provided for supplementary classes. On the top floor also are situated a cookery and laundry room, with a scullery, and a music instruction-room with a wood store.

WESLEYAN METHODIST SUNDAY SCHOOL, BURNLEY.—The foundation-stones of the new Sunday school at Newburn, which is being erected on a site adjoining the existing Wesleyan church, took place on the 5th inst. The work is being carried out by Messrs. Brown & Bell, of Newcastle, from designs

ered by Messrs. Marshall & Tweedy, also of Westclo.

SCHOOL, HILGAY, NORFOLK.—On the 1st inst. a new church elementary school at Hilgay was opened. The work was carried out from plans prepared by Mr. L. F. Eagleton, of Lynn, at a cost of 1,500l.

WESLEYAN SCHOOL, NEWBURN.—The foundation-stone has just been laid of a new Wesleyan Methodist Sunday School at Newburn. The new building, which is being erected on a site adjoining the Wesleyan church, will have a hall 75 ft. by 41 ft. At the rear of the schoolroom there are to be two vestries for class meetings. The exterior of the building will be faced with red pressed bricks, and have stone dressings to windows, doors, and buttresses; the style being late Gothic. The work is being carried out by Messrs. Brown & Bell, of Newcastle-on-Tyne, from designs prepared by Messrs. Marshall & Tweedy, also of Newcastle.

CATHOLIC SCHOOL, CARDIFF.—Bishop Hedley recently blessed and opened the Roman Catholic Secondary School for Girls at Heathfield House, Richmond-road, Cardiff. Messrs. James & Morgan were the architects, and Mr. Davies the builder.

SCHOOL, WITTINGTON, NEAR MANCHESTER.—The foundation-stone of a new public elementary school, which is to be built in Cavendish-road, Wittington, was laid on the 4th inst. The new school is intended to accommodate, in the first instance, 500 children, but the plans have been so arranged that an extension, which will provide room for another 500, can be made. The exterior will be faced with red London brick, with buff terra-cotta dressings. There are to be a central hall, capable of holding 800 children, with two teachers' retiring-rooms and six classrooms on each of the two floors. The school will have a science-room. There is also to be a detached cookery and manual instruction school. The architect is Mr. Ernest Woodhouse, of Manchester.

RAILWAY MISSION HALL, OXFORD.—The Railway Mission Hall, which has been erected on the Botley-road, was opened on the 3rd inst. The hall is 40 ft. by 30 ft., and there is a vestry, 19 ft. by 12 ft., adjoining. The architect was Mr. Herbert Quinton, and the builders were Messrs. T. H. Kingler & Sons.

LEICESTER-SQUARE.—No. 49, on the west side of the square, has recently been pulled down, the rebuilding on the site, by Mr. F. C. Barber, contractor, of the out-patients' department of St. John's Hospital for Diseases of the Skin. The architects of the new hospital are, we gather, Messrs. Treadwell & Martin.

WORKHOUSE INFIRMARY, EXETER.—The foundation-stone of the infirmary, to be erected as an addition to Exeter Workhouse, was laid the 3rd inst. The new infirmary is being erected on the separate block system, from designs by Mr. R. M. Challice. The complex design comprises five blocks, viz., an administrative block, situated in the "wing," which are located the medical officers' surgery, offices, etc., and the quarters of the nursing staff. From this department covered corridors emerge to the respective wings; block 1, for males and children, providing for sixty-six beds; block 2, the maternity portion, comprising seven beds; block 3, for males, sixty beds; and the consumptive block, providing for thirteen beds; making a total accommodation of 152 beds, exclusive of the nurses' quarters. The wards in each wing are of varying sizes, ranging from eighteen to single beds for separation purposes; each floor is provided with an administration department, comprising duty kitchen, larder, res, etc. Day-rooms are arranged for all the larger wards. The sanitary offices are situated in towers, having a free passage of air between them and the main buildings; they are provided with glazed brick domes. The emergency dressings are provided for at each end of the main blocks. The wards are to be heated by Messrs. Shorwood's Manchester stoves and grates, while the corridors, bathrooms, and sanitary wings are warmed by hot water radiators. The first portion of the complete scheme is now being carried out by Messrs. Ham & Passmore, of Exeter, at a cost (inclusive of main alterations to the existing infirmary) of 500l.

DISPENSARY, HYSON GREEN, NOTTINGHAM.—The foundation-stone of the new Hyson Green church dispensary has just been laid. The building is to be of brick, with external facings of sand brick and Derbyshire stone, and to have a frontage of 93 ft., and a depth of 60 ft., the total cost being estimated at 3,000l. The plan provides for a dispensary and a surgeon's house, the former containing waiting-hall, consulting-room, male and female dressing-rooms, accident and first-aid room, and a dispensing-room. Storage for drugs is provided in the base-

ment, approached by a short flight of stairs from the dispensing-room. The new dispensary, of which Mr. Ernest R. Sutton is the architect, is to be finished by the end of April. Messrs. Vickers & Son are the contractors.

HOME FOR SAINT EPILEPTICS, LANGHO.—On the 25th ult. the foundation-stone was laid of the central administrative block of an epileptics' home for Manchester. The site acquired is at Langho, six miles beyond Blackburn. The architects are Messrs. Giles, Gough, & Trollope, and the contractors Messrs. R. Neill & Sons. The joint committee have acquired upwards of 150 acres of land, and are providing for 240 patients on the home system.

MINERS' INSTITUTE, CAMBOIS, BLYTH.—Viscount Ridley recently opened the new Miners' Hall and Institute which has been erected at Cambois. The building consists of a library, reading-room, billiard-room, smoke-room, and committee-room on the ground floor, the reading-room being 25 ft. by 32 ft. and the billiard-room 35 ft. by 25 ft. The bathroom is also situated on the ground floor. On the upper story there is a public hall, 56 ft. by 36 ft., capable of accommodating between 500 and 600 people, with three ante-rooms and a good platform. The electric light is fitted through a portion of the building, and the heating arrangement is on the hot-water low-pressure system. A caretaker's house adjoins the main building. The total cost is 2,400l., and the structure has been built by Messrs. Cook Brothers, contractors, of Blyth, from the plans of Messrs. T. Tulip & Son, of Whimsey Hill, Choppington. The electric installation is by Mr. R. Robson, of Newcastle, and the heating by Messrs. Emley & Sons.

PUBLIC LIBRARY, RAMSGATE.—The new public library which has been built at Guildford Lawn, Ramsgate, was opened a short time ago. The building has been erected from the designs of Mr. S. D. Adhead, architect, the contract having been carried out by Messrs. Deane & Sons, of Deal. The cost was 7,000l.

MUSEUM AND ART GALLERY, KINGSTON-ON-THAMES.—Lord Rosebery recently opened Kingston's new Museum and Art Gallery, erected on a site adjacent to that of the public library. The principal front of the building is to Fairfield West, and the main entrance is through a carved archway of Bath stone, above which is a stone niche. There is a like recess on either side in brickwork. On the north gable is a round panel of carved brickwork. The roof is covered with tiles, and is surmounted by a miniature tower. The building stands back about 30 ft. from the roadway, and is connected with the free library by an annexe. Internally the museum is 45 ft. long by 24 ft. wide. Leading from the museum, through panelled screens, is the lecture hall, 40 ft. by 27 ft., with a dome roof. The room will accommodate an audience of 200. A staircase of oak gives access to the art gallery, 45 ft. by 24 ft., which is the only room on the first floor. In addition to these main apartments, there is a committee-room, from which access is gained to a strong-room, and a retiring-room, fitted with sanitary appliances. The artificial lighting throughout is by electricity. The ventilation is provided for also by means of an electric fan in the roof. The heating is by means of the hot-water radiator system. The work has been executed by the contractor, Mr. E. Chamberlain, of Ardlestone, for whom Mr. P. Maytum has acted as foreman. Mr. Alfred Cox was the architect for the library. Mr. R. Squelch was clerk of the works.

NEW PREMISES, BRISTOL.—The Cabot Café, in College-green, Bristol, has now been completed. The architects for the new buildings are Messrs. La Trobe & Weston, and the builders Messrs. R. Wilkins & Son.

EXTENSION OF THE POST OFFICE, RICHMOND.—The Richmond post office in George-street is now being enlarged and improved. The work is being carried out by Messrs. B. & E. Nightingale of Lambeth, from plans prepared by Mr. J. Rutherford.

NEW PREMISES FOR THE LIMMER ASPHALTE PAVING COMPANY.—The Limmer Asphalt Paving Company's new premises at Blackwall (at the mouth of the Lea) have a frontage of 430 ft. to the river, with facilities for vessels unloading and loading direct alongside, and 450 ft. to the road, Orchard-place, covering an area of about 2½ acres. The Company were formerly the lessees of only a portion of the property, but purchased the freehold of the whole some few years ago. Certain of the old buildings were demolished and new factories, workshops, offices, stables, offices, and stores are now erected, also a new wharf wall and quay for landing and shipping material. The main factory, which consists of crushing mills, grinding mills, powder floors, spaces for boilers, roasters, grit stores, etc., is of two floors, each floor having an area of about 15,000 ft. super. The substratum

of the site is of that difficult nature which is generally found near the river, and it was consequently necessary to carry down the concrete foundations to a considerable depth, especially next the quay. The buildings are built of stock bricks in cement. The floors are of fireproof construction and supported by steel stanchions. The steel joists used are embedded in concrete and covered with the Company's mineral rock mastic asphalt. The roofs are treated in a similar manner, being laid flat with openings in them to allow materials to be lowered in their places on the respective floors as required. The new stables and loose boxes are lined inside with salt glazed bricks. The Limmer Company's new patent paving, "Lithofalt," is used for paving the stables. A roof, 22 ft. 6 in. high, has been thrown over the yard (53 ft. by 30 ft.) between the buildings so that the vans, etc., may be loaded dry. There are carpenters', engineers', and smiths' shops, and other buildings placed in suitable positions for the proper carrying out of the works. A manager's residence and horsekeeper's cottage are also provided, and abut upon the public roadway. The Company obtain their rock from their own mines in the heart of the Bassin de Syssel, also from Sicily, and Hanover. The raw rock is brought to the wharf in vessels which come alongside the quay, and are unloaded by means of a travelling crane which can run to any part of the wharf and pick up the material from any part of the vessels and deliver either on the roof of the buildings, into the buildings, or into trucks, which are run upon a steel overhead gantry to different parts of the works. A new patent crusher is placed in a sunk basement for the crushing of the rock asphalt, and other disintegrating and mixing machines are placed in proper sequence so that no ground is travelled over twice before the rock, reduced to a fine powder, reaches the boilers and roasters, where it is finished ready for use. The machinery in the new works is driven by electric motors of 120 h.p., and the premises throughout are lighted by electricity, the electric current being taken direct from the mains of the Poplar Borough Council, and thus with the old works the Company have the whole of their machinery duplicated. Messrs. Clarkson, of Poplar and Bloomsbury, were the architects, Messrs. Selby & Saunders, Westminster, were the quantity surveyors, and the several contractors were Messrs. F. & H. F. Higgs, of Loughborough Junction, for the buildings, Messrs. G. Munday & Sons for the river frontage, Messrs. H. J. Cash & Co. for the electric installations for both power and lighting (including motors), and the steelwork was supplied by Messrs. H. T. Shaw & Co., as sub-contractors.

DRILL HALL, LONDON.—Prince Alexander of Teck, on Saturday last, opened a new drill hall and gymnasium at Buxton-street, E. The buildings, which are of brickwork, with steel roofs, were designed and carried out by Mr. Alfred Cox, of Baker-street, W. The contractors being Messrs. F. & E. J. Wood, of Mile End.

SANITARY AND ENGINEERING NEWS.

BRADFORD SEWAGE WORKS.—During the last twelve months, by means of the thirty-two sludge filter presses at the Frizinghall works, 81,295 tons of pressed cake have been made. The small experimental apparatus for the distillation of grease direct from the sludge cake has been removed, and a plant, estimated to be capable of dealing with 13 tons of pressed cake per day, is being put down. A new Lancashire boiler, heated by means of a brick furnace, has been fixed, the fuel used being pressed sludge cake. The sludge filter works at Sandy-lane Sewage Works have been converted into filters for the purification of tank effluent water. The sewage is being purified by chemical precipitation, followed by irrigation on land. Arrangements have been made to connect the main sewer of the Green-gates works with the main sewer of the Galle sewage farm. This farm now receives all the trade effluent of the Idle district. The sewage formerly reaching the Tong works has been diverted to Frizinghall by means of a connecting sewer. The new sewers within the district of Hipperholme, towards the extensive of which the Corporation are contributing, have been constructed, and it is now possible to discharge the sewage of the Lower Wyke district into the Brighouse sewers. This will be done as soon as the agreement with the Brighouse Corporation is completed. The mills discharging liquid refuse into the sewers of the city have been visited from time to time, and during the year thirty-four firms have entered into agreements with the Corporation with reference to trade effluents. Of these, twenty-seven have agreed to pay the Corporation for the treatment

of the effluents, and seven have erected their own plants. In consequence of the engineer's report as to the character and constantly increasing volume of the liquid refuse discharged into the sewers from the various laundries of the city, the committee determined to apply the provisions of the local Act of 1897 to refuse of this nature. A few proprietors of laundries agreed upon terms with the Corporation for the treatment of their refuse with the ordinary sewage of the city, but owing to the intervention of the North-Eastern Laundries' and Dyers' Association, the committee met with resistance in other quarters, their demand that the refuse should either be treated before discharge into the sewers or be dealt with by the Corporation on suitable terms being ignored. Consequently, the committee found it necessary to proceed against one laundry, and this would, no doubt, be treated as a test case to determine the liability of laundry proprietors. The case had been heard before the Stipendiary Magistrate, who had reserved his decision.

WATERWORKS, TARBERT, N.B.—The new Tarbert waterworks were recently opened by Lady Freese Campbell. The works consist of two filters, each 50 ft. by 25 ft., with telescopic tube outlets for gauging the rate of filtration, and with inlets so arranged that, by lowering the water level of the one filter, it can be cleansed with filtered water from the other. At the east end of the filters a sand-washing platform, 40 ft. by 20 ft., has been laid down, with a sand-washing box of modern type. The service tank has a capacity of 190,000 gallons, and is 50 ft. square by 11 ft. 6 in. deep. The old 4-in. main to Tarbert has been supplemented by a 6-in. main, and, as the new filters have been placed at an elevation of 287 ft. above Ordnance datum, or about 100 ft. higher than the old service tank, the pressure within the supply area has been increased. The contractor for the works was Mr. Thomas Christie, Stirling, Messrs. Warren & Stuart, of Glasgow, being the engineers. The cost has been about 3,500.

NEW BRIDGE, KING'S FERRY.—After operations extending over two years, the new railway bridge over the Swale at King's Ferry, which connects the Isle of Sheppey with the mainland of Kent, was completed on the 6th inst. The engineer is Sir Benjamin Baker, who has worked in conjunction with Mr. P. C. Tempest, chief engineer South-Eastern and Chatham Railway. The cost of the structure was about 50,000.

FOREIGN.

FRANCE.—The architectural journal, *Le Bâtiment*, has advertised a competition in its columns for the best design for a type of "barraques" to be erected on the Paris Boulevards during the usual Christmas and New Year's fêtes. It is proposed to considerably enlarge the range of conservatories on the Cours la Reine, Paris, by means of annexes added between the Pont des Invalides and the Pont de l'Alma.—Bartholdi's monument to the aeronauts of the Siege of Paris is to be erected at Neuilly-sur-Seine, on the axis of the Boulevard Couvion St. Cyr.—M. Georges Ermant, architect, of Laon, has been elected President for 1904-5 of the Architectural Society of the Department of Alsace.—A hospital on a great scale is to be built at Soissons.—A new hospital is to be built at Marseilles, at an estimated cost of 600,000 francs.—It is proposed to organise next year, at the Calliera Muscum, an exhibition of the work of the sculptor and ceramic artist, Emile Gallé, who died recently at Nancy.—The death is announced at Isle-sur-Sorgue (Vaucluse) of the painter, Victor Leydet. He was a pupil of Gérôme, and a member of the Société des Artistes Français. He had obtained medals at various Salons; his picture under the title "Le Vendredi Saint" attracted a good deal of notice at the Salon of 1900.

GERMANY.—Mr. C. A. Niessen, H.M. Consul at Cologne, reports that unfavourable business conditions have existed in the cement industry of Rhenish, Prussia, and Westphalia for the past three years, owing to large over production. In 1902 the prices were so low that the cement works could not make any profit. A market was then found in South Germany; but in 1903 the prices in this district likewise fell to such a point as to leave the cement manufacturers no margin. To remedy this state of affairs, a meeting of proprietors of Rhenish-Westphalian Cement Works was summoned last month (October). After negotiations lasting two days, an agreement was arrived at for the establishment of joint sales offices, to last until the end of 1913. A union of the cement works of the Lower Elbe has also been formed, and now negotiations are pending between this syndicate and the Hanover works. Furthermore, a committee at Berlin is making efforts to unite in the first

line the Upper Silesian and the Berlin factories. When an agreement is come to between Upper Silesia and Berlin on the one side, and the Lower Elbe and Hanover group on the other side, common negotiations will be entered into between these two groups.—The new Law Courts at Kreuznach are completed; the designs for the building were planned under the direction of Herr Thoenner.—The engineer, Professor Eduard Gerlich, died on October 14, in his sixty-eighth year; he was formerly Chief Inspector of the St. Gotthard Railway, and has been Professor of Engineering at the Technical Schools in Zurich since 1892.

AUSTRIA.—The "Mozart Fountain" in Mozart Platz Vienna is in course of construction; the fountain is the work of the sculptor, Theodor Wolk, and consists of a large, semi-circular stone basin, from the back of which the water gushes from the mouths of fabulous creatures; the central figures are taken from the "Zauberflöte," and are cast in bronze.—The "Berthold" bridge at Vienna is to be rebuilt in the spring of 1906.

BRIDGE WORK IN SPAIN.—Tenders will be opened on November 29 at the "Direccion General de Obras Publicas" for the construction of (1) a bridge over the river Guadajoz, on the road from Jaén to Códoba, at the upset price of 244,789 pesetas (about 7,120/), and (2) a bridge over a branch of the river Pisuergra, on the road from Saldaña to Masa, in the province of Burgos, at the upset price of 53,977 pesetas (about 1,553/).

MISCELLANEOUS.

COMPENSATION CASES.—It is stated that a sum of 255,672/ is claimed in respect of the freehold property adjoining to St. Clement Danes Charity Schools, and compulsorily acquired by the London County Council for their Strand to High Holborn improvement scheme.—An award to the amount of 13,870/ has been issued by Mr. Daniel Watney, a past President of the Surveyors' Institution, who presided over the arbitration, in settlement of a claim for 27,000/ preferred by the Pwllycrochan Estate Company, of Colwyn Bay, as against the London and North Western Railway Company for lands taken by them to widen their line in that locality.

IMPROVEMENTS, BELFAST.—On the 28th ult. Mr. P. C. Cowan, M.Inst.C.E., Chief Engineering Inspector to the Local Government Board, held an inquiry, at the Town Hall, into the application of the Belfast Corporation for sanction to the following loans:—15,000/ for erecting an additional story to the new Municipal Technical Institute; 48,000/ for the Seddalaham and Kinoy Drainage Works; 16,000/ for the Greencastle Drainage Works; and 2,000/ for erecting an additional fruit market. In the course of the inquiry Mr. Samuel Stevenson, architect of the institute building, said the extra story would provide 21,700 super. ft. additional floor space. A loan of 85,000/ had been originally sanctioned for the institute. The contract price was 81,000/ and architect's and surveyor's fees would come to about 4,000/. Including the new story, which would cost 14,406/ the salary of clerk of works, and other necessary expenditure, the Institute would cost over 100,000/. Mr. H. A. Cutler, City Surveyor, gave evidence at length regarding the proposed drainage works at Sydenham and Greencastle.

CHANCEL SCREEN, ALL SAINTS' CHURCH, DRIFFIELD.—The oak chancel screen, which has been placed in this church, was dedicated on the 1st inst. The screen has been designed by Mr. Temple Moore, of London, and the work has been executed by Messrs. George Shepherdson & Sons, Ltd., Driffield. The work consists of seven principal divisions, filling the width of the chancel arch. The four-light window in the gable of the south wall of the nave, and immediately above the screen, has been filled with painted glass from the studio of Mr. H. Victor Milner, of London.

REBUILDING IN PICCADILLY AND OLD BOND-STREET.—The site of Nos. 57, 58, 59, and 60, Piccadilly and the adjoining Nos. 44, 45, and 46, Old Bond-street, is being cleared for the erection of new premises, after the designs of Messrs. Read & MacDonald, for Messrs. Callard, Stewart, & Watt, confectioners. The former shop, Stewart's, at the corner of the two streets, was established there nearly 200 years ago, and was reputedly the oldest baker's shop in the west part of the town. In July, 1887, it was sold by auction at the Mart for 15,000/—the purchasers being, it was stated at the time, the Prudential Assurance Company—the freehold building site at that corner covering 3,210 ft. super., with frontages to Piccadilly and Old Bond-street, and having extensive vaults. The six houses were

then let for an aggregate rental of 2,410/ per annum under the leases which have recently expired together. Messrs. Howard & Co. are the general contractors for the new building, the steel construction and concrete floors will be supplied by Messrs. Richard Moreland & Sons.

MEMORIAL, ST. ANNE'S CHURCH, ALDERNEY.—An engraved brass has been placed in the porch of the Church of St. Anne at Alderney, in memory of the late John Le Mesurier, M.A., Hon. Canon of Winchester. A memorial Celtic cross of granite has also been placed over the grave of the deceased divine in the graveyard of the Tateley parish church, Hants. Bell memorials have been executed by Messrs. Harry Hems & Sons, of Exeter.

BATH ABBEY.—A public meeting was held at the Guildhall, Bath, on the 4th inst., under the Presidency of Lord Bath, to consider a statement which had been drawn up by Mr. G. Jackson, R.A., upon the condition of Bath Abbey. Mr. Jackson, after recalling the fact that early in August the south-eastern pinnacle of the central tower was struck by lightning, stated that the damage done was less than might have been expected, but that the top 15 ft. of the spirelet was seriously disturbed and some of the stone shattered. There were no conductors on the building, which was obviously in danger from any storm, and should be protected by a complete system of points and copper tapes on the plan he submitted. The removal of the shattered part of the pinnacle had, he was sorry to say, revealed another defect. The whole of the pinnacles, as well as those at the east end of the choir, were put together with iron clamps, which, being near the outside of the stone and exposed to damp, had rusted so seriously as to expand sometimes to twice the original thickness and had thereby disjunctured the masonry to that extent. He recommended that the whole of the four spirelets of the tower and those of the east end should be reconstructed, substituting copper rods as slat dowels for the iron clamps and ties.

The pinnacles had to come down, he thought, would be well to consider whether, instead of the modern bulky pinnacles, they were not substitute pinnacles of a lighter design, something more like those of Malvern Priory and Gloucester Cathedral, which would be a return to what was the character of the original pinnacles as shown by old prints. The north-east pinnacle of the choir was considered, in a dangerous state, and should be seen to without delay. The final was broken across, and the two top courses were left 14 in. on one side. The flying buttresses, which he directed attention more than 20 years ago, were, he believed, put up for ornament and had no work to do until Sir Gilbert Scott vaulted the nave. The vault was now overpowering the buttresses, and the walls had an inclination outwards. He considered it imperative necessary that the walls should be shored at certain points and the flying buttresses reconstructed without delay, or the consequences might be serious. The buttresses had all come over several inches, and it was not safe to leave any of them. Some repairs to the parapets were also needed. The western turrets were prepared for flying buttresses to give the same architectural effect as the west front as was given by similar buttresses at the east end, and though in neither case were they needed for strength, but for beauty, he thought the west front would gain very greatly if these buttresses were added. It was estimated that the whole of the work recommended by the architect would involve an expenditure approximating 4,000/. It was resolved, on the motion of the Bishop of Bath and Wells, seconded by Mr. E. T. Foxcroft, to proceed at once with that part of the work which was considered urgent at a cost not exceeding 3,000/. The erection of the two buttresses at the west end and the question as to the alteration of the character of the pinnacles were deferred.

LIVERPOOL CATHEDRAL.—At a meeting, on the 7th inst., of the Liverpool Cathedral Committee, the Lord Bishop of the Diocese read a letter which he had received from Mr. Arthur Earle, of Childwall Lodge, Wavertree. Mr. Earle asked the Bishop "to be the medium of offering to the Cathedral Committee a sum of 25,000/ for the erection of a Lady Chapel, to be dedicated in due course by the Bishop, with the approval of the donors." The donors," continued Mr. Earle, "are members of the Earle and Langton families. . . . A resolution expressing thanks to the donors and a decision immediately proceed with the building of a Lady Chapel was passed unanimously. The Lady Chapel had been designed by Messrs. G. F. Bodley, R.A., and C. Gilbert Scott, architects of the cathedral. The Committee hope to have it completed by 1909.

25,081 of 1903.—R. PRATT: Rust Prevention Compounds.

A compound consisting of a quickly evaporative and mobile spirit, such as petrol, gasoline, ether, petroleum spirit, benzene, light naphtha, or like material, or any mixture of such material with a rust preventing material such as vasoline, heavy oil, fat, wax, rosin, stearine, spermaceti, balsam, or any mixture of such material, the resulting compound retaining in a sufficient degree the mobility of the spirit.

27,617 of 1903.—H. J. HADDON (G. Malard): Construction of Buildings for the Prevention or Spread of Fire.

The construction of buildings for the prevention or spread of fire, comprising a system of mill, turnstile, or cylindrical drum with wings, and made of incombustible materials, said mill or the like being placed vertically or horizontally in the aperture in the wall separating two parts of a building to completely close same, but permitting the passage of workmen or goods by means of a rotatory movement around an axle or on a central pivot without danger of a current of air or flame affecting the same passage.

17,436 of 1904.—F. HENNEBIQUE: Ferro-Concrete Piles for Quay Walls and other like Constructions.

A system of piles of ferro-concrete (or strengthened beton) for making quay walls or other like constructions, in which a branch is cast on the pile proper, so that the part of the piles driven in at intervals and according to the inclination of the wall, forms with the intermediate sheeting piles the wall proper, whilst the branches form with the upper part of the piles a fork serving as brackets for holding suitable planking, while the branches by themselves serve as a means of attachment for one or more fender beams.

SOME RECENT SALES OF PROPERTY.

ESTATE EXCHANGE REPORT.

Table listing estate exchange reports with columns for date, location, description, and price. Includes entries for Hatfield Broad Oak, Franksin & Son, October 31, and various other properties.

November 2.—By BOXTON, SONS & BUCKMASTER.

Table listing property sales by Borton, Sons & Buckmaster, including locations like Fulham, Hampstead, Clapton, Forest Gate, Bow, Bromley, Bayswater, Edgware, Biddlesden, Ferry Fyston, and Woolwich.

Crouch End.—23, Cecil-pk., n.t. 78 yrs., g.r. 107, p. ...

Table listing property sales by other agents, including locations like Crouch End, Streatham, Bow, Sidcup, Hatherley-rd., and various other areas.

MEETINGS.

FRIDAY, NOVEMBER 11. Architectural Association.—Mr. W. Hennan on "Ventilation." 7.30 p.m. MONDAY, NOVEMBER 14. Surveyors' Institution.—The President, Mr. H. T. Stewari, will deliver an Opening Address at 8 p.m. ...

WEDNESDAY, NOVEMBER 16.
Architectural Association Discussion Section.—Mr. W.
Anon of the Society, by Sir William Abney, at Ryckholt-
Builders' Foremen and Clerks of Works' Institution—
Monthly Meeting of the members. 8 p.m.
Institution of Sanitary Engineers, Ltd.—Election Com-
tee. 3 p.m. Examination and Literary Committee,
ance Committee, Organising Committee. Council
ing at 7 o'clock.
Society of Arts.—Inaugural Address of the 151st
on of the Society, by Sir William Abney, at Ryckholt-
, D.S.C., F.R.S., Chairman of the Council. 8 p.m.

THURSDAY, NOVEMBER 17.
 Leeds and Yorkshire Architectural Society.—Address
 of the President, Mr. G. Bertram Bulmer, and distribu-
 tion of prizes. 6.30 p.m.

FRIDAY, NOVEMBER 18.
 Junior Institution of Engineers (Westminster Palace
 Club).—Mr. William H. Lindley, of Ryckholt-
 on, will deliver his Presidential Address, on
 "Unipol Engineering on the Continent." 8 p.m.
 Institution of Mechanical Engineers.—Ordinary
 General Meeting. Mr. A. E. Seaton and Mr. A. Jude
 "Impact Tests on the Wrought Steels of Commerce."
 8 p.m.

TO CORRESPONDENTS.

NOTE.—The responsibility of signed articles, letters,
 papers read at meetings rests, of course, with the
 authors.
 We cannot undertake to return rejected communica-
 tions, and the Editor cannot be responsible for
 drawings, photographs, manuscripts, or other docu-
 ments, or for models or samples sent to or left at this
 office, unless he has specially asked for them.
 Letters or communications (beyond news items)
 which have been duplicated for other journals are NOT
 REPLIED TO.
 All communications must be authenticated by the
 name and address of the sender, whether for publica-
 tion or not. No notice can be taken of anonymous
 communications.
 We are compelled to decline pointing out books and
 news addresses.
 Any communication to a contributor to write an article,
 to execute or send a drawing for publication, is
 subject to the approval of the article or drawing, when
 received, by the Editor, who retains the right to reject
 any article unsatisfactory. The receipt by the author of
 a proof of an article in type does not necessarily imply its
 acceptance.
 All communications regarding literary and artistic
 matters should be addressed to THE EDITOR; those
 relating to advertisements and other exclusively busi-
 ness matters should be addressed to THE PUBLISHER,
 and not to the Editor.

PRICES CURRENT OF MATERIALS.

Our aim in this list is to give, as far as possible, the
 average prices of materials, not necessarily the lowest.
 Prices and quantities obviously affect prices—a fact
 which should be remembered by those who make use of
 information.

The London Building Act Amendment.

CONSIDERING the very long period during which the old London Building Act was left untouched, before it was superseded by that of 1894, the fact that the latter

is already about to receive what promise to be numerous and important amendments indicates that there is a much greater activity of mind in regard to such points than existed during the previous half century. The Report of the Building Act Committee of the County Council states that it was originally intended merely to bring in a Bill to amend the 1894 Building Act in relation to provision against danger from fire. The Council however came to the wise decision that if a Bill to touch the Act were to be brought in at all, it would be better to make this the opportunity for drafting and carrying all amendments to the Act which seemed to be required; and accordingly the previous reference to three Committees in relation to provisions against fire was rescinded, on the understanding that the Building Act Committee would proceed with the preparation of proposals for securing all the amendments. The Report of that Committee, which was partially discussed at last Tuesday's meeting of the County Council, was printed in full in our last issue (pages 489 to 491 ante). As will be seen, the Committee have not yet published the actual wording proposed

for the altered portions of the new Act; they only detail the points in regard to which they propose alteration; so that a great deal yet remains to be done before any Parliamentary action can be taken.

The first of the suggestions given under "details" in the Report includes the proposal "to define certain terms not at present defined"; there is no suggestion as to what these are, but it is to be hoped that it is at last intended to define "building" and "structure," words which are used in the existing Act as if they had a different meaning, but of which neither is defined. To pass an Act to regulate buildings, and to omit to define what legally constitutes a "building" is certainly one of the most extraordinary oversights ever made in an Act of Parliament, and it seems amazing that it should have been allowed to pass. It is also proposed in the next paragraph of the Report to amend the provisions as to what constitutes "the commencement to form or lay out a street," a reform also urgently demanded in the face of the extraordinary wording of section 8 of the present Act, wherein it is stated that certain acts constitute a commencement to form or lay out a street, unless the person concerned shall have done any of these acts "for some purpose other than that of forming or laying out a street"; so that, as far as the wording goes, he has only to affirm that he had "some other purpose," to put himself outside the Act; a laxity of definition almost as inconceivable as the omission to define "building." Among the proposed alterations in regard to streets we are

glad to see that it is proposed "to enable the Council to require a greater width than at present" "in the case of new streets or the adaptation of ways to streets"; a rather vague sentence which, it is to be hoped, amounts to a confession that the limits of street width in the present Act are too small. It is also proposed to make universal the requirement, at present absurdly limited to "dwellings for the working classes" (by the way is the new Act to define "the working classes" ?), that a dwelling-house within a distance of 20 ft. from the centre of the roadway shall not be erected to a height greater than the distance to the nearest external wall on the opposite side of the street. But the most satisfactory point in reference to this part of the subject is that it is intended to provide that in new streets "no building shall exceed in height the distance between buildings on opposite sides of the streets." That is what has been wanted all along; and that will put an end to the absurd anomaly in the existing Act, which we pointed out at the time it was passed, that with a street 49 ft. in width the height of buildings is limited to the width of the street, but that the moment you get to 50 ft. wide you may carry the buildings to a height of 80 ft. But why not go a step further, and apply the same rule to new buildings erected in an old street? Private owners would grumble, no doubt, and it might be a case for compensation, but it would unquestionably be for the public good.

The proposed alterations in regard to building line seem also to indicate that the authorities are at last waking up to the

fact that the contemplated widths for new streets in the existing Act are too narrow. It is now proposed that the buildings in any new street not within two miles of St. Paul's shall not be nearer to the centre of the road than 35 ft. without consent; and that the Council shall have power to define a building line in any important street "not being at any point more than 75 ft. distant from the centre of the roadway." This is a change indeed from the provision of the existing Act, that the Council should have no power to require a greater width than 60 ft. for any street. It is proposed also to provide that on payment of compensation the Council may require any building or structure projecting beyond their defined building line to be set back.

The suggestions as to the naming and numbering of streets seem to be redundant in some points and deficient in one very important one. It seems contemplated that the Council should now take the initiative in street naming, instead of merely exercising a veto over any name they may disapprove of; but they already have power (section 34) to alter the name of any street to any other name they think fit. Section 33 already provides that the local authority is to paint or affix the name of a street, so that we do not see the point of the new suggestion in the Report "to require the local authority and not the owner to set up the new name whenever the Council finds it necessary to change the name," etc. But what we do not see in the Report, and should have wished to see, is some decisive provision for the compulsory naming of streets at every corner and on a definite system, as is done in Paris. The existing Act uses the vague phrase that the local authority "shall and may" cause the name of every street to be affixed "on a conspicuous part of some house or building at or near each end or entrance to such street, or some other convenient part of the street." This is not precise enough; it is at the entry to the street, at the corner of each street, that we want to see the name. But even as it is, it is disgracefully neglected by local authorities. A man who goes into any neighbourhood in London with which he is not familiar, is likely to have difficulties in finding the street he wants. He will probably pass corner after corner where there is no name to the street, and where, if the names are written up, they are in all kinds of different forms and lettering; no rule is followed. What we ought to see in the amended Act is some such clause as this:—

"The Council will decide upon the best and most convenient form of lettering for the names of streets, and on the material and the manner of fixing the names; and the local authorities are bound to adopt this general model, and to affix names, designed and executed on the same model, at the corners of all streets in their district; and the local District Surveyor shall be considered responsible for carrying out this regulation."

If some such clause as this were inserted in the Act, and its operation insisted on, we should at last have all our London streets fully and legibly named and labelled, in the same form and lettering, in place of the present partial and haphazard lettering, the result merely of carelessness and want of system, and which is a discredit to London.

The suggestions in regard to open

spaces in connexion with buildings, though rather vaguely expressed, obviously point to an intention of enlarging the scope of these provisions, one sentence in fact running—"To provide that open spaces behind houses shall be larger than the present Act requires"; which is certainly in the right direction, for the open space provision is small enough at present. There is a want of logical clearness and decision in some of these paragraphs; e.g.:—

"To require the space at the rear of all buildings used solely for dwelling purposes, in streets laid out before the commencement of the Act of 1894, to be provided at the level of the adjoining pavement."

This is just what the existing Act provides (section 40); the only real difference being that section 40 restricts the requirement to domestic buildings erected since the Act of 1894, while it is now proposed to make the provision retrospective, and apply it to buildings erected at any time before the 1894 Act. It would surely have been simpler and more sensible to state it that way, instead of bringing in what at first sight seems to be a new proposal. Among other proposals are those for making a minimum provision for ventilation to an enclosed court; to omit from section 45 the second paragraph (allowing a court of which the greater dimension is not more than twice the lesser one, if equivalent in area to the required space); and to apply the third paragraph of the same section to any habitable room, whether above or below the level of the ground story. This is in the direction of common sense; why the existing paragraph was not to apply to windows in ground floor and basement is one of the numerous little puzzles of the existing Act; one presumes there was some motive in the mind of the framers of the existing paragraph; but it is difficult to understand what it could have been.

The proposals for providing against danger from fire may seem rather numerous and drastic, and we understand that the report of them has already raised alarm in the minds of property-owners and intending building-owners, but we do not see that there is anything more than reasonable in them, considering the terrible examples we have had of the danger from inadequate construction and insufficient means of exit in city fires. The greater proportion of them deal with the provision of means of escape, but there are one or two important provisions in regard to structure. Floors of wooden joists with concrete pugging are now to be recognised as fire-resisting, which is a concession, though a perfectly right one; an exception being made in regard to floors over any room in which a furnace is fixed. The lesson from the Whitechapel fire has evidently led to a provision that windows of warehouses within 30 ft. of openings of other premises (should not this be "of premises opposite"?) shall be protected in a prescribed manner to prevent the spread of fire. Another provision that we are very glad to see proposed is that "boarding and panelling shall be so fixed as not to allow of any space between it and the wall," and such work is to come under section 145 of the present Act, viz.: work of which notice is to be given to the District Surveyor. Though this comes under the head of provisions

against fire, in reality it is a salutary provision for other reasons. We have always been of opinion that hollow spaces that no one can get at are most undesirable in any building, from a sanitary well as from a fire-protection point of view.

Under the head of "construction" a general paragraph promising to provide for and regulate the use of iron and steel construction in buildings was almost a matter of course; no details are as yet given. The proposal to increase the minimum height of "habitable" rooms by 6 in. will no doubt meet with opposition, as unnecessary, but we entirely approve of it. In regard to habitable rooms over stables there is a proposal to extend the provision as to floors, rooms over coach-houses and barn rooms; this seems unnecessary unless such rooms communicated with the stable, which they never should. Indeed, it seems to us that 70 *e* of the existing Act provides all that is necessary. When reviewing the existing Act, we asked why the wall between the staircase and the stable must be of brick, and concrete would be just as effectual. In the new proposal there is the opposite mistake, and only concrete is specified for both. It should be "brickwork, cement or concrete." Paragraphs of this kind seem to be drafted without sufficient thought as to facts and wording. We note that in regard to certain points of construction (of what nature is not indicated) there is to be a right of appeal to the superintending architect against the judgment of the District Surveyor, a very benevolent provision. An architect may have a new method of construction which is perfectly sound, which a surveyor may condemn merely because it is unusual or against the letter of the law.

To provide for horizontal separation of properties as an alternative to separation by party walls is a step with the increasing use of solid floors, and constant subdivision of properties, tenements within the same general exterior structure, renders both possible and desirable.

Among the "Miscellaneous" provisions is one very important one, which has long been called for; to enable the Council to sanction the cubical contents of buildings to be used for trade or manufacture, "or for any purpose which the Council may think it expedient to permit," being of such dimensions as the Council may think necessary. The restrictions of section 75 in the existing Act are vexatious at a time when buildings are so frequently being required of a larger extent for manufacture, storage, and the safety of such buildings really depends not so much on the limit of size as on their manner of construction; and a special provision to empower the Council to require the maintenance of proper arrangements lessening danger from fire in buildings of large cubical extent" is suggested in another portion of the Report, which probably has reference to the paragraph before named, though the two are under different headings: they should have been placed together. And the paragraph—"to provide that where an building is taken down or destroyed"

more than half its cubical extent, the remaining portion of the building shall be demolished or made in all respects to conform with the provisions of the Act"—seems only another way of expressing what is already provided for under "Definitions" in section 5 of the existing Act, which provides that "any building which has been taken down for more than half of its cubical extent and re-erected or commenced to be re-erected wholly or partially on the same site after the commencement of this Act" comes thereby under the definition of a new building," and is therefore subject to all the provisions affecting new buildings; the powers to deal with the case are sufficient already; the new paragraph superfluous. Under the same heading, "Miscellaneous," is a provision "to revise the schedule of fire-resisting materials." This is undoubtedly necessary, and we should recommend that the amended Act should include the power to revise the schedule from time to time at the discretion of the Council, since new fire-resisting materials are frequently brought forward.

The proposal to give the Council powers to introduce the system of paying District Surveyors by salary, if they wish to do so, will no doubt arouse some opposition, but in itself it is a move in the right direction. Human nature being what it is, it is almost impossible that there should not be aroused, in some cases at all events, a disposition on the part of the Surveyor to lie in wait for faults, to be "extreme to mark what is done amiss," when every fault that can be established is something in his own pocket; and even where he is quite free from such a reproach, he will not be thought to be so by the people whom he fines. The objection to salaries is that in most districts they cannot be high enough to attract the best class of men, and the Surveyor is to be debarred from private practice; and there lies the great mistake of the County Council, which they have now an opportunity to correct. When the District Surveyorship was an appendage to private practice, the Council had some of the leading architects of London looking after the construction of new buildings; men whose names and position had weight in themselves. By abolishing the system they deprived themselves of the services of this class of architects and surveyors. Their wisest course would be to take this opportunity of restoring that state of things, and throwing open the District Surveyorships to men in private practice. In that case the salary system could be established without extravagant cost, since a salary which would be inefficient in itself to attract a man in a high position may very well be accepted of such a man as an addition to his private professional income.

It is proposed to increase the numbers of the Tribunal of Appeal to five; one member (not a member of the Council) to be appointed by the Council, the fifth to be chosen by the other four, and to be a Barrister of not less than ten years' standing, who shall be chairman. Why a lawyer should be supposed to be a better chairman of the Tribunal than an architect or a surveyor we fail to see. It is very well to provide that a lawyer

should be a member of the Tribunal—his assistance would no doubt often be most useful; but why make him *ex officio* chairman? A still more surprising proposal, and one that we cannot understand in the least, is that no "architect or surveyor practising in London shall be eligible as a member of the Tribunal." Has there been any experience in regard to the action or judgments of the Tribunal hitherto to give any colour or excuse for such a provision? It appears to us to be a preposterous one. Who is likely to be so well able to understand the points or the special difficulties of a case in London building, an architect or surveyor familiar with work in London, or a provincial man who is familiar with work under local conditions only? Or is it intended that architects and surveyors are not to be members of the Tribunal at all? The proposal appears to us not only to be absurd and unalled for, but to imply a kind of insult to the whole profession in London, as if there were no men among them who could be trusted to act with impartiality. We shall be surprised if such a proposal is sanctioned.

NOTES.

This subject was brought forward for discussion at a meeting of the London Chamber of Commerce a few nights ago, when Sir John Jackson and other speakers expressed themselves in favour of the construction of the tunnel. None of these gentlemen appeared to anticipate any serious difficulty in the execution of the work, but this is a view which, in the present state of knowledge as to the precise condition of the strata for the entire length of the proposed route, we are not prepared to endorse. Circumstances already ascertained seem to point to the possibility of a serious fault in the stratum of clay upon which the practicability of the project largely depends, and the great depth of the workings would render impracticable the employment of compressed air for the exclusion of water in the case of any fault being discovered in mid-channel. Moreover, the ventilation of a tunnel more than 20 miles in length would constitute a most serious and difficult problem, for which a satisfactory solution could scarcely be found without involving the establishment of two or more island ventilating shafts in the open sea. We have already pointed out in a previous "Note" the disadvantages of long tunnels from the hygienic standpoint, and experience of subways in the metropolis does not encourage confidence in tunnel engineers as experts in the practice of ventilation.

TWO PAPERS on this important subject, read before the Institution of Civil Engineers last week, were further discussed on Tuesday last. The first paper is mainly directed to the question of constituting a single authority for the purpose of dealing in a comprehensive manner with the entire coast-line of England and Wales. We entirely approve of the proposals made by the author,

and feel sure that the evils arising out of inaction in some places and ill-advised action in others can only be combated by properly organised efforts instituted with due regard to the requirements of all places on the seaboard. Our own sporadic methods and the general indifference of our Government stand in strong contrast to the businesslike manner in which coast protection is conducted and regarded in Holland and Belgium. In this connexion we may mention the curious differences existing between theory and practice in England and Belgium. In this country the Government claims absolute authority over the foreshores, but does nothing for their protection, except in a few special cases. On the other hand, the Belgian Government, although accepting no responsibility whatever, devotes large sums of money to, and takes great practical interest in, defensive works. The second paper, by Mr. E. R. Matthews, is of more limited interest, being devoted principally to the effects of erosion on the coast between Bridlington and Spurn Head. Still, it has the effect of showing the enormous proportions of the work, and the difficult character of the problems, that would be involved in a scheme for safeguarding the entire coast-line. For instance, the author is of opinion that the protection of the whole Holderness coast would require an expenditure of about 1,250,000*l.*, while the value of the agricultural land saved during thirty-three years would not be more than 34,000*l.* These figures make clear the fact that owners of land in the immediate vicinity of the sea cannot be expected to bear more than a small part of the cost if exceptionally heavy outlay should become necessary. No doubt the case cited is exceptional, and the estimate may be unduly high, but it serves to suggest that protective works ought to be treated primarily from the national standpoint.

At a meeting of the Council of Ministers last month it was decided to recommend the Khedive to authorise the raising of the Assouan Dam, and the construction of a barrage—similar in design to that of Assiout—near Esneh, a town of some 15,000 inhabitants between Assouan and Assiout. Both of these undertakings are included in the new irrigation programme which was fully discussed in our columns two or three months ago. While referring to this subject, we may mention that by a Khedival decree Sir William Garstin has been promoted from the position of the Under-Secretary of State to that of Adviser to the Khedive in Affairs Relating to Public Works, with a status equal to that of the Financial and Judicial Advisers. Knowing the thoroughly conscientious and able manner in which Sir William has laboured for years past in the endeavour to prepare the way for the complete engineering control of the Nile, we heartily congratulate him upon the recent official recognition of his invaluable services. He has a special claim to the thanks of our readers because of the sympathetic interest he has always displayed in the ancient monuments of Egypt and for the measures

The Channel Tunnel.

Egyptian Irrigation Works.

he has invariably authorised, when within his power, for their preservation and repair.

Sub-Contractors and Compensation. THE case of *Evans v. Cook*, decided by the Court of Appeal on the 10th inst., merely determines an important point of practice. The respondents were builders who were constructing a workhouse infirmary, and had employed sub-contractors to do the plastering. One of the sub-contractor's men sustained an injury, and the respondents, by agreement, had paid him weekly compensation. The respondents then, under section 4 of the Act, claimed an indemnity from the sub-contractors, who brought their insurers in as third parties to the action in the High Court. It was contended that the respondents had no right to bring an action for indemnity in the High Court, but could only proceed under the Workmen's Compensation Act by arbitration. The Court held that the provisions as to arbitration contained in the Act apply only where there is a question as between the workman and the employers or undertakers as to the amount of the compensation, but that they have no application where, as in this case, that question has been settled by agreement.

Workmen's Compensation. In the case of *Pattison v. White & Co.*, decided by the Court of Appeal in August, the question was raised as to the meaning of the words "on, in, or about" in connexion with an "engineering work." The employers were contractors constructing a light railway for the Corporation of Darlington. The claim made upon them was in respect of the death of a carter who was engaged in bringing sand to the works from a pit distant $3\frac{1}{2}$ miles from there. This man was killed by accident at a spot $2\frac{1}{2}$ miles from the works. On his behalf it was contended that in connexion with the first half of the definition of "engineering work," that is to say, "any work of construction, alteration, or repair of a railroad, harbour, dock, canal, or sewer," the words denoted the labour bestowed, and not the works themselves, and that the idea of "physical contiguity" to the works had no application. This contention was negated on the authority of the cases, *Chambers v. Whitehaven Harbour Commissioners* (1899, 2 Q. B., 132) and *Atkinson v. Lumb* (1903, 1 K. B., 860). In this last case it may be observed that the man was injured when working some 500 yards from the works—the construction of a reservoir in which machinery had to be employed—and he was held to be within the physical area and entitled to compensation. The Departmental Committee have advocated the abolition of this idea of physical contiguity as attached to compensation in the employment and the above cases well illustrate the necessity for reform. At what particular point between the quarter of a mile denoted in *Atkinson v. Lumb* and the $2\frac{1}{2}$ miles in the case under consideration does the workman pass from the protection of the Act? It is obviously inequitable that he should do so at all if his employment remains the same.

Elementary and Secondary Schools. A PAPER on "The New Education Code and the Report of the Mosely Commission" was read by Mr. W. Osborne Smith before the Sanitary Institute last week, and is in the main a critical commentary on the Board of Education's rules for the planning of elementary and secondary schools. Mr. Smith thinks that "in most cases" it is "quite unnecessary and undesirable from the point of view of health and supervision" that the closets of elementary schools should be, as the rules require, "at a short distance and completely disconnected from the school." We should say that "from the point of view of health" the rule errs, if at all, on the safe side, and that it is not wise in most cases to place within the school groups of water-closets and urinals for the use of young and irresponsible children. We have greater sympathy with Mr. Smith's remarks on the importance of sunshine in class-rooms, but, as to the relation of this to the central hall type of plan, we may note in passing that, if the axis of the central hall is placed due north and south, or approximately so, the class-rooms at the sides will not be entirely sunless. Other critical remarks refer to floor space, ventilation, the spacing of hat-and-coat hooks, single and other desks, and to various details of construction. Very little is said about the discoveries of the Mosely Educational Commission in America, but the paper as a whole is a sane and useful contribution to the literature of an important and interesting subject. It would have been still more valuable if it had been longer.

Preservation of Stone. IN a letter in the *Times* of the 15th inst., Mr. Thackeray Turner, Secretary to the Society for the Protection of Ancient Buildings, draws attention to the decay of the stonework of many of our ancient buildings, and concludes (we think rightly) that more damage is done by the corrosive gases and vapours evolved from burning coal than by rains, winds, and frosts acting in the absence of coal smoke. To arrest this decay Mr. Turner and his committee advocate the use of lime-wash, the lime-wash to be repeatedly applied to the face of the stone. For reasons which are obvious to all who have any chemical knowledge, lime-wash is very inferior to baryta-wash as a preservative for calcareous stones, and we think the process adopted by Professor A. H. Church for preserving decayed stonework in the Chapter House, Westminster Abbey, is much preferable to that advocated by Mr. Turner. This process consists in first cleansing the surface of the stone with the aid of an air-blast, and then, by means of a pneumatic diffuser, injecting a saturated solution of barium hydrate into the pores of the stone. The injection is repeated several times. By the use of barium hydrate instead of calcium hydrate (lime-wash), sulphate of barium instead of sulphate of lime is eventually formed in the pores of the stone for a distance of several inches from the surface. Since sulphate of barium is practically insoluble in rain water and in dilute acids, whereas sulphate of lime is distinctly soluble, the advantage of using baryta-wash instead

of lime-wash is evident. Calcium sulphate has, moreover, a greater tendency to cause exfoliation of the stone. The interested in the preservation of calcareous stones will find much valuable information in the reports of Professor Church on the treatment of the decayed stonework in the Chapter House, Westminster Abbey, to the First Commissioner of H.M.'s Works, dated May 28, 1903, and November 18, 1903, respectively.

Institution of Electrical Engineers. MR. ALEXANDER SIEMENS gave his presidential address at the opening meeting of the Institution of Electrical Engineers last week. He began by discussing the relations between capital, labour, and management of works. He laid great stress on the ill-advised action of workmen's trade unions in restricting output of works, and pointed out that the effect of this action was generally to throw more and more workmen out of employment, due to the fact that with the price of an article rises owing to restricted output then a number of consumers begin to do without it, and the demand for it diminishes. The converse of this is also true, namely, that when the price of an article is lowered the demand for it increases rapidly, so that, as a result, more workmen are employed. Gas lamps were first made by a few highly skilled workmen and sold at 25s. each. Naturally the demand for them was small. At the present time, when labour can be had for a shilling each, thousands of skilled workmen are employed making them, and tens of thousands of unskilled workmen are employed tending the machinery, packing lamps, etc. Mr. Siemens said that times of depression the only remedy workmen's representatives would suggest was "restricting the output." It could not see that lowering the wages thus lowering the cost of production would increase the demand, and so provide labour for more workmen. It seemed to us, however, that Mr. Siemens looked upon the question too much from the employers' point of view, and something could be said in favour of workmen's contention that this style of reasoning would lead to the conclusion "that everybody would find employment if no wages were paid at all!" In concluding his address the President made a strong plea in favour of the universal adoption of the metric system. He pointed out that the feat in electrical measurements which has contributed most to the rapid rise of the industry was that all countries adopted the same units of measurement. Some prominent engineers profess to have trouble to work with metrical units, and to be found that they could not work as quickly and easily with them as with their accustomed units. In his opinion, their conclusion on this particular matter is about as trustworthy as that of the man who tries to skate, and, after his first attempt, says that he has proved that you can skate faster than you can walk.

King's Ferry Bridge, Sheppey. AN interesting example of a modern bridge construction is to be found in the highway and railway bridge over the Swale at King's Ferry, between the

Sheppey and the mainland of Kent. Its structure is of the Seberzer rolling-t type, and the only other bridge of the kind in this country is one at Barking, Essex. The bascule, providing for the passage of vessels with fixed masts, is an enlarged end of curved form which, when the span is being opened, is rotated so as to come into contact with a track forming a kind of rolling ledge. This type of construction has been very largely employed in the United States, and its simplicity is certainly a great recommendation.

The Mystery still surrounds the fate of the Plummer Tower on the wall of Newcastle.

August last we drew attention to the threatened destruction of this ancient landmark, and to the strange reticence played by its owners as to the actual terms of negotiations then believed to be pending with regard to its disposal. Now appears from a report of the Town Improvement Committee that a serious proposal is before the City Council purchase and remove the tower for the purpose of widening Croft-street. By this means let the authorities buy this historic relic with a view to its preservation, but they should not be allowed to take away with it for a comparatively important street improvement that could easily be effected by some alternative means.

The new entrance gates and railings, bearing the heraldical coronet, crest, and motto of the house of Cavendish, which have been erected at the ends of Burlington Arcade, are the work of Messrs. J. & Smith, of Brierley Hill, Staffordshire, and replace the old and more laboursome iron-work. The arcade, built by Samuel Ware's designs, was opened March 20, 1819, having been erected by Lord George Cavendish (Earl of Burlington) upon the Duke of Devonshire's land to serve as a screen between Burlington House and its gardens and the houses in Bond-street. Lord George wanted to build a similar screen along the east side of his property in that part of Piccadilly, and the tenants of the Albany successfully resisted the project. Since the demolition of the elder Sydney Smirke's Exeter Change leading out of Wellington-street into Catherine-street, and for the building in 1862 of the Grand Music Hall, and of W. Young's other Arcade for Messrs. Coutts & Co.'s new bank, the arcade which was built and Repton built in 1816-19 along the west side of the Haymarket Opera House, the Burlington Arcade, and its adjacent neighbour in Old Bond-street remain as the only covered passages with vaulted roofs, being thoroughfares, after their kind in London; the two in Ludgate-hill have no features of an architectural character.

A CONSIDERABLE number of the works exhibited at the New English Art Club suggest the idea that the gallery is the work of the pavement artist. There is hardly a work in the gallery which we could call really a picture in the full sense of the word. Mr. Mark Fisher's "A Garden Walk" (50) is an exception,

though it is hardly one of his best works. Powerful sketches there are, like Mr. Rich's "In Danny Park" (20) and "Near Hurstpierpoint" (34); Professor Fred Brown's "A Valley" (102) and "The Edge of the Park" (112), and some others. There is a large study for a portrait by Mr. Furse, which is of interest in every sense; and two or three hasty studies for pictures by Mr. Sargent, which of course are also of interest; but are such rough studies, for the artist's own use, things for exhibition? There are qualities in Mr. Wilson Steer's "Twilight" (54), but in his "Storm" (58) we are again reminded of the pavement artist. Mr. Roger Fry treats architectural subjects well on a small scale, and his "Christ Church Library" (6) shows the texture of stone work, in contrast with an architectural subject next to it (7) where there is no texture at all, and the bridge might be made of mud. Texture seems to go for nothing with some even of the best exhibitors here; Mr. W. Rothenstein's "Deserted Quarry" (62), for instance, is a powerful composition, but the quarry might be cut out in cheese, for any special idea of surface that we get. As to some of the things exhibited—formless dabs of colour which we are asked to accept as architectural subjects; heads and half-lengths of personages apparently selected for their repulsive appearance, or made repulsive by the way they are treated, we do not care to particularise; but it is melancholy to see such things put forth as "art," and supported, as they are in some of the daily papers, by people who call themselves "art critics."

Drawings by Mr. Harry Goodwin. AFTER the New English Art Club, it is refreshing to look at a set of water-colours, like the "English Towns and Swiss Mountains" of Mr. Harry Goodwin (Messrs. Dickinson's Gallery), which are really beautiful and delicate art work, and are finished. All are good; among those we may specially mention are "A Pool under Monte Rosa" (30); "Au Alpine Footpath" (38); "The Calm before the Storm, Lake of Geneva" (41); "Morning on the Old Bridge Lucerne" (57); and "The Old Church, Maidstone" (17). We may add that where Mr. Goodwin introduces architecture in his composition it is always well and conscientiously treated.

THE SOCIETY OF PAINTERS IN WATER-COLOURS.

THE first drawing numbered in the catalogue of the Society of Painters in Water-colours is an architectural one of the most delicate beauty and finish; that of "The Great Church, Dordrecht" by Mr. Reginald Barratt. There are few artists of the day who paint architecture like this, combining accuracy of draughtsmanship with a feeling for colour and artistic effect; this is a real picture, which at the same time gives a perfectly satisfactory representation of architectural detail and material. Mr. Barratt's other drawings are all good, but none equal to this, and there seems to have been a little oversight in the view of the angle of the Ducal Palace (135): "A Summer Evening, Venice", for one can hardly imagine that the piers of the two front arcades, on the side furthest from the spectator, could from any standpoint be all hidden behind the nearer ones on the return side, and the impression is produced that the arcades towards the front are missing. If the point of view has been specially selected so as to give a clear vista through

the arcades in this way, it is not the best for the effect of the building, which looks as if it wanted solidity. Architectural drawing which is simply architectural and not pictorial is illustrated in Mr. Rooke's large interior "The Choir of Le Mans Cathedral" (57); irreproachable in drawing and perspective, but totally wanting in sentiment and, we must say, deficient in texture and in the expression of different planes of distance, the masonry of the near piers not appearing to stand out in any way from that of the aisle wall in the rear. This is architectural drawing, but it is not a picture, in the full sense of the word. In Mr. R. W. Allan's "Amiens Cathedral" (43) we have the other extreme, in which the building is used for pictorial effect alone without the slightest attempt to indicate detail, the architecture being only shown in a collection of dabs with a wet brush. Here, of course, the artist was only aiming at general pictorial effect and not professing to paint architecture; but we think that architecture, if used as part of the material of a picture, demands a rather more decisive treatment than that.

How different this is with Mr. Albert Goodwin's pictures of cities, which, as we have before observed, are somewhat too dream-like in their delicacy of tint, but in which the buildings, though subservient to a general effect, are treated with most conscientious care, the smaller details being even, if we mistake not, lined in with a pen, before or after the brush-work. "Winchester" (37), with a rainbow resting on the cathedral, is an exquisite example of this class of the artist's work. In a more romantic vein is his fine "Sea Breeze" (80), a red sunset, a lonely shore, and waves, combining to make a gloomy poem which is very impressive. "Venice, from the Hebrew Cemetery" (15), is another work of the same poetic cast; Venice is only dimly discerned in outline through mist and cloud, seen from a foreground—

"By Lido's wet accursed graves,"

and with a very fine and effective treatment of a stormy sky.

A feature in the exhibition is the collection at one end of the room of four or five drawings, two of them large ones, by the late Mr. Arthur Melville, who, whatever one may think of his method, was an artist of real genius, and a great loss to the Society. He carried the system of painting by dots and dabs of colour too far, so that form is almost sacrificed for colour and effect; but he unquestionably achieved great brilliancy and brightness by this method of handling, and his drawing "The Green Minaret" (211), whether we are to regard it as finished or not, is one of the best things in the gallery. Among the more recent members Mr. Walter West more than keeps up the promise of his earlier appearances; "The Quakeress" (150) presents a lady in the costume of her sect, her long grey funnel-like bonnet on her knee, and with a head which is perfectly beautiful for finish of execution and refined character; the pencil study for the figure (202) is perhaps even more charming. The fine colour in the interior entitled "A Silken Cord" (27) also attracts one, though the figures are less interesting. As Mr. West likes to paint the costumes and surroundings of that period, he is a painter who might do something for the illustration of Jane Austen's scenes, so strangely neglected by artists. Figure pictures are generally less numerous than landscapes at the Society's exhibitions, but we should mention "The Watchers" (170), a very charming and suggestive composition by Mr. Anning Bell, which we like better than his larger work "The Garden of the Sleeping Beauty" (164), very much spoiled in a decorative sense by the ugly trellis in the foreground; since this is a purely ideal work, surely something more pleasing might have been invented as a foreground object. Miss Rose Barton's portrait of a child seated by a pond (293) is excellent, and still better her terrace and infantine children under the title "Grab" (63); she is always characteristic in her treatment of children. Mr. Rackham's grotesque bogie pictures are undoubtedly very clever, but we do not think that they are the things to include in a high-class exhibition. A very realistic study of a lobster is exhibited by Mr. Edwin Alexander (230); it is worth something to see the thing so well done, though it is only what the Royal Academy would class among "mere transcripts of the objects of natural history," and therefore inadmissible. Among landscapes not already mentioned

are two by Mr. Eyre Walker of the cliffs above Farringford (29 and 141) remarkable not only for their fine broad style, but for their great truthfulness to the scene, especially No. 29. "Mallerstang Edge" (129) is another by the same artist, who also, in "Ox-eye Daisies—Early Morning" (125) gives us a flat composition and a crowd of wild flowers, as well painted as his hill scenes. Mr. Colin B. Philip's "The Wild West Wind" (49) is a grand hill landscape in his best style. There are too many interesting landscapes even to mention all; among Mr. Robert Little's various drawings, all fine, that of "Crichtoun" (93) is grand in composition, and impressive in spite of its small scale. Mr. Thorne-Waite's "The South Downs" (30), with their rolling surfaces fainter and fainter in succeeding planes of distance, is a true representation of a landscape that, whether in reality or in painting, seems never to tire. Mr. Callow, whose architectural subjects have for many years, we confess, left us unimpressed by their conventional style, arrests attention by exhibiting two of his early landscape sketches, of which "Distant view of Bamboro Castle—sketched from nature 1843" (84) is exceedingly fine, and far more interesting than his present drawings of old street scenes. Mr. Callow should exhibit some more of these early sketches. Mr. H. S. Tuke, who generally paints boys bathing, on this occasion sends various clever sketches of shipping; Miss Mildred Butler has a splendid study of "Perennial Poppies" (301) flashing red against a background of dark foliage; also should we praise her "Gay Garden" (192) and her "Ramblers" (126), an admirable study of peacocks wandering in the fields, where they look curiously out of place; one always somehow associates peacocks with a formal garden and a balustrade. Among works with a particular and specialised kind of interest, we may note how decidedly Mr. Cameron's "Autumn on the Tay" (77) is an etcher's landscape, a composition which would come out better in etching and is hardly satisfactory as a water-colour; and how distinctly Mr. Louis Davis's "October Showers" (97) is a stained glass artist's landscape, which would work out admirably in that form, though effective and poetic also as a water-colour; and that Mr. Rackham shows, in his peculiarly delicate little picture "Sussex Farmstead" (226), a little gem of a drawing, that he can do something better than bogie-pictures; we should like to see more of this kind of work from him, instead of the jokes to which he has hitherto confined himself, and which are hardly worth the talent bestowed on them.

MAGAZINES AND REVIEWS.

THE *Quarterly Review* contains an article on "The Palace of Knossos," by Mr. D. G. Hogarth, and accompanied by a pretty large reproduction of the plan of the later Palace as excavated, drawn out by Mr. Theodore Fyfe, and stated to be the most complete yet issued. Mr. Hogarth remarks on the great advantage which Dr. Evans, as an explorer, has had in his previous knowledge of prehistoric archaeology and of local antiquities. While unquestionably the most important archaeological enterprise since Schliemann's, it has been carried out in a far more scientific spirit. The article is a learned and lucid summary of the main conclusions to be derived, or considered to be derivable, from the study of the work un-earthed at Knossos; and no better exponent of the subject could be found than Mr. Hogarth, unless it were Dr. Evans himself. But while it is unquestionable that his brilliant discovery has thrown quite a new light on early archaeology, not exactly Greek, but related to Greek development, we confess that we are disposed to take *cum grano* the complete historic scheme of earlier and later periods of "Minoan art," as it is now called, which has been formulated on the basis of fragmentary remains of art from one large building. Practical archaeologists and explorers, writing on these subjects in general periodicals, have things all their own way, for whatever conclusions they have come to cannot be refuted except by one of the small handful of people who have personally gone into the subject in the same manner. But those who have more or less to take statements on trust may certainly be allowed to think that, granting all the actual facts to be correct, too much is built on them and too great a demand made on our faith. And the artistic optimism of explorers is so remarkable. As in Mr.

Hogarth's article, so in nearly every archaeologist's description, the words "beauty" and "beautiful" dance before our eyes incessantly. Every jar that has a hit of pattern on it is "beautiful," and the fragments of painting and sculpture are spoken of as if they rivalled the work of the great period of Greek art. Now, we paid most careful attention to the Knossos exhibition at Burlington House some little time ago, but we saw little that was beautiful, though much that was interesting; as to the wasp-waisted figures with (apparently) metal rings round them, they are simply hideous. The historical interest of such a find is surely enough, without trying to persuade us, against the evidence of our senses, that a great art period has been un-earthed. The same number contains an article by Mr. E. E. Fry on "French Painting in the Middle Ages," really an article on, or suggested by, the recent exhibition of the French "Primitifs" at Paris. Mr. Fry is very well up in his subject, and has many suggestions to make in regard to the history of the period; but one almost requires a series of engravings or photographs of the works to follow the writer. The article will be interesting chiefly to those who visited the "Primitifs" exhibition. There is a suggestion, however, in regard to the relative value of mediæval symbolical painting and modern realistic art which is rather startling:

"We are now so familiar with the view that painting must follow the actual appearance that it is hard for us to realise how little in the year 1400 that necessity was apparent, how contradictory even it may have appeared to the essential aims of pictorial expression. Let us take two examples: one a circular and the other a diamond-shaped pane of glass in Chartres Cathedral whereon a hunting scene is depicted. The huntsmen, on whom are concentrated our imaginative sympathies, fill the left-hand angle of the diamond and extend across the centre of the pane; up the right-hand lower border run two stags, whose antlered heads fill the space between the horses' fore-legs and noses; while the space between the horses' fore and hind legs is filled with the pack of hounds. Here we have condensed into the smallest possible space the elements of the chase that appeal most to the imagination; and the appeal is made by the sympathetic and keen observation, the dramatic fitness, of every line. To the artist who drew it and the public which enjoyed it, the criticism that these images do not bear the same relations as they do in three-dimensional space would have appeared impertinent. Our other example shall be a faithful picture of a modern battlefield: a wide undulating stretch of country broken by tufts of bushes and stones, here the almost indistinguishable accent of dust which tells of the human spirit. Our thirteenth-century artist might complain that we have imposed limitations on our art which, in certain circumstances, reduce it to complete impotence."

That is ingenious, but we think fantastic; and besides, the comparison is hardly fairly made between a mediæval scene filled (in however conventional a manner) with figures and animals in action, and one in which hardly any figures are to be seen. Sergeant could paint modern field of battle scenes that held one breathless with interest; witness his "Napoleon at Marengo."

The *Burlington Magazine* devotes an article to the subject of the Sheffield plate in Lady Wolseley's collection. The article is written by Mr. Spink, who gives a description of the manner in which the process, invented by G. T. Bolsover in 1742, is carried out; the substance of the Sheffield plate being produced by rolling together a sheet of copper with a thinner one of silver. The technical description of the process in all its details is very fully given, and is of considerable interest. The illustrations of examples from the collection referred to, though not all of equal merit, are many of them most artistic and beautiful work. The notes on Mr. Blackborne's collection of lace are continued, the present article dealing with Rose Point lace, of which some perfectly fascinating illustrations are given, of course not so architectural in design as the example in the last article, reproduced in our issue of October 22 (page 417 ante). In an article on the new Titian at the National Gallery, called a portrait of Ariosto (a reproduction of which forms the frontispiece to the number), Mr. Roger Fry shows, we think, very good reason, by reproductions of medallion heads of Ariosto, to conclude that if the picture is Titian's, in which we see no improbability, the portrait is not that of Ariosto. One rather wishes it were, it seems to accord so well with one's conception of the author of the "Orlando Furioso." A writer signing himself "P. A." makes a curious attempt to provide a kind of rule for answering the question "What Modern Pictures are worth Collecting?" The perfect artist is supposed

to present five qualities in equal degree—Strength, Design, Insight, Drawing, and Colour—to each of which 6 marks, so to speak, are allotted. So that if the buyer find his proposed purchase is not up to 6 in any of the qualities, or only in one, and is as low as 2 in Insight and 1 in Strength, then we suppose he will say, with Browning's "Mr. Shdige, t Medium"—

"I'm warned—I let the trick alone this time." The misfortune is that there is no real criterion for either Strength or Insight, and hardly a Design; it comes to a matter, after all, of perception, not of rule; and the perception may as well be applied at once to the picture as a whole. These attempted mathematical estimates of qualities of art are perfectly useless, any practical purpose, though they may be amusing in a speculative sense.

In *Technics* several serial articles are continued. Part II. of "The Mechanics of Heat Electric Traction" is largely occupied with speed, distance, and time curves for various accelerations, and explanatory notes related to the diagrams. Mr. J. B. C. Korsholm in Part V. of "Electro-chemical and Electro-metallurgical Industries," describes the manner in which the electric furnace is applied in the production of calcium carbide, carborundum, artificial graphite, glass, and iron alloy. Professor J. A. Fleming, in Part IV. of "Electric Waves," directs attention to various devices suggested or employed for detecting the presence of an electric wave, and for utilising it telegraphically. Mr. Ibbotson discusses analysis of steel alloys and the determination of minor constituents of high-speed steel. Mr. Edser continues his simple explanation of "The Electro-Magnetic Theory," and Mr. Fiander Etchells contributes a further insight into the "Theory of Structural Design," devoting attention to steel pillar design.

A suggestion for the construction of a diagram of working loads will be found useful, and enumeration of special points for the consideration of the student is good. The writer is wise, however, to designate the well-known radius of gyration as the radius of "equilibrium." There is really no sense in departing from standard nomenclature, and the present only tends to confuse students. A short article on "Colour Photography," by Mr. Colin Bennett, gives an interesting account of the three-colour process, first demonstrated in 1861 by Mr. Clerk Maxwell, and briefly describes a recent method by which a colour-photograph may be obtained on paper. The latter represents the last step of progress in this direction, but as the writer says, a wide field remains for further serious work. An illustrated paragraph on "A Roller Attachment for T Squares" should interest our readers. "The Future of Electric Heating" is the title of an article by Mr. Edwin Edser, in which the writer, admitting that the chief drawback to the electrical production of heat is the low thermal efficiency of the process, argues that the convenience and perfect control of the electric heater often counteracts the initial disadvantages. We fully agree with many of his contentions, but the general application of electric heat must largely depend upon a very considerable reduction in the existing cost of current.

The *World's Work* contains a long article by the writer who signs himself "Home Cities" on the at present much vexed question of "Cheap Country Cottages." There are many illustrations, some of them of considerable practical and picturesque interest. Groups of three four-roofed cottages on one roof, on Mr. Clough's estate, look very well and provide rooms of a fair size, at 110s. dwelling; but the sanitary provisions are shown, and must form a small separate building perhaps grouped to serve for several blocks this must be a distinct addition to the expense. The Calway cement slab cottages are very well and we fear the attempt at "artistic treatment of corrugated iron," by having a gable trellis and creepers over it, does not do it to mitigate the case; one feels, in fact, sorry the creepers. The article is an interesting one, however, and may suggest new and practical ideas to some landowners who wish to improve the housing of their tenants on an economic basis. The same number contains an interesting article on "Dispelling Fog by Electricity," a clear description is given of Sir Oliver Lodge's experiments, and it is pointed out that the invention of the mercury vapour rectifier by Mr. Cooper Hewitt has made it possible to do these experiments on a commercial scale.

the present time experiments are being carried out by Sir Oliver Lodge at Birmingham University. It is suggested that shipping and railway companies should experiment with fog-dispelling apparatus. It would be perfectly feasible to disperse the fog round railway stations and in the neighbourhood of signals. It would also be possible to keep all the space within fifty yards of a ship clear of fog. We consider that the problem is one that will repay serious study.

EGYPT EXPLORATION FUND.

The eighteenth ordinary general meeting of this fund was held on Friday at Burlington House, W., by permission of the President and Council of the Royal Society.

The President, Sir John Evans, K.C.B., occupied the chair.

The Hon. Treasurer (Mr. H. Gruber) read his financial statement, which he said was the most unfavourable he had yet had to deal with. There had been a heavy expenditure, which had not been met by commensurate receipts, not only in the case of the Fund proper, but also in each of the branches—the Archaeological Survey and the Græco-Roman Branch. It was, however, on the Exploration Fund that the blow had chiefly fallen, and this had arisen from two causes—the necessity of sending out two expeditions and the diminution of receipts from America. The general balance-sheet showed that this year the assets of the Fund and its branches amounted to 3,061*l.*, against 4,914*l.* last year. At the present market price the invested capital of the Fund would only realise about 1,890*l.*, so that the assets of the Fund stand at present at about only 1,653*l.*

On the motion of Sir H. Smyth, seconded by Dr. Redpath, the report was adopted.

The Chairman, in the course of his annual address, expressed his regret that the financial position with regard to the undertaking of further excavations was in so unsatisfactory a character, and that the relations with their fellow workers and former well-wishers in the United States were so far from what they desired them to be. He hoped an appeal shortly to be issued would meet with liberal support, for they were in honour bound to renew their explorations at Deir-el-Bahari and to organise an expedition in which Professor Flinders Petrie might carry on his fruitful researches, not improbably this season, in a new field. The Chairman proceeded to deal with the work done by Professor Petrie on the site of the ancient Herakleopolis, some 60 miles south of Cairo, and that at Thebes by Dr. Edouard Naville and Mr. H. R. Hall. Referring to the construction of the mighty dam across the Nile at Assouan, which seemed destined to bring about a state of affairs in the Valley of the Nile above Assouan which archaeologists could not contemplate without a feeling somewhat akin to dismay, they must heartily deplore the deeper immersion of the lovely temples at Philæ and the probable effects on those of Kalabshah and even Dakkeh; but it was to be feared that all they could do was to make the strongest representations in their power to the Egyptian Government in order that they might take all possible precautions for the preservation of such monuments as lie within the area of the extended reservoir, and submit themselves with what grace they could to this application of the old-world maxim, *Salus populi suprema lex.*

Professor Petrie, in the course of his address said: "Last winter we found that we were limited to work at Ehnasya, about sixty miles south of Cairo. The attempts that we have made to be allowed to complete the history of the early Dynasties at Saqqara have been fruitless; and English work is still prohibited there under any conditions. To sit down to a site which had been abandoned as exhausted, after Dr. Naville's work at Ahnas or Ehnasya, was by no means tempting, but we had to make the best of it. Some of the results you have seen this summer in London. The temple site was cleared to the bottom, and over about three times the area of the former work. Four temples were shown to have successively occupied the ground from the XIIIth Dynasty to the Roman times. Historically, the important point was settled that Antef V. and a 'king of the Annu,' or Sryians, had ruled before the XIIIth Dynasty. And as regards objects we found the largest triad of granite that is known, a colossal group of Rameses II. and two gods, 11½ ft. high, and also the beautiful gold statuette

dedicated by the king of this province about 730 B.C. This is one of the finest gold statuettes known, and it was most satisfactory that the workmen fetched one of our party to take it from the undisturbed ground himself, so that every detail of its discovery is completely known. Two large gold octadrachms of Arsinoe were also found by another man, and almost every year we obtain gold work; while from excavations where no *bakhsheesh* is given gold is scarcely ever obtained. We have thus secured not only the history of the place, but two antiquities which, in their respective classes, are the finest known.

"In later antiquities we have made a collection of Roman lamps, from which a *corpus* will be published of photographs of more than a thousand in systematic arrangement. And the Roman terra-cotta figures have been accurately dated, and a large collection will be systematically published. Both these subjects can now be studied in future from a fixed basis of classification and dating.

"While waiting for the possibility of working more of the great historical problems—which can only be solved by very few sites in Egypt, all at present unattainable—the best prospect of important results seems to lie in the complete examination of Sinai. The mines were worked there from the 1st to the XXth Dynasty, and nearly 150 inscriptions are already known; as every explorer has recorded much which no one else has seen, it is probable that many more inscriptions exist. We hope to completely copy all of these in full size facsimiles and publish them next year. The questions about the mines have never been settled; whether they were for turquoise or for copper, or both together, is quite undetermined. Not a single plan of the positions or form of the mines has been made, and the whole of the mineralogy has still to be cleared up. If a permission to excavate is granted to the Fund, we hope to search the remains of the miners' settlements and their waste heaps from the 1st Dynasty downward. And later than all these Egyptian interests there are the various early Christian settlements in the peninsula, which all need planning and examination, entirely apart from the one convent which is now inhabited.

"A necessary foundation for this research in the eastern part of Egypt has been laid by the work of Captain R. Weill, who has just published an account of all the Egyptian inscriptions there, which is as complete as the various present copies allow. Such has been a laborious research, and very needful before doing fresh work there. These copies annotated by scholars will serve as a check on our work, and will show on the spot how much is already known. All the more we see the need of complete facsimiles to form a final publication. After we had formed our plans M. Weill offered to join our party at Suez and assist in our work, in which his knowledge will be of great value. We expect to form a party of about half a dozen copyists, and to have over a selection of my old diggers from Egypt. With such a party, and four months of steady work, I hope that we shall know a great deal more than has resulted from the hasty journeys of isolated travellers.

"This district has also great importance in view of the many questions of early Israelite history; and recently the later Jewish history has been much criticised by introducing a supposed independent kingdom of Muzri in this region, apart from the Egyptian Muzri. I fail to see that any allusions to Muzri in the historical books are not completely applicable to the Egyptian territory of Sinai, but any fresh light on the Egyptian occupation here in the later Dynasties will further strengthen such a conclusion. We have then before us for this winter a certainty of much solid work in the Egyptian frontier history and ancient mining, a fair chance of more light on the early Dynasties, and possibly some further illustration of the Jewish times.

"To return to Egypt. The serious question for us is how soon the great interest felt in such work, which has been so largely supported by the public, can lead to the remaining problems of the country being opened to our research; how soon the supremacy of Mammon in the management of that land may leave a little opening for the higher interests of thought, how soon political intrigue may cease to hinder scientific investigation. Although we do not ask for public money, which is so freely given by other governments for such work, we must all strive to obtain for England liberty of research."

