Mr. McCall, K.C., on behalf of the respondent, submitted that the order made by the learned judge was right. The learned judge had affirmed the order of the Master, sending the case to an official referee, and the parties agreed on a special referee, and the Master's view was that the case should be decided by a surveyor. The ground on which he made the order was this:—The houses of the plaintiff and defendant adjoined, and before defendant rebuilt his premises he gave the usual party-wall notice under the Metropolitan Building Act, and thereupon the surveyors were appointed, and the contract was entered into, under which, in the usual way, defendant became liable to compensate for any disturbance, based on the under-pinning and using the party-wall. The only question here was, whether the under-pinning or alteration of defendant's premises actually caused the damage. The fact was that the plaintiff's premises had fallen away, not towards the defendant's work, but in the opposite direction where the Metropolitan and District Railway was, but he (counsel) said that was a question to be decided by a surveyor. He thought it was clear that if the damage to plaintiff's house was caused by the disturbance of the defendant, the plaintiff's house would inevitably have come towards the disturbance instead of going the other way. It was difficult now to see the premises because the plaintiff's and defendant's premises were closed up altogether, the underground work was now covered up, and on the other side it was impossible to see it without the permission of the Metropolitan and District Railway. He submitted that this case came within the section which enabled the court to send it to the Official Referee, as it involved local investigation, and which could not, in the opinion of a judge, be conveniently dealt with by a jury. There would be no difficulty in getting a view by an official or special referee, but there would be great difficulty in getting a view by twelve jurymen. The defendant would have been perfectly satisfied to have the case sent to a special referee.

In the result their lordships held that it was a case which the plaintiff was entitled to have tried by a judge of the High Court and a jury, allowed the appeal, and made the costs, both in that court and in the court below, costs in the cause.

DAMAGE TO PROPERTY BY FLOODING.

THE hearing of the case of *Benning v. the Ilford Gas Company* concluded in the Court of Appeal, composed of the Master of the Rolls, and Lords Justices Stirling and Mathew, on the 4th inst., on the application of the defendants for judgment or new trial on appeal from verdict and judgment at trial before Mr. Justice Grantham and a special jury, in the King's Bench Division. The case was reported in the *Builder* of April 23 last.

In this case the plaintiff sought to recover from the defendant damages for injury done to his property by an alleged breach of a statutory duty and negligence of the defendants, and also by the defendants doing certain acts to the Aldersbrook, causing water to accumulate upon land, thus creating a nuisance.

Defendants, by their defence, denied that they had been guilty of any nuisance, negligence, or breach of statutory rights.

It appeared that the plaintiff owned property at Ilford, situate on land near the Aldersbrook. In June, 1903, his land was flooded, and his property damaged. Plaintiff's contention was that the defendants were bound to keep in repair a wall on the banks of the Aldersbrook, constructed to protect the land from floods, and that in June of last year, owing to the defendants' acts, the wall gave way and the land was flooded, and his property damaged. Running nearly parallel with the Aldersbrook was the river Roding. Defendants had obtained Parliamentary powers to use some of the land between the Roding and the Aldersbrook for the purposes of their undertaking. The powers granted were conditional on the defendants providing a cutting to carry away water in flood time that formerly flowed from the Roding to the Aldersbrook. The plaintiff alleged that defendants had used the bed of the Aldersbrook and had broken down the wall, so that when the floods of June, 1903 came, the water flowed into the old bed of the Aldersbrook and through the breach in the wall that defendants had made, and so on to the plaintiff's land. The plaintiff said that, as defendants had failed to make the cutting they should have done, they had committed a breach of their statutory duties. At the trial the jury, in answer to specific questions left to them, found that the defendants, before action had created a nuisance, that defendants had not exercised proper methods in stopping up the Aldersbrook, that defendants were not negligent in the mode of placing their mains, and that the flood in question was caused by the defendants not providing against it. Mr. Justice Grantham decided that this was a verdict for the plaintiff, and referred the case to the official referee for the assessment of damages. The defendants now appealed on the ground that the verdict was against the weight of evidence, and that the learned judge had misdirected the jury.

Mr. Lawson Walton, K.C., Mr. Duke, K.C., and Mr. Meyer appeared for the appellants, and Mr. Montague Shearman, K.C., and Mr. Crawford for the respondents.

At the conclusion of the arguments on behalf of the appellants, their lordships held that there was abundant evidence to support the verdict of the jury, and that there had been no misdirection by the learned judge. The appeal was therefore dismissed with costs.

THE BRIGHTON AND HOVE SEWAGE DISPUTE.

In the House of Lords, on the 6th inst., judgment was delivered in the case of the Brighton Intercepting and Outfall Sewers Board *v.* the Mayor, Aldermen, etc., of Hove, on appeal from an order of the Court of Appeal reversing a judgment of Mr. Justice Kekewich in the Chancery Division.

The appeal had reference to the intercepting sewer along the sea front of Brighton and some of the neighbouring districts, and the question was, whether the Borough of Hove was entitled to pass its sewage into this intercepting sewer as they asserted. The Brighton Intercepting and Outfall Sewers Board contested the claim, alleging that the sewer was constructed for a special purpose—to intercept the sewage from certain defined districts—and that the right to pass the sewage from any outside district was never contemplated as part of the original scheme. The case depended chiefly on the construction to be placed on local Acts of Parliament and orders of the Local Government Board. Mr. Justice Kekewich held that the Borough of Hove had failed to establish the right they claimed, but the Court of Appeal reversed his decision, and gave judgment in favour of the claim of the respondents to discharge the sewage of Hove into the intercepting sewer. Hence the present appeal of the Brighton Intercepting and Outfall Sewers Board.

The Lord Chancellor (whose judgment was read by Lord Macnaghten) said that, after long consideration, and contrary to the impression he originally formed, he had come to the conclusion that the judgment of the Court of Appeal was right, and ought to be affirmed. The awkward collection of statutes with the powers of local bodies produced an impression of confusion, and of conflicting authorities which it was extremely difficult to disentangle; but he could not resist the reasons given by the Court of Appeal for the judgment at which they had arrived.

Lords Macnaghten, James of Hereford, and Lindley concurring, the appeal was dismissed, with costs.

ACTION BY THE URBAN DISTRICT COUNCIL OF WEYBRIDGE.

THE case of the Attorney-General and others *v.* the Urban Electric Supply Company, Ltd., came before Mr. Justice Joyce in the Chancery Division on the 3rd inst., on a

tion by the plaintiffs, the Attorney-General, and the Urban District Council of Weybridge for an injunction to restrain defendants until the trial from supplying electrical energy from their power-station at Weybridge beyond the urban district of Weybridge, and from breaking up any streets in the district for the purpose of laying down electric cables, service lines, or distributing mains for the supply of electricity or electrical energy outside the district.

The facts were these:—The Urban District Council of Weybridge are the sanitary and lighting authority for the district, and the defendants, having obtained a provisional order under the Electric Lighting Acts of 182 and 1838, giving them powers to supply electricity in the urban district of Weybridge, by another provisional order, secured this year, received similar powers in regard to an adjoining district of Walton-on-Thames, for the purposes of their Weybridge undertaking defendants erected a power-station within the urban district of Weybridge, and took up the streets in the district so as to lay electric mains for the supply of electrical energy to the district. Defendants now suggested supplying the district of Walton-on-Thames from their power-station in Weybridge, and for that purpose to break up the streets in Weybridge to lay the additional cables which would be required. The Urban District Council of Weybridge said that as it would necessitate the excavation of their roads, an increase in the size of the Weybridge generating station, and an increase of vibration and annoyance to the residents, they were entitled to the injunction claimed. After hearing the arguments of counsel, his lordship granted an interim injunction, restraining the defendants until the trial of the action from exercising any of the powers conferred by the Weybridge Electric Lighting Order, or by means of lines or works laid down, or erected under such powers, supplying energy outside the area of supply mentioned in the said order, or breaking up streets within the area for the purpose of laying lines for the supply of energy unless until the defendants should be licensed to do by the Board of Trade. Mr. Hughes, K.C., and Mr. F. Newbolt appeared for the plaintiffs, and Mr. Younger, C., and Mr. Clouston for the defendants.

THE WHITEHALL PAVING DISPUTE.

THE case of Alcott v. the Mayor, etc., of Westminster came before Mr. Justice Phillimore in the King's Bench Division on the 11th inst., on two summonses. In the first the plaintiff asked for an injunction to restrain defendants from interfering with his wood-paving in Whitehall, and for the appointment of an independent engineer, other than the engineer nominated in the contract between the parties, for the purpose of deciding certain questions which arose with regard to the paving. The plaintiff's case was that, when bad-paving had been laid and it became defective by reason of bad foundations, he is not liable to maintain it. His complaint is that defendants had served him with notice to repair, and had afterwards employed a firm named Messrs. Mowlem, to repair the foundation and the wood-paving. His lordship said that, though the plaintiff is entitled to do the repairs himself, he had refused to do it. He was therefore not entitled to an injunction. He thought the plaintiff must be given notice to repair, and might assent or decline. In the cases in which the plaintiff declined, defendants would be at liberty to repair after giving plaintiff notice of their intention, so that the plaintiff might inspect and watch the work as it was being done.

In the second summons taken out by the defendants for an injunction to restrain the plaintiff from raking up the cement beneath the paving, the plaintiff, on certain terms, gave an undertaking not to interfere with the concrete. His lordship directed that the costs of both summonses should stand over till the trial. Mr. Montague Lush, K.C., and Mr. Daldy appeared for the plaintiff, and Mr. McCall, C., and Mr. Morton Smith for the defendants.

DISPUTE AS TO PAVING EXPENSES.

IN the King's Bench Division last week Mr. Justice Bigham delivered judgment in a case of the Mayor, etc., of Hampstead v. the Midland Railway Company, on a special case stated for his opinion of the court on a question of law arising in the action. The action was brought by the plaintiffs to recover from the defendant Company £1000. 12s., the apportioned amount they alleged to be due from the Company as the estimated expenses of paving a portion of a new street, called Westbere-road, Hampstead.

The facts were shortly these:—The plaintiffs, on June 4, 1903, resolved to pave Westbere-road, and on September 25 served the defendants with notice demanding from them the sum alleged to be due from defendants as the owners of land "bounding or abutting" on the new street. Defendants contended that they were not the owners of the land in question within the meaning of the Metropolis Management Acts, 1855 and 1862, and therefore not liable for the expenses in question. It appeared from the special case that the defendants acquired the land, and held it subject to the provisions of section 18 of the Midland Railway Act, 1900, and which provided for the protection of the owner that the Company should not use any part of the sidings to be placed on the land acquired from him for any purpose except for the purpose of empty passenger trains; that the Company should acquire all the land of the owner up to Westbere-road, and should leave a strip of land 20 ft. wide along the whole length of Westbere-road, and should, at their own expense, plant and maintain the same with shrubs and trees to the reasonable satisfaction of the owner, and also fence off the land from the Westbere-road by an iron fence, 7 ft. high, the planting and fencing to be carried out within one year from the Company getting possession of such lands. The Company duly acquired the land referred to, and left a strip of land, 20 ft. wide, along and contiguous to the whole length of the west side of Westbere-road, and dealt with it in the manner provided by the section. They fenced off the land from the Westbere-road by an open, unclimbable fence, 7 ft. high, and planted a quick-set hedge immediately inside the fence along its whole length. On the other side of the strip of land, the land sloped down to the edge of the railway, a cutting having been made for the purpose of its construction. The plaintiffs contended that the defendants were "the owners" of the land "bounding and abutting" on the new street within the meaning of the Metropolis Management Act, and were therefore liable for the amount claimed. The defendants, on the other hand, contended that the land was not land bounding or abutting on the street within the meaning of section 77 of the Metropolis Management Act, 1862; that the land was subject, in perpetuity, to the burden of public and private rights which deprived it of all beneficial value to the defendants, and was not such land as was intended by that section; and that the defendants were not the owners of the land within the meaning of that section, and sections 105 and 250 of the Metropolis Management Act, 1855.

Mr. Macmorran, K.C., and Mr. Courthorpe-Munroe appeared for the plaintiffs, and Mr. Montague Lush, K.C., and Mr. William Wills for the defendants.

Mr. Justice Bigham, in giving judgment, said he had looked into the cases bearing on the subject, and the result was that, when land was incapable of yielding rack-rent by reason of some public use, on or over such land, the owners of such land were not the owners of land within the meaning of the Metropolis Management Acts, and thus not liable to contribute, in respect of such land, to the expenses of paving a new street. But, where the burden of the land was imposed for the benefit of some individual or set of persons, the owners of such land were not relieved from having to contribute towards those expenses. In the present case the burden was placed on the land in question for the benefit of a Mr. Powell-Cotton by a private Act of Parliament, and it was competent for him by contract with the defendants to release them from their obligation towards him in respect of the land. In the other case, nothing but an Act of Parliament could release the land of the burden. He thought, therefore, that the defendants' contention failed, and he gave judgment for the plaintiffs for the amount claimed, with costs.

A stay of execution was granted with the view to an appeal.

ACTION BY A CIVIL ENGINEER FOR FEES.

IN the King's Bench Division, on the 8th inst., Mr. Justice Lawrence delivered a considered judgment in the case of Robinson v. Cadogan, an action by Professor Henry Robinson, the well-known civil engineer, against Earl Cadogan, to recover 401*l.* for professional services rendered in 1903 in connection with a sewage scheme of the Corporation of Bury St. Edmund's. The defence was that the plaintiff had exceeded his instructions by preparing an alternative scheme to that proposed by the Corporation, and that his charges were excessive and unreasonable. The facts of the case and the evidence given were fully reported in last week's issue of the *Builder*.

Mr. Justice Lawrence, in giving judgment, after stating the facts and reviewing the evidence given at length, said that, in his opinion, the plaintiff's claim was an exaggerated one, work being done which was absolutely unnecessary, and which the plaintiff was not retained to do. Without going into figures he thought that the sum paid into court by Lord Cadogan (120*l.*) was sufficient compensation for the services rendered, and there would be judgment for the defendant, with costs.

PATENTS OF THE WEEK.

APPLICATIONS PUBLISHED.*

15,241 of 1903.—J. W. PHILLIPS: *Water Checks for the Shutting Joint of Casement Sashes, Doors, etc.*

Water checks, with rebated face-plate, with slot and plate at back, with pivot screw, also fixed cross-bars for the purpose of allowing a double arm between, with pivot pin screwed to bottom bar, to allow the above double arm to swing forward and backward, also a spring to force one end of double arm forward with a back casing-plate, screwed to fixed cross-bars.

15,340 of 1903.—W. W. TAYLOR: *Doors, Windows, etc.*

The door or window consists of two parts hinged together in the manner used in making partitions in rooms by means of a folding screen, by a second line of hinges parallel to the first line. The part between the first and second lines of hinges is preferably about two-sevenths of the whole width of the door or window; at the same distance as this from the second line of hinges, a pin or bolt, parallel to the lines of hinges, extends into a fixed straight bolt that runs along either of the sides of the door or window, perpendicular to the line of hinges when the door or window is shut, and causes that part of the door or window to move always in the plane that is occupied by the door or window when shut.

19,331 of 1903.—C. MAJOR: *Roofing Tiles.*

This invention relates to tiles having ribs and channels reversely disposed on the under and upper faces, so that adjacent tiles engage when they are placed together in roofing. The tile, constructed according to this invention, is provided, on its upper face, with ribs so arranged as to form a channel near the edges of the upper portion of the tile, the said channel having a passage therein at the lower end leading towards the central plane portion of the said upper face. This channel extends from the upper end of the tile to preferably about halfway down the length thereof, and on the opposite edges or sides of the tile are multiple projections and recesses reversely disposed on the two opposite sides, so that when the tiles are arranged side by side they are engaged or locked together.

19,578 of 1903.—E. WALKER: *Means for Protecting Door and other Locks.*

This invention relates to means for protecting door and other locks. The ordinary key-hole is covered with a hinged-plate, which is capable of being locked and unlocked so that it is impossible to tamper with the main lock without first operating the protector lock. The key-hole and lock of the said protector may be materially smaller than the main lock, so as to afford little scope for tampering with it. The protector-plate hinges within a metal frame and in such a manner that, when the protector-plate is locked within its frame, its edge is flush with the frame. The hinge employed for the plate is preferably an edge-hinge. The said frame for the hinged protector-plate may be secured to the door and over the key-hole of the door, by providing the top and bottom of the frame with an inwardly projecting lug-piece, which is screwed into the door.

19,741 of 1903.—H. C. WALKER: *Lifts and Hoists.*

Lifts or hoists, consisting, in the combination with the controlling gear, of an electrically-controlled locking device, adapted to engage both the controlling rope and suitably-shaped guides carried by the cage, whereby, on the interruption of the current through the locking device, such device is brought into contact with the rope of the controlling gear, so that on any movement, as between the latter and cage, a jamming action is set up.

19,998 of 1903.—L. E. BUTCHER: *Flushing Cisterns for Lavatories, Water-closets, etc.*

This consists in the combination with a flushing cistern, of a disinfectant reservoir having a discharge cock normally closed by a

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

weighted lever, which is in connexion with the operating chain of the flushing cistern, so that the cock is opened simultaneously with the operation of the flushing cistern.

4,108 of 1904.—J. SALT: *Window Frames and Sashes.*

This consists in the combination in a window frame and sashes, of vertical grooves in the frame, with racks bearing in said grooves, engaging with pinions carried in the frame, ears made with said racks, and pivots carried in the sashes and to bear in said ears.