Dr. Bernard P. Grenfell also addressed the

meeting, and said that the third season's excavations at Oxyrhynchus began on December 4, 1903, and lasted three months, and though they had not any fresh sayings of Jesus to announce, they proved quite successful. One mound in particular yielded a rich harvest of papyri of the first four centuries of our era, amongst which are numerous literary fragments, while another fourth to fifth century mound produced some theological pieces. In the extreme north of the town, where they were digging towards the end of the time, the papyrus-yielding layers ran as deep as 25 ft., so that the progress of the trenches was slow, and much remained to be done this winter in that part of the site. The papyri had as usual all been sent to Oxford for publication, pending a division with the Cairo Museum later. Dr. Hunt and he had not, however, been able to examine them this summer, since they had devoted most of that to beginning the formidable task of unrolling their large collection of papyrus cartonnage from Ptolemaic mummies found between 1900 and 1903, together with the second collection of mummified crocodiles wrapped in papyrus rolls found in the Fayûm in 1902. While the Oxyrhynchus papyri, which were packed between layers of paper inside tin boxes, would keep dry for an indefinite period without being unrolled, the cartonnage and papyri from crocodiles not only are much more fragile to start with, but had to be packed in cotton wool—a substance which attracted and retained damp—so that they could not be expected exactly to improve their condition in an English climate. Not that those which they had brought back had suffered at all so far by being kept, but it is certainly not advisable that they should continue longer than is necessary without being unrolled. The Hibeh papyri had quite come up to their expectations. A special feature of these fragments from Hibeh were their great literary antiquity. Dr. Hunt and he left in a fortnight for Egypt, and the excavations at Oxyrhynchus will be resumed early in December, it may be for the last time. Not that they could possibly hope to finish excavating the site on the scale which it has the right to claim after all that it has yielded. They might indeed, perhaps, hope to finish those portions in which papyri of the Roman period were found close to the surface, and which were, therefore, the most profitable. But the mounds of the Byzantine period were worth clearing away systematically for the sake of finding theological pieces, apart from the chance of finding earlier documents in the lower levels. Unfortunately, the income of the Græco-Roman Branch, at no time large, threatened to be insufficient for providing an annual expedition in addition to the annual volumes which they were pledged to publish, and after the coming winter the cessation of work in Egypt may for a time at any rate be necessary. While no one would regret this more than Dr. Hunt and himself, if they were compelled to stop in the middle of what had been a fairly consistent tide of success, especially when there are so many rivals in the field, and the number of good sites was rapidly diminishing, they would have the satisfaction of knowing that they had done their best to avoid such a result.

On the motion of Judge Baylis, seconded by Mr. Cotton, a vote of thanks was passed to the chairman for presiding.

TRINITY CHURCH, SALFORD.—In their Bill which they will introduce during the next Session of Parliament for effecting an enlargement of Exchange Station, Manchester, the London and North-Western Railway schedule the site of the Church of Holy Trinity, Salford. The church, in Chapel-street, was first erected in 1635, with a capacity for 800 persons; it was rebuilt after the Grecian Doric style, in 1752, and on two subsequent occasions has been repaired and restored. The church was built by Humphrey Booth, in whose descendant the patronage still vests, as a chapel-of-ease to the then parish church of Manchester; it is the oldest church in the borough, and possesses many historical and local associations. Strenuous opposition to its demolition is expected.

NEW PULPIT, PARISH CHURCH, WESTON-SUPER-MARE.—A pulpit has been placed in the parish church of St. John the Baptist, Weston-super-Mare, as a memorial to the victims of the fire with which the town was visited in May last. The pulpit, which is of Caen stone, enriched with polished marbles and alabaster, is nearly 8½ ft. in height. The work was carried out by Messrs. Harry Hems & Sons, of Exeter.

ECONOMIES OF CONSTRUCTION IN SMALL HOUSES.*

The term "small houses," I have considered, includes cottages, entrance lodges, houses detached, semi-detached, and houses built in rows. The subject, therefore, I have found too vast to do more than make general suggestions upon, and I beg you to forgive me if I do not satisfy your expectations. I am not at all sure, too, that I shall be able to suggest sufficient points of economy, for I will not, if I can help it, sacrifice quality for cheapness, but rather suggest that economies be obtained by adopting *simplicity* as the principle.

The aim, then, is economy. The subject, small houses, including cottages, entrance lodges, houses detached, semi-detached, and houses built in rows.

The details will be:—(1) Site, (2) Aspect, (3) Special requirements, (4) Size and number of rooms, (5) Plan, (6) Elevation, (7) Materials, (8) Sanitary arrangements and drains, (9) Decoration, (10) Cost, (11) Builders.

(1) *Site*.—Both for cottages, as well as for houses in a row, if possible, the site should be on fairly level ground, else the foundations will run up the cost of the building.

(2) *Aspect*.—Though this has little to do with economy, aspect should be considered even in cottages, the south or south-east being the best, and moderately near trees for protec-

* A paper read before the Discussion Section of the Architectural Association, on Nov. 2, by Mr. A. H. Belcher, A.R.I.B.A. A short abstract of the paper has already appeared in our pages, but as since then Mr. Belcher has sent us some of his illustrations, and as the subject is of considerable practical interest, we give the paper so far as it can be given without the full number of illustrations, which were constantly referred to.

tion from winds, and these often afford pretty views towards the living-rooms can be arranged to have their windows looking.

If the house is one in a row you may not have a choice of a site, and must then arrange your best rooms to have the best aspect you can give them.

(3) *Special Requirements*.—Even a cottage may have its special requirements as one at Hollingbourne had, which I shall presently quote. It was for a man and his wife who did the laundry work of a mansion, and, therefore, a special wash-house was needed which was put at the back with a lantern-light over to let out the steam.

Generally speaking, a cottage or small house is required and built for the working class, viz., a man and his wife with or without a family.

(4) *Size and Number of Rooms*.—Cottages and very small houses for the working class in the country are provided with about six rooms.

In London and suburbs the small houses are divided up into separate tenements, each floor containing three or four rooms as a separate tenement, viz., sitting-room, kitchen, and two bedrooms, and sometimes a separate water-closet on each floor, while on the ground floor at the back will be a wash-house for the use of all the tenants.

The general run of the speculative builder's house in the suburbs of this great Metropolis, let at about 40l., will contain about seven rooms with a bathroom and water-closet often combined in one room. (But the number of rooms will depend, I suppose, as the song has it, upon "Matilda and the builder, and the childer.") This bathroom is a perfect boon to those who

like washing in these days, and I really believe it is more done now than, say, thirty years ago, when you could not get a bathroom in a small house, no, nor yet in a large house. The accommodations, I believe, draw poor attention, and prevent them from looking at the construction and beauty, of which it is often little or none.

For size of rooms, I think no sitting-room should be less than about 100 sq. ft., or 11 room than 80 sq. ft., and 9 ft. high for ground floor, and 8 ft. for first floor, but they are, of course, built of less height. The 8 ft. for first floor may for half the area of the room in the roof, and this saves waste of room. Mr. Bateman, in his most interesting paper on this subject in *The Builder* of March, 1, gives 8 ft. 6 in. height for ground as well as first floor.

(5) *Plan*.—(1) For small houses of the speculative builder's type I show a plan of six houses in Fitzalan-street, Lambeth, which have borrowed. It is for a row of houses the working class, three stories high, let out the floor of three rooms and a water-closet, with a wash-house on the ground floor at the back for the use of all the tenants.

Cottages and lodges give more scope for planning. Generally speaking, there is doubt that the cheapest form of plan is a square or oblong under one roof, with only one chimney stack if possible.

(2) The "But and Ben," or working cottage, by Mr. R. Norman Shaw, R.A., illustrated in the *Building News* in 1873, really an oblong plan under one roof. The name implies, it is a two-roomed cottage with the clever arrangement of recessed beds,* and only one stack.

(3) Cottages at Hollingbourne, Kent, for the laundry woman and her husband, did the washing for the mansion close by, this a special wash-house was required. It is a six-roomed cottage, and one of the objects I kept in view was to have, if possible, a fireplace in every room, yet only one stack. One room, however, is without a fireplace, although there is only one stack. The wash-house put at the back.

(4) For entrance lodges I give three sets of drawings. First, one of the entrance lodge Steyne House, Bembridge, in the Isle of Wight for Sir John Thornycroft, by my brother Mr. John Belcher. This is a four-roomed lodge two stories high, with one stack, and has a wash-house and water-closet at the back. It was not, however, so far as I know, built on the cheapest method.

(5) One of the *cheapest* lodges I know is an entrance lodge at Amersham, Buckinghamshire, by Mr. T. P. Figgis (see lithograph plate). It is really a four-roomed lodge, with store-room on first floor, and wash-house at side. It is signed on the square-plan principle with the roof all round and one stack in the centre.

(6) I would refer you also to Mr. May B. Adams's book on "Modern Cottage Architecture" recently published. He gives many varied examples of lodges and houses of eminent men, and the suggestions he makes are most useful. I will just quote one or two.

Plate XXII. is a lodge at Leamington, Mr. Briggs, one story high, with four rooms and one stack, but you have to pass through the room to get to the others.

Plate XXXII. is a gardener's cottage at Great Warley, Essex, by our President, Mr. Guy Dawber (see lithograph and Fig. 1). It is two stories high, and has six rooms and one stack and is built with red bricks and tile. It is to me an excellent example of beauty in simplicity of design obtained by proportion of solids and voids.

I also give another example, by Mr. E. C. Dawber, of two entrance lodges in one, at Moreton-in-Marsh, which he has kindly lent. These are built in stone, being in the county of Gloucestershire. Each are two stories high and contain five rooms, and have one stack between them. In these the simplicity of their design is their charm, nothing is introduced but what is wanted for use. The stack, I presume, is built in brick because it bonds better than the rubble work. There are some interesting details of these lodges.

Next is a clever plan for a cottage at North by Mr. Arnold Mitchell (Fig. 2).

Plate XXXIX. I mention here, though it belongs to a larger type. It is called Cott-

* We consider, however, that these beds in recesses are most unhealthy, and should never be adopted.

Fig. 1.

at Medmenham, by Mr. Arnold Mitchell, and is on the quadrangle plan. It is really a nine-roomed house, but is very simple and nice and works well.

Plate XLII. is a house at Royston, by my brother, two storied with eight rooms, and has a porch.

Of groups of cottages I will just quote the following:—

Those at Chisclhurst, by Messrs. Ernest George and Peto, 1878; three storied, five rooms, and looks somewhat expensive. Those at Pinner by the same architects in 1879. Those at Midhurst by the late Mr. Ernest C. Lee in 1878. Those by Mr. R. Norman Shaw in 1878.

A group of four cottages at Hidcote, in Gloucestershire, by Mr. E. Guy Dawber. These work out exceedingly well both in plan, elevation, and grouping, although they do have five stacks to the four cottages.

Then there are those by the Elementary School of Design, illustrated in A. A. Notes for August this year, to be built in stone. But these have six stacks between three cottages.

Lastly, I quote a good example of a pair of cottages at Trushurst by Mr. W. Curtis Green, under one roof. These are very simple in plan and were very cheap though well built.

Then there is the question of almshouses, often built in the form of a quadrangle, but as these generally include other buildings, such as a chapel, they are really outside the scope of this paper.

For middle-class houses in a row I might quote those at Turnham Green by Mr. R. Norman Shaw in 1878—three stories high, with nine rooms, and simple elevation.

For single houses of a larger type there is a good example of one at Buckhurst Hill by Mr. A. Needham Wilson, simple in plan and elevation, and which was built very cheaply.

Mr. E. Guy Dawber has also lent me his drawings for a house at Hampstead. It is really three stories high with eight rooms, built with red bricks and red tiled roof, and is very compact, although it has a spacious hall. Here are some interesting details of this.

(6) Elevation.—Much might be said on this head, but I do not believe in laying down any hard-and-fast rule, except that I venture to think *simplicity*, if worked out in accordance with the requirements of the cottage or small house to be designed, and taking the materials most easily obtained in the neighbourhood, is the right principle to adopt.

If only the speculative builder of small houses would believe this, and would at least obtain the assistance of an architect who devotes his life to the study of the subject, we should not see half the heaps of rubbish and mortar piled up on either side of the new roads constantly opened up in the suburbs of this great Metropolis.

Walls are run up, broken with bay windows for every house must have a bay window). These are faced with red bricks, which they often colour pink and then point with black tuck pointing. A brick apron is put under the windows cut to fantastic shapes. String courses of terra-cotta are built in across the front and enriched, at so much a yard run, and terra patere, and panels are introduced to fill up any spaces that are left. Some houses with bays have the angle mullions in stone, with carved caps of realistic foliage which they call Gothic, a small moulding half way down, and a moulded base, while the edges in between are all stop chamfered. Then a pediment will be put over the entrance door, with carved scrolls in the tympanum of a Classic type. The door itself is heavy bolection moulded, highly grained and varnished, and the upper panels glazed with a kaleidoscope of stained glass of all the colours of the rainbow. Green slates cover the roof, purple slate ridging finish the eaves of the bay, while red tile cresting crowns the roof. I won't weary you with any more details; you know them only too well. But for all these fancies, which every one can see, the speculative builder has to scant his timber construction and anything else that you cannot see. In all this, simplicity is sacrificed for a false show. I feel constrained to add, in the words of Shakspear, "Therefore, thou gaudy red, I will have none of thee."

The speculative builder, of course, says he cannot afford to employ an architect, and I have almost wondered if our Advanced Class of Design could not be set to design a simple suburban house which might be offered to some speculating builder for a small fee, sooner than see some of the monstrosities that are put up.

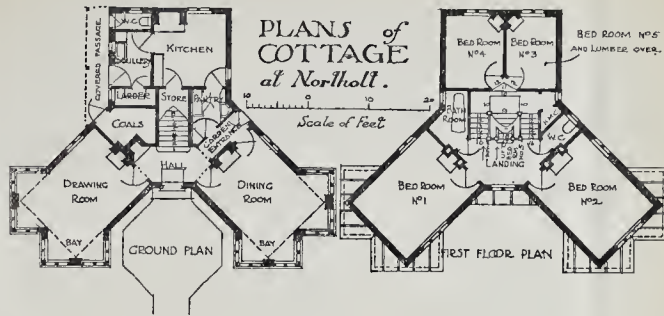

Fig. 2.

Well, if anything can be done, let us remember the principle of simplicity, for the builder often thinks an architect's design costs more money.

(7) Materials.—This, perhaps, is the crux of the subject, and a difficult one.

First, as to cottages in the country, materials must be governed by the locality, and I suggest using only those that can be readily obtained.

In the clay counties bricks are to hand, in counties like Somersetshire stone is cheaper, in Norfolk flint stones are used. When using bricks, local red facings often look very nice in colour and can be used.

If tiles are ready to hand you can use them above the ground floor for weather tiling as well as for the roof. Those for the cottage at Holingbourne were made about half a mile away. It is true they cost a little more than red facings, but not more than about 2d. a foot super, and if you use them you can build your walls behind them with brick on edge in mortar as sketch (Fig. 3).

I would add, do not use Broseley tiles if you can help it, they are expensive.

If tiles are not to hand rough cast may be used instead of weather tiling, as that is about the same price or even cheaper than facings. For rough cast Mr. Wilson informs me the walls of the house at Buckhurst Hill were built with grizzles, and the rough cast was a rendering in Portland cement, finished with rough cast made with clean coarse grit mixed with blue has lime putty and thrown on with a trowel.

At the lodge at Amersham by Mr. Figgis the external walls were 11 in. hollow walling formed with two half brick walls in cement with a 2 in. cavity between and bonded together with galvanised iron twisted ties with clawed ends, three ties to each yard super, and this cost 1s. 3d. foot super.

For damp course in the country slates are the cheapest and are quite effectual.

Fig. 3.

For roofs slates are cheaper than tiles, the former being about 30s. a square and the latter about 45s., but slates do not look nice in a clay district. In either case I think rough boarding should be used under them, but ½ in., or rather, I would say, ¾ in., will do. Felt may be given up, it costs 9d. a yard super. Where tiling is used I think nothing looks nicer than half round ridge tiles for the ridge.

For flashings, I think far better be safe and use lead—zinc is poor, and cement filletings crack often with the frost.

Thatched roofs I confess I know nothing about; perhaps someone present can enlighten me on the subject.

Half round eaves gutters I think look better and are cheaper than moulded, and round R. W. pipes I think better and cheaper than square.

Floors.—For ground floors, if you have not much top soil to take off, you can put a bed of 4 in. cement concrete floated in cement, with a 1½ in. deal wood block floor on top. This was done in the lodge at Amersham.

But cheaper than this would be to bed 4 in. by 3 in. plates as joists splayed two edges in the concrete bed and a 1 in. floor nailed on to this. This was done at the cottages at Trushurst by Mr. Curtis Green.

If you have to take off as much as 12 in. or more, then the usual method seems the best one to adopt, viz.—a bed of 4 in. concrete, half brick sleeper walls built honeycomb, 4 in. by 3 in. plates, 5 in. by 2 in. ground joists, and 1 in. flooring. And this is cheaper than the wood block flooring, I think, by about 7d. a foot super.

For sculleries and wash-houses a concrete bed floated with ¾ in. neat cement is the cheapest and cleanest.

For first floor, if you have not much funds joists and flooring only can be used, and lime-white the underside.

Finishings to Walls.—Some would adopt two-coat plaster, but this I think risky. I don't think you can give up the "render, float, and set" for living and bed rooms.

For a wash-house pointing and lime-white is the best, and if you have the room partly in a roof, and funds will permit, put ½ in. matched boarding on the roof timbers. Plaster will not do—it will come down with the steam.

Windows.—Double hung sashes are generally cheaper than casements and frames, but do not look so nice. If you use casements and frames, in cottages I think 4 in. by 3 in. will do for frames and 1½ in. casements, and I think such labourers as splay-rebated bottom-rails and hollow grooves to styles should be given up, they all cost 1d. foot run. But sash bars always look nice and do not cost more than 1d. foot super over casets in one square.

For ironmongery I would not choose quite the cheapest, as it is often inferior, but for a cottage japanned iron will do, in fact while the war is on it ought to be the rage. For reveals plain plaster will be found cheaper than wood linings and architrave.

Where casements and frames are in weather tiling or rough cast, stone cills are not required, as the frame is best flush with the tiling or rough cast and the oak cill made about 2 in. wider.

In London you cannot project timber beyond the external face of the wall, but if you wish to finish the head and sill of your frame with a moulding it can be done in oak if you make application to the L.C.C.

If your frame is in rough cast you can finish the head and sill with a course or two courses of tiles fixed sloping and no application is needed for this.

Where your frame has mullions, and is flush with the external face of brickwork you can finish the top with flush brick on edge, and this saves arches and cuttings.

Doors.—For cottages, if you use panel doors, I think square framed quite sufficient and look well; and do not put large panels, else you must specify the thickness, or the builder may use thin wood and the panel will split. For general

thickness of internal doors $1\frac{1}{2}$ in. will be sufficient. For outhouses, such as water-closets and coals, etc., ledged and braced doors are more economical. For linings use 1 in. plain with $\frac{1}{2}$ in. by $1\frac{1}{2}$ in. stop planted on, as more economical than $1\frac{1}{2}$ in. rebated on the solid.

Partitions.—For partitions other than stud partitions $1\frac{1}{2}$ in. square framing about two panels high looks, I think, best, but at the lodge at Amersham $\frac{3}{4}$ in. matched and V-jointed boarding on 3 in. by 2 in. rails were put.

Stoves.—For stoves I venture to think a combined stove and chimney piece is the most economical, but of these I only know a few that I care for, viz., some of the early ones of those supplied by Mr. Elseley at p.c. 2l., 2l. 10s., and 2l. 15s. Or you can obtain a stove at Bratt Colbrant's at ll. 7s. 6d. and design a simple chimney-piece for that.

Ranges can be had almost anywhere, though none that are safe under 5l.

(8) **Decoration.**—Under this heading I take painting and papering. For painting in my humble opinion there is nothing to beat plain ivory white throughout for economy, effect, and cheerfulness. The only thing I know against it in cottages is that finger marks will show on the doors where they are opened. Well, then, I would say paint black finger plates on the doors.

Of course, the front door can have a choice colour for effect, and I do not think it necessary to add, do not do as the speculative builder and grain to imitate oak or any other wood which it is not; it would be a lie, and for Raskin's sake give it up.

Mr. Maurice B. Adams in his book mentions a useful point, viz.—the tarring the inside of eaves gutters, instead of painting; it lasts longer.

Papering is far better left for six months till the walls are thoroughly dry, but if anything is required I think plain coloured lining paper is best and looks best, and even brown paper. But do not use blues, as these are sure to fly and show patchy, and this applies also to papers with a pattern on.

(9) **Sanitary Arrangements and Drains.**—These you will have little choice over, as they will have to be carried out in accordance with the Regulations of the Urban District Council, whose regulations sometimes are often in my humble opinion very absurd; such, for instance, as separating the rain water from the soil drain where the rain is not stored for use.

The weights of pipes are regulated, generally by the water companies, and these pipes I think are best not covered up with pipe casings, as uncovered they are more easily accessible.

Closets I cannot suggest, their name is legion, and new ones continue to flood the market, but whichever you select, if you have the pan and trap in two pieces you can often replace the one if required without the other. And again, if you select a wash-down closet with a seat, choose those in hardwood, else the hinges will probably be poor and not last. They are now made without lids, and these appear to me to get over this difficulty.

If the cottage is a gardener's one, you can put an earth closet. I mention gardener's cottage, as other servants do not always keep them in order, and in that case they are not healthy. They were used at the cottages at Trushurst and Amersham.

As small suburban houses now generally have baths, why should not cottages? Mr. Maurice B. Adams in his book gives an ingenious device for one in the saving of room, by sinking it in the scullery floor and covering it over with a lid, which is stood upon after the bath is used.

In some places in the country the rain water is collected, and in this case an underground tank is built in brick, from which it is pumped up.

For drains, where the house is one in a row and they have to pass under it, iron pipe drains are best, as these have less joints, or stoneware encased entirely in concrete can be used with the usual gulleys outside, manhole next sewer, with air inlet pipe from same, and exit pipe at the highest end of drain for which the soil pipe can be used. When in the country a cesspool with overflow takes the place of the sewer.

Of course, there are a thousand and one little points I have not touched upon, which may be treated economically by adopting simplicity as the principle. For instance, if you wish to finish a certain spot with a moulding, use if possible the same moulding that has been

adopted elsewhere so as to save cutting fresh irons.

Before leaving the subject of materials, I have said that materials used should be those obtained in the locality. And this has reminded me of a sketch I attempted on a holiday in Switzerland. It was of a Swiss chalet in the village of Engelberg, where we had to go for a week, as the hotel was full. This was three stories high, the ground floor built of stone, the upper part entirely of timber. The walls were built with logs of timber one on the top of the other, all framed together, covered outside with boarding, and that again with wood shingles. Where the cross walls and side walls met the front walls they projected outside the latter and formed buttresses. The gables were low pitched, and had beautifully cut barge boards, with pendants, and the halcyons were cut with fret-work, while the roof, which had considerably overhanging eaves, was kept from being lifted by the wind with large stones placed on the top. Internally some of the floors were covered with parquet, and the ceilings panelled in wood. If you look at the rough sketch you will see all this perhaps better than I can describe it.

One other interesting arrangement which has been adopted nearer home, is that of some bungalows on the beach at Shoreham near Brighton. An artist cousin of mine had one built some years ago when there were only a few, now I am informed that there are over two hundred. The one my cousin had built was, I believe, illustrated in the *Strand Magazine*. The process is described briefly as follows:—Three railway coaches were purchased for from 10l. to 15l. These, according to the class purchased, consist of four or five compartments. One was first class, another second, and another third. They were raised on sleepers to the height required and placed in position as shown on sketch plan.

The centre space was divided up into dining and drawing rooms and roofed in. Some of the partitions were knocked out of the coaches to make good size bedrooms, the doors of same opening on to the sitting-rooms. Kitchen and other offices were formed at the corners and roofed in, the space from floor of coaches to the ground was boarded in, and when all was complete the whole was painted white to get rid of the look of the railway, and, *voilà*, you have your habitation, at a cost of from 150l. to 200l., and, as far as I can tell, a nine-roomed house.

(10) **Cost.**—And now to return to cost. I can give the cost of some of the examples I have quoted as follows:—

For Cottages.

- (1) The lodge at Amersham cost 225l., or 6d. a foot cube. 1900.
- (2) The gardener's cottage at Great Warley, 340l., or 7½d. ft. cube. 1903.
- (3) The cottage at Hollingbourne, 475l., or 10d. ft. cube. 1901.
- (4) The lodge at Bembridge, about 400l., or 10d. ft. cube. 1886.
- (5) The pair of cottages at Trushurst, 660l., or 6d. ft. cube. 1900.
- (6) The two entrance lodges at Moreton-in-Marsh, 500l., or 6½d. ft. cube. 1903.
- (7) The four cottages at Hidecote, 1,095l., or 5½d. ft. cube. 1904.

For Houses.

- (1) The house at Buckhurst Hill, 680l. at 6½d. ft. cube. 1902.
- (2) The house at Royston, 1,542l. at 6½d. ft. cube. 1893.

Now this shows what has been done, but we must never forget it may not show what can be done, as the cost of building may go up, or it may go down, and that point must always be borne in mind when considering the cost.

(11) **Builders.**—As to builders, of course small builders, especially country ones, build cheaply, but I always feel they are dangerous, as they are often men who have been in one trade only, and know little about the others, which they let out to piece work. And if they have been bricklayers they will probably not do good joinery, and you may have shrinkages and defects in this trade which everyone can see and grumble at. If you employ a fairly substantial builder the work may cost a little more but it is more likely to be well done throughout, and he will probably understand your details better. I therefore recommend this class of builders being invited to tender.

In conclusion, doubtless I have missed many points untouched, and whatever I have missed for want of time, I suggest that the simplest

method of doing things is generally the most economical, and the most truthful, and we can hark to our old motto, "Design with beauty build in truth."

THE ARCHITECTURAL ASSOCIATION.

An ordinary fortnightly meeting of the Association was held on Friday evening last week at the new premises of the Association, No. 18, Tufton-street, Westminster, S.W. Mr. E. Gay Dawber, President, in the chair.

Mr. Louis Ambler, hon. Secretary, having announced that Mr. E. M. Gibbs had been reinstated as a member, the following gentlemen were elected, *i.e.*, Messrs. Quittenen, J., Warrington, Surrey; Sich, P. B. W., Chiswick, Napier, W. A., Camden-square, N.W.; Turmeau, A., Bow, E.; Chick, H. R., Tulse Hill; Thorpe, W., Hampstead; Webber, S. J., Maidenhead; Kent, J. C., Hailsham, Sussex; Rogers, G. C., East Sheen, S.W.; Winship, B., London; Thomas, A. J., London; Woods, F., Maidenhead; Grant, T. F. W., Sittingbourne; Batalha-Reis, V. C., Notting Hill; Bateman, H. F., Harmondsworth; Boss, Albert; Victoria Park, N.E.; Hipkins, F. W., London; Crawley Boevey, F. H., London; Boyle, E., Westminster; Aickmann, W. A., London, and Dahl, J. L. G., London.

The late Professor Kerr and Mr. Batsford.

The President said that since the last meeting they had to deplore the loss of Professor Kerr, one of the original founders of the Association and their first President, in 1847. Professor Kerr was always a firm supporter of the Association, and its educational method, having for fifty years taken the greatest interest in its work, and in 1897 he was present on the occasion of the Jubilee Dinner, although it was then a very old man. They all knew Professor Kerr's great hooks, and the interest he took in the affairs of the Royal Institute of British Architects, and he was sure the members would wish to pass a vote of condolence to the relatives of the deceased, and he moved accordingly.

The motion having been agreed to in silence the President said they had also lost a friend to a certain extent, of the profession in a Bradley T. Batsford. His firm had always been extremely kind to students and others, assisting them to get such books as they needed, and he believed that the members would desire that a letter of condolence be sent to the Batsford's relatives in the sad loss they sustained.

This motion was also agreed to in silence.

The Building Fund.

The President then announced that following further donations had been made to the Building Fund, *i.e.*, Messrs. W. H. Le 21l.; Owen Fleming, 10l. 10s.; Wm. Will 10l. 10s.; E. Dru Drury, 5l. 5s.; Leslie Green, 3l. 3s.; A. H. Ryan Tenison, 3l.; F. W. Bedford, 2l. 2s.; H. Farquharson, 2l.; W. L. Grant, 2l. 2s.; Percy L. Marks, 2l.; George Frampton, R.A., 1l. 1s.; C. L. Hamp 1l. 1s.; Geo. Hubbard, 1l. 1s.; and Arthur Keen, 1l. 1s.

Mr. Louis Ambler announced the following donation to the library: "The Architecture Rundschau" (9 volumes); "Blätter für Kunsthandwerk" (3 volumes); presented by Mr. Edwin O. Sachs.

A vote of thanks was accorded to the donor.

Sir Aston Webb, R.A.

The President said they would all be in agreement with what he had to propose, that the most hearty congratulations of the Association should be sent to Sir Aston Webb upon the honour he had just received. His Majesty the King. Sir Aston Webb had been a consistent friend of the Association from early days, and he had been their Secretary, vice-President, and President, had always taken the warmest and kindest interest in their affairs. When the gift of new premises was being arranged with the Royal Architectural Museum, no one further the effort to make the matter a success than Sir Aston Webb. That was not an occasion to speak of Sir Aston Webb's work they all knew it well, but he could say of his urbanity, kindness, and willing advice, help to anybody who came in contact with him would endear him to all, and he was sure they would hope that Sir Aston Webb would be spared to enjoy his honours.

The motion having been heartily agreed to

Mr. W. Henman then read the following paper on

Ventilation.

The invitation which I received from the Architectural Association to address its members on the subject of "Ventilation" was accepted as a compliment and with somewhat of a light heart; but more recently I have been reminded by Mr. (now Sir) Aston Webb, R.A., that, like politics and religion, the subject of ventilation is apt to arouse passion and prejudice. This fact has recently been unpleasantly forced upon me to such an extent that I have had seriously to consider whether I could venture to face another audience and run the risk of exciting animosity in again dealing publicly with the subject.

To have withdrawn, however, might lead to the suggestion that I had not the courage of my convictions, or at least that I feared consideration and kindness might not be accorded to me by the members of this Association. Believing that truth and justice will eventually triumph in this as in other matters, and trusting in the good nature and reasonable spirit in which you will receive the few remarks which I have to make on this thorny subject, I have decided to brave the occasion, simply premising that it will be my endeavour, not so much to raise controversy as to stimulate observation, in the hope of extending sound views upon the principles involved and greater intelligence in their application.

Difficulties which confront one in dealing with the subject of ventilation arise from the fact that it principally relates to functions of life which, in their fulness, are practically beyond human comprehension, and because it has to deal with individual susceptibilities as well as with an invisible, elusive, and almost intangible body, viz., the atmosphere, affected by chemical and physical laws, but yet only partially understood. Literature on ventilation is somewhat profuse, and many eminent scientists have investigated various phases of the subject, yet it appears to me there is still an opening for a concise treatise which will deal with it in a scientifically practical and up-to-date manner, without prejudice, to serve as a textbook for architectural students. Under limitations imposed upon me by the Editor, I wrote an article some three or four years past which appeared in a publication called "Modern House Construction," which, in some respects, deals with details it would be tedious to repeat in an evening's paper, although in substance I must place before you the same conclusions as those dealt with in that article and drawn from my own practical experience.

Perhaps the most unfortunate circumstance in connexion with ventilation results from the fact that eminent early writers thereon, whose works are still largely resorted to, make assertions from their undoubtedly careful observations which, in face of more modern practice and the great improvements which have since been effected in appliances, cannot now be accepted.

One of the best standard works is that by Dr. D. B. Reid, who for some years supervised the ventilation of the Houses of Parliament. He published in 1844 a book entitled "Illustrations of Ventilation." His observations and general statements are fairly trustworthy, but his deductions are sometimes at fault.

A more modern book is that of Dr. J. S. Billings, of the Johns Hopkins' Hospital fame, entitled "Ventilation and Heating," consisting of some 500 pages. It brings together a vast mass of useful information on the subject; but being written by an American principally for use in America, a considerable portion of its contents is unsuitable for this country, and a careful perusal of the volume left on my mind a sense of indefiniteness, examples being given of so many different methods without clearly indicating those that are worthy of adoption or those that should be avoided. There are numerous other writers on different phases of the subject, but the two mentioned are, so far as I know, the only books in English which deal with it exhaustively. Yet there is in both a lack of that practical guidance based on modern experience such as architects now require. The result has been to engender what I may term a chaotic state of mind in the profession. Some are inclined to dogmatise upon the simplicity of this or that method, while others prefer to do nothing, on the excuse that the difficulties are too abstruse. Nevertheless there are certain well-recognised facts which ought to be

known by all, and intelligently made use of by those who realise the necessity for efficient ventilation or whose province it is to provide for it in our buildings.

It would be impossible for me in the course of an evening to go fully into what is known of the chemical and physical properties of the air we breathe. I must take it for granted that you are acquainted with its accepted composition and general characteristics. We all recognise our dependence upon the continuous breathing of atmospheric air to sustain life; but it is always realised that to sustain healthy life air must not only be breathed in sufficient quantity but that it must be of suitable quality?

Under ordinary conditions nearly everyone who can use the muscles of his body for filling his lungs may get quantity, but it is not always obtainable in suitable condition or state of purity. "Give us some air" is an expression often made use of even by people fully surrounded by air. What they really want is fresher or purer air. Ventilation, therefore, must deal with both quantity and quality, or it cannot be considered effective.

The science of ventilation may be said to consist in providing and employing means by which adequate quantity can be procured and the art of ventilation as that of securing a wholesome atmosphere for the purpose. Unless air is reasonably pure outside a building it is scarcely possible to have it pure within. Air may be screened and washed, but it is questionable if any means have yet been devised by which, in its passage from without to within a building, a thoroughly impure atmosphere can be made wholesome.

It is rather beyond the province of architects to practically deal with the outer atmosphere. The question of maintaining it in a reasonable state of purity is of necessity a communal matter, and must be attended to by the State and by local authorities; yet each individual is personally responsible to the community for every act of commission or omission which leads to contamination of the atmosphere. So much depends upon the condition of the outer air whether or no good ventilation can be secured within buildings, that it is right we should direct public attention to the fact that no means supplied by architects for securing ventilation within buildings can be effective unless the outer atmosphere is maintained reasonably pure and wholesome. Millions are spent in order to secure supplies of fresh, wholesome water, because people recognise that an impure supply results in ill-health, disease, and death. But probably in consequence of the subtle nature and obscure effects of the atmosphere which all of us constantly breathe, expenditure is ever grudged in obtaining it pure and wholesome even within our dwellings.

It is this subtle nature of the atmosphere which doubtless accounts for the difficulties which most people find in dealing with it. They cannot see, and only with difficulty handle it. Yet, as Sir Wm. Preece when young is said to have been told by his father: "The air, although you cannot see it, is as material as water; you feel it in every puff of wind, and see it in every bending bough." I am convinced by experience that the possibilities of dealing with it for the purpose of securing ventilation are greatly facilitated by fully recognising the material nature of the atmosphere.

Air and water have different properties, yet in many respects they behave in a similar manner, and I believe the more thoroughly you study the latter and picture to yourself the material nature of the former, the better able you will be to make provision for adequate circulation of air in your buildings. Air is more universally distributed around the earth than is water, and, fortunately for us, it is in the open, naturally maintained in a fairly uniform condition; many influences being continuously at work to keep it in a sufficiently pure state for supporting human existence. Yet, even apart from human agency, it becomes fouled. In certain localities the atmosphere is well known to be unhealthy, and although it may appear heretical to say so, in these days when the open-air treatment is so greatly extolled, there is reason for believing that better health and comfort can at times be secured within doors than outside—or why should buildings be erected? Partly, no doubt, to shield ourselves from excessive velocity of winds, which may give us a pure atmosphere, but then the over-rapid movement of air is liable to so reduce the heat of our bodies when at rest that ill-health may result.

An important difference between air and water is that while air is very elastic and can be compressed, water cannot be reduced materially in bulk by compression. It is now demonstrated that air can be brought to a liquid and even solid condition, and we know that water can easily be frozen solid or volatilised. I mention these facts in the hope of impressing upon you the material nature of the atmosphere, that it can be handled and dealt with, that it is subject to certain laws which can be ascertained, it can be measured and weighed. Like water, it dissolves certain substances and vapours. It will hold in suspense insoluble matter. Fresh air, like fresh water, may become fouled by contact with impurity, either in the open, in confined vessels, or by passing through dirty conduits.

If desiring a "drink of water" you find it unpalatable, it would be folly to continue taking it from the same source in the expectation of getting a refreshing draught; or if you know of a pure source of supply, you would not willingly permit it to be conveyed in a dirty vessel or through a foul channel. Similarly you cannot expect to have fresh air unless it be taken from a pure source, and having a pure source around a building care should naturally be exercised so that it be not contaminated by contact with impurity, whilst entering or when within a building, before being breathed by occupants.

Architects being principally concerned in the design of buildings which, on being erected, cause obstruction to the free circulation of air, it is only reasonable that upon them should devolve the necessity for providing efficient means whereby adequate change of air can be secured within and around the buildings they design and erect, so that stagnation may not take place to the injury of those who occupy them, or to the detriment of surrounding properties.

Movement above all things is necessary for maintaining a healthy atmospheric condition. Consequently, the first consideration in respect to securing ventilation within a building is—how can the required movement be brought about? Probably the earliest buildings were erected in order to secure protection from excessive movement of the atmosphere. Our term "house," signifies a covering or protection. At an early period the necessity for securing ventilation must have been recognised, because in the simplest dwellings an eye or opening for the wind, now termed a window, was provided; and as there must also have been a second opening for the ingress and egress of individuals, means were provided by which movement of air within could take place. When it is understood that air is a material body it becomes evident that, before a fresh supply can enter, an equal volume must make way for it. Consequently an outlet as well as an inlet becomes essential, and at the present day buildings are mostly provided with both windows and doors, but, unfortunately, they are not so generally made use of for assisting ventilation as they might be, although by their reasonable regulation, according to the varying state of the outer atmosphere, it becomes possible, by the exercise of a little personal attention, to adjust matters. Except the property of diffusion, which is common to all gases, air has no inherent power of movement, but movement being essential for maintaining its freshness and for securing efficient ventilation, some power must be brought to bear upon it. The most potent natural power available is wind; yet wind is only the result of varying temperature on large bodies of the atmosphere. When heated, air becomes specifically lighter than an equal volume of cooler air; the latter falling by the power of gravitation, forces up the warmer, and therefore lighter air around; consequently it is the power of gravitation which principally causes natural movements of the atmosphere, i.e., winds. Let me specially direct your attention to this, because I believe considerable misapprehension, in respect to possibilities of securing ventilation, has resulted from a somewhat slipshod manner in dealing with this scientific fact; for it is most commonly stated that heat causes air to rise, and that statement of the case has led many to infer that heat causes a suctional influence in a flue. By adequately appreciating the fact that no power is known which largely attracts air upwards, while we are well acquainted with the power of gravitation which attracts it downwards, you may realise that when a fire is lighted at the base of a flue it causes a body of air to expand, which then being lighter than the air around, the

latter is attracted downwards by gravitation and forces the warmer and lighter air to ascend. Such being the case, it is by propulsion and not by suction that the air of the room is changed when a fire is lighted at the base of a flue.

So much importance do I attach to a clear understanding on this point that I ask you to test the correctness of it yourselves; place two large thin glass vessels in a delicate balance, let each be filled with air of equal temperature so as to secure an even balance, now heat the air in one of the vessels, permitting the excess to escape as it expands, and it will be found that the arm of the balance which carries the lighter air will rise—not because it is attracted upwards by the lighter air, but because the heavier air on the other arm of the balance is attracted downwards by gravitation.

People of some scientific attainments with whom I have discussed this question, were inclined to treat it rather as a distinction without a difference, and asserted that where there is a push there must be a corresponding pull, and *vice-versâ*. Theoretically that may be, but practically it has certain limitations. You can pull with some effect by means of a rope, yet with it very little power of push can be exerted; with other substances—with fluids and even more so with gases—considerable force of propulsion may be exercised but very little "pull."

If you suck or draw air out of an enclosed space around which are various apertures, you will find that the incoming air will take the line of least resistance towards that outlet. Suppose the enclosed space to be a large room, with windows or other openings around, some high up, others lower down; if a suctional influence be brought to bear upon the interior, say by an extraction fan near the upper portion of the room, the greatest volume of air will come in by the openings nearest to the fan, and but little change will be effected in the lower portion of the room. Close all the openings high up, and the air will have to travel from greater distances, consequently better change of air within the room will be effected; but if people at the floor level are to benefit by that change they also run the risk of experiencing discomfort from draughts, because when a suctional power is made use of it is difficult to determine where the incoming air will enter, and some may be sucked in directly from the outside, and will certainly cause discomfort in cold weather. The effect is the same whether mechanical power or the natural force of wind be employed. So I think it fortunate that Nature has provided forces which act more strongly in propelling than in extracting air from dwellings.

Other terms used in connexion with our subject have been unfortunate from a scientific point of view, such as "Automatic Ventilation," "Natural Ventilation," and "Mechanical Ventilation," because ventilation is a result brought about principally by the exercise of an ascertainable power. It can never be properly described as "Automatic," "Natural," or "Mechanical." It may, however, be brought about by natural or by mechanical means, and there is, correctly speaking, no such thing or appliance as a ventilator unless there be also power acting in conjunction therewith. It is the power which causes change of air.

To my mind this should be most comforting to architects, because, as natural power must most frequently be relied on for securing ventilation, all that they can do in such cases is to provide suitable means in and about their buildings; for it rests with occupiers to maintain, regulate, and properly employ the means which every architect ought to suitably provide for ventilating his buildings.

In this country, at least, the warming of our buildings is necessary for several months in every year, during which times it is practically impossible to effect ventilation without considering the subject of warming in conjunction therewith.

Whether the lighting of a fire results in the development of a natural, artificial, or mechanical power, is not very material, the important fact is that it does develop a power, and an open fire is most useful, not only because it gives comfort by the heat it evolves, but because the power developed may be usefully employed to assist in securing ventilation.

Those of you who have followed up the subject, know what controversy there has been on the question of upward and downward ventilation. All will probably agree in condemning actual down draught, and I shall

not attempt to defend that; but, what is draught? Why, simply an excessive movement of the air which causes discomfort. It has been ascertained that at a velocity of 4 ft. a second most people would complain of draught, some might at 3 ft., fewer would at 2 ft., and not even the most sensitive person is likely to complain of draught when the velocity does not exceed 1 ft. per second. The temperature of the air will naturally have some effect, so it must be assumed to be normal, *i.e.*, about 60° Fah.

Efficient ventilation of occupied apartments implies the continuous change of air without causing discomfort to or adversely affecting the health of occupants, and after several years observation I cannot detect the least objection to that change being effected in a downward direction, so long as draughts are avoided.

Because air respired and emanating from our bodies is warm, and being warm it is light and will therefore rise, is the argument used by the advocates of what they call upward ventilation, and they term it Nature's method. But, again, I believe this to be the result of an imperfect appreciation of scientific facts.

In the act of respiring, air is expelled with considerable force from the mouth and nostrils, largely in a downward direction, by the contraction of the lungs, and the expired air being warm and light is, at some distance from where it was emitted, forced upwards by cooler and fresher air coming down from above, for the benefit of the individual. Consequently, if our ventilating appliances are so arranged as to secure a constant supply of fresh air above the heads of individuals, and to carry off the expired air at a low level, is it not probable that, as occupants move generally occupy the lower portions of a room than the upper part, they are likely to obtain fresher air from the larger volume above their heads than from that below?

Take an extreme case, such as a compact body of people in an assembly hall—is it not evident that they can be supplied with fresh air better from above than from below, for in the former case the air above is far greater in volume, can circulate freely, and is likely to be more pure than the smaller volume below their heads, which can only move about with difficulty, and must be contaminated by emanations from so many people being congregated together? To ventilate efficiently such a crowded room from below is practically impossible, because even if fresh air be supplied from below, it must become contaminated by passing over the bodies of a number of people before being breathed, but it has been proved to be quite possible to do so from above.

If under such adverse circumstances ventilation can best be secured by downward movement of the atmosphere, surely it can be attained under more favourable conditions for smaller numbers. In an ordinary room, with an open fireplace, where do we find the outlet opening? Why, within 2 ft. to 3 ft. of the floor level. Every one can prove for himself that, unless some greater power be exerted, such as a strong gust of wind or a much larger fire in the same or in an adjoining room, etc., which will only occasionally occur, the sole outlet for air is by the fireplace flue. If any present are not thoroughly convinced of this fact, I beg they will test it for themselves. A lighted match or a piece of thin paper held before every possible opening is all that is necessary, and I venture to say that under normal conditions they will easily detect that air is entering at every other opening and only quitting the room by the fireplace flue. Bearing in mind then that efficient ventilation implies comfort for the occupants of a room, the next question is—Where should any special inlet for air be placed? I say "special inlet" because if air quits the room by the fireplace flue, other air must enter some way or other to replace it; generally you will find it comes in through casual cracks and crevices around the lower portion of the room, and travels in narrow streams direct to the fire, frequently resulting in unpleasant draughts, and the more thoroughly cracks and crevices are closed the more likely will discomfort be experienced from draughts. On this point I shall have something to say later on. At present we are considering an ordinary room, built in the ordinary manner. And although it may appear paradoxical, the best way to prevent draughts is really to admit air more freely. It may involve rather more expenditure of fuel for

maintaining comfortable warmth, but that is better than catching colds. If, however, change of air is too rapid in any room, the one way to prevent it is to reduce the outflow—contracting the sectional area of the outlet flue, because it is the cooler air pressing on all sides which forces the air of the room up that flue. And, as with the same pressure only given quantity of air can be forced through a flue of given section, reduce that section in size, a less volume of air will be passed through a given time under similar conditions. Consequently the velocity with which the air travels from inlet to outlet becomes lessened, a draughts in the room may be overcome, I then the question will arise—Is the room efficiently ventilated? If not then the outlet area must again be enlarged, and a special inlet provided. So we come back to the question: Where shall it be placed? After careful observation and experiment, extending over several years past, I say, without hesitating that it should be on the same side as the fireplace opening, as nearly central thereto as may be, and towards the upper portion of the room (say, about 2 ft. below the ceiling). By providing louvres or other means for distributing the incoming air throughout the upper portion of the room, it will mix with the warmer air rising in front of the fire, and gradually fall and make its way towards the fireplace flue, without causing discomfort because its velocity will be slight, and, coming in contact with the warmed surfaces in the room, its temperature will be raised, while if the fresh air enters freely at the special inlet less air will enter by the casual cracks and crevices. With inlet openings in any other position there will be less diffusion throughout the room, because incoming air will take a shorter and more direct line towards the fireplace, and leave portions of the room less perfectly ventilated. If the arrangement I suggest is right, then downward ventilation with comfort is secured.

Another subject in connexion with ventilation to which I have devoted attention is that of condensation and evaporation. I do not think these results, brought about continuously by variations in temperature and movements of air, have received the consideration which they deserve, for they exercise very decided influences in connexion with ventilation. If the temperature of air is raised it becomes more and more capable of absorbing moisture and becomes specifically lighter than dry air at the same temperature. Again, as it cools by coming in contact with cooler surfaces, moisture is deposited, and becoming specifically heavy, it falls. Vitiated air may for a time be somewhat purified by condensation, but the impurities are deposited upon the cold surfaces with which it comes in contact, and unless those surfaces are frequently cleansed, the animal matter deposited with the moisture in time putrefies, with the result that rooms become stuffy, where such condensation takes place and is not soon removed. You may open the window freely and freshen up the atmosphere for a time, but when again closed up the stuffiness again becomes apparent, particularly if a fire is lighted, because heat assists in volatilising impurities. For this reason I hold the opinion that the most healthy rooms to live in are those of which the walls are not constructed of decorative materials which do not retain heat. In fact I believe that rooms, the walls of which are constructed of pervious materials, are likely to be the best ventilated, even when no special inlets for air are provided. Such walls take heat and retain heat from the fire, they allow heat to pass through them over their whole surface, the air is filtered and takes up heat in its passage through, it enters gradually yet in large volume, and keeps up a thorough change of atmosphere in the room without perceptible draughts.

Some think that the continual passage of air through the walls will in time contaminate them, but with reasonably pure air outside and exercising its known purifying effect, it is more than likely that no deleterious effect upon it would take place, provided always that the walls are kept dry. Wet in the walls would partially close the pores, and probably cause vegetable and, maybe, animal growth. Unless ample provision be made for permitting continuous change of air in a room, nothing else is worse than constructing all walls, floors, and ceilings of impervious materials, or than covering of all surfaces with impervious materials—such as linoleum, linocrusta, paint, &c.

Movement of air outside—in a word, wind—is the active force by which ventilation within doors is principally brought about; consequently, when rooms are unoccupied windows and doors should be freely opened, so that frequent change of air may take place. Surfaces and materials on which deleterious matters have been deposited or by which they have been absorbed, may then become purified, in addition to which, the frequent cleansing of surfaces and materials is necessary if a pure atmosphere within doors is to be maintained. In some places, even with air constantly changing, the air never sweet and wholesome. Urinals and the household water-closets, unless all surfaces are kept scrupulously clean, are unwholesome places which may contaminate the atmosphere of a house. Many of these appliances are still badly constructed, particularly in public places. Generally speaking, at railway stations they are a disgrace. The large surfaces contaminated and infrequently cleansed constantly generate noxious fumes which foul the air, change it never so frequently. Public urinals are capable of great improvement; there should be no angles in which deposit can accumulate, open channel ways should be abolished, each separate urinal should be trapped and provided with a frequent flush of water so directed as to cleanse all surfaces which can be fouled. Properly constructed and maintained little contamination of the atmosphere will take place in and around them. I draw attention to these necessary appliances as being illustrative of our subject, and to impress upon you that mere change of air is not all that is required to secure good ventilation; cleanliness and the continuous removal of everything which defiles the atmosphere is quite as essential, particularly in and about the channels and ducts which convey air from without to within the building.

Let us summarise the points to which reference has already been made:—

1. The deductions of early writers or of those who simply adopt their views should not be accepted without personal examination as to their correctness.
 2. Ventilation is an effect always brought about by the exercise of an ascertainable power; it is never automatic, and no appliance without the employment of power is, properly speaking, a "ventilator," but simply a means by which ventilation may be secured when a power acts to cause movement of the atmosphere.
 3. Air to be serviceable for ventilation must be kept free from defilement.
 4. To secure change of air within doors, both inlets and outlets are essential.
 5. Warm air rises, because it is forced upwards by cooler air, the latter being attracted downwards by gravitation.
 6. Nature's principal method for causing movement of air is propulsion.
 7. By taking precautions to reduce velocity and so to prevent unpleasant draughts, the upward movement of air may reasonably be employed for securing ventilation.
 8. To secure fresh, wholesome air for the purpose of ventilation within doors, condensation on surfaces should be guarded against, and all surfaces, as well as the substance of materials, should be maintained in a clean condition.
- In this country, as I have previously mentioned, it is necessary to employ heat during the four or five months of the year for the sake of comfort within doors, and the open fire has been referred to as a means for assisting ventilation, because it necessitates a flue by which the products of combustion may be carried away. Such flues, even when no fire alight, generally act as outlets and so assist the ventilation of an apartment. To close them by a register or any other means is, therefore, an improper proceeding and should on no account be resorted to. Other forms of heating—say by steam or hot-water pipes or by electricity—do not on their own account necessitate separate flues from the apartments heated, but it is quite as essential that outlets as well as inlets—should be provided if change of air is to take place in apartments so heated.

Judging from the various schemes for ventilating buildings which have come under my notice, I am surprised to find what little attention is given to even the most elementary calculations as to the probable results which will be attained notwithstanding that certain data have been arrived at, which experience proves to be fairly reliable, and so simple that

there is no excuse for neglecting to employ them. Failure, where it takes place, results generally from under-estimating the supply of air necessary for securing efficient ventilation, and from the employment of restricted areas of inlet or outlet channels, openings, or ducts.

An ordinary room is provided with one fireplace flue, and, as previously stated, when a fire is lighted, that flue is practically the only outlet for air from the room. Consequently, by ascertaining the velocity of air passing up the flue and the sectional area of the flue, it is easy to find how much air will pass through the room in a given time.

Several influences will be at work at varying times which will affect the velocity of air passing up the flue, such as more or less fire in the grate, more or less force of wind outside, larger or smaller inlet openings, etc., but under medium conditions a flow of about 5 cubic ft. per second may be taken as the average volume passing up an ordinary 14 in. by 10 in. flue. Kindly note that I give the volume at about 5 cubic ft. I do this for the purpose of simplicity, and because it is near enough for practical purposes and can easily be remembered. If 5 ft. be multiplied by 60 times 60, the number of seconds in an hour, the result—viz., 18,000 ft.—will be the volume of air passing through the room in that time, and if change of air be demanded at the rate of six times per hour, the cubical capacity of a room with only one fireplace flue should not exceed 3,000 ft., say 20 ft. by 15 ft. by 10 ft.

A point which requires consideration is the size of a special inlet relative to that of an ordinary fireplace flue. A good rule is to have it of ample dimensions with easy means for its regulation. It is then the fault of the occupants if care be not taken to adjust it to requirements. The difficulty, however, is that people are generally careless in paying attention to so simple an appliance—on a windy day the opening will be closed to prevent discomfort from draughts, and no one thinks of opening it in calmer weather; therefore, when the inlet is placed as I advise—on the same side as the fireplace and as nearly central thereto as possible, about 2 ft. below the ceiling—a clear opening of about one half the area of the outlet flue will suffice, for the following reasons:—

1. If the inlet is simply through an external wall there will be less friction than in the long outlet flue, therefore the velocity can be greater.

2. Because with a properly-formed and louvered inlet the additional velocity in the upper and unoccupied portion of the room will distribute the air throughout better than if entering at low velocity.

3. Because variations in the force of wind outside will not be so much noticed within the room when the area of inlet-opening is not excessive.

But because of the well-known and frequent variations in the force of wind outside I have devised this little automatic regulator. You will notice that in calm weather the central flap will stand stationary allowing some 2½ in. of space for the air to pass in, but as the force of wind increases the flap will be deflected and the available space is thereby reduced proportionately. A difficulty which took some time to overcome was, so to hang the flap that its movements could take place without producing a clicking noise; after several attempts I believe this has been successfully accomplished, consequently the appliance may be usefully employed to avoid the necessity for any personal regulation, and I believe it should go a long way towards solving one of the difficulties hitherto experienced in securing constant and adequate ventilation without personal attention. Only one size is made, suitable for a room with a single ordinary flue, two or more of the automatic inlet regulators being necessary for larger rooms. Attempts have previously been made in the same direction, but the difficulty of overcoming the annoyance of clicking noises in appliances with movable parts has militated against their adoption. Having no pecuniary interest whatever in the appliance, I may safely commend this automatic inlet regulator to your favourable consideration.

Much more might be advanced as to the necessity for considering details in connexion with the employment of natural means for securing efficient ventilation, not only in domestic buildings but also in those for more public purposes. Let me again remind you that doors and windows can, and should, be more generally

regarded as legitimate means for securing change of air within buildings. Windows should be constructed so that they may with ease be opened and closed, and that whenever practicable they should be freely opened, particularly at times when the buildings are unoccupied. Although the many appliances called ventilators, employed when open fires are not employed, only permit of the passage through them of a limited amount of air—for, as a rule they are too small in size, and are only serviceable when there is sufficient movement of the outer atmosphere—it fortunately happens that in this country some movement is taking place more frequently than not, and one advantage secured by the use of ventilating appliances is that a certain amount of change of air takes place through them almost continuously. For continuous occupation however the change of air which takes place when such appliances alone are depended upon, is generally inadequate—a few figures will easily prove this. Ascertain the cubical capacity of the building and the total minimum area of the free openings in the appliances, and find the time required for the volume of air contained in the building to pass through the openings say at a velocity of 5 ft. per second, and unless the whole volume can pass through in twenty minutes, i.e., at the rate of three changes per hour, efficient ventilation will not be secured for reasonable occupation of the buildings during any considerable length of time. In calculating the amount of change of air required in a building it is safer to take as a basis the cubical contents and number of changes per hour than to take the number of people to be accommodated and allow so many cubic feet of air in a given time for each, because it is important to remember that the building itself has to be ventilated as well as that the occupants require change of air.

For this reason I have come to the conclusion that, unless it is considered worth while continuously to ventilate buildings when mechanical means are provided, there is risk of failure, because when the mechanism is stopped change of air ceases, and although when the machinery is restarted change of air may soon be effected, the long period of stagnation permits the materials of and in the building to cool down; condensation then takes place on all exposed surfaces and other influences deleterious to the atmosphere of the building may, for a considerable time, result.

For buildings such as hospitals which are continuously occupied and throughout which it is important that continuous and ample change of air should take place, together with uniform heating, I thoroughly believe that mechanical means will in time become an absolute necessity. Having recently dealt with this subject at the R.I.B.A., I will only now say that to successfully ventilate a building by mechanical means implies a considerable knowledge of the various appliances available—there must be no stinting of space or of materials necessary to secure the most thorough and economical results. A change of air up to ten times per hour must be insisted upon, the plant in all important features should be duplicated and the most economical power available should be employed. All air ducts and channels should be of ample sectional area so as to reduce friction to a minimum and so that they may be readily cleansed; both inlets and outlets must be arranged with judgment and properly proportioned. The air must be taken in at a point most free from contaminating influences, it must be screened, brought to a suitable temperature, and hygrometric condition, and passed on to the several apartments required to be ventilated, without the possibility of its becoming deteriorated until it approaches the outlets and is again discharged into the open, through properly constructed outlets so that movements of the outer atmosphere may not exercise any influence upon its outflow.

For some time there was considerable controversy as to whether methods of propulsion or of extraction were to be preferred. I believe that by far the majority of those who have had practical experience in the matter are now more favourable to propulsion. One of the most serious mistakes has been the combination of the two systems, for they cannot possibly be worked together economically, and I fear that even if expense were no object, imperfect results only can be attained by employing conjointly means for securing extraction as well as propulsion.

Experience of the practical working of well-proportioned installations of Plenum ventilation

by mechanical means has proved to me that it is possible to secure continuously, and at a reasonable expenditure, efficient ventilation such as is quite out of the question when natural means alone are relied on. In saying this I on no account undervalue the necessity for taking advantage of the means which Nature places at our disposal, because I realise that for the majority of buildings anything in the way of mechanism for securing ventilation is out of the question at present, although I venture to predict that, as time goes on and the possibilities of employing mechanism for the purpose are more appreciated, an architect's training will not be considered complete unless he has made himself fully acquainted with the principles and appliances by which buildings may be successfully ventilated by mechanical means.

Mr. John Murray, in proposing a vote of thanks, said he had very little criticism to offer upon such an excellent paper, which would assist students in studying this important and intricate subject. They all knew that Mr. Henman advocated the plenum system of ventilation, but the great difficulty about that system when applied to ordinary buildings was in getting the appliances so arranged that the shafts or ducts could be properly cleaned. He would like to know how a small shaft could be arranged so that it could be adequately cleaned. It was quite possible to keep them clean in large institutions, such as the Victoria Hospital at Belfast, but the difficulty, he felt, was with small installations. In most systems of ventilation the great difficulty was to get sufficient personal attention devoted to the regulation of the mechanical appliances, and he felt that no system of ventilation could be satisfactory unless it was continually attended to and regulated. One might provide a carefully arranged and adequate system, but the people who had to regulate it did not attend to it, and the result was not satisfactory. He would like to know whether Mr. Henman advocated the use of ventilating electric fans in conjunction with the plenum system. An electric fan might be of assistance, but Mr. Henman seemed to suggest that it was not necessary. [Mr. Henman: As a propelling power or suction?] As suction. He would also like to know Mr. Henman's views upon inlet ventilating stoves, where the air was admitted about 2 ft. above the outlet opening, also how much air passed through an ordinary 9 in. brick wall, plastered on one side. Did Mr. Henman consider one fire flue in an ordinary London dwelling sufficient to ventilate properly a room, provided that sufficient inlets were supplied? In the case of inlets to an ordinary dwelling room, how high should they be from the floor? A great difficulty in London, and perhaps in most towns in England, was the screening of air which passed into a room, and it seemed to him that no house could be properly ventilated unless there was a screen arrangement connected with every inlet. That appeared to be an expensive and very intricate matter to arrange, but he felt we should never get adequate and efficient ventilation until some simple mechanical device was invented to screen the air at its entrance and before passing through such an arrangement as the inlet shown by Mr. Henman. They all knew that air could be purified in the case of large buildings, but the difficulty was to screen and cleanse it through small inlets into ordinary rooms. Another difficulty in connexion with plenum ventilation was the regulation of the degree of heat. The plenum system or the warm-air system was very largely used in American houses, and he knew from the experience of friends of his that American houses were not always healthy, because they were frequently overheated, and the air was not always pure, because it was carried through the buildings in small ducts, which became dirty, and the air was thus tainted. Mr. Henman suggested that the external air might be purified, whereby it might be admitted in a purified state into our domestic buildings, but he (the speaker) was afraid that that would never be effected in towns.

Mr. H. P. G. Maule, who seconded the vote of thanks, said there were one or two points that naturally occurred to one in listening to such a paper. Take the case of an ordinary dwelling house: it seemed to him that it would be rather difficult to insert a ventilator of the kind Mr. Henman had shown in the walls of a dining-room or drawing-room, and he should like to know if Mr. Henman had any special method of dealing with an ordinary dwelling house where

there was some architectural treatment of the walls. There was one point which seemed to be always overlooked, and that was the education of the public in the matter of appreciating fresh air coming into rooms through windows. If one accustomed oneself to live in a house with open windows, any other condition could not be tolerated for long. One learnt to appreciate purity and freshness of air so much that in entering a room one could tell at once whether the window was open or not. He ventured to say that he could go into a room with his eyes shut and could tell in half a minute whether the windows were open or shut, and that because he accustomed himself, winter and summer, to wide open windows, and he thought that architects, in ordinary domestic work, were in error in providing anything like mechanical methods of ventilation. It was a matter of the education of the individual rather than the ventilation of the house by mechanical means. The point raised by Mr. Murray as to the cleansing of ducts seemed to be the crux of the Plenum system. Mr. Henman had said it was of the utmost importance that the flues should be kept clean, but, human nature being what it is, unless the flues were sufficiently large to enable people properly to clean them, they would in course of time most certainly become foul. If the extract of a room was by the fireplace flue and the inlet to the room was only half the size, surely the amount of ventilation one would get in the room, supposing the windows were shut, would be quite inadequate on the assumption that there were more than a certain number of people in it. If the number of people in a room was increased, there ought to be special provision for allowing more air to come in. He did not see how the insertion of one or two ventilators in the walls of a room would adequately ventilate that room unless the windows were opened too. The paper they had heard was a very interesting one, which they would want to turn to for information again and again.

Mr. W. J. H. Leverton asked Mr. Henman whether he found his methods of ventilation sufficient when gas was burning. In ordinary circumstances during the day, with the air coming in at an opening 2 ft. below the ceiling on the side of the fireplace, the air would be properly diffused, and would find its way out of the chimney, but with the ordinary gas burners creating fumes he was afraid that the arrangement recommended would not be sufficient.

Mr. Alfred Burgess said that Mr. Henman had made some very clear distinctions. A ventilator originally was a man who turned a wheel, and it was interesting to see how correct was Mr. Henman's statement that proper ventilation could not take place unless there was some mechanical force to aid it. In mechanical ventilation there were really three processes which might be adopted, and he did not agree that a system of propulsion and extraction would not work satisfactorily. The conclusion of the committee appointed to consider the ventilation of the House of Commons was that the ordinary propulsion of air into a building should be assisted by extraction. Almost every mechanical system of ventilation was apt to be called a plenum system, and it was necessary to define the three processes he had referred to. There was the system which consists in putting air into a building at an excess of pressure on that outside the building; there was also that system of drawing air through a building so that a slight vacuum might be created; and there was the conjunction of the two, which was used in the House of Commons, i.e., putting the air in at one end by a fan and extracting it at the other. By this means they avoided excess of pressure and also a vacuum, and got instead an equilibrium, which was a good name for the third system. He thought it was a good thing that architects, when discussing mechanical ventilation, should make use of definite terms in regard to the different systems which they were describing.

Mr. A. Needham Wilson asked Mr. Henman what he thought the height of rooms should be in houses where the system of ventilation he favoured was adopted. One of the difficulties one had to deal with was that the average client insisted on excessively high rooms, and Mr. Henman's conclusions were necessary for their efficient ventilation. Mr. Henman's statements seemed rather to reverse the accepted order of things; if we want to let out foul air from rooms we must open the windows at the bottom, and if we want to let fresh air in we must open them at the top.

The President, in putting the vote of thanks to the meeting, said that two things had struck him in the course of the evening. It was cheering to hear from an expert like Mr. Henman that the much-abused open fire was a satisfactory means of ventilating a room. Mr. Henman had heard so often about its wastefulness and that we ought to use stoves and radiators that it was pleasing to hear for ordinary dwelling rooms we could make use of the open fire. With regard to the ventilator, a number of which Mr. Henman had shown, he understood it had to be put about 2 ft. from the ceiling and on the same side as the fireplace, but in most houses the fireplace being on the inner wall, he did not quite see how the ventilator was to connect with the open air where the chimney was in the centre of the house. As far as he could gather from the paper, the jerry-built house was the one most satisfactorily ventilated. Plaster made of mud and bricks made of sawdust produced perfectly-ventilated houses without any of these mechanical means!! Any mechanical appliance that depended on people for regulation and attention was bound to get out of order, for they would not be attended to. Under the new by-laws which were insisted upon, ventilators had to be put in, but as soon as any draught was felt the occupants invariably closed them, and depended on doors and windows for ventilation. That was one thing that was not insisted on so much as it should be with regard to ventilation, and that was keeping walls and surfaces of rooms absolutely clean. There was no doubt that if a room were kept closed up for any time the walls would become dirty and foul, and the furniture too. To a certain extent he agreed with Mr. Maule about the open window, but it would be a difficult matter to persuade people in a city like London to keep open their windows. The great objection seemed to be how to keep out the soot, dust and fog, which spoilt almost everything in a room.

The vote of thanks having been very heartily agreed to.

Mr. Henman, in reply, said that his experience had been contrary to that contained in what were called the recognised works on ventilation. He found that nearly everyone writing on the subject went back to Dr. Reid, although Dr. Reid made the most careful experiments with the apparatus he was using to obtain in his day, nevertheless in regard to many of the important statements and deductions he made he was scientifically wrong, and it was for that reason that he (the speaker) had put before them the particulars he had hoped he had given his reasons sufficiently clearly, and that they would be able to see that Dr. Reid was wrong in the conclusions he arrived at. As to the question of keeping the air clean, i.e., flues, ducts, and flues clean, in any system of ventilation, mechanical or natural, it was a question of having the flues get-at-able; unless the flues were kept clean good ventilation could not be obtained. Flues should be so arranged that they could be swept, and "if they are arranged so that they can be swept, then sweep them. As to walls being pervious, and as to the amount of air that would come through, several experimenters had tried to ascertain this. It differed with every class of material and every surface put upon a wall, but it was surprising what an enormous amount of air came through the walls of an ordinary room. He had been in rooms where he had known that the bricks and the materials were thoroughly pervious, and that the walls of these rooms had always been fairly sweet and clean. On the other hand, some thirty years ago he took an office on the walls of which was a thickly varnished grained paper, which he could not endure that sort of thing, he had painted a dark green. There was linoleum on the floor and the ceiling was painted, and uncomfortable was the room that he had given up the office for that reason. Air did not enter only through cracks around the doors and windows, or by a special inlet over the top situated on the opposite side to the fireplace. It was one of the most uncomfortable rooms he had ever been in, stuffy without a fire, very draughty with one; and wherever you sat on a cold day you were in a draught, you could not prevent it. The more you opened up the pores of a room, the more this was the case. Air would come in, and if it did come through the materials it would come through cracks or windows, and cause a draught in its passage across the room to the chimney. He had told them that air heated in a

ascended because it was propelled upwards by the surrounding cooler air being attracted downwards by gravitation; the outer air was then pressing in all directions, seeking entrance to the room; if openings were few and of no great size, air would be forced in thin streams rapidly in direct lines to the fireplace, probably causing unpleasant draughts, and yet not efficiently ventilating the room. With larger openings more distributed, the better results might follow, but with one or two properly constructed openings on the fireplace side about 2 ft. below the ceiling, the incoming air might be well distributed throughout the upper portion of the room, and would return towards the fire at low velocity from all parts much in the same way as it would if it came in through porous walls, floor, and ceiling. As to propulsion and extraction being combined, it was one of the safest of mistakes. It was a fallacy altogether, to begin with, that the two could be used economically. It was not effective. In connexion with this room they were occupying, if there were a propelling fan of sufficient power to force in a volume of air equal to a change throughout of, say, ten times an hour, all that would be necessary for doing it effectively would be to properly dispose and proportion the inlets and outlets. The addition of an extraction fan could not possibly help matters, it would simply entail extra expense; but supposing that the propelling power were not sufficient to effect the required change, then it might be supposed that supplementary power would be necessary; yet it should not be in the direction of extraction, because if air from the apartment were forcibly removed, other air must enter, additional to that supplied by the propeller, hence it must be drawn from somewhere else probably through casual cracks and crevices, resulting in draughts, or it may be sucked from impure sources. Under such conditions the ventilation of the apartment could not be said to be efficient. If, however, instead of supplementing a propelling power by one of extraction, the propelling power were augmented, better results might be expected, provided the inlets and outlets were properly arranged and proportioned. Propulsion and extraction could not be used together effectively. It had been done in the Houses of Parliament and the Law Courts, where the ventilating appliances were not sufficient, and extraction fans had been put in in addition to propulsion; but people complained of draught, and that was because the air was being drawn from some position from which it did not require to be drawn, and thus draught was caused. Generally it was adopted as a makeshift; the original means provided having proved inadequate, supplementary power had been made use of, too often in the wrong direction. At the Victoria Hospital, Belfast, and at Birmingham Hospital the rooms were perfectly ventilated, at a considerable distance from the propellers, without any extraction whatever. As to the position of the ventilator he had shown that evening, when the fireplace was on the internal walls, generally there was a recess, and if the fire prevented the ventilator being placed on the chimney breast, then it could be put in the recess—as nearly central to the flue as possible, he said. In his own rooms he had put a ventilator on each side of the chimney breast, and he had been complimented on the efficient way in which his rooms were ventilated. As to the height of rooms, that was a point about which his clients rather laughed at him, but he had been pleased to find that a number of architects who had built houses for themselves had low rooms, but it had been suggested to him that that was because architects were not troubled with much money, and they had low rooms in order to keep down the expense. He was inclined to think that many of them realised that, provided there was not a lot of gas burning—gas fumes were a difficulty, but he was using electric light much more generally now—low rooms were better for comfort and good ventilation. They reduced the cubical capacity by having low rooms, and if they used a propelling force for ventilation it would cost less to change the air often with a small cubic capacity than if the cubic capacity were larger. Or the air at a given power could be made to pass through a small room more quickly than in the larger room. As to the height of the rooms, it was a question of taste, and it must depend on the size of the room to get the right proportion. He had to enlarge an old house, and the height of a room not half as large

as the one they were then in was 7 ft. 4 in., and that did not seem an uncomfortable height, and a large class was held in the room. People had high rooms, he thought, because of gas fumes. If one mounted a ladder in a room in which gas had been burning some time, they would realise what a state the air got into, and all that foul air having no means of escape, had to come down in the ordinary way, but if the ventilator were at the upper part of the room the fresh air was constantly sweeping that away. Any opening, other than into the fireplace flue, served as an inlet for air whenever a fire was alight, and if the opening was high up in the fireplace, air only passed away by such an opening under most favourable conditions, and back flaps were necessary to prevent the egress of smoke from the fire. The air at the top of the rooms in his house was constantly fresh.

The Chairman announced that the next meeting will be held on November 25, when Messrs. J. T. Micklethwaite and E. Prieoleau Warren would deal with the subject of "Excavations in Westminster."

The meeting then terminated.

THE SURVEYORS' INSTITUTION:
PRESIDENT'S ADDRESS.

The first meeting of the new session of the Surveyors' Institution was held on Monday evening at No. 12, Great George-street, Westminster, S.W., Mr. H. T. Steward, President, in the chair.

Mr. Currey, Hon. Secretary, read a list of donations to the Library and the Library Fund, and on the motion of the Chairman a vote of thanks was accorded to the donors.

On the motion of the Chairman, Lord Armstrong, of Newcastle-on-Tyne, was elected an honorary member of the Institution.

The President then read his opening address, the first part of which dealt with the question of housing.

The Housing Problem.

He said that out of a total population of 32,678,213 persons in England and Wales, rather more than 15,000,000, or nearly one half, are dwellers in London and seventy-five other great towns. The towns have to find quarters on a limited space for nearly half the population of the Kingdom. London alone, with its 74,839 acres, has within it 4,536,541 persons, dwelling in 1,019,646 separate tenements, exclusive of the City proper. The recent census showed that of these 1,019,646 tenements 672,030 are tenements of fewer than five rooms, 149,524 being single room tenements, of which 60,421 were occupied by one person only, 48,341 by two persons, 23,680 by three persons, 11,279 by four persons, 4,001 by five persons, 1,257 by six persons, 354 by seven persons, 103 by eight persons, and 58 by nine or more persons. The latest returns available at the moment showed that eight of the principal companies have in their dwellings some 120,000 persons distributed approximately as follows:—

1. Metropolitan Association for Improving the Dwellings of the Industrial Classes	6,000
2. Trustees of the Peabody Donation Fund	19,000
3. Improved Industrial Dwellings Company	29,000
4. Artisans', Labourers', and General Dwellings Company	42,000
5. Victoria Dwellings Company	4,500
6. East-end Dwellings Company	5,600
7. The Four per Cent. Industrial Dwellings Company	4,200
8. Guinness' Trust	8,500

The Metropolitan Board of Works and the London County Council have made, or the latter body is in course of making, provision for some 70,000 persons, and the railway companies, and other commercial undertakings have provided under their Acts for about 15,000 more. The great landlords of London, and the Ecclesiastical Commissioners, and the borough councils have also materially aided in the erection of dwellings for the working classes.

With regard to the class of persons who occupy the dwellings provided, it was interesting to notice by the return of the London County Council that in thirteen of their schemes, out of 1,458 heads of families in their dwellings on December 31, 1899, there were persons of over 100 distinct callings, of which about half may be classified as artisans, presumably earning good weekly wages; while a considerable number of the other half belonged to the class of skilled labourers, but included 7 clergymen, 32 clerks, 73 policemen, 39 postmen, and 26 salesmen. While the population of London was, of course, increasing as a whole, it was

satisfactory to find that the ratio of increase had declined in the last five decennial periods from 18'8 per cent. in the census period 1851-61, to 7'3 per cent. in the period 1891-1901. According to the last census the population of Shoreditch since 1891 had decreased 5 per cent., Finsbury and Westminster 9 per cent., Holborn 10 per cent., and the City 30 per cent., while the population of Chelsea, Bethnal Green, and Poplar had increased 1 per cent., Southwark 2 per cent., Islington 5 per cent., and Stoke Newington 7 per cent. The places in which a marked increase had taken place were Greenwich 20 per cent., Lewisham 45 per cent., Fulham 48 per cent., and Wandsworth 50 per cent. This increase was, however, only to have been expected, as there was vacant land in these parishes, and such districts would until quite recently have been deemed suburban.

In spite of the great increase in the facilities for locomotion and the cheapening of transit in recent years, and the disposition to remove factories to the suburbs, while London remains the centre of the life of the country, there must necessarily be a large number of the working class population who, not only by inclination desire to, but by the nature of their callings must, reside in the central districts. The working class population in these districts where, even under the best conditions, their surroundings must be of a somewhat depressing character, would be materially benefited by removal to an open or more cheerful neighbourhood where they might feel the influence of better surroundings, and it was to be hoped that the efforts of the London County Council in this direction might meet with the success they deserve. We must all have noticed the recent erection, in the nearer suburbs, of rows and rows of small flats or double tenement houses, of good exterior, and with internal fittings and conveniences beyond the dreams of twenty years ago. In these dwellings could be traced the influence of improved housing upon the habits of the occupants—in the rivalries in flower-beds and white lace curtains, and in general attention to external appearances; but they were, generally speaking, occupied by those in more or less regular employment at fixed wages.

As to lodging houses, in addition to those already provided, the London County Council was, he believed, about to erect a lodging-house of the superior kind for women on the south side of the Thames; while the Directors of Rowton House, he understood, have had the subject under consideration for some time past, and would, no doubt, as opportunity offered, erect one of their Rowton Houses for women. It was to be hoped that such a building might prove a success, and be the forerunner of others, as a house of the kind would be a great benefit to women, and should tend to prevent the overcrowding that at present exists in some parts of London. By overcrowding he did not mean the mere density of population. It was the overcrowding in particular rooms that was the evil. No doubt at the present time, in spite of the law, there were a large number of persons living in houses that were overcrowded in direct contravention of the Public Health Act, 1891. Putting the law in force often meant driving people to the streets or to the workhouses, and for this reason the magistrates hesitated to use the full powers of the law, and frequently decline to make closing orders.

Rural By-laws.

"Before I leave the subject of working-class houses," continued the President, "I should like to add a few words about the by-laws now pretty generally adopted in rural districts in so far as they affect cottages in the country or in proximity to towns. Many of the councils in rural districts, with, no doubt, laudable intentions, have adopted model by-laws with reference to houses framed on the London Building Act, a statute totally inapplicable to cottages in the country, with the result that landlords and others are discouraged from providing them, as the cost of building is altogether disproportionate to any return that can be obtained. It is worthy of note that one of the judges of the High Court has lately been, and I believe still is, in conflict with a rural authority upon the subject, and I trust this may lead to some alteration in the future by a remodelling of such by-laws as those to which I have alluded.

Increase in Parish Rates.

"The large increase in the parish rates of recent years is a matter of much concern to

many, and affects the question of housing. It is impossible to contemplate, without misgivings as regards the future, the state of things in boroughs like East and West Ham. In the former the rates have reached 8s. 8d. in the £, while in the latter they have arrived at the unprecedented amount of 9s. 8d., though Southampton and Wakefield run this close with 9s. in the £. I notice in the recently-published Report of the Public Works Loan Board that the outstanding advances of the Board to the Corporation of West Ham, in connection with the Education Act alone, represent something like the sum of half a million. The population of West Ham is largely dependent on works and factories which seem to show a tendency to migrate further afield, probably in order to escape the burden of such rates as these. Surely we must ere long reach, if we have not already done so, the limits of taxation. In the year 1874-5 the total Metropolitan rates stood at 4,271,538s., and the outstanding loans at 21,009,799s. In the year 1900-1 the figures were, rates 11,740,320s. and outstanding loans 58,130,587s. This is a somewhat alarming increase, and it is not to be wondered at that some lending bodies, of which the Public Works Loan Board is the chief, are arriving at the conviction that the local indebtedness has, in some instances, now reached such a figure that the rates no longer afford a sufficient margin of security for advances of public money; indeed the Board has issued a warning to borrowers that future applications will probably not be entertained unless a reduction is shown in the rates levied. In pursuance of this policy, the Board has lately refused a good many applications from various boroughs and district councils in England and Wales.

Standard of Public Taste.

"I think everyone will admit that there are signs on every side of a general rise in the standard of public taste. While we may not have improved, speaking generally, upon the examples set us by Wren and Chambers in our public buildings, everyone must be impressed by the immense improvement in our domestic street architecture in recent years. All around us is rising a new and greater London. I cannot wholly agree with the President of the Architectural Association in his recent address, for I should be sorry to see the present picturesque irregularity of our street architecture superseded by the uniformity which characterises many of the much-lauded streets of Berlin. Let us have spacious streets and fine vistas by all means. These can be secured by a regulation of street lines, and the rest may be left to the general rise in the standard of public taste—with, of course, some control as to dealings with special sites. All will agree that the London County Council has done much to improve our modern London by the widening of our streets and the opening-up of new thoroughfares. The days are, I hope, far distant when London will be disfigured by monstrous steel frame erections like those of Chicago and Manhattan Island. We, too, have to deal with sites of enormous value, necessitating building to the utmost possible height, but, in common with some other cities, we have decided that there is a height beyond which buildings shall not go. If we should resort to steel frame buildings, as I think is quite possible before long, it will be for the sake of rapidity of construction and the saving of space; but if this is to be of any practical use some modification in the interpretation of our Building Act would appear to be necessary, for there can be no necessity, in a building supported entirely by steel construction, that the walls, which practically carry nothing but themselves, should be of the same thickness as though they carried many stories of superincumbent weight. The steel construction system, like most others, has no doubt some drawbacks and some advantages; but economy of material and the consequent saving of labour, as well as of space, would be the main advantages of the system. There seems to be a prejudice in this country against a large employment of ironwork in the construction of buildings, principally on the ground of its behaviour when exposed to great heat; but I do not think the last word by any means has been said on the question of fireproof construction and on the precautions that may be taken to protect ironwork from the effects of a conflagration.

The Building Trade.

"I fear it is true that the rise in wages in the

building trade which has taken place during my memory does not alone account for the great increase in the cost of building during the same period, for it is undeniable that the rise in wages has been accompanied by a great decline in the quantity of work done by a man in a day. Take two oft-quoted cases for example, viz., the Westinghouse works at Manchester, where, it is said, the bricklayers laid 1,600 bricks a day per man on part of the works; and the case of the Great Northern Railway at Manchester, where the men, it is said, laid 1,760 bricks per man in hydraulic lime-mortar in a nine hours' day. There were perhaps exceptional circumstances to account for such expedition; I do not know, but what we do know is that the bricklayer does not lay as many bricks in a day as he used to do, and it is declared by many who ought to know that 400 or 500 bricks per day per man is now regarded as a fair average, as compared with 800 to 1,000 bricks per day per man some years ago. The builders, with whom as a class I have perhaps a somewhat special acquaintance, have naturally attempted to counteract the combined influences of increased wages and decreased work by the adoption of every labour-saving appliance that presents itself. I have sometimes thought that a modern builder's yard might form a fascinating subject for a paper, for the extent to which manual labour has been displaced by machinery in many shops would be instructive reading. This has been done, not from any desire to injure the workman, but because the saving of time and the rapid turnover of capital are necessary to the existence of a business of the kind under modern conditions. It is for this reason, among others, that I think, as I have said, that we may some day see the adoption of American methods on a large scale. Strikes there will and must always be as long as human nature remains what it is, but the establishment of Boards of Conciliation for the London district has, I understand, done a good deal towards the immediate settlement of disputes, by bringing masters and men together in conference. These Boards have been the means of settling a considerable number of the irritating inter-trade disputes as to allocation of work, which have so often resulted in such serious losses alike to workmen, employer, and client. In cases where the dispute cannot be settled in conference, the Boards, under their constitution, can appeal to the Board of Trade. This arrangement is at present optional; but I understand that the men show a disposition to agitate for a compulsory reference in all cases of failure to agree. What this might come to mean under certain conceivable political conditions is too obvious for comment. As to the extent of the evil, I see from the handbook for 1904 of the London Master Builders' Association, that according to the General Report of the Labour Department of the Board of Trade there were no less than 39 strikes in the building trade in 1902 for an advance in wages, in which 5,356 persons were involved directly and indirectly, and which had an aggregate duration of 115,860 working days, representing an enormous sum as loss of wages. Anything which can be done to prevent such a loss must be to the real interest of all concerned. The decision in the Taff Vale case has deprived the men of one of their most potent weapons for enforcing their demands, but it must not be forgotten that it is two-edged, rendering the masters' associations as liable as the men's to actions for damages for anything done in their corporate capacity. This is not the place to comment upon this important judgment; but it is to be observed that even the champions of trade unionism admit its equity as a matter of abstract law.

Ancient Lights.

"While on the subject of the various cases which add to the risk and expense of building in towns, I will refer very briefly to the recent decision in the now famous case of *Colls v. Home and Colonial Stores*. It is too much to say, as some have held, that the judgment has put the law as to ancient lights on a clear and definite footing. The most that can be stated is that it has cleared the air by sweeping away many contradictory decisions. We now have it, on the highest authority, that some of the decisions were based on misconceptions of the effects of the Prescription Act, that, in some, findings of fact had been adopted as principles of law, and that in others, as the Lord Chancellor stated in his judgment, it had been erroneously assumed that there was inherent in the dominant

tenement a sort of proprietary right in light itself, whereas light, like air, is the common property of all to enjoy, and it is the exclusive property of none. By this judgment it is settled that an action will not necessarily lie against the servient owner because, owing to his operations, the dominant owner has a light than before. There must be an actual and substantial deprivation of light, such as to make the premises less suitable—not for special and extraordinary purpose, but for ordinary purposes of men living together in crowded centres of population. It must, in fact, be a deprivation of such magnitude as amounts to a nuisance. It is held, further, that a mere diminution of light gives the party affected no right to an injunction, but merely a right to damages. As a result of this decision we shall in future, I hope, have our eyes often offended by the unsightly boards bearing the menacing words "Ancient Lights," which are apt to be used as a lever for virtual blackmailing in cases where persons are timid or fearful of the risks of an action at law. Members are no doubt aware, the Council of this Institution and the Royal Institute of British Architects have for some years been so impressed with the necessity of relief by legislation to the servient owner that with no little labour and expense, they prepared a private Bill which, so far as its provisions were concerned, would have had the same effect which has now been brought about by the recent interpretation of existing law. But there still remains, in my opinion, the necessity for a special technical tribunal (for which we made provision in the Bill) composed of persons familiar with the difficulties or arrangement and construction which beset building operations in large cities and working on settled and consistent lines for dealing with questions of fact. Before leaving this subject I should like to express our obligations to Mr. Howard Colls for his courage and persistence which he showed in fighting this matter to the bitter end, and to the members who, I am sure, endorsed the action of the Council in deciding to assist Mr. Colls in meeting the heavy costs he has incurred in battle with an evil which threatened to obstruct greatly building operations in London and other large towns."

In conclusion the President referred to the retirement of Mr. Penfold, who, commencing from the earliest days of the Institution, filled the office of honorary secretary for this six years, and to the election of Mr. Currey as his successor.

On the motion of Mr. C. Bidwell, seconded by Mr. Howard Martin, a hearty vote of thanks was accorded to the President for his address.

Presentation to Mr. Penfold.

The President said he had now to perform what was likely to be his most pleasing duty during his year of office. He found entered in the minutes of the Institution of July 18, 1874, the following:—"Resolved, that Mr. J. Penfold be appointed Hon. Secretary of the Institution." From that date until the end of last year Mr. Penfold continued to discharge the duties of that important office. The Council accepted his resignation last year with the greatest possible regret—for his was the guiding hand which had steered the Institution through the troubles and difficulties of its early career, and his wise counsel had always been at the command of the Institution. It was, therefore, felt that mere words were not adequate to express the feelings of the Institution or the appreciation of the members of his services, and it was decided to give a more tangible expression of the regard which he was held by asking him to sit to a portrait by Jacob Hood for a presentation portrait. Though no longer Hon. Secretary, Mr. Penfold had not been allowed to escape from the trials and duties in connexion with the Institution, and they would still have the benefit of his wise counsel and advice. At the suggestion of the Council Mr. Penfold had been appointed to a position of "less freedom and more responsibility." He would not dilate on the esteem and regard in which Mr. Penfold was held, but he would express the earnest hope that would be with them for many years to come.

The President then unveiled the portrait, and, in the name of the Institution, presented it to Mr. Penfold.

Mr. Penfold, in reply, said he was overjoyed by their generous recognition of any service he had rendered the Institution. He would

ways look back upon his tenure of the office of Hon. Secretary as one of the most pleasant experiences of his professional career, and he would always remember the very cordial relations which had existed between himself and the various Councils, and he thanked them for the kind way in which they had always listened to anything he had to say. In the early days of the Institution, when he was Secretary, porter, editor, and accountant, etc., he came in since then the Institution had found in Mr. Julian C. Rogers, their Secretary, a most able general administrator of its affairs, and he took that opportunity of thanking Mr. Rogers, whose cordial friendship had made his (the author's) tenure of office most pleasant, and also thanked the staff for their most cordial cooperation. He also thanked the members for the position they had just placed him in, and to Mr. Jacob Hood for the portrait he had intended. He had one request to make, and that was that the Council would accept the statue and would place it somewhere in that room, as a companion portrait to that of his late and valued friend John Clutton. The President said he was sure the Council would accede to Mr. Penfold's request. The Secretary announced that the next meeting would be held on Monday, November 22, when a paper would be read by Mr. C. J. Junon on "The Building Surveyor: his Training and Practice." The meeting then terminated.

Illustrations.

TAIL OF THE PRINCIPAL ENTRANCE, PISA CATHEDRAL.

It will be remembered that the Cathedral at Pisa was begun after the naval victories of the Pisans near Palermo. "The most famous artists from foreign parts vie in lending their aid to the building of such an important work, under the direction of Buschetto." The plans from Palermo, Majorca, and elsewhere are fitted into the cathedral as integral parts of the design. It is therefore not easy to distinguish between the classic work and that of the thirteenth and thirteenth centuries. There is no doubt that the founders of Gothic Sculpture were intensely influenced by the fine classical remains in the Campo Santo at Pisa. We need go no further than the South Kensington Museum to see this in the cast that is there in the architectural room of Niolo Pisano's shop. Some of the figures in this are direct descents from the antique. The pillar on the right, in our illustration, is a beautiful specimen of ancient work. The figures on the jamb, representing the origin of Christ from David, are probably the work of Gislelvi, who built the baptistry about 1150. Smaller shaft is probably an antique of neo-Byzantine workmanship, though not by many of the sculptors at work on the building were steeped in the influence of this style of ornament. The Cathedral is famous for its marble shafts, of which many are of antique.

ALTAR FRONTS.

These are examples of modern altar fronts commissioned from Mr. Edmund Hunter, of London, and designed and executed by him. We are unfortunately unable to give the full effect, which counts for so much in work of this kind; but the drawings show clearly the design and character of the designs, and the sense of beauty that them as to the main colouring enable the reader in some degree to appreciate their effect. From a note received by the artist at the last meeting, we learn that the lower design on the left, which is described as made for Buckingham Palace Chapel, has in fact just been put up by him in the private chapel at Windsor Palace.

NEW OFFICES FOR THE N.E. RAILWAY COMPANY.

The North Eastern Railway Company have been compelled to build new offices on a site in Dowley-street, Westminster, their present building in Great George-street having been requisitioned by the Government for the new Government offices. The south front of the new building, here illustrated, is to be faced with red bricks from

Messrs. Lawrence and Mr. Allen of Sudbury; light bricks for the quoins, darker bricks for the filling in, rising five courses to the foot. The stone is brown Portland.

The contractors for the work are Messrs. Holloway Bros. The architect is Mr. Horace Field, and the drawing was exhibited at the last Royal Academy exhibition.

COTTAGE, GREAT WARLEY; AND LODGE AT AMERSHAM.

These two designs, by Mr. Guy Dawber and Mr. Phillips Higgs respectively, formed two of the illustrations to the paper on "Economies in Small Houses" read before the Architectural Association Discussion Section by Mr. A. H. Belcher, and printed nearly in full in the present issue. They are referred to and described in the course of the paper.

THE METROPOLITAN ASYLUMS BOARD.

The usual fortnightly meeting of the Managers of the Metropolitan Asylum District was held at the offices, Victoria Embankment, on Saturday last week.

Millfield Homes.—The Works Committee reported that the total cost on completion of Millfield, Rustington, had been 24,234. The cost had been increased on account of the Managers having to provide their own water supply. The homes accommodate 100 patients. Messrs. J. Parsons & Sons were the contractors for the work.

North Eastern Hospital.—The Committee have ordered the renewal of some ceilings of this hospital at a cost of 408. 10s. The work is being done by Messrs. Higgs & Hill.

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday at the County Hall, Spring-gardens, S.W., Mr. Williams Benn, Chairman, presiding.

Loans.—On the recommendation of the Finance Committee it was agreed to lend Kensington Royal Borough Council 7,600. for street improvement, and Woolwich Borough Council 10,000. for baths and wash-houses. Sanction was also given to Paddington Borough Council to borrow 5,833. for contribution to reconstruction of Westbourne-park-bridge.

St. Louis Exhibition.—The General Purposes Committee reported the receipt of letters, dated October 22, 1904, from the Commissioner-General for Great Britain of the St. Louis Exhibition, stating that the International Jury have awarded to the Council a gold medal for its exhibit of the model of the shield used in the construction of Blackwall Tunnel, and that the chief engineer of the Council has been awarded a similar medal.

Selected Lists of Contractors.—On the recommendation of the Education Committee the name of Messrs. Walter Lawrence & Son, of Canal Works, Waltham Cross, was added to the selected list of contractors to be invited to tender for the erection of new schools and additions to schools; the name of Messrs. Chittenden & Simmons, of West Malling, Kent, was added to the list of contractors for paving the playgrounds of L.C.C. schools; the name of Messrs. J. Yetton & Co., of No. 4, Carr-street, Limehouse, was added to the list of contractors to be invited to tender for repairs to heating apparatus under the printed schedule of prices for heating works, and Messrs. Frank W. Harris & Co., Limited, of "Albion Works," Albion-grove, Barnsbury, were placed on the selected list of contractors to be invited to tender for carrying out structural alterations and repairs to school buildings to the value of 500l.

The London Building Act Amendment.—The following report of the Building Act Committee was brought up as a matter of urgency, and it was discussed at great length, together with the long report of the Committee on the Amendment of the Act, which we printed in *extenso* last week—

"We think it right to draw the attention of the Council to the fact that the suggested amendments to the London Building Acts which are outlined in the report of the Building Act Committee affect the work of many other committees of the Council. For instance, paragraph 7 of our recommendation deals with the provision of means of escape in case of fire and the reduction of risk of fire in buildings. The numerous fatal fires that have occurred in recent years (amongst others the fire in Alder-street on October 19, 1904, in which six lives were lost; in a restaurant in Duke's Head-passage, Ivy-lane, E.C., on February 25, 1904, seven lives lost; in Hackney-road, on October 18, 1903, three lives lost; in Brownlow-street, Holborn, on January 18, 1903, three lives lost;

in Ben Jonson-road, Stepney, on December 29, 1902, six lives lost; in Queen Victoria-street, on June 9, 1902, ten lives lost) amply demonstrate the need for urgent action with regard to the question of safety from fire, and the Fire Brigade Committee have impressed upon us the necessity of every effort being made to obtain the sanction of Parliament as early a date as possible to the proposals with regard to this matter. The suggested amendments which particularly affect the work of the Highway Committee are contained in paragraph 8 of our recommendation; those affecting the Improvements Committee in paragraph 4, and those affecting the Main Drainage and Public Control Committees in paragraphs 11 and 12 respectively. All these committees are submitting reports to the Council on Tuesday, November 15, 1904, stating that they consider that it is desirable that every effort should be made to obtain the sanction of Parliament at the earliest possible date to the suggested amendments with which they are particularly concerned. There are also very important amendments which affect the work of the Public Health Committee (paragraph 6), and also amendments suggested by the Local Government Committee (paragraph 5). These committees met too late to submit a report to the Council, but we know from the memoranda which they have sent to us that they are anxious that the sanction of Parliament should be obtained to their proposals as soon as possible. In view of the importance not only of the suggestions particularly affecting the work of the Building Act Committee but of those affecting the work of other committees of the Council, and of the urgent representations which have been made by those committees with respect to the suggested amendments affecting their work, we desire to express the hope that the Council will decide that every effort should be made to obtain in the session of 1905 the sanction of Parliament to our proposed amendments to the London Building Acts."

The following are the reports of the Fire Brigade Committee and the Highways Committee and the Public Control Committee respectively:—

"We have had under consideration the Building Acts (Amendment) Bill, 1905, so far as it relates to fire protection and means of escape in case of fire, and we observe that nearly all the suggestions which, after consultation with the late chief officer of the Fire Brigade and the present chief officer, we made to the Building Act Committee have been met in the Bill. These suggestions dealt mainly with, (a) the means of escape from buildings above a certain height, (b) fire protection and means of escape in premises used partly as shops and partly as dwelling-houses, with special provisions as to fire premises used partly as shops, (c) fire protection and means of escape in premises part of which consists of projecting shops, (d) buildings over 80 ft. in height, (e) doors between buildings, (f) the storage of timber and protection of neighbouring buildings, (g) the conversion of a dwelling-house into a factory, warehouse, etc., (h) the division of one shop into two or more shops, (i) the protection of windows and openings of buildings within 30 ft. of openings of other premises, (j) the protection of constructional ironwork, and (k) the construction of lift shafts. As a result of our consideration of the Bill we informed the Building Act Committee that we thought that the clauses with regard to projecting shops, the protection of windows and openings in buildings, and the protection of constructional ironwork should be retrospective after a certain period, and that the provisions with regard to the storage of wood and timber should be made more stringent in the case of timber yards adjoining dwelling-houses, but the Building Act Committee have not seen their way to make the necessary amendments. We are still of the opinion that we expressed in the joint report of the Building Act, Fire Brigade, and Parliamentary Committees, presented to the Council on May 26, 1903, that the need of further legislation with regard to protection against fire in and provision of means of escape from buildings is extremely urgent, and we therefore think that clauses dealing with the matters mentioned above should be proceeded with in the next session of Parliament."

"We have, at the request of the Parliamentary Committee, considered the provisions of the London Building Acts Amendment Bill, which the Council has decided to introduce in the next session of Parliament, so far as they relate to tramway buildings. In connection with tramway work, we have experienced certain difficulties from time to time, owing to the limitations contained in the London Building Act, 1894, as to the cubical extent of buildings, and sections 80 and 81 of the Bill, as now submitted to the Council, will, we are of opinion, deal satisfactorily with that point. The size and special character of buildings used for electrical tramways made it extremely important that the exemptions in those respects accorded by section 203 of the London Building Act, 1894, to buildings of certain descriptions should be extended to tramway structures. In these circumstances, we desire to express the hope that every effort will be made to secure the passing of a Bill in the next session of Parliament to secure these objects."

"The Building Act Committee have been in communication with us on the subject of the suggested amendment of section 118 of the London Building Act, 1897, which prohibits the establishment, or the carrying on, of dangerous businesses at a less distance than 40 ft. from a public way, or 50 ft. from any other building or vacant land in other ownership. Proposals which have from time to time been made to establish such businesses in the County of London have had to be abandoned owing to the difficulty of complying with that section, but it appears to us that many of the businesses might be conducted with safety under proper supervision, and subject to proper conditions imposed in licence. We have therefore suggested to the Building Act Committee the desirability of applying to Parliament for powers enabling the Council to consent, in such cases as it may think fit, to the carrying on of dangerous businesses within the county. We are of opinion that the draft clauses embodied in the Bill prepared by the Building Act Committee will give effect to our views, and we consider that every effort should be made by the Council to obtain the sanction of Parliament to the proposals at the earliest possible moment."

Upon the reception of the report. Mr. Thomas asked why the Borough Councils had had no opportunity of considering the proposals?

Mr. Stuart Sankey said he had received a letter from the City Solicitor stating that he had written to the Council to ask that the draft Bill should be sent on to the City Corporation for their consideration. Nothing, however, had been done in that direction, and therefore the City could offer no opinion.

Captain Hemphill said they had written to the Borough Councils asking for their suggestions for the amendment of the Act. There would be no difficulty in sending them a draft of the Bill.

Mr. A. M. Torrance, Mayor of Islington, said they had not had the draft Bill asked for.

Captain Hemphill, chairman of the committee, moved the adoption of the Report. He proceeded to give a history of the origin and fate of the last Bill presented in 1902-3. The committee, he said, subsequently wrote to the Corporation, to the Borough Councils, and to the building authorities, including the Royal Institute of British Architects, to ask for suggestions in regard to a proposed amending Bill. The result had been a mass of valuable information, especially from the Royal Institute of British Architects, which contained many useful suggestions. They eventually sent 245 suggestions to the Parliamentary Committee for embodiment in the Bill. Having sent these proposals to the committee, they—the Building Act Committee—proceeded with their proposals. The draft Bill was now in existence. It was not one for restrictions only, but granted concessions. It proposed for one thing to allow buildings of larger cubical space to be erected in London; and enabled the Council to approve buildings constructed of iron and steel and concrete. They also proposed to allow local authorities to supervise and control buildings under a certain size, and they dealt effectively, he thought, with the question of fire-resisting materials. They only asked the Council to approve definite principles. He did not suggest that the Council should be bound that day to every detail in the measure. They only wanted an assent to the general policy. The draft Bill must be deposited on December 17, and between that date and the middle of February there would be plenty of time for the local authorities to discuss the details of the Bill, which could be settled definitely by the Council itself before the end of January. The Council would then have ample opportunity for discussing the amendments and suggestions made by the local authorities. He thought it would be a great pity if the Bill was not approved that day, considering the time spent on preparing the measure, and especially the fact that they had dealt very carefully with the suggestions which had reached them from outside.

Dr. Napier moved the following amendment:—

"That, whilst fully recognising the necessity of amending, at an early date, the London Building Acts in many important particulars, the Council is of opinion that, having regard to the number and magnitude of the proposed amendments, to the fact that they have not been submitted to and considered by the professional bodies and local authorities in accordance with the practice hitherto adopted, and which the Building Act Committee in their report to the Council on June 14, 1904 (p. 989), implied would be followed, and to the further fact that the proposals of the Council for legislation in the next Session of Parliament are already both numerous and important, it is undesirable to proceed with the proposed amendment of the London Building Acts in the next session of Parliament; but that such proposals be referred back to the Building Act Committee for further consideration, with a view to legislation being sought in the session of 1906."

He said he hoped that the Council would not be misled by a suggestion that in giving the Parliamentary notices they were not committing themselves to the principal details of the Bill. The Act of 1894 when introduced consisted of 192 sections. It was really a consolidation of old Acts. The Bill of 1904 was not of that character; but introduced new laws and new proposals, which raised considerable opposition. The Bill of 1894 took twenty-two days before the Commissioners of Parliament, and he ventured to think that this Bill would take double that time. The Bill now before them needed at least five months' examination by the local authorities. The Building Act Committee had not given one-thirtieth part of the time they should have done to the consideration of the Bill. Finally, the local and professional bodies had not been properly consulted. They were asked in effect: How would you amend the Building Law? Now that was not what they wanted. They wanted the Bill in order to consider the actual proposals to be made. The surveyors and architects of London knew more about the Building Law of London than any member

of the Building Act Committee. They would have, without the Building Bill, eight highly contentious measures. If they carried the Committee's Report, and if the Parliamentary Committee were compelled to go on with the Bill, some of the measures he had mentioned would suffer. He believed that they could not get the Bill through the next session.

Mr. Shephard, in seconding the amendment, said it was impossible for anyone who did not devote days to studying the Bill to understand what it meant. It was a Bill of 179 sections, and, he ventured to say, would raise up in opposition all vested and individual interests, creating a hostility against which it would be useless to fight. The Bill proposed that the Building Act should apply to Government property. Did they think they could get that clause passed? Then the Bill attacked the magistrates. They proposed to ignore the duties of magistrates in respect to dangerous buildings and new streets. They were going to attack the rating authority. They were "going for" the district surveyors, proposing to pay those officials by salary instead of by fees. They were to be the servants of the Council, instead of independent officials. Summonses which were issued by the district surveyors were to be issued by the Council, and, as these summonses averaged 1,000 a week, they would need a bigger staff. They were asking Parliament to abrogate its functions by making streets wherever they liked. In effect, they proposed to pull down houses just where they liked. Then they attacked the Tribunal of Appeal—one of the safeguards of the Act. They proposed that no practising architect or surveyor should sit on the Tribunal of Appeal. They were dealing for the first time with churches and chapels by insisting upon bolts and swing doors. Not content with taking people's property, they were going to alter the Lands Clauses Act. The 10 per cent. for compulsory purchase was deleted, and they wanted foreclosures to be dedicated to the public. In old streets it had been held by law that if an owner erected a low house he could re-erect the house to the same height as his neighbours'. The Bill was drastic and offensive, and it was absurd to ask them at one sitting to pass a measure of this character. Let them use this time between now and a year hence in getting all public opinion together, so that they might be able to present a Bill which would have the deliberate opinion of London behind it.

Mr. John Burns, M.P., said that in the interests of the public they should go on with the measure. Passing on to discuss the question of narrow courts, Mr. Burns said that Angel-court in the City was not more than 6 ft. 6 in. wide. They suggested that as an escape could not get up such courts, the people should have a trap-door, so that they might escape. House-owners in the City did not mind the expense. As to District Surveyors, a man spent the other day 18. 3d. in putting in a bit of cement in a crack in the steps of his front-door, and the surveyor's charge was 19s. 3d., and there were other similar cases.

Mr. Alderman Alliston said it was not a question of this Bill or no Bill. They were agreed that there should be a Bill. They were also anxious that precautions should be taken against the risk of life by fire. The Bill, however, which was of a very drastic character had not been considered by the local authorities. They had heard a good deal of the protection of buildings, but nothing about the people. Who was to pay for carrying out this Bill, which would improve London off the face of the earth? If it were passed it would mean the reconstruction of London within the next seven years. How could a business man live if that was the case? Lawyers, architects, and surveyors would reap a fortune. He did not think that sufficient consideration had been given to the proposals, which would adversely affect the leaseholder and tenant, however much expense the owner might be called upon to bear.

Colonel Rotton said he could very well remember the inquiry as to the Cripple-gate fire. Then, as the chairman of the Fire Brigade Committee, he was looked upon by the City representatives and officials as one who was more or less responsible for the fire. Bearing in mind the remarks of the City members when fires occurred, he would be no party to shielding City merchants when there was a question of saving life.

Mr. Howell J. Williams complained that the Council had not sent the draft Bill to the authorities for their consideration. Architects and builders were not opposed to an amendment of the Building Act. They would welcome an amendment, but it necessary, before such a despotic power given into the hands of the Building Act Committee, that they should have the full force of public criticism. At present they were proposing to raise a hostility for which there was no necessity.

Mr. R. C. Phillimore said that the deputy chairman had told the Council that it ought to consult the business man in the City. That was quite right, so far as it went, for there was already too much power in the hands of the professional bodies.

Mr. E. Smith (Chairman of the Fire Brigade Committee) remarked that some of the proposals put forward by his Committee were far more drastic than those which the Building Act Committee recommended. They put life and wealth, and were determined to go on with the thing.

Mr. E. White said that while having no doubt to look after the interests of the moneyed class, he felt that to go on with the Bill now was to ensure certain defeat. The Bill ought to be sent to the various local authorities and the Institute of Architects and the Surveyors' Institute, and if this was done a great many of the present difficulties could be got over.

Mr. H. R. Taylor said that two years ago when a small Bill was brought before the Council, they were asked to withdraw in favour of a complete Bill. Now these members said that the Bill was too big.

Mr. Jephson said the Bill was not merely a fire-prevention measure, but one designed to improve the public health. He appealed to the Council to push it forward.

On a show of hands the amendment had 25 supporters and 62 opponents.

A division was then demanded, when it was voted: For the amendment, 27; against amendment, 75.

The Council afterwards approved the recommendations.

A New Fire Station.—The Fire Brigade Committee presented a report recommending the Council to take steps for the erection of a new fire station in place of the present Water Road Station, at an estimated cost of between 24,700*l.* and 26,000*l.* The recommendation was agreed to.

Tramways.—The Highways Committee recommended that the Standing Orders be suspended in order that application may be made to Parliament next Session for powers to construct tramways over Blackfriars and Water Bridges and along the Victoria-embankment.

Mr. Sankey hoped the Committee would consider the proposal. He had no mandate to speak on behalf of the City Corporation, he knew the question was being considered by a Committee of that body.

Mr. Wightman felt that it would be better to stop the Lord Mayor's Show or a procession occasionally by having the tramway rather than have the daily procession of people walking over the bridges from South of London.

Mr. Alliston supported the proposal, as he considered it an absolutely necessary tramway. At the same time, an assurance ought to be given to the City Corporation that this was to be a street in itself, and was not to be made a set-back stone for tramways through the narrow streets of the City.

The recommendation was agreed to.

The Preservation of Garden Squares.—The Parliamentary Committee submitted a dealing with the preservation of garden squares and enclosures, and recommended:—Parliamentary authority be sought in the Session of 1905 to secure that the garden square enclosures in London shall be permanently preserved as such, and that such garden squares and enclosures when so preserved shall be free from any future legislation relating to taxation of ground or site values."

Mr. H. P. Harris said he thought the Council was entitled to more information on the matter, more particularly as to what squares were scheduled in the Bill.

Dr. Napier replied that the owners of half the squares in London were friends of the Council, as was the Chancellor of the Exchequer as the head of the Woods and Forests Department.

The recommendation was carried.

Long-grove Asylum—Erection of superstructure.—The Asylums Committee reported as follows:—

In pursuance of the promise of our chairman to submit to the Council further information as to the estimate for the erection of the superstructure of the Long-grove Asylum, we now report as follows:—
 The amount of the accepted tender (that of Messrs. Foster & Dicksee) is £359,892 10 0 the architect's cube estimate was £338,000 0 0
 which must be added for "foundations" of some of the detached buildings omitted from the foundation contract and included in the superstructure contract 10,000 0 0
 leaving the amount of the tender in excess of the architect's cube estimate to be £349,892 10 0
 The estimate of the quantity surveyors (based on priced bills) obtained at the request of the Finance Committee amounts to £389,119 17 3
 deduct amount of accepted tender £359,892 19 0
 leaving the excess of the quantity surveyors' estimate over the accepted tender to be £29,227 1 3

In the event of the Committee having contemplated the execution of the work by the Works department, in accordance with the standing orders of the Council, they would have had to obtain an estimate from the proper officer, and, before reporting to the Council, to refer to the Finance Committee the estimate and the specifications, to the Works Committee for consideration. The estimate, therefore, that would have been submitted to the Works Committee is that prepared by the quantity surveyors referred to above. As shown in the tender accepted by the Council, viz., that of Messrs. Foster & Dicksee, amounted to £359,892 10s., is £277 7s. 3d. less than the quantity surveyors' estimate.

Housing.—The Housing of the Working Classes Committee reported that all the tenements in Barnaby-buildings, Leroy-street, Bromley-road, are practically completed. The dwellings have been provided for the purpose of rehousing 291 persons of the working class who will be displaced by the carrying out of the Long-lane and Tabard-street improvements, and the two blocks together contain accommodation for 400 persons in 40 tenements of two rooms, and 40 tenements of three rooms each. The Council, adjourned shortly before eight o'clock.

APPLICATIONS UNDER THE LONDON BUILDING ACT, 1894.

The London County Council at their meeting on Tuesday dealt with the following applications under the London Building Act, 1894. The names of applicants are given between parentheses:—

Lines of Frontage and Projections.
Kensington, South.—A deviation from the an approved on April 26, 1904, for the erection of an electrical transformer station on the site of Nos. 1 and 3, Pelham-street, and Nos. 1 and 2, Thurloe-houses, Thurloe-square, Kensington, so far as relates to an alteration the frontage line in Pelham-street (Mr. W. G. Green for the Metropolitan District Railway Company).—Agreed.
Lewisham.—Three houses, with one-story shops in front, on the site of No. 63, Dartmouth-road, Forest Hill, and the erection of additional stories over the existing shops on Nos. 55 and 55a, Dartmouth-road (Mr. E. C. Christmas).—Consent.
St. George, Hanover-square.—That the application of Mr. T. Worlock for an extension of the period within which the erection of two iron and glass shelters at the St. George's station workhouse to abut upon Wallis-yard, Buckingham Palace-road, St. George, Hanover-square, was required to be commenced, and granted.—Consent.
Brixton.—That the application of Mr. A. Burne for an extension of the period within which the erection of a three-story addition to the Stockwell Training College on the north-west side of Stockwell-road, Brixton, was required to be commenced and completed, be granted.—Consent.
Finchley, Central.—Two projecting porches a proposed factory on the site of Nos. 61 to 63 (odd numbers) inclusive, Collier-street, Penville (Mr. S. D. T. Pettit for Messrs. Verrett & Co.).—Consent.
Fulham.—Projecting porches with balconies over and barge boards at Nos. 41 to 79 (odd numbers), Finlay-street, Fulham (Mr. A. Dawkins for Mr. R. B. Mason).—Consent.
Hackney, South.—The retention of a wooden and glass porch at the workhouse, Honey-road, Homerton (Mr. F. R. Coles for

the Guardians of the Hackney Union).—Consent.
Marylebone, East.—A house with projecting porch and bay windows on a site abutting upon the southern side of St. Edmund's-terrace and eastern side of Avenue-road, St. Marylebone (Mr. A. F. Faulkner for Mr. W. Willett).—Consent.
Poplar.—Projecting porches at the Primitive Methodist Chapel, Manchester-road, Cubitt Town (Mr. H. Harper).—Consent.
Wandsworth.—Retention of four houses on the east side of Burstock-road, Putney, northward of No. 21 (Mr. T. G. Rutherford).—Consent.
Wandsworth.—One-story shops in front of Nos. 93, 100, and 102, Lower Richmond-road, Putney (Mr. J. Durham for Mr. A. Welham).—Consent.
Westminster.—A projecting porch, steps, and angle turret at Hopkinson House, Vauxhall Bridge-road, Westminster (Mr. R. S. Ayling for the Brabazon House Company).—Consent.
Lewisham.—That the application of Mr. A. H. Kersey for an extension of the periods within which the erection of houses with bay windows on the west side of Brockley-rise, Lewisham, was required to be commenced and completed, be granted.—Consent.
Dulwich.—Two two-story bay-windows at No. 73, Camberwell-grove, Dulwich (Mr. F. Banister for Mr. H. W. Haile).—Refused.
Hackney, South.—That the Council do not accede to the request of Messrs. W. Silk & Son for permission to retain a showcase on the forecourt of No. 20, Urswick-road, Homerton).—Refused.
Hampstead.—An iron and glass covered way at No. 14, Buckland-crescent, Hampstead (Mr. J. P. Hamilton).—Refused.
Stepney.—A projecting hood over the entrance to "Court House," Holloway-street, Commercial-road, Stepney (Messrs. Joseph & Smith for the Council of the United Synagogue).—Refused.
Width of Way.
City of London.—Re-erection of buildings on the western side of Cross Key-court, London-wall, City (Mr. A. Griffin for Mr. G. J. Mathieson).—Consent.
Hampstead.—Additions to "The Whims," North End-road, Hampstead, with a boundary fence at less than the prescribed distance from the centre of the roadway of the street (Messrs. Grayson & Ould for Mr. W. H. Lever).—Consent.
Holborn.—Working-class dwellings on a site abutting upon the south side of Summers-street and west side of Back-hill, Holborn (Mr. A. T. Quartermain for Mr. A. J. Best).—Refused.
Width of Way and Line of Frontage.
Marylebone, West.—A scullery and entrance hall addition, projecting steps, and hood in front of No. 22, Hill-road, St. John's Wood (Mr. S. A. Tatchell for Mr. E. A. Benjamin).—Consent.
Width of Way and Space at Rear.
Southwark, West.—A two-story building upon the site of No. 103, Broadwall, to abut also upon Rouppell-street (Messrs. J. Hoare & Son for Mrs. A. Hoare).—Consent.
Space at Rear.
Battersea.—A modification of the provisions of section 41 of the Act, so far as relates to the proposed erection of club rooms on a portion of the open space about "The Cedars" clergy house, High-street, Battersea, to abut upon Orville-road (Mr. J. S. Quilter for Canon J. Erskine Clarke).—Consent.
Southwark, West.—A modification of the provisions of section 41 of the Act, so far as relates to the proposed erection of a cart-shed with four stories over, on the east side of Gravel-lane, Southwark, to extend over part of the open space at the rear of a stable building on the north side of Orange-street (Mr. E. Carritt for Mr. J. Sainsbury).—Consent.
Paddington, South.—A modification of the provisions of section 41 with regard to open spaces about buildings, so far as relates to the proposed erection of a building at No. 32, Westbourne-grove, Paddington (Mr. A. Young for Mr. J. Rossdale).—Refused. (That the applicant and the District Surveyor be informed that if it be proposed to unite Nos. 30 and 32, Westbourne-grove, it will be necessary to bring the united building into conformity with the provisions of section 74 (2) of the Act.)
Deviation from Certified Plans and Projections.
Chelsea.—The construction of an additional story and a projecting angle turret to the Cadogan Hotel, Sloane-street, Chelsea (Messrs. Brown & Barrow for Mr. T. Lassam).—Refused.

Formation of Streets.
Clapham.—That an order be issued to Mr. J. Donkin sanctioning the formation or laying out of a new street for carriage traffic to lead from Kendoo-road to High-street, Clapham (the late T. G. Foster).—Consent.
Wandsworth.—Permission to retain barriers across Ellerton-road, Burntwood-lane, Wandsworth (Messrs. Holloway Brothers).—Consent.
Buildings for the Supply of Electricity.
Woolwich.—Floors of an addition to the engine-room at the electric-light station, Globe-lane, Woolwich (Mr. F. Sumner for the Council of the Metropolitan Borough of Woolwich).—Consent.
Height of Buildings and Means of Escape at Top of High Buildings.
Kensington, South.—A building on the north side of High-street, Kensington, at the corner of Brown's-buildings (Mr. P. E. Pilditch).—Consent.
Deviation from Certified Plans.
Whitechapel.—Deviations from the plan certified by the District Surveyor, so far as relates to the proposed erection of buildings upon the site of Nos. 2, 4, and 6, Old Montague-street, and a portion of the site of "The Archers" public-house, Osborn-street, Whitechapel (Messrs. Turner & Holditch for Mr. A. G. Turner).—Consent.
Widening of Streets, Width of Way, and Line of Frontage.
St. Pancras, North.—A building upon the site of Nos. 9, 11, 13, 15, and 17, Highgate-road, St. Pancras, to abut also upon Greenwood-place, and in connexion with such building the widening of a portion of Greenwood-place (Mr. G. H. Greatback for Mr. W. A. Currock).—Refused.
Working-class Dwellings.
Limehouse.—Dwelling-houses to be inhabited by persons of the working class on a site to the northward of the Rotherhithe-tunnel approach, between Rose-lane and Butcher's-row (Mr. R. Robertson for the Housing of the Working Classes Committee of the Council).—Consent.
 The recommendations marked + are contrary to the views of the local authority.

ARCHITECTURAL SOCIETIES.
SHEFFIELD SOCIETY OF ARCHITECTS.—The ordinary monthly meeting of the Sheffield Society of Architects and Surveyors was held on the 10th inst. in the Lecture Hall of the Literary and Philosophical Society, Leopold-street, Mr. T. Winder presiding. A ballot was taken, and the following gentlemen were elected Associates of the Society: Messrs. S. S. Smith and G. H. Rawcliffe. A lecture was then delivered by Dr. John Stokes on "Monumental Brasses." In the course of his remarks he said that monumental brasses made their appearance in England in the XIIIth century, the earliest now in existence being that of Sir John d'Abernon, of Stoke d'Abernon, Surrey, dated 1277; earlier ones now lost are recorded. This form of memorial probably first arose in Germany, and seemed to have sprung into existence as a perfect art, for the earliest examples were best in execution and design. The material of which they were made was known as "latten," a term loosely used to designate any compound of copper, and also as "Cullen plate," a corruption of Cologne, where, together with Flanders, the plates were chiefly made. Many brasses in England were of continental origin, but most were of native workmanship. The brass being a substitute for a stone effigy, the figures were represented as if lying on the back, the head resting on a cushion or helmet, and the feet on a lion or dog, as in the stone monuments; but in the XVIIth century the practice arose of showing figures kneeling and in other awkward positions—an attempt at realism, but an evidence of decay in art which was not found at the best period. Enamel was used in some brasses, but this, not being a durable material, or perhaps the method of its application not being sufficiently understood, had in most cases worn off. There was an example of the use of enamel locally in some brasses in Hathersage Church. These monuments, he said, might be divided into four classes—military, ecclesiastical, civil, and miscellaneous. It was impossible to overrate the importance and value of monumental brasses, forming, as they did, a series of illustrations of and a commentary on the history, dress, manners, and customs of our ancestors. In them they could trace the change from mail to plate armour, and its gradual disuse as a means of defence, the changes in civilian

costume showing the rise of a new order, but perhaps the clerical ones were especially noteworthy, as it was the rule of the church to bury ecclesiastics in full dress with all the ornaments of their orders, which were hence faithfully represented on the brass.—On the motion of Mr. J. Hale, seconded by Mr. C. F. Innocent, and supported by Messrs. J. R. Wigfill, H. L. Paterson, W. C. Penton, and T. S. Brown, a hearty vote of thanks was accorded to the lecturer. The lecture was illustrated by rubbings taken by Dr. Stokes.

LIVERPOOL ARCHITECTURAL SOCIETY.—On the 7th inst., in the Society's rooms, Harrington-street (Mr. P. C. Thicknesse presiding), Mr. Robert P. Oglesby gave a lecture before the Liverpool Architectural Society on "Sir John Vanbrugh, Dramatist and Architect." Mr. Oglesby said that as a playwright Vanbrugh was subject to considerable railway by Swift, Pope, and other contemporaries, but still more so when, apparently without any education in that direction, he began to practice as an architect, and under the affluence of Court favour quickly attained to great success, even ousting Sir Christopher Wren from connection with the great Blenheim Memorial undertaking. By the aid of limelight views Mr. Oglesby was enabled to point out the main features of Vanbrugh's architectural style, distinguishing what approved itself to him as commendable in contrast with the many eccentricities and extravagances of Vanbrugh, who subordinated utility to scenic effect.

EDINBURGH ARCHITECTURAL ASSOCIATION.—The opening meeting of the new session of Edinburgh Architectural Association was held on the 9th inst., in the Association's rooms, 117, George-street, Mr. Harold Tarbolton, F.R.I.B.A., President of the Association, in the chair. In his opening address, which was on the subject of "Education and Architecture," Mr. Tarbolton said the two schools in Edinburgh which included the teaching of architectural subjects—the Heriot-Watt and the School of Art (better known as the School of Applied Art)—both fell very far short of meeting the real requirements of a school of architecture. The scope of the work was not sufficiently extensive. The standard and results of the Applied Art School were excellent so far as they went, and, being under the direct control of architects, the school supplied in a limited way the needs of those who used it as a supplement to their office work. In the teaching schools in London, Birmingham, Liverpool, Manchester, and Glasgow, the requirements for the examination of the Royal Institute of British Architects were kept in view, and a systematic course of instruction in architectural history and detail and general professional practice provided. In Edinburgh no attempt was made to prepare students for this examination. A chair or lectureship of technical science was urgently required, which would pave the way to organised teaching schools. The University authorities said that funds were not available for the endowment of a chair. In America patriotic citizens had met the occasion, and surely there were those in this country who would in a like manner come forward in the interests of an object that so much touched the welfare of the country. The course of instruction would need to embrace the special subjects demanded from architectural students for the passing of the R.I.B.A. examination, as well as such subjects of general education as were required for degrees in science, including modern languages, and the course would be useless unless it extended for at least three academic years.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.—The twenty-ninth report of the Leeds and Yorkshire Architectural Society, for the period from November 1903 to May 1904, shows that up to the latter date the total membership was 155; namely, thirty-five honorary members, sixty-seven members, and fifty-three associates, as against a membership of 152 at the date of the last report, showing a slight increase. A silver badge of office, to be worn by the President of the Society, has been purchased. The badge has been executed by the Bromsgrove Guild of Applied Arts, and has been subscribed for by members of council and of the Society. The Society's library has now been deposited with the reference department of the Leeds City Library authorities, where the books will be more strictly supervised. Any member or associate can borrow books on the production of his certificate of membership.

NORTHERN ARCHITECTURAL ASSOCIATION.—The council (with the approval of Mr. Glover)

have decided to purchase No. 6, Higham-place, Newcastle-on-Tyne, as permanent premises for the Association. In addition to the 500l. of Consols, already given by their past President, Mr. Glover, about 700l. or 800l. will be required to complete the purchase and make the necessary repairs and alterations. Those who wish to subscribe are requested to send their donations to the hon. treasurer, Mr. R. Burns Dick, 24, Grainger-street West, Newcastle. A list of the amounts received will be acknowledged in a circular. It is hoped (subject to the consent of the council) to further arrange with Mr. Stanley A. Smith, P.A.S.I., for a course of six lectures to members of the Students' Sketching Club, on "Quantities."

ENGINEERING SOCIETIES.

THE SOCIETY OF ENGINEERS.—A *conversazione* in connexion with the jubilee celebration of the Society of Engineers was held on Wednesday at the Royal United Service Institution, Whitehall, which was used for the first time for such a purpose. Founded in 1854, the Society was first known as the "Putney Club," owing to the fact that it had its inception among the students of Putney College, an institution then existing for the education of engineers. Meetings were held periodically at the offices of Mr. R. M. Christie and Mr. H. P. Stephenson, who, with Mr. Alfred Williams, were chiefly instrumental in bringing the new body into being. In 1857 the Society received the title it has since borne, and twelve months later the authors of papers were for the first time encouraged by the award of premiums for their most noteworthy contributions. To provide for the augmented membership that followed, the lower chamber of Exeter Hall was engaged for the meetings, and the usefulness of the organisation was further recognised in 1863, when the members began to pay visits to works possessing special interest to engineers. The Society has steadily advanced in strength, and on the occasion of the present jubilee numbers nearly 600 members. Mr. Perry F. Nurey, the present secretary, and an ex-president, was first associated with it in 1858, and, in a retrospect of the work done, he has mentioned the fact that forty-four volumes of its transactions have been published, embodying 371 papers and filling over 10,000 pages. The guests of the Society on Wednesday who assembled at the invitation of Mr. D. B. Butler, the President, and the members of the Council included Alexander Siemens, Dr. Kennedy, Dr. Francis Elgar, Sir Leader Williams, Sir A. Noble, Sir J. Thorneycroft, and the Presidents of the Surveyors' Institution, Institution of Mining and Metallurgy, Junior Institution of Engineers, Royal Institute of British Architects, the Civil and Mechanical Engineers, and the Chairman of the Society of Arts. The museum of the Institution was thrown open to visitors.

Correspondence.

ARCHITECTURAL ASSOCIATION DISCUSSION SECTION.

SIR,—In the report of the last meeting of the Architectural Association Discussion Section in the current number of the *Builder* (page 495), many of the remarks attributed to me are quite different from, and in one case contrary to, what I actually said, and I shall be much obliged if you will kindly insert a correction in this week's number. I said I thought that 9-in. thick external walls would not keep out the wet, cold, and heat unless covered with cement, rough-cast, or weather tiles, or something of that nature. Also that I had found straw thatch required renewing in a few years, but that reed thatch lasted a great deal longer. My experience was that there was practically no difference in cost between casement windows and double-hung sashes.

LOUIS AMBLER.
[* * * We are not responsible for the errors Mr. Ambler complains of; the reports of the Discussion Section meetings (unless in exceptional cases) are kindly furnished to us by members of the Section, and are not by our own reporter.—Ed.]

BOOKS RECEIVED.

HISPANO-MOORESQUE WARE OF THE XVTH CENTURY. By A. Van de Put. (Chapman & Hall. 12s. 6d.)

THE CATHEDRAL CHURCH OF ST. ASAPH. By Pearce B. Ironside Bax. (Geo. Bell & Sons.)

COMPETITIONS.

LIBRARY, BENWELL.—In a competition designs for a public library for the Ben District Council, that by Mr. Vernon Hodgkin, Grand-parade, Teddington, has been placed first, and the premium of 75l. awarded.

ISLINGTON PUBLIC LIBRARIES.—The special committee appointed by Islington Borough Council to carry out the arrangements in respect to the proposed new public libraries reported on Wednesday that they had approached the President of the Royal Institute of British Architects (Mr. J. Belcher) with a view to obtaining his services. He had agreed to act as assessor and adviser to the committee in respect to the designs for the central and branch libraries.

OBITUARY.

MR. NORTON.—We regret to announce death, on November 10, at Bourne-mouth, his eighty-second year, of Mr. John Norton, formerly of No. 13, Bedford Row, London. Mr. Norton was elected an Associate (as a member) of the Royal Institute of British Architects in 1850, and a Fellow in 1857, served for a while as a member of the council. Amongst Mr. Norton's more important architectural works we may cite: Church, Great North-road, Finchley, for 670 sittings, and illustrated in the *Builder* of February 19, 1870; the station, thirteen years ago, of parish church, Newport, Shropshire; church of St. Helena, Lundy Island, in 1881; Stoke Bishop Church, near Bristol, in 1886, which he added the tower and spire in the "Infants' Home" at Limsfield, for Church Missionary Society; St. Matthew Church, Brighton; Christ Church andmanuel Church, Clifton; other churches: Bedminster, Builth, Ebbw Vale, New (Salop), etc.; Training College and School for the Diocese of Gloucester and Bristol; Royal Normal College for the Blind, Wood; Evedon Hall, Suffolk, for the Maharajah Duleep Singh; "Tyntesfield," Somerset; Ferry Hall; public works and buildings for the new Boulevard, Florence; walled garden, Tynemouth; the Turf Club, Bally; South-Western Terminus, H. Southampton; Horstead Hall, Norfolk; Fillingham Hall, Norfolk; Brant Knoll, Somerset; several county courts and residential, and hotels, etc. He leaves, besides his wife, eight daughters and two sons, the youngest of whom, Mr. C. Harrold Norton, is carrying on the practice. Mr. Norton was President of the Architectural Association for the Session of 1858-9; and at the funeral, which took place at Bourne-mouth on Monday, the Association was represented by their Secretary, Mr. Driver.

MR. SAMES.—We have also to announce death of Mr. W. H. F. Sames, aged 47 years. Mr. Sames practised as an architect in partnership with his brother, Mr. G. Sames, under the style of "Sames & Green" at No. 65, Northgate, Blackburn, and 2, Knott-street, Darwen, Lancashire. Mr. Sames & Green made the plans and designs for the new buildings, and for the extension of the then existing buildings, of the Royal Cross School at Preston, together with a school sanatorium; the Sunday school, Lower Darwen, for the United Methodist Church; the Conservative clubhouse, Guide, Lancashire; and the Central Stores, the Green, at Darwen. Four years ago they were one of the six architects who were invited to take part in the competition for the erection of the Blackburn Police Courts, with a station, firemen's cottages, etc. We mentioned upon their submitted designs in our article upon the competition in our number of December 22, 1902.

MR. BOYCE.—We regret to have to record the death of Mr. Thomas Boyce, of 18, Hart-street, Bloomsbury, the known contractor, who died on Friday, 4th inst., after a very short illness, at the comparatively early age of fifty-seven. Mr. Boyce had carried on a very large business for thirty years, having started at the age of twenty-five years, and had been entrusted with numerous important works. Among the works he carried out were the following:—Alterations at Sandringham, for the late (then Prince of Wales); mansion in Bayswater Park, for the Duke of Connaught; "Saint Bruno," Sunningdale, for the Duke of Gleichen; Oakleigh Court, for Lord Gerald; mansion, Newmarket, for Marquis Huntingdon; Constitutional Club, Northberland-avenue; Maxim Nordenfelm Villa, Erith. Numerous blocks of flats—Artisan mansions, Victoria-street; St. Mary's mansions, Paddington; Brook-street-mansions,

anover-square, W.; No. 9, Cavendish-square. Various hotels—Badminton Club, Piccadilly; Naval and Military Club Chambers, Piccadilly; Burlington Club; The Metal Exchange, E.C.; numerous churches, schools, private houses, etc. Mr. Boyce, in addition to being a contractor, was also one of the largest owners in London, and was chairman and director of several property companies.

Mr. STANFORD—Mr. Edward Stanford, Geographer to the Queen, died at his residence in Sidmouth a few days ago, in the twenty-eighth year of his age. Mr. Stanford, who succeeded the late James Wyld, of West Strand and Charing Cross, as Geographer to the Queen, founded the well-known business of "Edward Stanford"—sellers and publishers of maps and geographical and topographical works, and sole agents in London for the publications of the Ordnance Survey; retired from business some years ago. The firm removed from No. 55, Charing Cross, on the completion of their present premises, Nos. 26-7, Cockspur-street, in 1889, erected for them upon the site of the British Coffee house, after designs by Mr. Thomas Barnes-Williams, which were illustrated in the *Builder* January 12, 1889. Those premises having been purchased by the London County Council for purposes of their staff in 1901, the firm selected additional premises at Nos. 12, 13 and 14, Long-street, as their chief establishment for the housing of their complete stock of the Ordnance maps, transferred their general (not geographical) bookelling and stationery departments to Messrs. Hugh Reed, of No. 124, Pall Mall, and, having removed the front shop in Cockspur-street, retained it as a place of retail business for the sale of their own publications as well as of maps and geographical books.

GENERAL BUILDING NEWS.

RESTORATION SCHEME, BERWICK PARISH CHURCH.—A commencement has been made in the scheme for the enlargement and restoration of the parish church. The architects are Messrs. Hicks & Charlewood, diocesan architects, Newcastle, and the main features of the improvements are:—(1) The entire removal of the existing north and south gables; (2) the construction of an organ chamber on the north side of the chancel, and removal thereto of the organ; (3) rearrangement and extension of the west gallery, consequent upon the removal of the transept, with a new staircase and additional vestry; (4) provision of a new system of heating and ventilation. The total number of sittings in the remodelled church is to be 354. The work has now begun on the construction of the organ chamber. The contract for the improvements is in the hands of Messrs. J. & S. Sons, masons, Berwick.

CHURCH, LINCOLN.—A new church was consecrated at Lincoln on the 5th inst. by the Bishop of Lincoln. The new Church of All Saints consists of a nave, with north and south aisles, chancel, with transepted organ chamber on its south side, and a transept on the north, with a choir vestry opening out of it, and a sacristy outside the east end of the chancel. A stained-glass window has been placed in the east end by Messrs. Clayton Bell. At the west end, under the three towers, is a font, carved in red stone, and opening on two steps. A large organ is being built for the church by Messrs. H. & S. Sons. Externally the church is of red brick, with Bath stone dressings, while the faces of the walls are plastered. The roofs are covered with red tiles. The contractors for the church were Messrs. Otter & Sons, of Lincoln; Messrs. Bowman & Sons, of Bedford, for the oak work; Mr. Milburn, of York, for the font and carving; Mr. C. Gory, of Lincoln, for the electric lighting; Messrs. Richardson & Co., of Darlington, for heating; Messrs. Laidlors, of Durham, for brass standards; and Messrs. Patterson & Co., of Durham, for altar frontals, hangings, and other textile fittings. Mr. A. Gordon Clerk of the works, and the architect was Mr. C. Hodgson Fowler, F.S.A., architect, Durham.

CONGREGATIONAL CHURCH, NEWLAND, HULL.—Foundation-stones were laid a short time ago of a new Congregational church, which is being built at Newland. The building is intended to provide 803 sittings, 634 in the body of the church and 169 in the gallery. The church vestries, with a church parlour, and a school, will be provided. The total inclusive of all charges, is estimated at £12,000. Mr. J. H. Messers, Bowman & Sons, of Bedford, are the contractor for the work, the architects being Messrs. G. & S. Porritt, of Manchester.

MEMORIAL CHAPEL, TOTLAND, ISLE OF WIGHT.—A memorial Bible Christians are erecting a memorial chapel at Totland Bay. Mr. S. E.

Tomkins, of Newport, is the architect, and Messrs. J. Ball & Son, of Cowes, are the builders. The chapel will be built of Swage stone and Bath stone dressing, and have a length of 55 ft. and width of 36 ft. The height to the walls will be 22 ft. 9 in., and to the apex of the roof 46 ft. The pitch-pine pews are to seat 260 worshippers. The rostrum, behind which is to be the choir gallery, will be constructed of pitch-pine. The minister's vestry and the stewards' vestry will be situated on each side of the rostrum, while at the entrance to the building there will be a vestibule with granite columns.

SYNAGOGUE, NEW CROSS-ROAD, LONDON.—The new South-Eastern Synagogue in the New Cross-road will provide accommodation for 200 men and 150 women. The building cost £5,000. Mr. Delissa Joseph and Mr. C. P. Roberts were the architect and builder respectively.

SCHOOL, LOUGHBOUGH.—Upon the site of the Cobden-street Board Schools, Loughborough, which were partially destroyed by fire about a year ago, has been erected a new school. At the new school accommodation is provided by a two-story building on the Cobden-street frontage, the girls being allocated to the ground floor, and the boys to the first floor. The accommodation provided in the new building is for 300 girls and 300 boys, while the classroom formerly belonging to the girls' school has been restored and added to the infants' department. The building consists of five classrooms on each floor, each classroom arranged on either side of a corridor, 10 ft. wide, and extending from end to end of the building. The two classrooms in each department are divided by removing partitions, so as to be thrown open into one. Separate sitting-rooms for teachers are provided. The floors and staircases of the building are of fireproof construction, but in order to avoid any risk of fire an iron staircase is provided on the outside of the building, approached from the main corridor by a door fitted with panic bolts. An additional exit has been made for girls upon the ground floor. The floors of the classrooms and corridors are covered with maple boards, and the walls are plastered and lined to a height of 4 ft. with glazed tiles. All the woodwork is in pitch-pine. The staircase floors, cloak-rooms, etc., are of concrete stone. Messrs. Clark & Sons are the contractors, and Messrs. Barrowcliffe & Alcock the architects.

SCHOOL, WEST HARTLEPOOL.—On the 2nd inst., at West Hartlepool, the foundation-stones were laid of a new school situated in Elwick-road. The new building, which will be utilised for the purposes of higher grade education, will be a three-story erection with two-story wings. Accommodation will be provided for 1,200 scholars, divided equally into senior and junior boys' and girls' departments. The third story will provide accommodation for science teaching, and will include a lecture-room, with gallery, and demonstration table, and preparation-room. Over the boys' playshed a room will be provided as a workshop, equipped for instruction in manual work. The building will be lighted by electricity. The school has been designed by Mr. Richard Holt, of Liverpool, and the contractors for its erection are Messrs. T. Beetham & Son, West Hartlepool. The total estimated cost of the new school is £21,041.

COUNCIL SCHOOLS, BROOMHILL, NORTHUMBERLAND.—The new schools at Broomhill, which have been erected by the Northumberland County Council, were recently opened. Mr. J. W. Douglas, architect, designed the buildings, and the contractors were Messrs. R. Carse & Son.

PAROCHIAL BUILDINGS, ST. SILAS'S, BYKER.—The foundation-stone of St. Silas's new parochial buildings at Byker was laid on the 2nd inst. The new buildings are situated at the corner of Roder-street and Heaton Park-road South. They will contain two large halls, on the first and second floors, with classrooms, etc. The total cost will be 2,500. Mr. A. B. Plummer, Newcastle, is the architect, and Mr. J. L. Miller, North Shields, the contractor.

ST. JAMES THE LESS, BETHNAL GREEN.—The medical mission-house was opened recently, after plans and designs by Mr. E. Hoole. The building, situated within the grounds of the church, includes two consulting-rooms, two dressing-rooms, a waiting-hall, surgery, etc., and the mission will be served in connexion with the Ridley Hall, now in course of being built.

WESLEYAN MISSION CENTRAL HALL, SHEFFIELD.—At a meeting of the Wesleyan Mission Committee, which was held on the 4th inst. at the Norfolk-street premises, Sheffield, the amended designs for the new central hall, on the site of the Norfolk-street chapel, which had been

prepared by Messrs. Waddington, Son, & Dunkerley, were submitted by the Plans Committee. On the proposition of Mr. S. Meggitt Johnson, seconded by Mr. Albert Heath, it was agreed that the plans, as amended, be now accepted by the committee.

FREE LIBRARY, SANDOWN, ISLE OF WIGHT.—The free library, which is to be erected at Sandown, will have a frontage to High-street of about 57 ft., with a little more than that to Victoria-road. A tower, 42 ft. high, is over the main entrance, which will be at the corner. The building will be of white bricks, with slated roof. On the High-street side will be the reading-room, 31 ft. 6 in. by 18 ft., and 14 ft. in height, with a side recess. On the Victoria-road front will be the lending library, and reference library behind. A corridor, 6 ft. 6 in. in width, extends the entire length of the Victoria-road part. Upstairs there is a committee-room, 31 ft. 5 in. by 19 ft. This, it is hoped, may in time develop into a museum. The ladies' room measures 19 ft. by 12 ft. On this floor also will be found the domestic offices for the curator. In the tower provision has been made for the accommodation of a sundial recorder. Mr. E. James, of Binstead, is the builder, and Mr. J. Newman is the architect.

PROPOSED WESLEYAN COLLEGE, BRISTOL.—A new Wesleyan college is to be erected on a site in Hampton-road, Bristol. On the ground floor, besides the entrance hall, will be the inner or staircase hall, common-room for students, library, and dining and assembly hall, which will be carried up the height of two floors and surrounded by a gallery. At the rear of the hall will be the buttery, kitchens, pantries, and rooms for the house-keeper. A committee-room will also be provided, and the necessary cloakroom and lavatory accommodation. The staircase leading to the first floor is in oak, and on this floor are two large lecture-rooms and one smaller one, the gallery of the hall being also reached from this level. Adjoining the college and communicating with it will be the residence of the principal, which will face and be approached from Cotham-road. Bath stone in random courses will be used for facings, with Gloucestershire stone slates for the roof, the stone mullioned windows being glazed with lead lattice panes. The interior will have floors of wood block, some of the rooms being finished with oak panelling. The buildings, in addition to open fireplaces in the principal rooms, will be heated on the low-pressure hot-water system. Mr. H. Dare Bryan, architect, has prepared the plans for the work.

FREE LIBRARY, SALISBURY.—The Mayor of Salisbury (Mr. C. J. Woodrow) laid the foundation-stone recently of the new free library building. The entrance will be at the left hand, or western side, of the front by means of a vestibule, 11 ft. wide, opening on the hall and staircase, which, together, will be 19 ft. wide. The staircase leading to the reference library will be of artificial stone, with iron balustrade. The lending library will be 29 ft. by 30 ft., and will be separated from the hall by a glass screen and the librarian's counter. At the back end of the hall access will be obtained to the reading-room, which will be 61 ft. by 32 ft., and is to be lighted by means of two large lantern lights in the ceiling. Between the lending library and reading-room will be placed the librarian's office, provided with glass sides, so as to command nearly the whole of the ground floor of the premises. On the first floor the reference library will be 40 ft. by 26 ft., and a ladies' room, 17 ft. by 13 ft. 6 in. The premises are to be heated with hot-water radiators, which will be placed in front of the fresh-air inlets. The total cost of the building will be 4,000. It has been designed by Mr. Alfred C. Botbams, and the contractors are Messrs. Harris Bros.

NEW BUILDINGS, LIVERPOOL UNIVERSITY.—Two new buildings for the University of Liverpool have just been opened—new medical buildings and the George Holt Physics Laboratory. The new medical buildings form an addition to, and in some respects a completion of, the equipment of the medical school of the university. It is now some years since the entire block of which they are a part was designed by Messrs. Alfred Waterhouse & Son, of London, and the present buildings have been carried out by Mr. Paul Waterhouse. A polygonal apse at the western angle is the outline of the two theatres—surgical and anatomical—the sloping seats of which are arranged over one another so as to avoid the possibility of loss of space. The basement room below these theatres is a polygonal laboratory. The building contains a professors' common-room, private rooms for the Dean of the Medical Faculty and the Professor of Anatomy, and certain storerooms and workshops,

but with these exceptions the whole of the contents are taken up with laboratories and classrooms, large or small. On the top floor there is, among other rooms, an operative surgery theatre. Special classrooms for materia medica, etc., are placed on the mezzanine between the ground floor and the first, in which the working benches are covered with enamelled iron tops. The external walls are faced, like the other buildings of the university, in ordinary local bricks, with dressings of red Ruaban bricks. The George Holt Physics Laboratory is built in juxtaposition with the new Johnston Bacteriological Laboratory, communicating with it on the external walls corresponding with those of that laboratory, being of common brick with broad courses of red brick and dressings of Storeton stones. The tower is provided for experimental purposes, and is open all the way down, with an electric lift to give access to any portion of it. It is also used for a water-tank. The ground floor of the building comprises an entrance hall, arranged under the high part of the seating of the lecture theatre. From the one side of the entrance hall approach is given to the professor's private room and research laboratory; from the other there is access to the junior laboratory and a classroom. Behind the theatre are placed the preparation-room and apparatus-room. On the first floor are a library, senior students' laboratory, standard-room, sound and light rooms, and dark-room. The second floor is devoted mainly to research for honorary students. A spectroscopic-room is also here, and there is access to an observatory. In the basement are an additional research-room for the professor, a furnace-room, workshop, liquid-air room, and a room for the use of X-rays. There are also a constant temperature-room and stores. The building stands on solid rock, and precautions have been taken to prevent vibration. Messrs. Willink & Thicknesse, of Liverpool, and Professor F. M. Simpson, are the joint architects.

INSTITUTE PREMISES, READING.—Lord Rosebery recently visited Redhill to open the new Colman Institute. The building includes a lecture hall, to be known as "King's Hall," capable of seating over 500 persons. The work has been carried out from designs by Mr. Hubert Gilford, at a cost of about 5,500l.

NEW WARDS, THE LONDON HOSPITAL.—The consecration and opening of four new Hebrew wards at the London Hospital took place on the 14th inst. The new wards are situated on the top floor of the west wing of the hospital, and provide accommodation for twenty-seven men and twenty-seven women. Each ward measures 72 ft. long, 21 ft. wide, and 12 ft. high, and has a sister's room, scullery, bath-room, etc., attached to it. The floors are finished with cement, while the walls throughout are lined with light green opalite. As the wards are constructed side by side—two of them running parallel to the other two—special attention has been given to the ventilation, which is obtained by raised lanterns in the roof along the back of the wards. A large kitchen—to be used exclusively for these wards—and scullery, which are constructed in the centre of the floor, with two wards each side of them, are paved with mosaic, the walls being tiled. A wide balcony is fixed round the south end of the building. The architects are Messrs. Rowland Plumbe & Harvey.

BOYS' BRIGADE HALL, WARLEY.—The 1st Warley Company have just erected new headquarters at Warley. The hall is 55 ft. long and 25 ft. wide, having small non-commissioned officers' room at the rear; the exterior elevations are of rough cast and local red brick, the brickwork inside is left perfectly plain, the woodwork throughout stained green. The heating is by beaten iron fireplaces on the "well fire" principle, and supplied by Messrs. Bratt, Colbran, & Co., the lighting being by Lucas' lamps; the floor is of pitch pine, laid by Messrs. Ellis, Geary, & Co., of London. This building was opened on the 10th inst. by Bishop Taylor Smith, with a silver key designed and presented by the architect, Mr. Hugo R. Bird. Mr. F. W. Burtwell, of Brentwood, was the contractor.

WESLEYAN CHURCH, WAVERTREE, LIVERPOOL.—A new Wesleyan church was opened on the 4th inst. in Elm Hall-drive, Penny-lane, Wavertree. The scheme comprises the erection of a church to seat about 300 people. Adjoining this site a school-chapel has been built at a cost of between 4,000l. and 5,000l., this being the building which has just been opened. The structure is of red Ruaban dressed brick, with Portland stone facings. The large hall will seat about 500 people, and there are vestries, cloakroom, classroom, a ladies' parlour, and other accommodation.

On the upper floor is a smaller hall, which will seat about 300 people. The construction of the building has been superintended by Messrs. Gilbert Fraser and Arnold Thornley.

POLICE STATION, STRADFORD, SUFFOLK.—The erection of the new police station at Stradford has now been completed. The work has been carried out by Messrs. E. Rumsey & R. Butcher, builders, under the supervision of Mr. Henry Miller, the County Surveyor.

STAINED GLASS AND DECORATION.

WINDOW, ST. GEORGE'S CHURCH, BRISTOL.—A large stained-glass east window has just been placed in the Church of St. George, Bristol, containing five lights and tracery. The centre light depicts the Crucifixion, the other four illustrating the Baptism of Our Lord, St. John, the Virgin, and The Supper at Emmaus. All the subjects are crowned with canopy work, angels with outspread wings appearing in the tracery, and at the bottom of the two outside lights. The work has been executed in the studio of Messrs. Percy Bacon & Brothers, of London.

SAVITARY AND ENGINEERING NEWS.

WATERWORKS, MAESTEG.—The new reservoir, which is being constructed by the Maesteg Council, is situated at the head of a valley on the mountain side at a spot known as Blaencwm-ceryn. The gathering area comprises about 200 acres, situated at the top of the mountain. An earthenwork impounding dam is being constructed across the valley to form a reservoir, with a storage capacity of 30,000,000 gallons of water. A puddle trench wall will be constructed through the middle of the dam, from the bottom of the puddle trench to within a few feet of the top of the embankment. An outlet tunnel is being constructed through the side of the hill, clear of the dam, through which the supply pipes will be carried, and also the sludge or wash-out pipe. A cast-iron water-tower will be erected from the bottom of the reservoir, rising above the highest water level, in which sluice valves will be fixed to draw off the water at different levels for supplying the town. The inner slope of the dam will be pitched with stones on edge, and the exit tunnel will be lined with brickwork all through. The actual water area will be 4½ acres. The scheme is the work of Mr. J. Humphreys, C.E., the Maesteg District Surveyor, who drew up the plans. The contract price is 29,000l., and the contractors are Messrs. W. Jones & Sons, Neath.

WIDENING OF UXTON BRIDGE, ABERDEEN.—Plans have been prepared by Mr. William Dyack, the Burgh Surveyor, for the widening of this bridge. The structure at present has a width of 40 ft., but when the proposed alterations have been carried out this will have been increased to 60 ft.

FOREIGN.

GERMANY.—The new exhibition buildings at Berlin designed by Herr Paul Jautschu will be finished on May 1, 1905, and are to open with an exhibition of the German Society of Artists.—The well-known inn "Zum Ritter" at Heidelberg, a Renaissance building of the year 1592, is to be restored under the direction of Herr Otto Lindle.—The Museum of Armoury at Munich, designed by Herr Meltinger, and built at a cost of 2,750,000 francs, is nearly completed.—The Diocesan Museum in connexion with the cathedral at Treves was opened on October 3.—An exhibition took place in October at the ancient "Red House," in Treves, of a collection of household furniture and utensils used by ancient inhabitants of the Saar, Biele, and Mosel districts; the collection was left to the town by Professor Kraus, a native of Treves.

AUSTRIA.—A "Peoples' Palace" is being built at Vienna, from the plans by Herr von Neumann; the building is to contain a large hall for dramatic representations, a concert hall to accommodate 200 persons, some small lecture-rooms, a reading-room with a library attached, a canteen, a club-room, and living accommodation for the officials.—The new chapel connected with the asylum of district XIII. in Vienna is to be designed by Professor Otto Wagner.—The Austro-Hungarian Bank at Buda Pest is completed; the building was designed by Herr Ignaz Alpar in Renaissance style, and was erected at a cost of four million francs.—The restoration of the cathedral at Salzburg, which was undertaken by Herr Josef Eigl in May, 1899, will be completed in the spring.—Herr German Wanderley, Professor of Architecture at the German State School, died at Brin on October 31 in his sixtieth year.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENT.—Professor Henry Adams, M.Inst.C.E., recently retired from the City of London College, where for thirty-five years he has been head of the engineering department; however, continuing his practice as a consulting engineer at 60, Queen Victoria-street.

IMPROVEMENTS, MANGOTSFIELD, GLOUCESTERSHIRE.—At the parochial office, Stapleford on the 28th ult., Col. Langton, M.Inst.C.E., conducted an inquiry concerning an application from the Warmley Rural Sanitary Council for sanction to borrow 800l. private street works in the parish of Mangotsfield and 400l. for the purposes of lighting in the parish. Details as to proposed works were given by the Surveyor, Mr. H. Bennett.

ANCIENT CROSSES AND HOLY WELLS OF CASHIRE.—The seventh of a series of papers "The Ancient Crosses and Holy Wells of Cashire," which have been prepared by Henry Taylor, F.S.A., the President of the Lancashire and Cheshire Antiquarian Society, held on the 11th inst. at the Cheshire Library. The paper was read by Mr. Taylor. It dealt with the Hundred of Salford. The inland position of this part of Lancashire, which consisted in the 14th Ages of wild, uncultivated moors, did not, Mr. Taylor said, tempt the monks to settle here, and consequently there were only a few institutions of this character in the Hundred of Salford—Kersal Cell and the Manor of Collymore. Among the ancient crosses in the hundred were those in the parishes of Manchester and Salford, destroyed in the first quarter of the 17th century, and both probably many times rebuilt in the course of time.

There were, besides a pre-Norman cross at other early sculptures at Bolton-le-Moors, a portion of a pre-Norman cross found on the banks of the Irwell near Eccles, and crosses at Bolton-le-Moors, Rochdale, Stretford, Ashton-under-Lyne, and in some other towns. In all Mr. Taylor collected information about thirty crosses in this hundred. The derivation of the word Salford had, he said, by some supposed to mean the ford over which was brought from the Cheshire mines, and his researches had led him to form a different conclusion. He considered that the word derived from the Anglo-Saxon *Sallow*—for in numerous instances throughout England the name Salford occurs (Tonbridge, in Kent) far away from salt and invariably in low-lying situations near marshy banks of rivers, where the word Salford in the ancient charters of Tonbridge was unquestionably derived from the willows, or poplars, which grow so abundantly on the banks of the Medway. In Lancashire instances of similar positions near Blackburn, Bolton, and Clitheroe. Again, leading down from Eccles market-place, where were ancient market crosses, Salter's-lane took one ancient ford over the Irwell at the very place where the shaft of a pre-Norman cross was found in making the Manchester Ship Canal. The shaft is now preserved in the Museum. "Salford" means the ford over the willow tree. Manchester had its name to which cripples were carried on horse or barrows, and it might be hoped that the sufferers were actually cured, miraculously or not. The site was in New Bailey-street bridge. A curious tradition of the tenacity of ancient customs to be found in John Byrom's "Memoirs" is there recorded how in times of dearth—as on the arrival of the Pretender in Chester—the people met for common mutual protection at the Manchester cross, and it was here—at the market of Manchester, Salford, and Bolton—that John Wesley preached to tumultuous multitudes in the middle of the eighteenth century.—*Manchester Guardian.*

MILTON MEMORIAL, CRIPPLEGATE.—A statue of Milton, standing at the entrance of St. Giles', Cripplegate, was recently unveiled by Lady Alice Egerton. Bas-reliefs in stone adorn two sides of the base, which is decorated on the east representing the expelling of Adam and Eve from the Garden of Eden, the Archangel Michael; while that on the west is of a scene from *Comus*. Mr. Montford was the sculptor, and Mr. Hammond the architect, of the monument.

WAR MEMORIAL, BTRY ST. EDMUND'S.—A memorial which has been erected at the entrance of the officers and men of the Suffolk Regiment who lost their lives in the South African war, was unveiled on

est by Lord Methuen, G.C.B. The monument stands upon the Cornhill, and it has been designed and executed by Mr. Arthur George Walker, sculptor, of London.

ST. ERIC'S CHURCH, NEWTON, CORNWALL.—New altar rails have been placed in this church. They are of XVth century Gothic design, and have been executed in oak by Messrs. Harry Hems & Sons, of Exeter.

THE SLATE TRADE.—A meeting of the Fossing Quarry proprietors was held on the 10th inst., and it was decided to continue the present prices and terms for 1905. The Cornwall Slate Quarry owners have not yet issued their lists for next year, but it is believed that uniform prices will be arranged for all the quarries working on the Bangor vein. This will have the effect of steadying trade, which has been rather disorganised the last few months.

Legal.

BUILDING OWNER AND ARCHITECT: QUESTION OF THE OWNERSHIP OF DRAWINGS.

THE case of Gibbon v. Pease came before Mr. Justice Ridley, sitting without a jury in the King's Bench Division, on the 15th inst., a motion by Mr. Henry Gibbon, of Kent House, Ealing, against the defendant, Mr. Charles Edward Pease, of No. 15, Clifford's-inn, E.C., for delivery up of certain plans, specifications, papers, and writings which the plaintiff alleged the defendant had wrongfully retained. There was also a claim for damages.

Mr. Danckwerts, K.C., and Mr. H. Gatehouse appeared for the plaintiff, and Mr. T. Kemp, K.C., Mr. P. B. Morle, and Mr. Simmonds for the defendant.

Mr. Gatehouse, in the absence of Mr. Danckwerts, opened the plaintiff's case. He said the action was brought to recover from the defendant, who was an architect, the possession of some plans, specifications, papers, &c. The defendant, in his statement of defence, set up that there was a custom in his profession which entitled him to detain the plans and other papers. The defendant also said that, in October, 1903, differences arose between him and the plaintiff with regard to the work and the claim of the defendant to the plans and other papers, and that, in November, 1903, the plaintiff paid, and the defendant accepted, a sum of money in satisfaction of all differences, and that the plaintiff's claim in this action was thereby satisfied and discharged.

Mr. Kemp said that his learned friend need not trouble himself with the second point in defence.

His lordship: Then the only question is whether the plans, etc., belong to the architect?

Mr. Kemp: Yes.

Mr. Gatehouse, continuing, said that the facts were these:—In September, 1902, Mr. Henry Gibbon, the owner of certain premises in the Queen's-road, Bayswater, was desirous of converting several of a row of houses, which were shops, into flats, and the plaintiff was introduced by a firm of house agents to Mr. Pease, and Mr. Pease was employed by the plaintiff as the architect for the purpose of carrying out the conversion of the shops into flats. A contract was entered into with a firm of contractors in October, 1902, and the work was proceeded with, and Mr. Pease did the usual work of an architect in preparing plans, specifications, and bills of quantities.

At this stage Mr. Danckwerts came into the court, and, by leave of his lordship, continued the opening of the case. He said that the question to be decided was a comparatively simple one from some points of view. The real question was whether an employer who employed an architect for reward to make plans for him, and to supervise the building operations, was entitled to have the plans paid for by the employer.

His lordship said he thought that matter had been settled in the case of Ebdy v. McGowan.

Mr. Danckwerts said he thought that the question in that case settled the point.

Mr. Kemp remarked that his contention would be that the facts in that case were to be different from the facts in this case.

Mr. Danckwerts, continuing, said that the plaintiff employed the defendant to do the work in question on the usual terms, and that the defendant should receive for his services 5 per cent. on the contract price. For the purpose of preparing the plans the plaintiff lent the defendant the original plans of the buildings, and the defendant was to return them to the plaintiff on the day on which they had been built. The contract with the builders was dated

October 24, 1902. His lordship would see that the plans which were then in course of being prepared by the defendant were made part of the contract. It was also a condition of the contract that the work should be carried out under the direction and to the satisfaction of the architect. Amongst other things water fittings had to be put in the premises. These fittings were put in, but the water company, not being satisfied with them, some question arose between the plaintiff and the defendant in that respect. The plaintiff, having employed a plumber in the neighbourhood to satisfy the water company, there arose a dispute as to what sum the defendant was entitled to. Eventually the defendant was paid his charges. In the meantime Mr. Gibbon had been asking Mr. Pease for the plans he had prepared for him, and the other documents belonging to him in the possession of the defendant. Mr. Pease refused, however, to deliver them up, and set up a claim to them. He (counsel) thought it was old law that when you employed somebody to do something for which that somebody was paid, it was an implied term of the contract that the result should belong to the employer. Mr. Pease apparently said no. He set up the defence of custom. The custom to be good must be universal, well known, and generally acted on. The Institute that looked after the interests of architects had, he thought, always accepted the ruling in Ebdy v. McGowan.

His lordship: I do not think I need trouble you further, Mr. Danckwerts. I say there is no custom. The architect is not entitled to plans I have paid him for.

Mr. Kemp said that the plans in question were probably not of value, but there was no doubt that this was a *bona fide* and honest dispute between two persons as to who was entitled to certain documents. The statement of claim was, of course, in *detinue*, and the plaintiff could not succeed unless he could prove that the various documents were his property. That was how the claim was based. If his lordship looked at the particulars, he would see what the plaintiff claimed.

Mr. Danckwerts said that the plaintiff would be satisfied if the defendant returned the signed plans he had prepared for the purpose of carrying out the work, and the specifications.

Mr. Kemp said he should be able to show that the defendant was employed by the plaintiff, not only as architect on the ordinary terms, but also as a quantity surveyor. As a rule the quantity surveyor was a person other than the architect. In many cases it was not desirable to employ the architect as a quantity surveyor. Different principles applied to the documents he prepared as quantity surveyor than to those he prepared as architect.

Mr. Danckwerts said he thought he could clear the ground on this point. What he wanted were the builder's priced lithographic bills and their day work sheets.

Mr. Kemp submitted that what the contract was, was this. The plaintiff being desirous of converting the shops into flats got into communication through another gentleman with the defendant. This gentleman saw the defendant and asked him to prepare certain drawings for the alteration of the buildings. That was done, and they were shown to the plaintiff. The plaintiff made certain alterations, and the result was that Mr. Pease was asked to reconsider the matter, and he prepared some more plans to be shown to the plaintiff some few days before the contract was ever entered into at all. These plans were shown to the plaintiff before there was any contract of employment. On September 9, 1902, Mr. Pease was appointed for the purpose of doing what? He was to have the ordinary fee of 5 per cent. on the contract price, and for that he was to do this:—He was to see that certain buildings were altered in accordance with certain plans approved of by the plaintiff, and after that was done, he submitted, with some confidence, that the plaintiff had got all he bargained for, and that was his claim in the action, and the plans would not belong to him at all. The next thing that happened was that, some few days afterwards, the defendant was employed as quantity surveyor at the ordinary charge. That came out of the pocket of the contractor. On this head all the plaintiff now claimed were the priced lithographic bills and the day work sheets. The priced lithographic bills were sent to the quantity surveyor entirely for his own use, and with these the building owner had nothing whatever to do.