6,479 of 1904.—J. E. GUTTERIDGE: *A Lock for Windows, etc.*

A sash-locking or fastening device, consisting of two parts, each comprising a pair of plates held at a proper distance apart, one pair being attached to one of the sashes, and the other pair to the other sash, one of the pairs of plates having a semi-circular plate turnable on a pin, in which plate is a curved slot which, on moving the said semi-circular plate across the space between the two sashes, will receive a pillar connecting the upper and lower plates to the other pair, means being provided for locking the semi-circular plate in its required position.

9,343 of 1904.—W. FLINT and A. E. FLINT: *Chimney Pots, Ventilating-shaft Tops, etc.*

A chimney pot, consisting of an up-take tube, having lateral openings or apertures in two of its opposite sides, and an inwardly rising guide-plate, or baffle, in connexion with each lateral opening.

10,517 of 1904.—G. H. BOOTH: *Construction of Register Grates.*

In carrying out this invention a set of one or more bars is made, into which hooks are placed at the back of their upright sides which fit into a series of two or more slots formed in the upright space of the fireplace, thus holding the bars in position for use.

15,137 of 1904.—J. GREEN and W. GREEN and Co., LTD.: *Cooking Ranges, and the like.*

A cooking range, or the like, consisting in the combination with an oven having mains for being heated from a fire, of a recess at the bottom, gas-pipes leading from the recess within the oven, an air-duct from the recess to the back of the oven, with or without air-pipes adjacent to the gas-pipes.

13,214 of 1904.—C. McCALLUM: *Window, and the Fasteners.*

A window and like fastener, composed of two members capable of being clamped together by screw and nut devices, the one member having a slotted extension in which the screw works, and the other member having a boss and milled nut for jamming said screw, whereby the window can be locked either with its upper sash drawn down or the lower sash raised, or with both sashes respectively raised and drawn down within limits.

13,319 of 1904.—D. T. DONALD: *Decorative Coverings, or Hangings for Walls, or other Surfaces.*

A covering or hanging for walls, or other surfaces, composed of a face of canvas, or other woven fabric with a thickness of paper, which may have been previously ren-ered damp-proof or water-proof, pasted or cemented to the inner surface thereof.

13,446 of 1904.—G. L. ROLLINS: *Machines for Applying Cement to Stock.*

The use, in a machine for applying cement to stock, comprising a rotatable brush, a tank, having a valve, and means to open the valve to discharge cement on the brush, of a wiper, arranged between the valve and the axis of rotation of the brush on a chord of the circular path of the brush, and slotted that the bristles at the upper edge of the brush may travel therethrough the wiper wiping from the bristles excess of cement towards the periphery of the brush.

17,319 of 1904.—A. B. JOHNSON: *Improvements Relating to Manhole Covers, etc.*

This invention relates to manhole covers, and the like, and has for its object to provide a manhole cover in which there shall be an absolutely tight joint of great durability. According to the invention the cover frame is recessed so as to form an underface on each side thereof, by which the frame is mounted in the brickwork with a continuous four-sided channel protruding downwardly, within which the flange of a second cover lies. The upper part of the frame is provided with a continuous four-sided channel, within which the flange of the first cover lies. The second cover is laid upon the lower inner edge of the channel of the cover frame, upon which rubber or other packing material is laid, so that thus a dry and tight joint is secured. The second cover is pressed in position against the edge aforesaid by means of a locking-bar or bars, which may be secured upon the second

cover, and may be turned to engage with inclined surfaces provided upon the inner wall of the frame. The joint for the first cover may be made by the use of grease, tallow, sand, or any other similar and suitable material.

16,500 of 1903.—A. E. GRAY: *Construction of Tanks, Reservoirs, and other like articles.*

Tanks, and like articles, consisting in the employment of plates, in combination with a sectional frame, such plates being held in position and secured to the frame by means of angle knees or clamps, and bolts and nuts.

16,860 of 1903.—F. PLATT and L. PLATT: *Dies for Use with Tile Presses for Making Tiles, Slabs, etc.*

The construction of metallic dies, of any desired shape and size, with detachable metallic strips, triangular in transverse section, an inclined or bevelled inner side, or a curved or rounded inner side secured to their sides or peripheries for use in making tiles with bevelled, inclined, or rounded lower edges from "dust" clay, or the like suitable material, so as to reduce their area of contact when laid or placed in position, and make close joints.

19,293 of 1903.—M. J. ADAMS: *Lavatories.*

This invention consists in the arrangement for supporting the lavatory and carrying the waste, and is particularly suited to a range of basins. A hollow arm is formed which supports the basin and carries the waste liquid down to a pipe connexion placed horizontally on the wall-face, this horizontal pipe having sockets or connexions so formed that pipe connexions may unite the basins and carry the waste away.

19,724 of 1903.—J. T. WRIGHT and J. HOLT: *Flushing Cisterns for Water-closets, Urinals, and the like purposes.*

Flushing devices for water-closets, urinals, and the like, consisting in the combination of a main syphon adapted to discharge the main compartment, and an auxiliary syphon communicating with the main syphon, or with the drop or discharge pipe connected thereto, and adapted to discharge the sectional compartment, the said auxiliary syphon being perforated at or near the bend to prevent continuous syphoning.

19,736 of 1903.—F. ROUGH: *Method of, and Means for, Making Joints in all Materials, and Especially in Woodwork, water-tight, and otherwise Wind, Weather, and Rain Proof.*

A means for creating a tight joint in and between two pieces of material, consisting of making one or more strips of indiarubber, or other material, duly to fill two or more complementary grooves, formed in such pieces of material, and arranged facing each other.

22,081 of 1903.—A. EMANUEL and SONS, LTD., T. C. ROSE, and J. WOOD: *Apparatus for Testing Drains.*

The plug consists of a pair of discs (preferably mounted on wheels), connected together by a spindle or frame, and supporting the ends of a cylinder of flexible material. One of the discs is provided with means of attaching to it the push-rod and the end of a flexible pipe, the other end of which is fixed to an air-pump. In testing a drain, the plug is pushed in a distance which is known by the number of lengths of push rod employed, and is inflated by the air-pump, the drain being then filled with water. After the test-plug is deflated, it is pushed or pulled to another point, and the test is repeated, and so until the exact position of the leak is determined.

2,649 of 1904.—C. H. HUTCHINGS: *Machines for Moulding Building Blocks and Artificial Stone.*

A machine for moulding building blocks and artificial stone, consisting in the combination of the main frame, a mould-box journaled therein, consisting of a bottom side, two end sides, and a front side connected to the bottom side, a removable side opposed to the front side, and means for temporarily locking the sides together.

The Report of the Committee on the Chantrey Trust.

THE Chantrey Trust Committee have issued their Report with commendable punctuality, and the Report itself is characterised by an equally commendable brevity, precision, and moderation of language.

In regard to the quality of the works already purchased under the Trust, the Report refers to the evidence of various witnesses to the effect that “while containing some fine works of art, the collection is lacking in variety and interest, and while failing to give expression to much of the finest artistic feeling of its period, it includes not a few works of minor importance.” The Report continues—“Full consideration of the evidence has led the Committee to regard this view as approximately correct. The collection, in their opinion, contains too many pictures of a purely popular character, and too few which reach the degree of distinction evidently aimed at by Sir Francis Chautrey.” It is in the latter sentence especially that the true state of the case has been hit. It is hardly correct to say that the collection is wanting in “variety”; there is quite as much variety, in regard to class of subject at all events, as could be reasonably expected. But it is perfectly true that a considerable number of the pictures belong to what may be classified

as “popular” pictures; the kind of works which please the ordinary exhibition crowd, and are reproduced in the popular illustrated papers. It is amusing to notice in the evidence that the painter of one of these popular pictures—a pretty but conventional *genre* work which has no claim to be in such a collection, declared (according to the report in the *Times*) that the Chantrey pictures formed “the best collection of modern art of its size that existed”; an optimistic estimate in which we fear we will not find many supporters; although, as we have said on a previous occasion, the sweeping condemnation of some of the critics on the subject is equally exaggerated. The collection includes some really fine works, amid a good deal of mediocrity.

Both the Report and the evidence* seem to show a curious uncertainty and difference of opinion as to Chantrey's object in the bequest, which appears to us to be perfectly clear from its very terms. He wished to encourage British art and to stimulate the production of the highest class of work, by providing artists with a fair chance of purchase for works of the highest class, which would be out of the run of popular estimation or comprehension. The works purchased were to be preserved as a collection, no doubt; but the formation of a Gallery was only a secondary object; the primary object was to stimulate and promote the highest class of artistic production. We cannot understand how any clear-headed person could read the terms of the

* The evidence has not yet been officially published, but it was reported pretty fully, and we have no doubt in the main correctly, in the *Times*.

bequest without recognising this as its object. The suggestion in the Report (clause 12), that “a greater flexibility of method” in finding and selecting pictures might be attained, among other means, “by purchase from private owners, or even occasionally at auction from dealers,” appears to us to be quite at variance with the terms and intentions of the bequest, which aimed at the direct and immediate reward of the artist himself, and not at paying a dealer's commission; and it is much to be regretted that such a suggestion should have been allowed to stand in the Report: it is directly subversive of Chantrey's obvious intentions. There is another recommendation in the Report for which more may be said, but which we think very doubtful; that is (clause 17), that “some modification should be effected in the provision of the will which forbids the purchase of incomplete works of sculpture.” What is really intended by this is that the Trust should be empowered to give commissions for the execution in a monumental material of works in plaster or terra-cotta which showed exceptional excellence. The word “incomplete” is ill-chosen to express the meaning, for it is obvious that the work, before it could be approved and commissioned, must be complete in modelling, although in a perishable material. It is quite true that the requirement of the execution of a work in marble or bronze, before it can be purchased by the Trust, puts a heavy burden on the sculptor who has to go to the expense of these materials on the chance or hope of being selected;

but it should be remembered that Chantrey was himself a sculptor, and therefore knew all about a sculptor's difficulties; that he may have specially intended to promote or encourage the execution of sculpture in monumental materials; and, moreover, that he emphasised in his will the fact that considerations of benevolence or of helping struggling artists were to be taken into no account whatever in the administration of the Trust. This recommendation therefore we consider to be a contravention of Chantrey's intentions in an important matter, and we must regret that it has been made.

Apart from these points, everyone (outside the Royal Academy) will probably agree with the conclusion of the Committee that "too exclusive a preference has been given to pictures shown at the annual Exhibition of the Royal Academy," and also that "any purchases of works by deceased artists should only be made in exceptional circumstances, and with great caution." We have some doubt whether they should be made at all, considering that the manifest object of the bequest was to encourage good art among living artists, and not to form a gallery of the works of deceased artists; but at all events we are glad that it is discouraged.

The main and important conclusion of the Report is to the effect that the constitution of the purchasing body, as appointed by the testator, is inherently defective; that a committee of ten artists, actively engaged in the practice of their art*, cannot give the requisite time or attention to the search for the particular three or four works of art which it is possible to purchase in any given year. We fancy that this has really been a good deal at the root of the system of purchase from the walls of the Academy; the largest annual collection of paintings and sculpture is there to their hands, and selection from that source saves time and trouble. The proposal of the Special Committee is that a Selection Committee of three be appointed, to consist of the President of the Royal Academy *ex officio*, of a Royal Academician appointed by the Council, and of an Associate appointed by the body of Associates; the members to hold office for five years, and not to be immediately eligible for re-election. It is very likely that this smaller body will be able to give better and more systematic attention to the subject than the more numerous one originally constituted; but the real advantage of the inquiry lies in the fact that it has formalised the conclusion that the public, or that portion of it which takes a serious interest in art, is decidedly dissatisfied with the way in which the Trust has hitherto been administered; and that is a fact which, when thus emphasised, cannot be without influence on its administration in the future.

NEW HALL, WALLSEND. The Victoria Memorial Parish Hall, which has been erected in connexion with St. Peter's Parish Church, Wallsend, was recently opened. The premises have been erected from the plans of Mr. E. F. Simpson, architect, at a cost of 2,400.

* The words of the Report are, "in the exercise of their Profession," which is not a happy expression. Art is not a "Profession."

NEW IRRIGATION PROJECTS FOR EGYPT AND THE SOUDAN.

MAKING no pause in their efforts, the rulers of Egypt continue the execution of works for the more complete utilisation of the water already furnished by the Nile and the consideration of means for the more complete engineering control of that great river. The national reservoir at Assouan, the regulating weirs at Assiout, Cairo, Zifta, and similar works on the great irrigation canals stand prominently forth as evidence of what has been accomplished.

Equally important, though less noticeable to the casual observer, are the construction and improvement of canal and drainage systems, the conversion of lands from basin to perennial irrigation, and the reclamation of large areas in different parts of the country. We need not refer further to the important constructional works here indicated, or to the inestimable administrative services of the Irrigation Department. These have been fully discussed in previous articles, and our intention now is to consider the future requirements of Egypt and the Soudan.

For the present no monumental works are required, with the solitary exception of adequate provision in Egypt proper for the escape of surplus waters during years of unusually high flood. Thanks to the magnificent work done in the past, Egypt is reasonably assured against agricultural disaster, but much remains to be done before the full benefits of the recently-completed works at Assouan and Assiout can be experienced.

Money has still to be provided for converting the lands of Middle Egypt from basin to perennial irrigation. Fully 600,000*l.* is being spent yearly upon new irrigation works for the more efficient distribution and utilisation of the existing water supplies, and at least 1,000,000*l.* will have to be spent in a similar manner during future years before the full benefit of the works at Assouan and Assiout can be attained.

Hence it is abundantly evident that progress is by no means at a standstill. Nevertheless, the demand for cultivated land is becoming more and more pronounced, and, as the increase of the cultivated area is necessarily attended with a corresponding increase of revenue, the Egyptian Government has very wisely taken steps to ascertain the means by which may best be obtained the further water supplies necessary for rendering additional areas of land available for the purpose of agriculture.

Comparatively little has been heard of the measures in question, which are now brought prominently to the notice of the public by the recent Report* of the Under-Secretary of State for Public Works in Egypt. With the exception of a brief despatch by Lord Cromer, the voluminous Blue-book published last week is devoted to a description of the investigations undertaken by Sir William Garstin. The Report embodies the results of observations made during five consecutive years on the Upper Nile, and presents some general conclusions regarding

future schemes in connexion with improvement of the White Nile, together with an account by Mr. C. Dupuis, of Egyptian Irrigation Department, relative to his expedition to Lake Tsana and the rivers of the Eastern Soudan.

In a previous Report, made in 1901, irrigation projects for the Upper Nile Sir William Garstin made no definite proposals, but merely indicated the directions which might advantageously be taken by further inquiries. Since that year has made an extended tour in the districts of the Upper Nile, with the result that much valuable information has been acquired as to the respective discharges of the river throughout the year. In the present volume, as the author says, is no sense of the word intended to be a record of travel. It is a purely technical report written for the purpose of presenting information regarding the Nile basin in a convenient form, and with a view to the object of assisting the comprehension of the various problems connected with the hydrography of the river.

Nevertheless, a large part of the Report is descriptive, and includes voluminous notes upon the lake area at the head of the White Nile, on the great lakes themselves, and on the various channels of the river Nile. This part of Sir William Garstin's work is full of the greatest interest, and an invaluable record of facts which may inevitably form the basis of all future schemes for the further utilisation of the Nile.

Considering the gigantic nature of the task undertaken, it is by no means surprising that many points still require elucidation, and that more complete information is essential before accurate data will become available for the definite guidance of the engineers who will ultimately have to deal with the stupendous problem of controlling the Nile from its sources to the sea. At the same time we find in the Report sufficient indication as to the general conditions which have to be taken into account, and ample evidence that the author has fully appreciated the correct method of dealing with the work lying before the Egyptian Government.

Very considerable are the difficulties connected with exploration in the immense regions through which the Nile passes. Little more than five years have elapsed since the Upper Nile valley was reopened to travellers. The clearance of "snags" in the Bahr-el-Gebel, although commenced, has not been entirely completed, and, as a matter of fact, it was not possible to send expeditions to the sources of the Blue and the White Nile until the end of the year 1902.

Moreover, it must be remembered that until the Nile reservoir works were completed, the Government was scarcely justified in embarking upon other extensive irrigation schemes such as those which are now under examination.

Now that the Assouan reservoir and other works in Egypt are in operation, Sir William Garstin feels himself free to suggest fresh projects for the improvement of the Nile supply, based upon the experience gained and observations made during recent years. He also makes proposals for the formation of a regular organised Irrigation Service in the Soudan, so that the study of the riv-

* Despatch from His Majesty's Agent and Consul-General at Cairo, including a Report by Sir William Garstin, G.C.M.G., Under-Secretary of State for Public Works in Egypt upon the Basin of the Upper Nile, Egypt, No. 2 (1904). London: Eyre and Spottiswoode.

Fig. 1.

may be continued and the different projects be presented to the Government of Egypt in a complete and well-considered form. The problems to be investigated, as Sir William Garstin states, "have two main objects—namely, that of increasing the water supply of Egypt in the summer and that of securing similar advantages to the Soudan during the same period." Although both ends are of equal importance, the former is certainly more likely to be immediately remunerative.

From the information contained in the present Report, it appears probable that the most satisfactory way of securing the desired results would be to reserve the waters of the Blue Nile for the improvement of the regions bordering that river, and to utilise the waters of the White Nile for the supply of the areas of the Nile valley lying to the north of Khartoum. In discussing such projects, Sir William Garstin first deals with those in connexion with the White Nile. These are (1) the regulation of the great lakes, and (2) the prevention of the waste of water caused by the vast swamps through which the river passes in the upper portion of its course.

By reference to the plan and cross section in Fig. 1, it will be seen that there should be no great engineering difficulties in connexion with the construction of works for controlling the flow of water issuing from Lake Victoria Nyanza. In that portion of the Report descriptive of the outlet, it is stated that "the rock is a hard and compact diorite, and appears to be sound and suitable for such a work. The river could be turned through one of the openings, while the masonry in the others was in progress. When this portion of the work was completed the river could be passed through the sluices and the remaining opening similarly closed. To lower the reef would be rather more difficult, as it would not be so easy to manage the diversion of the stream, and a considerable amount of

blasting would be necessary in the channel below to ensure a clear outfall for the water. Still, even to this proceeding there would be no insuperable difficulties."

The construction of a regulator at the Ripon Falls would be a comparatively easy task, for the soundness of the rock and the width of the channel would permit the construction of foundations without any serious trouble. In his recent work on "The Nile Reservoir Dam at Assouan and After," Sir William Willcocks suggests that the best method of dealing with the Ripon Falls would be by cutting down the sill, building a suitable weir capable of holding 10 ft. of water, and drawing upon the immense amount of water annually stored in the lake. This suggestion, we are pleased to observe, meets with the entire approval of Sir William Garstin, who considers that, "should regulation of the Victoria Lake outfall ever be undertaken, the necessary works should be carried out upon these lines."

This huge natural reservoir would undoubtedly afford, even after deducting loss due to evaporation, more than sufficient water to meet the wants both of Egypt and the Soudan, and it is stated in the present Report that the necessary regulating works "would in all probability be far easier to construct than was either the dam at Assouan or the barrage at Assiout."

Turning now to Lake Albert, it is clear from information available that it would be perfectly easy to build a weir at the northern outlet. Sir William Garstin says that as the rock is at some distance below the bed of the river, the foundations of the work would have to descend to a considerable depth, but the chief difficulties to be contended with are those due to the remoteness of the locality and the absence of labour and supplies.

Thus the regulation of the two great equatorial lakes presents no insuperable difficulty, nor would the works involved be of any great size. They would, in fact, be regulating weirs of ordinary dimensions and not larger than many which have been built during recent years in Egypt.

In connexion with the utilisation of these two lakes, it should be remarked that as the Victoria Nile discharges its waters into the Albert Nyanza, this lake undoubtedly forms a great regulating reservoir. The two discharges of the Nile measured in March, 1903, one above its junction with Lake Albert and the other below the outfall, seem to prove that when the river and the lake are low, and their levels not far above the minimum, there is a very inappreciable increase in the volume escaping from the lake over that which enters it from the Victoria Nile.

It is stated, on the authority of Felkin, that in the dry season less water is brought into Lake Albert from the Victoria Nyanza, and the level of the lake sinks until the rainy season sets in and the usual current of water is brought in by the Victoria Nile. What the relations may be between the incoming and outgoing discharges during the rainy season the present Report does not suggest, and until a gauge has been erected on the lake, and results have been accumulated for some years, all theories on the subject

must be purely speculative. The fact remains, however, that the construction of regulating works at the outfalls of the two lakes would permit the storage and discharge of all the water required for the future needs of Egypt and the Soudan.

The great objection to any scheme for augmenting the discharge from the equatorial lakes is, as Sir William Garstin points out, that under present conditions the increased volume of water would never reach the White Nile, but would be entirely wasted in the marshes through which the Bahr-el-Gebel passes. This brings us to the second scheme in connexion with the control of the river.

The truth of this statement is made abundantly evident by the section of the report dealing with the discharge of that part of the river. The Bahr-el-Gebel, which extends from Lake Albert to Lake No, is 1,156 kilometres in length. It is shown that between Mongalla and Bor, in a distance of 133 kilometres only, the river loses 50 per cent. of its volume before entering the "Sudd" region at all. The reason for this evidently is that the flood water, instead of flowing forward, spreads out in all directions over marshes and lagoons, filling up a huge basin or natural reservoir in the river valley between Lado and Ghaba Shambé. Thus an enormous quantity of the water coming from the south is used up and never finds its way to the north at all, the effect upon the river being similar to that produced by filling the irrigation basins in Upper Egypt. The natural reservoir to which we now refer plays an important part in securing the constancy of supply in the Bahr-el-Gebel.

As the river falls much of the water stored must slowly return to the channel, although a large proportion of it is undoubtedly lost by evaporation. Still, enough remains to assist to no inconsiderable extent in keeping up the supply during the winter months.

The next point for consideration is the loss of water in the enormous marshes traversed by the Bahr-el-Gebel. These marshes commence at about 766 kilometres from Lake Albert, and continue without a break to the junction of the Bahr-el-Gebel with the White Nile at Lake No. The following table, compiled from data given in the Report, gives the discharges observed in the "Sudd" region during 1902 and 1903:—

DISCHARGE OF THE NILE IN THE "SUDD" REGION.

Distance from Lake Albert in kilometers.	Year.	Month.	Discharge in Meters Cube per second.
400 (Lado)	1902	September	1,079
400 "	1903	"	1,955
820 "	1903	"	582
820 "	1902	"	308
947 "	1903	April	331
943 "	1903	September	375
941 "	1903	"	429
1,003 "	1902	"	333
1,146 "	1903	April	285
1,147 "	1903	August	318
1,147 "	1903	September	315

Examination of the foregoing table will show that in 1902, which was a year of low flood, the river lost 64 per cent. of its volume in a distance of 420 kilometres from Lado, while in 1903, a year of very high flood, the loss in the same distance amounted to no less than 73 per cent. of the discharge passing Lado. Equally serious are the losses observable

that should be undertaken as soon as the preliminary investigations can be completed. The other project, involving the control of the Equatorial lakes in the former long since proposed by Sir William Willcocks, can afford to wait, and must necessarily wait, until the Bahregebels has been improved, so as to permit the establishment of an augmented discharge.

Next, we must briefly refer to the most interesting and able Report of Mr. Dupuis on Lake Tsana and the rivers of the Soudan. This portion of the Report will amply repay perusal, and we much regret that space will not permit us to discuss it at any length. The various beginning and fountain-head schemes for the improvement of the Blue Nile would be the utilisation of the Lake Tsana, were it not for political considerations. If this natural reservoir, with an available capacity of 3,000 million cubic metres, were not situated beside the Soudan, the construction of a regulator at the outlet of the Blue Nile would at once settle the question of the summer supplies for the river. As William Garstin says, however, that the questions involved by its position are so many and so difficult of adjustment that the abandonment of the project for an indefinite future appears to be a matter of certainty."

Hence the study of alternative projects is necessarily to be taken up. The following are the schemes requiring investigation in the order of their importance as stated in the Report:—

(1) The selection of a site for an open drainage near Wad Medani and the study of projects for main irrigation canals east and west of the river. (2) The possible construction of a dam at the head of the saires Rapids to supplement the winter supply of the Blue Nile. The reservoir would be filled during October and November and emptied during the months of December, January, and February. (3) The improvement of the regulation of the river Gash by the construction of a large circular basin near the apex of the delta of the river, for the distribution of the flood waters into canals through head regulators in the banks of the basin. (4) The construction of a dam and storage reservoir on the Atbara river. (5) Examination of the rivers Dinder and Kahad, with the object of deciding whether the construction of storage reservoirs would be practicable; and (6) Examination of the upper valley of the Atbara, with a similar object.

Of the projects mentioned in connexion with the Eastern Soudan, the most important are those for the control of the river Gash and the construction of the dam on the Blue Nile. The first of these is strongly recommended, as it does not involve any considerable expenditure, and would render fully 100,000 acres of land available for cultivation by the population already settled in the district. The second would be more costly and less remunerative, although its realisation must be attempted sooner or later.

It is satisfactory to learn that the study of all the problems for the development of irrigation in the Soudan is to be taken up by a regularly organised Department, under the direction of Sir William Garstin.

The Soudan at present represents an unknown quantity, but there is every reason for believing that its return to prosperity may be looked upon as a certainty, even if the work of development be somewhat slow. Brief and inadequate as the present review undoubtedly is, enough has been said to convey some idea of the momentous conceptions contained in the Report. The rescue of the Nile from the marshes, which take from it half its volume, the control of the giant headwaters of the river, and the regulation of the Blue Nile for the regeneration of the Soudan, are some of the tasks now seriously proposed. But even these do not exhaust the category of works set forth by Sir William Garstin, and we must defer to a succeeding article the further consideration of the monumental programme he has placed before the world.

NOTES.

THE premature death of Mr. Justice Wright, admittedly one of the ablest judges, is noticeable from the point of view of the Law of Light and Air. He may be said to be the real destroyer of the doctrine of the right of the owner of a dominant tenement to an extraordinary amount of light. In *Warren v. Brown* he gave a remarkable judgment exploding the doctrine. This decision was reversed by the Court of Appeal. But when the case of the Home and Colonial Stores *v.* Colls came before the House of Lords on the same subject the Lord Chancellor directly and admittedly adopted the reasoning of Mr. Justice Wright in *Warren v. Brown*, and so the great appellate decision in *Colls'* case is in many ways based actually on Mr. Justice Wright's previous judgment, which certainly threw so much light on the subject as largely to lead to the final declaration of the law.

THERE appears to be no doubt, from what transpired during the debates last week on the Education question, that many local authorities are dealing too easily with the managers of the Church schools in regard to the buildings. These buildings should have been handed over to the authorities in complete repair; on the contrary, they have in many cases been taken as they stand. There also seems to be some doubt if the sanitary arrangements of the elementary schools are being kept up to the mark, and assertions were made during the same debate that county authorities were inclined to overlook these defects. Nothing can be more important for the public health than that elementary school buildings should be kept up to a high standard, since children are massed in them at an age when they are susceptible to contagious diseases. That within ten years there will be few non-provided elementary schools left seems probable, but, as long as this class of schools exists, they should be kept up to the mark both in structure and in sanitation.

THE advent of British rule in Uganda is bringing many changes to countries that a few years ago were scarcely marked on the maps then available. In Uganda railways are

by no means the only evidence of constructional science, for the capital of that country now possesses a permanent and well-built cathedral, designed by the architect-missionary, who has instructed the inhabitants in brickmaking, carpentry, and other mechanical arts. The new cathedral is the first really noteworthy public building erected in the country. The walls and two rows of columns are of sun-baked bricks, while the foundations are of bricks burnt in a kiln. It would be scarcely correct to regard the roof as a permanent structure, for it is merely covered with thatching of long grass. But the reed-work forming the ceiling is described as being a remarkably fine piece of work, and the palm-stems serving as beams and rafters also appear to possess considerable interest. The building, which is capable of accommodating a congregation of 3,500 persons, includes three aisles and transepts, meeting below a central dome, a well-appointed chancel, and the usual adjuncts of a cathedral. In the consecration of the cathedral by Bishop Tucker, assisted by fifty European and native clergy, we find striking testimony to the advances being made in a country that has only been rescued from savagery within quite recent times.

THE extension of the Mall, as a processional road, through Spring-gardens into Charing Cross, involves the demolition, already begun, of some remaining buildings in Spring-gardens, and of the two houses at Charing Cross near Drummonds' banking-house. The latter mark the site of the Bull's Head tavern and of the next-door house where, at one Thomson's, Milton lodged for a while, as is mentioned in his "Life" by Philips. A drawn plan made in the interval 1734-48, and formerly belonging to the Westminster Bridge Commissioners, plots the sites we mention together with "Cromwell's Palace"—where is now the bank, and the "French Church" and the "Chapel" in "Spring Garden." The Chapel stands at the north-east corner of New-street in the line of the new road, and was originally founded by some French Huguenot refugees, *temp.* William III., on the west side of the passage—now a road—leading out of Cockspur-street into Spring-gardens. Having been consumed, with the adjoining Thatched House tavern, by a fire in 1726, it was rebuilt in 1731-2 by the Honourable Edward Southwell. The French church was subsequently replaced with the chapel erected at the corner of New-street as a chapel-of-ease to the parish church of St. Martin-in-the-Fields, and dedicated to St. Matthew. Some apprehension is felt that the statue of King Charles I. will also be removed from its time-honoured position upon the site of the Queen Eleanor Cross at Charing. It has remained there during a long period, and many changes have been made around it; we may, indeed, apply to it Pope's couplet:—

"I see, I see where two fair cities blend,
The ample bow, a new Whitehall ascend."

At the remoter end of the processional road the stone piers, lamp-standards, and railings of the fore-court of Buckingham Palace are being removed

for an enlargement of the enclosure, and for a reconstruction of the railings with their middle length in one straight line instead of in a series of stepped curves, and with two chief gateways, for one of which is being made a copy of the gates which formerly stood in the "Secretary's gateway."

James II.'s Statue, St. James's Park.

REPLYING to Mr. Pierpoint in the House of Commons last week, Lord Balcarras stated that the First Commissioner of Works does not intend to correct the inscription which has been cut in the renewed pedestal, as being probably contemporaneous with the statue. But is that so? The "Autobiography of Sir John Bramston," first printed for the Camden Society in 1845, contains an entry:—

"On New Year's Day Jan. 1688-7 a statue in brass was to be seen (placed the day before) in the yard at Whitehall made by Gibbons, at the charge of Toby Rustick [Tobias Rustat] of the present King, James the 2nd."

In his "New View of London," 1708, Hatton quotes the inscription (saying it is nearly worn out) thus:—"JACOBUS SECUNDUS DEI GRATIA ANGLIÆ, SCOTIÆ, FRANCIE, & HIBERNIÆ REX. FIDEI DEFENSOR, MDCLXXXVI." The later mistake of "JACOB," for "JACOBUS," was rectified some years ago, but somehow the mistake of "GRATIE," for "GRATIA," has crept in, whilst "ANNO" was inserted before the date. In the Soane Museum is a picture (1782) of the Privy Garden, by Wheatley and Mortimer, showing the statue in its original position before the east front of the Banqueting House, Whitehall, with a railing around it. In June, 1896, the bronze was cleaned, and then painted with a very thin solution of a chemical product invented by Professor Church for preserving the patina, and a large hole in a shoulder of the figure, decayed by rain-water, was stopped up. Fourteen months afterwards the statue was removed into the garden of Gwydyr House, Whitehall, where it remained until the erection of a stand for the Coronation procession of 1902.

This is the title of a paper read by Mr. W. D. Scott-Moncrieff at the annual meeting of the Incorporated Association of Municipal and County Engineers. No one can say that the title is lacking in boldness, but the sewage problem has been solved so often (in theory) that we turn to a new claim of solution with some fear that it may be as unwarranted as its precursors. Mr. Scott-Moncrieff is, however, so careful a student of the problem that his views are worthy of thorough consideration. In his recent paper he gives the results of experiments made in filtering sewage, the principal novelty being the control of the air supply. The filter was 6 ft. deep, and the tests showed that nearly the whole of the purification was effected in the upper 3 ft., whether the air supply was at the rate of eight or sixteen gallons of air per gallon of sewage per hour; in some cases an appreciable increase of purification was effected in the fourth foot of depth, but below this the filter was for practical purposes useless. Somewhat curiously, the test without any air-supply gave approxi-

mately the same results as the other tests, but as the filter was only in operation for twelve hours per day, the periods of rest afforded a fair amount of aeration. We need scarcely say that the filter was of the percolating or trickling type, and not a contact-bed. The tests were made at Staines with sewage pumped directly from the sewer through a strainer, and, although they were not exhaustive, they were sufficient to show the advantages of Mr. Scott-Moncrieff's apparatus for determining the best conditions for the purification of a given sewage, including the rate of flow, the depth of filter, and the quantity of air required.

It is now generally conceded that percolating filters give better results than contact-beds, but the difficulty of securing uniform distribution of the sewage over the filters has to some extent detracted from the utility of this method of purification. A new type of distributor has recently been tested on a large scale at Hanley, and the results are so satisfactory that it will soon be adopted for the whole of the sewage of that town. The peculiarity is that the distributor is driven by power, and the speed can, therefore, be regulated to give that rate of flow which is found to be the best for any given conditions. The experiments were made by Dr. George Reid and Mr. J. E. Wilcox, A.M.Inst.C.E., and the results were given by them in short papers read at the recent Congress of the Sanitary Institute in Glasgow. Two filters were constructed, one circular and the other rectangular, each having an area of a quarter of an acre. The distributor for the circular filter was designed by Mr. Scott-Moncrieff and the other by Mr. Wilcox. In each case the degree of purification effected by treatment in an open septic tank and subsequent filtration at the rate of 200 gallons per square yard for the circular filter, and from 100 to 230 for the other, varied from 91 to 97 per cent. The filters were 4 ft. 6 in. deep, and were divided into sections containing material (crushed "saggars") of different sizes; the best results were obtained with the smallest pieces, namely, 3-16 in. to $\frac{1}{4}$ in. The experiments certainly show that power-driven distributors are worthy of an extended trial. If the cost of installation and the working expenses are not excessive, they will probably be the means by which the principal objection to the filtration of sewage is overcome.

We have received from the Engineering Standards Committee an interim Report with reference to British Standards for Electrical Machinery. We are asked, in view of the "very great importance" of these recommendations, to give them as much publicity as possible. The Sub-Committee on Generators, Motors, and Transformers, who have drawn up the Report, mention that they have decided to confine themselves to such points as would ensure uniformity in "nomenclature, outputs, and test conditions." Some of the recommendations as to pressures and frequencies have already been published, and the others seem to have been adopted by finding out the pressures most commonly employed in this country. It may be

worth mentioning that the standard pressures, for alternating current transformer work, which are recommended are 115, 230, and 460. It seems to be curious that these numbers are chosen instead of 110, 220, and 440, which are the numbers given for alternating current work. Before consulting engineers adopt these recommendations they certainly want to know why these numbers are adopted. Again, under the heading of "Alternating Current Generator" we read that they must "give an E. M. F. curve, which, under all working conditions, shall be as nearly as possible a sine wave." We should very much like to know what were the reasons that induced the committee to arrive at this recommendation. Did they introduce it so to avoid possible dangers from resonance or with the idea that alternators would work better "in parallel" when they gave sine waves? They may possibly have thought that transformers and arc lamps would work better with sine waves. As a matter of fact, however, is a physical impossibility to make an alternator that will give anything approaching a sine wave under "working conditions." Are manufacturers to understand that the pole-pieces of a field magnets must now be twisted so to avoid the harmonics caused by slots in the armature? We fail to see what good is being done by the committee publishing recommendations like the one given above, without stating the object which is to be gained by following the recommendation. The Committee hint that they will probably relax stringency of the usual conditions regarding the rise of temperature in motors. It is stated that the recommendations are likely to be "more liberal" than those laid down by the American and German Electrical Standardisation Committees. We suppose, therefore, that a consumer in the future may be able to get a cheaper machine. Whether this is an advantage or not depends on the durability and efficiency of machines which heat excessively.