His lordship said he should follow the ruling in the case of Ebdy v. McGowan

unless Mr. Kemp could show him that there was an express contract between the parties that the plans, etc., should belong to the defendant. If he did not do that he should hold that they belonged to the plaintiff.

Mr. Kemp said he hoped to establish a custom in the profession that the plans under such circumstances belonged to the architect. It could not be reasonably suggested that such a contract was an unreasonable one. The plans were prepared simply for the purpose of enabling the architect to see that the buildings were constructed in accordance with the approved design. If architects were bound to hand over these papers immediately at the conclusion of the work, they would be left in an absolutely hopeless position, and if they were attacked at any time they would be unable to protect themselves.

His lordship: Unless there is any contract to the contrary I say that the plans belong to the building owner.

Mr. Kemp: Well, I shall tender evidence of custom that, in the circumstances of this case, the plans and specifications and details are the property of the architect.

His lordship: I do not think I ought to receive it. I do not think there is any distinction between this case and Ebdy v. McGowan. I think that this is an attempt to break the law. You must make your terms if you want to keep the plans.

Mr. Kemp: Will your lordship grant me a stay of execution.

His lordship: What about the quantity surveyor documents?

Mr. Simmonds (after consulting with his client): We do not claim them. We will abandon our claim to everything but the plans and specifications.

Mr. Kemp said that those papers were quite enough on which to raise the question of principle. He asked for a stay of execution for three weeks, and if the defendant entered an appeal within that time, a stay until the hearing.

His lordship: Yes.

In answer to his lordship, Mr. Kemp stated that the defendant would undertake to hand over to the plaintiff the documents in question if the Court of Appeal affirmed his lordship's judgment.

His lordship said that on that understanding he would only give the plaintiff the nominal damages of 1s.

Judgment accordingly.

THE WIDENING OF QUEEN-STREET, HAMMERSMITH.

THE case of Parry v. the Metropolitan Borough of Hammersmith came before Mr. Justice Warrington, in the Chancery Division, on the 15th inst., on a motion by the Vicar and Churchwardens of St. Paul's Church, Hammersmith, for an interim injunction to restrain the defendants from enforcing the compulsory powers given them by Michael Angelo Taylor's Act, under which the defendants proposed to acquire a portion of St. Paul's Churchyard for the purpose of widening Queen-street, Hammersmith. The application was based on the ground that the defendants were not *bona fide* exercising their statutory powers for their own purposes, but for the purpose of assisting the London County Council compulsorily to acquire the land for the purpose of their Queen-street improvement.

It appeared that the London County Council, by an Act passed in 1902, acquired power to construct an electric tramway along, amongst other streets, Queen-street. The defendants opposed the Bill when it was before Parliament on the ground that Queen-street was too narrow for the purpose. Subsequently the defendants withdrew their opposition on the London County Council agreeing to widen the road if they could get the necessary consents. The defendants agreed to assist in obtaining the necessary consents, and to bear one-third of the expense of widening the street. To do this work of widening the street it was necessary for the London County Council to acquire a portion of the churchyard. As the County Council could not come to terms with the plaintiffs as to purchase of the land, and the County Council had no power to acquire the land compulsorily, they requested the defendants, in July, 1904, to put into force the powers they had under Michael Angelo Taylor's Act for the compulsory acquisition of the land required. On July 27 the Borough Council held a meeting at which a report from their Law and Parliamentary Committee was presented, the Committee recommending that the Borough Council should grant the County Council its aid by putting in force its statutory powers

under Michael Angelo Taylor's Act. The Borough Council passed a formal resolution agreeing to do this, and appointed the solicitor and valuer of the County Council to be the solicitor and agent of the Borough Council for the purpose of acquiring the land in question. The defendants served notice to treat on the plaintiffs, and ultimately the present action was commenced. The plaintiffs' case was that the adjudication of July 27 was void, as being *ultra vires*, and was a device for getting their property for the County Council, which deprived them of the right they had of appearing before the Parliamentary Committee and opposing the County Council Tramway Bill when they might have got the tramway route altered, or have obtained ample compensation for their land.

In the result his lordship refused the motion, holding that the plaintiffs had not shown any want of *bona fides* on the part of the Borough Council, who, in his opinion, were exercising the statutory power on their own behalf with a view of facilitating improvements which they thought desirable.

Mr. Spence appeared for the plaintiffs, and Mr. Norton, K.C., and Mr. Methold for the defendants.

ACTION BETWEEN PROPERTY OWNERS IN BERKELEY-SQUARE.

The case of *Hall v. Lewis* came before Mr. Justice Buckley in the Chancery Division on the 10th inst.

Mr. Astbury, K.C., and Mr. Ashton Cross appeared for the plaintiff, and Mr. Buckmaster, K.C., and Mr. Holmes for the defendant.

Mr. Astbury, in opening the case, said the action was brought by Mrs. Hall for the purpose of recovering damages for an injury she had sustained to her house, No. 2, Berkeley-square, by reason of damp percolating through from the adjoining premises, No. 3, Berkeley-square. The plaintiff was leasee for a term of fifty-five years of her premises. Defendant recently purchased and was now the lessee of the adjoining premises. His case was that defendant allowed water to accumulate in the basement of his premises and failed to keep it in, and it percolated through the lower part of the plaintiff's house. It had cost 89l. to put the matter right. Defendant had done some work, and the matter complained of had, it appeared, been stopped. An injunction had been asked for, but there was no necessity for that now, and they simply asked for damages. The damp had soaked the party wall and spread through to the plaintiff's floors.

Mr. Buckmaster: The Tyburn runs at the rear of these houses.

Mr. Astbury: I thought it was a mews there.

Mr. Buckmaster: The Tyburn is covered in now. I have seen leases on this property giving the right of fishing in the Tyburn.

In the result his lordship, after hearing evidence, said he had no doubt that at some period the soil of the houses was a water-bearing strata. But it was not proved that the defendant allowed water to accumulate in his basement. The owner of No. 3 had made his basement watertight. In his lordship's opinion it was not proved that the damp came from No. 3, and that was the only question he had to consider. To his mind the party wall sucked up the damp from the water-bearing strata, and that was how the mischief was caused. The plaintiff had not proved her case, the onus being upon her. The action would be dismissed, with costs.

LIABILITY ON PLASTERER'S CLAIM UNDER WORKMEN'S COMPENSATION ACT.

The case of *Evans v. Cook-Lancashire and Yorkshire Insurance Company, Ltd.*, third parties, came before the Court of Appeal, composed of the Master of the Rolls and Lords Justices Stirling and Mathew, on the 10th inst., on two appeals from the judgment of Mr. Justice Wills at the Nottingham Assizes.

The action was brought by a contractor against the defendant, a sub-contractor, to recover 84l. 5s. 3d. paid to a workman named Fraime who was in the employment of defendant, and who had been injured by an accident which arose out of and in the course of his employment. The plaintiff also claimed any other sums which he might pay to the workman down to the date of the judgment and a declaration that defendant was liable to indemnify him in respect of future payments.

It appeared that in July, 1901, plaintiff, under a contract, was constructing a workhouse infirmary at Nottingham, the defend-

ant entering into a sub-contract with the plaintiff to execute the plastering work necessary for the building. On July 9, Fraime, while at work on the plastering, met with an accident, notice of which was given both to the plaintiff and the defendant under the provisions of the Workmen's Compensation Act, 1897. The plaintiff immediately agreed to pay Fraime 15s. 9d. per week, being half his average weekly earnings, during incapacity. A year afterwards, the House of Lords having in the meantime decided the case of *Cooper and Crane v. Wright*, the plaintiff demanded repayment of the sums paid to the workman Fraime, and brought the present action against the defendant in the High Court. The defendant, then being insured against liability under the Workmen's Compensation Act, 1897, with the Lancashire and Yorkshire Insurance Company, brought that Company in as third parties, claiming an indemnity from them. The Company contended that the plaintiff had no right to sue the defendant in the High Court, but was bound to take proceedings for arbitration under the Act of 1897, and that therefore, as the defendant was not liable in the action, the Company were not liable. Mr. Justice Wills, however, held that the action was maintainable, and gave judgment for the plaintiff for the 84l. 5s. 3d., and for a further sum, calculated at 15s. 9d. per week from the date on the writ up to the date of the judgment. His lordship also made a declaration that the defendant was liable to pay to the plaintiff such sums as the plaintiff might be liable to pay to Fraime under the Act in respect of the accident. He also entered judgment for the defendant against the third parties for payment of the amounts in question to the defendant. Hence the present appeal of the Insurance Company and the defendant, the latter served notice of appeal at the request of the Insurance Company, so that the whole case might be before the court.

Mr. Hugo Young, K.C., and Mr. J. D. Crawford appeared for the Insurance Company, Mr. W. Wills and Mr. T. T. Blyth for the defendant Cook, and Mr. Stanger, K.C., and Mr. McCardie for the respondent on the appeal (the plaintiff).

Mr. Hugo Young contended, on behalf of the Insurance Company, that the action was not maintainable in the High Court, the whole scheme of the Act of 1897 being that all claims thereunder should be decided by arbitration.

In the result their lordships, without calling upon counsel for the respondent, held that such an action as the present was maintainable, and dismissed the appeals, with costs.

PATENTS OF THE WEEK.

APPLICATIONS PUBLISHED.*

25,374 of 1904.—H. C. MICHELL and D. S. MICHELL: *Manufacture or Production of Material Suitable for Use as a Non-conducting Covering for Steam Pipes, Boilers, and other bodies.*

A non-conducting material composed of or containing flake mica, consisting of a binding material such as clay that is normally dry, and is capable of forming a plastic binding agent when mixed with water, and fibrous material, for example, asbestos fibre, the mica and fibrous material being more or less uniformly mixed together, and the binding agent being more or less uniformly distributed amongst and firmly attached to the flake mica or flake mica and fibrous material so that it will not become readily detached therefrom during transport, and so that upon addition of water to the mixture the latter can be readily formed into a plastic mass.

27,488 of 1903.—R. A. BREARE: *Hoists.*
This invention relates to a hand-operated hoist, applicable mainly for the transport of light articles, at comparatively high speeds, between the various floors of shops, warehouses, and other buildings. In constructing this hoisting apparatus a suitable counter-balanced cage is employed suspended by means of a rope fastened over a grooved pulley, which is keyed on to the main shaft of the apparatus. This shaft carries a two-compartment drum which is arranged on the free wheel principle, that is to say, the drum is adapted to rotate freely upon the shaft independent of the motion of the shaft itself. Upon one compartment of the drum is wound the hand rope for actuating the hoist, whilst the other compartment carries a counter-weighted rope wound in the opposite direction. The aforesaid shaft carries also a pair of ratchet wheels

keyed thereon, one on each side of the drum, one of these ratchet wheels engaging with a travelling pawl carried by the drum, and the other engaging with a stationary pawl forming an independent support. A trip bar is provided by which the two pawls may be released from their respective ratchet wheel by the rope which actuates the said trip bar being connected also to a suitable band or

27,727 of 1903.—J. S. GABRIEL: *Treaders, Stairs, Floors, and the like.*

According to this invention a tread for a floor, and the like consists of a metal plate having grooves in it to receive bars, lead, or the like, the bases of which are formed to fit the grooves in the plate. The spaces between the bars are filled with cement or other similar substance which, with the bars, forms the top of the tread. Preferably the grooves are of dovetail section, and the bases of rail section, and made in short lengths. Preferably also the base plates are provided with vertical longitudinal flanges on one or both edges of their upper faces. By means of a durable tread is provided that can be easily constructed and easily broken when it is desired to repair it.

27,853 of 1903.—W. WILLIAMS and F. COLLINS: *Means for Securing Door and Handles to their Spindles.*

This consists in securing door and like handles to their spindles by means of a baffle plate the like made in two portions, and adapted when in position and fixed to the door to engage a groove or flange in or on the end of the handle.

27,908 of 1903.—J. H. J. B. PITTER: *A Combination Household Dust Bin or Receptacle or Receptacle and Sifter.*

A combination household dust bin or the closed receptacle and sifter, comprising a receptacle with means to close same, a cylindrical volute or nautilus or similar-shaped reticulated cage, sieve, or sifter arranged and adapted to be revolved or reciprocated around a shaft or axis horizontally disposed thereabouts in said receptacle, and means to revolve or reciprocate said cage, sieve, or sifter from the exterior of the receptacle.

28,128 of 1903.—J. H. DOUGLAS: *Construction of Hinged Window Sashes.*

This relates to windows, and consists in use of hinges which permits of the lower sash being raised, and, when thus raised, provides means for pivoting or supporting such sash so that it may be bent inwardly.

28,141 of 1903.—FRASER & CHALMERS, LTD., F. L. WHITMORE: *An Adjusting Link for Hoisting Cages, and the like.*

An adjusting link for hoisting cages, and the like, comprising three plates, one of which having transverse grooves or slots on its sides, corresponding projections or ridges on the inner surface of the other plates, bolts or slots in all the plates for enabling them to be bolted together, and a hole or holes in the plates for connecting to a part or attachment.

14,593 of 1904.—A. BOWMAN: *Casement Fasteners.*

This invention relates to casement fasteners, and commonly known as "cockspur" fasteners, in their various kinds. The main object of this invention is to provide a fastener of the above-named type, which can be readily adapted for use either upon a right- or left-handed casement. To adapt the fastener for use on a right and left handed casement, it is constructed in the following manner:—The short arm or tongue of the fastener which engages with the hook or ratchet plate on the casement frame, is separated from the handle part, and the latter will fit on the inner surface of the ratchet plate in either room in use. The upper part of the handle is connected to the aforesaid short arm or tongue, at right-angles or approximately the same, by passing it through a vertical hole in the short arm, the upper part of the handle projecting above the top of the eye.

18,142 of 1904.—C. W. HUNT: *Hoisting Apparatus.*

A hoisting apparatus, consisting in the combination of two drums loosely mounted on an equalising gear in operative relation to both drums, means to apply power to the equalising gear, a brake for said equalising gear, and an independent motor operable independently of the said means to apply power to one of said drums.

18,143 of 1904.—C. W. HUNT: *Hoisting Apparatus.*

A hoisting apparatus, consisting in the combination of an equalising gear, two drums mounted on axes independent of the equalising gear, loosely mounted baffle gear

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

engagement with said equalising gear, transmitting gearing between the baffle gears and said drums respectively, and means to apply power to the equalising gear.

18,278 of 1904.—B. E. BEHTLE: Method of and Apparatus for Drying Bricks and other articles.

A dryer, consisting in the combination, a hot-air flue having a top opening, means to support a row of brick stacks along said opening, and a fabric hood or covering along said row of brick stacks, said covering formed in sections, each section comprising a top framework, the fabric extending over the framework and having depending curtains.

3,902 of 1904.—E. R. PALMER: Automatic Flushing Siphons.

An automatic flushing siphon wherein by giving the connecting bend of the discharge limb and seal a rising gradient or curve from approximately where it leaves the vertical portion of the seal, the foot of the air column when on the horizontal plane which it reaches is just before escaping through the seal, is caused to extend beneath practically the whole length of such bend to close to the commencement of the vertical rise of the seal, and is increased in area.

10,172 of 1904.—M. D. HELFRICH: Water-closet Bowls.

This consists in constructing a closet bowl with a trap seal whose passage or outlet is of uniform area throughout, a main supply passage leading to the trap seal on the opposite side thereof from its outlet or discharge, said main supply passage being of uniform area in cross section to the water line of the trap seal, and gradually diminishing in area from said water line to its communication with said seal, and having a hollow rim and a passage opening upwardly from the main supply passage to and opening into the said hollow rim.

2,726 of 1903.—C. E. LIVESAY: Means or Apparatus for Admitting Water from Rivers and other Waterways into Hydraulic Works.

A dock connected to a river through an entrance lock, the means for admitting water to the dock as the river rises consisting of paddle wheels, or other suitable positively-operated devices that draw water from the river and deliver it into the dock to prevent low through the entrance lock, whereby the channels conveying the water can be fitted with appliances to prevent or impede the ingress of the greater portion of silt.

6,655 of 1903.—C. H. ROBOTTON: Apparatus for Making Artificial Stone Blocks.

A hinged or pivoted platform vibrated by revolving cam wheels, and supported by eccentric means, whereby the amount of vibration may be regulated.

7,328 of 1903.—J. TAYLOR: Ventilating Buildings, Vessels, and other Confined Places.

A method of and apparatus for ventilating buildings, vessels, and other confined places, consisting principally in combining with a main horizontal feed pipe connected with a revolving fan, or the like, of horizontal arms extending therefrom, and having pendant pipes at their extremities, the lower ends of such pipes being closed by means of a cap or disc of larger diameter than the said pipes, and the latter being perforated with small holes above such caps or discs.

7,479 of 1903.—A. BROWN and H. G. CLARKE: Apparatus for Drying, Heating, Coaling, and Mixing Granite, Slag, Stone, or other Materials with Tar, or the like.

According to this invention the body of the apparatus may be constituted of a fixed cylindrical chamber set in an inclined position, on the underside of the lower end of which is a furnace-box. Above this chamber is a tank made preferably in the form of a saddle to fit in or form part of the wall of the chamber. The tank which is for holding and heating the tar or the like material, is preferably situated above the fire-box, and is made of any required capacity; it may also be divided by a partition into two compartments.

8,716 of 1903.—H. L. DOUTON and W. DENNISON: Making Moulds for Casting Baths, Cisterns, and similar articles.

This invention relates to moulds for casting baths, cisterns, and similar articles. Hitherto, in moulding a bath, a loose pattern has been employed, the procedure being to place the pattern on a flat ramming-up board, the latter being inverted. A box is then placed over the pattern, sand placed therein, and rammed upon the pattern, the box part and pattern being then turned over, and any excess part placed on the top of the sand being filled into the hollow of the pattern

and forming the core for the bath. When the core is formed the two box parts are turned over again, one of the box parts being lifted away from the other, the pattern withdrawn, and the box placed together again ready for casting.

483 of 1904.—L. W. CROSTA: A Joint for Sanitary Tubes, Conduits, and the like.

This consists in the combination with an ordinary earthenware or similar pipe socket of a joint ring, the inside of which is so formed as to provide two bearings for the spigot end of the inserted pipe to rest upon for forming a true invert.

3,351 of 1904.—T. MACHARACEK: Scaffolding.

A scaffolding frame, for use in working on house fronts, with sockets let into the wall of the building for fixing the frame supports, the distinguishing feature being that rods are employed as frame supports, the free ends of which are connected together either directly or with the aid of couplings through the medium of rods adjustable by means of tension fastening devices, the rods being thus crosswise strutted one with the other, and suspended against the wall of the house.

19,055 of 1904.—O. MESS: Floor, Wall, Ceiling, and other Coverings.

A floor or wall covering, consisting of a foundation of suitable material, a superposed layer of an oil containing cement composition, and a surface layer of wooden blocks united to the intermediate layer and to each other by a suitable wood cement.

19,671 of 1904.—W. L. CALDWELL: Paving Lights, and the like.

A paving light glass of arch form, constructed with a tread portion, locking tongues or shoulders spaced from the tread portion, a supporting base portion, and a plurality of prism portions projecting beneath the tread portion, the reflecting faces of the prism portions extending at different angles with relation to the tread surface.

20,018 of 1904.—T. W. RIDLEY, J. TAIT, and J. D. WILLIAMSON: Slag or Scoria Bricks or Blocks, and the Method of and Apparatus for Manufacturing the same.

A mould for casting slag bricks, consisting of two parts hinged together, one of the parts being slotted to receive the hinge pin so that lateral as well as radial movement of the part and pin relatively to each other is possible.

20,245 of 1904.—A. JACQUES and H. JACQUES: Waterproof Inlaid Floors.

Waterproof inlaid floors, characterised by individually-formed panels or slabs, each one consisting of several plank sections arranged lengthwise side by side provided on their underside with dovetailed grooves, and connected by means of transverse planks having dovetailed projections fitted into said grooves, the underside of each slab being coated with a thin layer of waterproof material, upon which is poured subsequently a strong layer of concrete, or the like.

20,250 of 1904.—J. W. HAYWARD: Glass Facings or Face Plates for Bricks, and the like.

A glass facing plate for bricks, provided with a rib of uniform thickness lengthwise on its back near each edge, and said ribs inclined laterally and terminating back from the end of the facing, thus leaving a narrow-ribbed portion at each end of the brick.

20,257 of 1904.—V. LION: Parquetry.

A member or element for parquetry, characterised by the connexion of the plates by means of screws upon dovetail cross-pieces, and by flat iron bars arranged diagonally relatively to the plates, upon the cross-pieces connecting them.

20,251 of 1904.—W. C. HARDER and C. W. ANDREWS: A Metal Sheet Piling.

This invention has for its object to provide beam piling sections in which the interlocking features necessary in holding the sections loosely together when assembled in a wall structure, is made an integral part of the piling sections which are duplicates of each other, and dispense with the use of a separate locking means mechanically secured to the beams.

SATURDAY, NOVEMBER 26.

The Sanitary Institute (Sessional Meeting to be held at the Guildhall, Nottingham).—Discussion, to be opened by Dr. P. Boothby, on "Present-day Aspect of Conservancy Systems." 11 a.m.

TO CORRESPONDENTS.

B. C. (MS. and diagrams received).

NOTE.—The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples, sent to or left at this office, unless he has specially asked for them.

Letters or communications (beyond mere news items) which have been duplicated for other journals are NOT DESIRED.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

We are compelled to decline pointing out books and giving addresses.

Any commission to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject if unsatisfactory. The responsibility of the author of a proof of an article in type does not necessarily imply its acceptance.

All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

PRICES CURRENT OF MATERIALS.

Our aim in this list is to give, as far as possible, the average prices of materials, not necessarily the lowest. Quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

BRICKS, &c.

Hard Stocks	£ s. d.
1 14 0 per 1000 alongside, in river.

Architects' Drawings.

CASE, fully reported in our last issue, in which an architect was compelled by the Court to hand over his drawings and specification to his client, furnishes the latest instance of the application of the ill-starred precedent of "Ebdy v. M'Gowan," which for the present is held by judges to decide the law as to the ownership of an architect's drawings, and to compel him, contrary to reason, equity, and commonsense, to hand them over to his client if the client demands them. In the case referred to the learned judge refused even to listen to the evidence of architects who were there as witnesses to support the defendant's claim. And of course, according to our wonderful system of English law, whereby a case is decided not on the consideration of its own merits but on the consideration of what was the ruling of some other judge in some previous case—inasmuch that, as an eminent judge declared on a celebrated occasion, "he did not sit to administer justice but to administer the law"—a judge will naturally hold that he has no other course than to give a judgment according to the existing precedent. If, however, the judge in this case had had the whole argument before him—if he had been willing to hear what the witnesses for the defence had to say—he might have realised, what lawyers in

general do not seem to be aware of, that "Ebdy v. M'Gowan" only covers one half of the field; that it was not on all-fours with the case he was trying, and therefore was not rightly applicable as a precedent. "Ebdy v. M'Gowan" was one of those cases in which the building was not carried out; only the drawings were made. Professional custom in such a case has undoubtedly sanctioned the handing over the drawings to the client, on the ground apparently that otherwise the client gets nothing for his money. Admitting that for the moment (we will return to the point just now), it is equally certain that professional custom is that in the ordinary case, where a building has been carried out from an architect's drawings, the drawings are retained by the architect. It is very seldom indeed that they are even asked for by the client; the case heard last week is quite exceptional. If the witnesses for the defence had been heard, this professional custom would have been established; and the law, to do it justice, has generally attached some weight to evidence of professional custom. But the judge refused to hear any evidence, and thereby lost the opportunity of supplying a new precedent from his own ruling, in a case which, as we have pointed out, is different in its circumstances from that of Ebdy v. M'Gowan. "This was looked for at his hand, and this was banked."

The whole difficulty arises from the fact that judges and lawyers generally apparently cannot be got to understand what an architect is and what he is really

paid for. He is *not* paid for making drawings; drawings are not architecture; he is paid for devising and carrying out a building, and, in cases where the building is not merely utilitarian, for producing artistic expression in architectural form. He cannot, like a sculptor, produce his work with his own hands; a building has to be carried out by many hands; and his drawings are the means of conveying his idea to the minds of those who are to carry it out. In principle, the client has nothing whatever to do with them; they are simply the architect's tools. There are even circumstances in which they may be dispensed with altogether. Pugin used in some instances to carry out a church without any formal drawings; he always employed the same builder, who understood his slight sketches. There are architects who hardly make any details in the office; who sketch them on a board or on a wall at the building. There are other architects, very clever men too, who affirm that the production of designs by drawings has taken the life out of architecture. We do not agree with them, or at least we say that their position is an impossible one for the present day, because the intricate requirements of large modern buildings cannot be adequately provided without considering them on a carefully drawn-out plan first. But the fact that there are able architects who hold this view should go to show, at least, that drawings are not really what an architect is engaged for. The lawyers have got hold of the subject entirely the wrong end first, but apparently nothing will

persuade them of it. In conversation with a solicitor in regard to this very case, we said, as an illustration, that you might just as well demand of a sculptor who had been commissioned to produce a statue, that he should hand over also whatever models or clay sketches he had made in the process of working out his conception. But the illustration was thrown away; our legal friend replied that if such a question came into court, he would probably have to give them up. Of course, after that, argument is useless. People who can say such a thing do not understand what art is, nor what is the position of an artist. But if such a judgment as that would not impossibly be given in an English court of law, we are well assured of one thing—it would never be given in a French court. In France the position and rights of the artist would be understood; in England they are not.

Apart from the illogical view of an architect's function which is taken by the law, the injury to him in demanding the handing over of his drawings is or may be a very grave and serious one. He has no guarantee that his ideas, which are represented by his drawings, will not be handed over in turn to another and perhaps quite inferior architect to make use of, or be made use of by the client himself to act as his own architect in carrying out other buildings. It leaves him, as the defendant's counsel truly said, "in a perfectly hopeless position; and if he is attacked at any time he is unable to protect himself." The same with the specification. The specification for a large building is a document summing up a great deal of special experience and special knowledge. The client pays for the application of that experience and knowledge in carrying out the particular building which he wishes to have erected, but for nothing more; he does not pay for having that experience and knowledge put into his own hands in perpetuity, to make what use he likes of it.

There is no doubt, however, that the difficulty and misunderstanding has been increased, to lawyers, by the custom which has been tacitly admitted by the profession in general, of giving up the drawings when the building is not carried out. As we said, that has no doubt been acquiesced in from a feeling that if plans and specification are supposed to represent half the architect's usual charge of 5 per cent. on the cost of the whole building, the client must have something for his money when the building is not carried out. In our opinion, the architectural profession has made a great mistake in admitting that custom. The client, as we said, comes to the architect to carry out a building, not (essentially) to make drawings of it. If, having given an architect a commission to carry out a building, he changes his mind, it is his own fault for not knowing his own mind. The reasonable and logical position for the architect to take up would be to say—"I have expended a great deal of time and thought in preparing the drawings for this building, which you have now abandoned; you must pay a reasonable charge for having wasted my time and

thought to no purpose." The charge in that case need not necessarily be the orthodox 2½ per cent. which is supposed to represent drawings and specification; it would be a charge based on circumstances, on the estimated value of the time and thought wasted; and even if the architect got rather less than what is usually charged for a building that is abandoned, his position would be a far better as well as a more logical one. He would at all events not be giving away the work of his brain at half-price for the client to make what use he pleased of it, which is the situation at present. And on the same grounds, if a man came to an architect and said "I want plans and designs of a building of such a nature" (describing its character and purpose) "but I do not mean to build anything at present, only I want to have the plans"; the reply we would give in such a case, and which we would recommend every architect to give, would be—"I should be most happy to carry out such a building for you whenever you have made up your mind; but I decline to hand over to you plans of mine to carry out as you please; my business is to produce buildings, not to make drawings for other people to make use of." If a few architects would have the spirit and independence to assume that position, it would do more than anything else to get rid of the mistaken ideas of the lawyers and of some clients, that the client pays for drawings and has a right to claim them.

But however mistaken the practice of the profession may have been in the case in which buildings are designed but not carried out, there can be no question that in that large majority of cases in which they are carried out, professional custom has always ruled that the drawings are the architect's—that they are his tools of trade, and that the client has nothing to do with them whatever; that this is the verdict equally of justice and commonsense; and that the law, based on a precedent which is at best only a one-sided one, is most unjust and injurious, and indeed almost insulting to the architect. He is told, indeed, that he may make it a provision in his contract with the client that the drawings are to remain his property. But, in the first place, to assume the necessity of making such a provision is to give up the whole principle we are contending for; and, in the second place, to make such a proviso in words is simply paving the way for discord. Do we not know perfectly well that in every case where an architect has a contentious and exacting client (and how many such clients there are architects know to their cost), the mere introduction of such a clause would be an immediate suggestion to the client to oppose it and to make it a bone of contention? And why should the onus be put upon the architect of making a special contract to secure what ought to be his by right and reason?

We are not making these remarks with any special reference to the case which has just been decided; we know nothing of either party to it, and have no personal concern whatever in regard to it. It is the principle on which it has been decided that we complain of; the mis-

leading and unfair precedent that has been established by law. We may have "*Ebdy v. McGowan*" either reversed or at all events confined in operation to the class of cases which it really covers. And in our opinion the newly-constituted "Board of Professional Defence" of the Institution of Architects ought to take the question up seriously, and, if judges and courts are deaf to them, approach Parliament with a view to procure an alteration of the law, which as it stands not only involves a gross injustice to architects but proceeds upon a totally wrong assumption as to what architecture is and what is the function of an architect. If the Board of Defence can deal with such a matter as that, we can see what was the use of its formation. And we may add that anyone who wishes to bring the subject before an authoritative tribunal may rely on any assistance which could be given him by the evidence of the editor of this journal, whose opinion on the *rationale* of such a subject I venture to think, be supposed to count for something—even with lawyers.

RURAL BUILDING BY-LAWS

THE agitation about the administration of the Building Acts, which may be said to have commenced with the case of *Till*, at Eynsford, has at last taken a practical form of a deputation to the President of the Local Government Board, very influentially attended. The objections urged by the deputation were that the by-laws governing the building of cottages were enforced by those having insufficient knowledge, (which is more serious) a personal interest in conflict with some of the principles of the undertaking the building of cottages, well as an inclination to magnify office by enforcing by-laws unsuited to the locality in a vexatious manner. The root of the evil seems to be that section 276 of the Public Health Act, 1875, the option is given to the Local District Councils in their discretion to apply the by-laws suitable to the urban districts to the rural districts. In reply of the President of the Local Government Board was highly sympathetic, but how far was it practical? The department has framed model by-laws for both urban and rural districts and with those by-laws, if applied in rural districts for which they were intended, we understand no cause of complaint would arise. The President stated, moreover, that the Local Government Board exercised its powers in correspondence to urge the local authorities to satisfy themselves that the by-laws were suitable to the districts in which they were to be applied, but that they could go further, and that the Department was not responsible for the constitution of local authorities. This reasoning hardly satisfies those who have a matter at heart. It is common knowledge that those who constitute the local authorities are not persons who could wield the unlimited powers of interference and obstruction conferred on them by the law as it at present stands, even apart from the question that in rural districts the councils are consti-

of persons having a direct interest in building schemes themselves, either as builders or as persons whose favourite investment is cottage property. The question to be answered is, how comes it that those responsible for the legislation in reference to local government have given bodies so constituted an unlimited discretion to apply by-laws to districts in which some of them are not appropriate? That is the point upon which the deputation were entitled to a more definite reply, and to an assurance that the Government would support an endeavour to obtain a reform of the law.

The æsthetic side of the question to most landlords and to all lovers of our countryside, is more important than the financial aspect. It is only necessary to regard the cottages erected by the district councils themselves to have some idea what the application of urban by-laws is doing for the country. In some absolutely pastoral districts are now to be seen rows of cottages suitable only to congested manufacturing districts. The cottagers are consequently herded together with no paving and with little contiguous back yards, and this leads, moreover, to serious danger in rural districts in time of epidemics. Where segregation is impossible, and where hospital accommodation is limited, as it always is in rural districts, these hlocks of so-called sanitary dwellings become a hotbed for infection. We think that a case has been made out for legislation on this question. The Local Government Board may be unable to control the action of the urban district councils, but it certainly should have authority to prevent them wielding inappropriate powers to the disadvantage of the rural community.

As Mr. Long observed in his reply, Sir W. Grantham seemed to complain not so much of the By-laws themselves as of the persons by whom they were left to be enforced. This is a complaint which applies to other than what are properly "Rural" districts. Any one who has studied, as we have, the various Reports made by medical inspectors to the Local Government Board in regard to the sanitary condition of Urban Districts, will have come again and again upon the complaint of the inefficiency of local sanitary and building inspectors, coupled with (and to a great extent explained by) the utter inadequacy of the salaries offered or paid. If building in rural districts is to be subject to official supervision, certainly it is a matter for serious complaint if the officials themselves are ignorant and inefficient. But we do not feel at all sure that the ignorance and inefficiency are all on one side. Sir William Grantham complains bitterly of the obstacles put in his way of building cottages as he pleased, and with such construction as he thought sufficient. But some of Sir W. Grantham's cottage plans have been published in magazines that have taken up the subject as a popular one; and we should say that they showed that the gentleman who devised them was very much in want of trained official supervision. They appeared to us to be ridiculous both as drawings and as plans, and we could feel no surprise that an official should say that he could not understand them. He may have been a very

incompetent official; be that as it may, a competent one would surely have equally disapproved of them. That landlords should be able to build cottages in a cheap manner is desirable, rather than that they should find it impossible economically to build them at all; but cottages of cheap materials require good planning as well as any others; and good planning is not a thing that "comes by nature," as Dogberry said of reading and writing.

The Model By-laws of the Local Government Board include a great many provisions which in their nature cannot apply to cottage-building in rural districts; but those which can so apply are not really so drastic or absurd as is represented. The practical prohibition of thatching is unnecessary for isolated cottages, and thatch is both a warm and a picturesque roof covering, and quite a suitable one for such buildings. In regard to the walls, the provision for the employment of "brick, stone, or other hard and incombustible materials," does not exclude, for example, cement slah cottages. And when the By-laws allow timber-framing only with the proviso that there shall be 4½-in. brickwork at the hack of it, is that so unreasonable? Any one who has ever stayed, in winter, in a country cottage with the walls formed of timber-framing with lath and plaster between, will probably be able to testify that it makes a remarkably cold abode. The provision, again, of a layer of concrete over the site, and of damp-preventing courses, is only a provision for things without which a cottage cannot be really healthy to live in.

The valid objection is to the imposition of hard-and-fast rules which may exclude constructions that are really quite adequate but do not come within the wording of the By-laws. Proposals for cottage construction should be judged on their merits, not on the wording of By-laws framed within too narrow limits. And if official authority is to be exercised, steps should be taken to ensure the appointment of officials who are competent to act. But we are by no means disposed to think that improvement would necessarily result from freeing well-meaning landlords from all official control, and allowing each one to build as he pleases. Well-meaning people sometimes make serious mistakes. And it is doubtful whether it would be a real kindness to rural tenantry to leave landlords to build cottages as they please, on the plea that (for economical reasons) they must have this or nothing. There are two sides to the question; and just at present it seems to be entirely the landlords' side which is evoking public sympathy. Leave us to build as we like, they say, and we will provide our tenants with homes. But will they be healthy homes? And are the landlords always safe, or indeed entirely disinterested judges on that point?

THE SURVEYORS' INSTITUTION.—The Council gold medal has been awarded to Mr. John Smith Hill, B.A., B.Sc.Lond. (Associate), for the best paper read by a member of the Institution during the session 1903-4.

RESTORATION OF THE PARISH CHURCH, PORTSMOUTH.—The restoration of the Church of St. Thomas à Becket, at Portsmouth, has now been completed, and the building was reopened on the 8th inst. The work has been carried out under the supervision of Mr. T. G. Jackson, R.A.

DRAINS AND SEWERS.

TWO most important decisions have been given by the Court of Appeal under the Public Health Acts on the ever-green question of drain or sewer. By the Public Health Act, 1875, section 4, "Drain" is defined as "any drain of and used for the drainage of one building only or premises within the same curtilage, and made merely for the purpose of communicating therefrom with a cesspool . . . or with a sewer into which the drainage of two or more buildings or premises occupied by different persons is conveyed." "Sewer" includes "sewers and drains of every description except drains to which the word 'drain' interpreted as aforesaid applies. . . ."

We have already in these columns drawn attention to the uncertainty which has been created in the law by this schoolboy method of defining a word by a repetition of the same word, and some of the cases under this section were set out by us in an article in our issue of June 27, 1903, in which it was shown that the liability could be shifted from the shoulders of the private individual and placed on the urban authority, even by an illicit connexion by a neighbouring owner with the drains of another house.

The present decisions deal, however, with the Public Health Acts Amendment Act of 1890, which has been the cause of considerable litigation. Section 19 of this Act has varied the above definition as follows:—"Where two or more houses belonging to different owners are connected with a public sewer by a single private drain, an application may be made under section 41 of the Public Health Act, 1875, and the local authority may recover any expenses incurred by them in executing any works under the powers conferred on them by that section from the owners of the houses." These powers are the abatement of nuisances arising from drains. Sub-section 3 provides that "For the purposes of this section the expression 'drain' includes a drain used for the drainage of more than one building." The two cases now decided by the Court of Appeal—Thompson v. Mayor of Eccles and Hardie v. Friern Barnet Urban District Council—arose on practically similar facts. A certain number of houses or blocks of houses, some of them in different ownership, were drained into a drain which was laid in private ground, and ran along the houses, and which carried their drainage into a main sewer. In the first case the owner of seven houses was being sued by the corporation in respect of work carried out by them in abating a nuisance from the drainage of one of his houses. In the second case the corporation were being sued by the owner of four houses to recover the expenses of work done at the request of the corporation. A great number of contradictory cases were cited to the court, and now we have at last a clear pronouncement of the law by the Court of Appeal, which comes to this, that where there is a drain laid in private property receiving the drainage of two or more houses belonging to different owners, not being a drain which any

member of the public has the right to use by connecting it with the drain from his own house, that is a single private drain within the section. This decision approves two decisions that have recently been decided by Divisional Courts—*Self v. Hove Commissioners* (1895), and *Bradford v. Mayor of Eastbourne* (1896), but of course leaves the anomaly created by the Legislature that when the houses are in the same ownership, but are separate buildings, then a similar drain is repairable by the urban authority—as in the case of *Travis v. Uttley* (1894).

In the second case a further point was raised that all the owners of the private drain should be served with notice and the expenses apportioned, but the court disposed of this contention, since in fact the nuisance had been localised by the urban authority as being upon the plaintiff's premises.

NOTES.

London Squares and Enclosures. THE Bill drafted by the London County Council for the prohibition of building on the gardens of squares and other specified lands in the administrative county of London relates to what we find are as many as 411 enclosures and spaces, which are bounded by roadways and occupied premises. The comprehensive scope of the measure may be estimated from the fact that it ranges from such open areas as that in front of the houses of Audley-square at the end of South Audley-street, Mayfair, to the gardens of all squares, crescents, terraces, and so on, and all such secluded enclosures as the gardens of our Inns of Court and the pleasure-grounds of Carlton-gardens at the rear of Pall Mall. The freehold of many of the railed-in enclosures appertains to the Bedford, Westminster, Lord Howard de Walden (formerly Portland), Portman, and other opulent estates. By way of inducing private owners to agree to the prohibition of building in the future, the Council offer to secure legislative exemption of the ground from any scheme of taxation in respect of land and site values, and, in addition, to take over lands into their own control and maintenance as "open spaces," or as may be otherwise agreed upon between them. The Bill will provide means for continuing an owner in his existing rights in the event of an equivalent area being set apart and brought within the operation of the intended Act. In a few instances the lands are automatically protected by the circumstance that it is well-nigh impossible to build upon them and at the same time to satisfy the requirements of existing statutory regulations; in some others the tenants of the surrounding houses possess under covenant certain rights as to user and enjoyment which enable them collectively to withstand encroachment upon the part of their landlords.

Railway Rates. A STATEMENT was made some weeks back to the effect that an advance of 1d. per ton had been made by the railway companies on the rates for conveyance of all coal brought into London by

rail. This provoked a perfect storm of indignant protest—out of all proportion to the amount of the impost. Consumers would suffer, the coasting trade would benefit (for coal would come by sea instead of by rail), and other far-reaching results were predicted. The mere mention of advances in railway rates affects some people in the same way as a red rag does a bull. It is the same with the word "foreign" when railway charges are under consideration. At a great meeting once held in the City to denounce the enormities of the railway companies, a printed form was produced headed "past foreign overcharges," which was held to prove that surreptitious allowances were being made in respect of foreign traffic. But, as a matter of fact, the objectionable document merely related to disputed charges on traffic from other English lines; for each railway company alludes to traffic from other lines as "foreign" (their own being "local"). We now notice, from an announcement in an official railway journal, that the 1d. per ton advance on coal is confined to five collieries only, and that the quantity of coal sent from these pits to London is very small. So much for this particular railway rates scare.

Ventilation of Railway Carriages. IN spite of various ingenious devices which have been introduced, the ventilation of ordinary railway carriages is best attained by the open window policy. This is extremely efficacious and generally quite comfortable for the happy person who sits next to the window with his back to the engine. But the occupant of the corresponding seat at the other end of the carriage often gets a draught, reflected from the opposite wall, down the back of his neck, and passengers facing the open window receive a strong blast in their faces. Thus it will be seen that the system results in the smallest benefit to the greatest number. On some Continental railways an attempt has been made to deal with the problem by providing a loose board which can be fitted into the window sash, so as to project at right angles from the outside of the carriage, and thus shield the window opening in some measure from the draught created by the rapid motion of the train. It has been suggested that a similar arrangement might be applied with advantage to all railway carriages of the old-fashioned type in this country. Unfortunately, there are practical objections to the employment of such a device. In the first place, it would be necessary to make the wind deflector a permanent fitting, and to fix one on each side of the window for use in either direction of the train. Then the deflectors would have to be hinged and provided with catches to hold them in the required position, and they would have to be provided with other catches to hold them flat against the outside of the carriage when not in use. Further, unless the width provided were at least from 6 in. to a foot, the maximum benefit would not be derived, and a width of even 6 in. would mean that the deflector, when folded back, must cover a portion of the side window, blocking out light and

preventing its occupant from enjoying an unimpeded view of the external scenery. Altogether we are not certain that this contrivance would be generally appreciated by the public, especially in view of the increasing adoption of corridor carriages on long distance train services.

Hydrodynamics and Magnetism. THE paper on "Hydrodynamical and Electro-magnetic" experiments, by Professors Hele-Shaw and Hay, which was read this week to the Institution of Electrical Engineers, is not only of great scientific interest, but is also of considerable value to the designers of dynamos. The late Sir G. G. Stokes pointed out in 1898 that the lines of flow in an ideally perfect fluid which had no viscosity were identical with those of a very viscous fluid, provided that both fluids moved between parallel plates at short distance apart. Professors Hele-Shaw and Hay were able to map these lines by forcing clear glycerine, into which had been injected thin streams of glycerine coloured with an aniline dye, between parallel glass plates very near together, in which obstacles of various shapes could be placed. When the motion had become steady they photographed the slides, the coloured streamlines of glycerine representing the direction of the flow of the molecules of the liquid. In a paper which they published in the Transactions of the Royal Society three years ago they showed that their experimental results were in exact accordance with the predictions of the theory. Now Kelvin and Clerk Maxwell showed many years ago that the mathematical solution for the lines of flow in a liquid was the same as the solution of the analogous problem for the "lines of force" in magnetism. As a matter of fact, also, the solution applies equally well to Faraday's "tubes of force" in connexion with electrified pith balls and to the "lines of flow" of electric current in metal sheets. As the authors have obtained the hydrodynamical solution they have therefore solved also the electrical and magnetic problems. They are thus able in their paper to show electricians how the magnetic lines of force in dynamos cross the air-gap between the field magnet poles and the armature, and to give them useful formulæ and tables. Some of their results have been anticipated by Mr. F. W. Carter, who, by applying the mathematical method of conjugate functions, developed mainly by German mathematicians, obtained complete solutions of the magnetic problems in those cases where the field poles and the slots in the armature were rectangular in shape. The experimental methods devised by the authors of the paper is a triumph of ingenuity, and, if necessary, it could be applied to the study of problems which have not yet been attacked mathematically.

Hawkmoor's Grave, Shenley. IN the course of some renovation works that are being carried out under the superintendence of Messrs. Hopkins & Walker at the parish church of Shenley, near St. Albans, the tomb of Nicholas Hawkmoor has been repaired. The brickwork, which rises to about 18 in. above

ground, is set in order, and the crack across the tombstone has been cemented. The grave lies beneath a yew tree at the east end of the church. Hawksmoor, aged seventy-five years, in his house at Millbank, on March 25, 1736, few months after he had completed the two towers of Westminster Abbey—a which it was intended to erect spires 100 ft. high. He had been appointed surveyor-general to the fabric after Wren's death in 1723, and N. Blackerby, his son-in-law, records that he made a noble design for repairing the west end of Westminster Abbey." Hawksmoor entered Wren's service as a domestic clerk, or assistant, when eighteen years old; in July, 1735, he was surveyor-general, and during the last few months of his life is variously described as "surveyor-general" and principal surveyor of His Majesty's parks." After Gibbs's resignation he was appointed in January, 1716, as first surveyor to the Commissioners, in connection with J. James, for the building of the new churches in London; ten years afterwards he became deputy-comptroller under Vanbrugh, who died in 1726. A skilful mathematician and geometer he emulated the attainments of the first master. He was, besides, an accomplished draughtsman, and possessed an uncommon knowledge of architectural history and literature.

St. Paul's Chapel, Great Portland-street, and St. Peter's, Vere-street, Oxford-street, known as the rhyebone Chapels, have drafted a Bill provide for the demolition of the first-named chapel, and the vesting of the same in the Ecclesiastical Commissioners, together with a transfer of all present lands and securities held by the trustees, and the proceeds of the sale of the site materials, to the Commissioners. The chapel was built upon the site of Mary-one basin which supplied that part of the town with water, in 1760-6, at a cost of 5,000*l.*, from plans and designs for the Classical style, by S. Leadbeater (Leadbetter). Originally called Portland Chapel, the building was consecrated as St. Paul's on December 31, 1811. The organ, 1879, is by Hill. In number of December 1, 1894, we published an illustration of the pulpit, constructed in 1892 by Messrs. Shuffrey & Co., of Welbeck-street, from a design by Mr. Paul Waterhouse—the work being of fumigated oak, and the pulpit resting in five of its six sides in panels of ebony, box, and walnut wood, decorated with cartouches bearing the sacred names.

UNDER the general title "Italy and her Alpine Walls," Mr. Wallace Rimington exhibits at the Fine Art Society collection of water-colours the special feature of which is the contrast between the beauty of the scenes and cities of the Italian plains and the grandeur of the mountains which form the barrier between Italy and the north. This is a new way of regarding the subject; and some of the rugged wintry scenes on the Simplon certainly present an effective contrast with the garden-

like scenery of many of the other drawings. On former occasions we have thought Mr. Rimington's style in landscape-painting somewhat mannered and conventional; there is less of this defect now, more of freedom and variety; but even now we think the best of all the works in this collection are not the more extensive and more highly finished views, but the few sketches, in a much broader style, of bits of Alpine landscape—"An Alpine Garden" (19), "An Alpine Stream" (36), "An Alpine Meadow" (78), and one or two others. These few drawings form a class apart, and are different from the others and seem produced under a different influence, and we like them best of all. But there are some fine and most interesting views among the others: "From Perugia" (64), with its plain little church and campanile backed by an extended landscape; "A City of Towers—Vercelli" (26); "Assisi" (40), with its ramparts in long perspective; "On the way to Italy" (48) a view from the Splügen; "One of the Gates of Italy—Gondo" (58) an exceedingly striking piece of what may be called natural composition; "In the Engadine" (96), and "A Town of the Adriatic Lagoons" (101). This last the artist describes as "a miniature Venice unknown to the travelling world. It lies in the midst of lagoons larger than those of the far distant mother city, with canals, bridges, palaces and campanilli unspoilt by the hand of the restorer. It is approached by a narrow causeway eight miles long, and is a painter's paradise." Mr. Rimington will not give its name, lest it should get popularised and spoiled; and he is quite right. The drawing is charming; one of the best and most interesting in the collection.

Drawings by Mr. Moffat Lindner. At Mr. Dunthorne's Gallery there is a collection of water-colour sketches of Venice (chiefly) by Mr. Moffat Lindner, whom we have hitherto been familiar with mostly as a painter of effects of cloud and reflection. In the present collection he appears as a painter of architectural subjects. We must say that if architecture is treated pictorially we prefer to see it treated with somewhat more solidity and indication of detail than is to be seen in these sketches. Seen at a requisite distance, one may admit that the general effect of the buildings is conveyed, and moreover that they have an upright and structural appearance, as if solidly founded; but they are totally destitute of form in detail; mere spots of colour, windows represented by formless splashes, etc. That may serve to give the general effect of Venice in an artistic sense, but architecture is worth more careful treatment than that; and while the general colour effect is good, one becomes rather sceptical about its worth when we see that the front of the Ducal Palace, of which the arcades are stone and the upper portion brick, is shown as all of one tone from base to cornice. Some of the scenes in which water and shipping predominate are very good; "On the Maas" for instance (one of the few non-Venetian subjects); and the sketch of an effect of

"coming storm" at Venice is powerful. But generally speaking, the style of the sketches is too slight and visionary for scenes in which architecture forms an important element. We congratulate Messrs. Dunthorne on the great improvement they have made in their gallery by the recent alterations.

Mr. Fedden's Pencil Drawings. A COLLECTION of pencil drawings by Mr. A. Romilly Fedden, on view in a new small room which has been added to the Fine Art Society's suite of galleries, is a very good illustration of the interesting work that may be done by the pencil, without making any attempt to go beyond the proper capabilities of this instrument of artistic expression. The drawings are all small, and consist of town and village scenes under different aspects, alternating with studies of heads; The latter are all well executed but not mostly very interesting in character; the scenes form the best part of the collection, and are very effective, while they represent what may be called an excellent pencil style. "The Harbour" (42) we may mention particularly as one of the best. "The Haunted Room" (41), in which a figure of a woman, with her back to the spectator, looks through an open door into the darkness of a passage, is a very suggestive little picture, reminding one somewhat of Fred. Walker

THE INTERNATIONAL GAS EXHIBITION.

L. LOHR.

ON Saturday last an International Gas Exhibition was opened by the Lord Mayor of London, at Earl's Court, London, and it is to remain open until the 17th prox. Although the exhibition is described as international, the foreign exhibits are very few. This is not so regrettable in connexion with the gas industry as it would be in the case of some other industries, for Great Britain, the birth-place of the gas industry, has up to the present date retained its leading position as gas maker and gas consumer, and has little to learn from abroad. That the streets of some Continental cities are better lighted than many English towns, is due neither to the use of a better quality of gas nor to the use of superior burners or mantles, but to greater generosity in the consumption of gas and more careful attention to the condition of mantles and lanterns. In recent years Berlin has acquired a reputation as the best lighted city in Europe, yet Berlin is supplied with a lower grade gas than London. Paris also uses a poorer gas than is used in London. That the brilliant lighting of Berlin streets is not due to electricity is evidenced by the official statistics recently published, for of the total of 23,903 lamps in the city streets, 23,215 are incandescent gas lamps.

Great Britain possesses a magnificent stock of good gas coal; and for this reason gas, as compared with electricity, is cheaper here than in most other countries. That the fact that lighting can be efficiently and cheaply performed by gas is now becoming generally recognised, even by municipal authorities, is shown by the decision that the important new London thoroughfares, Aldwych and Kingsway, shall be lighted by incandescent gas lamps. The high-power lamps which have been selected for the lighting of these and other streets of importance may be seen at the exhibition, and if these lamps could be seen side by side with the best lamps exhibited in the last important gas exhibition, which was held at the Crystal Palace in 1882, the contrast would be most striking. Since 1882 the Welshbach system of lighting, and gas engines of high power, have been introduced, and gas has come into general use for cooking and heating purposes; and, in consequence, gas is now valued by its calorific value and flame temperature, instead of by its candle-power when consumed in an Argand burner. Pedagogues, with their proverbial conservatism,

still cling tenaciously to the Argand burner for testing purposes, but it has long since been laid aside in favour of the thermo-couple and the calorimeter by business men.

High-Pressure Gas Lamps.—The high-pressure lamps are naturally the first objects to attract attention in the exhibition. These lamps depend for their efficiency upon the increase in flame temperature obtained by increasing the pressure under which the gas is supplied to the burner. The compressed gas passing into the tube through the air-holes a larger proportion of air than would be drawn in by gas under normal pressure. Combustion at the burner head, therefore, takes place more rapidly; and a shorter and hotter flame is produced than would result from the same volume of gas mixed with less air. Normal pressures in gas mains vary from $1\frac{1}{2}$ to 4 in. of water, and by the use of compressors the pressure under which the gas enters the burner is increased from 16 in. (Sugg & Company's lamp) to 57 in. (British Compressed Gas Company's lamp), according to the views of the different manufacturers as to the most suitable pressure to be used for high-pressure lighting. The high-pressure flame is, in fact, a kind of blow-pipe flame, and equally good effects may be obtained by compressing the air supplied to the burner instead of compressing the gas.

We shall not attempt to describe the differences between the various forms of compressors and high-pressure lamps, but mention, as specially worthy of inspection, the "Millennium" lamp of the British Compressed Gas Company, which has recently been adopted for the lighting of Aldwych; the Keith lamps, with which a portion of the Queen's Palace is lighted, and of which some extremely satisfactory specimens may be seen in various conspicuous spots in the City streets; the high-pressure lamps exhibited by Messrs. Wm. Sugg & Co.; and the "Pharos" lamps, with which the main entrance leading up to the Ducal Hall is lighted.

Self-Intensifying Lamps.—Instead of obtaining an increase in the proportion of air drawn into the mixing tube of the burner by increasing the pressure of the gas flowing into it, the gas may be allowed to enter under normal pressure, and by enclosing the mantle and head of the burner in a glass case, which admits very little air to the burner-head, and which terminates upwards in a long chimney, a description of "forced draught" may be created. This forced draught will result in an increase in the proportion of air pulled through the air-holes into the mixing tube. The increase in efficiency thus obtained is not so great as that obtained by the use of modern high-pressure systems, but the results obtained are very good, and a point in favour of self-intensifying lamps is that it is not necessary to provide compressing plant. Good examples of self-intensifying lamps are the "Lucas" lamps, exhibited by Moffat's, Limited.

Gas Arc Lamps.—The term "gas arc" lamp is applied to a gas lamp which resembles an electric arc lamp in general appearance. Excellent forms of gas arc lamps are the "Humphrey" lamp, exhibited by Messrs. E. C. Haywood & Company; the "Khoma" lamp, exhibited by Messrs. Clark W. Harrison & Company, and the lamps from the Crown Lamp Works. The "Humphrey" lamp is particularly pleasing because, while emitting brilliant light, the light is softened and the eyes are protected from direct rays from the mantle by a large clouded spherical shade. Some of the gas arc lamps are forms of self-intensifying lamps.

Inverted Burners.—To obtain a gas lamp free from downward shadows, burners have been devised which will throw a non-luminous flame in a downward direction, and which, when fitted with a suitable mantle, will raise the mantle to brilliant incandescence. These inverted gas lamps possess all the æsthetic advantages of incandescent electric lamps. The exhibits include some clusters of very small incandescent inverted lamps mounted on handsome standards, and these form the most attractive description of gas lamp for the lighting of halls or wide passages which we have yet seen. Inverted lamps are well represented by the exhibits of the New Inverted Gas Lamp Company, the Star Inverted Incandescent Burner Company and Messrs. Falk, Stadelmann & Company.

Ordinary Incandescent Burners.—Incandescent burners and shades of all the descriptions

in common use are exhibited, but these are so familiar to our readers that they do not require description. A very comprehensive collection of these goods may be seen on the stands occupied by Messrs. Falk, Stadelmann & Company.

Gas Light and Coke Company's Exhibits.—Earl's Court is situated within the area supplied with gas by this company, and they have constructed, as part of the Exhibition, a model workman's parlour and kitchen, and have fitted them with gas appliances in the style in which they are prepared to fit up the homes of the working classes. The company bear the initial cost of these gas installations, but the consumer pays a higher price for gas to cover the cost of the prepayment meter, stove, fittings, and pipes. The company have already about 185,000 of these penny-in-the-slot meters in use in the district they supply with gas, and they collect therefrom over 100 million pennies per annum. The fittings provided include a cooker and a grill or boiling-ring. A series of furnished rooms representative of a modern flat have also been provided with gas fittings under the supervision of the company.

Gas Mantles.—A host of mantles of different brands are exhibited by the various manufacturers and importers of these goods. The Voelker Incandescent Mantle Company have a large stand, upon which they demonstrate some of the methods used in the manufacture of Voelker mantles. This is a very interesting exhibit. The Buhlmann Incandescent Syndicate exhibit mantles manufactured in their factory in East London. These mantles are "burnt off" by machine instead of by hand, and are remarkably uniform in shape. The syndicate also exhibit an ingenious apparatus for testing the ability of mantles to resist injury when subjected to severe shocks. By means of this device the great difference in strength between some of the numerous brands of mantles placed on the market by various manufacturers may be demonstrated. Among the other mantles to be seen at the Exhibition mention may be made of the well-known "Veritas" mantles shown by Messrs. Falk, Stadelmann & Company, the "Bray XXX" mantles shown by Messrs. Geo. Bray & Company, the "G. I. C." mantles of the General Incandescent Company, Limited, and the "Ino" mantles of Messrs. Julius Norlen & Company.

Self-Lighters.—Devices which possess the power of igniting coal gas when exposed in air to their influence are exhibited by Messrs. Dae & Company, of Berlin, and by Mr. Jacques Kellermann, of Berlin. These more or less resemble some of the self-lighters which have become familiar to the public during the last few years; but whether improvements have been effected which render them reliable self-lighters in all seasons, and after prolonged use, we are not in a position to state.

Illuminated Advertisements.—A form of illuminated advertisement, which is attracting much attention at the Exhibition is exhibited by "Chameleon Signs, Limited." Any advertisement may be illuminated by this device at trifling cost by gas, and all the lettering is made to attract attention by appearing in a combination of constantly-changing colours. But while we mention this as an ingenious contrivance, we have no desire to see this form of advertisement adopted. We have already too many of them, and they are an irritating nuisance in our streets at night.

We shall have further comments to make on the exhibition.

CITY BUILDINGS AND FIRES.—Notification is given of an intended application to Parliament next Session by the Corporation for leave to bring in a Bill to require owners of houses and buildings within the City of London to provide stairways or other means of escape from fire. Authority will be asked for to empower the Corporation to apply for and the Court of Summary Jurisdiction to make orders requiring owners to construct such means of escape from fire, or, in case of their default, for the Corporation to provide the same at the owners' cost; and to impose and recover penalties.

INSTITUTE OF BRITISH DECORATORS.—A lecture on "Pompeii" was given by Mr. Hugh Stannus, on Monday evening last, at Painters' Hall. The lecturer gave a brief account of the history of the place, and of the catastrophe by which it was destroyed, and then, by a series of photographs shown on the screen, led his audience through the most interesting of the streets and buildings.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

The usual fortnightly meeting of the Institute of British Architects was held, No. 9, Conduit-street, Regent-street, on Monday evening, Mr. H. T. Hare, Vice-President, in chair.

The minutes of the last meeting were read.

The Late Mr. Norton.

Mr. Graham (Hon. Sec.) said he regretted to announce the death of Mr. John Norton, F.R.S.A., F.R.A.S., F.R.I.B.A., F.R.I.C.A., F.R.I.C.E., F.R.I.C.S., F.R.I.C.S.A., F.R.I.C.S.E., F.R.I.C.S.M., F.R.I.C.S.N., F.R.I.C.S.O., F.R.I.C.S.P., F.R.I.C.S.Q., F.R.I.C.S.R., F.R.I.C.S.S., F.R.I.C.S.T., F.R.I.C.S.U., F.R.I.C.S.V., F.R.I.C.S.W., F.R.I.C.S.X., F.R.I.C.S.Y., F.R.I.C.S.Z., F.R.I.C.S.A.A., F.R.I.C.S.A.B., F.R.I.C.S.A.C., F.R.I.C.S.A.D., F.R.I.C.S.A.E., F.R.I.C.S.A.F., F.R.I.C.S.A.G., F.R.I.C.S.A.H., F.R.I.C.S.A.I., F.R.I.C.S.A.J., F.R.I.C.S.A.K., F.R.I.C.S.A.L., F.R.I.C.S.A.M., F.R.I.C.S.A.N., F.R.I.C.S.A.O., F.R.I.C.S.A.P., F.R.I.C.S.A.Q., F.R.I.C.S.A.R., F.R.I.C.S.A.S., F.R.I.C.S.A.T., F.R.I.C.S.A.U., F.R.I.C.S.A.V., F.R.I.C.S.A.W., F.R.I.C.S.A.X., F.R.I.C.S.A.Y., F.R.I.C.S.A.Z.

Ferro-Concrete.

In the absence of Mr. W. Dunn the illness, a paper by him on "Ferro-Concrete" was read by Mr. R. Watson. The following is an abstract of the paper:—

Mr. W. Dunn said that, owing to unpleasant experiences, there was a feeling among many architects and builders that concrete was a treacherous and unreliable material. In all such experiences there is something mysterious; the cement, from a maker of established repute, has been specified "Best London" Portland cement, the sand and gravel looked clean, the builder was an honest man. Nevertheless, it failed to set; it cracked; it thrust out of walls, and generally led to a great deal of trouble. To make good concrete much care in the selection of the materials and in the mixing is required. The cement was the most important ingredient, and the only way to get good cement was to test it constantly and to get that which was faulty. That was the only way to ensure that only good cement was used. The fact that it is frequently tested by the known to the merchants, it will be found a dangerous article, such as bad cement would be less and less frequently sent to floors, walls, roofs, or pillars are made of concrete, a bad cement is really dangerous. It would be an excellent plan if the Institute of British Architects, and the cement makers could agree upon a standard suitable for architectural work. But until such a standard was fixed, architects must describe it themselves in their specifications. Many cement makers had given model specifications, but the same points in cement specification require building work which a cement expert should know.

Fineness of grinding is all important, and the very fine particles have cementitious qualities. Foreign makers were much ahead of us—two or three; now we can get English cement which will all pass a 76 by 76 and leave 10 per cent. on a 180 by 180 sieve.

This is a very fine cement, and perhaps good for ordinary work. All, however, to pass 50 by 50 and leave only 5 per cent. on a 120 by 120 sieve. A good cement is one which we make a stronger mortar or concrete with much less of it, so that the extra cost is more than repaid. The particles which are more than 50 by 50 sieve are practically so much waste.

The author strongly urged the use of the setting cement. Pats made with the minimum quantity of water should set in not less than five hours when the temperature is at 60° and in not less than twenty minutes when the temperature is at 75°, and proportional time when the temperature is between 60° and 75°.

Soundness or constancy of volume is the most important qualities a cement should have. Tests without elaborate apparatus are fortunately available. Make two cement balls on small pieces of glass, tap them out to a spherical shape, about 3 in. diameter, $\frac{1}{4}$ in. t.

the centre, and with thin edges; keep one under water and one in air for several days. The cement should then show no cracks, change of shape, or tendency to curl off the glass, if found. The author went on to describe other methods of testing, and strongly urged architects to test their cements by one and all of them as often as they could. It would save many after troubles.

Tensile strength he regarded as the least important; it is the test on which the most varied results may be got by different observers according to the method employed in filling the briquettes. A strength of 400 lb. per sq. in. at seven days and 25 per cent. increase in twenty-eight days is usually asked for and easily obtained; many briquettes he had found go up to nearly 1,000 lb. at seven days.

It is not unusual to specify that sufficient cement should be delivered on the works at starting, kept stored in a dry weather-proof shed to a depth of not more than 2 ft. and turned over daily for a fortnight before use. It is found that makers send out the cement hot from the mills, and (unless it is a very high-class cement) it is much improved by air slaking. Aeration seems to improve an inferior cement by the slaking of the free lime, which if it took place in the work would be dangerous. A thoroughly sound cement should have no free lime in it, and is not improved by air slaking; it rather suffers; cement in which there is no free lime can be produced by the maker, but it requires much care in the making, and is consequently expensive.

As regards the aggregate, the strongest concrete is made with broken stone and gravel; the size should vary from large sand to small stones, passing a 1 in. mesh, for floors or walls, to 1 1/2 in. even more for foundations. The cleanliness of the aggregate and the water is most important, as is also the cleanliness and sharpness of the sand. Small sand, such as would run in a hour-glass, is utterly useless—the sand must be fairly large and sharp; it should vary in size; the more uneven the sizes the smaller the voids. The finer the sand the less the strength. There could never be more than three of sand to one cement.

The author described the process of mixing concrete, which should always be done under supervision. Concrete mixing machines are such used in America and on the Continent, producing very good and uniform results. These machines are rarely seen here. One has frequently seen on a building a lot of concrete mixed up, and left for an hour or so before being put in place. If too stiff more water was added. The treatment of the material invites disaster; initial set begins very quickly, and the concrete should be put in position as soon as mixed, and without a moment's delay. When the concrete is eventually laid on the surface, or put in the moulds, it is put in in layers 2 in. to 3 in. thick, and beaten down by iron heaters very carefully all over. This is essential in order to prevent the formation of voids, and to increase the resistance of the concrete.

Mr. Dunn then treated in considerable detail of the strength of the material in place, describing various tests of cement made by eminent scientists, and illustrated by diagrams and mathematical calculations. For further mathematical investigation of the subject, he referred those interested to Professor Perry's *Applied Mechanics* (p. 345), and to M. Considère's experiments, the results of which are communicated to the French Académie des Sciences in a note of March 18 last—an extract of his communication appears in the *Revue Civile* for April 30. These writers base their discussion on "Rankine's Ellipse" of stress, which, as given in Rankine's own words, not easy to grasp. In Alexander and Thompson's "Elementary Applied Mechanics," however, the ellipse of stress is fully explained, and a preliminary reading of part of the last-mentioned book should enable anyone to follow M. Considère's or Perry's reasoning.

The resistance to the swelling and bursting of concrete to which columns in concrete alone could be subject, can be produced by binding the columns with iron or steel wire. Makers of concrete columns do so bind these according to the effect to be combated is more or less clearly understood. What is done in the Hennebique column is done by other concrete specialists. In all there is first the concrete; second, vertical bars of metal, iron or steel; third, bindings of sheet metal or wire. The method of construction is very simple.

A wooden box or mould is made in which the rods are set upright; one of the bindings is then put in, and about 6 in. or 12 in. of concrete well rammed down; another of the bindings is put in and the process repeated.

The special functions of the vertical rods are (a) to aid the concrete in resisting the compression due to the load; (b) to resist any tensile stress which may be set up in the concrete by unequal loading or by any want of homogeneity in the material itself, which tensile stresses cannot be safely left to the concrete to overcome.

Almost all the makers of reinforced concrete constructions put their trust in the vertical rods of metal, as the special element adding strength to the concrete, if we may judge by the large proportion of metal so used, and by the rules employed to fix the safe load, which rules take no account of the binding.

If there were no initial stresses in the combination the load would be carried by the two materials on the inverse proportion of their rigidities; that is to say, if the concrete were ten times as easily compressed as the iron or steel, the iron or steel would be carrying ten times as much per square inch as the concrete.

But the question is not so simple. Concrete setting in air shrinks, while concrete setting in water expands. Columns for buildings always set in air, and consequently the concrete shrinks. As the concrete adheres rigidly to the metal, the concrete is put in tension and the metal in compression—into a state of internal initial stress—before the load comes on. So strong is this action that the concrete may be at the limit of its tensile strength, and the metal at its elastic limit. No formula has so far been devised which takes this initial stress into proper account.

The function of the bindings is to prevent lateral swelling and bursting. M. Considère was the first to give this its proper consideration and importance. In almost all columns, except M. Considère's, these bindings are usually about 6 in. to 12 in. apart, showing that the true use of the metal is not yet fully recognised.

The author gave the results of some experiments on concrete in compression, armoured and unarmoured, referring to those carried out by Professor Gaetana Lanza, and reported in the "Transactions of the American Society of Civil Engineers," (1903; p. 487); by M. Gary, of the Ecole Polytechnique, at Charlottenburg; by the Commission des Vités de la Société des Ingénieurs et Architectes Autrichiens, reported on in 1901; and others by M. Considère described in his papers on "Resistance à la Compression du Béton Armé et du Béton Fretté," in *Le Génie Civil* (November and December, 1902). Reference was also made to Mr. Dunn's report of the armoured concrete column test in the "Journal" of the R.I.B.A. for November 21, 1903, and to the test of a column made by Messrs. Chittit & Co., and tested at Messrs. Kirkaldy's Testing Works in June, 1904.

The lecturer went on to give the formulae and rules which various constructors use to determine the necessary sizes of reinforced concrete pillars to carry given loads.

As regards fire-resisting properties, from all the reports on the Baltimore fire, whereas intense heat was experienced, as will ever occur, the armoured concrete constructions appear to have stood best. Concrete and iron or steel expand at about the same rate under changes in temperature, and the permanence of the concrete covering in fires is no doubt due to this. There is now no doubt that iron or steel buried in ordinary concrete remains unimpaired for generations.

When an architect decides upon adopting reinforced concrete for a structure, or part of it, he will probably put the work in the hands of a concrete specialist, who makes his own calculations for the strength of the members, and arranges the details of the construction according to his own ideas. But as the responsibility must always in some measure lie with the architect, he will naturally want to check the specialist's work, particularly when the contract has been let in competition, and there is an object in the specialist endeavouring to reduce cost to a minimum.

Monolithic Construction in Hennebique Ferro-Concrete.

M. L. G. Monchel followed with a paper entitled "Monolithic Constructions in Hennebique Ferro-Concrete." He said that it had been his fate to be the pioneer of the new

material in Great Britain. The work of initiation had been arduous, but was not without its compensations, as it had brought him in contact with many English architects and engineers whose courtesy and kind support had been a precious encouragement to him.

Having explained in detail the general principles of Hennebique ferro-concrete construction, M. Monchel said that it was to its great simplicity, to the common-sense which had presided at its conception, that it owed its startling success. Any labourer of ordinary intelligence could be made an apt workman in the material in a few days. He himself had had to form his own gangs of men when he introduced ferro-concrete into this country, and it took him very little time to drill them in the practice of arranging the various parts of a work in which robustness was combined with simplicity.

Respecting the theory of the system of construction, it was evident that the laws, formulae, and methods of calculation used for ordinary materials could not be applied in structures composed of such heterogeneous substances as concrete and steel. It had been objected that their formulae for ferro-concrete was empirical. It was not so, because they had not started their work on formulae. It was only after many years' patient observation of the results obtained that they deduced the formulae which were the bases of all their work.

Ferro-concrete was an absolutely new material, which had come in its time to enrich the engineering world. It could not be treated as a combination of steel and concrete in which the properties of the component elements could be considered and treated separately. It had its own laws of deformation. Experiment demonstrated that a rectangular bar of concrete, when subjected to tension, showed an elongation at rupture of, say, one-tenth of an inch; a bar of ferro-concrete, of the same external dimensions and made of the same concrete, showed at rupture an elongation of an inch; that is to say, ten times greater, before showing any crack or trace of disintegration, than in the first case. The elasticity of the new material was well known; it varied in notable proportions with the distribution of the steel in the mass of concrete.

The so-called Hennebique's empirical methods could be relied upon with absolute confidence; for they had been the basis upon which over 12,000 different works had been constructed, and which, in almost every case, had been subjected to severe tests, the results of which had been carefully recorded.

As regards tests, the age of a piece of concrete is a most important element. Good concrete goes on increasing in quality year after year. It is not advisable to test to destruction samples a few weeks or a few months old. No two results will ever be alike, even on two samples of the same age, unless they are composed exactly of the same materials, mixed in identical proportions and by the same operator. The adhesion of concrete to steel increases with the age of the work. Unlike construction in ordinary materials, which, if left to itself, will deteriorate, ferro-concrete construction goes on improving endlessly in quality with age. Tests must be made on the structures themselves.

The Hennebique practice is always to test their structures within a very few weeks after completion with loads 50 per cent. in excess of the calculated load. When the load is removed, it is found that the floor, owing to the elasticity of ferro-concrete, regains its former level, or, at any rate, that the deflection, if any, will be quite inappreciable. It could not be otherwise, for any stress applied to any part of a well-made ferro-concrete floor affects not merely the part under load, but also a very large area of the floor surrounding the part under observation. This is due to the absolute monolithism of the work. Besides static tests, there should be severe dynamic tests; without these the trials of a structure in which concrete and steel are combined are incomplete.

The great security offered by ferro-concrete construction arises from the fact that it never collapses suddenly, but always gives, long beforehand, unmistakable warnings.

The author described an interesting test on a Hennebique beam which he had had carried out at Bermondsey. The beam was placed on two common concrete supports; 3½ tons—i.e., five times the calculated load—was put by degrees on the beam, when the operation had to be stopped, the pillars being

New Headmaster's House, Upper Latymer School, Hammersmith.

crushed and having taken a slanting position, which caused the beam to twist badly. The load was then discharged. The deflection was measured at that point, and the following morning it was found that the floor had sprung back by 1 in. The beam was cracked, but loading might have been continued for some time before complete destruction had not the supports given way.

Buildings of Hennebique construction have been subjected to very unforeseen tests. At Lens, in the north of France, coal silos had been constructed of ferro-concrete 40 ft. high, to contain 1,200 tons of coal. The silos were supported on fourteen pillars. One day, when they were quite full to the brim, a train of coal trolleys came into contact with one of the legs and broke it. The corner of the silo structure was thrown suddenly in cantilever, but, owing to the monolithism of the whole building, no injury resulted to the silos themselves, nor to the other three pillars of the silo affected. They merely had to reconstruct the broken pillar. A car-shed of Hennebique construction at Le Mans was divided in two spans of 21 ft. by a central line of ferro-concrete pillars. One of the cars coming down a gradient got out of control, ran off the metals, and dashed into the central pillar at the entrance of the shed and broke it. The span instantly became 42 ft. instead of 21 ft., but, notwithstanding this, the beams supported by that pillar held perfectly, and did not show the least trace of strain—another proof of the safety due to the monolithism of the ferro-concrete construction.

The construction of ferro-concrete piles the author described as one of the finest, most startling, and most useful applications of ferro-concrete. Their cost is little more than that of a timber pile, and they can bear safely a weight so much in excess of timber piles that a very considerable economy can be effected on the total cost of a foundation. At the present moment a foundation was being constructed in which the use of ferro-concrete piles procured a saving of over 12,000*l.*, as compared with the original estimate for timber

piles. Judicious distribution of steel in ferro-concrete is at the root of success, whether it is in a beam, in a pillar, or in a floor—but, above all, in a pile.

Owing to the absolute monolithism of Hennebique constructions, they are far less liable to vibrations than ordinary constructions. One of the things which strike one most when entering a factory constructed entirely of ferro-concrete, where heavy machinery is at work, is the absence of vibrations and of noise. It is an everyday practice to attach shafting direct to the Hennebique pillars, which consequently have to sustain powerful lateral pulls. Heavy machinery—such as disintegrators grinding heavy materials, dynamos, and dynamo-motors—is also fixed direct on the Hennebique floors; and, after years of that treatment, the quality of the concrete has been found not to have suffered in the least.

Indisputable proofs have been given that the very best material to protect steel is concrete itself. Oxide of iron cannot exist in contact with concrete; rusted bars embedded in concrete will, in the course of a month or so, be as bright as new.

Concrete used in ferro-concrete is markedly different from ordinary concrete, both in its composition, in its make, and in the way it is employed. It is composed of materials of small volume ($\frac{3}{4}$ in. maximum for the gravel or stone), and the materials used are very clean. The proportions of sand and stone are always adjusted so as to give a concrete quite full—it is used in small quantities at a time, and so vigorously rammed that no cavities or porosity are at all possible.

As regards the adherence of concrete to steel, its value is such that it justifies the practice of some ferro-concrete builders who only reckon on concrete to make the junction between the different metallic parts of a structure.

Experiments have demonstrated its surprising resistance to high temperature and sudden cooling. After the most destructive fires, Hennebique constructions have been found

as sound as ever. At the great Baltimore fire the Hennebique buildings stood the ordeal admirably, and they are again in use as before. One of them received on its roof the top store of a high "sky-scraper," and it resisted the shock as well.

As regards ornamentation, there is no reason why ferro-concrete buildings should not be made as artistic as constructions in ordinary materials. There is none that lends itself better, and more economically too, than ferro-concrete to any shape that one may wish to give to it. The author exhibited photographs of some buildings in Paris erected entirely of ferro-concrete which would be an eye-sore to anybody in London. To show the ease with which the material lends itself to ornamentation a photograph was exhibited of the main reception-room in the extension recently carried out at the French Embassy in London. Except the external walls, the whole of the building is in ferro-concrete.

In his concluding observations the author referred to the mischief of the building by force in London. London enjoyed the unique privilege of being the only city in the civilised world where ferro-concrete constructions are actually prohibited. Building regulations of nearly every other city in the United Kingdom did not, read strictly, permit the use of ferro-concrete; but, after intelligent and impartial investigation by the various authorities, Hennebique constructions have been allowed. Such buildings have been erected in London, but only on ground belonging to railway and dock companies. The facts had been brought to the attention of the London County Council when they had applied for permission to erect similar buildings on ground within their jurisdiction; in vain. They always met with the reply:—"The Act stipulates a certain thickness for walls. If you give your walls that thickness you can build." But to give ferro-concrete walls that thickness would be financially impossible and, practically speaking, absurdity, since the comparatively thin

of ferro-concrete are many times stronger and safer than those stipulated in the Act. He trusted that when the new London building by-laws were framed, ferro-concrete construction would no longer be excluded. Ferro-concrete construction is absolutely safe; it cannot lend itself to the malpractices of the jerry-builder. Trickery is impossible with it. Should the contractor try to cheat, try to escape the specification, detection will not occur months or years after, but at once.

The Chairman said the two papers they had listened to were undoubtedly of great interest, but at that late hour in the evening it was quite impossible to allow any discussion, although there were many gentlemen present who would have liked to have made remarks and to have asked questions. All they possibly had time for now was the passing of a formal vote of thanks to the readers of the papers. As it was such an interesting question, it would be quite possible and desirable for them to adjourn the discussion until the next business meeting on December 5, and probably M. Mouchel would favour them with his attendance again, and open the discussion with a few remarks which he had not time to give that night.

Mr. H. H. Statham asked if they would have the papers in print before that.

The Chairman said they would, and they would hope also to have Mr. Dunn with them and the other guests present that evening.

Mr. Graham proposed a hearty vote of thanks to the readers of the papers.

Mr. S. Perkins Pick, in seconding the formal vote of thanks, said he would add but one word. Mr. Dunn stated that the cement was the most important part of the concrete. He hoped when the discussion took place they would have a good deal to say on the aggregate, because in his opinion a great many failures of concrete had come about from the bad aggregate.

The motion was carried, and the discussion was adjourned till December 5.

NEW HEADMASTER'S HOUSE, UPPER LATYMER SCHOOL, HAMMERSMITH.

This house is in course of erection, and is being built in red Sittingbourne bricks and is being built in Monk's Park stone dressings. The house will occupy the site of an old riverside mansion, pulled down some years ago, and the balcony has been provided to take advantage of the excellent views of the river that the site affords.

The contract has been given to Messrs. Frank W. Harris and Co., of Barnsbury, and the joint architects are Mr. W. I. Chambers (of Messrs. Chambers and Martin), London, and Mr. J. H. Brown, Fulham.

RECENT EXCAVATIONS IN THE ROMAN FORUM.

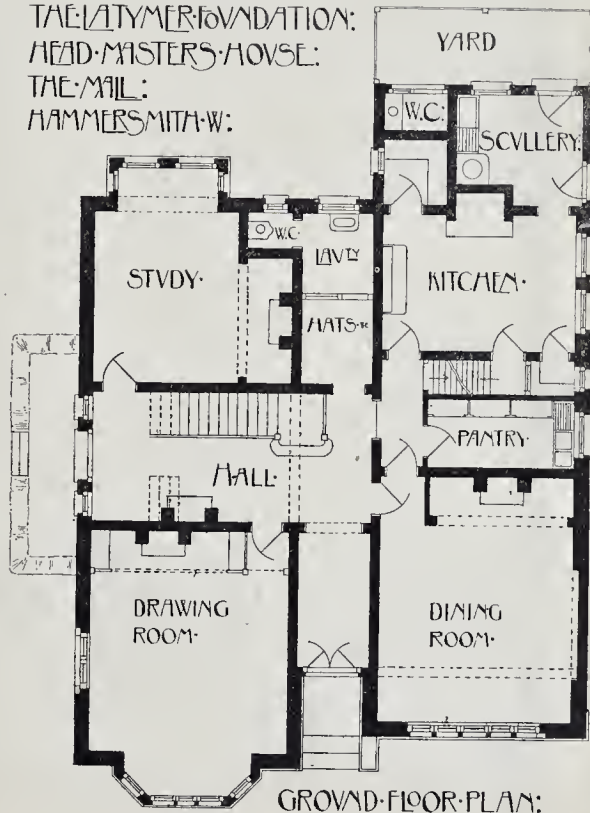

At the London Institution, on Monday evening, Mrs. E. Burton Brown gave a lecture on "Recent Excavations in the Roman Forum."

In the course of the lecture—which was illustrated by lime-light views—Mrs. Brown said her only claim to being privileged to speak about the Forum and the excavations of Comm. Boni was that for eight years she had followed them daily. She had watched so much what had been done and was being done that she could really claim to know at first-hand about the wonderful work he had achieved and was still achieving. He had found all the things which were most significant for their knowledge of the religion and of the political history of the early Romans, in the short space of between six and seven years. The Latin peoples began to come into Italy about the middle of the second millennium before Christ; they were in a pastoral stage, and they settled towards the west on the low hills. The Forum was simply a narrow low-lying marshy valley surrounded by hills, on the top of each hill there being a small community of those Latin peoples settled. The Forum became the market-place of these peoples, who came down from the hills to barter and exchange, and it was owing to the intense loyalty of the Romans to their old early traditions and to anything which had to do with the origin of their State, that the Forum Valley became the centre of the whole of the life of Rome. It was there that the criminal courts were held; that the triumphal processions

passed by; where the buying and selling was done; and where social meetings were held. It was this wonderful loyalty to their own traditions which was one of the great secrets of Rome's greatness, and why it lasted so much longer than the little republic of Greece did. First there were open stalls, and then the great bankers' shops, and so on, which became the cardinal points of interest in the Forum as a market-place. Mrs. Burton Brown proceeded to point out the principal features of the Forum and the buildings adjoining on the map thrown upon the screen. As they knew, records of early races had been found generally to be better preserved in tombs, and Comm. Boni pointed out some years ago that they knew there was a sanitary law in Rome which precluded the burial of the dead in houses, and he believed that as the Forum Valley lay in the midst of village communities there would probably be tombs there. He dug in many parts of the Valley, but most of the old tombs had been destroyed by the foundations of later buildings. Just at the end of the Esquiline Hill, however, he found an interesting and exceedingly primitive graveyard. The bottom stratum of these tombs dated from between 1300 and 800 B.C., and in one was found a warrior who had been buried and was not burned. But at the same level were found a great many other tombs of another character—they were not graves, but pit tombs. About thirty-seven such tombs were excavated, and at the bottom were found enormous jars. Inside the large jar was a smaller jar which contained the ashes of the dead man, and in the large jar also were from nine to thirteen vases containing the remains of food. In some of them the bones were so perfectly preserved that they could be identified as the bones of coats and sheep, and in one were the bones of a fish, which were exactly identical with the bones of a fish now found in the Tiber. The reason why food was buried was doubtful. The general belief was that it was placed there as food for the spirit of the deceased, but it seemed more probable that it was an act of simple sacrifice—the people

sacrificed what they found most difficult to get as an offering to the deceased. The pottery was exceedingly interesting, for it was all made by hand before the introduction into the country of the potter's wheel. Boni took out some clay from the district, and proved that these early people used the clay of this very place. In several of the tombs were found models of huts. They were round, with gabled roofs supported by cross beams with a peculiar little chimney. On the frontier between India and China some years ago she saw huts exactly the same as the models found in the tombs. They found also in the Forum graves of a later date with pottery which was well made. They were tombs of little children, and were about 800 B.C. The lecturer next dealt at some length with the pool of Juturna. She remarked that it had always been the duty of the women to go for water while the men were away fighting, and it was just the same in the Forum. The little group of shrines started with the water-spring of the Pool of Juturna, just at the end of the Palatine. To excavate this Comm. Boni had to dig down about 50 ft. He found many things, but nothing so interesting as this Pool of Juturna. What they saw on the screen was a great oblong basin made of concrete with a base intended for a statue, which only dated from the reign of Augustus. They found another large basin underneath, and underneath again were found traces of a little pool with yellowish sand. There was no doubt that the Romans thought the water of this pool had curative properties, for alongside were a number of little arched chambers which must have been erected for the sick, and there were also fragmentary statues of health-deities. They saw first that the Pool of Juturna was for the water supply for the Palatine women, and then was used as a health place. There had also been found, however, the statue of a horse and two torsos, which undoubtedly referred to the story of Castor and Pollux. When the Tarquins were turned out of Rome by Brutus and his army, they caused to be spread

THE LATYMER FOUNDATION:
HEAD-MASTERS' HOUSE:
THE MALL:
HAMMERSMITH-W:

the legend that Castor and Pollux had helped them to win the battle, and that after they had done so they washed their horses at a well. The well referred to was undoubtedly the Pool of Juturna, and statues of Castor and Pollux were erected just by. Beside that the temple to Castor and Pollux was erected, and the three remaining pillars were the most beautiful thing in the Forum. A few steps away from the pool was found a white marble well-head, but the peculiar thing was that there was no well. It looked down a shaft, and Boni found that it was supplied with water from a little leaden pipe from the Pool of Juturna. It seemed probable that this was to enable the Vestal virgins to obtain their supply of water, which it was their duty to get for all great expiatory sacrifices. The lecturer briefly referred to the remains of the Temple of Vesta, and the House of the Vestal Virgins, which she said must have been an exceedingly beautiful house. Coming to the Regia she (Mrs. Burton Brown) said that the basis of what may have been the sacrum for the sacred spears of Mars was unearthed. The Regia stood by the Via Sacra, and there were still two interesting shrines left. Going towards the Quirinal Hill they found the Comitium, what was the House of Commons of ancient Rome, and the Senate House, or House of Lords, and they discovered last May the Gulf of Curtius. Boni chose the Comitium for excavations, and found twenty-three layers. It was a regular record of Roman life—one floor above another. There were found traces of the Rostra. There was a mass of evidence that in the Comitium near the Rostra was the "black stone." The black stone was a great piece of black marble let into a white marble pavement. Boni shored this up, and got beneath to see what was there, and he found underneath the bases of two statues which might well be those of the lions said to guard the tomb of Romulus. Behind them were two columns, each of which was originally about 5 ft. high, but had been broken off. There was an inscription on one of the stones, but although about 87 papers and books had been written on this inscription, only one word could be made out. It was probably broken by the patricians in their anger against the Plebeians. There were records by Cicero that about the end of the third century B.C. these stones were broken. They were found surrounded with ashes and broken vases, and it was evident that a great sacrifice was made there, and the place burned away, although it was marked by the "black stone." In conclusion, Mrs. Burton Brown showed a number of photographs of the Forum of Cæsar, and of the great system of underground tunnels, by which Julius Cæsar hoped to provide better games for the people. These tunnels were 7 ft. high, and 4 ft. wide, and there were openings to the surface, and lifts were constructed, worked by windlasses, one of which Commendatore Boni found.

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, S.W., Mr. J. Williams Benn, Chairman, presiding.

Loans.—On the recommendation of the Finance Committee it was agreed to sanction a loan by Hampstead Borough Council of 27,340*l.* for electric light installation, and to lend Mile End Old Town Guardians 1,310*l.* for poor law purposes.

Selected Lists of Contractors.—On the recommendation of the Education Committee, it was agreed that the name of Messrs. Lole & Co., of Trafalgar-square, Chelsea, be added to the selected list of contractors to be invited to tender for structural alterations and repairs to school buildings; and that they be allowed to tender for works to the value of 7,000*l.* That the name of Messrs. Kirk & Randall, of Warren-lane Works, Woolwich, be added to the selected list of contractors to be invited to tender for the erection of new schools and additions to schools. That the name of Mr. A. Fernhead, of No. 354, Caledonian-road, be added to the selected list of contractors to be invited to tender for the electric lighting of L.C.C. schools. That the names of the under-mentioned firms be removed from the selected lists of contractors to be invited to tender for works in connexion with L.C.C. schools:—(i) Mr. J. Watkins, Clapham; (ii) Mr. J. Burrows, Islington; (iii) Mr. T. Nicholson, Scho-square;

and (iv) Messrs. George Williams, Ltd., Holland-park-avenue.

Storm Floodings.—On the recommendation of the Main Drainage Committee, the following recommendations were agreed to:—

(a) That the estimate (No. 4324) of 10,000*l.*, submitted by the Finance Committee, and that expenditure not exceeding 10,000*l.* be sanctioned for the acquisition, in connexion with the scheme of flood relief works, of properties (including the site at Shad Thames) necessary for the erection of pumping-stations and the construction of storm-water outlets.

(b) That, subject to the consent of the Secretary of State to the compulsory acquisition of the property, the site at Shad Thames, Brompton, as shown by red tint and red hatched lines upon the plan presented to the Main Drainage Committee on 12th May, 1904, be approved as a site for the erection of a pumping-station in connexion with the scheme of flood relief works.

(c) That application be made to the Secretary of State for the Home Department for his consent to the compulsory acquisition by the council of such land and property as may be required for the purpose of a site for a pumping-station at Shad Thames; and that before such application is made the solicitor do take the steps prescribed by section 153 of the Act, 18 and 19 Vict., cap. 120.

Sewage of Claybury Asylum.—On the recommendation of the Asylum Committee, it was agreed that the estimate (No. 4342) of 1,150*l.*, submitted by the Finance Committee be approved, and that expenditure not exceeding that amount be authorised for the laying of a drain from the filter beds which deal with the sewage from The Hall, Claybury, to connect with the drainage system of the farm buildings.

Erection of Buildings at the Rear of No. 10, Parson's-green, Fulham.—The Building Act Committee recommended, and it was agreed, that the solicitor do take all necessary steps to obtain the decision of the High Court upon the case stated by the magistrate in the matter of the Council v. Heathman, re the erection of buildings at the rear of No. 10, Parson's-green, Fulham.

Arbitration Case: Hackney-wick to Abbey-mills Relief Sewer.—The Main Drainage Committee recommended, and it was agreed that the estimate of 750*l.*, submitted by the Finance Committee, be approved; that expenditure not exceeding 780*l.* be sanctioned in connexion with the award of the arbitrator and of the costs of and incidental to the arbitration proceedings and to the settlement, in the matter of the claim of Messrs. J. G. Nicholson & Sons in respect of damage to their property at Bromley-by-Bow by reason of the construction of the Hackney-wick to Abbey-mills relief sewer.

Rating of Site Values.—The Local Government Committee reported with reference to the meeting on October 7 last of a municipal conference on the taxation of land values, convened by the Glasgow Corporation, when resolutions were passed in favour of the introduction of legislation on the subject. The committee stated that the Glasgow Corporation had asked whether the Council was prepared to co-operate with the committee of the conference in endeavouring to secure that the principles for which the conference was contending should be placed on the Statute-book. The Local Government Committee were of opinion that the bringing into line of so many provincial authorities was the most important step yet taken towards the rating of site values, and the Council should do what it could to assist the conference in its efforts to bring about this reform of the system of local taxation, which the Council had long advocated. They accordingly recommended:—
"That the Council reaffirms its opinion in favour of the direct rating of site values, and that it be referred to the Parliamentary Committee to approach the members of Parliament representing London constituencies with a view to their balloting for a place next Session for a Bill on the subject of the rating of site values."

Mr. H. P. Harris moved as an amendment that the recommendation be referred back to the committee, with instructions to report upon the reference made to the committee in March, 1902, to report as soon as possible upon the proposals contained in the minority report of the Royal Commission on the Taxation of Site Values, and also to state the general provisions of the Bill which they desired members of Parliament to ballot for.

Mr. Sankey seconded the amendment. On a division the amendment was rejected by eighty-five votes to thirty.

Sir Melville Beachcroft moved the further amendment to leave out all words after "site values."

Mr. E. White seconded the amendment, which was rejected by a large majority. The recommendation of the committee was then adopted without further discussion.

The Council adjourned at 6.30 p.m.

APPLICATIONS UNDER THE LONDON BUILDING ACT, 1894.

The London County Council at their meeting on Tuesday dealt with the following applications under the London Building Act, 1894. The names of applicants are given between parentheses:—

Lines of Frontage and Projections.

Kensington.—The retention of a one-store addition at the rear of the Stockwell Railway Station, Clapham-road, abutting upon Binfield-road (Mr. W. F. Knight for the City and South London Railway Company).—Consent.

Fulham.—Railway station for the Metropolitan District Railway Company over the railway cutting at the corner of Gliddon-road and Margrave-gardens, Fulham, and to be known as Baron's Court Station (Mr. C. Estall).—Consent.

Kensington, South.—An iron and glass house in front of No. 23, Roland-gardens, Kensington (Mr. W. Willett for Mr. J. B. Ellison).—Consent.

Fulham.—A gas-motor house at Beaufort House School, Lillie-road, Fulham (Mr. T. Bailey for the Education Committee of the Council).—Consent.

Bow and Bromley.—A building on a site abutting upon the eastern side of Wick-lane and northern side of Monier-road, Bow and Bromley (Mr. T. Wilson for J. Chessum & Sons).—Refused.

Hampstead.—Buildings upon a site abutting upon the southern side of Fawley-road and western side of Crediton-road, Hampstead (Messrs. Boehmer & Gibbs for Mr. V. Walker).—Refused.

Islington, North.—Fence walls and gate and an open iron shed at the southern end of Windermere-road, Islington (Mr. J. W. Stevens for Messrs. Knowlton Brothers).—Refused.

Lewisham.—A temporary building on a site on the east side of High-street, Lewisham, northward of No. 203, abutting also upon Court Hill-road (Austin Cycle Company).—Refused.

Space at Rear.

Marylebone, West.—A modification of the provisions of section 41 of the Act, so far relates to the proposed erection of an additional storey to No. 35, Great Cumberland-place, St. Marylebone (Mr. R. G. Hammon for Mr. F. Dugdale).—Consent.

Formation of Streets.

Walworth.—That an order be issued, Messrs. Cluttons, sanctioning the formation or laying out of two streets for foot traffic only to lead from Liverpool-street to Merrett-street, Walworth (for the Ecclesiastical Commissioners).—Consent.

Line of Frontage and Construction.

Islington, North.—A temporary office building at No. 89, Fonthill-road, Islington (Mr. W. Grummit).—Refused.

THE ARCHITECTURAL ASSOCIATION DISCUSSION SECTION.

The third meeting of the session was held at 18, Tufton-street, on the 16th inst., when Mr. W. Curtis Green read the following paper entitled

"The South Kensington Museum for Architects."

The subject of this paper was suggested to me by Mr. Lishman, and I accepted it with preference to unknown dangers. I imagine that if I could skim a few of the most possible subjects the museum offers and give you the cream, the object of the paper would be gained. My inexperience and the vastness of the subject are against such a possibility; but not only so, the museum is principally concerned with the handicrafts with which the craftsmen practising them can adequately deal; just as in architecture only the best can be learned from architects of practical experience. The crafts are, however, organically associated with architecture, and cannot properly be separated from it, and the more we study the better. It would probably be more profitable to begin in the workshop rather than in the museum. In the former we see the practice in the latter only the results, and it is with practice, i.e., the causes of the results, that should be principally concerned. To recognize good from bad in a museum we must understand the methods of the workshop, we must get down to the facts and work if possible among those whose eyes are open to distinguish good from bad, working in the spirit and traditions of those who fashioned the useful and beautiful things of the past. To understand our work is to be in sympathy with the simpler elements of

One reads of Michael Angelo spending years of his life quarrying his own marble—it is doubtful if those years were wasted. Or, again, whether the painter-architect who built the Campanile at Florence was not all the better that he began life as a shepherd? Ploughing, hewing, quarrying, iron smelting, weaving, moulding, all go to make up the complex conditions of modern building, lost sight of perhaps in modern specifications, but a due regard for which is at the root of all great success in building.

I think we must feel our relationship to the past and its workers to kindle the enthusiasm necessary to get us over the difficulties of to-day. Those who have been successful latterly have had this enthusiasm; they have had the genius at the outset of discerning the facts, and having mastered them—questions of design solved themselves—the weaving of fresh inventions became more easy than the revival of any style. They very likely did not feel at home the first time they entered a museum or gallery any more than you or I. Personally I have felt the chaotic sense of impotence in the museum, as in a big library without a librarian. It is only as we are enlightened outside under the sobering influence of technical knowledge that the "little miracles of art" begin to breathe for us. It is easy in the conditions under which we work to make mistakes. We may start with plenty of enthusiasm, but over confident, or unaware of the pitfalls that await us. To have spent hours drawing a subject the art of which at the time was a closed book; to have bought photographs of comparatively worthless objects and come home with copious notes and measurements without having seen the precious things we ought to have seen; to have measured carefully the *only* part of St. Paul's Cathedral not the work of Sir C. Wren—these are humiliating experiences to which I myself must own. Some students are better guided, or naturally do better; they browse in any pasturage, however rich, choosing wisely, referring from the first what they have before them back to their natural elements, or to recognised standards of taste which they have been so fortunate as to imbue from childhood. But there are a great many, perhaps the majority, who emerge from a home happy very likely in everything save in its pictures, furniture, and ideas of art. They have imbibed the current opinion that art is apart from life, an adjunct, a luxury, consisting of churches, pictures, and drawing-room statuary. Study at a museum may be the first corrective they will receive, and they enter it without the knowledge necessary to discriminate between the good and bad work which it holds. A museum represents a great change that has taken place in social life. The machine now rules us, and all that stands in the way of it and of the development of our mechanical faculties is in danger of disappearing. The State has at great expense gathered together the crumbs and fragments of the past that remain, and is engaged at last in properly housing them. It is affectation to rail against the present conditions of society unless we are willing to place ourselves outside its pleasures and conveniences; we cannot get back to the palmy days of mediæval art and romance even were it proved to be desirable. S. Bonaventura, writing in the XIIIth century on the arts, says that "the illumination of mechanical arts is a way to the illumination of sacred Scripture; and there is nothing in them which does not predict and foreshadow the true wisdom." I quote this merely to show that our art is a great enough concern for us for a lifetime, so near is it to the heart of things.

In the museum we see art in the humblest objects and materials. We can trace their relationships, and see that it was this relationship that made it so powerful in the past. It shows a close and healthy connexion with things of common use. There are no boundaries between the so-called "fine arts," the higher mechanical, and the lesser and useful ones. Hand and mind were trained in the same school, under master workmen, having for models contemporary work. Architecture, sculpture, carving, and painting were intimately connected, woven together of necessity and by Nature. As an instance of this, take the east of the monument of Walter Grey from York Minster, in the architectural room. It is a rather ornate work of the XIIIth century. The architecture adequate and refined; the sculpture of the recumbent figure simple and impressive, befitting an effigy neither dead nor sleeping; the carving of the foliage and the birds in the finials is fresh and pleasure-giving, while

touches of quaintness are allowed. There are two French fragments of the same date as the foregoing close by, one a charmingly-treated little Assumption of the Virgin from Notre Dame, the other a retablo from the Church of Saint Germer; each of them show a mastery of design, of figure sculpture, and carving. The easts of the doorways at Norwich and Rochester show the same connexion, and what would the Gothic portals from Amiens and Bordeaux be without their figure sculpture and carving? There is also a fine cast of Nicola Pisano's Pisan pulpit. Born at the beginning of the XIIIth century, it must not be forgotten that he grew up among some of the fine sculptures of the ancients, from which he got his inspiration. Classic as his figure work is, he has been called the founder of Gothic sculpture. Here you have a cast of his most famous work. It does not give the beauty of the material, the granite, jasper, and marble columns, but the sculptures are there, showing his study of classic models, some of the figures being direct copies from the Greek work in the Campo Santo at Pisa. I think it is the lovable humanity in the sculptured work of the XIIIth century that appeals to us. There is more reality about it than in the realism that succeeded it. The symbolism is less crude and mechanical. The later and richer work shows less restraint and less allegory; it fills us at once with a sense of the cleverness of the artist and with wonder at the command he has attained over his tools and material. As the admirer of the Renaissance craftsman said, his production seems "as if it were alive, a marvel too great to be believed." Such an end shows a misunderstanding of the purpose of art, which is not to exalt either the artist or the material into anything marvellous or unnatural. Neither is the artist to be a slave to technical skill and to imitation. You can judge of this by comparing the pediment of the doorway of Milan Cathedral with the work just mentioned. The east of this bangs on the north wall of the architectural east-room. Notice also the fine western portal of S. Sauveur at Aix, in Provence, the doors of which, the work of nearly a century later, very richly carved and sculptured, are treated in a manner much more suitable for bronze casting than for wood. The German work of Adam Kraft in the XVth century is also interesting; it seems to me too pictorial for architectural decoration. His large Sebreyer monument at Nuremberg is a design that would look more suitable executed in tapestry than in marble.

Besides enabling us to compare the characteristics of the different periods and the treatment suitable to different means and materials of expression, the museum gives an insight to any district or country. You can see the peculiarities of the work before visiting it, or remind yourself of the things you have seen on your return. To enter the Italian court is to desire to be in Italy again. It suggests cool white churches and rich colour decoration, sunny piazzas and polished marbles. We are in a new world, the world of the Renaissance. The fancy that inspired what we see is not that of the Gothic period; left behind are the XIIIth and XIVth centuries. What we see now is less lovable and homely, more scholarly, more refined and dignified; more dependent on exact workmanship and on fine materials; more the work of one individual who has coerced others to assist in the expression of ideas too great for them to understand. The architecture of the Renaissance is so dependent on greatness of idea, repetition and symmetry, that these fragments at the museum serve only to show the extraordinary skill and beauty of the workmanship. You can study Italian architecture better upstairs in the library from books and photographs. Here are only incidents; Italian history is the story of the art of the Renaissance. The whole field of art is widened and extended, and its study becomes more complex. Intellect is at work superseding the saintly artists of the XIIIth century. Arnolfo's fine Gothic church of Santa Croce at Florence passes almost unnoticed amidst the later work of the sculptor architects. In the east-room is a copy of the Renaissance pulpit in this church which attracts more notice from visitors than the church itself. It is the work of Benedetto da Miano; it shows the extent to which refinement with strength may be carried, and the attraction of elaboration. The detail is as beautiful as the general outline. The exquisite grace of the tiny statuettes set in their porphyry niches, as

well as the panels illustrating the life of S. Francis, is delightful. The execution of the whole work is carried to the last pitch of perfection, done by a man who began life as an intarsia worker. I speak with knowledge of this pulpit, having spent fifty precious hours at Florence making a drawing of it. Another example of the sculptor-architect's work at the museum is a cast of a window from the Certosa of Pavia. It is noticeable in these buildings that as the figure work improves the carving of the natural objects becomes harder and less free and graceful.

Unfortunately the great master architect, sculptor, engineer, and painter is not properly represented as far as architecture goes. There are no models of the Medici Chapel at Florence except for the statue of the Duke Lorenzo himself. In speaking of Michael Angelo I should refer to Alfred Stevens, so well represented in the museum. We cannot, in my opinion, study two greater masters of classic form applied to modern building. Their work was conceived in the round. With them sculpture and carving was not a thing to be added on afterwards or left out altogether as the funds allowed. When they employed either it was an integral part of the design. Besides the many interesting architectural fragments it is possible to study representative work of most of the great sculptors of the Renaissance. There are copies of the works of Orcagna Donatello, the della Robbia's Ghillerti, and the rest, each of their work distinctive and impressed with their own individuality.

Reverting to the bumber object of this paper, which is an endeavour to show the value of the museum for studying the handicrafts, we naturally turn to carpentry, which is so closely allied to architecture. Furniture, like building, was once intended to serve the everyday uses of common necessity; as this is more generally realised we shall be able to furnish our houses again so that they will be both convenient and interesting. We find very few varieties of furniture in the museum because there were very few different kinds of furniture made in the Middle Ages. The box was the principal item in a room; cupboards, stools or benches there were, but tables and chairs came later, and were something of a luxury. There is, unfortunately, little furniture of the XIIIth century in existence, but we know it was highly and beautifully decorated. The woodwork is simple carpenter's joinery with a character all its own from the straight-forward solution of the difficulties which the carpenter experienced in the course of his work. There are some coloured drawings of furniture of the XIIIth and XIVth centuries in the library, and some interesting reading on the subject in "Furniture and Woodwork," a book published some thirty years ago by Mr. Hungerford Pollen. Professor Lethaby's suggestive essay in the published volume of the Arts and Crafts Society is instructive and inspiring. These are all in the museum library, to which ready access can be got for a trifling sum. Professor Lethaby recommends the study of pictures in old manuscripts if we wish to furnish our rooms properly. I think a right understanding of furniture can only be arrived at by studying the earliest work, before the principles which govern its construction became lost sight of in the complicated work of later centuries. There is a fine collection of chests or boxes in the museum; the earliest are of the XIIIth century—one Italian, one French; the Italian one has a bowed top, the top and front are divided into six panels by thin bands of patterned metal; each panel is decorated with gesso-dunro ornament on alternate red and black backgrounds; the French example is more substantial and less ornate, its decoration consists of handsome wrought-iron scroll work with which the front and sides are well covered. The only English workwork of this date in the museum, besides fragments of carving, is an oak door. It is a lively piece of design worked in the solid in a primitive manner, with charming little beasts and birds and flowers carved with much simple skill. The chests were used for various purposes; they served indifferently as tables or seats; many of them are inlaid on top for chess, the players sitting at and on either end. They were used as portmanteaus when their owners went on their travels, being slung on horses. They were also used to keep the tapestries in which served as wall decorations on state occasions. These were usually of cypress-wood decorated with incised work in

scrolls or geometric patterns; they were not so substantial as the dower chests.

The early chests are dependent both constructively and for their ornament on the branching scrolls of iron work, of which the French example above mentioned is a fine specimen. There are many of these chests still to be seen in country churches. Some of them are very richly carved all over like that at Dersingham, Norfolk, a cast of which is in the English woodwork section; the front has the emblems of the four evangelists and a border of birds and rosettes; this is of the XIVth century. There is in the French section a small chest of this date showing two mounted knights in all the furniture of war, tilting; and there are both English and foreign examples of the fronts of chests carved with a perfect gallery of knights and ladies, showing on one plane the whole story of St. George and the Dragon. Much of this carved work was originally richly coloured. I read in Mr. Pollen's book that Henry III. directed that "the King's great chamber at Westminster be painted a green colour like a curtain, . . . and that the King's little wardrobe should be painted a green colour to imitate a curtain." The wardrobe of those days was a special room fitted with hanging closets for clothes, and for spices, etc. In the XIIIth century chests began to be furnished with panelled wooden backs and arms. Persons of quality used tapestry screens or dorsals at the back and sides to shelter them from draughts. It was this desire to give honour to individuals which created the invention of the separate chair. A survival of the chest and dorsal is still to be seen in village inns in the high-backed and sometimes roofed-in settles. I have just mentioned the introduction of chairs. You will notice in nearly all the early specimens at the Museum the great height of the seats from the floor. Was this to give extra dignity or to keep the sitter's feet above the draughts, etc.? Other early decorations of the chest are more suitable to modern furniture of a simple and serviceable kind than those above mentioned. They consist in emphasising the constructive features, beautiful patterned dove-tailing at the angles, the projecting lid or huck with purlled edges or gouge cuts in patterns or simple diaper work; or instead of being made of six planks of wood the sides and ends are framed and panelled, the framings being elaborately chamfered somewhat like the modern work of a wheelwright. Cupboards were originally panelled closets and sideboards called dressoirs originated the name of cupboard. The lively cupboards were the larders of the Middle Ages; a cloth was laid on the top—probably a coloured one powdered with worked flowers—and narrow shelves rose in steps at the back for keeping the pewter and other serviceable utensils on. The tables at this time were long boards hinged down the centre, laid loosely on folding trestles. There is a late and highly ornamented example of this in the Italian court on the west side, the top and legs being beautifully inlaid in geometric patterns with ivory. Note also the ivory inlay on the chest opposite to it which is of the XVIth century. I refer to the floriated panels which, instead of being a skilled imitation of Nature as in the later work, is rather a successful interpretation of it. All the bedroom furniture of the early period was of panelled wood, linen chests, settles, cupboards, and beds; in the last, printed or tapestried hangings played an important part in the design.

The Italians regarded furniture and woodwork as a fair field for decoration and their genius left its air of distinction upon it. Their work of the XVth century is full of interest as the type of later developments in all countries. The chests of this and the next century are very fine and there is a representative collection at the museum. Some of them are elaborately shaped and gilded, the fronts and ends decorated with gesso-duro showing brightly-coloured pictures of marriage ceremonies and classical stories. This is the sculptor's art of the time of Michael Angelo and Benvenuto Cellini which furnished the gorgeous palaces of Popes and nobles. Scholarship has got the upper hand of the arts of construction, carving, and painting. More beautiful, I am inclined to think, because more useful and less frail, are the exquisite inlays of this period to which I have already alluded. There are quite a number to be seen, showing what an immense output there must have been. Most of the pieces are inlaid marquetry of ivory and coloured woods low and rich in tone, decorated inside

and out, the inside no less beautifully than the out. The inside is fitted with little drawers and pigeon holes for jewels, money, and papers. Other chests of this period are lightly incised with a pattern, the excavated parts being filled with coloured mastics. One of these shows the judgment of Solomon on the front. Others again are quite plain without, like the XIIIth century chests, ornamented with metal work of more elaborate workmanship than the early ones. The metal work consists of very intricately pierced and chased lock plates, hinges within and without, handles at the ends, corner clamps, and bosses which are merely ornamental. In a few cases highly coloured textiles are placed beneath the metal showing through the piercings. The Italians are, however, outdone in richness of effect in this class of decoration by the Spaniards and Portuguese whose work may be seen in the gallery opposite the refreshment rooms. A phase of decoration in which the museum is not so rich is that more elaborate intarsia, inlaying with coloured woods whole pictures of figures and other subjects. There is a marvellous example from Augsburg of the XVIth century which is representative although it was an essentially Italian art. It is to be seen at its best in Bergamo in the decoration of the choir stalls of Sta Maria Maggiore, and at its worst in the late Dutch examples.

I cannot attempt to deal with the well-known periods of English furniture. I am afraid it is a fact that very little furniture was made in this country; most of it came from abroad, at least till after the Wars of the Roses. Later, again, most of the best English furniture, so-called, was made by Dutchmen in England or imported from Holland. And the Huguenots were responsible for a great deal. It is possible, I suppose, that inferior wood and workmanship is not confined alone to our own times, and that only the best has survived to our day. Anyway, it is disappointing that English work is not better represented. It seems to me that the good tradition of early work was more faithfully carried on in this country than any other.

If I may digress, I should like to add that I think it is to the early type that makers of the best modern furniture have turned. It allows more scope for the imagination and less for the machine than the later work of the Renaissance. Good furniture can never be made by machines, human or mechanical, therefore at the present time it cannot be procured at shops; one has to find individual craftsmen who make it themselves and treat them as we would that our clients would treat us. That is to say, they must not be asked to do impossibilities. Woods and their natures, and even the stock which they may have seasoned and in hand, must influence their work more than we may suppose. The labour of a thoughtful man following his craft is of much more value than of the artisan working from a drawing which we have made ourselves. We may conceive the furniture for the room, but intimate co-operation is necessary to bring it to a successful issue. The beautiful furniture now being made retains the simplicity that characterises all good work, often showing great ingenuity of construction and sometimes very elaborately decorated inlays or paintings. The experiments of William Burgess, Wm. Morris, Burne Jones, and Maddox Brown are bearing fruit, I believe, in a school of English furniture founded in reason and good workmanship.

No part of the museum is more interesting to me in itself than the ironwork gallery. There is so much variety; its contents show such a fascinating combination of simple ingenuity and intricate design. Where else can you see such door handles and knockers? or such locks and keys? so much mechanical skill allied to beauty of form and finish? The simplest rushlight-holder stuck in a log of wood is something more than a curiosity. Candlesticks in every form abound; really useful things down to great architectural corona and candelabra in the court below; German and Byzantine work of the XVth century; Italian Gothic of the XIIIth, and Renaissance of the XVth and XVIth centuries; window gratings and balconies; fire backs and fire dogs and irons, black or polished; hour glasses and vases painted in gay colours. Smiths' work in all its branches is interesting, especially applied to architecture. To have seen casting, puddling, and welding, is to ever afterwards have an interest in the material; to recognise its fitness in certain positions and in certain forms. Ironwork forms so important a part in

building it is a pity it is not more studied if it were, what still exists of the XVIIth century would be more valued and cared for. The lamp standards on Waterloo Bridge would not have disappeared and gas and electric standards would not be of the ugly and suitable type to which we are accustomed.

I suppose it is impossible for a mere man to know anything about the practical side of embroidery and needlework. Nevertheless, I think the English architect has a natural aptitude for the more homely arts. A chair covering, carpet, or the tiles on a hearth mean more to him than, for instance, such small things do to a Frenchman. As a friend said to me the other day, "abroad they have no fires, architecture," asking why? he replied, "because they have no fires!" And it is no doubt true that what we lack of continuity, orderliness and stately architectural effect our streets, we endeavour to make up for by comfortable homeliness in our houses. I do say that this is the better way, but it certainly adds to the pleasures of life to form a taste for the lesser arts. There is no more accessible place in London for the study of colour than the museum among the relics of the great times, early weaving embroidery and appliqué work. Not only should we find the gems of the Middle Ages and of the later work of the Huguenots both akin to our instincts and traditions, there is the richness of the East in Indian and Persian work. The beauty of the East work does not invite competition or imitation but it lets us into many secrets of colour, beauty of elaboration when all is fresh and inspired, and the value of patience in any work of art. Here, as in any other study we undertake at the museum, we shall be forced to the conclusion that the machine is impossible as a creator. No machine could have done these things, nor any man working as a machine. Such a person works against time, whose endeavour is to obliterate the gradations of texture of hand work done from day to day.

The mere fact of hand weaving being not so common a practice as to be almost though happily not quite extinct, tempts the architect into designing his own hangings and church furnishings. When this is necessary, it is the type that matters. Often the result is a dead-alive exercise in some "style" lacking the charm and the spontaneity of the Raphaelite work and the beauty of colour and texture of the more staid and scholarly work of the XVth, XVIIth, and XVIIIth centuries. The design is too often executed by machine or by ladies, accomplished in all the resources of stitchery, with machine-like accuracy.

We can become accustomed to good combinations of colour in the Italian Court and the majolica. In the Eastern Section among coloured tiles the pottery, china, and porcelain I think, too, the water-colour rooms have value for architects. The drawings of P. Roberts, Cattermole, Turner, and Hunt have something more than the architectural draughtsmanship of the present day. No representation of architecture seems to me complete without its colour and texture; any other kind of drawing is a make-shift, and as a rule a photograph preferable.

In one of the windows in the museum the Professor Moody has put a fine quotation which I must close. "The wisdom of a learned man cometh by opportunity—How can wisdom that holdeth the plough?—He giveth his mind to make furrows and is diligent to feed the kine fodder. So every carpenter and master that laboureth night and day; and the that cut and grave seals; the smith also sitteth by the anvil, and considering the iron work. The potter sitting at his work and turning wheel about with his feet, who is always careful to set at his work.—He fashioneth the clay with his arm and boweth down his strength before feet.—All these trust to their hands: With them cannot a city be inhabited: They shall not be sought for in public counsel, nor sit in the congregation: They shall not sit on the judges seat nor understand the sentence judgment:—and they shall not be found with parables are spoken.—But they will maintain the state of the world and all their desire is the work of their craft." I have taken up much of your time and leave the mass of subject to you untouched upon."

Mr. W. A. Forsyth, who opened the discussion said he was in agreement with Mr. Curtis G. The subject was a welcome one, and should lead to a better understanding of the pur-

of an architectural museum, and to a more suitable direction of its study. He apprehended that the subject was treated from the educational point of view, and it must be admitted that the South Kensington Museum formed an essential part of an architect's training. Mr. Curtis Green had said that only present day craftsmen could thoroughly understand the objects at South Kensington Museum, but he did not suggest how the many hundreds who were not craftsmen might best benefit by their study. Furthermore, as their study was surely to be taken on the comparative basis, there was, he thought, much to be wished for in the fuller explanation of the exhibits, and suggested as an instance the desirability of appending sales to photographs, sketches, etc., with notes of the history and sociology, together with a list of reference works and information where such could be found. In this way the telligent grasp of the subject would be facilitated and help to kindle that enthusiasm Mr. Curtis Green spoke of. In regard to that gentleman's remark "that hand and mind are trained in the same school under master workmen having for models contemporary work," this was, the speaker thought, sound and applicable to-day as it ever was, and the South Kensington Museum had, he ventured to think, acted wisely in its selection of modern work. He thought that the limited extent of the British examples formed one of the weak spots in this museum, and noted that there were no examples of such typical works as mediæval stone vaulting, colour decoration, flint, or plaster work, and apart from these such a national craft as Sheffield plate as represented by but one single case. He had always found this building trying from the "headache" point of view, and attributed it a great measure to the unsatisfactory nature of the light, especially at night, and he thought the open courtyards and exterior spaces might with advantage be used for exhibition purposes. He agreed with Mr. Curtis Green in advocating the study of early forms in furniture, and referred to the specimens of modern work on show at the last Architectural Association Innersession by Messrs. Bransley and Ineson as showing the advantage of such study. He thought the two panelled rooms in the South Kensington Museum were very valuable because being a "complete" idea of English decoration in furniture in earlier times. The objection to machine-made articles was, he thought, not within certain limits. In concluding he liked to paraphrase Mr. Curtis Green's statement and make it read thus: "To understand the simpler elements is to be in sympathy with our work."

Mr. F. Lishman thought that the smaller objects might be studied to better advantage on the larger, being more self-contained, and depending less upon their setting and surroundings. Some of the Italian and French mediæval "ivories" were instances in this connection, and examples from other sections of the museum also touched upon, with special reference to their colour and decorative—even neutral—suggestiveness for work on a large scale, whether secular or ecclesiastical. A satisfactory study of the ironwork on exhibition was possible, owing to the extremely bad lighting of the galleries where it is nominally on view. The Indian and Eastern sections deserved to be better known, for their contents offered a rich field for study.

Mr. T. Ryfe, in a brief speech, spoke of the comparison between a museum, and a library without a librarian, referred to by Mr. Ineson. Regarding the casts in this building, he sought a knowledge of the materials forming the original from which casts were taken was essential, otherwise they might prove a source of deception. It was, he thought, a good thing to guess at the materials first and afterwards prove or disprove these by making inquiries. He considered that some of the exhibits in the present building—for example, the Byzantine bronzes, could not properly be seen; and hoped that this might receive attention in Sir Aston Webb's new building.

Mr. A. H. Belcher said he knew very little of the South Kensington Museum, and regretted he trusted that Mr. Curtis Green's paper could be printed, for it was by open discussion in the public press that a great many desired improvements were effected with satisfaction at all parties.

Mr. H. Gregory Collins (chairman), on behalf of the meeting, expressed his gratitude to Mr. Curtis Green for his paper, especially the

practical side. Personally, he was not quite in agreement with Mr. Curtis Green as to the necessity of technical knowledge, for the museum had distinctly another side to it, and that was with regard to inspiration. He regretted the paucity of English work, although the beautiful examples of French must, he thought, be regarded as in some measure making up for this defect. The study of the gradual change from French Gothic to Renaissance was a matter of great interest to him, and doubtless many others. In concluding, he much appreciated the paper as being so exhaustive, a view fully shared by those present.

Mr. W. R. Lethaby, as Special Visitor, then summed up the discussion.

He prefaced his remarks by saying he held no brief for the South Kensington Museum, though possibly he had received more kindness at their hands than the usual visitor, but this was due to the frequency of his visits, he felt sure, more than anything else. At one of the late Mr. William Morris's lectures he remembered him saying that the South Kensington Museum had been built for him (Mr. Morris) and this remark showed the measure of his appreciation of the museum as a factor for education and inspiration. The speaker congratulated Mr. Curtis Green on the nice spirit and good taste displayed in his written paper, the reading of which had given much pleasure to him. He advocated the careful study of old manuscript pictures as tending to a better understanding of the principles underlying the design of old furniture, a study well worth while even though it were not undertaken with the view of immediate design for practical purposes. Mr. Lethaby said that he had known the South Kensington Museum for twenty-five years and had come to the conclusion that by a careful selection by one competent to judge, such an one might derive almost as much good from a tour of this building as by an actual tour in the country from which the examples came. A matter which had recently impressed him was the considerable number of mediæval sculptures in the museum. The point he most desired to emphasise was the need of concentration of which the late Mr. William Morris formed a conspicuous example. This master of crafts got his works up, so to speak, in passions, the last six or seven years of his life being concentrated upon printing, and to this end he exhausted every source of information and suggestion. Mr. Morris's life, as evidenced by the number and variety of his works, seemed to consist of, figuratively speaking, a series of giant-like gulps, each taking from four to six years. The whole of these times being given up entirely to the utmost concentration upon the particular craft in hand. The speaker urged the necessity of such concentration as leading to results which work based on a general scale fails to secure. He believed in the use of a museum for stimulating "our sense" of beauty, but old buildings he regarded as the best possible means of inspiration. He believed in no system that had for its object the "teaching" of beauty, that in his opinion, was impossible; what could be done, however, was to teach subjects and matters which would lead up to an appreciation and understanding of beauty and after that leave the rest to spontaneity. A matter of great regret to him was the sad waste of energy occasioned by the making of individual sketches based upon no organised system, and he thought there was great need of some such system being inaugurated, having for its object the collection, classifying, filing for reference, and such like of sketches, measured drawings, etc., as was done in certain departments in the British Museum. The Architectural Association *Sketch Book* had in this way done a great work for two generations, and he quoted it as an example of successful effort to a definite end. He would suggest that the Architectural Association might, seeing what fine new premises they now had, consider the matter. Perhaps the best advice he could offer those present was to look at things frankly and simply with "our own eyes," and not go to a museum with preconceived notions, as that was fatal to a proper appreciation of the contents of such a building. Lastly, he wished to say that the want of appreciation of a museum should not be a source of contention provided the person or persons concerned had an honest enthusiasm for something else. There must be a practical side to the community, and there was no doubt that too great an interest in ancient works tends to militate from success in more practical art for to-day.

Mr. Curtis Green briefly replied, and the meeting terminated with a hearty vote of thanks to him and the Special Visitor.

ARCHITECTURAL SOCIETIES.

GLASGOW ARCHITECTURAL ASSOCIATION.—At an ordinary meeting of the Architectural Association, held in the Rooms on Wednesday, the 16th inst., Mr. J. J. Gillespie, delegate from the Edinburgh Architectural Association, read a paper, illustrated by drawings and lantern-slides, descriptive of English towers and spires. Mr. Gillespie went closely into detail and sub-division, illustrating central and western towers of Norman Transitional and Gothic work, and similarly towers with spires and lanterns. It was announced that the next paper would be given on December 16 by Mr. Bromhead, on "Registration of Architects."

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.—At the opening meeting of the Leeds and Yorkshire Architectural Society, at the Queen's Hotel, Leeds, on Thursday evening, the 17th inst., the President, Mr. C. Bertram Bulmer, in the course of his address, had some interesting and critical comments to make on Leeds architecture. Mr. Vickers Edwards, in proposing a vote of thanks to the President for his address, expressed the view that the Leeds New Markets might have been erected for less money, with due regard to the interests of the ratepayers. He thought that every man who entered upon the noble profession of an architect should be registered. Mr. W. H. Thorpe, of Leeds, in seconding the motion, mentioned that he was an old member of the Society, and had served on its Council for twenty-eight years. He praised the good work being done for architecture by the Leeds School of Art, and commented upon the excellent positions gained by the Leeds candidates in the professional examinations. In passing, too, he had a good word for the Leeds Arts' Club. Earlier in the evening the President distributed a series of prizes competed for by associates of the Society. Mr. Ralph Thorpe was awarded a silver medal and 5*l.* for some measured drawings of Hemingborough Church, near Selby. A prize for drawings, showing the construction of an entrance hall and staircase, was won by Mr. Martin S. Briggs. Prizes for design were awarded to Mr. Godfrey L. Clark (first), and Mr. J. Crust (second); and prizes for sketching were given to Mr. Martin S. Briggs and Mr. S. R. Wyvill (extra). The prize work was on view at the meeting. As usual, the annual meeting partook of a social character.

ARCHÆOLOGICAL SOCIETIES.

BRITISH ARCHÆOLOGICAL ASSOCIATION.—The session 1904-5 was opened on the 15th inst., at 32, Sackville-street, Piccadilly, the President, Mr. R. E. Leader, in the chair. A lecture was given by Mr. John Garstang on the Roman fort at Brough, and the results of recent excavations on the site. The lecture was illustrated by a large number of photographic views and plans exhibited by lantern light. The Roman fort at Brough, said the lecturer, was a unit in the general scheme of defence in the north and west of Britain, which belongs, in the main, to the early and middle Iron century. One well-defined Roman road joins ancient Brough with the Roman sites at Buxton (Agna) to the south, and Dinting (Melandra Castle) to the north. The Roman fort (castellum) and the Roman camp (castra) are not to be confounded, although there are points of resemblance between them sufficient to warrant a conjecture that both were based upon a common general plan. Both were regular four-sided enclosures with gates and ways and buildings always symmetrically placed. But the camp, whether of a temporary nature, an earthwork thrown up on the march, destined, perhaps, to be evacuated after a single night, or a permanent fortress, was in either case planned for a large number of troops, a whole legion or more, and consequently covered many acres of ground. The Roman fort, on the contrary, was definitely small and strong, the permanent quarters of a garrison. Its area was commonly four to six acres; in some cases it might be so small as three or so large as eight. The number of soldiers who might be quartered within it is not known, and necessarily varied in different places; but, judging from inscriptions, a cohort

of auxiliaries would commonly constitute the garrison. Mr. Garstang then proceeded to describe the general aspect and purpose of a Roman fort, together with the interior buildings, so far as their uses are at present known. It is hoped the excavations recently undertaken at Brough may result in clearing away the uncertainty which exists as to the use of certain of these buildings—such as the large building usually found about the centre of the enclosure, generally called the Prætorium. The fort at Brough was one of the smaller forts, and is situated a short distance from Hope station on the Dore and Chinley line through Derbyshire. The excavations made for the Derbyshire Archaeological and Natural History Society in August, 1903, were of a preliminary character, but, they have, nevertheless, revealed some very interesting features, which prove the plan of the fort to be nearly a regular four-sided and walled enclosure with rounded angles, and, seemingly, a gateway about the middle of each side. One feature of particular interest disclosed was an underground chamber about 8 ft. long by 5 ft. wide at its narrower end, but about 7 ft. wide at the opposite end. This chamber showed unmistakable evidence of having been altered at a period subsequent to its first formation, the upper part of the wall at the narrower end having been cut away to insert a flight of steps, which, about half the height from the bottom, are built up against the wall, and are formed of the stones taken out of the upper part. A very interesting and important discovery was made during the excavation of this pit, or chamber, in the shape of an inscribed tablet. Although the tablet was in four fragmentary parts they practically presented the whole of the essential part of the text, which Mr. F. Haverfield renders as under:—"In honour of the Emperor Titus Aelius Hadrianus Antoninus Augustus Pius, Father of his country (erected by) the First Cohort of Aquitanians, under Julius Verus, Governor of Britain, and under the direct orders of Capitonius Fusus, prefect of the cohort." Only a few days before these fragments were unearthed an inscription of Antoninus Pius was found in the river Tyne,

at Newcastle, which also bears the name of Julius Verus. The discovery is the more valuable because hitherto Verus had not been known to have governed Britain. The photographic illustrations and the capital perspective and "bird's-eye" views, showing presumed restoration of Roman forts, gateways, and bastions, prepared from authentic details, enhanced the interest of the lecture. Dr. Birch, Mr. Forster, Mr. Emanuel Green, Mr. Gould, Mr. Kershaw, and others, took part in the discussion which followed.

Illustrations.

THE CARTWRIGHT MEMORIAL HALL, BRADFORD.

WE published a few weeks ago an illustration of what may be called a corner of this building, a portion of it shown in a drawing that had been exhibited at the Royal Academy.

We give now a plan of the building and a view of it as a whole, as well as a view from one end showing the side of the porch and loggia over it, and an interior view showing the main staircase.

The building was the subject of a competition which attracted a good deal of interest, and in which the design of Messrs. Simpson & Milner Allen, now carried out, was selected. The Hall was to be, as our readers may remember, a memorial museum and art-gallery; forming a monument to Cartwright, an eminent Bradford manufacturer who had been a benefactor to the city.

NEW ORGAN AND CHANCEL, KINGS WEIGH HOUSE CHURCH.

The present structure, built about fourteen years ago from the designs of Mr. Alfred Waterhouse,* is an oval building, with an iron and plastered ceiling domed up to the central oval ventilator. The gallery, which ran right round, stopped against the old organ

* An exterior view of the church was published in our issue of January 18, 1890.

case, which occupied the end wall-space. The design of the upper wall, above the gallery, was based on a system of niches alternating with windows.

In forming the new chancel the three niches were opened up, and a new wall came straight across, faced with terra cotta, and pierced with three windows corresponding to the opened niches, was built as a chancel end.

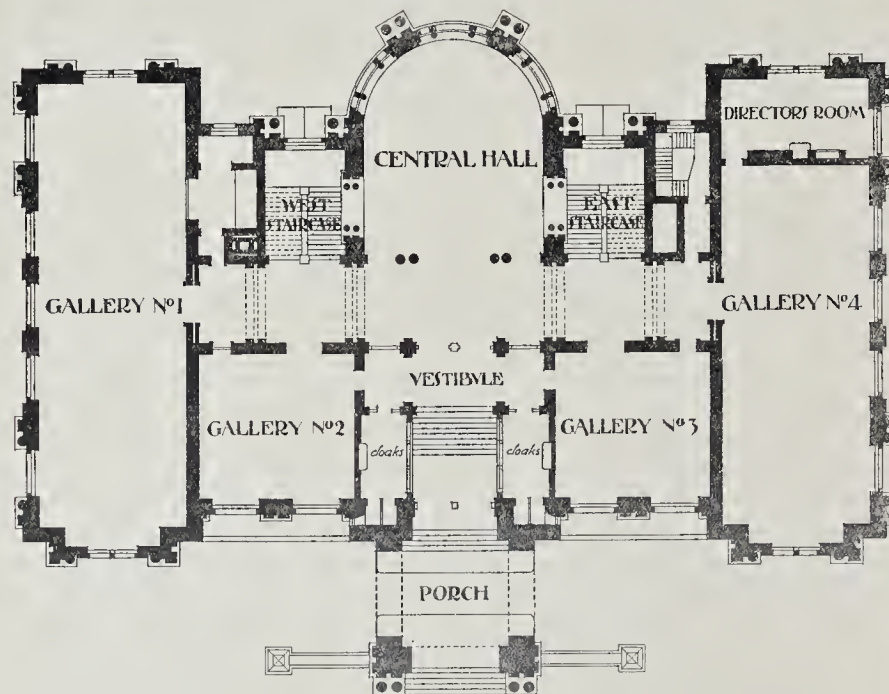

Part of the existing gallery was cut away on each side, and the new organ case, in two positions, was erected so as to form a chancel enclosure. The strong enclosing line of terra-cotta chancel end, and the projecting cornice over, were designed to emphasise the square form of the chancel.

Some slight alterations were effected in the pulpit, a reading-desk, and choir seats placed at the sides of the chancel, in front of the organ case. Seats for the minister and organ case were placed against the end wall, behind the Communion table; and above the space was 1 ft. for a hanging, or tapstry. The scale of the woodwork detail has been kept as far as possible in harmony with the present existing.

A niche for a font was formed in front of the left-hand organ case, and the base of this well as the pulpit base, the reading-desk, and the floor and steps of the chancel up to the choir seats, was finished with marble of various kinds.

The new organ case and all other new work was executed in Austrian wainscot oak. The contractors for the entire work were Messrs. John Shillitoe & Son. The sub-contractors were as follows:—Terra-cotta work, Messrs. Burmantofts (Leeds Fireclay Co.); masonry, Messrs. Galbraith & Winton (Glasgow); electric lighting and pendants, Messrs. Thomson, Ritchie, & Co.; heating and ventilation, Messrs. G. F. Haden & Son; upholstery, Mr. Thomas Hall.

The organ is by Messrs. Henry Willis & Sons. Mr. R. Anning Bell designed the stained glass windows of the chancel end, and they were executed under his supervision by Mr. Arthur J. Dix. Mr. John J. Burnet, A.R.S.A., is the architect.

WOOD CARVING BY STUDENTS OF THE ROYAL COLLEGE OF ART.

This illustration shows some of the work done by students of the Royal College of Art, and recently exhibited at South Kensington. Each of the panels are, in their way, fine examples of carving in wood; there is no straining after originality in design, but each student has attained freshness and sound decorative feeling. The hunting scene shows movement and rhythm; we like, too, the rendering of the bear at the mouth of the cave; the armorial panel is not quite finished; the mantling in this, and the foliage in the pilasters, is vigorously treated, showing far more life than we are accustomed to in work of this class nowadays. The horizontal panel also shows the result of thoroughly good training in rendering in conventional and suitable ways natural objects.

No. 1 panel is by Mr. A. E. Payne; No. 2, by Mr. E. Walker; No. 3, by Mr. J. H. Morton; No. 4, by Mr. W. Wetherell; No. 5, by Mr. W. Vetherell; No. 6, by Mr. A. H. Livens; No. 7, by Mr. J. H. Morton.

COMPETITIONS.

CARNEGIE TECHNICAL SCHOOLS COMPETITION.—We have received the programme, which forms almost a hook, of the competition (which has just been decided) for the selection of an architect for the Carnegie Technical Schools, to be erected at Pittsburgh, Pennsylvania, U.S.A. The scheme is an immense one, dealing with a site of the area of 32 acres, though of course a large portion of this land will not be actually built upon. Trustees of the scheme were appointed, who in turn appointed a Committee to carry out the architectural competition. The general features of the scheme may be best explained by the following extracts from the Programme:—

"For the purpose of selecting an architect the Committee have established this competition, and have engaged Professor Warren P. Laird, of the University of Pennsylvania, as their adviser in the preparation of its programme and the making of the awards. Five architects and architectural firms have accepted an invitation of the Committee to submit designs in a competition, for which service they will be paid 100 dollars each. They are Messrs. Carrere & Hastings, New York; Frank Miles Day & Brother, Philadelphia; Mr. Cass Gilbert, New York; Howells & Stokes, New York; Mr. George B. Post, New York.

The competition will be open also to all other architects whose experience and capacity in the design and execution of large work may warrant the Committee extending to them an invitation to take part. Architects desiring to enter are therefore requested to provide the Committee with information as to their professional rank upon blanks to be had upon application to the architect, Arthur A. Hamerslagh, 313, Sixth-avenue, New York, N.Y.

Also all other communications relating to the competition are to be addressed to the Director as above. The competition will be restricted to invited architects, selected as above.

Twenty-five 1,000 dollars each are offered to competitors, other than those who are named above, and the highest in merit, one of these five being assured may extend to Allegheny (see) County architects. These awards will be paid as hereinafter provided.

The prize of the competition will be the commission to design and supervise the erection of the buildings intended for portions of the County architects, and of other buildings, as hereinafter stated, and this prize will be awarded to the author of the design premiated, as hereafter provided.

The required buildings may be broadly classified by arguments, as follows:—
I. Administration.
II. School of Applied Science.
III. School for Apprentices and Journeymen.
IV. Technical School for Women.
V. School of Applied Design.
VI. Service.

The order in which these departments are named has been adopted only for convenience in designation, each will be known by its number, as a 'Group,' and one or more buildings are required for it."

The competition has been won by Messrs. Hornbostel of New York, the second being going to Mr. George B. Post, one of the specially invited and paid competitors; and third, fourth, and fifth places, each conveying an award of 1,000 dollars, to Messrs. Wood, and Deming with Corbett & Pell Assoc. (Washington and New York); Gram, Odine, & Ferguson (Boston and New York); Newman & Harris (Philadelphia), respectively. The highest rank among Allegheny* Architects, to whom was assured an award of 1,000 dollars, was taken by Mr. T. Billquist of Pittsburgh.

BURGH, GLASGOW.—Mr. John McIntyre, of

In the second communication we received, this is again spelt "Allegheny." Whether this is a clerical error or a new spelling, we cannot say. It is "Allegheny" in our atlas.—Ed.

8, Brunton Place, Edinburgh, has been awarded the first premium for his design of the new St. Paul's Church, Glasgow, which is to be erected in John-street, with frontages to Little Hamilton-street and Margaret-street.

Correspondence.

ST. MATTHEW'S, FRIDAY-STREET.

SIR,—You may like to supplement your notes, in your issue of the 12th inst. (page 483), on the subject of St. Matthew's Church, Friday-street, E.C., by the following facts:—

A block of commercial buildings was erected upon the site in 1886, from my designs, when I introduced a portrait of Wren into the carving over the porch, and had the following inscription cut upon the south flank wall of the new building:

"THE SITE OF THESE BUILDINGS WAS FORMERLY OCCUPIED BY THE PARISH CHURCH OF ST. MATTHEW, FRIDAY-STREET, FOUNDED BEFORE THE YEAR 1322, DESTROYED BY THE FIRE OF LONDON 1666, REBUILT BY SIR CHRISTOPHER WREN, AND TAKEN DOWN IN 1885, WHEN THE PARISH WAS UNIED WITH THAT OF ST. VEDAST, FOSTER-LANE."
DELISSA JOSEPH.

THE JOINERY TRADE.

SIR,—I think the present state of depression in the joinery department of the building trade calls for some movement to alleviate the distress through lack of work. Why is it that so many hundreds of thousands of pounds are spent annually on the imported foreign rubbish, wrongly named joinery, when an infinitely superior article, worthy of the name, can be made here in "England" quite as cheaply? I have done it over and over again. The joiner of these days is not the man of thirty or thirty-five years ago, when he was, if not bitterly opposed to, at least exceedingly suspicious of, machinery; he now recognises it as a power come to stay, and to make further progress yet, and is willing to follow it up; in fact, he cannot help himself if his work is properly put to him. Were our builders to utilise their machinery to its full capacity, and by up-to-date methods, I am certain from long experience that this foreign stuff would, ere long, become as extinct as the dodo.

Neither would the builder be disposed to put his work out to some trade joinery works, but put the profits into his own pocket. I have had a very intimate connexion with several of these joinery works, and in the majority of cases, the work is rushed along at fever heat. Client after client clamouring for their goods, this job is put aside to push that, and that to push another, causing, in numerous instances, mistakes and an appalling waste of both labour and material; and, excepting in a few instances I could mention, the work is done piecemeal, underpaid, or by young and inexperienced hands, scamped to an alarming degree, oftentimes (as I have known) to be condemned by the architect or clerk of works. In a well-ordered builder's shop and mill these things could not occur; and, as before observed, if a thoroughly up-to-date method is adopted, and the machinery impressed for all it is capable of, the change would be wrought, architects and their clients benefited and pleased, the builder himself satisfied, and the rank and file made happy with work, where now there is none. J. C. W.

BUILDING SOCIETIES' STATISTICS.

The Chief Registrar of Friendly Societies has compiled his usual abstract, which has been issued this week as a Parliamentary Paper, of the annual accounts and statements of societies for the year 1903. It appears from the figures that the numbers of incorporated building societies in the counties of the United Kingdom are as follow:—Bedfordshire 15, Berkshire 14, Buckinghamshire 11, Cambridge-shire 11, Cheshire 53, Cornwall 7, Cumberland 16, Derbyshire 23, Devonshire 29, Dorsetshire 12, Durham 104, Essex 39, Gloucestershire 29, Hampshire 49, Herefordshire 7, Hertfordshire 15, Huntingdonshire 1, Kent 57, Lancashire 329, Leicestershire 27, Lincolnshire 15, London 416, Middlesex 29, Monmouthshire 16, Norfolk 12, Northamptonshire 19, Northumberland 64, Nottinghamshire 17, Oxfordshire 3, Rutland-shire 1, Shropshire 8, Somersetshire 34, Staffordshire 56, Suffolk 5, Surrey 28, Sussex 36, Warwickshire 34, Westmorland 6, Wiltshire 9, Worcestershire 13, Yorkshire 93, and Berwick-upon-Tweed 1—total for England, 1,773; Anglesea 1, Brecknockshire 2, Cardiganshire 1, Carmarthenshire 9, Carmarvonshire 11, Den-bighshire 3, Flintshire 1, Glamorganshire 77, Merionethshire 1, Pembrokeshire 2—total for Wales, 108; Aberdeen 10, Argyll 1, Ayr 7, Banff 2, Clackmannan 1, Dumbarton 7, Dum-fries 2, Edinburgh 13, Elgin 2, Fife 15, Forfar 9, Inverness 1, Lanark 35, Linlithgow 2, Nairn 1, Peebles 1, Perth 2, Renfrew 7, Roxburgh 1, Selkirk 3, Stirling 7, Wigton 1—total for Scotland, 130; Antrim 37, Armagh 1, Cork 4, Down 1, Dublin 26, Limerick 1, Londonderry 24, Louth 2, Tyrone 1, and Wicklow 1—total for Ireland, 95; total of incorporated societies for the United Kingdom, 2,109. To this total have to be added 62 unincorporated societies, all in England, making a grand total of 2,171. The number of members enrolled in the 2,171 societies is 601,204.

The total receipts of the societies during the last financial year amounted to 40,734,866l. 1,665 out of the 2,171 societies made advances on mortgage, and the amount so advanced during the year was 9,959,553l.

The liabilities of the societies at the time of making up the balance-sheets were—to the holders of shares, 38,312,729l.; to depositors and other creditors, 24,161,484l.; undivided profits, 3,836,273l.

The assets, on the other hand, were:—Balance due on mortgage securities (not including prospective interest), 51,396,980l.; amount invested in other securities and cash, 14,900,247l.; balance deficits—in England and Wales, 113,039l.; in Scotland, 221l.; in Ireland, nil.

The incorporated societies in the County of London have 117,845 members; their receipts during the year amounted to 5,768,165l.; the amount advanced on mortgage during the year aggregated 2,839,763l.; the liabilities were—to holders of shares, 9,202,460l.; to depositors and other creditors, 3,225,985l.; and the amount of undivided profit was 766,560l. Assets—balance due on mortgage securities (not including prospective interest), 12,245,934l.; other assets, 893,523l.; balance deficits, 55,548l.

The following figures indicate the total receipts during the last financial year of the individual building societies with over 1,000 members each:—Wolverton (Bucks.) Permanent Benefit, 1,026 members, year's receipts, 20,650l.; Cumberland Co-operative Benefit, 2,342, 131,997l.; Derbyshire Permanent, 2752, 79,994l.; Barnstable Permanent Mutual Benefit, 1,389, 12,243l.; Darlington Equitable, 1,166, 45,592l.; Industrial and Provident Permanent, Sunderland, 1,147, 42,867l.; Sunderland Working Men's Permanent, 1,401, 50,898l.; Durham and Yorkshire, Darlington, 1,876, 59,355l.; Bristol, West of England, and South Wales Permanent, 1,566, 171,206l.; Cheltenham and Gloucestershire Permanent, 4,719, 205,590l.; Isle of Thanet Permanent Benefit, 1,520, 55,576l.; Sheerness Permanent Benefit, 2,209, 80,203l.; Burnley, 5,666, 304,377l.; Chatham Permanent Benefit, Liverpool, 1,095, 29,107l.; Queen's Benefit, Manchester, 6,570, 64,348l.; Furness and South Cumberland Permanent Benefit, 1,882, 42,546l.; Colne Permanent Benefit, 1,179, 29,176l.; Marsden, Nelson, Lancashire, 1,446, 37,842l.; Hincley Permanent Benefit, 1,240, 16,913l.; Leicester Permanent, 9,623, 224,806l.; Market Har-borough and District Permanent Benefit, 1,566, 26,141l.; Leicester Temperance and General Permanent, 3,506, 37,381l.; Woolwich Equitable, 4,799, 459,774l.; People's Co-operative Permanent, Greenwich, 1,320, 44,327l.; National Freehold Land and Building, 25, Moorgate-street, 10,035, 544,156l.; Perpetual Investment, New Bridge-street, Black-friars, 2,580, 94,261l.; Temperance Permanent, Ludgate-hill, 9,100, 721,124l.; Fourth City Mutual Benefit, Gresham-street, E.C., 1,813, 226,271l.; Borough of Finsbury Permanent

building has been designed to find sleeping accommodation for about seventy-five men, each having a separate cubicle. The ground floor of the building has a dining-room, in connexion with which is a kitchen for the men to cook their own food; also a shop at which they will be able to purchase provisions which, if it is wished, will be cooked for them. There is also a smoke-room provided. The remainder of the floor is occupied by the sisters' and caretakers' rooms. On the first floor is placed the chapel, which is so arranged that in the event of a detached chapel being erected, it can be divided into cubicles, and thus obtain accommodation for fifteen more men. There is also a recreation-room and five cubicles, sisters' room, etc. The remainder of the floors are given over entirely to the sleeping accommodation for the men. In the basement of the building ample kitchen accommodation has been provided, also a laundry for the lodgers. The architects for the building are Messrs. Brodrick, Lowther, & Walker, and the contractors Messrs. G. Jackson & Son, of Hull. The engineering works have been carried out by Messrs. Bradford & Co., of Salford.

LIBRARY, WALSALL.—A new Carnegie Library is about to be erected in Lichfield-street, Walsall, from the designs of Mr. J. S. Gibson, London. Messrs. Willcock & Co., of Wolverhampton, are the contractors.

BUSINESS PREMISES, BELFAST.—New premises are being built in High-street, Belfast, for Mr. C. McCullagh. Messrs. Blackwood & Jury are the architects for the work, the contractors being Messrs. McLaughlin & Harvey. A "Carara" front is being supplied by Messrs. Doulton & Co., London.

COUNCIL OFFICES, ABRAM, LANCASHIRE.—The District Council of Abram have erected new offices, and these have just been opened. The site of the offices is on the east side of Warrington-road at Abram-brow, opposite St. John's Church. The ground floor contains offices for the clerk, rate collector, nuisance inspector, and pay office. The first floor contains council chamber, 30 ft. by 20 ft., surveyor's office, chairman's parlour, and spare office. There is also a house adjoining containing six rooms, which can be attached to the offices when further accommodation is required. There are three fireproof safe-rooms, and the basement contains cellar for the heating apparatus. The entrance hall is paved with encaustic tiles, and the walls have ornamental glazed tile dado, and the offices have wood-block floors laid on concrete bed. The front elevation is of terra-cotta. The out-buildings consist of stabling for five horses, and hay-loft over, waterman's workshops and store-room, and shed for vehicles. The buildings have been erected by Messrs. Joseph Wilson & Co., of Wigan, and the furnishing by Messrs. Barlow and Messrs. Pendlebury, Ltd., and the heating by Mr. W. H. Gaskell. The total cost has been about 3,400l., and the work has been carried out from the designs and under the supervision of Messrs. Heaton, Ralph, & Heaton, of Wigan.

NEWSPAPER OFFICES, DUNDEE.—New premises are now in course of erection at Meadowside, Reform-street and Euclid-crescent, for the *Dunfer Courier*. The style of the buildings is Renaissance, the material used will be stone from Dumfriesshire quarries, and the total cost, including site, will be over 60,000l. The contract was obtained by Mr. Thomas C. Stooks, builder, Dundee. To secure a stable foundation ferro-concrete piles are being driven, and on these is being laid a bed of ferro-concrete, braced throughout with steel. The building will have seven floors, including basement and mansard, and the main entrance will be in Meadowside. The counting-house and advertising department will be on the street level, editorial departments will be accommodated on intermediate floors, and the composing-room will be on the top. Messrs. Niven & Wigglesworth, architects, prepared the plans for the work.

VICARAGE, THORPE ARCH, YORKSHIRE.—The foundation-stone was recently laid of the new vicarage which is being erected in this village. The design of the building is XVIIth century in style, the lower half being of Pateley Bridge stone, and the upper of hard brick, rough cast, and coloured. The roof will be of tiles, and the windows of leaded lights. Part of both house and stable are to be finished in half-timber work. The architects are Messrs. Oliver & Dodgshun, of Leeds and Carlisle.

SCHOOL EXTENSION, GRAYS, ESSEX.—A local inquiry was held recently at Quarry Hill Schools, Grays, by members of the Essex Education Committee into applications by the Governors of Palmer's Endowed School, Grays, with respect to proposed alterations and extensions. Mr. C. N. Sbiner, architect,

submitted plans to provide accommodation for 100 pupils, teachers attending half-time. Additional classrooms on the boys' side were proposed, to provide for 181 students as against 106 at present, together with a common-room for day boys coming from a distance, and a proportionate increase on the girls' side. It was estimated that the total cost of the land and works would be about 10,000l.

EXTENSION OF BUSINESS PREMISES, HAMMER-SMITH.—Alterations and extensions have been carried out at the premises of Mr. John Broughton, in Kings-street, Bridge-avenue. Mr. D. Carmichael was the architect, and Messrs. Henry Lovatt & Co., London and Wolverhampton, were the builders.

RENOVATION OF THE AQUARIUM, BRIGHTON.—Plans have been prepared by Mr. C. F. W. Gillam, architect, Brighton, for the improvements and alterations which are shortly to be made to the Brighton Aquarium. The scheme provides for the enlargement of the theatre, for a winter garden in place of the existing skating rink, and for the re-roofing and general renovation of the whole building. The work is estimated to cost 12,000l.

BELFAST MATERNITY HOSPITAL.—The new Maternity Hospital in Townsend-street, Belfast, was opened on the 7th inst. The site has a frontage along the east side of Townsend-street of 98 ft., and extends back 183 ft. The entire site is now occupied by the building, which is planned in the shape of the letter T, with the head towards the street. The hospital has three floors, the ground floor being used for the executive, etc., and containing the kitchen wing, the matron's room, committee, and nurses' dining-rooms, the quarters for the resident doctor, a room for students, and at the extreme end of the building the extern department. The principal entrance is in the front facing Townsend-street. The kitchen entrance, the students' and patients' entrances, are from a wide passage along the southern side of the building. The extern department contains a waiting-room and a consulting-room, a bathroom and lavatory, and it is by this portion that all patients will enter the hospital. The principal staircase faces the front entrance, and provision has been made in the stair well for a passenger hoist, communicating with each of the floors. The first or middle floor is devoted to the accommodation of patients, and contains the couchroom, and near it the observation-room, and a room beside it for the use of the nurse on duty for this ward. There are also four wards, each containing four beds, and some smaller one and two bed wards for separate cases or paying patients. Provision has been made for an extension in the future over the extern department, but in the meantime this portion terminates with a garden roof, level with the first floor, at the end of the building, and is reached from the lateral corridor that communicates with the wards. The lavatories, bathrooms, etc., are contained in a sanitary tower as an annexe, separated from the main building by a disconnecting passage. The third or top floor is, with the exception of one four-bed ward, occupied by the sleeping apartments of the staff, the larger rooms being sub-divided by cubicles. The laundry has been placed at the end of the yard. The yard also contains a disinfectant, as well as other hospital requirements. Owing to the floor level being kept well over the surface of the ground, a basement passage has been formed under the corridor, in which all the water, gas, and electric mains are carried. The coal store is also in the basement. The works have been carried out to the designs of Mr. W. J. Fennell, by Messrs. McLaughlin & Harvey, builders. The sanitary fittings and plumbing were entrusted to Mr. S. N. Gray, while the electric lighting was carried out by Messrs. Richard Patterson & Co., Ltd., under the supervision of Mr. John Woodside, consulting electrical engineer.

LABOUR HOME, ANCOATS.—The Lord Mayor of Manchester, on the 7th inst., opened the new wing of the Manchester and Salford Men's Mission Home and Workshop in Hood-street and Murray-street, Ancoats. The new wing provides accommodation for 180 beds, and provides also a day-room, which is to be used for recreative educational purposes in the evenings, besides certain kitchens and other departments. Messrs. Sankey & Cudbon have designed the structure, and the building has been carried out by Messrs. Gerrard, of Swinton.

THEATRE, KIRKCALDY.—The new King's Theatre, Kirkcaldy, was formally opened recently. The new playhouse, which is seated to accommodate from 2,000 to 3,000 persons, has been provided at a cost of 20,000l. It occupies a site on Redburn Wynd and High-street. It has been built from plans prepared by Mr. J. D. Swanston, architect, Kirkcaldy.

On the ground floor are the orchestral pit stalls, and pit, while on the first tier the lower gallery is the dress circle, and the second tier the amphitheatre. The upper gallery is divided into tiers. At each there are five boxes. The stage is 60 ft. by 30 ft., with proscenium opening of 28 ft. Tiring-rooms are provided to the various sections of the house.

STAINED GLASS AND DECORATION

MEMORIAL TO THE LATE MR. HUGH P. HUGHES.—A stained-glass memorial window in memory of the late Mr. Hugh P. Hughes, was unveiled in the Wesleyan Church, City-road, on the 17th inst. The central figure of the window is in a crimson robe, members of the Last Supper on the left, but in the upper part are figures of "Faith," "Hope," and at the base the subjects of the calling of the Apostles St. James, St. John, and St. Peter. Under the central figure are two inscriptions. Mr. H. J. Salisbury, the artist.

SANITARY AND ENGINEERING NEWS

NEW BRIDGE, ABERDEEN.—The new girder bridge connecting Guild-street, Bridge-street, and forming a part of the Aberdeen Joint Station extension works, now almost completed. The total width of the structure over the outside parapets is 57 ft. 6 in., comprising a carriageway 35 ft. clear width, and two footways each 8 ft. wide. The total length between abutments is over 180 ft., divided into two spans of 90 ft. each, and supported on the centre platform of two steel-bulb and riveted octagonal columns, which have each to carry a weight of 450 tons when the bridge is fully loaded. The main girders, which, owing to the limited headroom, project about 8 ft. above the level, in the line of the kerbs, vary in length from 90 ft. to 94 ft., and are 11 ft. deep at centre. They are of the multiple lattice type, with a curved top boom, the latter being the box shape. The main girders are fixed to the abutments, and are provided with machined bearing plates placed between them and the cast-steel bed plates. The top flanges of the girders consist of cross girders averaging about 22 ft. apart, nutted to the top booms of the main girders, and so arranged in position that they lie directly above, and in line of the 6-ft. ways of the railway below, thus utilising as much of the available headroom as possible. Between the main girders, and lengthways of the bridge are fixed lower girders, about 5 ft. apart, the top flanges forming the framework supporting the roadway. The spaces between the main girders are spanned by brick arches, 2 ft. thick, the lower ring being of brick, with concrete haunching above, finished level with the top of the girders, while the surface is spread over with asphalt 1 in. thick. The roadway is formed of 4-in. granite set in sand in the ordinary way, and finished off at the sides with a cast-iron kerb. The footways are similar, but of lighter construction, and are carried on cantilevers projecting in line of the cross girders. They are coated with asphalt, and paved with asphalt slabs. Provision is made below the footways for carrying gas and water pipes, and electric mains, openings being provided for them through the cantilevers and intermediate ports. On the outside of the footways a cast-iron parapet is formed in panels 3 ft. deep, and on the inside a lattice guard railing attached to the main girder. At the ends of the parapets granite ashlar parapets were built. The girder blocks and column bases were built of Rubislaw granite, while the top portions of the masonry work were of Portland cement concrete. The contractors for the whole are Messrs. Findlay & Co., engineers, Melville, and the sub-contractors—Mason & Mr. George Hall; joiner work, Mr. J. Anderson Hall; cast-iron, Messrs. James J. Mathy & Co.; and painter work, Mr. Doxey. The structure has been built from plans prepared by Mr. P. M. Bennett, Engineer-in-Chief of the Great North of Scotland Railway Company.

WATER SUPPLY, GOWDEN AND UPPER HEDGECOTE.—An inquiry was opened by Col. W. P. Black, R.E., on behalf of the Government Board, at Gowden, on the 17th inst., into the application of the Owe Rural Council for sanction to borrow 2,500l. to meet the cost of providing the village of Gowden and the Upper Hedgecte with a proved supply of water. Mr. E. J. Gray, M.P., explained that it was intended to pump a small proportion of the water from two springs in the neighbourhood, the water from which flows into a stream known by the name of Mardy. It

posed to extend the new supply to Whittington. Mr. F. Berrington, the Council's engineer, explained the details of the scheme, and the inquiry was adjourned.

FOREIGN.

FRANCE.—The Académie des Beaux-Arts appointed M. Saint-Saëns Director of the Villa d'Isti, but he has declined the appointment. M. M. Barrias and Bernier also withdrew their names. The architect M. Carou-Duran sole candidate. This apparently is not what was desired or expected, and the Académie is on a look-out for further candidates.—M. Cartran, the painter, has designed a special order for the tickets of the Opéra Comique. The design shows the figure of a Muse in front of a Grecian landscape, in which the Acropolis of Athens is introduced.—On September 3 the monument to Gavarni, by Denys Puech, is to be inaugurated on the site of the ancient fountain of the Place St. Georges. The architectural portion of the monument is by M. Henri Guillaume.—The specialist members of the Paris Municipal Council are demanding the secularisation of a church of the Sacré Cœur at Montmartre, in order to transform it into a "Maison du peuple." A vote of Parliament, however, would be required to carry any such scheme.—M. Georges Ernant, architect, of Laon, has been elected President for 1904-5 of the Société des Architectes de l'Aisne.—The library and the museum at Valence are to be rebuilt, at an estimated cost of half a million francs.—M. Weerts, the painter, has been commissioned by the Government to decorate a grand staircase of the Ecole Nationale des Beaux-Arts at Chaussees, Rue des Saints Pères.—Rodin is at work on a bust of Falguière.—Mme. Garnier, the widow of Charles Garnier, has presented to the Académie Nationale de Musique the bust in bronze, by Dupuis, of the eminent architect. The bust has been placed in the Foyer de la Daise, on the pedestal of Cippolino marble.—The Municipal Council of Paris has under discussion a scheme for a new architectural treatment of the façade of the Bibliothèque de l' Arsenal, and the formation of a square in front of it in the centre of which would be a statue representing "La Gloire Nationale."—M. Perron, the medallist, has just completed the design for a medal in commemoration of the jubilee of Academies. The composition includes draped female figures who symbolise the various Academies; they are crowned with laurel and grouped, under the presidency of Minerva, in a landscape suggestive of the architecture and scenery of Greece.—The new buildings of the Conservatory of Music, at Lyons, were formally opened on Sunday last.—The "Société Protectrice des Animaux" has opened a competition for designs for advertisements, which are now on view at the Grand Palais, at Paris. There are about 150 designs, many of them showing a great deal of taste and originality.—M. Pierre Capoulart, architect, of Toulon, has died, at the age of sixty-nine. He was a pupil of M. Mas, architect, of Brive, and carried out many country houses in that part of France.—The death is also announced, at the age of seventy-two, of M. Kuwasseg, the painter, pupil of his father, and of Durand Brager, who exhibited first in the Salon of 1859, and received a medal in that of 1862. He was especially a painter of sea pictures and marine subjects.

GERMANY.—A new theatre is to be built at Charlottenburg from the plans of the architects, Heilmann & Littmann, of Munich.—The new Catholic church at Ulm, designed by Herr Max Meckel, was consecrated on September 8.—The Commission for the Preservation of Memorials in the German Kingdom have arranged that Professor Dehio, of the University of Bonn, shall compile a "Handbook of German Memorials"; the Commission consists of Professor Cornelius Gurlitt, of Gießen, Professor A. von Oechelhäuser, of Strasbourg, and Herr Loersch, of Bonn.—The altar at Dortmund, designed by Professor Arthur Dülfer, of Munich, was opened on September 17.