The Port of Liverpool.

In the early part of the present month the Mersey Dock and Harbour Board had under consideration an important scheme recommended by the Works Committee, involving an expenditure of £222,000, for the extension of the Brunswick Dock over the site of the Union Dock and the Brunswick Graving Dock, the formation of a channel 100 ft. wide from the Toxteth Dock, and the erection of two sheds, one 1,800 ft. long by 150 ft. wide and the other about 500 ft. long. These important works were authorized last week, and, when completed, will constitute a very valuable addition to the facilities of the port. At the same time we may mention that a large graving dock is now under construction on the Mersey, in pursuance of the Act of 1902. The steel gates of this dock, 135 ft. wide, are of special interest, being wider than any hitherto constructed. Huge quantities of sand have been removed from the river during the past year, no less than 2,993,500 tons having been raised and conveyed out to sea by the sand pump dredger *Coronation* since September 1903. From the bar and shoals in

en's and Crosby channels 7,923,300 cu. yds. of sand were dredged during the past year. Some idea of the herculean task undertaken by the engineering staff may be gathered from the statement that, since the commencement of dredging in 1890, a total quantity of sand removed from the river is approximately 80 million tons.

FROM recent correspondence in the *Times*, it appears that negotiations of some kind in progress which may involve the demolition of the tower on the ancient city wall of Newcastle. Very little now remains of the ancient fortifications of the city, and it is almost impossible to believe that the inhabitants would permit the destruction of so valuable a relic as that which is now patterned. There is evidently some mystery about the matter. On one hand, Mr. Rawnsley refers to the common belief that the tower is doomed and to contemplated action by the local society of antiquaries, and, on the other, Mr. Lambert—who was born in the tower—is a trustee of the Incorporated Company of Masons, to whom it belongs—merely states that he and other members are not consented to the sale. This is a stark saying, and, coupled with the statement that Mr. Lambert does not give his refusal on antiquarian grounds, seems to justify apprehension. We sincerely trust that public attention will not be diverted from this threatened piece of vandalism.

THERE are two points in the evidence (as reported) given before the Special Committee on the administration of the Chantry Fund, on which we would say a word. In the first place, what is the meaning of the strange opinion expressed by the President of the Royal Academy, at the close of the evidence, that "French influence had tended to debase art, and had induced young men to take no trouble to learn anything at all"? Does this include French landscape-painting? Does it apply to such painters as M. Béraud, or such sculptors as MM. Mercier, Carpeaux, and Alfred Boucher, Gustave Boulle, and others who might be named? Is a comment on Impressionism it might be just; but French art is not all Impressionism. Another point is—how is it that among the names of artists who have been passed over, which have been repeated more than once in the evidence and in articles written on the subject, we hear nothing said of Mr. Arthur Hughes, one of the most gifted of the group who used to be called præ-Raphaelites, and whose pictures have been on the line at the Academy over and over again? He is a far more important artist than Frederick Sandys, whose name has been brought forward; and we can recall some of his pictures—his beautiful triptych, "Viola d'Amore" for instance (a work quite beyond popular appreciation), which would have been better worth purchase than some score or so, at all events, of the paintings in the Chantry Fund collection. The new Selection Committee, when constituted, might as well consider whether they cannot in this respect do at least tardy justice to a gifted painter who has been unduly neglected.

THE ARCHITECTURAL ASSOCIATION. EXCURSION.

FOR the thirty-fifth annual excursion of the Architectural Association, the committee have chosen the south-eastern corner of Somersetshire and the borders of Dorsetshire, with the old-world town of Sherborne as a centre. Here, in accordance with the usual custom, the majority of the excursionists took up their quarters, at the Digby Hotel, on Saturday. The President of the Association (Mr. Guy Dawber) took the chair at dinner, and a pleasant opportunity was afforded of meeting old friends and reviving reminiscences of former happy tours. Although this is the fifth occasion on which the Association have visited Somersetshire, the splendid list of attractions prepared by the untiring hon. secretaries, proves that the county is by no means yet exhausted. Former centres have been at Wells, Bath, Yeovil and Taunton; and but few of the places included in this year's programme have been previously visited. It is now twenty-one years ago since Yeovil was made a centre on the occasion of a visit to these parts, and but few members could recall that occasion. Sunday was quietly spent, many of the party visiting the Abbey church. Rain fell plentifully in the early part of the afternoon, but, in spite of threatening appearances, a drive was taken in the neighbouring district of the east of Sherborne.

Village of Trent.

The official programme of the excursion commenced on Monday morning, when the two breaks and a wagonette started from headquarters, full of good-humour, sketching paraphernalia, cameras and luncheon hampers for the north and north-west. The morning appeared inclined to be wet, but, fortunately, though some sharp showers fell, they did so at convenient intervals. After a drive of a few miles the party came to the little village of Trent, and alighted at the lychgate leading to an old-world burial-ground, with its old cross in a base of circular steps.

The lordship of Trent in the days of the Normans and Conquest was part of the vast possessions of Robert, Earl of Morcton. The church, which is dedicated to St. Andrew, consists of nave and chancel, a chapel on the north side, and a transept on the south, with porch and a small baptistry at the west-end of the nave. The nave and chancel are Perpendicular, but the tower is Decorated; it stands over the south transept, and is of rather fine design, terminated by a pierced, quatrefoil parapet, supported by a corbel table, with crocketed pinnacles at either angle. Rising above is a spire 35 ft. high, with moulded angles. This is one of the very few spires to be met with in Somersetshire, and it has been suggested that the idea emanated from Warwickshire, the county from whence the patrons of the church came.

On the north side of the nave is a chapel corresponding with the south transept: the eastern window, as well as a single lancet light in the western end, belongs to the Decorated period. Under the recessed arches in the north wall of this chapel are two stone effigies, one representing a man in plate armour of the period of Edward III.; attached to his girdle is a great sword on the left side, and a short dagger on the right, but it is not known whom the figure represents. There are slight traces of colouring. The other effigy is of a different character, and represents a civilian—probably a youth. The chapel is, perhaps, that of the chantry, founded by John Frank, a native of Trent and Master of the Rolls in the reign of Henry VI., and a lawyer of great repute in his day. The chantry was founded within the church, and this chapel appears to be the only part of it appropriate for the chantry altar and services. It was, however, probably used for some other purpose previous to the foundation of the chantry *temp.* Henry VI., as it appears to be of much earlier date, and is supposed to have been originally a Lady Chapel. On the suppression of chantries, the temporalities of this one, together with the mansion of the chantry of Trent, and stables and garden adjoining, was granted to William Fontoutay and Richard Mayne for the sum of 6*l.* The house of the chaplain is still standing adjoining the churchyard, and has some of its original windows remaining. The chapel itself was taken possession of by the Gerard family, and the site of the arch dividing it from the nave is decorated with two genealogical trees,

containing nearly forty shields of arms of Thomas Gerard and Ann Coker his wife, and their respective alliances. The rood-screen is a fine specimen, consisting of three perpendicular tracery bays, the central one with doors; a fan vault carried the rood passage, the cornice being richly decorated and gilt. The ornamented cornice, instead of being of carved wood, appears to be in some parts of plaster. The pulpit is very ornately carved with Biblical subjects, and apparently had its origin in Belgium or the Low Countries. Very many of the original seat-ends remain, and are quaintly carved with heraldic devices. Some parts of the church have been restored, and there has been rather too liberal a use of cement, but still several features commanded attention, more especially the exterior and the really fine tower and spire.

The sketchers found much to interest them out-of-doors, and the water-colourists of the party worked under particularly good conditions, as by now the day had decided to be brilliant. The fine old grey spire, surrounded by foliage of sombre yew trees; the Manor House and adjoining farmyard; the ancient presbytery, with its old-world garden nestling among the elms, provided a variety of picturesque subjects. Adjoining the church is the Manor House where King Charles II. lay concealed for more than a fortnight, during which period the house was rigorously searched on more than one occasion. The hiding-place is a dark space between a ceiling and floor above, apparently constructed intentionally, with scarce room to stand upright. From here Charles made his unsuccessful attempt to escape from Lyme, under the guidance of his host from Trent, Colonel Wyndham, who, for this and other services, was rewarded with a baronetcy and a pension.

Queen Camel Church, etc.

The next place on the programme was Sandford Orcas, but this house unfortunately had to be omitted, and instead the party drove some five miles to Queen Camel, an interesting church placed almost under the shadow of Camelot, famous in Arthurian legend—

"Like Camelot what place was ever yet renowned,
Where, as at Carlon, he kept the table round?"

The church has many interesting features, but its principal glories are undoubtedly the four fine timber roofs over chancel, nave, and aisles. The chancel roof is of arched form, in six bays, with many quaint and unique carved bosses of a variety of biblical and heraldic subjects, in several of which animals figure prominently. The mediæval idea of a camel is especially worth noting. Angels bearing shields support the principals, and between is a boldly-carved wood cornice. The nave roof is flat. It consists of five bays supported on stone corbels, and originally appears to have been panelled, though, at some later date, rafters were substituted for the panelling, with the exception of the half of the easternmost bay, which retains its original form. The clerestory is lit by three light windows, arranged centrally over the nave arcade, which consists of octagonal piers with moulded caps and bases. The arch between nave and choir is panelled, and in this respect recalls the nave arcade of Sherborne Abbey. One of the most interesting features of the church is the very fine and lofty rood-screen, in five perpendicular bays, and richly carved cornice. The church was well restored some thirty years since by Mr. Pearson. It contains many monuments, mural and otherwise, to the St. John Mildmay family. The font is of rather an unusual type, octagonal in form, with small square angle pillars with niches containing saints.

Luncheon was partaken of in an adjoining meadow, and afterwards a start was made for Hazelgrove, the seat of Captain Mildmay. This house was not on the programme, but was substituted for Sandford Orcas, and the short time allotted to it proved only sufficient for a cursory examination. The beautiful late Renaissance carved work in the dining-room, ornate in character and executed with wonderful skill and spirit, was brought here from Dartmoor House, and admirably adapted to its new surroundings. A small and low apartment adjoining forms part of an older building, and contains a good XVth-century plaster ceiling. It is known as Queen Elizabeth's room. The garden forms an attractive setting to the house, more especially the simple lines of kitchen garden with its intersecting yew alleys and gay borders.

North Cadbury Church.

From Hazelgrove a drive of two miles brought the party to North Cadbury, whose church, dedicated to St. Michael, was rebuilt by Elizabeth Lady Botreaux about 1415. Here the party were met by the Vicar, and an interesting paper was read upon the history of the fabric. The chancel was restored some thirty years ago, when a flat stone was discovered on the top of the wall plate, with a date, 1417, scratched upon it, and underneath it a mason's chisel. The church was formerly collegiate and in Dngdale's Monasticon is a copy of the charter granted by Henry V. It is a good specimen of the earlier Perpendicular style and consists of a tower, nave, chancel, north and south aisle, and north and south porches. Tradition says that the tower was first built and stood alone for some time. This is borne out by the appearance which the junction of the side aisles with the tower still presents. Both aisles appear to have been joined on to the tower and of later construction. There are four clustered columns on each side of the nave, and above are clerestory windows.

The wall of the south aisle encloses a portion of the string course of the tower above the clerestory windows; and in the north aisle may be seen one of the tower buttresses with the old string course. The roof of the nave, side aisles, and chancel is of oak covered with lead, and over both nave and chancel it is supported by well carved stone brackets. There is an ancient stone font at the west end of the nave. The whole building is practically of one date. The only fragment of an earlier church consists of portions of the piers and capitals of the nave arcades. One of the most striking features about the church is its excessive symmetry. There is even a two-story porch on the north side to match that on the south, and the only difference in the two elevations are due to the tower stair turret on the south side, and a vestry on the north. Mason marks abound on the outside of the church. It is probable that at some period the vestry may have been in use as a school, and two black letter alphabets can very plainly be deciphered painted upon the wall. In the church register is recorded an accident which occurred in the XVIIth century when one of the heaviest bells falling from the tower completely ruined a monument standing below. The oak seating, which is dated 1538, appears to have been partly Dutch and partly English, a mixture of Gothic and Renaissance detail. Under a yew tree in the vicarage garden may be seen the fragments of an elaborate stone pulpit dating from the XVth century.

Manor House, North Cadbury.

The Manor House adjoins the churchyard on its eastern side; a short carriage drive leads to the forecourt and north front of the house, with its charming variety of outline and collection of gables, its lichen-covered walls of warm-toned masonry and stone-slatted roof. On the western side is a picturesque addition, supported upon a bold arch. The plan is distinctly medieval, and whilst its decoration clearly belongs to a later date, it is very probable that much of the walling is earlier. The north side is by far the most attractive, and this was originally approached through a square forecourt and imposing gate-house. Unfortunately this has disappeared, though the inconvenience of having to approach the house on foot across the forecourt is hardly consistent with the greater comfort demanded in the present day. The character of the house has suffered much from the rebuilding of the south front in the early years of the last century. After seeing over the Manor House, the party were hospitably entertained to tea by the Vicar, who produced interesting souvenirs of the church's history. Then, at the sound of the quartermaster's whistle, a start was made at six o'clock for the long and hilly drive home to headquarters, passing *en route* the historic hill of Camelot, whose extensive earthworks indicate the important part this fortress town played in the early history of these parts.

Tuesday.

The second day of the excursion was devoted to the district south-west of Sherborne, and at 9.30 train was taken for Crewkerne, when the brakes met the party. A drive of several miles through lanes and orchards brought the excursionists within sight of the town of Beaminster, delightfully situated in a valley, its church tower rising proudly from amongst the collection of

stone roofs of the old-fashioned town which lies embosomed among surrounding hills, through which a peep may be obtained of the English Channel and Lyme Bay.

Beaminster Town and Church.

The town suffered great hardships during the Civil Wars, when an army under the command of Sir Thomas Fairfax "marched from Dorchester to Beaminster. The train and most of the foot quartered on the top of an hill; some laid in Beaminster town, a place of the pitifullest spectacle that man could behold, hardly an house left not consumed by fire, the town being fired by some of the enemy in five places at once when Prince Maurice was there, by reason of a falling-out between the French and Cornish." So record the chronicles of the day, and we are told that later on the inhabitants were successful in obtaining an ordinance of Parliament for raising 2,000*l.*, with which some part of the town was rebuilt. It was, however, again destroyed by fire in 1684, involving very heavy losses. It suffered from fire yet a third time in 1781. Then in the course of three or four hours all the houses on the west side of the street leading from the church to the market place were destroyed. These disasters no doubt account for the lack of old buildings to be met with in a town where one might have expected more.

The church consists of chancel, nave, north and south aisles, with another aisle or Lady Chapel north of the chancel. The tower is of good proportions, rising nearly 100 ft. in height, with highly ornamental angle buttresses and small crocketed pinnacles rising from their several spays; an additional air of elaboration is imparted by the miniature pinnacles in the upper story rising out of grotesque corbels, and entirely detached from the wall. About 8 ft. from the ground level the tower is encircled by a band of quatrefoil and tracery. In the second story on each face are square-headed windows, each of two lights. The upper story has pointed windows, each of two lights, divided by a central pier, at the foot of which is a small pinnacle, the shaft all anglewise, rising from a corbel placed in the centre of the string which marks the stage. On the west front of the tower are three niches: the central figure represents the blessed Virgin seated, on the right hand the figure of St. James, and on the left St. George subduing the dragon. Above these is a small square-headed window, walled up, and having beneath a small sculpture of the crucifixion, with the Virgin Mary and St. John; higher up are further niches and pinnacles, with central groups representing the Resurrection and Ascension. On each side are figures in the costume of the day, one a Palmer the other a Fuller, said to represent two of the principal contributors to the building of the tower. The whole structure is of uniform Perpendicular character, dating from the latter part of the XVth century, excepting a portion which is an elongation of the south aisle; the original purpose of this part is uncertain, but it is known as the "Mort House." The nave consists of five bays; the capitals of the three westernmost are of a pleasing type, entwined with a chaplet of vine leaves and fruit. The nave has a modern roof, but the aisles still retain their original oak roofs, the plaster by which the framework was hidden having been removed in recent years, and the whole restored. These roofs are not of a very interesting type, and from an almost entire absence of mouldings, are extremely severe and heavy. On the wall of the south aisle are two interesting monuments of marble, both belonging to the Strude family, and dated 1698 and 1746 respectively. A small stairway still remains, which formerly led to the roof-loft, which has, unfortunately, been removed.

Melplash Court.

The carriages were now taken and a short drive brought the party to Melplash Court, a typical Jacobean manor-house, with two fine old elm avenues leading to what was doubtless the forecourt of the house, which lies in a slight hollow, surrounded by its barns, farm buildings, and an ancient circular dovecote, with stone slatted roof and quaint cupola, easily capable of accommodating 250 pigeons. Here the party took luncheon under the avenue, and afterwards saw the interior of the house. The large dining-hall is now used as a kitchen, and has an elaborate plaster coat of arms. The buttery screen still remains intact. The parlour contains a fine chimney-piece—removed from another part

of the house—with the arms of England, France, Scotland, and Ireland, and the initials of "Jacobus Rex." Adjoining the house on the back is a small building called the chapel, probably only a domestic one, if ever thus used.

Parnham House.

The next place visited was Parnham House, where the owner very courteously conducted the party over the old Manor House, many years ago the seat of "the right antient and worshipfull familie of Strodes." Here they flourished a knight's degree, showing considerable astuteness and much bettering their estates by a careful selection of the heiresses they took for wives. We may gather from a minute and curious worded survey of the estate drawn up by Sir John Strude in 1628, that the mansion was rebuilt and enlarged with "Hamden Ashlar" by one Robert Strude in the reign of Henry VI. Unfortunately the alterations carried out in the early part of the XIXth century rather spoil the character of the earlier work, but the present owner has done much to keep the original character of the building, the treasure of which provided much material for study. The hall has a Tudor screen, a fine Renaissance fireplace, and many splendid suits of armour. A small apartment on the ground floor contains a very fine specimen of a Tudor fireplace, with its massive oak cambered beam and carved tracery panels.

Crewkerne Church.

The party then had a long drive of some eight miles northward to the town of Crewkerne, with its church on a slight rise. Crewkerne Church is one of the great cross churches of the country. The west front has a fine late-decorated doorway with niches on either side surmounted by busts. The gable of the nave is flanked with octagonal turrets embattled with vestiges of small pinnacles. As in so many churches in the country the nave is of better work than the chancel, it is also very much loftier. On the south side is a very large porch, something similar to the south transept. A curious change was made when the porch had been converted into a transept, and the transept into a sort of porch. The windows in the nave are very wide, so that there are only three bays where there would have been probably more in a nave of the length. The extreme flatness of the transept windows is remarkable. The north transept is the most elaborate part of the church. There are indications of a vestry below the east window, but this building has been destroyed, the doorways alone remaining. At the southern east corner of the church, which formerly contained the figure of the patron saint, are indications still remain of an iron grille which protected the statue. The church contains examples of three distinct periods of Perpendicular work. To the earliest period belongs the whole of the chancel and much of the southern transept, the second period the whole of the nave, aisles, porch, and tower, together with some alterations to the south transept, the works probably extending over a considerable period during the reigns of Henry VII. and Henry VIII. The third period is shown in the north transept, together with a series of chapels between it and the chancel. In the porch is a fan vault and stoup and outside on the parapet a very interesting series of gargoyles. Those over and around the porch welcome the people with a hymn of praise, with mediæval harps, lyres, tambourines, and bagpipes. The tower has several curious features; the lower part was probably early work, though now completely cased in. Perpendicular masonry; at three of the corners the buttresses stand within the church. Abutting on the churchyard is the old grammar school founded by John de Combe in 1499. It forms a very interesting feature, and in the market square is an interesting mediæval house of the XIVth or XVth century. Crewkerne was the last item on the programme for the day, and the short space of time left the party admitted of only the most cursory examination. Train was then taken to Sherborne. The day had been of great interest, and though overcast the rain did not interrupt proceedings.

Clifton Maybank Manor.

Wednesday.—The climatic conditions for the third day's work of the tour were anything but agreeable, and in consequence a change had to be made in the programme, and instead of driving to Clifton Maybank as had been originally

ended, the breaks were sent on ahead, first the party followed to Yeovil Junction by train. Clifton Maybank was probably built by Sir John Horsey, whose name and family arms, with the date 1586, are in one of the Hall windows. A great part of the former noble mansion has been pulled down, but enough is still standing to show that it was once quite an important mansion. A remaining wing was built by the Horsey family early in the reign of Henry VII. This wing inherited it from the Maubanks; after nine years the property passed to the Harveys. Manuscript account, dated 1648, gives the following quaint description of the house and environs:—"The capital messuage consists of a faire yellowe freestone buildinge, partly of wood and partly three stories. . . . In the front of the house a square greene court and a square gatehouse with lodgings in it standing to the front of the house to the south. . . . Without the gatehouse paled in a large square pence, in which standeth a faire chappell; the south-east side of the greene court, towards the river, a large garden. Of the north-west side of the greene court is a large bowling greene, with fower mounted walks about it, all walled about with a battled wall, and set with all sorts of fruit; and out of it to the fields there are large walks under many call elmes orderly planted." According to Hatches, the gateway leading into the court ascribed to Inigo Jones, and was erected by Sir Ralph Horsey in the reign of James I. It was taken down in 1800 and transferred tointon St. George, by Lord Paulet. The front of the building was purchased by Mr. Phelps, and erected against the west front of Montacute House, where it now remains. In the western angle of the now remaining wing is a fine oriel window, on which are carved the three horses' heads of the Horsey family and two roses. The terrace surrounding the bowling green and garden may still be traced.

Brympton Church and Manor House.

From Clifton Maybank a drive of about four miles took the party to the green-turfed forecourt of Brympton Manor House, with its nicely-proportioned stone balustrade wall and gate piers. The mansion and Church of Brympton form quite a striking architectural group. A large and stately mansion, a house of humbler pretensions, and the parish church all lie close together, and all are worthy of attentive study. The church is small, and originally was of the Decorated style, without aisles or tower. The south transept has a beautiful geometrical window to the south and a foliated arch connecting it with the nave; the south door is foliated. But one Sydenham, a pious benefactor in the reign of Henry VII., founded a chantry for three priests. He built for their dwelling-place the house which still remains, on the north side of the chancel, and at the same time modified the church to adapt it to his purpose. He made an eastern addition to the north transept, and altered the appearance of the gable so as to give it the external appearance of an aisle, whilst internally there are two chapels. The roof-screen is of stone, quite an uncommon feature in a parish church, and in all probability dates from the XIVth century. There is a quaint bell-cot, with quite a distinctive charm of its own, on the western gable, and the graveyard contains several well-designed tombstones. The so-called chantry house, now used as a toolshed, is on the right-hand side of the entrance courtyard. It is an oblong perpendicular building of two stages, with an interesting and remarkable octagonal turret giving access to the upper chamber, which is very large, with a good open roof and some fine plaster ceilings of later date. On the south side of the larger room is a small doorway, which was the entrance to the garderobe. Taken as a whole, the building presents the common type of a mansion house of the XIVth or beginning of the XVth century.

After the larger mansion had been built by the Sydenhams, this old manor house appears to have fallen into neglect, but early in the XVIIIth century it became necessary to make use of it again as a place of residence. This may have been on account of the alterations then being made to the larger mansion. The north-west portion of the house retains its early character, and there is a fine display of oriels, turrets, chimneys, and open battlements. The central part containing the hall has been altered in Elizabethan times, but it retains its original basement and a curious kind of oriel. The south

front of the house retains its original walls, but early in the XVIIIth century, when the house was brought "up to date," a classic front was added and the house was generally reconstructed. Horace Walpole is responsible for the tradition that Inigo Jones was employed on this work, but it was actually carried out by his nephew John Webb. The mullions and transoms employed in the pedimented classic windows are very unusual at this period, when the Classic styles were fully launched on this country; the refinement of detail which Jones shows at Wilton House and Coleshill, both anterior to Brympton, are certainly lacking, and the whole work much more suggests the hand of Webb than of Inigo Jones.

On the garden, or south front of the house, is a broad terrace belonging to the early part of the XVIIIth century. It has a broad central flight of steps, and at either end two smaller flights arranged at right angles. The piers support urns of different designs, with the exception of one which carries a sundial with gnomons on the sides of a square die. The porch of the house has a date 1722, when it is supposed to have been brought from Clifton Maybank, when that house was destroyed. The rooms are large and lofty, and contain some good tapestry and excellent portraits by Lely. Sir S. Ponsonby Fane very kindly entertained the party to luncheon, and in the afternoon they drove to Newton Surmaville, an Elizabethan building and seat of the old family of Harbin.*

TRAMWAYS AND LIGHT RAILWAYS ON PUBLIC ROADS.

THE following is a copy of the letter which has been received by Mr. W. Rees Jeffreys, the Honorary Secretary of the Roads Improvement Association, Down-street, Piccadilly, W., from the Board of Trade with reference to the matters connected with tramways and light railways on public roads, and bridges over railways and canals, which formed the subject of the representations made by the deputation from the Association to the Board on July 18:—

"I am directed by the Board of Trade to refer to the deputation received by Sir H. Jekyll on the 18th instant from the Council of the Roads Improvement Association, on the subject of tramways and light railways on public roads.

"The Board have carefully considered the representations then put forward with regard to the questions of centre poles, width of roads, and bridges over railways and canals, and I am to reply as follows:—

"(1) *Centre Poles.*—The Board do not see their way to recommend total prohibition of the use of centre poles, as there might be cases of exceedingly wide roads where such poles might be the best arrangement or other cases where, for some reason, centre poles might be necessary.

"The Board feel, however, the force of the objections stated by the deputation, and will be prepared to enact in Tramway and Light Railway Orders that centre poles shall not be used without the express consent of the Board of Trade. They will also communicate with the Parliamentary authorities concerned in private bill legislation as to the desirability of such a provision. In this way promoters will be required to justify the use of such poles in each case as it arises.

"(2) *Width of Roads.*—The Board do not consider that it would be advisable to fix a statutory limit that might have the effect of prohibiting by severance urgently needed lines. In dealing with applications for tramway and light railway powers, the Board always keep in view the 9 ft. 6 in. space referred to in Section 9 of the Tramways Act, 1870 (a limit which would appear to be reasonable), and make provision to secure it wherever practicable. The representations made by the deputation on this point will, however, be borne in mind.

"(3) *Road Bridges over Railways and Canals.*—Most of what was urged by the deputation with regard to this matter would appear to be for the consideration of the Local Government Board and not of the Board of Trade, this department being only empowered to deal with appeals from owners of road locomotives who may feel aggrieved by restrictions placed on the use of bridges over railways by such locomotives, either by notice under the Locomotives Act 1861 or by law under the Locomotives Act 1878. With regard however to the request for

* To be concluded in our next.

legislation to enable a county council to require the owner of a bridge to maintain it at its original strength, I am to point out that section 65 of the Railways Clauses Consolidation Act 1845 provides a procedure under which either a road authority or any two householders in the locality interested may take steps to compel a railway company to repair their bridges."

BRITISH ARCHÆOLOGICAL ASSOCIATION CONGRESS AT BATH.

THE sixty-first Annual Congress of the Association was held at Bath, from the 8th to the 13th insts., that city not having previously been visited since 1856, when the meeting was held jointly at Bridgewater, the Congress removing to Bath for the latter part of the week's proceedings.

The Congress was opened on Monday, the 8th, at 3 o'clock p.m., at the Guildhall, where the members were heartily welcomed by the Mayor, Alderman Major C. H. Simpson, J.P., M.C., and the members of the Local Executive Committee. After the President of the Association, Mr. R. E. Leader, B.A., had duly acknowledged the cordial reception extended to the members of the Congress by the Mayor and Corporation and the Local Committee, the party proceeded, under the guidance of the Mayor, to view the Guildhall and Municipal buildings.

Bath Abbey Church.

The Abbey Church was next visited, where the members were met by the Rev. H. L. Maynard, in the absence of the Rector, the Rev. Prebendary Boyd, who gave some descriptions of the building and related its history. The bases and portions of the columns of the Norman church, which are carefully preserved beneath the flooring of the present church, were examined with great interest; they, together with others just outside the east wall of the church, appear to belong to the edifice erected by Bishop Robert about 1160, the successor of John de Villula, who purchased the city of Henry I. for five hundred pounds of silver, together with the Abbey, and rebuilt the latter from the foundations. The Norman church must have been of grand proportions, if, as is said, the present church occupies the site of the Norman nave only. The existing building was commenced in 1500 by Bishop Oliver King, and is one of the latest examples of Perpendicular work in the country. Although there are, here and there, features of beauty, the general effect is that of coarseness and lack of refinement, due mainly to the largeness of the mouldings and want of delicacy in the details. The curious carvings on the west front, of angels ascending and descending ladders, representative of the vision of the Holy Trinity, which Bishop Oliver King saw in a dream one night in 1499, attracted much attention; the figures, however, although well executed are now much defaced.

President's Address.

Under the guidance of the Rev. C. W. Shickle, M.A., and Mr. Sturge Cotterell, the local hon. secretaries, visits were made to the hot mineral baths, the museum, and the Royal Literary Institute, and to some of the historical houses in the near neighbourhood. The party then returned to the Empire Hotel for dinner, and, at 8.30 p.m., attended a conversation given by the Mayor at the Pump Room and Roman Promenade. During the evening the Mayor expressed the great pleasure it had given him to receive the members of the Association, and then called upon the President to deliver the inaugural address. After dealing with the subject of archaeology generally, and contrasting the apathy and indifference displayed in the past towards the preservation of national monuments and objects of antiquity, with the attitude towards such matters at the present day, Mr. Leader went on to say—"Much irreparable mischief had been perpetrated in the last sixty years, much grievous vandalism had been rampant; but infinitely more would have had to be regretted but for the influence exerted by the British Archaeological and kindred associations." "Archæological enthusiasm had been spread abroad and new investigators had been brought into the field. Antiquarian research was no longer the possession of the few. It was widespread. It had its schools, and its chairs, and its endowments at the universities. One even heard of some rudiments at least being taught in our elementary schools. There was good reason to hope that before long the University of London would grant a degree in

archæology." Referring to the visit that afternoon to the Abbey church, the President said—"He was sorry to think that even in Bath—cultured, refined, educated Bath—it had been possible to mutilate the piers of the Abbey church in order to put in iron supports for an organ of not the most beautiful construction. If such an eyesore could be found in Bath, how could they wonder at outrages being perpetrated elsewhere? The Association was successful in Sheffield last year in saving an ancient monument from possible destruction, and it would be very gratifying indeed to members of the Association if any words from the Presidential chair should help to remove from the Abbey the disfigurement he had mentioned." "Bath had been exceptional, and was still exceptional, not only for the antiquities it possessed, but for the men who had devoted a large part of their lives to the study and elucidation of its antiquities. They had almost a literature of their own relating to Bath archæology. In the *Transactions* of archæological and other societies were numerous papers and articles relating to the city and its neighbourhood, contributed by learned antiquaries, while scattered throughout English literature, in memoirs, gossiping diaries, and romances, in reminiscences and novels are pictures of the social and fashionable life of which the city was the centre. The pages of their own *Journal* were enriched by those papers contributed by Bath's learned antiquaries when the Association met here nearly fifty years ago. The only justification for his attempting to add a few crumbs to the rich repast was that some records which recently came into his hands had never been published, and though they told the students of Bath life nothing new, they were not perhaps without their value in helping them to realise the doings in the city of Bath at the time when Beau Nash had made himself the controller of its destinies, and was, he supposed, at the height of his power. The housekeepers' accounts of the Howards of Worksop Manor contained payments made in connexion with visits to Bath by Lady Mary Howard in 1732 or 1733. They showed what a costly and elaborate pilgrimage was involved when a noble family journeyed to take the waters in the fashionable city. Before starting, large provisions of gay garments had to be made—French gowns, lace, and the rest. Remembering the greater value of money at the period, very considerable expenditure was implied in such items as 91l. 2s. 9d. for 'linen, lace, etc.,' 42l. 10s. for lace for Lady Fanny Shirley, and 15l. for 'linen for Mr. Southcote.' There was paid 4l. 12s. 9d. for habermaking and trimmings. There were twelve horses on the road costing 6l. 7s. 10d. Eating on the road cost 15l. 9s. 8d. Servants' drink on the road 1l. 8s. Arrived at the destination the expenditure was on the scale of a large establishment." Mr. Leader remarked that there was a certain undesigned appropriateness in Bath being chosen for this year's Congress in succession to their visit to Sheffield last year. Utterly dissimilar as were the two cities in the part they played in the nation's life, there were certain points of contact between them of no little interest. The first book of importance printed in Sheffield was a substantial quarto on the nature of the mineral waters, written by a Sheffield physician, Dr. Thomas Short. The two cities had also a joint share in the careers of two remarkable men, John Arthur Roebuck and the Rev. James Hunter. Sheffield gave Mr. Hunter to Bath, and Bath gave Mr. Roebuck to Sheffield. Both came of Sheffield families, both married Bath ladies, and Mr. Roebuck, while paternally descended from Sheffield, was on his mother's side the great grandson of a man famous in the musical annals of Bath—Dr. Lindley, one of whose beautiful daughters married Richard Brinsley Sheridan. In concluding his address, the President commended the action of the Corporation for its care in indicating by memorial tablets the residences of celebrated men and women of the past; he also expressed his appreciation of the value of the very carefully prepared historic map of Bath, by Mr. Sturge Cottrell. The company then descended to the Roman baths, which were illuminated by electricity, where Mr. Alderman Moore gave an interesting description of their discovery.

Great Chalfield Church and Manor House.