AUSTRIA.—The Town Council of Prague have accepted the plans of Professor Koula for the new bridge over the Moldau.—The engineer architect Franz M. Griesbach, died on September 17, at Brüx, in his sixty-sixth year; he had possessed the gold cross of merit, which was granted him on his completion of law courts, at Brüx.

SWITZERLAND.—Important alterations and extensions are to be undertaken at Lausanne, which the "Commission d'Art Public," consisting of five architects, sat in September.

The new museum at Geneva is being built on the plans of Herr Marco Camoletti; the

foundation stone of the building was laid on September 17.—The Swiss Society for Preservation of Historical Memorials held its annual meeting at Locarno on October 25.

A NEW GERMAN ART PAPER.—A new German publication, entitled *Hobe Warte*, has just appeared. This paper, the title of which is best rendered by the English *Watch Tower*, is perhaps equivalent to the *Studio*, though smaller and not so copiously illustrated; but the scope is more limited, and seems only to include what may be termed the "household arts," from external architecture, interiors, furniture, and decoration, to embroidery and photography. In an introductory note the editor announces his intention of showing, where possible, examples of the artistic and inartistic side by side, thus contrasting the good and bad, and leaving the reader to draw his own conclusions. This idea is effectively carried out in the first number by illustrations of model workmen's houses at "Port Sunlight" and "Bournville," as contrasted with a typically hideous row of small dwelling-houses of the old-fashioned kind. There is also an article on "Old Furniture in Modern Houses," by the architect, Franz Messner, illustrated by photographs of a room, the furniture of which dates from the beginning of the XIXth century. Herr Paul Schultze-Naumburg, in an article entitled "Villages," writes an urgent appeal to modern German architects to return to the simple, beautiful, and practical style so prominent in the old German farmhouses, and to leave the more ornate designs for more suitable occasions. Interesting, as showing a return to this simplicity of outline, are the designs by the architect, Professor Joseph Hoffmann, for furniture suitable for use in small modern dwellings. The object of this new magazine is given in the closing words of the editor's introductory note:—"Everywhere are indications of an eager desire for true artistic culture; and, in our opinion, this indication only needs to be constantly guided and turned in the right directions."

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—Messrs. Norton & Gregory, Photographers and Lithographers, etc., have removed from Artillery-row, Victoria-street, to Castle-lane, Buckingham Gate, S.W.

MINERAL OUTPUT FOR 1903.—According to the returns collected by the Inspectors of Mines and Quarries the total output of the principal minerals from all mines, from quarries, and from certain other workings in the United Kingdom in the year 1903 was as follows (in tons):—Alum shale, 5,224; arsenic, 922; arsenical pyrites, 57; barites, 24,271; bauxite, 6,123; chalk, 4,469,974; chert and flint, 73,151; clay and shale, 16,198,021; coal, 230,334,469; copper ore, 6,428; copper precipitate, 439; fluor spar, 11,911; gold ore (auriferous quartz), 23,600; gravel and sand, 2,245,757; gypsum, 219,897; igneous rocks, 5,425,538; iron ore, 15,715,645; iron pyrites, 9,539; lead ore, 26,567; limestone, 12,222,971; manganese ore, 213; celestine and amber, 14,150; oil shale, 2,009,602; phosphate of lime, 70; salt, 1,836,992; sandstone, 5,408,502; slate, 531,612; sulphate of strontia, 22,842; tin ore, 7,351; uranium ore, 6; wolfram, 272; zinc ore, 24,898.

THE INCORPORATED CHURCH-BUILDING SOCIETY.—This Society held its usual monthly meeting on the 17th inst., at the Society's House, 7, Dean's-yard, S.W., the Rev. Canon C. F. Norman in the chair. Grants of money were made in aid of the following objects, viz.:—Building new churches at Heigham, St. Barnabas, near Norwich, 105*l.*, and Smethwick, St. Alban, near Birmingham, 150*l.*; rebuilding the church at Sparkwell, All Saints, near Plympton, Devon, 20*l.*, and towards enlarging or otherwise improving the accommodation in the churches at Aberystwyth, St. Michael and All Angels, Cardigan, 60*l.*; Borstal, St. Matthew, near Rochester, 50*l.*; Cardigan, St. Mary, 50*l.*; Clevedon, St. Andrew, Somerset, 40*l.*; Compton, St. Mary and St. Nicholas, Berks, 25*l.*; Egg Buckland, St. Erasmus, near Crownhill, Devon, 10*l.*; Heckmondwike, St. James, Yorks, 50*l.*; Hednesford, St. Peter, near Stafford, 60*l.*; Hilton, St. Mary Magdalen, near St. Ives, Hants, 25*l.*; Little Ilford, St. Barnabas, 25*l.*, making in all 100*l.*; and Usworth, Holy Trinity, Durham, 35*l.* Grants were also made from the special Mission

"The Watch Tower" illustrated fortnightly magazine for the cultivation of home interests, artistic, intellectual, and practical. Founded by Josef Aug. Lux with the collaboration of the highest authorities. (*Hobe Warte*, Illustrierte Halbmonatsschrift für die künstlerischen, geistigen und wirtschaftlichen Interessen der Städtischen Kultur. Begründet von Josef Aug. Lux unter Mitwirkung erster Autoritäten). Lux and Lässig, Vienna. Carl Fleischer, Leipzig.

Buildings Fund towards building mission churches at Leyton, St. Edward, Essex, 50*l.*; and Skewen, near North Glam, 30*l.* The following grants were also paid for works completed:—Winterton, All Saints, near Doncaster, 25*l.*; West Bergholt, St. Mary, near Colchester, 60*l.* on account of a grant of 100*l.*; Ilenny, St. David, Glam., 100*l.*; Gainsborough, St. John, Lincs., 10*l.*, making in all 110*l.*; Brechfa, St. Teilo, Carmarthen, 20*l.*; Westham, St. Paul, near Weymouth, 25*l.* on account of a grant of 200*l.*; Downe, St. Mary, Kent, 5*l.*; Newcastle-on-Tyne, St. Matthew, 40*l.*; Leicester, St. Mark, 75*l.*; Bristol, St. Aidan, 130*l.*; Cutworth, St. Michael, Somerset, 25*l.*; Plymouth, St. Augustine, 75*l.*; Simpson, St. Thomas, near Blechley, Bucks., 20*l.*; Goresfield, near Wisbeck, 20*l.*; Heath Hayes, near Cannock, Staffs., 50*l.*; Bushey, Herts, 50*l.*; Eltham, St. Luke, Kent, 25*l.*; and Llaunsadwrn, Capel Dewi, Carmarthen, 25*l.* In addition to this a sum of 431*l.* was paid towards the repairs of twenty-five churches from trust funds held by the Society. Before proceeding to the usual business of the meeting, the following resolution was unanimously adopted:—"The Committee of the Incorporated Church Building Society, at its first meeting after the death of their friend and colleague Mr. F. C. Dobbing, desire to record their sense of the great value to the Society of his ripe experience, which, by his frequent attendance at their meetings, was placed at their service. They take this opportunity of recalling with gratitude his generosity to the Society, especially to the Mission Buildings Fund, to which he was a regular and most liberal contributor; they recognise with thankfulness his work for the church by his untiring zeal to promote the increase of free church accommodation, and they tender to Mrs. Dobbing and her family this expression of sincere sympathy."

AN ARTISTIC ALMANACK.—We do not usually notice the crowd of almanacks in sheet form which are sent out at this time of the year, and which seldom have anything in their design worth special notice. The sheet issued under the title "Calendariarum Londinense" (W. Monk and Elkin Mathews, Vigo-street) is, however, an exception. It is merely one folio sheet, the lower half of which contains the days of month and week in the year, the upper half contains an etching of a London subject by Mr. W. Monk. This is the third year of issue. The subject on this year's sheet is a view towards Westminster from the bank of the Thames at Grosvenor-road, a little way west of Lambeth Bridge; the shipping and staging, etc., forming an effective foreground, and the upper part of the Victoria Tower appearing over the houses. It is an admirable etching, and represents a corner of London which, when ever Lambeth Bridge is rebuilt, will probably be very much altered. The object of the publication is really to issue every year, for 2s. 6d., an etching of some point of interest in London, combined with an almanack. Such an almanack merits the support of architects.

BIRMINGHAM MASTER BUILDERS' ASSOCIATION.—The annual meeting of the members of the Birmingham Master Builders' Association was held on the 17th inst. at the Grand Hotel, the President (Lieut.-Colonel John Barsley) in the chair. The committee, in their report, regretted to have to still record the continuation of the depressed condition of trade referred to in the last two annual reports. Having secured the omission from the Operative Plasterers' general rules of the objectionable clause in Rule 3, Clause 15, the committee resigned the old rules with the operatives for twelve months, from April 1 last. Although the present state of trade fully justified notice being given for a general reduction in wages, the committee, after careful consideration, had decided not to disturb the trade this year. The committee recorded with pleasure the election of Mr. C. H. Barsley to the office of President of the Institute of Builders, and also the election of Mr. E. G. Whittal as one of the vice-presidents of the Midland Federation of Building Trade Employers. Satisfactory conclusions had been arrived at with the Architectural Association as to the interpretation of the prime-cost clause in the conditions of contract, and "on the question of making good after other trades." A prize of one guinea had again been offered by the Association for competition amongst the masonry students at the Municipal Technical School. The committee recommended that next year a total sum of five guineas should be offered to the students in the classes connected with the building trade at the Municipal Technical School, the details to be arranged after consultation with the headmaster. The total membership was now ninety-two. The balance sheet was described as satisfactory. The President, in

moving the adoption of the report, said the work of the Association during the past year had been chiefly of a routine character. The report opened with an expression of regret that the condition of trade had not improved during the year. They had to deplore depressed trade last year, and he thought, on the whole, they had again to deplore still more depression this year. The motion was seconded by the vice-president (Mr. J. B. Whitehouse), who remarked that the committee were refraining from giving notice of reduction of wage, although many considered that the depression in trade justified such a course. He thought they held that trade was not to be revived by cutting down men's wages. What they wanted to do was to encourage the men to give them of their best. Lieut.-Colonel Barnsley was re-elected President for the ensuing year, and Mr. J. B. Whitehouse vice-president. A committee and other officers were appointed. The annual dinner followed in the Grosvenor Rooms at the Grand Hotel. Lieut.-Colonel J. Barnsley, V.D., occupied the chair, and among those present were the Lord Mayor (Councillor R. H. Berkeley), County Alderman J. Bowen, Councillor Whittall, Messrs. J. Cooper (President Birmingham Architectural Association), J. B. Whitehouse (vice-chairman of the Master Builders' Association), C. H. Barnsley (President, Institute of Builders), J. Sharman Wood (President Midland Federation), and Alderman Bigwood (secretary). The loyal toasts having been honoured, the toast "Success to the Birmingham Builders' Association and the Trade of the City" was proposed by the Lord Mayor, who expressed regret that the state of trade generally was not satisfactory. The building trade might fairly represent what was happening in other trades, and it was significant to observe that the number of plans submitted last year at the city surveyor's office numbered 1,563, as compared with 2,352 in the preceding year. He hoped that there were better times in store in the near future. They could not, however, help looking with anxiety at the great number of men unemployed at the present moment. If it should be a hard winter that number would be increased.

The Corporation committees, who were in the habit of engaging temporary workmen, would, he felt sure, do all that was possible in the way of putting work to the front. The President, acknowledging the toast, said Birmingham men were proud of its institutions. The year had been crowned with that crowning blessing—the Welsh water. The toast "The Architects and Surveyors" was proposed by Alderman Bowen, and Mr. Thomas Cooper replied on behalf of the Birmingham Architectural Association. "Kindred Associations" was submitted by Mr. Whitehouse, and acknowledged by Mr. C. H. Barnsley. Councillor Whittall proposed the health of "The Visitors," and Mr. W. H. Kenrick replied.

BUILDING BY-LAWS.—The dispute between Mr. Justice Grantham and Chailey Rural Council in regard to the plans of a cottages which the judge proposes to build at Barcombe advanced another stage on the 18th inst. Sir William had given notice to the Council that, in spite of their refusal to pass the plans, he intended to go on with the building, and, in accordance with instructions, Sir William's employees started work. They met with no interference on the part of the Chailey Rural Council's officials. The clerk has written to Sir William stating that, in the Council's opinion, his letters to that body fully establish the necessity of any action the Council has taken in the discharge of its duty as the sanitary authority. A special meeting of the Council is to be held to decide what action shall be taken now that Sir William has gone on with the building before the plans have been passed.

THE TAIRY COMMISSION.—The Tariff Commission has held four meetings during the past fortnight at the Whitehall Rooms, under the chairmanship of Sir Robert Herbert, making seventy-five sittings to date. At the last four meetings evidence was taken in regard to the engineering, building, furniture, and textile trades. The witnesses examined in each section were as follows:—*Engineering*—Mr. John McLaren (J. & H. McLaren, Midland Engine Works, Leeds, engineers), and Mr. George Cradock (Geo. Cradock & Co. Wakefield, wire drawers and rollers). *Building*—Mr. J. Howard Colls (Colls & Sons, 5, Coleman-street, E.G., builders and contractors). *Furniture*—Mr. W. H. Greenfell (M.P. for the Wycombe Division Bucks.) made a preliminary statement on the history and development of the trade of High Wycombe and district, and the following witnesses were examined:—Mr. Walter Birch, of William Birch, Ltd., High Wycombe, and 370, Euston-road, London (chair manufac-

turers, cabinet makers, and upholsterers); Mr. Charles Skull, of W. Skull & Sons, Ltd., High Wycombe, and 45, Berners-street, W. (chair manufacturers, cabinet makers, and upholsterers). *Textiles*—Mr. James Mackay (Palmer & Mackay, Trowbridge, woollen manufacturers); Mr. H. Lovell Hewitt (Kemp & Hewitt, Ltd., Innox and Silver-street Mills, Trowbridge, woollen manufacturers); Mr. Alfred Sykes (Joseph Sykes & Co., Ltd., Brockholes, near Huddersfield, woollen manufacturers).

THE LECKY MEMORIAL, DUBLIN.—A meeting of the executive committee of the Lecky Memorial was held on the 20th inst. at 45, Merrion-square. It was proposed by the Dean of St. Patrick's, and seconded by Mr. Justice Ross, and passed, that Mr. W. Goscombe John, A.R.A., be commissioned to execute the statue of the late Right Hon. W. E. H. Lecky, for which a site has been granted within the precincts of Trinity College, Dublin.

APPOINTMENTS.—The members of the Officers and Clerks Committee sat at the Guildhall on the 22nd inst. for the purpose of making a final selection of candidates for the vacant position of City Surveyor. The list of twelve candidates previously selected was reduced to five, their names being:—Mr. F. Brown, of the London County Council Department, 19, Gharing Cross-road; Mr. J. E. Crouch, 29, Basinghall-street; Mr. S. Perks, 5, Crown-court, Cheapside; Mr. G. W. H. Prescott, Urban Council Office, Tottenham; and Mr. F. Sinner, Surveyors' Department, Plumstead. *The City Press* understands that an effort will be made by several members to induce the Corporation to increase the commencing salary of the office from 1,000*l.* per annum to, probably, 1,400*l.*

ROLLER BEARINGS FOR RAILWAY CARRIAGES.—An experiment, which serves to demonstrate in a striking manner the efficiency of roller bearings, has been in progress by the London, Brighton, and South Coast Railway Company since January last year. In that month the company commenced the regular use of a bogie coach fitted with the "empire" type of roller bearings. After experimental runs extending over an aggregate of 80,000 miles, the results were considered so satisfactory that further tests are now being conducted with the aid of a complete train of vehicles with similar bearings. For the purposes of comparison, a train of identical composition but with ordinary bearings is to be run along the same route and for equal distances. Records will be kept of coal consumption in each case, and if the anticipated saving of 10 lb. per train-mile should be realised, there is every reason for hoping that the adoption of roller bearings may become universal. It has already been demonstrated that the motion is far more pleasant for passengers, and that trains can be started much more rapidly than with ordinary bearings. This last point is of considerable importance to lines upon which it is necessary to provide services with very short intervals between the trains.

REVERDS, ST. MARGARET'S CHURCH, MOUNTAIN ASH.—At St. Margaret's Church, Mountain Ash, recently, the Bishop of Landaff unveiled and dedicated a reredos. The design of the reredos is Early English in character, and is executed in Caen stone. The spandrels between the gables of the central portion, and the arches of the wings are of selected alabaster. The clustered columns carrying the canopies of niches, in which are placed the sculptured figures, are of green Gonnemara and red Orwell marble. The copings of the gables between the niches rest on carved angels with extended wings, and the reredos proper is surmounted with richly-carved ornament. The retable is of pink alabaster. The plinth immediately under the base of the old structure is green stone from the Bridgend quarries. The work has been executed from the designs of Mr. Bruce-Vaughan, of Cardiff, by Messrs. H. H. Martyn & Co., Cheltenham.

CAPITAL AND LABOUR.

EMPLOYMENT IN THE BUILDING TRADES.—Employment in the building trades continued dull during October, and on the whole was rather worse than in September. It was also worse than a year ago. Employment with carpenters and joiners was bad generally, and worse than a month ago and a year ago. The percentage of unemployed trade union carpenters and joiners was 83 at the end of October, compared with 70 at the end of September, and 56 at the end of October, 1903. With plumbers it was dull generally. The percentage of unemployed trade union plumbers was 91 at the end of October, compared with 95 at the end of September, and 66 a year ago.—*Labour Gazette.*

Legal.

ACTION BY AN ARCHITECT FOR FEES.

The case of Worley v. Jay came before Justice Ridley, sitting without a jury, in King's Bench Division on the 17th inst. action by the plaintiff, Mr. C. H. Worley, architect, to recover from the defendant, J. W. Jay, 115*l.* professional fees.

Mr. Abel Thomas, K.C., and Mr. M. J. F. Banks, K.C., and Mr. Ernest Pollock for defendant.

Mr. Abel Thomas, in opening the case, the action was brought by the plaintiff who for many years had practised as an architect in Welbeck-street, W., to recover from the defendant his fees for services rendered. It appeared that Worley had a private residence in the neighbourhood of Potters Bar, and Mr. Jay, defendant, also resided there. The plaintiff claimed 115*l.* for work done in preparing and getting estimates for the erection of stables, coach-house, and cottages on defendant's premises. The pleaded deal was that plaintiff did no work at the request of the defendant and that his fees were excessive. The building work was never carried out, but an estimate was obtained, and a fore-plaintiff was entitled to the amount claimed. The defendant also pleaded that condition precedent to the plaintiff's claim was that the building of the stables, coach-house, and cottages from the plaintiff's plans should not exceed the cost of 100*l.* This the plaintiff denied.

Mr. Banks said that the defendant's was that the plaintiff understood that he not prepared to build unless plaintiff produced plans of buildings which would cost more than 1,000*l.*, and that if the defendant did not build he should pay the plaintiff 5*l.* for the plans and 3*l.* for the defendant's quantities. The defendant only obeyed the plaintiff's instructions to do the work, the stipulation that he was not going to exceed 1,000*l.*, and if the plaintiff should produce plans of buildings which would cost more than 1,000*l.* to erect, that was his own risk.

Mr. C. H. Worley, F.R.I.B.A., examined Mr. Thomas, said he had been in practice about twenty-five years. On February 3, 1904, defendant called at his office and said he desired to build stables, etc. Defendant asked him to advise him on the matter. Witness did so, and took down particulars of accommodation required. A question was asked as to what his fees would be. Witness replied that they would be 5 per cent. of cost, with the additional charges of taking the levels. Defendant did not raise any objection to that. It was not true, said witness, that at any other agreed to prepare the plans for the stables and cottages for 5*l.* At this interview defendant never said anything about 1,000*l.* being the amount wished to spend. Having regard to the particulars he took from the defendant, it was impossible to erect the buildings for 100*l.* or anything like it. Shortly after this witness went with the defendant to the site, that he prepared two alternative sketches. They were drawn 16 ft. to the inch. Defendant approved of one, from which the plans were subsequently drawn. It was decided that he should draw them to the usual scale of 8 ft. to the inch, so as to obtain ten copies. About March 18 he had an interview with defendant, when he returned the sketches. Defendant then asked if the building would be likely to cost 1,000*l.* Witness replied that that was an absurd figure, but the cottages themselves would cost about 100*l.* each. Then the defendant suggested that (plaintiff) should go on and get tenders to see what the price actually would be. Defendant afterwards instructed him to prepare tenders. He afterwards attended on the site and took levels, prepared the specifications, and got a tender from a Mr. Lewis. Witness saw him some time after that. Defendant said that the estimate was a good deal more than he desired to spend, and witness suggested that he should endeavour to reduce the cost. Defendant, however, did not tell witness the amount he wished to spend. Witness altered the plans and reduced the cost to some 300*l.* or 400*l.* The next thing he saw was on September 23, when the defendant rang him up on the telephone, and said he had decided to abandon building altogether. Defendant said, "I suppose I owe you nothing." Witness replied that he did not. Defendant said, "I propose sending you a cheque for 5*l.* 5*s.*" Witness replied, "You are joking," and then the telephone was rung.

to then sent in his account in the usual way. His charges were usual. He had never understood that he was to prepare plans for buildings which were not to cost more than 1,000l. He had charged the defendant 5l. 5s. with respect to the work he had done in connexion with some negotiations between Mr. Alderman Strong and the defendant as to the purchase of a piece of the defendant's land by Mr. Alderman Strong. He had prepared a plan and discussed the matter both with Mr. Jay at his house and also with the architect representing Mr. Alderman Strong.

Cross-examined by Mr. Bankes. He was a busy man, but he recollected the details of this business pretty fairly. He told the defendant what the Institute charges were. He did not have a discussion with the defendant as to whether he should receive 2 per cent. or 2½ per cent. He had never suggested that he should have the quantities got out for 3l. 3s. He could not have suggested such a thing, as such a figure as that was ridiculous.

His lordship: The figure is ridiculous. I do not think that any architect could have said that.

Cross-examination continued. I suggest that at every interview you have had with the defendant he always endeavoured to make it plain that the utmost he would spend was 1,000l.?—I cannot help what you suggest, but it is not the fact.

This being the plaintiff's case, Mr. Bankes said he would at once call his evidence. According to—

Mr. Jay, the defendant, examined by Mr. Bankes, said he was a partner in a business in Oxford-street. His house was a small one, his present stables being close by. The accommodation he had at present was a two-stall stable, coach-house, harness-room, and cleaning-room. He was on visiting terms with the plaintiff, who told him that his stables were a disgrace to his house, and an eyesore. Witness told him that he had got 1,000l. to spend, and plaintiff said he would get out plans for buildings at that price. At a subsequent interview he asked plaintiff what his charges would be, and he said 5l. 5s. and 2½ per cent. Plaintiff prepared the sketches. At several interviews the question of price was mentioned. Plaintiff said he would get a builder's clerk to get out the quantities, but that would cost 2l. 3s. Witness agreed to pay that. He afterwards told plaintiff that he could not afford to spend so much as 2,400l. on the buildings, and offered to send him on a cheque for the 5l. 5s. and the 3l. 3s. Plaintiff told him over the telephone that he must be silly to suggest such a figure.

His lordship at this stage said he did not think the plaintiff could substantiate his claim of 5l. 5s., his fees in connexion with the negotiations with Mr. Alderman Strong.

Mr. Thomas: I agree, my lord. The defendant was then cross-examined by Mr. Thomas. He said he wanted four stalls, two loose boxes, room for six carriages, and two cottages. He was under the impression that building these would cost him about 1,000l.

As a business man, do you think they could be built for 1,000l.?—Well I think from 1,000l. to 1,500l.

Cross-examination continued. He approved the plans. It did not strike him that he was getting a good deal for his 5s.

Re-examined. He had never had any experience of building at all. He did not know what a brick would cost. He should not have gone into the matter at all if he had thought that the cost of the buildings would be something near 1,000l.

Mrs. Florence Jay, the wife of the defendant, having given evidence, the defendant's case was closed.

Mr. Bankes then addressed his lordship on behalf of the defendant, Mr. Thomas not being called on to reply.

Mr. Justice Ridley, in giving judgment, said he did not think the defendant had made it that it was a term of the plaintiff's employment that the cost of the buildings should not exceed 1,000l. Having regard to what the defendant wanted, it was quite impossible for it to have been in the mind of either the plaintiff or the defendant that all that could be got for 1,000l. He thought he ought to be in favour of the plaintiff. He accordingly gave judgment for him for the sum aimed, less the 5l. 5s. he had previously mentioned.

Mr. Thomas: That will be judgment for the plaintiff for 94l. 19s. beyond the 15l. 15s. bid into court.

His lordship: Yes. Mr. Bankes: I suppose the plans will be sent to us on payment of the money?

His lordship: Yes. I had a case about that the day before yesterday. I then said I should follow the ruling in Ebdy v. McGowan. Mr. Thomas said the plaintiff would hand the plans over, of course.

ARCHITECT'S ACTION AGAINST SURVEYOR FOR FEES.

THE case of Norton v. Tracy came before Mr. Justice Lawrance and a common jury in the King's Bench Division on the 21st inst., an action by the plaintiff, Mr. Chas. Harold Norton, an architect, against the defendant, Mr. C. F. Tracy, a surveyor, for fees. The defence was a denial of liability. The defendant had also counter-claimed against the plaintiff for damages, but the counter-claim was now withdrawn.

Mr. Oliver appeared for the plaintiff, and Mr. Shaw for the defendant.

Mr. Oliver, in opening the plaintiff's case, said his client brought the action to recover from the defendant two sums of 50l. each, and also a sum of 20l. for extra work. The plaintiff had given the defendant credit for 20l. received, but he should have given credit for 30l., so that that reduced the claim to 30l. The facts of the case were as follows:—In the early part of 1899 the plaintiff and the defendant were very friendly, and the defendant was desirous of erecting a block of flats in Stoke Newington, and he approached the plaintiff to draw the plans and specifications. After negotiations it was agreed that the plaintiff should receive for this work a fee of 50l. The plaintiff promised to look after the work and to see that it was carried out according to the plans. The erection of the flats having been started, defendant had to get assistance, and he applied to the plaintiff to go to the works more often than he had expected he would have to do, and to give certificates. As this entailed extra work on the plaintiff, defendant agreed to give the plaintiff 20l. extra remuneration. As the work went on the defendant advanced to the plaintiff sums which amounted in the aggregate to 30l. After that work was finished negotiations were again entered into with regard to building another block of flats, and the result was that the defendant promised, in consideration of the plaintiff drawing the plans for the second block of flats, to give plaintiff 50l. The plaintiff made the plans and defendant approved of them. Then the defendant found he was not in a position to commence building, and the result was that the work had to stand over. This went on until the latter part of 1903, when there came about some small disagreement between the parties. Subsequently the plaintiff wrote to the defendant stating that he must have some money, and ultimately the defendant wrote that he did not consider he owed the plaintiff any money at all, saying that the plaintiff's work had been no use to him. Plaintiff then commenced the present action. Defendant had claimed damages against the plaintiff, saying that through plaintiff he had lost 1,500l., but that claim was now withdrawn. The only thing to be decided now was whether the plaintiff had carried out the defendant's instructions.

Mr. Chas. Harold Norton, examined, said he was an architect, practising in Bedford-row, W.C. In 1899 the defendant approached him with regard to making plans for the erection of flats at Stoke Newington. He arranged with the defendant that he was to be paid 50l. for drawing the plans. The defendant built these flats. Witness obtained the sanction of the District Surveyor to the plans, and he prepared the specification. Defendant afterwards asked him to superintend the building of the flats, and to give certificates. Defendant agreed to pay him 20l. for that work.

His lordship said if the plaintiff relied on a letter, dated August 21, 1900, as a contract, it required a stamp.

Mr. Oliver said he would withdraw the letter in these circumstances.

Examination continued. After the buildings were finished the defendant applied to him to make the plans for another block of flats. After negotiations witness agreed to do the work for 3 per cent. on the estimated cost of the building, if erected, and 1 per cent. if the scheme should fall through. On May 5, 1902, the defendant wrote offering to pay witness 2½ per cent. on the estimated cost of the building. On May 7 witness replied, agreeing to reduce the amount to 2½ per cent. on the cost of the building. He prepared the plans for the block of flats, and also the specification; but the defendant never erected the flats. He had applied to the defendant for the 1 per cent. on the estimated cost of the building—viz., 50l. Defendant had at various times paid him sums amounting altogether to 30l. Up to November,

1902, defendant had never denied his liability. He heard on Tuesday, the 15th inst., that the counter-claim had been withdrawn.

Cross-examined.

At the time the contract was entered into it was proposed to build both blocks of flats at the same time. At the time that the contract of May 12, 1899, was entered into two sets of sketch plans were prepared by a Mr. Stubbs, an architect, and were given to witness by the defendant. He thereupon prepared the plans for both the blocks of flats it was proposed to erect. The defendant at that time was only able to obtain enough money for putting up one block of flats. The erection of the first block was very disastrous to the defendant. The first builder failed to carry out the work, and a new builder had to complete it at an extra cost. There was a great deal of trouble in the erection of the buildings.

Did not the defendant call your attention to the fact that he had been a very heavy loser over the erection of the first block?—No; he said he was not making much profit on it.

Did you not on that occasion say that if he would employ you as architect to superintend the next block at 2½ per cent. you would waive the balance owing to you on the first block?—Certainly not.

His lordship (to Mr. Oliver): What is it you now claim?

Mr. Oliver: My claim is for 50l. in respect of the first block, and 50l. for the second, and from that there is to be deducted 30l. That will leave 70l.

This being the plaintiff's case,

Mr. Tracy, the defendant, called and examined, said that in 1899 he was very friendly with the plaintiff, who was a young man just starting business. At that time he proposed to put up both blocks of flats at the same time. The letter of May 12, 1899, referred to plans for both blocks. As a matter of fact plans for both blocks were passed immediately, and were passed by the District Surveyor shortly afterwards. He failed for the time to get the necessary finances to enable him to put up the whole scheme. He therefore proceeded with the erection of one block only at that time. There was a great deal of trouble with regard to the flats—it was a fearful job. The first builder overdraw, and he had to employ another one at a great deal of additional expense. It ruined the job. Subsequently he had a conversation with the plaintiff with regard to the scheme altogether. A conversation took place between them about payment. Plaintiff said they had both had a loss on the first block, and the best thing was to wipe the whole thing out and start afresh with the new block. Witness was to pay plaintiff 2½ per cent. on the cost of the buildings. He stipulated that that was only in the event of the buildings being proceeded with. There was no foundation for saying that he agreed to pay plaintiff an extra 50l. whether the buildings were erected or not. He had, up to the present, failed to raise the necessary finances for the erection of the second block of flats.

Cross-examined.

Mr. Smith, the builder of the first block, was a friend of his. He used to write to the architect for the certificates for Smith. He was a surveyor himself, but at that time he was not practising. He had never suggested to the plaintiff that he was to receive 50l. for preparing the plans for the first block. It was understood that plaintiff was to receive 50l. for the plans of the two jobs. The second block of flats would be put up as soon as he could get finances to do so. The plaintiff took on the work in a speculative manner.

This being the defendant's case, his lordship asked the learned counsel what the questions for the jury were.

Mr. Oliver said that the reason why the jury were asked to try the case was because there was a counter-claim. That counter-claim was now withdrawn. If it had not been for that counter-claim the case would have been tried before his lordship without a jury. The only question seemed to be whether there was the agreement by the defendant to pay the 1 per cent. upon the second block of flats made on May 5, 1902.

His lordship said he should tell the jury that it was a question for him to decide whether there was a contract which entitled the plaintiff to the 1 per cent. There was no acceptance by the defendant in writing of the plaintiff's suggestion that he should have the 1 per cent. He thought it was an attempt to add to the contract of May 5 something which was not accepted by the defendant.

Mr. Oliver contended that the three letters taken together made the contract.

His lordship: It was only a proposal made by the plaintiff to the defendant that if the

building was not proceeded with he should have 1 per cent. That was never accepted by the defendant at all. There must be judgment for the defendant, with costs, on the claim, and for the plaintiff on the defendant's counter-claim, with costs.

Mr. Shaw said that the defendant withdrew the counter-claim last week, and he did not see what additional cost the plaintiff could have been put to by it.

His lordship said that was a question for the taxing-master to deal with.

ACTION BY A SURVEYOR FOR FEES.

THE case of Klencz v. Farris and others came before the Court of Appeal, composed of the Master of the Rolls and Lords Justices Stirling and Mathew, on the 15th and 17th insts., on the appeal of the plaintiff, Mr. J. M. Klencz, a surveyor, from judgment entered at the trial before Mr. Justice Darling and a common jury in the King's Bench Division on April 14 last. (The case was reported in the issue of the *Builder* of April 23, 1904.)

The action was brought by the plaintiff against the defendants, Messrs. C. Farris and E. F. Fitch, churchwardens, and Messrs. A. W. H. Little and T. Freeman, overseers of the parish of St. Ethelburga, to recover 78l. 15s. for work done by the plaintiff as surveyor for and on behalf of the defendants. The defence was a denial of liability.

The plaintiff's case was that he had, before the year 1900, been engaged on many occasions by the overseers of St. Ethelburga in the valuation of property, etc. In 1900 there was a scheme to run tube railways through the parish of Bishopsgate, it being proposed that one of the lines should pass under the church of St. Ethelburga. It was thought that the railway might injure the church and other buildings, and on December 6, 1900, a meeting of the vestry was held, at which the defendants were present. At the meeting a letter was read stating that it was proposed to call a meeting on behalf of the Ward of Bishopsgate to decide the question of opposing the Bills for the railways in Parliament. It was then decided that the two churchwardens should attend that meeting, and the plaintiff's case was that he was instructed also to attend the meeting, as an expert on behalf of the vestry. The plaintiff attended the public meeting, when it was decided to start an organised opposition to the railway Bills, and a committee of subscribers was formed. The plaintiff was one of the committee, and he attended the meetings of the committee. On December 12, 1901, he prepared a report addressed to the overseers and churchwardens, and that report was read at a meeting of the vestry. At that meeting one of the members asked the plaintiff if he expected to be paid for his services, and the plaintiff replied that he did. In April and July, 1902, the plaintiff sent in further reports, and in March, 1903, he sent in his account, but received a letter stating that it could not be entertained, as he had no instructions to act for the parish. In cross-examination the plaintiff said he had subscribed 5l. 5s. to the funds of the committee, and had attended frequently before the Board of Trade and the Parliamentary Committee. The committee, owing to lack of funds, ceased to exist in February, 1902. After this he still continued to act on behalf of the parish, and sent in two reports to the vestry. About one-half of his claim was for work done before the committee ceased to exist, and the remainder for work done after February 3, 1902, when the committee ceased to exist. The defendants' case was that all that the plaintiff was appointed to do was to represent the vestry at the public meeting, and so far as he did any work he did it as a voluntary member of the committee of subscribers. Mr. Justice Darling said he should take the opinion of the jury on the question of amount in case there was an appeal on the point of law. He accordingly asked the jury to say what amount the plaintiff was entitled to for work done down to February 3, 1902, and for work done after that date. The jury found that the plaintiff was entitled to 25l. under each head. Mr. Justice Darling then gave judgment for the defendants on the point of law, but granted a stay of execution in view of the plaintiff appealing from his judgment. Hence the present appeal of the plaintiff.

Mr. Lewis Thomas appeared for the appellant, and Mr. Ernest Pollock for the respondents. At the conclusion of the arguments of counsel, the Master of the Rolls, in giving judgment, after stating the facts, said it was admitted that the defendants could not be sued as individually liable. It was said, however, that, by virtue of the Act, 59 George III, cap. 12, section 19, the defendants could be sued as representing the parish. That Act

did, for certain special purposes, vest certain buildings in the churchwardens and overseers of a parish, and created a limited power in certain circumstances to sue them as representing the parish. It did not, however, cover such a claim as the present one for services rendered in advising those who were opposing the tube Bill in Parliament. The case was not within the section. There was, therefore, no statutory power to sue the defendants in their representative capacity, and the action accordingly fell to the ground. He was also of opinion that there was no evidence of any contract to employ and pay the plaintiff. He thought the appeal failed on all grounds. The Lords Justices concurred, and the appeal accordingly was dismissed, with costs.

PLASTERER'S ACTION AGAINST A BUILDER.

THE case of Morris v. Cooke came before the Court of Appeal, composed of the Master of the Rolls and Lords Justices Stirling and Mathew, on the 22nd inst., on the appeal of the plaintiff from a judgment of Mr. Justice Ridley at the High Court Assizes.

Mr. Disturnal, Mr. J. B. Matthews, and Mr. Bosanquet appeared for the appellant, and Mr. Amphlett, K.C., and Mr. Adler for the respondent.

Mr. Disturnal said the action was brought to recover damages for personal injuries sustained by plaintiff through the alleged negligence of the defendant or his servants. At the time of the accident the defendant was engaged as a builder and contractor in the erection of a post-office at Ledbury, and under his contract with the post-office authorities he had, of course, to find all materials and plant necessary for the building. The plaintiff was a plasterer, and he was engaged by the defendant upon the post-office under a contract to do a certain small amount of the plastering work on the outside of the building. His contract was made upon the basis of an extract from the original quantities relating to this particular plastering, and the plaintiff tendered upon that basis for a sum of about 33l., and he was engaged by the defendant to do that work. In the course of that work the scaffolding upon which plaintiff was standing broke down by reason of one of the putlogs being defective, and plaintiff was precipitated to the ground, and he was seriously injured. The plaintiff complained that the learned judge did not deal with what was the real issue in the case, but decided the case against him on an issue which was really not relevant, and as to which he said there was no evidence to support it. One of the putlogs used for the scaffolding was admittedly defective, and it broke in two by reason of the weight put upon it, and brought about the accident. It was admitted, and it was common ground at the trial, that it was the defendant's duty to provide the materials for the scaffolding. It was proved beyond a doubt that the scaffolding broke down through the defect in the putlog, which was part of the material it was the defendant's duty to supply. He (counsel) submitted that, if that were so, there was, at any rate, a *prima facie* case for the learned judge to consider.

The Master of the Rolls: Who made the scaffolding? Mr. Disturnal said there was a controversy about that. His first point was that there was that duty upon the defendant to supply the material from which the scaffolding had to be constructed. The scaffolding broke down, and the learned judge had not considered how far that negligence was the cause of the accident, and how far the plaintiff himself was guilty of anything which contributed to it. There was a controversy during the course of the case as to which person had constructed the scaffolding, and there was some conflict of evidence on that matter. The plaintiff's evidence was that the putlogs which had previously been there for the building of the wall for some reason had been removed, but the holes were in the wall where they previously had been. He said he told one of the defendant's men that he wanted scaffolding for his work, and that thereupon the defendant's foreman directed one of his men to go and build the scaffolding. That man's name was Nichols. Nichols got the assistance of a labourer in the employment of the plaintiff, named Preece, and Nichols handed up the putlogs to Preece, and the latter put them in the wall. The plaintiff's view was that he, wanting the scaffolding for the purpose of his work, the defendant's foreman gave Nichols instructions to put it up, and the latter got the plaintiff's man to assist him. On the other hand, the defendant said that it was the duty of the defendant to erect the scaffolding.

Lord Justice Mathew: This was a question of fact of a simple kind, and I understand the learned judge found it against you—that it was your duty to erect this scaffolding. Mr. Disturnal: I submit there was reasonable evidence to support the learned judge's finding. It was admittedly the duty of the defendant to supply this material which caused the accident. Even though it was the duty of the plaintiff to erect the scaffolding out of the material supplied by the defendant, it was necessary for the learned judge to decide whether the plaintiff had been guilty of contributory negligence. He never considered that point at all. What the learned judge decided was this. He said it was the duty of the plaintiff to erect the scaffolding out of materials supplied by the defendant, that man did erect it, and therefore that the plaintiff was responsible for that, and he could not attribute his injuries to the defendant. The plaintiff said his contract was to do the plastering, and to use the scaffolding which was on the building. The defendant said it was the duty of the builder to supply scaffolding and erect it, but in order to get rid of a *prima facie* duty which arose from his contract to erect the scaffolding, he sought to draw distinction, which he said depended upon scaffolding custom, between what he called scaffolding and staging. The defendant said: "Although I am bound by my contract to erect scaffolding, yet a putlog is not part of scaffolding, but is part of the staging which, by the custom of the trade, it is the duty of the sub-contractor to put up." Upon that the learned judge found against the plaintiff. That custom was never suggested before the trial, and it was never put to the client. He was never asked specifically whether there was any such trade custom that. All he was asked was as to what had been his practice under other contracts he had. When the defendant got into the box, he stated there was such a general custom, that it was the duty of the builder to supply materials, and the duty of the sub-contractor to erect the scaffolding, and his duty to do the putlogs.

The Master of the Rolls: There is abundant evidence to show that the defendant filled his contract to supply material for the purpose of the scaffolding.

Mr. Disturnal said it was a breach of contract on the part of the defendant to leave 15s. about the place a piece of timber which was improper to be used for scaffolding.

Lord Justice Mathew disagreed with submission.

Mr. Disturnal argued that, the case had been properly tried, and said it ought to be sent back for a new trial.

Mr. Matthews followed on the same side. The Master of the Rolls, without calling upon counsel for the respondent, in his judgment, said he thought there was evidence to justify the learned judge finding as he had done. In his opinion there was no evidence of liability on the part of the defendant for what had happened.

The Lords Justices concurred, and the appeal was accordingly dismissed, with costs.

PATENTS OF THE WEEK.

APPLICATIONS PUBLISHED.*

16,221 of 1903.—F. M. MCLARY: *Apparatus for Coating, Dressing, Moulding, or Dyeing Metal, Stone, or the like, and for Analogous Operations.*

This relates to a machine, the arrangement consisting in the combination with the slides and saddles, and parts for carrying tools, or tool holders, and the portion of frame necessary to carry the same, of means for traversing, independently of the main slide of the machine, the main slides, saddles, or part carrying the tools, or tool holders, which means for enabling the material to be operated upon in lines corresponding to the line travel of the table whether or not the counterbalancing arrangement be used in combination therewith.

22,725 of 1903.—J. H. WHITTINGTON: *Appliance for Forward Drying of Bricks, the like, in Continuous Downdraught Kilns.*

An appliance provided with grates near the bottom of the large chamber on which the rests and means being so arranged that heat of the products of combustion generated in the appliance are drawn first upwards through the opening into the small chamber and thence downward through feed holes in the kiln for the purpose of heating or drying.

22,801 of 1903.—THE MISERO FOUNDRY COMPANY, LTD., and G. H. BOARDMAN: *Bull-Head Fire Grates.*

This invention applies mainly to barless fire grates.

* All these applications are in the stage in which opposition to the grant of Patents upon them may be made.

places which are fitted with splayed tile panels either slatted or fixed in a metal frame. A raised platform extending to these splayed panels forms the top cover of a chamber containing a siphon, the front of which chamber is formed by a movable vertical panel or plate fitting up to the platform and extending to the full opening of the splayed panels. The above-mentioned platform forms the front part of the well, containing the fire, and the admission of air to the chamber below it can be controlled.

27,271 of 1903.—J. RUSSELL: *Means of Joining Together Pipes, Rods, and the like.*

Means of joining together pipes, rods, and the like, consisting of screw threads of different diameter and different pitch, formed upon the contiguous and portions of the respective members to be united, and a union socket having its opposite end portions threaded to screw upon said threaded end portions of the respective members, with or without a washer or packing ring of compressible material interposed between the contiguous extremities of said members.

27,338 of 1903.—R. W. HORDEN: *Method of and Means for Constructing Staircases.*

A method of constructing fireproof staircases, consisting of the employment of trough-shaped cast-iron plates which are first placed in position to form the staircase, and then filled with cement or other suitable material.

27,510 of 1903.—E. KOLBASSIEF: *Manufacture of Impermeable Blocks and Composite Structures from Cork, and other Material.*

A process for manufacturing impermeable material, consisting in sub-dividing a mass of suitable nature into any desired number of smaller parts, in coating subsequently each of these parts with a layer of impermeable substance, and finally in cementing them together in the required shape or form.

27,706 of 1903.—COMYNG CHING & CO., LTD., and W. THWAITES: *Ventilators.*

A perforated baffle plate or grating formed of plastic materials, for use in or as a ventilator, provided with holes which traverse the thickness of the plate or grating obliquely and have their area greater at one extremity than at the other, said holes being produced by pressing the material between dies having projections adapted to enter the thickness of the plate, and to co-act with one another from opposite sides thereof.

28,463 of 1903.—S. OLIVER and HATERSLEY BROTHERS, LTD.: *Kitchen Fire Ranges.*

Kitchen fire ranges, consisting in the combination with a hinged grate, of a pivoted ratchet lever comprising a forward operating arm, and an inner toothed engaging arm, whereby the grate may be adjusted to different heights vertically.

28,469 of 1903 S. OLIVER and HATERSLEY BROTHERS, LTD.: *Kitchen Fire Ranges.*

Kitchen fire ranges, consisting of a bar frame provided with horizontal projections on its inner sides, and outstanding vertical ribs on its front faces, in combination with a separately-constructed shelf formed with rear projecting arms having engaging recesses formed in their outer sides adapted to take on the projections, said shelf being also formed with recesses in its rear edge adapted to take over the ribs.

28,493 of 1904.—J. GARDNER: *Chimney Tops or Ventilators.*

Chimney pots or ventilators in which there is a hood placed some little distance above the terminal of the chimney pot, and a pair of flaps hinged to this hood, and connected rigidly with each other, the whole being arranged in such a manner that while there is plenty of exit for the smoke or foul air the hood at the highest point and the flaps below cover the crevices and prevent the wind from entering the chimney.

28,505 of 1904.—J. WELLS and J. JACKSON: *Machinery for Grinding Slurry, Applicable also for Grinding other Substances.*

A machine for grinding slurry or other substances, comprising a rotating cylinder, the inner periphery of which is formed with a number of troughs or gutters, and a series of grinding discs of a shape and size such that they roll freely in the troughs.

28,021 of 1904.—R. C. MATHEWSON and G. ANDERSON & CO., LTD.: *Apparatus for the Dressing and Moulding of Stone, Marble, and other like Materials.*

An apparatus for the dressing and moulding of stone, marble, and other like materials, consisting of a reciprocating table, to which is pivoted a top table which can be made to vibrate by means of a lever pivoted to such reciprocating table, the one extremity of the

lever working in a guide in the top table, while the other extremity slides backwards and forwards in an adjustable guide which can be set at any desired angle, the tools for cutting the material being mounted on a side standard, such tools being capable of cutting both forwards and backwards, of being adjusted to move towards or away from the material being operated upon or upwards or downwards as may be found desirable, the combined movements allowing of the stone being cut in a convex, a concave, or in a straight surface.

8,705 of 1904.—J. P. O'DONNELL: *Sand Screening and Shaking Apparatus.*

A sand screening or shaking apparatus in which a vibratory movement is imparted to the screen or sieve by the reciprocation of a piston or plunger directly attached thereto whose movement is controlled by a fluid-actuated piston valve which alternately admits fluid pressure to and exhausts it from either end of the cylinder in which said piston or plunger works.

16,975 of 1904.—J. M. McDOWELL: *Machines for Moulding Building Blocks.*

A machine for moulding building blocks, consisting of a frame, a bed-plate movable within the frame, means guided by the frame and supporting the bed-plate for moving the same, means for moving the supporting means, means for pivotally supporting the frame whereby it may be tilted, and means for locking the frame in position.

18,410 of 1904.—F. NORDMANN and F. SAUERLAND: *Water-closets.*

A water-closet installation, frost-proof, and without stagnant water, in which the inlet pipe opens into a two-way valve placed behind the water-closet seat. When the water-closet is used this valve admits the water to the flushing cistern placed a little above the seat, and after use causes the water still left between the two-way valve and the flushing cistern to run off into the drain in such a way that each time the water-closet is used the weight applied to and removed from the seat produces, through the agency of a suitable system of levers, the filling and complete emptying of the pipes and the flushing cistern, the parts exposed to frost.

18,895 of 1904.—D. DOYEN: *Extensible Railings, Gates, and the like.*

This consists in the use of levers joined together in the form of trellis work so as to form lozenge-shaped parallelogram-shaped openings in the construction of extensible railings, doors, gates, and the like.

19,438 of 1904.—J. W. LEADLEY: *Seats for Water-closets.*

A water-closet, consisting in the combination with a back rail integral with the pedestal, of bushed pockets in said back rail, projections on the seat, and pins or studs passing through the projections and into the bushed sockets to form the pivot for the seat.

28,317 of 1903.—J. H. CUTTELL: *Apparatus for Moulding or Casting Paving Slabs, and the like.*

This relates to moulding or casting paving slabs, and the like, and consists of apparatus for causing the plastic substance to settle in the mould, comprising a frame or stand, a table loosely mounted upon said frame, a pair of horizontal shafts geared together and provided with lifters or their equivalent, adapted to alternately raise and let fall the table upon which the mould-box is placed, a heavy metal plate mounted at the end of an arm attached to a vertical shaft, means for raising said plate, and means for swinging said plate clear of said table.

19,132 of 1904.—J. LENNON: *Excavating Apparatus.*

An excavating apparatus, comprising a receiving truck and a transmitting truck, the receiving truck having means for supporting a load, and having its truck frame constructed to permit the transmitting truck to be run completely through it, below the load supported thereby.

20,260 of 1904.—F. SHAY: *Cleansing Openings for Drains, and the like.*

This consists, in the combination with the ferrule, having at its upper end a cap providing an interior downwardly-facing valve-seat, of a float valve, and a valve support, comprising bent wires arranged diametrically of the ferrule, and having their ends journalled in perforations in the walls thereof, said wires being notched to receive each other in final position.

20,281 of 1904.—G. F. RYAN: *Soil Pipe Fittings.*

This consists, in the combination with a main sewer conduit, of a sewage branch and a revert branch both entering the sides of said main

sewer conduit, said revert branch having its opening into said main sewer conduit arranged with the lower portion of its wall at said opening within the path of flow from said sewage conduit, whereby the interior of the end of the revert branch is flushed by the discharge from said sewage branch.

20,322 of 1904.—G. BARKER (Perfect Sewer Trap Main Company): *Sewer Traps or Valves.*

This consists in the combination of a valve casing provided between its ends with a reduced portion having a valve-seat, having a groove flared from bottom to top, and a valve located in said seat having a body portion shaped to conform to the valve seat, whereby a tight fit is produced between the same.

Reinforced Concrete.

IN a series of articles published last year, we set forth some of the more important facts relating to the new building material, consisting of concrete and steel combined in

such a manner as to present distinctive characteristics of the greatest value to architects and constructional engineers. The employment of this material in such a manner as to meet the varying requirements of every-day practice requires something more than a familiarity with the properties of concrete and steel, for the designer must be qualified to analyse the stresses established or likely to be established in every part of the structure under consideration, and to apply the results obtained by recent investigation when calculating the proportions of the various members as well as the relative proportions of the two constituents, and the exact disposition of the steel reinforcement. Finally, he must be imbued with complete confidence in the strength, stability, and durability of the structure designed. As in other departments of constructive work, such confidence comes only with knowledge, based on theory and confirmed by practice. We may add the remark that if theoretical knowledge is itself founded upon observed facts, as it actually is in every branch of constructional science, there is an additional

reason for accepting theory as a reliable guide.

Much still remains to be learned with regard to the remarkable properties of concrete when reinforced by steel. Considerable and other eminent European scientists are still pursuing their investigations, and, as we pointed out in a recent "Note," an influential joint committee has been appointed in the United States for the purpose of collecting facts and formulating conclusions. In this country, architects and engineers alike appear to remain in a state of expectancy, and are making no effort to throw light upon this most interesting subject. A recent work by Mr. Charles F. Marsh* is particularly welcome at this juncture, and the comprehensive review of reinforced concrete therein presented cannot fail to stimulate interest in a material whose practical utility is beyond question. This treatise, including 530 quarto pages, obviously represents an enormous amount of labour, and, as a summary of information hitherto to be found only by the laborious process of searching through sundry foreign treatises, the proceedings of sundry engineering institutions in various parts of the world, and innumerable articles in technical journals published in Great Britain, the Continent, and the United States, it ought to be widely appreciated by architects and engineers who desire to make a systematic study of reinforced concrete construction.

* "Reinforced Concrete," by Charles F. Marsh, A.M.Inst.C.E., A.M.I.Mech.E., with 512 illustrations and diagrams. London: Archibald Constable & Co., Ltd. 1904.

In Part I. the author gives a good "General Review of the Subject," and, among other questions, refers to the history of reinforced concrete, its limited employment in England, and its advantages and disadvantages. Regret is expressed "that engineers and architects in England are so conservative, one might almost say prejudiced in their ideas, that many of them will not use this form of construction, even though their Continental and American *confrères* have proved to them so clearly its usefulness and economy, and, above all, its safety." We quite agree with these remarks and believe that in this particular respect engineers are even more conservative than architects. But the fact must not be overlooked that reinforced concrete can never come into general use until our building regulations, and especially the Metropolitan Building Act, are amended so as to permit the economic possibilities of the material to be fully developed. So long as building rules continue, for some purposes, to base the proportions of structures upon the strength of brickwork, so long will the use of superior material be retarded, and progress stifled. While dealing with this point, Mr. Marsh refers to the regulations which govern building construction in several Continental and American cities, and shows that intelligent recognition is therein made of the modifications rendered possible by the employment of reinforced concrete.

Under the sub-heading entitled "Advantages and Disadvantages in the Use of Reinforced Concrete," the reader

will find a good deal of useful matter. The fire-resisting qualities of reinforced concrete are emphasised by official reports, which have already been printed in an excellent trade catalogue known to many of our readers. This testimony, although reliable, is somewhat old, and, even assuming that the conclusions deduced from the great Baltimore fire were not available until after the author's pages were in type, some records of more novel character could have been given with advantage. An important point made, however, is that, even after exposure to severe fire and water tests, the elasticity and strength of reinforced concrete is practically unimpaired. The immunity of the reinforcing metal from rust is clearly a meritorious characteristic, which is demonstrated by several investigations quoted in this section of the treatise. Various opinions have been expressed as to the imperviousness of the new material by water. For details of some of these we must refer the reader to the work itself. The author again quotes largely from the catalogue before-mentioned, repeating data obtained as long ago as 1886 in the city of Grenoble, but the evidence is of little assistance in a general way, the most valuable guidance being afforded by the statement that where resistance to the penetration of water is required, "the concrete should be of sand and cement only, and in proportions not more than three to one." We may add that it is frequently desirable to finish the surface of water-tanks and similar structures with a rendering of neat cement. So far as concerns durability, the statement that "reinforced concrete compares very favourably with steel and iron structures" certainly does not err on the side of exaggeration, for, apart from the constant painting and supervision required by steel structures, we have no reason to believe that they can possibly endure for periods anywhere approaching those attained by works in simple concrete. So far as reinforced concrete is concerned, sufficient evidence is afforded by pieces of iron embedded in lime concrete hundreds and even thousands of years, that the life of the combined material is not likely to be limited by destruction of the metal. Several other points relative to reinforced concrete are discussed in the general review made by the author. All of these are of importance, but in view of the voluminous records awaiting attention in succeeding parts of the work we cannot notice them individually. We must, however, take exception to the suggestion that the work of designing may advantageously be restricted to those who are interested in the different systems of reinforced concrete construction. Our view is that architects ought to make it their business to master the principles involved, so that they may be able to apply reinforced concrete freely and confidently, as timber, brick, and stone have been applied in the past, for the realisation of architectural conceptions. So long as the mind of the designer is fettered by the requirements of another intelligence, it will be impossible to obtain really satisfactory results. In other words, if the new material is to achieve the success it deserves in artistic building

construction, the architect must learn to think in concrete-steel as he has hitherto thought in brick and stone.

Part II, entitled "Systems Employed," is probably the most complete summary of the kind yet published. It includes detailed descriptions and illustrations of more than forty different patented systems of construction, of which thirty are of Continental, seven of American, and only one, we are sorry to say, of English origin. This analysis serves to demonstrate the backwardness of our own country, and, taken in conjunction with the fact that several of the Continental and American patentees have established agencies here, affords one more suggestion that we no longer aspire to lead the world in the way of progress, but are reluctantly dragged forward by more enterprising nations. Most of the information presented in the present part appears to have been collated from catalogues and pamphlets issued by the firms concerned, but it is no less valuable for that reason. Only a few of such publications find their way into Great Britain, and many of them, being published in foreign languages, are not so convenient for perusal as might be desired. The summary made by Mr. Marsh, although merely descriptive, will be found extremely useful for purposes of comparison, and should afford many valuable hints to the studious reader. Notwithstanding the numerous patents extant, the main principles of construction are not, and cannot be, protected, and, as a general rule, the valid patents generally rely upon comparatively insignificant details, and do not militate against the general use of reinforced concrete. One of the objections frequently raised against the adoption of this combination is the variable strength of concrete, which is affected not only by the quality of the cement, the character of the aggregate, and the proportions of the constituents, but also by the thoroughness of mixing. In practice, however, the variation of strength should be small if reasonable care be exercised, and if the mixing be performed by suitable machines.

In Part III, the author deals with the constitution and properties of cement, mortar, and concrete, giving data from a number of well-known authorities. He also includes a table showing the proportions of concrete as used for different classes of work by various reinforced concrete firms. While the proportions in question vary considerably, it will be seen that in some of the most reliable systems, 1 to 3 and 1 to 4 concrete are usually employed for beams and columns. Some general remarks by the author on this part of the subject will be found helpful to those requiring guidance as to the best proportions for adoption. Only a small space is devoted to "Reinforcing Metal." There is comparatively little to say about this constituent of reinforced concrete, as ordinary bars or rods are most generally employed. We observe that the author does not appear to be quite convinced as to the superiority of mild steel to wrought iron. For some special purposes wrought iron is still useful, but for ordinary structural work steel is far preferable, and, considering its greater strength and

uniformity of quality, far cheaper well as more reliable than iron. The advice that "when steel is at a low price than wrought iron it is always the better material to use" is somewhat curious reading, and, taken in conjunction with other passages in the paragraph relative to reinforcing metal, seem to indicate that the author's experience as a buyer and user of iron and steel has been of somewhat limited extent.

Part IV, on "Practical Construction," deals with methods employed in the erection of reinforced concrete structures. This part of the general subject will perhaps be more suitably placed in the two succeeding portions of the volume, but the point is not of great importance as the reader can easily skip and advance return to the present part. Under the sub-headings entitled "Moulding" and "Falsework," will be found a large amount of most instructive matter, the value of which is considerably increased by reproductions of sectional and plan drawings illustrating the methods adopted in the construction of columns, flues, beams, floors, arched roofs, and chimney shafts. Some of the details in the next two sections, the "Treatment of Reinforcing Metal" and "Special Reinforcements" are more or less repetitive of descriptions given in Part II, and some again would have been more appropriately placed under the previous sub-heading devoted to "Reinforcing Metal." Still, the descriptions will gain many useful hints from a careful study of the particulars furnished, and the methods adopted by various engineers for placing and inter-connecting the reinforcement, and in depositing the concrete.

The question of "Moulding in Advance" is one that deserves attention in connexion with many classes of reinforced concrete construction, not only in regard to bridges and structures, but also in the different members are, or should be, mutually dependent, the author is quite right in saying that "Moulding in Advance" should be universally adopted for important parts," for when moulded separately in advance, it is exceedingly difficult to insure proper connexion between the different members, and, further, unnecessary labour and expense would be incurred in packing, transporting, and handling heavy masses of finished material. Portions of any floor should be moulded in advance, for the beams, joists, and panels have all to be combined to form a perfectly homogeneous structure, the slabs actually constituting the ends of the compression flanges of the beams and joists. Similar considerations point to the desirability of constructing columns on the site, but it may be remarked that there are reasons for favouring the advance moulding of compression members, and the treatment is distinctly advantageous in the case of various details, such as lintels, sills, and portions that do not contribute directly to the stability of the structure as a whole. The advantages to be gained by moulding in advance are well summed up by the author as follows:—(1) It is more economical to mould beams, slabs, etc., in a shed than to cast false work. (2) The moulding can be carried on in all weathers, and

considerable saving in time. (3) There is more freedom and space where no falsework, or very little is employed, than with the mass of props, boxes, and staging rendered necessary when moulding *in situ*. (4) The erection can go on without intermission. (5) The structure will bear its final loading immediately the parts are in place. (6) The building up of the structure is greatly facilitated in consequence of the beams, slabs, etc., merely requiring lifting and placing in position. (7) The pieces can be tested, if required, before being placed in position." As stated above, the chief reason against the separate moulding of members in ordinary building construction is to be found in the difficulty of insuring absolute connexion between them when built together, but if this obstacle could be got over, the practice would have everything in its favour. The last two sections under the head of "Practical Construction" relate, one to the moulding of ornamental work and facings—a subject of special interest to architects—and the other to methods of forming the hinges in reinforced concrete arches of long span.

"Experimental Research and Data Deduced Therefrom" is a title which promises most interesting matter for study, and in Part V. Mr. Marsh clearly justifies anticipation of the kind. There is no finality in experimental investigation into the properties of reinforced concrete, and it is not to be expected that a volume of such portentous dimensions as that now before us should contain records of the most recent investigations. Still, Mr. Marsh is very nearly up-to-date, a result upon which he is to be congratulated. Some of the most noteworthy records presented in this part are those referring to the ratio between the coefficients of elasticity of concrete in compression and those of iron and steel, to the limiting stresses for concrete in compression and in tension, to the resistance of concrete to shear, to tests of reinforced concrete beams, and, finally, to the remarkable properties of "hooped" concrete columns, as recommended by the distinguished French engineer, M. Considère. The names of the investigators quoted as authorities by Mr. Marsh sufficiently vouch for the reliability of the data given. A suggestive recommendation made at the end of Part V., is that "the present method of treatment may not be the best, and that instead of resisting the stresses by placing bars or wires in such positions that they may take up the direct stresses, greater strength will be obtained by so placing the reinforcement, that instead of directly resisting the imposed stresses, they may always act in tension, the concrete being compressed, whatever the nature of the main stresses may be." The elaboration of this idea, which probably has been suggested to the author by the remarkable investigations of M. Considère, would lead to the design of members in such a way that swelling of the concrete might be resisted by the tensile strength of reinforcement disposed in rings, spirals, or netting.

Part VI., on "Calculations," may be regarded as the most important chapter in the entire volume. It is divided

into three portions:—I., Necessary Hypotheses; II., Loads, Bending Moments, Shearing Forces, etc.; and III., Formulae.

At the outset we must say that none of the many theories hitherto propounded are more than approximately correct. Some rules are expressed in the most approved mathematical form, and present a sufficiently terrifying appearance to practical men who have never wandered far into the intricacies of this fascinating branch of science, or to those who may have forgotten much of the knowledge acquired of it at school or college. Other formulæ are expressed in far more simple terms, and others again are purely empirical. At the present time, it is exceedingly probable that rules of the last-mentioned class may be quite as reliable as those stated in the most severely mathematical terms. Still, it is desirable that all formulæ should be expressed in correct form, with due account of all essential factors. Then, as further data are ascertained, the coefficients employed will simply require correction, and the results obtained will approach more closely to absolute accuracy than is at present possible. It is now necessary to make certain assumptions upon which to base calculations, and these are the hypotheses which form the subject of examinations in the first portion of Part VI. Among the usual assumptions several are admittedly inexact, and to those who desire information on the point we recommend a study of the opinions and arguments collected by the author. We may pass over the second portion of Part VI., as the subject matter is common to many text-books on applied mechanics. The reader ought to note, however, that the author reproduces a long extract from a paper by Mr. W. Dunn, F.R.I.B.A., published in the *Journal* of the Royal Institute of British Architects, on the bending moments on slabs. This subject has been very little discussed in treatises dealing with the strength of materials, and the references here made should be very generally appreciated.

The third portion of Part VI., consisting of some 125 pages, chiefly filled with formulæ and mathematical demonstrations, cannot well be discussed in any detail in this article. We must, therefore, be content to make a few remarks while passing over the pages in question. The author first deduces two general formulæ for members in direct compression, one for reinforcement consisting of small sections, and the other for reinforcement composed of large sections. Rules derived from Euler's formula are also given for checking resistance to flexure in the case of columns having a length of more than 20 diameters, and values of the co-efficient (k) are given, corresponding with different methods of fixing the ends of the members. Next, we have a discussion of columns in which longitudinal and hooped reinforcement are incorporated, the references to this type of construction being largely based on M. Considère's articles, published last year in "*Le Génie Civil*." Some additional notes, based on experiments by Mr. Dunn, are useful as supplementing the conclusions of Considère, but further investigation is required before the precise influence of this ingenious system of reinforcement

can be calculated with accuracy. The following section in the same part deals with "Longitudinal Direct Stresses in Pieces Subjected to Bending," the method of treatment adopted being practically that used by M. Christophe in his well-known work, "*Le Béton Armé*." It should be observed, however, that the formulæ here given differ from those of M. Christophe in the respect that the stress-strain curve is considered as parabolic by the author. The portion of the volume to which we now refer contains a very large number of equations for application to rectangular slabs and beams with single and double systems of reinforcement, and to T-shaped beams incorporating different systems of reinforcement. It also includes a series of most useful diagrams showing positions of the neutral axis, and unit bending moments for various percentages of metal in slabs and beams, as well as several tables calculated from the formulæ for purposes of comparison. Speaking generally, the conclusions expressed by the author are quite in accordance with those accepted as correct by authorities on reinforced concrete. He shows that double reinforcement is very uneconomical, and that the employment of large rolled sections is, for the same reason, not to be recommended. At the same time, we may remind the author that reinforcement in the compression area of a beam may sometimes prove economical in practice by permitting the application of concrete construction in places where it would otherwise be impossible, or where the adoption of intermediate supports would otherwise be necessary. At the end of the article relating to slabs, we find the following sentence:—"It will be seen that for a steel reinforcement the depth of the slab, for any given bending moment, will be greater than when a wrought iron reinforcement is employed, but the percentage of reinforcement is much less for steel than wrought iron." This pronouncement undoubtedly represents conclusions drawn from a diagram below which it is printed, but if read separately it would be misleading, and must not be taken as affording any true criterion to the relative merits of iron and steel. As a matter of fact, in general practice, the depth of a slab reinforced by steel of given volume or weight is less than the depth of a slab reinforced by an equal volume or weight of iron; and it would be quite easy, by using the author's formulæ in a different manner, to demonstrate the superiority of steel over wrought iron.

"Shearing Stresses in Pieces Subjected to Bending" is the heading of another article in Part VI. which ought to be studied with care, as the influence of shear on concrete has not invariably been accorded the consideration it undoubtedly deserves. Ordinary and special forms of longitudinal reinforcement, in fact, offer no resistance to shearing stresses in the concrete surrounding the metal. In the succeeding article of the same part, a summary is given of various methods of calculation for members subjected to bending, including references to those of Hennebique, De Lafarge, Bonna, Chaudy, Ritter, Considère, and Christophe. We miss here any mention

of several noteworthy theories pro-
pounded by various American authorities
on reinforced concrete, an omission which
scarcely does justice to the thorough
manner in which the study of the subject
has been taken up in the United States.
The author next sets forth the outlines
of "A Proposed Method of Reinforce-
ment and Calculation." The suggestions
here made are decidedly original and are
supported in principle by the results of
many of the tests already quoted in the
treatise. To quote the author's own
language:—"The best results should be
obtained if a hooping were provided
along the whole length of the piece, which
would prevent the swelling of the concrete
under compressive stresses, and some
form of reinforcement inserted on the
tensile side which would induce com-
pressive stresses in the concrete." For
details as to the manner in which Mr.
Marsh proposes to apply metal for the
purpose of attaining the ends here out-
lined, we must refer our readers to the
treatise. No attempt has yet been
made to test this method of reinforcement,
but we are quite inclined to think with
the author that it is a strictly rational
system, and that the resistance obtained
by its employment would considerably
exceed that afforded by any method
at present employed. The remaining
matter, under the heading of "Calcula-
tions," relates to rules for the design of
pipes, circular reservoirs, arches, and
other structures subjected to direct
stresses and bending moment combined,
and, finally, to a graphical method for
determining the stresses to be resisted
in domed structures, the treatment in
question being based upon a paper con-
tributed by Mr. Dunn to the "Transac-
tions of the Royal Institute of British
Architects," for March, 1904.

Part VII. is entirely descriptive, being
occupied with general particulars and
illustrations of structures erected in
reinforced concrete. Among these are
examples of houses, churches, ware-
houses, bridges, reservoirs, and many
other types of constructive work. This
portion of the work is most interesting,
and serves to show the wide adaptability
of the material.

An Appendix, in which the chief
feature is a fully detailed account of M.
Considère's test to destruction of the
Pont d'Ivry, is a fitting conclusion to a
volume, which, although it may lack
the authoritative character and originality
of a work by an investigator who has
made reinforced concrete the object of
experimental research, admirably attains
the aim of the author "to place before
engineers, architects, and others a com-
plete treatment of the subject of rein-
forced concrete in so far as is possible at
the present day."

EMPLOYMENT OF PLUMBERS.—In the Muni-
cipal Section of the Congress of the Sanitary
Institute at Glasgow, it was resolved:—"That
it is necessary to the effective administration
of the Public Health and Water Acts that the
relative authorities be recommended and
empowered to require that the competency of
plumbers employed to execute or inspect
plumbers' work under the regulations of these
authorities shall be certified by the Plumbers'
Company under the conditions appertaining
to the National Registration of Plumbers, or
by such other body as may be set up by
Statute, or be approved by the Local Govern-
ment Board."

NOTES.

Architects' Drawings. WE recommend our pro-
fessional readers, all of whom
are liable to become prac-
tically interested in the question in a
very serious manner, to read the very
clear and logical statement which
has been addressed, by the solicitors
for the defendant in the recently
tried case, to the individual members
of the Council of the Institute of Archi-
tects. There is no question that the
attitude which the Law Courts are
taking in regard to the application of
the precedent of *Ebdy v. McGowan*
constitutes a most grave attack upon
the architectural profession, and that
the general adoption of such a ruling
would be disastrous to them as well as
absolutely unfair and unreasonable. We
are speaking of course only on the
general principle; and on that account
purposely avoided, in our article last
week, making any direct reference to
the case which suggested the considera-
tion of the subject. But the matter is
exceedingly serious, and if the law is to
be interpreted as judges seem disposed
now to interpret it, we can only say
that the law *has got to be altered*. Our
own opinion, however, is that, owing
to a misconception as to the object of
architectural drawings and as to the
function of an architect, "*Ebdy v.*
McGowan" is being used to cover cases
to which it does not apply. Of the
failure, so far, of the Institute of Archi-
tects to take any steps towards defending
the profession we will say no more at
present, hoping that the Council, which
meets next week, may yet recognise
its duty to the profession of which it
is the central representative body.

Landlord and Tenant. THE case of *Woodall v.*
Clifton should be brought
to the notice of lessees of
real property, as it decides an important
and comparatively new point. In two
leases of land for ninety-nine years
an option was contained to purchase the
land or some part thereof at a named
price per acre, which might be executed
"at any time during the said term,"
and the two leases were in substantially
identical terms save that in one the option
was granted to the lessee, "his heirs and
assigns," whilst in the other it was reserved
to the lessee, "his executors, administrators
and assigns." These leases were granted
respectively in 1867 and 1869, and both
leases have become vested in the plaintiff.
The plaintiff exercised the option to
purchase the whole of the land comprised
in both leases, but was met by the con-
tention that the options were invalid
in law as offending against a principle
known as the rule against perpetuities;
that is, a rule which prevents any execu-
tory interest coming into force later
than "a life or lives in being and twenty-
one years after." Options contained
in leases to renew for a further term have
been held not to offend against the above
rule, and it was contended that the above
options were valid on the same grounds;
but the learned judge held that the options
in both leases were invalid since the
options in those conveyances created
an interest in the land which did not
vest in the lessee at the time when the

leases were granted—as is the case
an option to renew—but deferred to
interest to the exercise of the option
which might be exercised at a time
outside the limit prescribed by the rule.
Such an option as that above granted
would seem one so natural and desirable
to any layman that too much public
cannot be given to the decision, and lessees
must be careful to see that an option
to purchase the premises is not deferred
more than twenty-one years from the
granting of their lease, unless a life
lives of living persons are also inserted
in the clause giving the option.

The Isle of Wight Coast. IN a "Note" which
appeared in our issue
November 5 we mentioned
that the Isle of Wight Rural District
Council had decided to consider a Report
from the county surveyor relative to
the protection of the coast at Freshwater
gate. It is satisfactory to learn that the
Council have done more than this, for
a meeting held last week they were
to consider a Report furnished at the
request by a local geologist. This Report
emphasises the extraordinary fact that
great quantities of shingle are being
moved by Government from Whitecliff
Bay, between Sandown and Bembridge,
for the purpose of making concrete
to be used in the construction of a
fort. In consequence of this unju-
stifiable action the bay has been
denuded, and at high water the sea
reaches the base of the cliffs, a result
which has not happened for at least a quan-
ty of a century. We pointed out in our
column with the papers on "Coastal
Erosion," read before the Institution
of Civil Engineers, that the Government
"claims absolute authority over the
foreshores and does nothing for their
protection." From the facts now stated
it is clear that the Government do some-
thing less than nothing, for at the
Isle of Wight they are taking active mea-
sures for the destruction of the coast. This
is really scandalous, and we have every
sympathy with the decision of the
Isle of Wight Rural District Council to imp
upon the War Office and the Board of
Trade the necessity for immediate or
stopping the further removal of the
material. At the same time we should
like to know what the Council pro-
pose doing for the protection of Freshwater
gate. Their present inaction must not
be allowed to continue.

The Philæ Temples. *À propos* of the further
mention of the Island
Philæ, Mr. Somers Clarke
pays a well-merited tribute to the
anxiety displayed by the Egyptian
Government to protect the buildings as
far as possible. Admitting that there is
reason for believing that the stonew
of the walls and columns will not crum
away under the influence of the water
he fears the architraves and horizon
roof slabs may be prejudicially affec
by soaking for weeks at a time. From
past experience we feel satisfied that
the authorities will show themselves re-
solute to carry into effect any recommen-
dations that may be put forward by
Maspero, the Director-General of Ant
iquities, for the preservation of the
Judging from the results afforded du

the past two years, the masonry already subject to immersion has suffered no ill, although its exterior has been washed to a cold grey tint, and the colour of painted surfaces is rapidly fading. If the same care be given to the upper portions that will be immersed when the Assuan Dam has been raised, the permanency of all the buildings should be adequately assured.

The Disfigurement of Clifton. We are pleased to learn that owing to the jettiness of the jetty, which we mentioned in a recent "Note" as a useful weapon of opposition, Sir John Aird has definitely abandoned his intention of using the Leigh Woods quarries for the supply of stone to the Avonmouth dock extension works. This decision removes a great immediate danger, but does not in any way safeguard the future, as three quarries are still being worked, one of them by the Bristol Corporation, who ought to know better. The perfectly feasible suggestion has been made that operations could be conducted on the behind-bank system, the adoption of which would not affect the quantity of stone quarried, nor the number of men employed. Still, if the stone were delivered from the front of the quarries the Avon gorge would continue to present indications of work, which are quite out of keeping in a place of sylvan beauty. It may be that stone can be obtained in this spot a little cheaper than from other sources; the same may be said of shingle filched from the seashore, but in neither case is it right to cause irrevocable injury to national property for the sake of saving a few pence per ton of material.

Impact Tests on Steel. In the paper read before the Institute of Mechanical Engineers by Mr. A. E. Eaton and Mr. A. Jude, the authors stated that considerable movement had been made of late towards the establishment of a shock test for steel, and afterwards expressed the opinion that progress in this direction was taking place still so slowly. The latter is a view with which we fully agree, especially as nearly two years ago we said: "Impact tests have not received the amount of attention which their importance deserves. . . and some of the results obtained merely seem to indicate that the measurement of shock resistance is likely to furnish a new factor in judging the liability of iron and steel." The objects of the paper to which we now refer are to show some of the characteristics and peculiarities of commercial wrought steel, assist in the development of a more rational method of testing the suitability of such steels for particular purposes, and to point out a few of the peculiarities observed in the fracture of test specimens and actual parts of machinery. For steel used on structural work, subjected to steady loads only or to current loads at intervals, the ordinary tension test is doubtless quite adequate. In the other hand, for steel used in structures subjected to rapidly repeated loads more or less suddenly applied, to alternating loads, the tension test is insufficient. From the numerous bars

tested by the authors they conclude (1) that the number of blows to produce fracture is a fair gauge of the toughness or anti-brittleness of the steel, and (2) that there is no relation whatever between this result and the tensile test results, except that if the impact test result is good the elongation is sure to be good; but that a steel showing high tensile strength and good elongation may be useless to resist shock.

Electric Railways. THE report of the joint meetings of the Institutions of Electrical Engineers of Great Britain and America at the Exhibition at St. Louis last September, which has just been published in the "Journal" of the American Institution, is exceedingly instructive. The most important discussion was that on the methods and systems of using alternating current in electric railway motors. The report of the speeches makes it perfectly clear that the American engineers have completely mastered the problems of electric traction. Mr. Steinmetz, in a clearly reasoned speech, points out the different nature of the problems that have to be considered in electric traction in tramway systems in towms, in inter-urban railways, and in long-distance railways. For tramways in towms direct current at from 550 to 600 volts pressure is the most suitable, but for long-distance work the alternating current motor has found and developed a field of its own. Mr. Steinmetz, who is the author of the standard work on "Polyphase Currents," apparently has not a high opinion of the polyphase motor. The only use he finds for it is in connection with mountain railways, where the character of the work to be done is similar to that done by the motors used for lifts. The advantage that single-phase systems have over polyphase systems is that only one trolley wire is required. Another is that the motors used have a very large starting "torque," and so there is little likelihood of a train coming to rest on a steep incline at a considerable distance from the power station, and not being able to start owing to the considerable loss of pressure due to the large currents having travelled considerable distances. Mr. Sprague mentioned that the railway companies were adopting electric traction on their branch lines, because they found that this was the only way to make them profitable. Mr. Elihu Thomson pointed out that the new alternating current motor would work equally well either with direct or with alternating current, and that railways were now being built which worked primarily with alternating current, but that in the neighbourhood of towms they would be worked by direct current, the electrical apparatus on the motor-cars acting equally well in the two cases.

Fires in Country Houses. THE past ten days have seen several fires in important country houses, resulting not only in the destruction of property but of works of art such as are often found in English mansions, and which it is impossible to replace. It is obvious that much greater care is required not only in the inspection of flues and other fire traps from time to time,

but in that nightly guard which discovers a fire at an early period. It is indeed surprising that rich men who are owners of great houses do not have much more efficient watchiug, considering how small is the outlay for this purpose in comparison to the risk which is incurred by the absence of any such care. In some places means of communication with fire-stations, as by telephone, does not exist, and the water supply is singularly bad, the want of any means of escape too is also often remarkable. Whether warnings are of any value we do not know, but they must be given.

A Historical Atlas of London. MESSRS. GEO. FALKNER & SONS are about to produce reprints, in slightly reduced facsimile, of eight entire maps with some sheets of selected sections to illustrate the gradual growth of the town during the XVIIth and XVIIIth centuries. The descriptive notes will be written by Mr. Randall Davies, F.S.A. Seven of the maps will be reproduced from original specimens in the Grace collection, the facsimile of Faithorne's from the copy lately secured for the British Museum. The set ranges from Ryther's map of 1604 (engraved and sold at Amsterdam by Cornelis Dankerts) to that published in 1776 by Laurie & Whittle, of Fleet-street. It includes one of the two or three engraved by Hollar in 1666-7 showing the extent of the Great Fire, and Wren's plan for rebuilding the City. The former, we gather, is the unique specimen of which the original measures 33 in. by 21½ in., which, it seems, was "reduced into one entire plat" by John Leake, one of six who in 1666 had "first described in six plats," by order of the Corporation, "an exact surveigh of the streets, lanes, and churches contained within the ruines of the City of London." Vertue made a copy of it, to a larger scale, with amplifications. We may mention that of the map engraved by William Faithorne on seven sheets for Newcourt, the only other original impression of which the existence is known is preserved in the Bibliothèque Nationale, at Paris. It is a beautiful work, delineating, to a scale of 1 in. to 150 yds., the buildings, etc., *à vol d'oiseau*. Though dated "1658" it bears internal evidence that the survey was made in the interval 1643-7, for it depicts Charing Cross, which was pulled down in June—August, 1647, *teste* Lilly, and does not show the other Eleaour Cross, in Cheapside, which was pulled down on May 2, 1643, as Evelyn records. The impression in our national collection is, we imagine, that of which the discovery was announced in 1855. A copy of it, engraved by George Jarman, was published by A. E. Evans & Sons, of No. 403, Strand, on May 1, 1857. The limits of the survey are Clerkeuwell, Southwark and Lambeth, Shoreditch, Whitechapel, Limehouse and Wapping, and Holborn, St. Giles, Piccadilly Hall, Berkshire (Bridgewater) House, St. James's, and Tothill-fields; an inhabited area of between twelve and thirteen square miles.