A large party set out in carriages on Tuesday for Great Chalfield, Bradford-on-Avon, Farleigh Hungerford Castle, and Hinton Charterhouse. South Wraxhall Manor House,

a fine example of domestic architecture of the XVth century, was viewed from the road, time not allowing of a visit to it. On reaching Great Chalfield, the Parish Church was first visited, and was described by the Rev. C. W. Shickle, M.A., F.S.A. It consists of a nave, chancel, and side chapel, built in the XVth century, by Thomas Troponell, who obtained the manor by marriage into the Percy family. There is no tower, but a very picturesque corbelled-out bell turret and spire surmounts the western gable; it is of the decorated period. The church has been altered in many ways, and is in an unseemly condition, the walls being covered with yellow wash and the arches oak grained. The Manor House is of the XVth century, and immediately adjoins the little church, and constitutes, with the barns and farm buildings, of the time of Elizabeth, a most picturesque group of buildings, all surrounded by a water moat. In the Civil War the house was occupied by troops. Leaving Chalfield, the drive was resumed to Bradford-on-Avon, where, after luncheon, the Parish Church was visited, the party being received by the Vicar, the Rev. S. G. Collison, M.A., who gave a description of the edifice, which is of a very interesting character. It is dedicated to the Holy Trinity, and dates from about 1100. The chancel was lengthened in the XIVth century; it was originally only two-thirds of its present length. The tower at the west end is of late XVth century date, and has a groined and vaulted lower story. There are several interesting memorials in the church. On the south side of the chancel is a mutilated effigy of a cross-legged knight under a canopy, to a member of the Hall family, and on the north side a recessed tomb and effigy of a female wearing a wimple, considered to be Agnes Hall, who died in 1270. There are traces of a rood-screen, and there is a large and long hagioscope on the north side. There is also a brass to one Thomas Horton, who was a clothier in Bradford, and is thought to have built the tower.

The Saxon Church of Bradford-on-Avon.

The Saxon Church, dedicated to St. Lawrence, founded by St. Aldhelm, Abbot of Malmesbury and the first Bishop of Sherborne, in 705-709, was next visited, and was described by Mr. Chas. S. Adye. This very remarkable building has now been completely cleared of all the encumbrances which existed when the late Canon Jones first discovered its sacred character, and we now behold an almost unaltered Saxon church of the early VIIIth century. The chancel seat is still *in situ*, the arch itself of very narrow proportions, and over it are carved two large figures of angels, each wearing flowing robes and a nimbus, and probably at one time there was a crucifix between them. The exterior presents a remarkable appearance, the walls being arched and panelled, with arches supported on pilasters, with heads and bases of like character. From the Saxon church the party, under the guidance of Dr. Beidcoe, proceeded to view the exterior of the old Hall, which is a very fine example of domestic architecture of the early XVIIIth century. It was built by one of the Halls, who were wealthy clothiers in Bradford. This was the house, an exact reproduction of which was erected as the Royal Pavilion at the Paris Exhibition in 1900, as a typical example of an old English Manor House. The Tithe Barn, erected about the end of the XIVth century as a Tithe Barn for the Abbess of Shaftesbury, and the old Bridge were inspected, and the party resumed the carriages to Farleigh Hungerford Castle.

Farleigh Hungerford Castle.

Here, in the outer court, Mr. Patrick, hon. sec., read some notes on the history of the Castle, and pointed out the chief remaining features. In its original form the Castle comprised two courts, north and south, surrounded by a lofty encinte wall. On the south and west sides there was a moat; the other sides were protected by the steepness of the ground. The principal entrance was on the south-east side, where the remains of the gateway still exist, over the arch of which is the sickle, the crest of the Hungerfords, and higher up a shield of arms, with the initials E. H. In the outer or lower court are the remains of the guard-room, stables, etc. The chapel, which is the most interesting part of the Castle, is also situated in the outer court, on the right of the entrance gateway. It is well preserved, and

consists of a nave and chantry chapel on south side. The chapel is now used as a repository of local antiquities, and contains a large quantity of soldiers' armour of the XVIIth and XVIIIth centuries, banners, brig bits, stirrups, old keys, and some carved furniture. The walls of the eastern end rest some curious stencilled decoration, and a figure of a knight kneeling; while on one side of the altar is a delineation of St. George and the Dragon. There are several interesting monuments in the side or chantry chapel, including recumbent effigies, to various members of the Hungerford family, and in the vault beneath lie some six or seven corpses wrapped in lead, the outer wooden coffins have long since perished. At Hinton Charterhouse, the next halt place, Mr. E. T. D. Foxcroft met the party, and described the remains of the Carthusian Priory, one of the earliest of this order in England. Its probable date is considered to be 1232, as is related that the foundress, the Lady I. Countess of Salisbury, founded it and Abbey of Lacock both on the same day. From Hinton Charterhouse the party returned to Bath, which was reached about 6.30. An evening meeting was held in the drawing-room of the hotel at 8.30, and two papers were read.

Bath Stone.

The first was on "Bath Stone," by Mr. T. Sturge Cottrell, one of the local hon. secs. He said the Bath stone, which he was about to treat is quarried in the uplands south of Bath and north-west of Wilts, the quarries having been sunk in a vast oolite which American and Continental geologists call "jurassic" formation. From the time of the Romans down to the present day, thousands of tons have been extracted yearly from this bed, and the day is still distant when it will be exhausted. The mass structures at and around the hot mine springs, erected by the Romans two thousand years ago, are still in a state of preservation which testifies to their wisdom in the choice of the stone and to its excellence. It is quarried to the south of the city adjoining the "Fosseway," near to what is now Bloomfield Crescent. The votive altars in the museum at Bath are made of stone from the quarry on the "Fosseway," and were probably erected in the IIrd century. There were many Roman walls within the city boundary in which large blocks of the oolite stone could be found. Under the United Hospital a Roman wall exists in which there are several blocks, and on one may be seen the earliest mason's mark in Bath—viz., the letter "E." Ralph Allen and John Wood are the two most successful and conspicuous pioneers in the great industry of extracting splendid building stone from the oolite deposit. Ralph Allen came to Bath in 1715. Four years afterwards he established the system of bye and cross posts, which is the foundation of our present postal system. He was a shrewd and thorough business man, and, foreseeing the enormous possibilities when a supply of valuable building stone developed, decided to reopen the quarries at Coombe Down, and, subsequently, to devote the deposits on Hampton Down. He was succeeded by John Wood, the architect, whose genius is seen in the streets, squares, and crescents of the city. It was chiefly due to him that the efforts of Beau Nash to make the city a resort for pleasure seekers as well as invalids were crowned with a success unique in the history of the city. In the neighbourhood of Box Hill, both below and above the farm-tunnel constructed by Brunel, oolite has been extracted in large quantities as far back as Saxon times. "Hazelbury Quarre," or quarry, has been identified as the place whence stone was taken for building the Abbey of Malmesbury 1,100 years ago, and it is interesting to note that the stone for its restoration is being quarried from the same place.

Eighteenth Century Architecture of Bath.

Mr. Mowbray Green, A.R.I.B.A., next read a very interesting paper on "The XVIIIth Century Architecture of Bath," which was made more interesting to the audience by many admirable views exhibited by himself. Mr. Green prefaced his paper by exhibiting and explaining a map of the city as it was at the close of the XVIIIth century, when only measured about 1,200 ft. by 1,150 ft., and was surrounded by walls, of which there are traces remaining in the Upper Borough wall. In 1702 and 1703 Queen Anne and her

the Prince of Denmark, visited Bath, the city became more widely known, houses at that period were characterised by large windows with holocaust or wave designs round them. Of such was the Prince's Head, in Bond-street, with the initials "W. D.," and the date 1713 upon it. Old mullioned windows were then giving place to the new large sash windows. In 1716 the site of the new bowling green a row of houses was begun and called Green-street. It was one of the most picturesque parts of the town now remaining. John Wood was born in 1704, and in 1725 became interested in architecture. His first scheme was the building of a house for James Duke of Chandos. In 1727 he left London for Bath, where his men were busy, and in that year Chapel-street was begun. On the west side was the house in which Horace Walpole lived in 1765, the wing to the east was St. John's Hospital, founded by Wood in 1728. Queen-square was begun in 1728 on the eastern side. The whole was finished in seven years.

Including his paper, Mr. Green said that generally speaking the style of the XVIIIth century in Bath might be divided into three parts—that of the first twenty-five years, in which the houses had gabled roofs, and facades of large sash windows surrounded by bold mouldings, and the interiors were panelled in the rooms small and comfortable; the next twenty years when the work was modelled on classical Palladian manner with rusticated ornaments, two storied orders, a cornice and pediments with Mansard or curb roofs, while the exterior became spacious and dignified, and the interior work was brought into general use; and last twenty-five years, when the free manner of Robert Adam came into vogue and the new methods of the earlier times gave way to detailed and abundant decoration.

Wednesday, August 10.

The members of the Congress left the hotel carriage about ten o'clock for Box, Corsham, and Castle Combe. A brief halt was made at Box to view the church, which is in English, with features in the Decorated and Perpendicular styles, and a good perpendicular tower and spire at the intersection of nave and chancel. Leaving Box, Corsham was soon reached, passing on the way "Hazelbury Quarre," mentioned in Mr. Cotterell's paper, the village of Pickwick—the name of which is not an uncommon one in the neighbourhood of Bath.

Corsham Church.

Arrived at Corsham the party was met by the parish church by the Rev. E. A. S. M., M.A., who gave a brief description, then invited Mr. Patrick, hon. sec., to read some notes which Mr. C. H. Talbot sent him upon the church descriptive of its appearance before the restoration in 178. The nave arcade is Norman, and bears evidence of having been lengthened by one bay in the Norman period. The church had a central tower, removed at the restoration, when a new one was erected with a spire at the South side. The Tropæum Chapel on the north side of the chancel is of the XVth century, and has a very fine stone screen with fan vaulting under the loft: the cresting is modern. There is a piscina of good character in the south wall. The chapel contains a very fine table tomb with recumbent effigies of Thomas Trenchard and his wife Agnes, the builders of Great Chalfield Manor House. He is said to have died in 1490. There is also a second altar tomb to another member of the same family in the north east angle. The chancel exhibits no feature earlier than the XVth century, though some parts of the walls may be older. On the south side of the chancel there is a very fine chapel of the XVth century. It communicates with the chancel by two panelled arches. At first sight the east window and the easternmost window on the south side appear to have been blocked up, in the lower part, but they were so built, there being an ancient vestry inside lit by two small windows. This is said to have been the "Consistory," and as Corsham was formerly what is called a Peculiar, the vicar having had probate of wills, the records connected therewith were, no doubt, kept here. This room only rises to a slight height and there is a loft over it, open to the rest of the chapel and reached by a contemporary stair. This loft was, before the restoration, used as the vestry.

Lacock Abbey, etc.

Leaving Corsham the drive was continued to Lacock, where, at the church, the party was met by Mr. C. H. Talbot, M.A., who gave a description of the building, which is of the XIVth and XVth centuries, with a beautiful Lady Chapel, having vaulting and pendants of the date of about 1460. After luncheon at the Red Lion, the members proceeded to Lacock Abbey, where they were received by Mr. and Miss Talbot, who conducted them round the buildings of the monastery. Mr. Talbot described the buildings, which constitute the most perfect and unique example of a XIIIth-century monastic house remaining in England. The monastery was founded, as was remarked previously when speaking of Hinton Charterhouse, by Ela, Countess of Salisbury, on April 16, 1232, when Ela was in the forty-fifth year of her age, and the seventh of her widowhood. She founded the two monasteries in one day: Lacock, for canonesses of the Austin rule in the morning, and the Priory of Hinton in the afternoon, for Carthusians. The foundation of both monasteries, however, by charter had taken place some time previously. Eight years after the foundation the Countess took the veil and became abbess of her own establishment, which she ruled for some twenty years, when she retired, appointing Beatrice of Kent abbess in her stead on December 31, 1250. Five years later she died, aged seventy-four, and was buried in the choir of the church. At the dissolution the Abbey church was destroyed, but the cloisters, of the time of Henry VI., together with the refectory, chapter-house, sacristy, and other of the monastic buildings remain, and form a most valuable and interesting example of a conventual establishment. Leaving the monastic buildings, the party, led by Mr. Talbot, proceeded through the gardens to see the "Nuns' Cauldron," which is now raised on a pedestal. It holds about sixty-seven gallons, and bears an inscription on the outside as follows:—"I was molten or made by Peter Waghevens, of Mechlin, in the year of our Lord 1500. Praise to God and glory to Christ." Passing into the mansion house, the alterations made in the Abbey buildings to fit them for private residence by Sir W. Sharrington were pointed out by Mr. Talbot. In a long stone gallery, part of Sir W. Sharrington's work of adaptation, there is a very fine Renaissance chimney-piece, and here are preserved many priceless works of art. At the south-east corner of the house is an octagonal tower, also Sir W. Sharrington's work, which contains three rooms, one over the other. The lower two have vaulted ceilings, that on the first floor, known as the Monument Room, having a constructional fan vault but no fan tracery. It was originally intended to be painted, but this was never executed. In this room and the one over it are two remarkable tables of stone richly carved in the best early Renaissance style. The visitors were shown by Mr. Talbot, in the Library the Great Charter of the Abbey granted by Henry III. in 1225, once belonging to Ela, the foundress. Owing to the interest of the visit to Lacock, and time having slipped away, it was decided to abandon the proposed visit to Castle Combe and drive direct to Bath, which was reached about 6.45. At the evening meeting a paper was read by the Rev. Dr. Astley, in the absence of the author, Mr. Giheme Sieveking, upon "The Rise of the Woolen Industry."

West of England Roof-Screens.

A paper was also read on "West of England Roof-Screens," illustrated by lantern views, by Mr. F. Bligh Bond, F.R.I.B.A. Mr. Bond explained that the English Church from the earliest times had scrupulously preserved the division between nave and chancel. In the West of England, however, they found no true screen-work until the XIVth century, and of that period there was but very little extant. The reason was that in the XVth century so many churches were rebuilt, when almost all the old screen-work was swept away to make room for the work of the latter date. Amongst the many beautiful screens shown was that at Nunney Church, near Frome. A few years ago the Somerset Archaeological Society visited the church, but found the screen had been removed. It was found in a furniture dealer's shop awaiting sale, but, a strong protest by the Society resulted in its restitution to the church. Most of the screens in this part of the country are of wood, very few being of stone. Some eighty or ninety views illustrated the paper.

Bitton Church.

Thursday.—Rain set in in the early morning and was falling fast when the members of the Congress set out, about 10 o'clock, in closed carriages for Bitton, Syston, Pucklechurch, and Dyrham. Fortunately on reaching Bitton about 11 o'clock the weather cleared, and the afterpart of the day was very pleasant. At Bitton the Rev. Canon E. T. Ellacombe, M.A., received the party, and gave an interesting account of the church and the Manor. At the period of the survey in 1086 the Manor belonged to a Saxon Thane named Duns, who, previously to the Conquest, held this and other manors in Stoke, Rockhampton, and Brimsfield. He was, however, obliged to give them up to William. The church of Bitton held one hide of land in the parish and a prebendal stall in Salisbury Cathedral. The church, dedicated to St. Mary, consists of a nave, chancel, and western tower, with porch and north aisle. There appear to be some remains of a pre-conquest church built into the north wall near the east end. The nave is very long and of early XIth century date, with north and south doors of the same period. The chancel and west tower are of the XIVth century, 1370 to 1380. The Pope granted thirty days' indulgence to every one subscribing towards the building of the tower. On the north side is a chantry dedicated to St. Catherine, the consecration deed of which is dated 1299. Over the chancel arch on the east side are indications of an early rood. There are some good monuments.

Churches of Syston and Pucklechurch.

A drive of about three-quarters of an hour brought the party to Syston, where the church, dedicated to St. Anne, was visited. It is a small church with a Norman nave, an early English chancel and a western tower. The south doorway is particularly interesting and is richly carved. It is of the XIIth century, having a tympanum on which there is carved the tree of life, with mouldings of the cable, zigzag, and circle patterns. The capitals of the shafts have fluted ornament. A leaden font of transition Norman design, bearing figures of Apostles, alternately with scroll-work, beneath semi-circular arches and richly-ornamented, is a feature of great interest. Syston Court was next visited, by the kind permission of the owner, Mr. J. E. Rawlings. It is a Tudor House, said to have been built by a member of the Dennis family. It closely adjoins the church.

The drive was then resumed to Pucklechurch for luncheon, after which the Parish Church was inspected. The Rev. S. G. Gilham, M.A., gave a description of the building. Mr. Patrick, hon. sec., also read some notes on the architecture and monuments. Professor J. P. Hamelin, who attended the Congress as a delegate of the Société D'Archéologie de Bruxelles, drew some interesting comparisons between the flowing lines of the late decorated tracery of the windows and tombs in the north aisle, and the flamboyant style of the continent, and considered that French influence was exhibited in these beautiful monuments.

Dyrham Church and House.

From Pucklechurch the drive was continued to Dyrham, where, at the church, the Rector, the Rev. W. T. Blathwayt, M.A., received the members, and his son, the Rev. W. E. Blathwayt, read a short paper on its history. Dyrham is celebrated in English history for the great battle fought there in 577, by Ceawlin and Guthune, in which they completely defeated the Britons and captured Gloucester, Cirencester, and Bath. The church is dedicated to St. Peter, and was erected in the XIIIth century, but was largely added to during the XIVth century. Later a chantry chapel was added for a Guild, founded in 1520 by Sir William Dennis and his wife Anne. There is a life-size splendid brass on the floor of the chapel to the memory of Sir Morys Russell and his wife Isabel; it is a well-known example. The pulpit is a good elaborate sounding-board work, and has an elaborate party proceeded to Dyrham Park, the mansion closely adjoining the church. The house is of two dates, Tudor and late XVIIth century. It was the home of the Denrises, but was much enlarged by William Blathwayt, who was Secretary of State to William III. It was completed in 1698. The house contains a fine collection of paintings, mostly of the old Dutch school, Dutch picture-books, and old Delft pottery.

Leaving Dyrham about 5.45, Bath was reached about 7 o'clock.

The Saxon Church at Bradford-on-Avon.

After dinner the evening meeting was held in the drawing-room, when the Rev. Dr. A. J. D. Astley read a paper upon "The Saxon Church at Bradford-on-Avon." As the members had spent considerable time in the examination of the building on Tuesday, Dr. Astley omitted the actual description of the church, and confined himself to dealing with the controversial question whether the present building is the original Saxon Church of the VIIIth century, or whether it is a restoration of that building dating from 950 to 1000. He was in favour of the latter theory, and Mr. Wigfull, of Sheffield, was inclined to the same opinion. Dr. Birch, however, was emphatically of the contrary opinion. Mr. Patrick also was disposed to agree with the earlier theory, but disclaimed any special study of the subject.

Friday, August 12.

This morning the members of the Congress had to make an early start, leaving Bath from the Midland Station at 8.55, for Glastonbury and Wells. Arriving at the former place, after nearly two hours' travelling, they proceeded, under the guidance of the Rev. Prebendary Grant, M.A., to inspect the ruins of the famous Abbey, the Abbot's kitchen, the Abbey Barn, and the celebrated Museum.

Glastonbury Abbey.

At the Abbey, Prebendary Grant gave a history of the foundation of the Benedictine Monastery, and of the earlier buildings which occupied the site of the beautiful Lady Chapel, and described the meaning of the carvings on the north and south porches. Mr. Patrick, hon. sec., then described the plan, and pointed out the architectural features of the remains of the Abbey, and explained the construction of the western Galilee in the XIIIth century, by which the Lady Chapel, which originally was quite an isolated building, occupying the site upon which the earliest wicker church was erected, was united to the Abbey church, the latter being approached by a broad flight of steps from the lower level of the Lady Chapel. Glastonbury Abbey is so well known, and has been illustrated in the "Builder, Abbey Series," that further description is unnecessary here. A visit was subsequently paid to the well-appointed Museum, where the relics discovered in the lake village were fully described by Prebendary Grant. After luncheon, carriages were taken for Wells, and the Cathedral, Bishop's Palace, Vear's Close, etc., were visited. Indisposition unfortunately prevented the Rev. Canon Church from meeting the members and describing the Cathedral, as had been hoped for and arranged, to the great regret of the meeting. A smart drive had to be made to Masbury Station to catch the 5.8 train to Bath. In the evening, at 8.30, the Rev. C. W. Shickle, M.A., F.S.A., the President of the Bath Natural History and Antiquarian Field Club, gave a reception at the Art Gallery in honour of the Association, which was largely attended. In the course of the evening Mr. Shickle read a paper dealing with the "City Chamberlain's Accounts." He had gone very thoroughly into the investigation of the ancient documents, consisting of over 100 rolls, some of which were very difficult to decipher. They related to almost everything which could be thought of in connexion with the city, and covered the period from 1569 to 1725—a long and important period of English history. Mr. Shickle quoted numerous extracts from the accounts, many very curious, and mentioned that he intended to send a copy to the British Museum. Mr. Sydenham also read a paper on the "Hot Springs of Bath." In the library were exhibited by the Town Clerk some of the more interesting and valuable of the City Charters, which were described and commented upon by Dr. W. de Gray Birch, F.S.A., Hon. Treasurer of the Association.

Saturday, August 13.

It was intended to have completed the week's programme by a morning drive to some of the antiquities in the suburbs of Bath to-day, but, as so many members were leaving for London and other places, the excursion was abandoned, and the closing meeting was held in the drawing-room of the hotel, when votes of thanks to the Mayor and Corporation and the local hon. secs., and those who had assisted to make the Congress successful, were passed with acclamation, and the meeting separated.

Illustrations.

ST. GEORGES DE BOSCHERVILLE.

ABOUT eight miles west of Rouen by road, on a peninsula formed by bonds of the Seine, and rather more than a mile from the river, is the Abbey of St. Georges de Boscherville, now consisting of little more than the church and chapter-house. The village church is dedicated to St. Martin de Boscherville, and may have been founded by some Frankish Balcher or Baucher on his *villa* or estate. The abbey, however, grew out of a little chapel dedicated to St. George, and was founded by Radulphus or Raoul de Tancarville, the Grand Chamberlain of William the Bastard. The charter of foundation cites William as Duke of Normandy, and also mentions Matilda, which would place it after 1053, when he married Matilda, and before 1066, when he became King of England. The canons, however, were already in possession when the deed was drawn up; and the building of their monastery, therefore, may have begun as early as 1050, or thereabouts. At first the abbey church was served by Augustinian canons; but these were replaced by Benedictine monks in 1114, as happened in many churches both in Normandy and England about this period. Till the extinction of that great family in 1305, the abbey was the special care of the Tancarvilles, receiving from them large endowments; near its high altar all, or nearly all of them were buried. The estates of the Tancarvilles passed to the Meluns; then to the Harcourts; then to the Orléans-Louguevilles; all of whom kept up the intimate relation between the estates and the abbey. So that, though a great abbey church, it was, like our own Tewkesbury abbey, to a large extent always a family chapel. The number of monks seems at no time to have been very large; the establishment was by no means on the scale of the neighbouring abbeys of St. Wandrille, Jumièges, and St. Ouen, Rouen. In the XIIIth century there were only twenty monks; in the XIVth century there were from ten to fifteen; in the middle of the XVth century there were but eight; in 1790 there were but seven. Outside Normandy St. Georges possessed three priories or manors, Avesbury, Winterborne, and Weston or Edwiston, all in England. In 1390 the abbey sold the only one left, Edwiston, to the priory of St. Anne of Coventry for 100 gold florins; alien priories in England were a dangerous form of investment in those days. In Normandy the abbey had eight priories; it also had the patronage of thirty churches. Though never among the richest of the abbeys, it steadily gained in wealth, till under Francis the First there came in the system of appointing abbots *in commendam*, hardly ever Benedictines, but secular priests, very often non-resident. Among these may be mentioned two of the Cardinals d'Este, one Archbishop of Lyons, the other of Auch. The result was disastrous to the abbey; at the beginning of the XVIIIth century the abbot appropriated from 20,000 to 25,000 livres of its income, leaving only 10,000 livres to the abbey. At the Revolution the abbey had an income of over 20,000 livres; the abbot had 40,000. Like most of France, too, the abbey suffered greatly from the religious wars. In 1562 it was sacked by the Huguenots, and all the accessories of worship were destroyed. This was repeated in 1570. In 1590 the abbot's hall was burnt down, and much damage was done also to the church, which remained unrestored for many years. The XVIIIth century was marked by a great reform of the Benedictine Order throughout France; at St. Georges the claustral buildings, with the exception of the chapter-house, seem to have been wholly rebuilt, and the damage to the church to have been made good in this and the following century; to this work belongs the considerable repairs on the south side of the nave done in the style of the XVIIIth century. At the Revolution the monastery and the church were offered separately for sale. The village, which originally had centred round the old parish church of St. Martin, had long ago drifted away to the neighbourhood of the abbey; the parish church was out of repair; so the abbey church was bought for 10,000 francs to serve as parish church, which it does to this day, after the manner of our Benedictine abbey churches of Tewkesbury, Sherborne, and Selby. In 1822 the Norman archaeologists succeeded in saving the chapter-house also, with the aid of a grant

of 3,000 francs from the Ministry of the Interior.

St. Georges de Boscherville is one of the largest Romanesque churches in Upper Normandy, the best preserved, and the least altered. The chapter-house was built by Abbot Victor, probably in the last quarter of the XIIIth century; the high vaults of the nave and transepts, and the upper parts of the western towers with their stone spires, were built about the middle of the XIIIth century, the central spire of wood is a later work, damage done to the north side of the nave was repaired late in the XIVth or early in the following century; and damage to the south side was repaired in the XVth century. Otherwise the church is wholly Romanesque. The result is that it presents homogeneity and uniformity of design which, exceedingly striking. From eastern aspect the western front there is hardly the slightest change in design; the whole church would seem to have been built without break or interruption and with extreme rapidity. Internal measurements of the church are 66 metres 30 long; with a transept 31 metres 44 long; the nave is 38 x 13 metres 31 long, 8 metres 20 broad, and 15 metres 77 high; the walls are 1 mètre 75 thick. On plan it is an aisled nave of eight bays; transepts of 6 bays, each with a semicircular eastern apse; the aisled choir contains eastward in a semicircular apse, which externally is rectangular, as at St. Nicholas, Caen, Lessay, St. Gabriel, Bernay, Longueville, Roncesay, and Durham. East of the two bays of the choir is a narrow bay covered with a barrel vault; east of this again is a semicircular apse of five bays covered with a ribbed semi-dome. Each transept has a return gallery; that of the north transept is shown in the illustration. These return galleries occurred also at St. Stephen at St. Nicholas, Caen, Jumièges, Corisy, St. Taurin, Evreux, St. Serain, Toulon, Preuil, Sen-Claire, Winchester, and originally at St. Ouen, Rouen and Ely. In Gothic work this occurred at Nôtre Dame, Eu, Laon, and Lincoln. The vaults belong to two periods. Those contemporaneous with the building of the church are those of the aisles of the nave and choir, and below the transeptal galleries; also the high vaults of the choir; all the above are groined, i.e., unribbed; to the same work belongs the barrel vault east of the choir, and probably the ribbed semi-domes of the main apse, and of the transeptal apses. It is true that in the main apse the semi-dome is entirely independent of its ribs, which spring from short, stout columns between which and the wall there is a thoroughfare passage round the apse. But the moulding of these ribs are to be paralleled in parts of the church which are undoubtedly Romanesque. To the second period belong the high vaults of the nave and transepts and crossing. These are quadripartite, except that the crossing, like that of Amiens, which can be but little earlier in date, has also ridge-ribs; and that one supplementary rib occurs above the transeptal galleries, and two in the most western bay of the nave.

There is a single central doorway of great beauty in the west front; and smaller doorway in the most eastern and most western bays of the nave, both on the north and south sides. The cloister was north of the nave. There was no passage or slype between the north transept and the chapter-house. The latter is oblong; most monastic chapter-houses were divided into two or three naves by a row or rows of pillars; but that of St. Georges had no pillars. This seems to be a peculiarity of the Romanesque of Normandy, e.g., Jumièges, and Ronen Cathedral. The chapter-house is an exquisite example of the Gothic of Normandy as contrasted with that of the Ile de France.

SKETCHES WITH THE ARCHITECTURAL ASSOCIATION EXCURSION.

AS USUAL, we illustrate by sketches some of those places of interest which the Architectural Association excursion are visiting this week. Some of them are referred to in another column dealing with the excursion. An account of the last days of the excursion and other sketches of places visited will appear in our issue next week.

CONGREGATIONAL CHURCH, EPSOM.—In our last issue, under the heading "General Building News," we stated that the architects of the New Congregational Church at Epsom were Messrs. Gregg and Stapley. It should have been "Gregg and Stapley."

STANDARDS OF PURITY FOR SEWAGE EFFLUENTS.*

"At first sight it does not appear to be so very difficult to decide whether a certain sewage or effluent is in such condition that it might safely be let into the river. What we aim at is, that the beds and banks of our rivers are kept free from foul sediments; that the water of our public water courses does not become turbid, discoloured, and foul, and that such water sustains fish life.

In some cases other requirements must be enforced; for instance, sometimes it is essential to maintain the river water in a condition suitable for utilisation for domestic supply; sometimes factories discharge only their refuse water into the river, others utilise the river water for manufacturing purposes, and require that not too much condenser or other hot waste water is discharged into the river, and also that the river water remains soft, and is not spoiled for their purposes by admixture with injurious chemicals.

It is not necessary in all cases to fulfil every one of the requirements. Often only one or two of them must be considered. The greatest difficulty to our question arises from the variability of the proportion between the quantity of sewage to that of river water, into which the former can be discharged. In one case we can let crude sewage into a stream without having to fear that the slightest detectable alteration of the river water will result. In other cases offensive changes of the river water can only be avoided by purifying the sewage very thoroughly before discharging it into the river. These facts show the hopelessness of all endeavours to find one standard which would suffice for all cases.

As long as we do not drop the idea that the admissibility of crude sewage or effluents into rivers might be judged by standards based exclusively on the chemical or physical nature of the sewage or effluent, we can never hope to come to decisions that are just and rational. The only possibility in this line would, according to my idea, be to succeed in finding a series of standards permitting us to individualise and to arrange matters so as to allow us easily to determine the standards best adapted to the local conditions of every single case. In fact, things will never work satisfactorily if bureaucrats are allowed rigidly to enforce one single or set of standards for all cases. We shall therefore be the expert in every single case. It would, indeed, be a mistake to search for a reaction that would enable us in one and all cases to affirm whether a certain sewage or effluent is fit to be discharged into the river or not. Such a reaction indicating whether the effluents are sufficiently free from albuminous substances, or from certain products formed in the decomposition of proteins, could come in question in such case only where a thorough purification of sewage seems necessary.

It is not my intention to formulate definite propositions as to how many standards or classes of requirements would seem necessary, and which requirements ought to be made for the different standards or classes. I shall limit myself to the discussion of one question of fundamental importance, namely—Does that we know of sewage analysis to-day put us in a position to judge from the results of chemical investigation whether a certain sewage or effluent tends to undergo putrefaction or not? Of course there are cases where the substance does not so much consist in putrefaction, but where the waste water contains organic poisonous substances or chemicals influencing detrimentally the physical qualities of the water, or where coal dust or other mining refuse destroys the appearance of the rivers, but such difficulties only arise in certain relatively small districts. Town sewage, or suchactory waste waters that contain putrescible matter, are of far greater general importance. At any rate, I shall have to limit myself to a discussion of these to-day. Therefore, I modify my question as follows:—

Are we enabled to judge by the results of chemical analysis whether a certain sewage effluent tends to putrefy?

To this end several methods have been suggested, all of which were intended to give formation as to the amount of putrescible substances contained in a certain sample, or a long time extensive use has been made

of the oxygen absorption test. This method is founded on the observation that organic substances have a great affinity to oxygen. Here, in Britain, the albuminoid ammonia test is largely used. In Germany the determination of organic nitrogen is preferred, as it is believed to give more accurate results than the albuminoid test. Lately J. König has recommended an improved method for the determination of organic carbon, which is said to indicate also those putrescible organic substances which, being more resistant to decomposition, are not indicated by the methods mentioned before.

Still, not one of these methods can be expected to give perfectly accurate results. For the requirements of ordinary practice such exactness cannot be expected, nor is it necessary, since sewage—either domestic sewage or trade refuse—contains the most heterogeneous substances in quantities varying from minute to minute. The question, therefore, seems justified, whether the more simple methods would not suffice in common practice as well as the more complicated ones. Further on I hope to convince you that this really is the case.

Not long ago it was quite common to ignite the solid matter, and to reckon the loss of ignition as organic matter. Even nowadays we find reports based on this method of the determination of organic matter. Evidently, we cannot expect to get reliable results with regard to the amount of organic matter contained in sewage by this method. By ignition, ammonium salts, nitrites, nitrates, and sulphates, and eventually also alkaline chlorides, are decomposed and evaporated. The loss of weight caused by the breaking up of such inorganic matter figures as organic substances. By adding carbonate of ammonia or water containing carbonic acid these losses cannot be exactly compensated. By determining the loss of ignition, therefore, satisfactory results with regard to the amount of organic substances in sewage are not obtainable. Much less can we by this method specify the different organic substances or determine their relative quantities. Nevertheless, even this method is, as we shall see further on, not entirely useless.

The determination of oxygen absorbed is also incorrect, in so far as not only organic but also certain inorganic matter is indicated by this method. Permanganate of potash is discoloured by ferrous salts, nitrites, sulphites, sulphides, ammonia, etc. Furthermore, some organic bodies are very easily oxidised, others only after exposure to boiling point for several hours. On the other hand, the organic substances do not absorb oxygen in proportion to their molecular weight. More especially some substances most characteristic of sewage, such as uric acid, absorb very little oxygen in proportion to their weight. Lastly, the determination of oxygen absorbed is not made uniformly, but in very different ways.

It is plainly evident, therefore, that such results are not comparable. It is also clear that we cannot find out by the method in question any details as to the nature and relative quantities of the different organic substances present. Notwithstanding all these deficiencies, I shall, later on, have to attribute quite an importance to the determination of the oxygen absorbed.

The determination of albuminoid ammonia is a British method, and is, as above-mentioned, used mostly in Britain. Its chief recommendation is that by this method only the proportion of organic substances containing nitrogen is indicated, and to such substances the objectionable putrefaction is above attributed. I cannot quite agree with this last opinion. It will suffice to mention the foul odour of sulphuretted hydrogen and of some carburetted gases, as well as of some fatty acids, etc., which are formed in decomposing sewage, in order to justify my opinion that we ought not to keep in view only the determination of nitrogenous organic matter. On the other hand, the nitrogenous organic substances evolve albuminoid ammonia in varying quantities. We cannot, therefore, draw any conclusions by the results thus obtained as to the nature and relative quantities of nitrogenous organic substances.

The determination of albuminoid ammonia is also made in different ways. Some boil after addition of magnesia in order to first remove free and saline ammonia. Thus part of the albuminoid ammonia is lost. But this loss may, as you know, be avoided by making a separate determination of the free and saline

ammonia. Albuminoid ammonia is always present in very minute and variable quantities in sewage and sewage effluents. The slightest experimental error can, therefore, easily lead to differences of 100 per cent. or more in the calculation of the results.

For these and other reasons this method has not found favour in German laboratories. In Germany the determination of organic nitrogen has, as mentioned before, been preferred within recent years. This determination of organic nitrogen has also its drawbacks. By this method, too, those substances that escape by boiling with magnesia are counted as free or saline ammonia, although the free and saline ammonia figures are far higher when determined by distillation than when measured by Armstrong's colorimetric method without distillation. Moreover, this determination again only indicates nitrogenous substances, but no other putrescible matter, and, lastly, the results obtained represent only minute quantities. Aside therefrom, this really complicated method, which requires a great deal of time, leads to reliable results only in the hands of very careful chemists, especially experienced in this line of investigation. According to my idea, the determination of J. König is far more useful than any of the methods mentioned above. Still, even this method does not permit us to judge what kinds of organic bodies are present and in what proportions. But König's method requires less time, is sufficiently simple, and, what is most important, the results are determined by means of balances.