ENVILLE HALL, near Stourbridge, the seat in Staffordshire of the Countess of Stamford and Warrington, was almost

* The Builder, Vol. lxxviii, p. 119.

entirely destroyed in the morning of Friday, November 25, but most of the contents of the strong-room and the ground-floor apartments, with some pictures by Titian, Murillo, Rubens, and Romney, were removed in safety. At Enville Hall, of which the older portion was built in the middle of the XVIIIth century, were preserved some relics of Lady Jane Grey. John Grey, of Enville Hall, ancestor of the Earls of Stamford and Warrington, was a lineal descendant of Lord John Grey, of Pirgo, co. Essex, nephew of Lady Jane Grey's father, the Duke of Suffolk. The ornamental grounds at Enville were laid out by Shenstone, and contain a small chapel erected to his memory. The south aisle of the parish church, which Sir G. G. Scott restored in 1872-5, contains some monuments of the Greys, and is known by their name.

School of Art Wood-Carving. An exhibition of students' work was held in the Wood-carving School-rooms, Exhibition-road, South Kensington, this week. The work shown included studies under the direction of Mr. H. H. Grimwood and Mr. George Jack, and specimens of the course of studies given to students preparing for the Certificate Examination of the school. Instruction in design in practical relation to wood-carving is now given by Mr. Jack, whose excellent influence is already making itself felt in the work that is shown. We recently noticed Mr. Jack's book on this subject, and pointed out how enlightened were his views and what delightful results they achieved in practice. There is probably no other exponent of the art of wood-carving at the present day than Mr. Jack. Last week we were able to give illustrations of some work done by students of the Royal College of Art under his tuition; students, of course, not entirely devoted to wood-carving, as in the case of students at the School of Art Wood-carving. Photographs were on view at the exhibition showing some nice work, including a pulpit carved by Miss E. R. Plowden. Working drawings were also shown of designs in course of execution. Not the least interesting rooms were those in which the students were hard at work carving.

The Goupil Gallery. THE exhibition at the Goupil Gallery of Paintings and Drawings by Mr. G. Clausen is somewhat disappointing. There is the fine picture "Willow Trees at Sunset," which has already been seen at the Academy; most of the others are rather slight studies for pictures. Among these "October Moonlight" and "At the Back of the Farm" are very interesting suggestions in composition and lighting; "Early Spring" is another admirable study. "Mowing the Orchard," a larger work, is spoiled by the careless or indifferent painting of the figure in the foreground. The study of an old man, under the title "Old Joe," is admirable for breadth of style and effective colour. Mr. Clausen seems also to be taking up flower-painting rather in the style of Fantin-Latour; at least, his works remind one of that artist. The best of them is "Carnations by a Window," a very complete and satisfying painting of its class.

THE ARCHITECTURAL ASSOCIATION.

THE ordinary fortnightly meeting of the Architectural Association was held on Friday last week at the new premises, 18, Tuffon-street, Westminster, the President, Mr. Guy Dawber, in the chair.

Mr. H. Tanner, jun., Hon. Secretary, read the minutes of the last meeting, which were confirmed, and the following gentlemen were then elected members:—Mr. F. G. Booker, London; Mr. H. C. Tryon, Epsom; R. A. F. Guimaraens, Ealing; A. St. H. Brock, North Cheam; F. W. Langman, London; F. V. Longstaff, Wimbledon; and W. B. Medlicott, London.

The Building Fund.

The President announced the following further donations to the Building Fund, *i.e.*, Messrs. John Murray, 105*l.*; H. L. Florence, 50*l.*; T. Elsley, 2*l.*; A. N. Prentice, 10*l.* 10*s.*; C. Hodgson Fowler, 5*l.* 5*s.*; Theo Moore, 5*l.* 5*s.*; H. S. Moblett, 5*l.* 5*s.*; P. E. Pilditch, 5*l.* 5*s.*; W. Woodward, 5*l.* 5*s.*; Sir A. Blomfield & Sons, 3*l.* 3*s.*; W. H. Sorymgour, 3*l.* 3*s.*; G. Watson, 3*l.* 3*s.*; A. C. Galbraith, 2*l.* 2*s.*; P. W. Lovell, 2*l.* 2*s.*; W. L. Lucas, 2*l.* 2*s.*; A. Bolton, 1*l.* 1*s.* 6*d.*; F. H. Crawley-Boevey, 1*l.* 1*s.*; J. S. Gibson, 1*l.* 1*s.*; C. R. G. Harding, 1*l.* 1*s.*; and T. S. Inglis, 1*l.* 1*s.*

He also announced that the following members had kindly promised to double their annual subscriptions until the building debt was closed:—Messrs. S. Chatfield Clarke, W. E. Davis, E. Guy Dawber, Henry T. Hare, Arnold Mitchell, E. H. Sin, B. N. Southall, A. H. Ryan Tenison, M. E. Webb, Louis Ambler, A. Bolton, W. G. R. Bousfield, C. H. Brodie, F. Dare Clapham, A. O. Collard, G. Hubbard, J. K. Hunter, H. P. G. Manle, L. Simmons, and A. D. Smith.

The Late Mr. J. Norton.

The President said that since their last meeting they had lost an old member in Mr. John Norton. Mr. Norton had been a member of the Association for a great number of years, and in 1858 he was their President. He had been a good friend to the Association ever since. The Association was represented at the funeral by the Secretary, Mr. Driver, and he had now to propose that a vote of condolence be passed to the relatives of Mr. Norton.

The vote was carried in silence.

Mr. Tanner stated that, by the permission of Mr. F. T. Verity, a visit to the new theatre, Charlotte-street, Tottenham Court-road, would take place on December 3, the members to meet at the building at 2 p.m.

Mr. L. Ambler, Hon. Secretary, proposed a vote of thanks to Mr. E. Guy Dawber for the gift of an arm-chair to the reading-room, and this was agreed to.

Mr. J. F. Micklethwaite then delivered a lecture on

The Church of Westminster Abbey.

Mr. Micklethwaite said the subject he had chosen had been vaguely announced as that of Westminster Abbey, but what he wanted to talk about was the church of Westminster Abbey only, and how it came to take the form it was now. One of the rarest things in England was an old church which had been built straight out of the ground, uninfluenced by what was there before. Amongst the parish churches he did not think there were more than half-a-dozen which they could say were built on new sites and not influenced by what was there before. Amongst monastic churches perhaps there were some, but even there, if they looked closely into the case, they found nearly all of them influenced by earlier buildings which had sometimes been only temporary. Westminster Abbey was perhaps one of the most uniform churches of its kind to be found anywhere, for they found the same design running through it from beginning to end, and he had often seen it quoted as a complete example of a XIIIth century church, although it was admitted that the later parts were not XIIIth century. The same design, however, was carried through. He wanted to show them that the design as they had it now was really influenced by what had been before. He wanted to show how one step led to another until it grew from a church totally different to what it was now. The story of Westminster Abbey began in a fog—they knew nothing about it but what was legendary. They all knew that St. Peter came down on the wrong side of the river to consecrate it, and had to be paddled over, but why it was he missed his way they did not know. However, when they came to

genuine history they had nothing very new before the refoundation by Edward the Confessor except the fact that there was an older Westminster Abbey in existence. Edward the Confessor undertook to make what, for time, was an unusually large foundation its place. They had an almost contemporary description of what Edward did, and it told pretty well what the design must have been; but that was to some extent influenced by the Saxon work there before. They told it was built to the east of the old church, which was afterwards joined on to it with intervening vestibule, and it was his intent speaking as he was to architectural study to work the thing out by sections, and on the plan. Mr. Micklethwaite proceeded to illustrate his remarks by means of drawings arranged one on top of another. Starting with a blank sheet—which he described as fog—he had previously referred to—he showed first one part and then another part of Abbey was built and re-built, and altered until it reached its present state. In the beginning they knew that there was a church probably 200 or 300 years old, before the time of Edward the Confessor. They knew it stood, and could guess more or less what it was like. Edward the Confessor started to build his church in what was a new fashion. People commonly spoke of a style called the Anglo-Saxon, and a style called the Norman. It used to be said that when William came he brought over the Norman style in pocket, but the fact was that the so-called Norman style grew out of the so-called Anglo-Saxon. The church at Westminster was spoken of by Englishmen at the time it was being a new style, and they had in the "Life of Edward the Confessor" a description of it written by a man who had great admiration for the church, but did not know how to describe it. The writer told them that Edward I. built a church with a tower and transept, and it was round at the end, and that the church was in the middle, and that it was consecrated a few days before Edward died. The use of the future participle in the description proved that the chapels were not finished until several years after the church was consecrated. The case of the King's building westwards was very clear, for all they had remaining were a bases now under the floor of the Sanctuary. The style was quite Norman, and the moulding occurred at Peterborough and Blyth and other churches which they knew were of Norman. Proceeding to show a section of the church as Edward left it, Mr. Micklethwaite said it was very like what was found at Peterborough and Blyth. St. Albans was a little different as it was built in brick and finished in plaster, whereas the church at Westminster was stone. They had also a few fragments apart from the bases he had mentioned which proved that the church was more or less like the drawing they saw before them. There was a uniformity about the churches of that time both in England and Normandy, because they were practically the same at the time, for quite apart from the Conquest they were going on *pari passu* on both sides of the Channel. When the building was finished they joined it up by the vestibule he had mentioned, and they had the tall church and the little old Saxon church forming a nave. They must remember that in the old days in the monastic and secular collegiate churches the nave and choir were not as the nave and chancel of the modern parish church. They were practically separate buildings as far as use was concerned. The church was not considered complete as Edward left it, but his foundation well endowed. After his death they went on building, but they built slowly and it was the end of the XIIIth century before the nave was finished. They knew the church was completed, because they had written description of it in the XIIIth century before the next step was taken. An addition was made before anything was pulled down, which was the erection of a lady chapel at the east end in 1225. It was commonly said this was done by Henry III., but it was not so. Henry III. was a boy at the time, and there was evidence that the church was built by subscription in the usual way. They had the foundations of a good part of this remaining under Henry VIII.'s chapel. Twenty years later Henry III. became a benefactor, and undertook to rebuild the church of the church to give greater glory to the shrine of the Confessor, and this shrine also made at great cost. He began by pulling d

the Confessor's choir up to and including the crossing, and building what we now see in its place. Henry III. made two stores of his building to the height of the three stories of the original church. About 1260 it appeared that the first work was nearly finished and Henry undertook the completion of the whole choir. Some of the books told them that Edward I. did this, but there was no evidence of it. On the other hand, there was evidence in the coats of arms in the aisles that it was done in Henry III.'s time. There were the coats of arms of different persons which would not have appeared in Edward I.'s time, which proved that Henry built the choir proper. The design was the same, but with considerable variations of detail, which he could only show them if they were on the spot. They could trace distinctly where one work ended and another began. They knew it was finished in 1269, because on the Feast of the Translation of St. Edward, which was October 13, the monks entered the new choir. That was the state of things on the death of Henry III. in 1272. It left the church in the condition of having a lofty choir and a comparatively low nave, with a thick wall dividing the two, and some sort of lean-to roof at the junction. Fifty years or more afterwards they began to alter the west end, and somewhat later they came in for a large sum of money and rebuilt practically the whole of the domestic part of the abbey, and also set to work to rebuild the nave. A large part of the work was done during the XIVth century, but with the French wars and other things money was lacking, and the work then went on slowly to the end of the next century, when they filled up the gap between the XIVth century nave and the work of Henry III., and that work was here now to tell its tale. It was quite at the end of the XVth century that they closed the gap and put in a new west window. What he wished to impress on them was how much the form had been arrived at by what was there before. How first there was the Saxon Church and the Norman completion of it; then the XIIIth century work put in between the lady chapel and the still existing Norman nave; and then the Norman nave replaced by what was there now. That brought the church practically to its second completion, as he might call it. There was one other alteration. The XIIIth century lady chapel was pulled down and replaced by the splendid Henry VIII.'s chapel. Thus they saw the church grow up from a little church, bit by bit, until they got the present building.

Excavations in Ancient Westminster.

In the absence of the author through illness, Mr. L. Ambler then read the following paper for Mr. E. P. Warren, entitled:—"The Abbey Mill Stream and Bridge at the corner of Tufton-street and Great College-street, Westminster":—"Great College-street forms the southern boundary to the garden of Westminster Abbey, from which the street is separated by the well-known mediæval stone wall that runs along its northern side.

In many old maps this is called the Dead Wall, and separated the garden from the path and water-course, the situation of which are accurately represented by the street of to-day. In a map dated 1690, at the British Museum, this Dead Wall is shown as forming the southern enclosure of the Earl of Lindsey's garden, the eastern portion of which seems to have formed part of the site of the Abingdon-street houses.

Many confident statements are to be met with that the water-course in question was a tidal creek, practicable for boats and barges as far as the ancient Abbey Gateway, represented by the archway at present giving access to the south-eastern corner of Dean's-yard, anciently called "The Elms." A study of XVIth and XVIIth century maps and plans, however, makes it clear that this water-course was a mill stream of no great width, and serving a mill placed on the river bank at the southern end of the present Victoria Tower Garden.

This mill is clearly shown in several plans and "Birdseye" views, notably in the plan of Pieter Vanden Keere, 1593, in the print-room of the British Museum. In this plan a double structure is shown, labelled the Queen's Slaughter House and Mill.

Norden's map, in the "Speculum Britannicæ," published in 1593, also clearly shows the Mill and Queen's Slaughter House.

The Slaughter House existed well into the XVIIth century, and is shown as the King's Slaughter House, in the same position, in a plan

of intended improvements to Westminster Bridge, dated 1739, at the British Museum.

In view of its position on a tidal river, with so great a rise and fall of tide as the Thames, the Mill, in all probability, must have been worked between tides, and very likely by means of automatic flood gates, which admitted water as the tide rose, and held it back as the tide fell. There are, I believe, many mills of this sort existing on Southampton Water and elsewhere, and I have lately seen one near Chichester. If such was the nature of the mill, boats or barges could only have passed from the Thames to the mill stream at high tide by some side creek or lock, which I have been unable to detect on any of the maps or plans I have seen; and in the recent demolitions of buildings in Great College-street, and the subsequent excavations, nothing, so far as I am aware, has been discovered, either in the nature of quays or wharves, or in that of fragments of boats or apparatus of any sort, to warrant the supposition that the stream was navigable.

It is possible that the other branch of the Tyburne, which ran along the northern side of Thorney Island, and fell into the Thames further down, was navigable to some point in or near the enciente of the Abbey precincts, but of this I have no evidence.

In Richard Bloom's "Map of the Parish of St. Margaret's, Westminster, taken from the last Survey with Corrections" (1720), the position of the eastward commencement of uncovered waterway in Great College-street coincides with the bridge recently uncovered at the junction of that street with Tufton-street, and of which I am able to show a photographic view, and a measured drawing made last spring.

Bloom's map shows Tufton-street as the Bowling-alley, a name under which it figures in several contemporary and earlier maps, and indicates several small bridges crossing the course of the stream in what is now Great College-street and connecting the path that ran along the bank under the old wall, known as the Dead Wall. It further shows one wide bridge for general traffic on mill bank.

The bridge, as shown in my illustrations, consists at present of a round brick arch or vault, placed between two stone abutments or flanking walls of obviously earlier date. The brickwork appears to be, at earliest, of XVIIIth century character, and the arch uncovered recently, seems to me to be the end of a culvert rather than a bridge, and formed between the stone abutments of a demolished bridge, which was probably of timber, merely to enable the street to be carried solidly up to the entrance of Dean's-yard.

It is noticeable that the exposed end of this brick vault shows that there is no invert arch. The vault indeed springs from the clay of the bed, without anything approaching to foundations. As I saw it in the spring, the right hand or northern side of the vault rested upon a thin slab of wood, which, on inspection, proved to be not even oak or elm, but pine.

I have had no possible means of ascertaining the length of this brick vault or culvert, and its extent would throw considerable light upon its purpose, for, if extending back, *i.e.*, westwards as far as Great Smith-street, it would lead to the supposition that, after the disuse of the mill and mill stream, the latter was vaulted over to gain ground whereon to erect buildings or form gardens at the back or to the southward of Dean's-yard.

A few years ago the northern side of Little Smith-street, at present occupied by the Church House, was formed by a row of small houses, whose back-yards abutted on the mews and back-yards of Dean's-yard, under these back-yards approximately the stream must have passed. But Norden's map shows a twin stream, the southern branch of which would, I think, about coincide with Little Smith-street. These streams seem to converge at the bridge.

It will be noticed in Norden's map, of which my illustration shows a portion, that there is a group of buildings precisely at the point where the recent excavations have discovered so many indications of XVIIth century usage.

These are the only buildings which, in 1593, seem to have existed on the south bank between the Abbey gate and the river.

The stone abutments or flanking walls of the bridge are in fairly dressed masonry of Kentish rag, and are, I should say, not later than the early part of the XVth century.

Eastward of the bridge and marking the southern bank of the stream, is a row of small timber piles or camp shedding, probably placed to form a stable site on the bank for building purposes.

Upon this site, extending between Tufton-street (the old Bowling-alley) and Barton-street, a much more recent thoroughfare apparently, there stood until last year two blocks of houses separated by a narrow passage called Black Dog-alley, and all, I think, of the XVIIth century; though the brick-vaulted cellars beneath those in the eastern block next Barton-street, built of smallish bricks, had the appearance of XVIIth century work.

A very large number of objects, pottery, spoons, knives, etc., mostly of the XVIIth century, were found in the recent excavations beneath these houses, together with a portion of a Purbeck marble shaft, which I believe to be the upper part of the shaft from the north-eastern angle of the Confessor's shrine; it exactly fits that position. I shall now be able to show other objects of a similar character, but before doing so wish to offer a few remarks upon the course of the stream in the neighbourhood of Thorney Island, and must profess my indebtedness for much information to Mr. J. G. Waller, Fellow of the Society of Antiquaries, whose paper and plan contained in the transactions of the London and Middlesex Archaeological Society in 1890 is of extreme interest and value.

Mr. Waller derives its name of Tyburne from the Saxon Tye or Teo Bourne—a double brook—and accounts for this name by the duplication or bifurcation which forms the delta on which the city and abbey of Westminster stand, and which, as he says, it must have done much to form. He points out that in its southward course, from its rise in the Conduit fields below the hill of Hampstead, to the Thames, it gives name to Brook-street, to Conduit-street, and to Pump House-ground, at the junction of the latter with Bond-street. Hence it passed by the rear of the gardens of Berkeley House and the end of Clarges-street to the Green Park, which it crossed to the front of Buckingham Palace, where, in Faithorne's map of 1685, it was covered in from view. Passing in front of the Palace its course was down James-street, Chapel-street, Orchard-street, between the present Church House and the south side of Dean's yard to the bridge at the corner of Tufton-street.

Mr. Waller describes the junction of the other branch, the bifurcation, as occurring in front of Buckingham Palace, whence, he says, it made a bold sweep westwards forming the ancient boundary of Westminster, and, under the name of the King's Scholar's Pond Sewer, passed into the Thames, running close to Victoria station; there was in the early part of the XIXth century a brewery here—and by Vauxhall Bridge-road and Tachbrook-street, out to the river. But there is still the eastern branch which confined the island of Thorney to account for, and this is more difficult. In Norden's map a branch is shown running eastward along St. James' Park until close to Spring-gardens, somewhere about the present Admiralty buildings, it seems to be covered in, or at any rate disappears. The whole lie of the ground, however, and the lines of the houses in old maps, seem to indicate that it passed through Old Scotland-yard or thereabouts, and made for the Old Scotland Dock, shown clearly in the plan of the Palace of Westminster, published by the Society of Antiquaries in 1747, from a Survey of 1680. There seems, however, to have been an offshoot of this branch running southward across the present Parade Ground of the Horse Guards. I think it must have passed along a portion of the eastern side of St. James' Park, as excavations along the western side of Delahay-street some years ago discovered a number of willow trunks, etc., and down Princes-street, which in a map of 1685, as well as in others, is called "Long Ditch," though this, of course, may have been an artificial ditch.

The water has long since, been diverted from the natural course of the stream into the pond in St. James's Park, and into various sewers. There is no water in the old course in Great College-street, and my examination of such portions of the course as were recently exposed suggested that the diversion of the water, and the silting up of the course, had rendered the stream inoperative as a mill-race before the brick culvert or bridge was built.

I have now to draw attention to the objects found in the excavations on a spot bounded by Tufnell-street—or the old Bowling-ally—on the west, the Mill Stream or Great College-street on the north, and Barton-street on the east, and extending to some 80 or 90 ft. southward from Great College-street.

Most of the articles were found within 20 or 30 ft. of the old stream; many in the course itself. These mostly, to such an audience as this, speak for themselves.

They consist chiefly of spoons, knives, and pottery. Of the spoons, No. 1, a small slip-ended pewter spoon, is, I think, the earliest, probably early XVth century, and much like one in the Ellis Collection at South Kensington, having the date 1523 assigned in it.

No. 2, marked "S. G." on the handle, and No. 3, with "H" on the back, are of about the middle of the XVIIth century.

No. 4, a pewter spoon with a touch composed of two cross spoons, is of the first half of the XVIIth century.

No. 5, a brass spoon, 1660.

No. 6, a brass spoon with a heart on the touch and a *piéd de biche* handle, probably 1680-90.

No. 7, a spoon marked "T. S." and with a *piéd de biche* handle, of about the same date, as also No. 8, a pewter spoon with a lozenge-shaped touch.

No. 9, the sifting or straining spoon of brass, from the shape of its handle must be, I think, of the XVIIth century; probably late.

The knives are, I think, all of the XVIIth century, with the possible exception of No. 10, a knife with a small, blue-stained, short wooden handle, inserted in an iron ferrule, which may be of the late XVIth century.

The small glass hottles, Nos. 13 and 14 are probably scent or essence bottles.

I am indebted to Mr. W. W. Watts, F.S.A., and Mr. Mitchell, of South Kensington Museum, for kind assistance as to dates and descriptions of these articles.

The most interesting find has been No. 19, the "Gray heard" jug with its contents. When found and purchased by me it was stoppered down with a cork, and upon opening it and washing out the contents, was found then to be the objects here exhibited, viz. :—

A small piece of cloth or serge, formerly red, cut carefully, and neatly into a heart shape, and stuck full of brass roundheaded pins, each pin bent. A small quantity of hair, ostensibly human, and some small finger nail parings. I think there can be little doubt as to the nature of this deposit inside a corked jug, found in the clay of the mill stream bank. It is a malevolent charm, the intended victim of which was a woman, and it is perhaps permissible to surmise that the depositor and evilwisher was of the same sex. Perhaps a maidservant who had a grudge against her mistress, and who could easily obtain the clippings and prunings of her toilet.

The jug and its contents were probably buried, with the accompanying rite of a fearful incantation. The Lord's Prayer may even have been said backwards, and a peculiarly malevolent phase of the moon may have been awaited. If it is fair to form these somewhat uncharitable and ungallant surmises, the opportunity is also presented of adjusting the balance of charity, and of gallantry by expressing the sincere hope that the charm was ineffectual, that the fair intended victim escaped all aches and pains, and that the only pricks bestowed were upon the repentant conscience of the depositor.

Having but little knowledge of the Black Art, and being unable to count a single sorcerer amongst my acquaintances, I appeal to any of my audience who are more crude or more highly favoured to assist me with information as to the science and practice of charms of this order, or to cite similar or correlative instances of which they may have knowledge.

At the conclusion of the paper Mr. Ambler read from *Notes and Queries* an interesting article on folklore, bearing principally on the discovery of the box referred to by Mr. Warren containing a heart pierced with pins.

The Dean of Westminster said the associations of Westminster were always full of interest. He did not know that it was wise that such an immense amount of important information of a dangerous character should have been conveyed to a general meeting, but happily in these humane days they only used pin pricks in a controversial way. He really rose to thank Mr. Warren and those two of his pupils who

were good enough to bring back to the shrine of Edward the portion which had been carried away at the time of the Reformation, and which had found a lodgment in the mud somewhere near the little culvert of which they had seen a view. A portion of the shrine of St. Edward was something which was beyond all price, and it was highly honourable—scarcely that, for it would have been too terribly dishonourable if any person had kept this portion of the shrine back. At the same time they did most earnestly and sincerely thank those who secured it for them at a time when it might have slipped away. It might have slipped away into the American market, where it certainly could have been sold for a large sum of money. They were glad to get a fragment of that kind back again, and they owed a debt of gratitude to those who had restored it, and it was a desire to publicly acknowledge this which brought him there that evening. Mr. Micklethwaite's wonderful scheme he had had the privilege of seeing before, and it was always worth spending an hour just to see his "onion peeled," as he called it, again.

Mr. W. D. Caröe, in seconding the vote of thanks, said it was impossible to speak for the first time in that room without congratulating the Architectural Association on the acquisition of those admirable premises beneath the shadow of Westminster Abbey. They had been told in these latter days that architecture and archaeology were to be divorced, but it was satisfactory to hear amongst the earliest papers in their new abode such archaeological and, in part, mystical papers. He was afraid it was a good many years ago when he had the privilege and fortune of having the run of Westminster Abbey, and he believed there were none of its secret places or of its eloquent stones with which he had not at one time a pretty familiar nodding acquaintance. He referred to that because it taught him that if there was one person who knew far more about Westminster Abbey than he did that was Mr. Micklethwaite. He trusted that one of the influences of their new home would be to encourage the younger members more than was the case amid the solemnity of the walls of Conduit-street to take part in the discussions.

He thought he could assure Mr. Warren that the old writers were correct when they stated that the millstream was navigable, and he had taken from its bed from beneath the foundations of new buildings at Westminster a very unmistakable article, viz., the end of a barge pole. A still more significant article found was a boat-hook taken out at nearly the same position. It was possible that these might have been thrown in, but it was fair to assume that they were lost in use at the bottom of the river. Mr. Warren referred to the fact that there was a bowling green in Tufnell-street, and he (the speaker) produced two howls which had been dug up. All these articles were found beneath the foundations of Great College-street-buildings, which were removed. He also found an exact counterpart of one of the Grey-beard jugs, which was incomplete, and another which was considerably larger, and had a German inscription several times repeated. There was another article found in a deep foundation, but which no doubt came out of the ash pit. It was a coronation cup of King William IV., and as it was found a day before the coronation of King Edward VII. it was a curious coincidence. One effect of Mr. Micklethwaite's remarks ought to be to convince them that Westminster Abbey was one of the most interesting and best preserved buildings in Christendom. They could wander all over the Continent, and wherever they went they could not find a single building with so many curious points of interest. The extraordinary regularity with which the apse was set out, almost to within an eighth of an inch, and the introduction into it of the XIIIth century Italian work were all curious things one did not often see in other churches—certainly not in this country. Mr. Micklethwaite had referred to the question of the tower of the Abbey, and doubted whether it was ever built. He hoped in the course of another month or so to be able to make public a statement on the ancient Norman central tower at Canterbury, called the Angel steeple. The chief point of interest he would be able to establish was that the new arches were put in underneath the Norman tower which was entirely preserved. Whether the same thing took place at Westminster he could not say. It certainly was a very curious circumstance showing the immense skill in pure engineering works that

the builders of that time possessed. Of course they knew many examples where they succeeded in putting arcades under Norman walls, but was not aware of any other example where the entire tower was kept up and where the Norman piers were cased round and the Norman arches taken out and new arches put in underneath it.

A Visitor remarked that he had watched with sorrow new buildings going up in Westminster which to his mind were appalling eyesores—a disgrace to the City not only on account of their own intrinsic hideousness, but also account of the absolute incongruity with the ancient and beautiful surroundings—surroundings which were dear to those of them who were citizens of Westminster. He thought that the Association might possibly approach the authorities to prevent similar atrocities being perpetrated in the future. He would urge that Westminster City Council and the London County Council should be moved to appoint a permanent committee of architects which should have power to prevent the erection of any buildings which were inartistic and architectural bad and more especially incongruous with the existing surroundings. There would be difficulty in finding members for such a committee with the Association in their midst.

Mr. Francis Hooper said he would like to ask a question with regard to the earliest building on the site of Westminster Abbey. Mr. Micklethwaite had dealt with the outlines and situation of the Saxon church, but it was generally believed that this church occupied the site of a Roman temple dedicated to Apollo. Was that a fact, and were there any indications at all—any remains as evidence of the fact?

The Chairman, in putting the vote of thanks to the meeting, said the dissertation which Mr. Micklethwaite had given them had been one of the most interesting he had ever heard. There was only one fault about it—it was too short, and perhaps Mr. Micklethwaite would give some particulars when he replied. He quite agreed with Mr. Caröe that it was a good thing for the now and then to have archaeological papers. As architects he felt it was a great mistake to try to confine themselves to the practical everyday things. They should all take an interest in archaeology in some way or other, as it had direct bearing on their work. Especially now that they were in the precincts of Westminster Abbey it would be admirable if, as Mr. Caröe suggests, students took the opportunity of more frequent visits to the Abbey and studying what was one of the most unique buildings in the world. Mr. Warren's paper was entirely archaeological, and was difficult to criticise it. The only thing would like to suggest was that where there was so much pulling down, excavating, and rebuilding all over London, and certainly in some of the most historical sites outside the City, there should be some society formed so that all these valuable finds relating to the history and daily life of the people of the past should be collected and stored in some building. To a certain extent they were that for the City in the Guildhall, but he knew great many things found went into private hands. In the case of such finds as Mr. Caröe had shown of pottery and spoons and other interesting articles they should be put in some museum where they could be always seen.

Mr. Micklethwaite, in reply, said as to the story of the Temple of Augustus or Apollo, as it was sometimes called, he was afraid it was nothing but a legend. Some years ago when excavations were going on in the cloister for the purpose of fixing the engine for blowing the organ he did see fragments of what undoubtedly Roman mortar. There had been the materials of a Roman building somewhere, but there was no Roman wall or anything of that sort. There were fragments of old stonework with Roman mortar stuck on. There was the post which used to lie on its back in Margaret's Churchyard, and which, he believed, was in the vestibule of the Chapter House. It had a couple of letters on it which had the appearance of being Roman, and it was thought to be a Roman milestone. Probably the Roman passage of the river was at Westminster, or less on the site of Horseferry. That was speculation, but a good many people held that view. With regard to a Temple of Augustus being the church site, he could tell them a tale. He was old enough to remember a clerk of the works of Westminster Abbey whose name was Wright, and this clerk of the works came to Mr. Scott's office where he (the speaker) then, and told them he had made a great discovery—he had discovered one of the stonework

the Temple of Augustus Cesar. Some of them went down, and there he had got a panel with the initials "A.C." which he concluded meant Augustus Cesar. Unfortunately one of them recognised it as one of the missing posts of the tomb of Anne Clevees. That was the first evidence he could give them of the real existence of a Temple to Augustus Cesar. Had he spoken longer one of the things he would have insisted upon a little further was that a very strong ruling matter in the development of the church was its continued use. The church never went out of use. They had no tin tabernacle; they wanted the church was being restored; they wanted a church to use, and the rebuilding had to be done piece by piece and in such a fashion that some considerable part of the church was always fit for use. If they went into the details of the rebuilding, especially Henry III.'s work, they could see how the earliest parts were built. If they looked closely to the building they could trace bit by bit how the work was done without disturbing the piers. There were little details in the order of the work which could only be proved by looking at the building itself. It could be seen how things changed as they went along, although the general effect was the same. Mr. Carde spoke of the under-building of piers in the crossing, but that certainly had not taken place there, was not, however, an uncommon thing, and they found it done at Ripon and York. At York they found a perpendicular tower and they carrying it. If they went into the covered top of the roof high up above they found the main tower still visible.

Special Meeting.

The Chairman announced that there would be a special general meeting held at 7.15 on Friday, December 9, to pass the following by-law:— "The Association shall not make any dividend, division, or bonus in money between any of its members." The reason for that was they were claiming exemption from the rates which is a very heavy item, and it was necessary that they should get this small change in the by-laws. The meeting then terminated.

THE SURVEYORS' INSTITUTION.

An ordinary general meeting of the Surveyors' Institution was held on Monday at No. 12, St. George-street, Westminster, S.W., Mr. T. Steward, President, in the chair. Mr. J. C. Rogers, Secretary, read a list of donations to the Library and the Library Fund, a vote of thanks was accorded to the donors of the motion of the Chairman.

The Building Surveyor.

Mr. C. John Mann then read a paper entitled: "The Building Surveyor, His Training and etc." After some preliminary remarks, he said that the term "quantity surveyor" was comparatively recent origin. The members of the profession were, forty or fifty years ago, called surveyors or building surveyors. The demand for their services came in with the system combining all trades in a contract with one order, which at this time had become general. At an architect should speak of a surveyor as "a quantity surveyor" or his "measuring surveyor," as the case might be, was natural and doubtless quite right, because that generally the position a surveyor took in regard to the architect, his work, and his earnings. The fact that other branches of the profession came under the general designation "surveyor," might, in the minds of some, be a misleading term, in the desire for a prefix or some distinguishing term to mark those who specially dealt with quantities. The nature of the business the surveyor was so seldom understood by employers, particularly private clients, that this, he thought, a reason why the name by which they were called should be very much different to the architects through whom they got the production to most of their work. Those who had a sufficient quantity of work of a remunerative character fully to occupy their time, probably saw no objection to a title which appeared distinct from one description of work, but the state of things did not apply to the greater number, particularly to those commencing practice, and he thought many would prefer a restrictive distinguishing name if one could be found. As business increased and the quantity practice became definite, the designation "quantity surveyor" might be appropriate and distinct, but there were important matters connected with buildings, referred to surveyors' settlements, which embraced a much larger field than was covered by this designation. It

was only a line line that separates the profession of the architect from that of the surveyor, though most of them would agree that the more distinct the practice is, the better. In the event of any dispute or misunderstanding with the employer, the architect and the surveyor could take up their proper duties and positions with much greater freedom and force than was possible where one had combined both duties. He had more than once had serious disputes laid before him arising from the latter course, and involving law suits as well as arbitration, in cases where the employer had not been fully informed of the circumstances. It was interesting to note that the Birmingham Architectural Association had recently protested against the increasing amount of architectural work put into the hands of their city "surveyor," and the Wolverhampton Architectural Association had protested against the "unfair custom of entrusting architectural works to be carried out by the borough engineer's department." The advertising columns of the professional papers also showed that there was a considerable mixing up of the various branches of surveyor's work, and an attempt had been made to form a separate institution or association for quantity surveyors only. Personally, he did not think a sufficient number of qualified surveyors of good standing would be found willing to tie themselves down to quantities only, particularly having regard to the present tendency to lower remuneration for quantity work. Their practice in taking out quantities and in other work properly belonging to their profession soon proved what kind of surveyors they were, and he did not think it improved their position or independence to call themselves "quantity" surveyors, as if quantities formed the only legitimate part of their practice.

Training.

The surveyor should commence his career by serving his time in a surveyor's office, and between sixteen and seventeen was the best age. Except under special circumstances a pupil should be bound for four years. In some respects it was an advantage for him to spend a year in the shops of a first-class builder or on some building during its erection, but this must not disturb his training as pupil with the surveyor. Speaking generally, he did not think that in these days there was time for this, and the advantages to be gained were not unmingled with some disadvantages. By carefully regarding work in progress and taking every opportunity of following out details in the office and reading up special subjects, the pupil should become conversant with the details of construction and of the work connected with the various building trades. The surveyor's pupil could not too early learn to take responsibility, beginning of course with small things. The nature of the work he would first be called upon to do was simple, but until he could do it with precision and feel his responsibility in regard to it, he was worse than useless. The pupil need never be asked or expected to take the responsibility of any work that he had not mastered, but once trusted he must never fail. He must also learn to work quickly without feeling that the pressing rate at which the work was done is the slightest excuse for a mistake. Squaring dimensions, casting abstracts, fair copying, tracing, were all very simple, but the work must not be allowed to be taken in hand, for any use that was to be made of it, till the pupil had acquired precision and quickness together with a sense of responsibility. Distinct writing and figures, without flourishes, were indispensable. Nothing was more vexatious than to have to stop in the middle of a long cast and refer to other papers to determine whether what, at the first glance, you took for a 3 but subsequently thought might be a 5, was possibly a 6. It was the practice of some to place their sons for a short time, say twelve months or less, in different offices, as for instance, in the office of an estate agent, a builder, an architect, and a builder surveyor. Though they were often important well-known offices, he regarded this as a great mistake, for the youth could only occupy a very subordinate position in any of them, and under the most favourable circumstances he became a sort of Jack-of-all-trades and master of none, with the dangerous reputation of having been in the office of this and that important firm and having a very indistinct knowledge of what it was he did not know. The pupil, having established his reputation for reliability in small things, and added to his stock of knowledge the various terms used by surveyors, their abbreviations, and to a

considerable extent their meaning, passes on to abstracting and billing. Here it was, he thought, that many young men neglected to take full advantage of their opportunities, particularly in those cases where the system of taking off was to complete each item of the work in every trade with its consequent deductions, rather than to take off in separate trades. The careful and interested abstractor would look at each dimension and its description as he went on, and thereby learn the details of construction, with the relative sizes of the various parts making up the materials and labour connected with the whole of each item of the work. If pressure of time would not permit of this being done while abstracting, it could be done when the bills of quantities were finished, and perhaps sometimes before the drawings and specification go out of the office. This was not only a stepping stone to taking off, but also enabled the pupil to understand how to measure up works in progress. Every opportunity of acquiring a knowledge of pricing, which was, in perfection, almost an art in itself, should be taken advantage of. These would occur in moneying out, and making up estimates and builders' accounts. The pupil should, as occasion offered, be questioned by the principal with the view of testing his rate of progress and acquirements. Method was a most important factor in the profession of a building surveyor. Without very rigid order it would be impossible to supply accurate bills of quantities or bills of measurements. Another great benefit arising therefrom was fully realised when measuring up the variations on a contract and preparing bills of extras and omissions. In measuring variations the extras were generally fairly visible, and in any case attention was sure to be directed to them by the builder or his foreman; but the unseemly omissions could only be traced from the dimensions taken for the original quantities, and things not taken in their proper order were liable to be overlooked. The pupil must realise that, with the most elaborate specification and detail drawings, there might be a few discrepancies, which in taking off quantities were sure to be discovered, as well as matters which it might be difficult or impossible to delineate or describe so clearly as not to raise a doubt about them. Moreover, the constant introduction of new inventions, materials, and methods of construction might make it necessary for the surveyor preparing the quantities to see the specialist connected with them. All these points rendered it necessary for the surveyor to keep a neat query paper on which to record them in order that he might refer them to the architect for settlement and embody them in the specification and drawings, if approved.

It was probable that the pupil's work would by this time be interspersed with some of that general work of which he should now have a fair knowledge, and which the preparation for, and the passing of, the professional examinations should fit him to undertake. He would, as one of the examiners, remind candidates for the examinations to be on their guard against a superficial knowledge of any of their subjects, such as was attained by "cramming." Even if they were perfectly capable in their typical subjects, they should take care that their knowledge was thorough on the other subjects they had taken up, covering ground of a very varied character, and full of pitfalls. Mere superficial knowledge, acquired with the object of satisfying the examiners for the moment, would not stand by one in after years. The pupil should not be diffident in asking questions, particularly with regard to terms used which he did not understand, exercising judgment as to doing so at times when they would not inconveniently interrupt the business in hand. The intelligent and industrious pupil would naturally be taken up by the seniors to assist them in their work rather than the indifferent and careless, and hence some would progress by leaps and bounds whilst others fall behind. A few were naturally slow, but these he generally found come out right in the end, and if their articles expired before they had acquired the knowledge that was expected of them, he thought it was advisable in these cases to endeavour to make such terms as would enable them to remain until they became more proficient. A young man having served his time and passed his P.A.S.I. examination in Sub-division 3 would do wisely to remain in the same office in which he was trained or go to a good firm for some little time after, but it was a matter for his own consideration whether he

architect. The detail prices of the sub-contractor were filled in to the deposited priced copy of the quantities, in which the labour was separately set out. The architect made certain alterations in the details of his stonework, from the commencement and during the progress of the work. The builder, towards the close of the work, was asking for instalments evidently much in excess of what the contract sum would allow, and when asked for explanation said the sub-contractor for stone and labour was pressing him for money, and that, for the purpose of payment on account, he, the builder, had agreed with the sub-contractor as follows: To add the amount for all the labours together, and having found the proportional average amount of labour per foot cube of stone, to make up the total amount for 'stone and labour' in the quantities, and adopt this rate per foot cube for 'stone and labour' executed during the progress of the work. This price would have entitled the sub-contractor to the amount he was asking for. On looking into the matter I found that the calculation which the builder made was correct, as regarded the bills of quantities. Nearly all the architect's alterations in the actual work increased the size of the stone on the bed but not on the face labour. The sub-contractor, in estimating, had priced the cube stone at per foot very low and the detail labour prices high, so that, as the architect's alterations only added to the low-priced stone and not materially to the labour, the result, from actual measurements of variations, came out against the sub-contractor, who, finding both the original quantities and the measurement of variations correct, had to submit to what he called a loss, consequent upon his disproportionate and incorrect pricing. In very large buildings with detached blocks, where the works are carried out without uniformity, it is more necessary for the surveyor carefully to estimate approximately for the instalments. In some large works provision is made for payment of these services, but in works of less magnitude there is often no such provision, though most surveyors would be ready to assist the architect in such matters if asked to do so.

The Surveyor and the Architect.

"There are also questions of custom, and of matters which arise involving a certain familiarity with arbitrations and with legal decisions, where the experience and special training of the surveyor may be useful in consultation with the architect. There are many other matters in which the surveyor may assist the architect, from whom he gets his instructions, such as the clearing of a site on which are old buildings, party-wall questions, and light and air cases, and, occasionally, drains and sanitary matters connected with them. Such business is, of course, common to architects and surveyors. In private practice the employer seldom suggests the name of the surveyor who should take out the quantities, but the whole matter is left with the architect. In public matters it is now more often otherwise, and the boards or committees elect and appoint the surveyor to supply the quantities. The surveyor is not only generally indebted to the architect for his introduction to business, but often obtains assistance from him in seeing that his fees are paid by impecunious builders, or, in cases where his work has proved abortive by the employer altering his views, the architect will explain the nature and extent of the work done by the surveyor when otherwise it is often difficult to make the employer understand why he should pay him so much, or, indeed, anything at all.

Failure of Builder During Progress of Work.

"In cases where the builder becomes bankrupt during the progress of the works, great is the responsibility of the surveyor, both with regard to the accounts and the assistance it may be necessary to give the architect, in consultation on various causes and conditions in the specification and contract, and the employer's position with regard to these clauses. The troubles and difficulties with the position of the sub-contractors and other special tradesmen are sometimes such as tax the combined resources of the solicitor, architect, and surveyor to find a solution of the situation really beneficial to the employer. I knew of an instance where the employer's solicitors claimed, under the contract, the whole of the building as it stood at the time of the contractor's failure, although much work had been done by the various sub-contractors, for which the architect would in no course have specifically certified. Not

having done so, the builder had not, of course, paid them when he stopped. Unless this situation had been met, grave difficulty would have occurred through the impossibility of getting similar materials from any one else, and the sub-contractors declining to furnish any more if the work executed by them were not paid for. The architect had not certified, the sub-contractor had not been paid, and the employer's legal representative claimed the building as it stood and everything on the site. It goes without saying that an employer dealing with a competent architect and a competent surveyor places himself entirely in their hands, and it is much better on every ground that he should do so. It is their duty to look after the employer's interest, and they will do it.

Pricing and Settling up Accounts.

"In the matter of pricing and settling up the builder's account, usually done with the builder or his representative, very responsible work is required of the surveyor in the correct rendering of the prices in the deposited bills of quantities or schedule and the making up of prices for those items not in the schedule. There is often much controversy as to these before a final settlement is arrived at. In my experience, when the variations on a contract have been properly gone into, the result is, more often than not, an agreeable surprise to the architect, who, knowing the alterations that have been made in carrying out the work and the absolute extra work that has been ordered, has not fully realised the extent of the omissions consequent on these alterations and additions, and has been preparing himself and his client for a large extra. I find, although the surveyor has taken out the quantities, the architect sometimes settles up the accounts. This plan I do not believe to be the best for the employer; the surveyor, who knows every detail of the work in taking off the quantities, is in the best position to go into the variations.

"Serious disputes of a complicated character frequently arise in connexion with the erection of buildings under contracts, sometimes ending in the Law Courts or the arbitration room, and in any case furnishing much important work for the surveyor.

Surveys of Premises.

"One of the most useful branches of our profession is that of surveying and reporting on the condition of premises prior to their being taken on repairing lease. How many persons have suffered by neglecting to take precautions in this matter and have found out, when too late, the liabilities they have incurred through not having a proper survey made before they signed a lease with, perhaps, stringent repairing covenants. These surveys and reports are generally as to structure, condition of general repair, and sanitation. In making structural surveys it is often found, in the case of old buildings, that there are defects which it may be unnecessary and unreasonable to repair, to have remedied or made perfect, but it is none the less necessary a lessee may be about to take upon himself. In such cases they should be scheduled as being so excluded. Sanitary surveys and reports are, of course, frequently required by all sorts of clients. They may be very keen on taking a particular building, and may say they 'do not want any fads, they only want to know if the house is healthy to live in,' or they may say 'they have recently suffered from defective sanitation and that in this particular the house must be perfect.' Of course the surveyor will take care that, in either case, the sanitation is perfect.

Surveyors and the Law.

"It is essential, in spite of a little knowledge being a dangerous thing, for the surveyor to have more than a smattering of the law relating to buildings and the questions which may arise on them, and in consequence of them, before, during, and after their erection. We are indebted to the solicitors for a large share of our work, and it is the surveyor who has to interpret the repairing covenants of mysteriously worded leases, and translate into £ s. d. the various degrees of repair which from time to time come before him. In disputed accounts, the amount to advise a client to pay into Court is a matter requiring great consideration, as much cost may be saved or lost in such matters."

Quantity Surveyors and the Institution.

In concluding his paper, the author said:—
"Since the writing of this Paper certain

representations have been made to the Council of the Institution, with the view of obtaining a more distinct and definite recognition of the quantity surveyor members, and of increasing the sphere of usefulness of the Institution in their direction (a long-felt want), with the result that, under the guidance of our much respected and able President, the Council have approved and confirmed the appointment of a certain number of members to act as a Quantity Surveyors' Committee of the Institution, the quantity surveyors on the Council being *ex-officio* members of it. Any matters of interest connected with and affecting quantity surveyors' work may be considered by the Committee, whether brought under its notice by members of the Institution or otherwise. Matters brought before it may be discussed, resolutions passed, and reports made to the Council, who will deal with them as they deem right. This I am sure will be a great boon and advantage to every individual quantity surveyor member of the Institution, and I am glad to say that the Committee has already got to work."

Mr. H. Chatfield Clarke, in proposing a hearty vote of thanks, said that the architectural profession, as a whole, were deeply indebted to quantity surveyors for the very great aid they rendered architects in their work from beginning to end, and the more those two professions were kept separate in the carrying out of work, the better. The architect had quite enough to do with his plan and design, in the carrying out of the client's wishes, and with the specification, and the quantity surveyor could take a great deal of weight off his shoulders. He (the speaker) was very much indebted to the surveyors who had assisted him, and it was marvellous the manner in which they smoothed the way of the architect. He felt that it was a mistake for the architect to supply the quantities, and he advocated quantities being taken off by a separate surveyor. The status of the quantity surveyor was shown by the fact that, as a rule, the builder did not appoint quantity surveyors to take off the quantities. The builder was quite ready to accept the quantities of the architect's surveyor. As to whether quantities should form part of the contract, he never made the quantities part of the contract. He made the drawings and specifications, the basis of the contract, and left the quantity surveyor to settle with the builder as to any discrepancy in the quantities. The work was made easier if the quantities were not part of the contract. The writing of the specification by the architect he held to be a duty, and surveyors preferred to have the specification before them. As to verifying the quantities before sealing them, this was not generally done, but it was a very important matter. If it were done it saved a great deal of trouble in the end, and if there were any mistakes in them it was better to deal with those mistakes at first. They were all glad that a new committee had been formed by the Institution, and quantity surveyors were looking forward to that committee aiding them materially. As to urban and rural by-laws, it seemed to him that they would have to be re-considered, for it was absurd that the building regulations we have in towns should be applied to remote country districts, although he thought that a part of them should be. As to the plans of a learned judge for cottages he wished to build, he (the speaker) had seen them and he could hardly make head or tail of them. Still, that learned judge was treating the matter as one of principle, and no doubt the by-laws would have to be altered. Building was dear everywhere, and in the country it was impossible to build cottages at anything like a price that gave a reasonable return.

Mr. Gandy seconded the vote of thanks, and said that on large works he thought it was better for the builder to have his own quantity surveyor, so that if difficulties arose they could be thrashed out with the other surveyor. It did not matter on small works. As to quantities forming part of the contract, he did not think it mattered when the surveyors were well trained.

Mr. W. Woodward said that there were many works now being carried out by municipal surveyors which should be carried out by architects, though there were works which the borough surveyor was quite as capable of doing as the architect. He hoped that the protest in this matter would lead to good

results. He very much regretted the lowering of the remuneration of the quantity surveyor, but the surveyor was responsible for that himself. If the work was properly done by competent men, the money that was paid was well earned. He agreed that it was a waste of time for a young surveyor to spend a year in a builder's workshop, and if the young man had eyes to see he could get a great deal from visits to works in progress. He always made the quantities part of the contract. It was a perfectly fair thing if the quantity surveyor made a blunder, for that blunder to be rectified.

Mr. Stephenson said, as to fees for taking out quantities, that every job should stand by itself. He knew that their President had had work on jobs where 2½ per cent. had been the rate, and the remuneration was not great, whereas, on other work, where the rate was less, the remuneration had paid better. He did not think it mattered much whether quantities formed part of the contract or did not.

After a few remarks by Mr. Assiter, Mr. Guy M. Nicholson said, as to surveyors' fees, one could not avoid competition. What surveyors did grumble about was the tendency of public bodies to reduce the fees and increase the responsibilities. The London County Council and the Metropolitan Asylums Board made their fees strictly competitive—the Board having had work done as low as ¼ per cent.—but at the same time they bound the surveyor to pay for any work which was left out. Every one knew that in the rush of work and in order to get large works done more than one surveyor had to be employed on the same set of drawings, and it was extremely likely that a mistake would occur. The fees paid were really only sufficient for doing the work; they did not compensate the surveyor for the risk of paying for part of the building. In one of the M.A.B. jobs there were thirty-six cottages all alike. It would be said that that was a good thing for the surveyor. So it was, but suppose he had made a mistake in those cottages—it was a mistake thirty-six times over! They did not mind competition, but they objected to public bodies demanding more and giving less. It seemed to him to be the fairest way to make the quantities part of the contract, because the primary object of the surveyor was to get a competitive price for the work. If the surveyor were found to make a great many mistakes the remedy would be that he would not get work, and would have to retire. As to the architect's specification, he agreed that it was easier to get notes of the special points that the architect wanted, and to trust to knowledge of that architect's general practice for the remainder. He had a specification the other day of a very ordinary building which consisted of rather more than 200 pages, and everything was described three times over and in three different ways, and the specification did not agree, and the details did not agree with the specification. It was practically impossible for architects satisfactorily to take off their own quantities, for a busy architect had his time pretty fully occupied without having to do with quantities, which required incessant practice to ensure success. Perhaps in a small country practice the architect could take off his own quantities, but in other cases it was not fair to the client to do so. He thought it was a great advantage to go through the priced estimate before it was sealed up. The London School Board (now merged in the L.C.C.) always did that, and it saved in many instances a very awkward position arising. He agreed that it was an advantage on a big work for the builder to have a surveyor as well as the architect. That was compulsory in big Admiralty contracts.

The Chairman then put the vote of thanks, which was heartily agreed to, and Mr. Mann briefly replied. It was announced that the next meeting will be on December 12, at 4 p.m., when Mr. J. Jopling will read a paper entitled "Notes on Clay Working, more Particularly Bricks and Tiles." The meeting then terminated.

PROPOSED NEW CHURCH, ELGIN.—At a recent meeting of the congregation of the Elgin parish church it was decided to invite the following architects to send in plans for the new church, which is to be erected in that town:—Messrs. A. Marshall Mackenzie, Aberdeen; Robertson, Inverness; and Chalmers, Glasgow. The cost has been fixed at 4,000l.

THE REBUILDING OF VICTORIA STATION.

The enlargement of the West-end terminus of the London, Brighton, and South Coast Railway is only one item in an extensive scheme of alterations, of which the total cost will be at least 2,000,000l. For a long time past the company and the public alike have suffered from the limitations due to the small number of running tracks between Clapham Junction and Grosvenor-road, the narrowness of the Grosvenor Bridge, and the contracted nature of the approach to the terminus. From Clapham Junction to Grosvenor-road the permanent way runs along what is practically a continuous viaduct of brick arches with occasional girder bridges. This portion of the line has already been widened so as to accommodate four lines of rail; the widening of Grosvenor Bridge is now in progress, and extensive alterations in hand at the Victoria Station approach will shortly give ten roads available for traffic in place of the solitary pair—one "up" and one "down"—over which all trains now have to pass. The construction of new works outside the present station has made it necessary for the Elizabeth and Eccleston bridges to be raised by some 6 ft. In the case of the former bridge exceptional difficulty has been encountered owing to the fact that it was found necessary to sink to a depth of 30 ft. before reaching a sufficiently firm stratum of earth for the foundations. The altered level of the roadways upon these two bridges has involved a corresponding alteration in the level of Buckingham Palace-road.

We may here recall a curious statement connected with that portion of the line between Victoria and Grosvenor-road station. At the time when the original Bill of the railway company was before Parliament considerable opposition was raised to the construction of the line by residents in the neighbourhood of the proposed terminus and particularly by the Duke of Westminster. The chief reason alleged was that the noise caused by trains would constitute an intolerable nuisance, and to appease local sentiment the company undertook to roof in the whole of the line from the terminus to a point not very far from Grosvenor-road, the object being to confine or deaden the sound of the trains. Having obtained their Bill, the company were bound to erect the long line of roofing, but in consequence of a singular oversight on the part of those representing the local residents, no stipulation was made compelling the company to keep the construction in repair. The covering of the railway was duly executed, consisting of iron columns and other members supporting iron roof systems covered with glass. After a time the company seem to have discovered the flaw in the Act of Parliament—through which they drove their trains in substitution for the proverbial coach and horses—and decided to let the line of roofing fall into a state of decay. Broken glass was not replaced, and as portions of the unpainted ironwork became dangerous through oxidation they were gradually removed. Until quite recently considerable portions of the old columns and roofing still remained on this portion of the railway, but they have been removed lately under powers granted by the new Bill obtained by the Company.

Turning now to the new terminus, the width will be 320 ft. and the length 1,500 ft., as compared with the present dimensions of 230 ft. wide by 800 ft. long. The future train accommodation will include four island platforms and one side platform, all 1,100 ft. long, so as to permit two trains to occupy each of the new platform edges at one time. Unfortunately the scheme of the new station is seriously impaired by the existence of the Grosvenor Hotel, occupying a position which would have been invaluable for traffic requirements and the convenience of passengers. Like the directors of other railway companies, the directors of the London, Brighton, and South Coast line were unable to foresee the enormous development that has taken place in railway traffic, and in permitting the erection of the hotel on the site chosen they left a heritage of trouble to their successors. Subject to this criticism the general arrangement of the new station is good. Access to the departure platforms will be gained as at present from the forecourt, and egress from the arrival platforms will be afforded by a new and commodious exit leading into Buckingham Palace-road. At one side of this exit a new parcels office, connected by a subway running the entire width of the station, has already been built, and from the same point a

wide roadway for vehicular traffic will be carried through the station to the high bridge outside. The present mean appearance of the forecourt will be improved by the erection of a wing to the Grosvenor Hotel, extending far as the miserable sheds which form the front of the South-Eastern and Chatham Railway station, and on the ground floor of the hotel extension will be situated the booking hall, waiting-rooms, and offices.

Unfortunately there is nothing satisfactory to report relative to the architectural treatment proposed for the façade of the hotel extension. It might have been hoped that the company would have realised the necessity for erecting a structure in every way worthy of the important site in their hands. In our opinion the most appropriate way of dealing with the building on the forecourt of the station would have been by joint action on the part of the two railway companies with the object of continuing the hotel buildings along the entire frontage, a novel idea, by enlisting the co-operation of a competent outside architect so as to ensure that the new structures should be architecturally worthy of the importance of the occasion and the site. That this point has been strongly and authoritatively brought before the Board of Directors we have reason to know. But the only answer was in the shape of a *non possumus*—the façade is to be carried out by the Company engineer; and we only too well know what the result is likely to mean.

THE QUANTITY SURVEYORS' ASSOCIATION.

An ordinary general meeting of this Association was held on Monday, at the Duke's Sale, Holborn Restaurant, Mr. Walter Lawrance, F.S.I., President, in the chair.

The Hon. Secretary, Mr. F. B. Hollis, reported the notice convening the meeting, and also minutes of two previous meetings, of November 18, 1903, and March 2, 1904, which were confirmed.

The President then made a statement in reference to the position of the Association and what had been accomplished since the confirmation of the Articles of Association at the meeting on March 2. The articles were sent to the Board of Trade, and the Association was subsequently informed by the Board that objections had been received from the Surveyors' Institution to the grant of a licence to the Association. July 20 was appointed by the Board to receive deputations from the Surveyors' Institution and the Association to the objections and replies thereto, but those of the Association's representatives were ready to attend they were informed on July 19 that the Surveyors' Institution did not intend to oppose. The petition of the Association then went before counsel of the Board of Trade and his amendments were received on September 10, and these amendments, only one of which the Association could take serious objection to, were approved by the Council of the Association, and on October 12 the licence was finally granted. The one serious alteration the Board of Trade made was as to the use of the letters "Q.S.A." The Board intimated that they could not grant a monopoly of any letters that could be done only by Royal Charter. The members could use the letters after their names, but so could outsiders if they wished.

The President then dealt at some length with the objections of the Surveyors' Institution to the replies thereto. Proceeding, he expressed to Mr. Hollis, the Secretary, the thanks of the Council and the members for the zeal and heartiness Mr. Hollis had thrown into his work, and the grateful thanks of the Association were tendered to him.

The President then referred to the advantage to young quantity surveyors of admission to the Association as students, and he stated that it was the intention to bring forward for deliberation subjects of interest to quantity surveyors. One grievance they had was that an uncompetent person was allowed to issue so-called bills of quantities and receive payment for them. That was the cause of an unfairness; either the building owner or the contractor must suffer in a greater or less degree. Up to the present time there had been no restraint on the issue of bad quantities, what was worse for the protection of the profession, there had been no punishment or exposure of the offending party by

institutions of which he might be a member. The Association, in clause 13 of the Articles, dealt with this evil. Among other evils, the greatest obstacle they had to contend with was the fact that the public did not know them, and did not understand their work, and therefore could not know its great importance. Who was it who really decided what money was to be paid the builder? Undoubtedly the quantity surveyor's figures governed these matters, and very few of the general body of building owners understood this. One of the objects therefore should be to let the public have a better knowledge of the quantity surveyor and his duties. The outcome of this would be (1) the direct appointment of the quantity surveyor by the building owner, and (2) the payment of the quantity surveyor's fees by him. Why should the custom be continued of appointment by a third party and payment by a fourth? There was much to be done to improve the conditions of appointment and selection of quantity surveyors by public bodies. The conditions of some appointments were an absolute disgrace to the profession, seeing that quantity surveyors were willing and ready to accept such terms. As to the actual conditions of building contracts, the quantity surveyor had a very important question to settle—i.e., should the bill of quantities be the basis of the contract? There was much to be said on this subject, and also as to the wording of the clause to that effect in the contract; the clause in the present form of contract as agreed between the Royal Institute of British Architects and the Institute of Builders, etc., being, in his opinion, open to dispute owing to recent legal decisions. The nomination of the arbitrators was also worthy of very serious attention; in most instances the questions to be arbitrated upon were those with which a quantity surveyor should deal and not an architect, and all should do their best to have quantity surveyors' names inserted in the contract. Another very important question was that of a scale of fees. A settled scale of fees might not doubt prevent one from getting an occasional good fee, but at the same time it would also be a preventive against quantity surveyors being offered an inadequate fee, and might on the whole be for the general welfare. He most strongly protested against the idea that because a job happens to be a large one, that the fee should reach the lowestebb as regards percentage, especially with their clause 13; the extra responsibility, care and anxiety required to carry through a large job, or a job with very heavy quantities of particular work, deserved recognition. A scale of fees, if ever arranged, could not be based on the size of a job only—the class of work, the amount of detail required in the quantities, and, not least, the amount of responsibility thrown on the quantity surveyor must all be considered. Speaking of detail caused him to mention one point they should like settled; that was the measurement of stone. They were not pleased after spending weary days over measuring labours, to find them unpriced, or priced, with prices made to agree with the estimator's idea of the price per foot cube, irrespective of the quantities of labours given in the bills. He should like to see some arrangement arrived at with contractors on this point. The Association, he hoped, would be able to keep a register open to members for situations vacant and for assistants, temporary or permanent, requiring situations. Questions on professional subjects, addressed to the Secretary, would be laid before the regular meetings of the Council, and answered by them or referred to experts' opinion. The Council propose holding the first annual dinner of the Quantity Surveyors' Association in February, the ordinary general meeting, in accordance with Article No. 101, would be held in April, and the annual general meeting in May. It is proposed to hold examinations in May. The Council would be glad to receive the offer of papers fully discussing or to inaugurate discussions on any subject of professional interest.

Mr. Nixon asked if there was any chance of getting a Royal Charter so that they might use the letters Q.S.A.?

The Chairman said there was not the slightest doubt that the Council would do everything they could to obtain a Charter as soon as possible, and there was no doubt that they would meet with strong opposition.

In answer to other questions the Chairman said they would hold regular meetings as soon as they could arrange a syllabus. As to forming a library, the Association in time would, no

doubt, take all the steps they could to educate the young surveyor and to provide information for older members, and a library would naturally be one of these steps.

Mr. Gate, Vice-President, said he did not think that anyone not a member of the Association would dare to use the letters Q.S.A., for he would be liable to serious exposure and disgrace. What the Association wished was that the public should get to know that those letters indicated that a man using them was prepared to pay for any errors he might make in his quantities. For his part he meant to use the letters and for that reason, and if an outside quantity surveyor used them he would be exposed.

A vote of thanks to the Chairman for presiding and to Mr. Hollis for his services as secretary brought the meeting to a close.

THE BUILDERS' BENEVOLENT INSTITUTION.

The fifty-seventh annual dinner of the Builders' Benevolent Institution was held in the Whitehall Rooms, Hotel Metropole, W.C., on Thursday evening last week, Mr. W. Downs, President, presiding. There were also present Colonel G. Haward Trollope and Messrs. C. J. Bennett, J. W. Blackham, H. W. Bayne, H. H. Bartlett, H. D. Blake, C. Bussell, C. Braby, H. A. Bartlett, J. F. Bolding, J. M. Beveridge, L. Bennett, A. Burnell-Burnell, F. A. Crisp (Master of the Carpenters' Company), J. Howard Colls, T. Sturge Coterell, W. Casselton, T. E. Clarke, T. I. Cannell, R. Downs, T. Gregory, T. H. Griffiths, H. Gibbs, C. Gude, W. Higgs, F. Higgs, C. G. Hare, B. Hellyer, W. M. Hill, T. Hall, T. A. Hunt, C. V. Hunter, A. W. King, D. W. McInnes, H. Le Marchant, F. G. Minter, S. W. Neighbour, G. N. Nicholson, A. E. Parker, J. Randall, A. Ritchie, J.P., J. Sabsy, S. Stiff, T. Stirling, G. Gilbert Scott, E. Toms, C. Watkins, S. Michael Young, Douglas Young, T. Costigan, Secretary, and others.

The loyal toasts having been honoured, Mr. B. Carter proposed "The Imperial Forces," to which Colonel G. Haward Trollope suitably responded.

The Chairman then gave the toast of the evening, "The Builders' Benevolent Institution." He said that the Institution was established fifty-seven years ago, since which time some 276 pensioners had been assisted. That gave an average of about five new pensioners each year, which might seem to be a small number until they realised that the Institution was limited in its work by the amount of the funds, and he appealed to the friends of the charity for help. At the present time there were thirty-one men on the list and twenty-nine widows—the men received 42*l.* a year and the widows 21*l.*—and he might add that husbands and wives were not separated. One point he would strongly impress on them was as to the way in which the Institution was managed. He knew of no similar institution that was managed on more economical lines, for of the total income received some 89 per cent. was given to the pensioners, which left 11 per cent. to the management. This was possible mainly owing to the care of their Secretary, Mr. Costigan, assisted by the staff and a very able and willing committee, who personally looked into each case and saw that only those properly qualified came on to the list. On behalf of the subscribers and donors, he thanked the committee for their care of the affairs of charity. Their aim seemed to be to do as much good as they possibly could with the funds at their disposal and at the same time to consider the feelings of the pensioners as much as possible. There was a balance on the current account of 350*l.* The income was derived from builders, builders' merchants, architects and surveyors, and others. The committee thought, and he agreed with them, that they ought to have the support of more builders; if it were not for the support of other friends, the trade list in itself would be very small. The committee could not expect every merchant's firm to subscribe largely every year, but they felt that every builder ought to be a subscriber. The Bricklayers and Tybers Company, he might add, had given room in their almshouses for two pensioners. In conclusion, he asked them to think of the blessing and comfort they could afford by their help to many who, without aid, would be doomed to an old age of want and suffering.

Mr. Alex. Ritchie, J.P., then gave the toast of "The City Companies." He thought that the City companies ought to help such charities

as the Builders' Benevolent Institution. They did a great deal in furthering the cause of charity, and they were always willing, not only in the City but in greater London, to extend their munificence and bounty.

Mr. F. A. Crisp, Master of the Carpenters' Company, briefly acknowledged the toast.

Mr. J. Howard Colls then proposed "The President," and Mr. Downs suitably replied.

Mr. F. Higgs proposed the toast of "The Architects and Surveyors" coupled with the names of Mr. G. Gilbert Scott and Mr. Guy Nicholson. Architects of the present age had no reason to be ashamed of their position in comparison with past ages. As we went through London to-day and saw the fine buildings—some of them he might call dreams in stone—we saw that the present-day architectural works were equal to those of the past and gave promise of a great future for the profession. Much as builders owe to architects, they had a more intimate knowledge with quantity surveyors, in whose hands they generally fell safe.

Mr. G. Gilbert Scott, in responding for the architects, said he felt honoured in being called upon to reply for their grand art. The Institution was for the benefit of those builders who had fallen in the battle of life, and the fact that architects were invited to the dinner showed a fine spirit of forgiveness, and he had no doubt that architects reciprocated that feeling. Architects could not get on without the builders, nor unless there was a friendly feeling with the men who put their dreams and castles in the air into concrete shape and form. He had heard it said that the builder was the architect's natural enemy; he did not believe it, and certainly the builder would never be his enemy.

Mr. Guy Nicholson having responded for the surveyors.

Mr. Val Hunter proposed "The Vice-Presidents, Committee, and Stewards." The men connected with the charity were business men and they extended their charity wherever possible.

Mr. J. T. Bolding, in replying, said the work of carrying on the affairs of the charity was considerable, but the reward was great when they saw the good that was done. During the last two or three years much had been done to improve the position of the pensioners. The amount of the pension had been increased by 3*l.* a year; the pensioners were elected after much scrutiny but without putting them to the trouble of canvassing and of a contested election; the limit of age had been decreased from sixty years to fifty-five, and they had saved the pensioners much trouble in making it no longer necessary for them to come month by month to collect their small pensions. In the majority of cases the amount was sent by post. The Institution had an assured income of only 1,100*l.* per annum and the money to pay to pensioners actually amounted to 2,100*l.*, so that they needed a thousand pounds to meet their liabilities. There was no other institution managed with less expense; they paid 2,100*l.* a year in pensions and their total expense for printing, salaries, rent, etc., came to 260*l.* only per annum.

During the evening lists of subscriptions and donations were read, the total amount being 894*l.* 2*s.*, of which 738*l.* 6*d.* was on the President's list. The President himself contributed 100*l.*, the Institute of Builders 50*l.*, and Messrs. G. Trollope, Sons and Colls & Sons, Ltd., 20*l.*

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday, in the County Hall, Spring-gardens, S.W., Mr. J. Williams Beun, M.P., Chairman, presiding.

LEAS.—On the recommendation of the Finance Committee, it was agreed to lend Camberwell Borough Council 8,725*l.* for paving works; 12,000*l.* for public baths purposes, and 10,000*l.* for erection of lodging-houses; Greenwich Borough Council, 950*l.* for purchase of site for public library; Hackney Borough Council, 5,339*l.* for paving works; and Woolwich Borough Council, 4,500*l.* for granite paving works, and 1,000*l.* for assisted wiring of consumers' premises for electric lighting, etc. Sanction was also given to Lambeth Borough Council to borrow 2,044*l.* for street lighting purposes, and to Shorehedge Borough Council to borrow 9,189*l.* for street improvement and paving works.

Port of London Bill.—The Parliamentary Committee recommended that a Bill be proposed in the next session of Parliament relative

to the administration of the Port of London, in accordance with the resolutions passed by the Council on November 8, and that the costs and expenses of promoting the Bill be defrayed out of the county fund.

After discussion the recommendation of the Committee was carried by eighty-seven votes to twenty-eight.

Drury Lane Theatre.—In reply to Sir Algernon West and Mr. Johnson, Mr. Yates stated that the result of the arbitration as regards the Council's requirements relative to Drury Lane Theatre was that 143 requirements were made by the Council, and of these 111 were confirmed absolutely by the arbitrator. Fourteen were modified and confirmed, and eighteen were not confirmed, although the arbitrator said some of them were desirable, but that they were matters of management and not of structure. Consequently he could not confirm them, but he thought the Council were justified in the line they had taken. The real test as to whether the Council had succeeded arose on the cost of the arbitration, and the arbitrator had decided that the Drury Lane Theatre Company should pay the whole of it.

Mr. Strans asked if it would not have cost the company less if they had accepted the Council's requirements in the first place instead of going to arbitration.

Mr. Yates replied that he had not the official figures before him, but he thought the reply would be in the affirmative.

Brickmaking Operations: Norbury Estate, Croydon.—The Housing of the Working Classes Committee recommended that an estimate of 4,000, in respect of brickmaking operations on the Norbury Estate, Croydon, during the season 1904-5 be approved. The Finance Committee, in reporting upon the matter, pointed out that 10,500, had already been authorised for brickmaking on the estate. Up to the present between 6,000,000 and 7,000,000 bricks had been made, and were now lying on the site. Owing to difficulties with the Croydon Corporation, building operations had not yet commenced, and this delay altered the financial aspect of the operations.

Mr. E. White in moving that the recommendation be referred back, said the losses were so serious that he hoped the Council would not go on piling up a sum which would have to be added ultimately to the cost of erecting houses for the working classes. It seemed to him that it was one of the most disastrous experiments the Council had ever made.

Mr. Gaskell seconded the amendment.

Mr. Phillimore said he thought that if they made good bricks last summer it would be a pity to stop the work. The losses in the past were due to bad seasons and poor management.

Mr. Hunt remarked that one-third of the bricks on the ground would have to be carted away and shot on the dust-heap.

Mr. Dew argued that they had to move a great clay mound to the site to enable them to build, and it was cheaper to turn it into bricks than to cart it away.

Sir J. McDougall contended that the bricks they made last season showed a profit of from 10s. to 12s. 6d. a 1,000.

The amendment was defeated, and the recommendation adopted.

Housing.—The Housing of the Working Classes Committee also reported that Redman-buildings on the Portpool-lane frontage of the Bourne Estate, Holborn, have been almost completed. The buildings contain accommodation for 710 persons in twenty-seven tenements of four rooms, fifty-eight tenements of three rooms, thirty-one tenements of two rooms, and eleven tenements of one room. The third section of Radcliff-buildings on the Clerkenwell-road frontage has also been completed, accommodation being therein provided for 208 persons in six tenements of four rooms, twenty-two tenements of three rooms, six tenements of two rooms, and two tenements of one room.

Coleridge's Residence.—On the recommendation of the Museums Committee, it was resolved to affix a memorial tablet to No. 71, Berners-street, to commemorate the residence thereof of Samuel Taylor Coleridge.

The Council adjourned at a quarter-past six. **Premises for the Council.**—Among the notices of motion is the following in the name of Mr. J. Piggott:—

"That, having regard to the fact that the Council's present rental in respect of the inadequate and disconnected chief offices, comprising over five-and-twenty separate blocks of buildings, amounts to over 34,000, per annum, and also having regard to the in-

creasing extra expense, loss of time, and inconvenience caused by the departments of the Council's service being so far removed from each other, and to the pressing need for adequate office accommodation for the staff, it be referred to the Establishment Committee to consider and report as quickly as possible upon sites available for County Hall and offices, and that the Committee do submit a definite recommendation for the acquisition of the site which, in their opinion, is most suitable for the Council's purposes."

ARCHITECTURAL SOCIETIES.

THE NORTHERN ARCHITECTURAL ASSOCIATION.—Mr. William Glover, F.R.I.B.A., past President of this Association, who has in recent years given 1,000, in consols and other valuable donations towards the permanent premises and to aid the work of the society, has now promised further aid in the following letter he has written to the Hon. Secretary:—

"66, Tyrwhitt-road,
Brockley, London, S.E.,
Nov. 22nd, 1904.

A. B. Plummer, Esq., F.R.I.B.A.,
Hon. Secretary.

Northern Architectural Association.
My dear Mr. Plummer,—At our meeting in London, on a deputation to the Council of the R.I.B.A., I promised, if they arranged their meetings in Newcastle, that I would commemorate the event by a gift for the benefit of the profession. This was agreed to, and I have therefore much pleasure in giving 1,000, for the following objects, and will discuss the division with your Council:—

1st. Additional half, to complete the purchase of the house for our Association, which I have been so anxious to see accomplished.
2nd. The Architects' Benevolent Fund.
3rd. The scheme of Sir Aston Webb, R.A., for the higher education of architects.
The conditions for the two latter are that the funds are invested in trustee securities; the nominations of the Council of the Northern Architectural Association to be first considered, so far as the interest on the funds will allow. This will enable me to carry out three leading principles which have influenced me through life:—1st. To spend my money where I made it. 2nd. To assist those poorer than myself. 3rd. To endeavour to leave the world better than I found it. I do sincerely hope that the effort made for the higher education of our students will make them better men than we are. With kindest greetings to you and all my old colleagues and friends.

Yours very sincerely,
WM. GLOVER."

ARCHITECTURAL ASSOCIATION CAMERA AND CYCLING CLUB.—On Tuesday, 29th November, Mr. Chas. B. Howdill, A.R.I.B.A., President of the Leeds Camera Club, gave a lecture on "Colour Photography for Architects." Commencing with a short description of the composition of light the lecturer dealt fully with the various processes of colour photography at present employed, and showed slides illustrating each. Mr. Howdill then showed a number of slides of modern and medieval stained glass taken by various processes, some taken by a combination of telephotography and colour photography, and finished his paper with a short demonstration of the Sanger Shepherd process. Many of the slides shown reproduced the colours of old glass, particularly that in the "Seven Sisters" window at York Minster, in a remarkable manner. Mr. W. Wonnacott, in proposing a vote of thanks to Mr. Howdill, referred to his own troubles in practising colour photography and also to the beauties of the Lippmann process, which had not been used by Mr. Howdill. Mr. Wonnacott also briefly described the new Sanger Shepherd camera, which would reduce the time of exposure very largely, and touched upon the cost of the process. Mr. J. D. Grace seconded the resolution, which was carried with acclamation, and the meeting terminated with the announcement that on December 20th Mr. Arnold Mitchell would speak on "Photography for Architects."

Illustrations.

CHRISTIAN SCIENTIST CHURCH.

THIS drawing, which was exhibited at the Royal Academy, represents a building of some interest in itself and because it is designed for a special sect, and hence we should have been glad if the architect would have furnished us with some little information in regard to the intention of the plan and design. All we have been able to obtain from him, however, after two applications, is that it is built with 2 in. common bricks and roofed with green slates, and that the gable front is in cement whitened. Further than that we must leave our readers to draw their own deductions.

CHELSEA BATHS.

THE scheme was chosen in a limited competition by the Chelsea Corporation.

The cost of the first section of the scheme which is to be carried out immediately, 21,000, and includes the men's swimming bath and slipper baths for both sexes. Artistic wells and storage tanks are also to be carried out at a cost of about 3,500. The ladies' swimming bath and Turkish bath are deferred till a future date, and are estimated to cost another 10,000.

The fronts will be carried out in red brick with Portland stone dressings, and the interior fittings will be of a simple and serviceable character, such of the old fittings as are being re-used, together with the existing engine and most of the laundry fittings of the present baths.

The elevations are designed to harmonise with those of the newer portions of the Town Hall, that being one of the conditions laid down by the Corporation.

NEW CHURCH OF ST. ENDA AT SPIDDAL, CO. GALWAY.

THIS church is designed in the spirit of the work seen in early Irish buildings, not necessarily copied in any part, but adopting those features which are characteristic of that early period and developing them to suit modern requirements, and the material at hand.

The situation of the church being an exposure on the Atlantic seaboard, it was deemed necessary to finish the tower with a parapet instead of projecting eaves. The north transept is roofed in two spans, and has a parapet returning against the tower; this gives an appearance of mass and solidity, and marks this part in contrast with the low eaves of the main building.

The sacristy is placed at the end of the south transept, and within this transept is a gallery for the choir. The north transept will contain a small lady chapel, and pews for the Rev. Killanin, one of the founders.

The chancel arch will be semi-circular, in orders, the inner springing from long corbels with carved terminations. It will be constructed in finely-chiselled limestone, and provision will be made for embellishing it with carving a future time. The roof will be of open timber work, and covered with Killaloe slates, in random sizes. The ridge covering will be cut from solid sandstone. The porch doorway will have round arches recessed in three orders and a plain for future carving.

The jambstones of doors and windows and arches and internal piers will be of Galway limestone. The workmanship will mostly be local production. The masonry, which is to a special feature, will be done by local masons; the leaded lights will be by Irish artists, executed in Dublin.

The foundation stone was laid on October and the building is now well advanced.

The architect is Mr. W. A. Scott, of Drogheda, near Dublin.

THE MILL HOUSE, ALDEBURGH.

WE published in our issue of September a drawing representing the house which had been built, from the designs of Mr. R. A. Briggs, the form of additions to a disused windmill, near Aldeburgh, retaining the mill as an integral portion of the house.

With no disparagement to the drawing, two photographs subsequently sent to us by the architect, and which show the building from other points of view, seemed to us to bring out the picturesque effect of this rather novel experiment even better than the drawing, and we thought it therefore quite worth while to give these two further illustrations taken from the actual building.

A plan, and a short description of the work were given in connexion with the former illustration in our issue of September 10.

The photographs which are reproduced were given to the architect by Messrs. Henry H. & Sons, of Birmingham, who supplied all the casements for the building. The general contractor, as before mentioned, was Knowles, of Aldeburgh.

WAR CORRESPONDENTS' MEMORIAL.—At an annual dinner of the London District of the Institute of Journalists, the Chairman, J. D. Irvine, announced that the memorial to the war correspondents who fell in the South African War, 1899-1902, will be unveiled in St. Paul's Cathedral on January. The memorial has been designed by Mr. Goscombe John, A.R.A.

APPLICATIONS UNDER THE LONDON BUILDING ACT, 1894.

THE London County Council at their meeting on Tuesday dealt with the following applications under the London Building Act, 1894. The names of applicants are given between parentheses:—

Islington, North.—A one-story shop upon part of the forecourt of No. 15, Highgate-hill, Islington (Mr. H. Williams).—Consent.

Islington, North.—Buildings upon part of the forecourts of Nos. 11 and 13, Highgate-hill, Islington (Mr. C. W. Calcott for Mr. J. W. Galton).—Consent.

St. Pancras, South.—A porch in front of the University College Hospital, Gower-street, St. Pancras (Mr. P. Waterhouse).—Consent.

Hammersmith.—Bay-windows at the "Lord Nelson" beerhouse, Mashro-road, Hammersmith (Messrs. N. Parr & A. E. Kates for the Royal Brewery, Brentford, Ltd.).—Consent.

Chelsea.—A projecting hood over the doorway of a building upon a site abutting upon the western side of Sloane-street and northern side of Basil-street, Chelsea (Mr. F. S. Chesterton for Mr. G. A. Cobb).—Consent.

Dulwich.—A porch in front of a detached house on the southern side of Court-lane, East Dulwich, westward of "Charwood" (Mr. H. J. Welch for Mr. E. G. Ash).—Consent.

Fulham.—Porches, with balconies over, to Nos. 42, 44, 46, and 48, Stevengrove-road, Fulham (Mr. W. Hawkins).—Consent.

Hampstead.—The retention of a pent at the entrance, and a wooden balustrade over the one-story addition, to No. 27, Platt's-lane, Hampstead, abutting upon Clarone-gardens (Mr. J. Murray).—Consent.

Holborn.—A projecting sign in front of No. 21, Tottenham Court-road, Holborn (the Brilliant Sign Company, Ltd.).—Consent.

Kensington.—A boxroom upon an existing one-story building on the east side of No. 32, Campden-grove, Kensington (Messrs. J. W. Duffield & Son for Mrs. Finney).—Consent.

Holborn.—That the application of Mr. R. Robertson for an extension of the periods within which the erection at the proposed men's lodging-house, Drury-lane, Holborn, of projecting staircases and an oriel window, was required to be commenced and completed, be granted.—Consent.

Hammersmith.—A parish hall on the south side of Great Church-lane, Hammersmith (Mr. W. D. Caroe for Rev. J. Parry).—Consent.

Hammersmith.—Buildings on the north side of Uxbridge-road to abut also upon the east side of Ormiston-road and west side of Bloomfontein-road, Hammersmith (Messrs. Palgrave & Co. for Mr. R. Le Butt).—Refused.

Hammersmith.—A building on the north side of Dunraven-street, Hammersmith, to abut upon Adelade-road (Messrs. Boyton, Sons, & Buckmaster for Mr. J. Allen).—Refused.

Paddington, North.—An iron and glass covered way to residential flats known as "South Block," Nos. 5 and 7, Maids-vale, St. Marybone (Messrs. Boehmer & Gibbs for Messrs. G. H. & A. Bywaters & Sons).—Refused.

St. Pancras, East.—A one-story addition at the rear of Nos. 60 and 62, Pratt-street, St. Pancras, to abut upon Camden-street (Mr. S. Emanuel).—Refused.

Wandsworth.—Two buildings on the eastern side of Gassiot-road to abut also upon Okera-road, and three buildings on the northern side of Church-lane to abut also upon Gassiot-road and Eswyn-road, Wandsworth (Mr. W. Bartholomew).—Refused.

Width of Way.

Hampstead.—A deviation from the plan approved for the erection of the new Hampstead hospital in Haverstock Hill, Hampstead, with the boundary fence at less than the prescribed distance from the centre of a roadway leading to the North-Western Hospital, so far as relates to the land to be dedicated to the public and the position of a portion of the western boundary of the site (Messrs. Young & Hall for the Committee of the Hospital).—Consent.

Clapham.—A billiard-room on the western side of Cranmer-court, Clapham-road, Clapham, adjoining the Clapham Assembly Rooms, with external walls at less than the prescribed distance from the centre of the roadway of Cranmer-court (Mr. A. B. Hudson).—Consent.

St. Pancras, East.—A one-story cart-shed at the rear of No. 39, St. Augustine's-road, St. Pancras, with external walls at less than the prescribed distance from the centre of the roadway of Murray-mews (Mr. E. H. Abbott).—Consent.

St. Pancras.—A one-story building at the

rear of No. 5, North-villas, Camden-square, St. Pancras, with external wall at less than the prescribed distance from the centre of the roadway of Camden-mews (Mr. W. E. Sanders for Mr. A. H. Rosevear).—Consent.

Finsbury, Central.—A warehouse on the south side of Baker's-row, Farringdon-road, Clerkenwell (Mr. E. Power for Mr. Collins).—Refused.

Lines of Frontage and Construction of Building.

Hampstead.—Retention of a wood and iron tool and cycle shed at No. 6, Briardale-gardens, Hampstead, abutting upon Clarone-gardens (Mr. R. V. Hart for Mr. L. Hardy).—Refused.

Width of Way, Line of Frontage, Projections, Space at Rear and Means of Escape at Top of High Buildings.

Holborn.—A building to be known as the Cranston "Ivanhoe" Hotel, on a site abutting upon Great Russell-street, Bloomsbury-street, Stratham-street, and Drott-street, Holborn (Mr. T. D. Rhind, for the Cranston London Waverley Hotels Company, Ltd.).—Consent; also, means of escape in case of fire proposed to be provided on the sixth (top) story of the building.—Consent.

Formation of Streets.

Lewisham.—That an order be issued to Messrs. Norfolk & Prior refusing to sanction the formation or laying out of streets for carriage traffic to lead out of the east side of Ravensbourne-park and the north side of Westdown-road, Lewisham (for Mr. A. E. Rudd).—Refused.

Space at Rear.

Strand.—A modification of the provisions of section 41 of the Act, with regard to open spaces about buildings, so far as relates to the proposed erection of an addition to the existing building on the space between No. 10, Brewer-street and Nos. 35 and 36, Bridge-lane, St. James', Westminster (Messrs. H. & H. A. Furber for the executors of W. H. Corfield & H. M. Pike).—Consent.

Means of Escape from Top of High Buildings.

City of London.—A deviation from the drawing approved, showing the means of escape in case of fire, proposed to be provided in pursuance of section 63 of the Act, on the topmost story of the premises of the Liverpool and London and Globe Insurance Company, at the corner of Lombard-street and Cornhill, City, so far as relates to an alteration in the position of one of the step ladders and of a gangway across the roof of the building (Mr. J. Macvicar Anderson).—Consent.

Dwelling-houses on Low-lying Land.

Camberwell.—That a licence be granted under section 122 of the Act to Mr. P. Blake-way for the erection of eleven dwelling-houses on low-lying land abutting on Clarendon-street, Camberwell (Messrs. E. T. Anson & Son).—Consent.

*The recommendations marked * are contrary to the views of the local authority.*

ENGINEERING SOCIETIES.

JUNIOR INSTITUTION OF ENGINEERS.—A large number of the members, accompanied by the President, Mr. W. H. Lindley, and the Chairman, Mr. Samuel Cutler, Junr., availed themselves of the opportunity for visiting recently the Central Station of the South Staffordshire Mond Gas (Power and Heating) Company at Dudley Port, and the most recent additions to the Birmingham Corporation Gas Works at Nechells. At the former they were received by the managing director (Mr. Howell), the resident engineer (Mr. Lindopp), and other gentlemen. Mr. H. A. Humphrey, the company's consulting engineer, was prevented at the last moment from being present. The station, the first as yet erected, occupies a position which is practically the industrial centre of gravity of the district, comprising 120 square miles in South Staffordshire, over which the company have powers. There are to be four units, each of eight producers, and the first unit, together with a complete set of spare towers, is now ready for working. Each producer is capable of gasifying one ton of fuel per hour throughout the day and night. The coal elevators, storage bunkers, producers, superheaters, gas mains, mechanical washers and towers, the lead acid towers for sulphate of ammonia, and the cooling towers were all examined with much interest. Steam is raised by means of climax vertical boilers arranged for burning small coal with forced draught, and also for firing by gas. Fraser and Chalmers' compressors for putting the gas under pressure

for distribution were seen in the machinery house, and two vertical Westinghouse gas engines driving various electric motors used in connection with the plant and for lighting. The pipes for conveying the gas to Wolverhampton, Walsall, and intermediate towns have been laid by Messrs. John Aird & Sons, and are mostly of the steel locking type made by Messrs. Ferguson. At the Birmingham Gas Works, on behalf of the engineer-in-chief, Mr. Henry Hack, by whom the whole plant has been designed and carried out, the members were welcomed by Mr. W. Chaney and Mr. T. R. Murray. A fine example of an inclined retort installation was seen here, the house being 324 ft. long by 114 ft. wide, with semi-circular "arch rib" roof of one span. There are four benches of retorts, each bench consisting of thirteen settings, eight retorts per setting, and all heated on the regenerative principle. The special mechanical appliance for dealing with the coke, hydraulic crane of 75 ft. radius, atmospheric and water condensers, the exhausters, washers, purifiers, and meters were shown, and the special features in their construction and operation explained. A carburetted water gas plant capable of producing over 6 million cubic feet of gas per day was also seen, consisting of generators, carburetors, superheaters, condensers, washers, blowers, purifiers, &c. In connexion with this plant are four oil-storage tanks of steel of 60 ft. diameter, 25 ft. high, and 1,760,000 gallons total capacity. The whole of the manufacturing and purifying plant at Nechells is now in course of duplication and well advanced, and will, when finished, complete the scheme of works as originally designed—viz., for 10 million cubic feet of gas per day, excluding water gas.

COMPETITIONS.

SCHOOL, CHESTERGATE, STOCKPORT.—The designs of Messrs. Cheers & Smith, architects, Blackburn, have been selected for a new public elementary school to be erected at Chestergate, Stockport. The school provides accommodation for 950 children—viz., 300 infants, 250 mixed juniors, and 400 mixed seniors. A large swimming bath and cokeroy and manual instruction rooms form features of the building.

"ARCHITECTS' DRAWINGS."

SIR,—We are delighted to see your leading article in the current issue of the *Builder*, and we hope that the conclusion to which you have arrived will meet with the general support of the profession.

In the particular action referred to there may or may not be a good defence as the law now stands; but in any case, as the action is to be carried further it seems to us that, in the interests of the profession, every effort should be made to uphold the well recognised custom that, except in special cases, the drawings are the personal property of the architect. In order to assist the defence we are willing to contribute ten guineas each, provided that not less than eight other architects are willing to come forward with contributions of a like amount, so as to insure 100 guineas at least toward the costs of defence.

GEORGE HERBARD, F.S.A., F.R.I.B.A.
ALFRED W. S. CROSS, F.R.I.B.A.

SIR,—Whether due to comparative poverty or to want of backbone, architects, as a class, have for a long time constituted a species of "Aunt Sally" for the benefit of the legal

profession; but, if the decision in the case of *Gibbon v. Pease* be not reversed on appeal, the future position of architects promises to be well-nigh contemptible—to be, in fact, merely that of “plan makers in ordinary” to their clients, to enable the latter, as untrained amateur builders, to comply with the requirements of building authorities, and, at the least possible expense to themselves, to obtain the services of a trained architect to assist them to carry out, without personal risk, their ideas of “architecture.”

Your able leading article in the last issue of the *Builder* so exactly and completely summarises the position that further words seem unnecessary; the one thing now needed being action upon the part of architects as a body. Such action must also be prompt and strongly supported if full advantage is to be taken of the fortuitous circumstance of a clear case upon which the issue may be explicitly stated and fought out. Surely it is in the interest of every architect to see that his position as a highly-trained adviser—and not a mere tool of his client—is explicitly stated and conceded. Consequently, whether or not the defendant in the case of *Gibbon v. Pease* or the “Board of Professional Defence” is or is not financially able to contest the point, the foginess would more likely be cleared away from the eyes of the legal profession as to what an architect really is, if the matter received the support of the entire body of architects.

You, sir, have rendered signal service to architects by your most clear and instructive remarks. Will you add one more favour by opening a fund, through your columns, to enable the question to be taken to the Court of Appeal—and to the House of Lords if necessary—on behalf of architects as a body instead of one member thereof?

I have not the pleasure of Mr. Pease's acquaintance, and, therefore, my letter can be accepted as written with entire singleness of purpose.

I enclose a cheque for 5*l.* 5*s.* in case you are willing to open such a fund; but for the present I should prefer that my name should appear as “A PROVINCIAL ARCHITECT.”

*** We shall be quite prepared to take the action proposed by our correspondent should it become necessary. For the present, however, we have handed him back his cheque, with the intimation that we preferred to wait and see whether the Institute of Architects may yet be persuaded to recognise what we regard as its duty to the Profession.—Ed.

SIR,—We, as solicitors for the defendant in *Gibbon v. Pease*, have read with the greatest interest your leading article in last week's copy of the *Builder*, on the question which was raised by that case, and we ought to say that your remarks as to the desirability of the R.I.B.A. taking the matter up, entirely accord with our own views of the subject.

Unfortunately, however, they do not appear to accord with those of the Royal Institute Council, as will be seen from the enclosed letter, which was sent to all members of the Council of the Royal Institute, and in reply to which we received a letter from its Vice-President, a copy of which we enclose for your perusal.

As matters now stand an appeal is, of course, a great expense, and while the Surveyors' Institution has subscribed 100*l.* towards the expense of the trial, so far as it involved the delivery up of documents appertaining to their branch of the profession, the Royal Institute as a body has offered no assistance, pecuniary or otherwise, although several members of the Council have been markedly different in this respect; and, we are given to understand, did their best for us at the Council Meeting, before which the enclosed letter was laid.

You will also observe that our Mr. Daphne never had the opportunity which he has repeatedly asked for, to lay the matter before the Council of the Institute, and as a matter of fact (unless the enclosed letter from the Vice-President is to be taken as such) we have had no report from the Council at all as to what took place at the meeting before which our letter was laid. This being so, and inasmuch as our client, Mr. Pease, is by no means a man of wealth, and the point involved affects every architect in the United Kingdom and Ireland, we feel it is right that our letter to the Council of the R.I.B.A. should be laid as it stands before architects generally, through the medium of your columns, in order that they may, at any rate, have the opportunity

of helping Mr. Pease to enforce the rights of the profession to which he has the honour to belong, and the burden of which ought clearly not to fall upon one man alone.

CHAS. ROBINSON & Co.

10, Norfolk-street, Strand, November 28.

*** The following is the letter addressed by Messrs. Robinson & Co. to the Members of the Council of the Institute of Architects. If we understand correctly, Messrs. Robinson had already addressed the Council formally on the subject, and had received no official reply and no intimation that their letter had even been considered by the Council; they therefore addressed the following circular to Members of the Council individually:—

“10, Norfolk-street, Strand, W.C.
November 17, 1904.

GIBBON V. PEASE.

DEAR SIR,—As you are no doubt already aware from the correspondence which, we are given to understand by your Secretary, has been laid before your Council, we are acting on behalf of Mr. C. E. Pease, who has been sued by the plaintiff, Mr. Gibbon, for the detinue of a number of documents, a list of which is *inter alia* as follows:—

All plans, drawings, and specifications prepared by the defendant for the purpose of the alterations and works carried out under his supervision, and in particular the drawings Nos. 1 to 5, and the specifications marked A, and the copies of the drawings returned by the contractors to the defendant referred to in the contract dated 21st October, 1902, and copies thereof, all estimates and tenders, etc., and copies thereof, all contracts made by plaintiff or defendant on his behalf, and copies thereof, all bills of quantities and copies thereof, all letters and copies of letters in connection with or relating to the buildings, plans, specifications or contracts, or any of them and all other plans, specifications, papers and writings, including copies thereof relating to the said alterations and works, or any of them.

We feel that, in the interests of the profession at large, the detailed circumstances should be laid before your Institute with a view to obtaining financial assistance for Mr. Pease in appealing from the decision given on the 15th inst. by Mr. Justice Ridley.

The facts of the case are as follows:—
Mr. Pease was acting both as architect and as quantity surveyor in the alteration of certain premises in Queen's-road, Bayswater, which the plaintiff desired converted into flats.

It was to act as architect on plans which he had previously prepared as a commission of 5 per cent. on the accepted tender, provided that the accepted tender was for less than the sum fixed by the building owner. He was also employed as quantity surveyor at the usual charge of 2½ per cent. The plaintiff, on completion of the work, demanded from Mr. Pease the whole of the documents referred to above (which, it will be noticed, were both those which would come into his possession as architect and also as quantity surveyor) and we should perhaps here mention that the Surveyors' Institution guaranteed up to 100*l.* Mr. Pease's costs of defending the action so far as such part of it as related to quantities was concerned, and called a meeting of their Council and sent a deputation of them to prove the custom of the quantity surveyor's profession at the trial.

What happened at the trial yesterday was this:—

The plaintiff feeling, no doubt, his position as claiming the dimensions, abstracts, and draft bills of quantities, was hopeless, gave up his claim as regards these, and he also gave up his claim to all the other documents above mentioned with the exception of the contract drawings and the specifications.

As regards the contract drawings and specifications, the judge refused to hear the expert evidence we had at hand as to custom, ruling that this contract was governed by the case of *Ebdy v. McGowan*, with which case you are, no doubt, familiar, and he accordingly gave judgment for the plaintiff in respect of the contract drawings and specifications. He, however, gave the defendant his costs of the issue regarding the papers prepared by the defendant in his capacity of quantity surveyor, and he gave leave to appeal the question as to the contract drawings and specifications, and stayed execution for three weeks, or if appeal entered within that time, then until the trial of the action.

The question of the appeal thus becomes a matter of vital importance to the profession as a whole, as, while this decision stands, an architect, working on the usual 5 per cent. commission for superintending building work to completion, will be forced to deliver up all his plans to the employer after he has completed the job.

We are advised that this species of contract which was the contract in this case is clearly

distinguishable from that in *Ebdy v. McGowan* and we are quite clear, as a matter of fact, that text-books quoting *Ebdy v. McGowan* have relied on the judgment in that case as reported, without looking at the facts upon which the judgment in question was based and that the judgment itself was in terms limited to the facts of this particular case.

What happened in *Ebdy v. McGowan* shortly as follows:—

A vicarage was to be built by the architect of the following express terms:—5 per cent. if the vicarage was completed, 3 per cent. if tenders obtained and work not commenced, 2½ per cent. if no tenders issued.

The building owner decided not to build at all, and consequently the 2½ per cent arrangement applied, that is to say, the contract resolved itself into a special contract to buy plans at 2½ per cent. The contract was not, as we may term it, an unseverable one (as the case is), as the building owner had the option to build or not to build, and further the terms of the arrangement implied a special contract as to what was to be done if the plans were drawn and no tenders issued.

The architect accordingly sent in a demand for his 2½ per cent. commission for the preparation of the plans, but in subsequent correspondence he refused to deliver up the plans themselves even were he paid, and the building owner refused to pay unless he had the plans delivered up.

In the Court of first instance the architect succeeded in proving a custom that he had a right to keep the plans, although he was paid for them, and what the Court sitting in Bank decided on appeal was, that such custom, even if proved, would be unreasonable, which seems perfectly natural and proper, as otherwise the building owner would not be getting what he actually bargained for, i.e., the plans.

The distinctions between our case and that, among others, are as follows:—

In our case plans were prepared before, a matter of fact, any contract was made between the plaintiff and defendant at all, and were only accepted on the basis of the tender coming in under 3,500*l.* That is to say, our contract was, “if you can get the building done on the plans you have shown me for 3,500*l.*, or under, I will give you 5 per cent. on the accepted tender.” Mr. Pease could have claimed nothing whatever for his preparation of the plans had they not been

(1) Approved by Mr. Gibbon after having been drawn, and

(2) An estimate having come in at less than the given price, and

(3) The building having been completed in accordance with the plans; or, in other words, that our contract was not a contract to prepare plans at all, but to carry out alterations, and we say that the plans were merely prepared by us for our convenience in carrying out the work, and no obligation existed to prepare plans at all, and we should particularly point out that had the plaintiff refused to complete the work we could have claimed nothing whatever for the work involved in the preparation of the plans, but must have sued for the whole of the amount due under the contract, and recovered either that or nothing at all.

The position we take up is as follows:—

Where the retainer of an architect and his employment is to superintend work, and the preparation of plans is merely ancillary to the supervision of the work, or where the architect is instructed in the first instance to prepare plans, and afterwards to superintend the carrying out of the work thereunder, the architect keeps the plans, not only by custom but because on completion of the work the building owner has all he bargains for.

Where the employment of the architect is confined to the preparation of plans without reference to the carrying out of any work then the employer, by special contract, keeps the plans, but there is no recognised custom as to the employment of an architect for the latter purpose (the architect's duty being primarily to superintend the building of premises, and not to prepare plans), and therefore, in every case where the employer keeps the plans, he keeps them in pursuance of a special contract.

Now, if this contention be correct there should be no distinction between the employment of an architect and that of a quantity surveyor, as laid down in the case of the School Board for London v. Northcroft, as regards delivery up of materials prepared for the carrying out of his contract.

This case was an action in which the School Board sought to recover from Mr. Northcroft, a quantity surveyor, certain bill of quantities, dimensions, and abstracts made by the defendant, and relating to certain

property belonging to the London School Board; and which action the School Board lost, although, as a matter of fact, an error of no less than 677 cubic yds. was made by the quantity surveyor, and the School Board required dimensions, abstracts, etc., for the purposes of checking these off. The judge, Mr. Justice A. L. Smith, in his judgment, made the following remarks:—

"The defendants deny that the plaintiffs are to have the documents in question, as they allege such documents were prepared by them solely for the purpose of making up their bills of quantities for the contractors. An action of detinue will not lie, for how can the defendant's private memoranda be the property of the plaintiffs; the ink, papers, and brains used in making them are all the defendant's, and they are right in law in refusing to give them up."

Now the ultimate object of the quantity surveyor, and the purpose for which he is employed, is to make and deliver to the building owner a bill of quantities, and all the machinery whereby he arrives at that result are held to be his own property.

The ultimate object of an architect is to supervise the construction of, and deliver to a building owner, a completed house, and the materials whereby he arrives at that result, *etc.*, his plans, specifications, and correspondence, etc., should, we think, be held to be his property also, by analogy with the above case.

Quite apart from this we ought to call your attention to the fact that the Court of Appeal is at liberty to over-rule *Ebdy v. McGowan* altogether, as *Ebdy v. McGowan* was decided by the Court in Bank merely, or they could say that in *Ebdy v. McGowan* there was, on the facts, a special contract, whereas, in our case there was not, and send the case back to the Court of King's Bench for trial as to the existence of a custom.

It is, of course, difficult to place the whole of the circumstances before you in a letter, and our Mr. Daphne would be pleased to attend before your Council, as he has already offered to do, and put the matter before you in detail, which we should be very much obliged if you would give him the opportunity of doing, as there are many arguments in favour of the architect, which, if included in this letter, would make it altogether too lengthy for convenient digestion.

For convenience of reference the following is a list of the correspondence between Mr. Pease and ourselves, and Mr. Locke, and we shall be glad if you will see that it is all laid before your Council at their next meeting:—

Letters, Mr. C. E. Pease to your Secretary, January 9, 1904, August 4, 1904, September 7, 1904, October 20, 1904.

Letters, C. Robinson & Co. to your Secretary, January 12, 1904, January 14, 1904, February 15, 1904, and enclosures.

Letters, your Secretary to Mr. C. E. Pease, January 11, 1904, August 10, 1904, September 8, 1904, October 15, 1904, October 21, 1904.

Letters, your Secretary to C. Robinson & Co., January 13, 1904, January 15, 1904, February 19, 1904, March 1, 1904.

Yours faithfully,
CHAS. ROBINSON & CO.
To a Member of the Council of the Royal Institute of British Architects."

FIRE-RESISTING FLOORS.

SIR.—In your advertisement columns of last week, my name, honorary function, and part of a sentence from some writings of mine regarding the Baltimore fire, are utilised by Messrs. Mark Fawcett & Co. in a manner that would make it appear that I endorsed the system of floor construction with which that firm is specially associated.

The extract is quite correct as far as it goes, but it should be read in conjunction with my observations on the Baltimore fire generally, for, if standing alone, and appearing below an illustration of Messrs. Mark Fawcett & Co.'s floor, a very different impression is obtained from what I intended to convey in my remarks on that conflagration.
EDWIN O. SACHS.

THE JOINERY TRADE.

SIR.—"J. C. W." says he can make joiner's work in "England" quite as cheaply as the foreign joinery. This is not the experience of the majority of people, or "Laxton" would not put the price of foreign-made doors, sashes, and frames at such a much lower figure than the English make.

I beg to say I have a well-equipped joiner's shop, with modern machinery, and have often tried, but without success, to make doors, window sashes, and frames at less cost than the foreign make, and of which we see such large quantities brought into and sold in

London, and used in the various building estates now being developed in the suburbs of London.

My first trouble is the prohibitive local rates; and, as every manufacturer knows, machinery is assessed "right up to the hilt"; this presses very heavily.

Then we have the Factory Act, with the inspector's requirements as to fire-escape ladders, staircases, sanitary arrangements, etc., all of which cost a great deal of money.

Of course, the rates of the London joiner's wages—namely, 10d. per hour—is much higher than that of the foreigner, and also of many of our own provincial towns, who pay 8d., and some less.

But in the case of the foreigner, he pays none of our rates or Imperial taxes, and he does not come under our Factory Act, therefore, the remedy I would suggest is, that some toll or tax be put on all foreign-made joinery, as an equalisation for the rates and taxes paid by us, and which would enable English employers to employ English joiners.

A LONDON BUILDER.

COURT OF COMMON COUNCIL.

THE usual fortnightly Court of Common Council was held at the Guildhall on Thursday last week.

Artizans' Dwellings, Houndsditch.—The Improvements and Finance Committee reported that certain repairs, painting, pointing, etc., were necessary at the artizans' dwellings in Stoney-lane, Houndsditch. It was agreed that the works, estimated to cost some 2,000*l.*, should be included in next year's estimates.

Street Improvements.—On the recommendation of the Streets Committee it was agreed to carry out various minor street improvements. It was also agreed to withdraw the stipulation as to the working at night only in the case of certain street works in Wormwood-street, London Wall, and Basinghall-street, in connexion with the General Post Office. An officer of the Metropolitan Drinking Fountain and Cattle Trough Association to provide an ornament at drinking fountain, to be fixed round the base of the lamp column over the underground convenience at St. Martin's-le-Grand, was accepted. It was ordered that an expenditure of 85*g.*, 10*s.* should be incurred in the substitution of incandescent gas burners for the old lamps, and the provision of 115 additional lamps in various side streets and courts in the City. Permission was granted to the City and South London Railway Company to fix a clock outside their Bank Station at the corner of Lombard-street and King William-street.

Hairdressers' Saloons: Regulations.—The Sanitary Committee submitted a report from the Medical Officer of Health on the conduct of hairdressers' saloons. Regulations drawn up by that officer were approved. The same Committee submitted the revised by-laws with respect to houses let in lodgings, and these also were adopted and received the City Seal.

London Squares and Enclosures Bill.—A letter from the Clerk to the London County Council transmitting a copy of the first draft clauses of this Bill was referred to three Committees—The City Lands, Streets, and Bridge House Estates Committee.

Cattle Market, Deptford: Lighting.—On the recommendation of the Cattle Markets Committee, it was agreed to renew the contract with the Kitson Lighting Company of Great Britain, Ltd. (now merged in The United Kingdom Lighting Trust, Ltd.), for leasing installation of oil incandescent lamps for the roadways and open areas of the Foreign Cattle Market, Deptford, for one year, at the reduced cost of 600*l.*

—

METROPOLITAN ASYLUMS BOARD.

THE fortnightly meeting of the Managers of the Metropolitan Asylums District was held at the offices of the Board, Victoria Embankment, W.C. on Saturday last, Mr. Scovell presiding.

Joyce-green Hospital: Internal Painting.—Among the correspondence received was a letter from the Local Government Board asking to be furnished with more definite information relating to the proposed internal painting work at the Joyce-green Hospital, and why so large an expenditure of 7,000*l.* is necessary at this stage. It was agreed to inform the Local Government Board that the estimate was for the whole of the interior painting, and that the amount was not considered excessive.

North-Eastern and North-Western Hospitals.—A letter was received from the Local Government Board authorising the erection of cottages at these hospitals for the accommodation of the engineers at a cost of 1,120*l.*

Rochester House Asylum.—The Asylums Committee recommended, and it was agreed, that unconditional consent be given to a proposed rearrangement of the boundary line between the Rochester House estate and the property of the Ealing Borough Council. The Managers are terminating their tenancy of Rochester House at Midsummer next.

The Downs School.—The Children's Committee reported having decided on carrying out certain improvements to the fire-extinguishing appliances at this school at a cost of 110*l.* The ten outside hydrants will be replaced by modern hydrants with outlets to suit the hose couplings used by the local fire brigade.

Park Hospital.—It was referred to the Works Committee to take the necessary steps for the erection of six permanent stagings in the casing of the well at the Park Hospital.

Belmont Asylum.—The Works Committee reported that since the last meeting of the Board they had sanctioned certain further variations on Messrs. Enness Brothers' contract, amounting in value to 13*g.*, 10*s.* Mr. W. Crooks, M.P., asked the Chairman of the Works Committee if he could give him any information with regard to a letter from Messrs. Enness's on the question of the rates of wages paid to the workmen at this asylum. It appeared that part of the asylum was outside the twelve-mile radius from Charing Cross, and the contractors had "measured the milestones" which he considered was mean. Mr. Helby, in reply, said that Messrs. Enness Brothers had decided to take no further action in the matter, but it had been agreed by the Committee that, in all future contracts, the whole of the asylum should be included in the twelve-mile area.

North-Western Hospital.—The Engineer-in-Chief reported the completion of the fire-resisting works at this hospital. The works were carried out by Mr. W. Harbrow at a cost of 2,33*g.*, 16*s.*, being 6*l.*, 16*s.* in excess of the contract sum.

Minor Works and Repairs, Mode of Carrying Out.—On the recommendation of the Works Committee it was agreed:—"That in the event of a committee deciding that any work or repair (the value of which is estimated not to exceed 100*l.*) is necessary and should be dealt with by the Works Committee, it shall be the duty of the Works Committee to determine in what manner and to what extent such work or repair shall be carried out."

South-Eastern Hospital.—The Works Committee further reported that they had authorised the provision of 300 Gilmour (Canadian) hospital doors in the eight pavilions, two isolation blocks, and the receiving and discharge wards, at an extra cost of about 240*l.*, in place of the internal doors originally specified for those buildings.

OBITUARY.

MR. HENRY S. WHALLEY.—We have to announce the death, which took place on the 25th ult., of Mr. Henry S. Whalley, F.S.I., 5, Hunter-street, Chester. Deceased was a son of the late Mr. Jno. Whalley, surveyor and land valuer, to whose business he succeeded. He was frequently employed as an expert in arbitration cases, land disputes, and in connexion with the promotion of railway and other Bills in Parliament.

GENERAL BUILDING NEWS.

CHURCH, CLYDACH.—At Clydach-on-Tawe, Swansea Valley, on Thursday last week, the memorial-stone was laid of the new Church of St. Mary. The church is situate on the corner of the main road. The plan consists of a nave, 69 ft. long by 28 ft. 6 in. wide; north aisle, 65 ft. long by 12 ft. wide. The south aisle, terminating in a west tower, 18 ft. square, is 43 ft. long by 12 ft. wide. The chancel is 36 ft. long by 22 ft. wide, with an organ chamber and choir vestry on the south side and clergy vestry on the north side. The length of church inside, from the west wall of nave to east wall of the chancel, is 105 ft. An arch, rising to a height of 34 ft. to the apex, divides the nave from the chancel, and the roof of the chancel is barrel shaped, divided into panels by moulded ribs. There is to be a scullia in the chancel, the work of Mr. Clarke, sculptor, of Llandaff, in whose studio the rest of the carved work will be done. The main entrance to the church is from the south side of the tower, and the tower will rise to a height of 100 ft. to the turret. A chiming clock, with illuminated faces on three sides of the tower, will be placed in it at a height of 65 ft. from the road level. The arches to nave arcades are carried on columns, alternately circular and octagonal on plan, with bands of red

Forest of Dean stone. The arcades are surmounted by three-light traceried windows, with arches carried on small columns. The nave roof is open to the apex, and is 49 ft. high. The principals spring from circular shafts with moulded-caps and bases. All the timbers are of pitch-pine, and will be left clean from the plane. The chancel is lighted with a five-light traceried window in two orders of mouldings. The west window is a three-light window, flanked by a single light on each side. The aisle windows are two-light, each having different tracery in the heads. The church will be seated with benches throughout for 500 adults, and the choir stalls executed in Austrian oak. The chancel steps are to be of white Sicilian marble, and the pavement of chancel and passages of black-and-white marble in large squares. The system of heating adopted is Grundy's warm air apparatus. The walls are being built with grey native stone, with box ground stone dressings, and the roofs are to be covered with green Tych slates. The church, when completed, will cost 10,000. The contractors are Messrs. Bennett Brothers, of Swansea. Mr. Bruce Vaughan, of Cardiff, is the architect.

CHURCH RESTORATION, NEWTON ABBOT.—Wolborough Church, Newton Abbot, was reopened by the Bishop of Exeter on the 17th ult. after the restoration of the roof by the feeoffees. The whole of the old slating, plaster ceiling, and roof timbers have been removed, and an oak roof substituted. The principal trusses, purlins, and horizontal and vertical ribs are moulded with carved oak bosses at the intersections, and the former plaster barrelled ceiling has been replaced by a ceiling of oak battens in narrow widths. The wall plates in the nave and aisles are of moulded oak, but in the chancel they are carved in addition. The central bosses in the chancel roof are carved, representing the emblems of the Passion. The rafters of the roofs are also of oak, boarded on the outer face with red deal boarding, which is covered with felt, on which battens are laid, while the outer covering is of slate with plain ridge tiles. An alteration has been made in the form of the gables at the western ends of the aisles. hitherto joined squarely to the tower. The inner sides of the gables now correspond with the outer sides, with Bath stone copings, and a Bath stone cross and base fixed on the apex of each, to correspond with the gables at the ends of the chancel and south aisle. A similar cross has also been fixed on the apex of the gable at the eastern end of the north aisle. The interior of the walls has been cleaned down and coloured a light stone colour, and the Beer stone columns between the nave and aisles and the stonework of the windows have also been cleaned down, while the seats have been cleaned off and varnished. The ventilation of the church has been improved, ventilators being provided in the cells of the windows for the admission of fresh air, while the foul air is extracted by means of adjustable exhaust under-roof ventilators. The work, which has cost about 1,300, has been carried out from the designs of Messrs. Powell, Sons, & Locke, architects, of Newton Abbot.

CHURCH RESTORATION, CLAUGHTON, LAN-CASHIRE.—The Church of St. Chad, at Cloughton, which has recently been enlarged and repaired, was reopened on the 9th ult. by the Bishop of Manchester. The work was commenced six months ago, and the interior has been entirely renovated from designs by Messrs. Austin & Paley, architects, of Lancashire. The total cost is 900.

CHURCH FOR SEAMEN AT THE VICTORIA DOCKS.—On the 9th inst. the Bishop of St. Albans will dedicate the new church of the Missions to Seamen at the Victoria Docks. The building has been designed by the Rev. Edmund Sinker, and the work has been carried out by Mr. Edward Beasley, builder.

ROMAN CATHOLIC CHURCH, SHEFFIELD.—The foundation-stone of a new Roman Catholic church was laid recently on a site just below Banner Cross, on Ecclesall-road. St. William's, as the new church will be called, will accommodate 100 worshippers, and will be of brick, with stone facings. Mr. C. M. Hadfield is the architect.

WESLEYAN METHODIST CHURCH, HANWELL.—The opening of the new Wesleyan church at Hanwell took place a short time ago. The building stands on a site about 450 ft. deep by 90 ft. wide, and has been erected at a total cost of 8,400. Accommodation has been provided for 600 persons on the ground floor, while the transepts will be used for school purposes, and will seat 500 scholars. Messrs. Gordon & Gunton were the architects, the contractor being Mr. Charles Brightman, of Walford.

RENOVATION OF WESLEYAN CHAPEL, CRAN-MOOR.—The improvements to this chapel have

now been completed, and the building was reopened on the 26th ult. The walls have been partly rebuilt, and the interior has been re-seated; a new entrance has been made, a new roof has been put on, and a new floor laid, the entire work being carried out according to plans prepared by Mr. R. M. Loxley, of Sheffield.

CONGREGATIONAL SCHOOLROOM, LEDBURY.—A new schoolroom was recently opened at Ledbury in connexion with the Congregational church in that town. The building is connected with the chapel by a short corridor. It is built of corrugated iron, lined with match-board, which is stained and varnished, and will seat 200, being 40 ft. by 20 ft. The windows have Gothic heads and the glass is fluted. Gas pendants hung from the roof provide the artificial lighting. The seats have reversible backs, and there is a portable platform. The frame of the building has been so constructed that it can be taken down and re-erected elsewhere. The exterior in Church-street is fenced with dwarf walls, surmounted by wrought-iron railings. The architect was Mr. G. Stephens, of Ledbury, the contractors being Messrs. F. Smith & Co., of Stratford, London, E.

DAIRY PREMISES, ABERDEEN.—A new dairy has been opened in Whitehall-road, Aberdeen. At the front of the buildings a sale shop, the walls of which are lined with white tiles, has been fitted up. Stables, sheds, etc., have also been erected in connexion with the establishment. The whole building is heated with steam radiators. The architects were Messrs. Walker & Duncan, Aberdeen.

PRESBYTERIAN HALL, NEWCASTLE.—In connexion with St. George's Presbyterian Church, in this city, the foundation-stone was laid, on the 15th ult., of a new hall in Jesmond-road. The building will seat 450, and the total cost will be about 2,500. Mr. R. Burns Dick was the architect, and Mr. S. F. Davidson was the contractor for the work.

EXTENSION OF BUSINESS PREMISES, ABERDEEN.—The premises of Mr. J. W. Reid, in Crown-street, Aberdeen, have recently been enlarged and improved. The work has been carried out from the plans of Mr. R. G. Wilson, architect, by the following contractors:—Mason work, Mr. David Weir; carpenter, Messrs. R. & J. Reid; plumber, Mr. J. Campbell; plasterer, Messrs. J. Buccochie & Sons; slater, Messrs. J. & A. Milne; painter, Mr. E. Copland; lift, Messrs. Claude Hamilton, Ltd.; and electric lighting, Messrs. Blaikie & Sons.

DALZIEL NEW POORHOUSE.—The hospital and receiving blocks of the Dalziel new poorhouse at Motherwell were opened a short time since. The buildings have been erected by the Dalziel Parish Council at a cost of about 14,000, and they are situated on a site at Airbles, overlooking the Clyde. The architect is Mr. Alexander Cullen, Motherwell.

NEW PARISH ROOM, ST. ETHELRED, NORWICH.—A new parish room for the parishes of St. Ethelred and St. Peter, Southgate, Norwich, was opened recently by the Lord Bishop of the Diocese. The room stands upon the site of the ancient Hildebrond's Hospital; it was afterwards occupied by what was known as Ivy Hall; and, lastly, the site was encumbered by a number of old cottages. The building is of red brick, with green slate roof. The interior apartment, 55 ft. long by 21 ft. in width, is lighted by side and end windows, and the roof is of polished pitch-pine. The floor is boarded. The architect was Mr. C. Clowes, and the builder Mr. G. Greengrass.

BRADFORD TOWN HALL EXTENSION.—The Town Hall Extension Committee have decided to put in hand at once the work of excavation for the extension of the Bradford Town Hall. The working drawings are at present in the hands of the quantity surveyors, and it is expected that in about five weeks the contracts for the whole work may be considered. It has been decided that the Plenum system of ventilation shall be adopted for the new addition to the town hall.

DALZIEL HALL, ELGIN.—New headquarters are to be erected for the 3rd V.B. Seaforth Highlanders, at Elgin. Mr. W. C. Reid, Elgin, is the architect. The new headquarters will consist of an orderly-room and offices, sergeant-major's quarters, drill hall, gymnasium, armouries, stores, etc. The probable cost will be about 3,200.

NEW HALL, ARMAGH.—The new hall of the Irish National Foresters, at Armagh, was recently opened. The building has been erected from the plans of Mr. J. M. Dermott.

PROVIDENCE INSTITUTE, PENARTH.—A new church institute is to be erected on a site in Albert-place, Penarth. Plans have been prepared by Mr. H. Snell, architect, and the cost is estimated at about 3,000.

MEMORIAL HALL, PLYMOUTH.—The Pitts Memorial Hall, in Gibbon-street, Plymouth, was opened on the 23rd ult. Mr. Alton Bazeley, architect, designed the building.

APPOINTMENTS.

PATENT OFFICE, CALCUTTA.—Mr. Henry George Graves has just quitted H.M.'s Patent Office, where he was an examiner of patents for mining and metallurgy, to take up the appointment of Comptroller of the Patent Office in Calcutta. Mr. Graves received his training in the Royal College of Science and the Royal School of Mines, 1881-5, where he gained the De la Beche medal for mining, and an Associateship in mining and metallurgy. As a member of the Iron and Steel Institute he, for some years past, compiled technical abstracts and papers for the journal of that Institute, and took a leading part in the conduct of their annual meetings.

MISCELLANEOUS.

MUNICIPAL COUNCILS AND ARCHITECTURAL WORKS.—Committees of a number of the Metropolitan Borough Councils have now under consideration a letter from the Secretary to the Royal Institute of British Architects enclosing copy of a memorial from that and other architectural bodies urging:—(a) That architectural work be not placed in the hands of engineers or surveyors; (b) that where it is deemed desirable for architectural work to be carried out by a county or municipal official, such official shall be required to have passed the qualifying examinations of the Royal Institute of British Architects; and (c) that the work of an official architect be restricted to structures of secondary importance, and that all buildings of a monumental character be entrusted to independent architects to be selected in such a way as may seem best to the local authority. Final decisions upon the subject may not be expected for one or two weeks, or even more.

DRAINAGE PLANS.—On Saturday last week the Public Health Committee of Camberwell Borough Council reported the receipt of a letter from the London County Council asking the Borough Council's views on a communication sent to the Spring-gardens authority from the Royal Institute of British Architects expressing the view that compliance with the by-laws respecting the deposit of plans for drainage work involves great and unnecessary expense, and suggesting modification of the by-laws so that they shall only require the submission of a block plan and a written description of the pipes and apparatus. In April last a similar application was received by the Camberwell Council from the Royal Institute of British Architects, and was referred to the Borough Engineer, who reported that he only insisted upon sufficient drawings being deposited to enable the Committee to consider whether the whole of the suggested drainage was in accordance with the general Acts of Parliament, and that he considered that this should be insisted upon more especially as owners were now taking every advantage in claiming drains as sewers in cases where, in the past, the late vestries had not insisted upon the deposition of the full detailed plans. This report of the Borough Engineer was adopted by the Council. The Committee now resolved to inform the London County Council of the foregoing facts, and the decision of the Borough Council thereon. On Monday the General Purposes Committee of Lewisham Borough Council reported being in receipt of a similar letter request from the London County Council. The Borough Surveyor, the Committee's report went on to say, had reported as to the unnecessary expense involved in the preparation of the plans, and was of opinion that the suggestions of the Royal Institute of British Architects might be agreed to, providing that the block plan clearly indicates the position in a street of the intended building, either by sheet, or by indicating the distance of the intended buildings from the nearest street corner. The Committee concurred in the views, and had directed that the London County Council be so informed in reply to their letter.

THE SANITARY INSTITUTE.—At an examination in Practical Sanitary Science, held at Manchester, November 18 and 19, two candidates presented themselves, one of whom succeeded.

DEAN FARRAR MEMORIAL.—On November 1 Lord Peel unveiled the memorial which had been erected in the east, or "House of Commons," porch of the Church of St. Margaret, Westminster, to the late Dean Farrar, who was rector of the parish, 1876-1895. The memorial, designed by Mr. W. D. Carr, consists of a bronze medallion in a setting of carved stone, the bust being modelled by N. N. Hitch. The porch itself was erected in 1891, after designs by J. L. Pearson, R.A.,

Lady Sherbrooke, in memory of her husband, the statesman.

RURAL BY-LAWS.—At the recent meeting of the Chailey Rural District Council, at which it was unanimously decided to take proceedings against Sir William Grantham for building on his estate at Barcombe, in contravention of the by-laws, in the course of the discussion the Council's attitude in the matter was explained by the Rev. A. C. Lucey, the rector of Westwinton, who said the real cause of the dispute was simply this:—Sir William Grantham, before the Local Government Board, had twisted words used by their surveyor and other persons with regard to their not understanding the plans he had submitted. He had taken upon himself the duties of architect and had drawn his own plans, which were not intelligible to them, and they wrote to him in a courteous manner and asked him to produce plans which were intelligible. The whole dispute lay within very small compass:—"We do not understand your plans; will you please explain them?" This, said the rector, ought to be thoroughly understood by the public, because they were showing a tendency to judge the Council before they had heard the Council's side, and local bodies throughout the whole of England should clearly understand what their position was. Their by-laws were the simplest by-laws which could possibly be carried out, while the policy of the Council was in the direction of building cottages in the country districts. Sir William Grantham had remarked sarcastically that two clergymen were on the Council. Few persons knew better than the clergy from personal experience the need of increased cottage accommodation in the country. One of the two clergymen referred to was the owner of considerable more property than Sir William Grantham, and he had shown that he was a great deal better able to manage his land, and understood cottage accommodation better than Sir William Grantham. There were grave moral questions involved in this matter, and the Council had adopted a set of by-laws in order that increased accommodation might be given at as cheap a rate as it was possible to build, and at the same time to safeguard the interests of the working classes. If there were representatives of the working classes on county councils, he perfectly certain that they would stand shoulder to shoulder with the Council against Sir William Grantham.

ROYAL SANITARY INSTITUTE.—The Royal Sanitary Institute held a provincial sessional meeting in the Exchange Hall, Nottingham, on Saturday last. After a civic welcome had been accorded the members, the chairman of the Council of the Institute, Mr. W. Whitaker, B.A., F.R.S., F.G.S., took the chair, and was supported by the Mayor (Alderman J. Bright), and the Sheriff (Dr. T. J. Dabell). Dr. P. Brobbyer, the Medical Officer of Health for Nottingham, read a paper on "Some Present-day Aspects of Conservancy Systems." He remarked that the dry system which obtained in Nottingham was recognised as obsolete, and the gathering of the members of the Institute would be helpful to the local administrators in their effort to convince the public that the system was out of date and altogether insanitary. A lengthy discussion ensued. The Sheriff of Nottingham spoke of the ravaging effects of infantile diarrhoea, which were always more noticeable in districts where the dry system existed. Dr. H. Handford, the Medical Officer of Health to the Notts County Council, thought that improvements should first be made in regard to elementary schools. Dr. J. R. Kaye (Medical Officer of Health, West Riding District), Mr. H. Gilbert Whyatt (Grimsby Borough Engineer), Mr. A. J. Martin (London), Miss Evans, Dr. J. Robertson (Medical Officer of Health, Birmingham), and others, joined in the debate. The members were subsequently invited by the Health Committee to luncheon, and afterwards visited the Bacteriological and Chemical Laboratory, destructor works, and sanitary wharves, and the works of Messrs. Goddard, Massey, & Warner, engineers.

AN OLD BRITISH ROAD.—Mr. Hilaire Belloc delivered a lecture on Saturday afternoon last at the Botanical Theatre at University College, Gower-street, on "An Old British Road." He said that the subject on which he intended to speak was the old road from Winchester to Canterbury, which he had explored about a year ago, and his object was to show what interest could attach to a subject of this kind. Though the idea was difficult for the modern mind to seize when all our principal thoroughfares ran from north to south, yet it was the case that the earliest of our important roads ran from east to west, that was to say from Dover, which was the natural port of entry

into this island, to Stonehenge, which, in primitive times, was the centre of its political and religious life, and from this there was a branch going to Winchester. Up to the Reformation the South of England contained a very large proportion of the wealth of the country. Winchester was its capital, and remained so right up to the 11th century. Henry II. was probably the first monarch who called London his chief town. One of the causes which contributed to the preservation of the road from Canterbury to Winchester was that a great part of it lay on chalk. He believed that of its total length of 121 miles, about 55 per cent. was on chalk. Another reason was the pilgrimage to the shrine of St. Thomas à Becket, at Canterbury. The murder of St. Thomas took place just before Winchester had lost its old importance. The old road was undoubtedly revived by the pilgrimage, and remained a kind of sacred way until the Reformation. It was an interesting fact that, when Henry VIII. was going to the field of the "Cloth of Gold," he did not go by Rochester, as he might have done, but went instead by the old way to Canterbury. That was, however, the last of the great progresses along the road. It was an excellent instance of the irony of history that the effect of the turnpike system, by inducing people to make use of roads in which there were no turnpikes, was to tend to the preservation of the old roads, which had been on the point of disappearing. About 60 per cent. of the old road from Winchester to Canterbury was well known. Of the remainder about 20 per cent. was guessed at, more or less accurately. In tracing it they were guided by the indications afforded by the road in places now known, by the soils which were chosen, by the trees which grew along it, and by the names of places along the route. He had been able in this way to reconstruct, he might say, the whole way, with the exception of some small gaps. He admitted that as regarded twenty miles it was only a hypothesis, and close on two miles he was unable to find. Of all the important roads of antiquity this one was nearest to London, a great section of it running close to the capital.

MEMORIAL, OXFORD.—A bust of the late Marquis of Salisbury was recently unveiled by Lord Rosebery in the Debating Hall of the Oxford Union Society. The bust, which is the work of Mr. George Frampton, R.A., has been executed in white marble, mounted on a black pedestal about 5 ft. in height.

PROPOSED ENLARGEMENT OF THE WORKHOUSE, COLNBROOK.—At a special meeting of the Board of Guardians held recently a report was presented by Mr. Brook Kitchen, Architect to the Local Government Board, dealing with the present condition of Colnbrook Workhouse, and suggesting various additions and improvements.

WAR MEMORIAL, OMAHÉ.—On the 25th ult. the Duchess of Abercorn unveiled the memorial erected in Omaha to the officers and men of the Royal Inniskilling Fusiliers who were killed in the Boer war. The monument consists of bronze figures of Fame, War, and Death, standing upon a granite base, and has been erected from the designs of Mr. Sydney March, Farnborough, which were accepted in competition. The execution of the work was carried out by Messrs. Elkington & Co., of London.

ASYLUM EXTENSION, BARMING, KENT.—Colonel Hepper, D.S.O., an Inspector of the Local Government Board, recently held an inquiry at Barming Asylum respecting the application to borrow £3,250*l.* for the purpose of enlarging and improving this institution. It is proposed to erect two new blocks, one for males and the other for females, to accommodate some 200 patients. The proposed buildings would have corridors to connect them with the existing structure, and there would also be an addition of two bays. In accordance with the wish of the Lunacy Commissioners there would also be a new isolation hospital erected. There will also be a system of water mains, with pumps and hydrants, in case of fire. Mr. J. W. Jennings, the Asylum Architect, mentioned, in putting in the plans and specifications, that they had been approved by the Commissioners. This closed the inquiry.

WAR MEMORIAL, NORWICH.—On the 17th ult. the Norfolk War Memorial, which has been placed on a site to the north-east of the Shire Hall, was unveiled at Norwich. The design represents a figure of Peace, with outstretched wings, alighting on a globe and sheathing a sword. This is 9 ft. high, and worked in bronze. It symbolises the coming of peace after victory. The head is crowned with laurel leaves, and in the left hand is an olive branch. The figure rests on a sub-structure about 30 ft. high, the lower portion

of which is built of Aberdeen granite. Four pillars rise from this base, and these and the remainder of the masonry of the column are of Portland stone. On each of the four faces of the column is sunk a tablet of gun-metal, upon which the names of the Norfolk soldiers are inscribed. The total height of the column is 40 ft., and its cost 1,500*l.* Messrs. George & Fairfax Wade designed the monument.

CARPENTERS' COMPANY.—At an examination in Sanitary Building Construction, held at the Carpenters' Hall last week, bronze medals were awarded to the following candidates:—Wm. C. Portman, John D. Manners, Thomas C. S. Hall, and E. E. J. Lawrence. Certificates were awarded to Hy. Merryfield, Wm. F. Lombard, E. E. Barks, Wm. E. Sheppard, Hy. Crossley, Wm. Hughes, F. Lambert, E. G. Walker and Fredk. C. Chant (equal), and Robt. H. Griffith.

Legal.

ACTION BY BUILDING OWNER AGAINST ARCHITECT—HEAVY CLAIM FOR DAMAGES FOR ALLEGED NEGLIGENCE.

In the King's Bench Division on the 29th ult. the Lord Chief Justice, sitting without a jury, concluded the hearing of the case of *Hodgson v. Waugh*, after a seven-days' trial.

In this case the plaintiff, Mr. George Herbert Hodgson, a loom maker, of Baldon, near Bradford, Yorkshire, sued the defendant, Mr. John Waugh, an architect and civil engineer practising in Bradford, to recover damages laid at over £10,000 for alleged negligent breach of duty as architect, and also damages for alleged breach of contract. The defendant denied the alleged breach of duty and contract, and counter-claimed for 1,250*l.* for fees for work done and services rendered.

Mr. Lush, K.C., Mr. Clavell Salter, K.C., and Mr. Compston appeared for the plaintiff, and Mr. Tindal Atkinson, K.C., and Mr. F. P. M. Schiller for the defendant.

It appeared from the opening statement of Mr. Lush that about the middle of the year 1900 Mr. Hodgson was looking out for a property to buy, and ascertained that there was a large estate in Hertfordshire known as Heaton Manor, situated half way between Hitchin and Luton, for sale. It consisted of a large hall and some 1,600 acres of land, and there were also residences known as "Summerville," Hexton Lodge, Pegsdon Lodge, and Meg Cottages. The plaintiff found that a certain amount of alteration and repair was necessary, the property having been in the hands of mortgagees for some years, and, being acquainted with the defendant, he engaged him to do the work. At the time plaintiff was in ill-health, and was about to travel abroad, and his case was that, during his absence, the defendant caused work to be done and buildings to be erected which were not in accordance with the plans and estimates he had prepared, and which had been submitted to and approved by the plaintiff. The plaintiff's case in regard to "Summerville" was that the house was rebuilt in such a way as to need a rental of 75*l.* a year to repay the outlay, whereas the defendant had been informed that the plaintiff had a tenant at 50*l.* a year, who would not pay more. As a result, the plaintiff lost the tenant. The learned counsel also enumerated a number of items of expenditure, of which the plaintiff complained, with regard to buildings, the cleaning of a lake, and work upon a mill stream, a trout stream, and ponds.

The plaintiff, examined by Mr. Compston, said he agreed to buy the Hexton Estate, in Hertfordshire, in the year 1900. For twenty years previously it had been in the hands of mortgagees, and the buildings upon it were in a bad state of repair. In August, 1900, he sent for the defendant with regard to the alterations he desired to make. On August 10 defendant accompanied witness and Mrs. Hodgson to the estate. They went over the hall and Hexton Lodge, and discussed what was necessary to be done. They also discussed as to the stables, conservatories, greenhouses, and kitchen garden. It was left that the defendant should send him some plans of the hall, which were found to be in existence. On September 13 he received a letter from the defendant headed, "Report and Estimate." First of all it dealt with the stables, stating that the total cost of the stables would be about 2,855*l.* Then, as to the hall, it ran: "I have gone into this, and, roughly, it means this: The expenditure per plan amended No. 2 would be about 4,500*l.* at the least." Defendant suggested that Pegsdon Lodge should be pulled down altogether. After receiving that report, he met Mr. Waugh at Hexton on September 24. A Mr.

Milligan was there, and he made an offer to take "Summerville" at a rent of 50*l.* a year. They considered the alterations necessary to be done to that house, and witness asked what it would cost to pull the older portion of the house down. Defendant said he thought about 800*l.* Witness replied: "If it can be done at 800*l.*, I will have it done, and Mr. Milligan will take it." Witness also said that, if a dry cellar could be put in there it should be done, but not at an increased cost. It was arranged on that day that the old portion was to come down, but not the new portion, and that 800*l.* was to be the cost. He rejected the scheme as to the glasshouses. He wanted cheap glasshouses built against the existing wall. He also objected to the stables, because he did not want to spend that amount of money on them. He insisted upon that estimate being reduced. Witness said that he would leave all the conservatories and gardens until his return from Japan. On that day he said he would not have Pegsdon Lodge pulled down. On October 10 defendant suggested pulling down Pegsdon Lodge and putting it the other side of the road. Witness would not agree to that. All he asked the defendant to do with regard to Pegsdon Lodge was to increase the bedroom accommodation—in number rather than in height. From Pegsdon they went on to Meg Cottages, and there he simply wanted the bedrooms made rather higher and a slight addition at the west end. From Meg Cottages they went to Hexton Lodge, and he decided that it should come down and be rebuilt.

Had you at any time named a sum that you intended to go to in your outlay upon the hall and all the rest of the works?—I told Mr. Waugh that I would not like to go on with the thing at a greater cost than 10,000*l.* That was to include everything.

Examination continued.
Final drawings were to be put before him before he went to Japan. On October 13 the question was discussed as to the external brickwork of "Summerville." Defendant was not present, but his son, Mr. Brunel Waugh, was, and he produced several sample bricks, and he decided upon a red brick. He received some revised plans before he went to Japan. On October 25 there was the submission of the final plans to him, and he and defendant discussed what should be done as to payment during his absence abroad. Witness told defendant that, if he would undertake to direct Mr. Dean, he would leave that gentleman a power of attorney. Mr. Dean was supposed to do nothing but pay under the direction of the defendant. He gave Dean the power of attorney on October 26. The estimates which were submitted to him along with the general plans were set out in the correspondence on November 2.

May I take it, shortly, when you sailed for Japan you intended the whole of this work, that was to cost 14,596*l.*, should be done in accordance with the plans you had approved?—I did expect it.

His lordship: He had approved of the estimates which amounted to 14,596*l.*?

Mr. Compston: Yes.
Examination continued.
On December 25 he cabled and wrote Dean to suspend the alteration to the hall. On January 17 the contracts for Meg Cottages and the two lodges, Hexton and Pegsdon were signed.

Mr. Compston said that the contracts for Meg Cottages and the two lodges, Hexton and Pegsdon, were all let in one contract, and the three together came to 1,280*l.* The contract of "Summerville" was for 1,975*l.*, for the stables 1,129*l.* for the builder's work alone.

Examination continued.
On his return from abroad in September or October, 1901, he found that his instructions had not been followed. He found that Pegsdon Lodge had been pulled down and rebuilt, and white bricks used instead of red, the new buildings being to the old plan. The height was, he thought, higher than the plans submitted to him, and the bay window was carried up two stories instead of one. With regard to Meg Cottages, he complained that the old buildings had been pulled down entirely, and that the new structure was in white brick instead of red, and that the height was far in excess of the plan. With reference to "Summerville," he found the old part pulled down, white brick instead of red, and that the building was considerably higher—about 7 ft. higher at the ridge—than what it was in the plan submitted to him. The length of the billiard-room was 5 ft. longer than the other one. The house was longer, and nothing at all like what he wanted. He had given orders to Mr. Newton (the builder) direct for work at the stables at "Summerville." The rearrangement there was to be about 30*l.*, but on his return he found that 126*l.* had been paid to Newton for the work there. In addition, defendant had

made various alterations to the buildings without his authority. He found that his instructions with regard to the lake had not been carried out. He also complained of 193*l.* being spent on the mill and the mill stream without his authority.

The witness was taken in great detail through other complaints he had against the defendant for expenditure for work on a trout stream. He said he had never intended to spend 1,500*l.* on greenhouses.

Cross-examined by Mr. Tindal Atkinson, I think you have been a little unfortunate, have you not, with regard to everybody you employed in connection with this estate? Mr. Shillitoe was your agent, was he not?—Yes.

A solicitor at Hitchin?—Yes.
I believe you got rid of him, did you not?—I dismissed him.

And you brought an action against him for damages for cutting some trees, did you not?—And shooting my game with his friends without my permission.

The case lasted for four days, and the verdict was against you, I think?—Yes.

He was suing for his account, and you counter-claimed for very heavy damages. Mr. Dams was the head gardener, was he not?—He was the gardener.

You dismissed him, I think?—I dismissed him.

Mr. Dean, who had been your father's confidential secretary and cashier, I think, in the employment of the family for over forty years, you have recently dismissed?—I said it would be better.

Cross-examination continued.
The first claim was between the estimates and what was spent. The first claim was as between outlay and estimates.

Do you suggest now that Mr. Dean was induced to sign those contracts in excess of the estimates in consequence of Mr. Waugh withholding the instructions you had given him?—Mr. Dean will be able to say.

Now you make those charges both in your statement of claim and in the letter. In the last amended statement of claim I see that you have put that out altogether, and you have put your case now as a claim of the amount between the contract prices and the actual cost, recognising Mr. Dean's signature to those contracts? What made you do that?—There were certain letters came up afterwards, I think. I was advised to do it.

Now let me refer you to this passage in a letter of November 12, 1900: "The letting of all the contracts, both of hall and cottages, must, under no circumstances, exceed estimated estimates, everything included, otherwise you"—that is, Dean—"have full powers to act as you think best." Now, there is your own letter communicating to Mr. Dean the instructions that the estimates were in no sense to be exceeded, and yet you made this charge against Mr. Waugh that he had misled Mr. Dean by not communicating your instructions that the estimates were not to be exceeded. How do you explain that?—I still think that Mr. Waugh ought not to have gone on, in face of what I said to him.

Now, that is not what I ask you. How do you justify this grave charge against Mr. Waugh in the face of this letter?—Because I had given Mr. Waugh definite instructions.

So you had Mr. Dean?—If Mr. Dean does wrong, it does not exonerate Mr. Waugh. Mr. Waugh was under obligations to me to carry out my instructions as well.

Cross-examination continued.
He suggested that Mr. Dean was not informed about the pulling down of Meg Cottages and Pegsdon Lodge until long after they were down. He first learnt that the estimates had been exceeded in October, 1901. He complained about it as soon as he had seen the place, so far as he knew.

Was that after Mr. Waugh had made a request to you that you should pay an amount of 250*l.* to him?—Yes; that was.

It had been "Dear John" I notice up to that time, and, when he asked for 250*l.*, the letters after that time were all "Dear Sir"?—If they are so they are so.

And it was after he had made a claim for 250*l.* on account that you for the first time, on September 21, made any complaint at all as to what had happened. Is that not so?—I wanted to know why this money was to be paid.

Cross-examination continued.
He did not know until his return from abroad that Mr. Dean was getting a weekly report from the clerk of works. If he had known what was afterwards reported to him as to the condition of the Summerville house, he should have had a smaller house built, not occupying so much room. He had claimed 500*l.* from the defendant for having used in Meg Cottages and "Summerville" white bricks instead of red, and was not upon his express instructions that white bricks were used. Defendant had never told him that

Mr. Milligan should be charged more than 50*l.* a year for "Summerville." He had paid Mr. Newton cheques as against the certificates signed by the defendant. He had told Mr. Newton that, as the defendant had ordered the work and given certificates for it, then he (witness) was bound to pay it. After a time, Mr. Dean insisted upon having, and did have, weekly reports from the clerk of works to show how the work was going on. Mr. Waugh was an engineer and architect of experience. He never gave instructions anybody to make the trout stream. He claimed from the defendant 214*l.* upon that head.

By his lordship: On his return from abroad he stopped the work upon the plans at the hall, finding that the tenders were so much in excess of the estimate. The lowest tender was 15,000*l.*, and the highest about 20,000*l.* He declined to go on with it, because defendant's estimate was only about 7,000*l.*

On what ground do you decline to pay your architect?—Because the tenders were so much in excess of the estimates.

Then is he your view, as a man of business, that, supposing an architect has estimated what we will say, 7,000*l.*, and you see his plans and say you do not like them and make alterations, and then tell him to get tenders, if you refuse the tenders you can decline to pay for the plans; is that your view?—I took it that the estimate of 7,000*l.* was a basis upon which I could go.

The Lord Chief Justice: All I can say is that I shall not act upon that view, and I believe it is exactly contrary to the law.

Mr. Tindal Atkinson having cross-examined witness at great length on his various heads of claim against the defendant in the statement of claim, asked if he remembered having an interview with Mr. Newton in his drawing room at "Summerville." The witness said he did remember it. His wife was present at the interview.

Did you say that you had had the strictest investigation made, and that money had passed between Mr. Newton and Mr. Waugh?—Yes; I asked him if he had not paid Mr. Brunel Waugh 10*l.* and never got it back again, and he said that was so.

You said you had had the strictest investigations made?—I said I would have the strictest investigation made.

Did he say "What do you mean?" And did you say this to him, "Now, make a clean breast of it, Mr. Newton"? Now, be careful.—I never said that. I heard that this money had passed, and I said: "If there is anything make a clean breast of it."

Did he say, "Of what?" and did you say "Of money paid to Mr. Waugh"?—I asked him if he had paid more than 10*l.*

Did he say that they had some money when they ran short on one occasion?—That was the explanation he gave.

Did not he tell you, and do not you know perfectly well, that it was a temporary loan obtained by Mr. Waugh when he had to pay his hotel expenses?

The witness said he did not know it, and also, in answer to further questions, denied that he had suggested that Newton's book should be examined for the purpose of ascertaining whether money had passed between him and Mr. Waugh.

Re-examined.
He had dismissed the gardener, Dams, because he had neglected his work. His business belonged to a company, and Dean was asked to resign by the directors. His dismissal was nothing to do with this matter at all. When he first put forward his claim, he did not know that the schedule of prices had been sent to Mr. Dean from Mr. Waugh. He then, upon advice, made certain changes in his pleadings.

Mr. Chas. Dean, examined by Mr. Lush, said he was under the impression that 10,000*l.* represented the total figure plaintiff wished to spend. He had only been to Hexton twice, in addition to the first time, when he went there with the plaintiff. On his first official visit he found that Pegsdon Lodge had been demolished down to the ground. Defendant never consulted him about it. He also found that the new portion of "Summerville" had been pulled down, and Mr. Brunel Waugh said that his father had ordered that to be done. He was never consulted in any way. He did not know until his return from abroad that Mr. Dean was getting a weekly report from the clerk of works. If he had known what was afterwards reported to him as to the condition of the Summerville house, he should have had a smaller house built, not occupying so much room. He had claimed 500*l.* from the defendant for having used in Meg Cottages and "Summerville" white bricks instead of red, and was not upon his express instructions that white bricks were used. Defendant had never told him that

Mr. Hodgson never left the estimates with him. The only copy he ever received was from the defendant. With the exception of one, all the contracts were signed after 1

got the estimates. He wrote a letter to defendant on December 28, 1900, to keep down all contracts compatible with good work, and he repeated that many times in his correspondence. He thought it was usual in contracts that things sprang up which had not been anticipated. He stipulated that he should have a report direct from the clerk of works. He did suggest that, under the power of attorney, he was merely a person to sign cheques.

His lordship: In my opinion, Mr. Atkinson, the rights in this case do not depend upon any supposed authority given to Mr. Dean or supposed consultation with Mr. Dean. I think Mr. Waugh rightly took upon himself the responsibility. The whole question will be whether there is negligence or breach of contract, having regard to the peculiar position in which Mr. Waugh was placed. If Mr. Waugh is not prepared to justify the thing upon the merits, the apparent sanction of Mr. Dean will not justify it.

Mr. Tindal Atkinson: Mr. Waugh is quite prepared to deal with that.

His lordship: I still say, having regard to the fact and taking "Summerville" as an instance, and only as an instance, and not expressing any opinion, and as there had been an estimate for the contract, I think it does impose on the architect carrying out the work the responsibility of taking care to see that only really what is necessary is spent.

Mr. Tindal Atkinson agreed, and said he had nothing further to ask the witness.

Mr. Robert Hudson, examined by Mr. Clavell Salter, said he was a member of the firm of Mawson & Hudson, architects, of Bradford. He had been consulted by the plaintiff with a view to ascertaining why the sums of money he had been called upon to pay had exceeded the estimates and contracts. He had been carefully into the matter with a view to advising him on the subject. He had been many times to the place, and had had the plans, correspondence, prices, and contracts before him.

The witness, having given detailed evidence in support of the claim, also gave evidence as to the defendant's counter-claim, stating that in several instances the defendant's charges were excessive.

Mr. Salter asked the witness what he said as to the plaintiff's claim for 4½ per cent. on the lowest tender that was received at Hexton Hall.

His lordship (to witness): Supposing you had honestly prepared the plans on the instructions of a gentleman asking you to do so, and the specification and orders and the estimate came out at 10,000£, whereupon the employer says, "I am not going on with the work; it is too much money altogether; I am not going to pay," what should you charge for your plans? That is a very simple question, and you ought to have no hesitation in answering it.—I should say, 2½ per cent. on the plans and 1½ per cent. for the quantities.

And for tenders.—Nothing for tenders.

You do not agree with the ½ per cent. ?—No.

Examination continued. Assuming that the owner desired to spend 7,000£, only, the defendant's plans were no use for that purpose. If he had prepared plans which were of no use in consequence of his estimate being wrong, he thought he would have a difficulty in getting his charges in such a case as that.

Cross-examined. He was not a member of the Institute of Architects. It was not the first time that he had heard of a charge of 2½ per cent. upon the execution of plans where they were not carried out. He agreed to the other item of 5 per cent. where the works were carried out.

What is the scale upon which this bill is founded, which you dispute?—The great dispute was that the house was to cost 15,000£, and the estimate was 7,000£.

Is that the only thing you criticise in this bill?—No; I criticise two or three other items.

Mr. John Leaning, a member of the firm of John Leaning & Sons, quantity surveyors, of Bedford-row. Mr. Butler Wilson, F.R.I.B.A., Mr. Christopher Noble, clerk of works; Mr. George F. Cowley, clerk of works; and Mr. George Marshall, a contractor, having given evidence, the plaintiff's case closed.

Mr. Tindal Atkinson said he did not propose making two speeches, but would at once put the defendant into the box. Accordingly,

Mr. John Waugh, examined by Mr. Schiller, said he was an architect and civil engineer, practising in Bradford, and he had practised there for the last thirty-three years. He had known the plaintiff since he was a small boy, and his father before him. At the time plaintiff consulted him about the Hexton Estate he was a very great friend of his. After plaintiff acquired the estate he discussed

the plans with him on three occasions. He had also many talks with the plaintiff as to the alterations. Several sketch plans were submitted in the ordinary way to the plaintiff. Plaintiff finally decided which portion of each building should stop up and which portion should come down. Plaintiff then asked for some estimates, and in an off-hand sort of way witness gave him estimates. They were given verbally. As regarded "Summerville," plaintiff asked him what it would cost, and witness, having regard to what the plaintiff wanted to do, said it would come to about 900£. The plans were from time to time altered by the plaintiff, and, after he had given the estimate, he prepared further plans. He submitted to the plaintiff before he went abroad what were called the approved plans. When these plans were approved they set to work with the rather better-considered contract drawings. The plaintiff had given him no limit with regard to the cost of "Summerville." Plaintiff had never given him a limit which he was not to exceed. He never pretended that the sketch plans were accurate plans. Plaintiff never told him that "Summerville" was not to exceed 1,000£ in cost, nor that the rent of the place was to be based on the expenditure upon it. He did suggest to plaintiff that he should pull down Pegsdon Lodge and put it the other side of the drive. Plaintiff said he would not have it there. Plaintiff had agreed to the contract price paid for the lake work. He had discussed many times with the plaintiff the alterations on the various parts of the estate. With reference to the plaintiff's complaint about the bricks, the witness said that plaintiff never told him that red bricks were to be used.

When plaintiff returned from Japan witness had a conversation with him with regard to the alterations and additions that had been made to the buildings. They went into the thing in detail, and they were together about two or three hours. During the whole of the time that witness was with the plaintiff the latter did not utter one single word of complaint about what witness had done. He had explained to plaintiff what he had found it necessary to do at Pegsdon and Meg Cottages, and that he had had to pull the front wall of the stables of the hall down in consequence of putting a roof on which weighed about thirty tons. It was necessary to put buttresses, because he thought the plaintiff was going to put a thirty-ton roof on, but plaintiff abandoned that idea, and that was the reason the buttresses were there. Before he gave the estimates for the approved plans he had not examined the foundations of "Summerville," the cottages, or Pegsdon Lodge. Plaintiff never complained about the cost of the work until after witness asked for payment of his account. He called Dean's attention to the discrepancy between the estimates and the tenders for "Summerville." Dean said that Newton's tender was considerably more than what he called the summary of prices. Witness replied that that was quite possible, but it was carrying out the plaintiff's wishes.

Dean then said that Newton could have the contract if he would take it for the price of the lowest tender. Witness told Dean that it was usual to give the contract to the lowest tender. Dean replied "business is business, Mr. Waugh." The reason the contract work came to a great deal more than the original estimate was due to the pulling down and raising of the cellars, and the fact that they elected to take nothing from the hall. He explained to Dean the reason of alterations he had not foreseen. He treated nearly all the contracts as measure and value contracts. It was such a complicated case of extras that he thought that was the fairest way to do it. He thought he had treated Hexton Lodge as a lump sum contract, because that was a new building altogether.

Mr. Atkinson said he thought the defendant had made a mistake about the contract of Hexton Lodge, and that he had treated all the contracts in the same way.

The witness stated that he was not quite sure about that matter, as his son attended to it.

The witness was then examined by the learned counsel as to the several matters complained of by the plaintiff, and he justified everything he had done and asserted that he had acted in the best interests of his client.

Cross-examined. Plaintiff told him that he wished to have the finest glasshouses that he could get, and the very best stables in the county. Pegsdon Lodge and Meg Cottages were pulled down on his responsibility. He knew that plaintiff did not wish Pegsdon Lodge pulled down, but it was necessary, because the foundation was bad, and there was a damp course. He did not prepare the quantities for all the buildings himself, but they were prepared in his office. He went over everything that

Newton had done before he certified for it. Plaintiff had never stipulated that red bricks should be used. Plaintiff had never told him with regard to Meg Cottages, that if his scheme could not be carried out he would not have them touched. The calculations he had made were necessarily of a rough character. It could not be an accurate estimate, as he had not got the quantities. He was very much surprised, with regard to Hexton Hall, when the lowest tender came out at 15,000£, instead of 7,400£, and he advised Mr. Dean to abandon that matter until Mr. Hodgson came home.

Mr. Brunel Waugh, examined, said he was an architect and civil engineer, and was the eldest son of the defendant. Before the plaintiff went abroad witness saw him from time to time, and he had many discussions with him with regard to the plans. The plans had to be altered from time to time in consequence of the additional suggestions made by the plaintiff, and that involved more work. The estimates supplied to the plaintiff were, in consequence of the plaintiff starting for Japan, hurried estimates. The reason why the tenders were larger than the estimates was due in a great measure to local circumstances. The carriage of material had a great deal to do with it. They had not at first sufficiently taken into account the cost of carriage.

Mr. Clive Waugh also gave evidence as to the preparation of the greenhouse plans, and as to the work done at the lake.

Mr. Thos. William Cutler, F.R.I.B.A., examined, said he had been in practise for forty-two years. He visited Hexton on July 19 last. Speaking generally, the work appeared to be substantially and well done. From his experience, he found it very difficult to estimate beforehand the actual or probable cost of pulling down and altering a portion of old buildings. A number of things might occur which were not foreseen.

Cross-examined by Mr. Salter. If an architect was asked to give an estimate of the probable cost of building operations, and he wanted to be accurate, he ought to carefully prepare plans and get out quantities. What is there in this case to justify an error of 120 per cent.?

The witness replied that he understood that great hurry was necessary in consequence of the plaintiff starting for abroad, and the drawings were only intended to be approximate drawings, and were not sufficient to enable anyone to give an accurate estimate. The defendant had not sufficient detail to allow him to get an accurate price.

Supposing I told an architect to build me a house and he shows me a plan with rooms of a certain size, has he the right to build them of another size?—Not if you approve the plans definitely.

His lordship: I shall hold, of course, that, if the principal is there, he has no right to do so; but, in this case, the architect was in a very difficult position.

Mr. Salter (to witness): Before involving his principal in any substantial extra cost, should an architect communicate with his principal, if possible?—Well, I should do so.

His lordship asked the witness if there was any custom in the profession when plans were prepared and the work not carried out that the percentage due to the architect was calculated on the provisional amount.

The witness replied that he did not think there was any custom.

Mr. Thomas Wynn, F.S.I., practising as an architect and surveyor at Leeds, gave evidence as to going to Hexton in July last, accompanied by the last witness, to inspect the work. He agreed with what Mr. Cutler had said. He said that, in the case of alterations to old buildings, he had found it necessary in contracts of his own to re-measure the whole of the building. It was very difficult to find out where the old work left off and the new began, and to get at it in a satisfactory manner.

At the conclusion of the defendant's case, Mr. Lush asked and obtained permission to recall the plaintiff for the purpose of rebutting some of the evidence given by the defendant and his son, Mr. Brunel Waugh.

The plaintiff accordingly went into the witness-box and denied *in toto* some of the statements made by the defendant and his son as to what took place at the interview after his return from Japan.

Mr. Atkinson, in the course of his address to his lordship on behalf of the defendant, commented on the way the plaintiff had originally launched his case against his client. He said that when the plaintiff started the action he claimed damages against the defendant founded on an express warranty by the defendant as to the figures of the estimate, and the measure of damage claimed was the difference between the amount of this estimate and the amount of the cost. In order to get rid of the difficulty of the fact that the plaintiff's attorney, Mr. Dean, had signed the

contracts which were in excess of the estimates, the plaintiff did not hesitate to charge the defendant with the grossest dishonesty. There existed on the first statement of claim a charge which no one could read without coming to the conclusion that it was a deliberately made charge of the gravest professional misconduct. The object of that charge was to get rid of the difficulty that Dean had signed those contracts. The plaintiff's case being framed on the estimates, it was necessary to get rid of the contracts, and that was the reason the plaintiff made this disgraceful charge against the defendant. In March, 1902, the statement of claim was amended by the plaintiff adding a number of items of claim, a great many of which had now gone. The next amendment was in June, 1904, two years after. It was only a few months ago that the plaintiff withdrew that charge out of the statement of claim, and he then rearranged his claim altogether. The learned counsel said he hoped to convince his lordship that the claim by the amended statement of claim was a claim confined to the difference between the contract price and the cost. He contended that the evidence of the plaintiff could not be relied upon, while, on the other hand, there was absolute confirmation of the evidence which the defendant and his son had given. He submitted that the plaintiff must have known perfectly well that the estimates which the defendant had given him were of the roughest possible character. The plaintiff must have been aware that the estimates were to be taken *cum grano salis*. The learned counsel, having briefly commented on the evidence given, in concluding his remarks, reminded his lordship that the result of this trial was of the greatest importance to his client, because the charge that the plaintiff really made against him was that of professional misconduct. He hoped his lordship would say that there was no ground for the claim made against the defendant by the plaintiff, and that the defendant was entitled to judgment both on the claim and counter-claim.

Mr. Clavell Salter replied on behalf of the plaintiff. He contended that the evidence showed that the defendant had, in the enforced absence of the plaintiff abroad, done his work in a manner which was at once unskillful, careless, and reprehensible. The defendant had ignored the contract to build for a lump sum of money, and had treated the whole matter as though the parties had made a perfectly different contract—viz., that this work should be done, and then, on measurement, whatever it came to on the schedule of prices, should be paid by one party to the other. The defendant had arrived at that sum regardless of the contract, and therefore he had been guilty of a breach of duty in certifying that that was the sum the plaintiff was liable to pay. With reference to the counter-claim, the learned counsel said the only really important point there, was as to whether the defendant was entitled to anything with regard to the preparation of the Hexton Hall plans. He submitted he was not.

At the conclusion of the learned counsel's address, Mr. Lush disclaimed any intention during his conduct of the case of imputing anything like fraud to the defendant or his family.

His lordship said he was pleased to hear that, but asked if that withdrawal was made on the instructions of the plaintiff.

Mr. Lush said it was not, as, unfortunately, his client was not then present in court.

His lordship said that he could not take any notice of the withdrawal unless it was made with the plaintiff's authority. He said that the learned counsel had properly conducted the case on his instructions, and therefore no disclaimer from him was necessary. If, however, any disclaimer was coming from the plaintiff, it must be made with his authority. He hoped to give judgment next Monday week, or, at any rate, next Monday fortnight. Judgment was accordingly reserved.

WEST-END BUILDING DISPUTE.

The case of Julie Dutrey v. The Assets Realisation Company, Ltd., came before Mr. Justice Buckley, in the Chancery Division, on the 29th ult., an action by the plaintiff for damages for injury occasioned to her business premises owing to the action of the defendants.

Mr. Arthur, K.C., and Mr. Foà appeared for the plaintiff; and Mr. Buckmaster, K.C., and Mr. H. Gregory for the defendants.