After these explanatory statements I will now return to my question, whether by chemical analysis we are enabled to decide with certainty whether a given sample of sewage or effluent is liable to putrefy or not. According to my view this question can be answered in the affirmative in all those cases where we have to do with samples containing very small quantities of organic substances, as indicated by one of the above-mentioned methods. If, for instance, in a certain sewage or effluent we find a loss of ignition amounting to not more than two or three grains per gallon, or if we obtain an oxygen absorbed figure as indicated by Kubel's method of not more than about one or two grains per gallon, or by the four hours' test an absorption of oxygen amounting to not more than one grain per gallon, or albuminoid ammonia equivalent to 0.1 grains per gallon, or organic nitrogen of approximately 0.2 grains per gallon, or organic carbon about one grain per gallon, we can almost positively say that these samples will not undergo putrefaction. Are we now to understand that every sewage or effluent that contains a quantity of organic substances more or less exceeding these figures is liable to putrefaction?

The ingenuity and infinite pains which our leading men have brought to bear on the improvement, and on raising the accuracy of the methods in question, will, according to my idea, have brought us to a satisfactory end only if from the absolute figures obtained we are enabled to say with certainty whether any given sewage or effluent is liable to undergo putrefaction or not. I am sorry to say that expectations in this direction are not justified.

In England standards have been published by some Rivers Boards according to which sewage effluents are considered bad if they contain more than 0.1 or 0.112 grains per gallon of albuminoid ammonia, or if they absorb more than 1 grain per gallon of oxygen as determined by the four hours' test.

We may safely assume that these committees have laid down such requirements because they are convinced that any sewage or effluent in which albuminoid ammonia or oxygen absorption exceeds those figures will tend to undergo putrefaction. Now it is a fact that from very concentrated sewage we are able by means of biological treatment to produce an effluent clear, limpid, colourless, and free from odour, which will under no circumstances undergo putrefaction, yet which will give far higher albuminoid ammonia figures; for instance, 0.3 or even more grains per gallon of albuminoid ammonia, or will absorb, as determined by the four hours' test, far more oxygen than is allowed by the above-mentioned standards.

I have brought with me a sample of effluent which absorbs 6.8 grains of oxygen per gallon determined by the four hours' test, that is to say, about the same amount of oxygen absorbed by the crude sewage of Manchester not freed from suspended matter by filtration. Moreover,

* Part of a paper by Prof. Dr. Dunbar (Hamburg) read before the recent Congress of the Sanitary Institute Glasgow.

you here see samples in which 0.83 or even 1.37 grains per gallon of albuminoid ammonia have been determined. That means to say several times the amount of these substances allowed by the standards in question. These samples are so clear, colourless, entirely free from stench and non-putrescible, that the commissioners would doubtless be very pleased if all effluents let into their rivers were equally good.

How are we to understand these singular facts? According to my view, it would be a mistake to think that by biological sewage purification only about three-quarters of the soluble organic matters present are entirely removed from the sewage, the remainder staying unaltered in the effluent. We have good reasons to believe that by biological treatment the entire organic matter present in crude sewage is retained and decomposed. If, therefore, a crude sewage contains, say, about 3 grains per gallon of organic nitrogen, we must not believe that about one-third of the organic substances containing nitrogen had passed the plant unaltered; but we may suppose that, with the exception of those substances unusually resistant to decomposition, and, therefore, not liable to putrefaction, all of the organic matter has been decomposed, and that those substances giving the reaction of 1 grain per gallon of organic nitrogen are entirely different substances not liable to undergo putrefaction.

The effluents from biological plants always contain substances which determined by the methods spoken of are called albuminoid ammonia, organic nitrogen, organic carbon, etc. If, for instance, the crude sewage freed from suspended matter contained 6 grains per gallon of a certain substance, we find in the effluent from a biological plant in good working order about 1.5 to 2 grains per gallon; if the crude sewage contained 4 grains per gallon of the same substance, we find in the effluent 1 to 1.5 grains per gallon, and so on in proportion to the concentration of the crude sewage.

If we make all the determinations spoken of in one effluent we generally find the percentage of reduction to be the same, or about the same, in all the different determinations. This observation was made so often and on such different sorts of sewage and effluents that Dr. Thumma and I a few years ago came to the conclusion that any one of the methods described would give almost equally reliable results as the other methods, and that, therefore, it would in general practice suffice to use the simpler methods only, as, for instance, the determination of oxygen absorbed.

But the substances indicated by our methods in the effluents are not identical with the putrescible matter contained in the organic crude sewage. These subjects certainly contain nitrogen and carbon, but they are products of decomposition fully oxidised and non-putrescible. Therefore it ought to be of very little consequence whether the effluent contains 0.1 or 0.2 grains per gallon, or even several times as much as these substances as indicated by the albuminoid ammonia test, or whether we find 1 or 2 grains per gallon of oxygen absorbed or even much larger amounts, as long as these substances are non-putrescible and not harmful to fish, even if they are placed into the concentrated, not diluted effluents. Such effluents should be considered as harmless, and we ought not, therefore, to object to their being discharged into our rivers.

In a town with a relatively low water consumption we find comparatively concentrated sewage, and, therefore, in such case the absolute quantities of organic substances contained in a gallon of effluent will be higher than in the case of a town showing a larger consumption of water, and yet the effluent in the former case may be equally fit to be discharged into the river.

This sample, for instance, is an effluent derived from town sewage treated biologically. Ought this effluent, looking nearly as clear and limpid as pure well water and being absolutely free from any offensive smell, and entirely non-putrescible, to be considered bad, and not fit to be discharged into a river because it absorbs 2.18 grains of oxygen per gallon determined by the four hours' test?

We come, as I have explained, to similar results by the determination of albuminoid ammonia and of organic carbon. An excellent effluent may occasionally give figures by far exceeding those of a turbid, discoloured, crude sewage tending to undergo putrefaction.

Every attempt to formulate standards, based on absolute figures, must appear hopeless in the face of these results which I have just laid before you, and which are only extracts from a great number of analyses at my disposal all tending to prove the same.

Although I admit that the standards mentioned before may suffice in the case of certain cities, it would, to my idea, be a grievous mistake to generalise them. In many cases the effluents will just about not putrefy if they contain 0.1 grains per gallon of albuminoid ammonia, or if they absorb 1 grain of oxygen per gallon. But in many cases we can only get satisfactory information as to the putrescibility of the effluents if we also know the nature of the crude sewage.

With a moderate degree of certainty we can by the appearance and smell of an effluent tell whether it will putrefy or not. But it must be admitted that this physical method of examination is not sufficient for all cases, and that even the judgment of a well-practised observer may be impaired by a cold or other indispositions.

The effluents when kept in a room in firmly-stoppered bottles for several days will, if not thoroughly purified, develop a smell of sulphuretted hydrogen, and this can hardly escape our sense of smell, even in quantities far too small to be detected by chemical analysis. This method of examination, although leaving nothing to be desired as to its simplicity and reliability, is yet one of those subjective ones which we want to avoid, and, besides that, it does not allow us to form a judgment before the lapse of several days. Now, in nearly all cases it is most desirable that the efficiency of a purifying plant can be ascertained at any time and at once.

A few years ago I observed when examining, together with Dr. Thumma, the effluents of biological purification works, that when either the oxygen absorption—determined by Kubel's method—or the loss on ignition, or the organic nitrogen showed a reduction of at least 60-65 per cent. in the effluent as compared with the crude sewage freed from suspended matter, these effluents were not putrescible. Since then I have made similar observations in regard to the reduction of organic carbon. I am not going to advance the statement that this ratio holds good for every sewage and every biological system. Still, we have as yet regularly found it confirmed in every domestic and town sewage as well as in different trade wastes. I am, therefore, inclined to hope that whereas absolute figures appear to be useless for our purpose, the percentage ratio between an effluent and the corresponding crude sewage may enable us directly to judge as to the putrescibility of that effluent. Fortunately we can in this case do without the above-mentioned complex methods, as the determination of oxygen absorbed gives us sufficiently reliable results.

Every one of the above-mentioned modifications of the determination of oxygen absorbed gives satisfactory results, if used for such calculation only. Of course it is necessary always to examine the crude sewage and the effluent both in exactly the same manner. Moreover, the above statements hold good only for sewage that has been freed from suspended matter. When examining the crude sewage unfiltered—as is usually done when making the four hours' test—the reduction is often found to amount to about 10 per cent. more than when comparing filtered crude sewage with filtered effluents.

To my view, the examination of unfiltered samples is far more open to objection than the examination of filtered samples. The suspended matter in effluents of biological purification-plants is of an entirely different nature to that found in sewage. The former consists of, to a large extent, animal and vegetable organisms grown in the filter-beds, and which should be regarded from quite a different point of view than the suspended matter in crude sewage.

The determination of oxygen absorbed is the simplest of all methods in question, and if Kubel's modification is employed the results can be at hand within very few minutes. These, I think, are great inducements to the use of this test. Concluding, I should like to state that, according to my opinion, we can judge the putrescibility of effluents better by the percentage of reductions effected by biological plants than by standards based on absolute figures.

The absolute figures obtained even by the best methods of determining putrescible matter in sewage do not in all cases give definite indications as to the putrescibility of any given sample. Effluents of purification works may present a most satisfactory character, and yet under certain circumstances contain as large or even larger quantities of either organic carbon, organic nitrogen, and albuminoid ammonia; as high an oxygen absorption, and loss of ignition as other samples of crudesewage which are in a high degree liable to undergo putrefaction. We should, therefore, give up the attempt to find a standard of general applicability based on absolute figures.

A far safer judgment as to the putrescibility of effluents can be obtained by calculating the percentage of purification effected. Simple methods like Kubel's oxygen absorption test give results entirely sufficient for wants of practice, if used only for calculating the percentage of reduction. The analytical determinations spoken of are not needed in all cases. The requirement that all effluents should be absolutely non-putrescible needs only to be made where the river presents most unfavourable conditions, or where the river districts are densely populated. In many cases it will be sufficient to require only that all coarser suspended matter be removed from the sewage. In other instances all suspended matter, including finer particles, should be removed as efficiently as possible. In other cases, again, the authorities will have to insist not only on the removal of the entire suspended matter, but also on a reduction of between 40 and 50 per cent. of oxygen absorbed by the dissolved impurities, the determination being made after filtering the samples; and there will certainly be such cases, too, where it must be stipulated that the effluents are limpid and entirely non-putrescible.

It would be desirable that leading men in Britain and Germany, where the great questions of rivers pollution and sewage purification are at present being discussed more than ever before, should come to an understanding to carry out the examination of sewage on the same lines. In such case the large amount of analytical work carried out in both countries every day would lead to comparable results, and progress might be accelerated by mutual labour and interchange of ideas.

APPLICATIONS UNDER THE 1894 BUILDING ACT.

At the meeting of the Building Act Committee of the London County Council, held on July 25, being the day before the Council adjourned for the Summer Recess, the proceedings were governed by the clause in the order of reference which empowers the Committee at certain seasons to act on behalf of the Council in relation to matters included in the Committee's order of reference. The names of applicants are given in parentheses:—

Lines of Frontage and Projections.

Wandsworth.—Bringing forward the frontage of six houses on the north side of Rose-dale-road, Herne-hill, between No. 1, Park-villas and Guernsey-grove (Mr. P. C. Davies for Messrs. R. Parry, H. Eabor, and F. J. Chapman).—Consent.

Hampstead.—The erection of one-storey buildings on the east side of West-end-lane, Hampstead, northward of "Tower Mansions" (Mr. A. Whitlaw for the London and North-Western Railway Company).—Consent.

Levensham.—Twelve houses on the northern side of Rutland-road, Perry-hill, Catford (Mr. W. C. Poole for Mr. J. Johnson).—Consent.

Clapham.—Buildings on a site abutting upon the south side of Clapham Park-road and the east side of Park-hill, Clapham (Metropolitan Borough of Wandsworth).—Consent.

Battersea.—A pumping station on a site abutting upon the east side of York-road at the north side of Creek-street, Battersea (Mr. M. Fitzmaurice for the Main Drainage Committee of the Council).—Consent.

Hampstead.—A porch at a house in course of erection on the east side of Finchley-road, Hampstead, northward of "St. Hilda" (Mr. A. O. Breeds for Mr. C. Tavener).—Consent.

Kensington, South.—The retention of illuminated sign at the "Kensington Army public house, Warwick-road, Kensington" (Mr. T. H. Smith for Mr. A. N. Foley).—Consent.

Marylebone, East.—Balconies in front Nos. 2, 3, 4, and 5, Duke-street, Portlanoth-place, St. Marylebone (Messrs. Boehmer & Gibbs for Messrs. Matthews, Rogers, and Co.).—Consent.

Islington, East.—A warehouse building at the rear of No. 32, Newington-green, Islington, to abut upon Matthias-road (Mr. J. H. Storror for Mr. C. Fell).—Consent.

Hackney, South.—An addition to a warehouse building at No. 17, Sutton-place, Hackney, abutting upon Urswick-road (Mr. J. Hamilton for Mr. T. C. Wootton).—Refused.

Kennington.—Buildings on a site on the southern side of Wandsworth-road and the eastern side of Southville, Kennington (Mr. I. Bignold for Mr. O. Camburn).—Refused.

Lewisham.—The retention and completion of a porch and coal cellar at No. 165, Wellmeadow-road, Lewisham, abutting upon Downhill-road (Mr. E. J. W. Hider for Mr. V. Taylor).—Refused.

Lewisham.—An addition at the rear of No. 7, London-road, Forest-hill, to abut upon Queen's-road (Messrs. Dorrell Brothers for Mr. A. J. Dorrell).—Refused.

Marylebone, East.—A one-story lavatory at No. 62, Portland-place, St. Marylebone, to abut upon Weymouth-street (Mr. H. Lake for Mr. W. Tobb).—Refused.

Strand.—Two projecting signs in front of No. 25, Charing-cross, Strand (Mr. J. N. Taylor for the Great Western Railway Company).—Refused.

Wandsworth.—A bay window and wood cornice and pediment at No. 134, Devonshire-road, Balham (Mr. N. H. Meyrick for Mr. V. Scott).—Refused.

Woolwich.—A verandah and the use of half timber work at a building on a site situated between Nos. 194 and 220, Plumstead-common-road, Plumstead (Mr. F. Bethell for the Royal Arsenal Co-operative Society, Ltd.).—Refused.

Width of Way.

Hampstead.—An addition to Christchurch cottage, Christchurch-passage, New-end, Hampstead, with the boundary fence at less than the prescribed distance from the centre of the roadway of the street (Mr. J. D. Hunter for Mr. E. A. Rusher).—Consent.

Hampstead.—An addition to Christchurch cottage, Christchurch-passage, New-end, Hampstead (Mr. J. D. Hunter for Mr. E. A. Rusher).—Refused.

St. Pancras, East.—A two-story building on the north-east side of Rochester-place, Camden Town, with external walls at less than the prescribed distance from the centre of the roadway of the street (Mr. T. B. Westcott for Messrs. G. Skey and Co., Ltd.).—Consent.

Paddington, North.—That the application of Mr. J. H. Bethell on behalf of the London and South Western Bank, Ltd., for an extension of the periods within which the erection of buildings on the north side of Harrow-road, Paddington, westward of No. 474, was required to be commenced and completed, be granted.—Agreed.

Southwark, West.—A building on the south side of Clink-street, Southwark, eastward of bank-end, with external walls at less than the prescribed distance from the centre of the roadway of the street (Mr. H. Baerselman).—Refused.

Lewisham.—Five buildings on a site abutting upon the north side of Marischal-road, High-road, Lee, with external walls and boundary fences at less than the prescribed distance from the centre of the roadway of Marischal-road (Messrs. D. Smith, Son, and Wakley for Earl St. Germans).—Refused.

Width of Way, Lines of Frontage and Projections.

Strand.—A building upon the site of Nos. 17, 19, 20, and 21, Tavistock-street, Covent-garden (Mr. E. L. Lutvans for Sir G. Newnes, Bart.).—Consent.

Marylebone, East.—A building upon the site of No. 54, Harley-street, St. Marylebone, with external walls at less than the prescribed distance from the centre of the roadway of Lansfield-mews, and with a bay-window and balcony abutting on Harley-street (Messrs. Aven and Wigglesworth for Dr. J. Galway).—Consent.

Bermondsey.—Buildings on the east side of Vild's-tennis, Low-lane, Bermondsey (Mr. E. Trosse for the Old English Vinegar Company, Ltd.).—Consent.

Hampstead.—An iron and glass covered way in front of "Normanhurst," Priory-road, West Hampstead (Messrs. Baker and Iay for Mr. F. P. Schoite).—Refused.

Paddington, North.—A one-story addition upon part of the forecourt of No. 11, Warwick-road, Paddington, abutting also upon Warwick-street (Mr. J. Martin for Mr. H. B. Merton).—Refused.

Buildings for the Supply of Electricity.

Paddington, South.—A sub-station on the east side of Salem-road, Moscow-road, Paddington (Mr. W. H. White for the Metropolitan Electric Supply Company, Ltd.).—Consent.

Marylebone, West.—The use of a portion of the ground floor of No. 34, North-street, St. Marylebone, as a battery-room (Mr. J. S. Highfield for the Metropolitan Electric Supply Company, Ltd.).—Consent.

Norwood.—A roof over a grease separating plant at the generating station at Bengeworth-road, Norwood (Messrs. Kincaid, Waller, Manville, and Dawson for the South London Electricity Supply Corporation, Ltd.).—Consent.

Formation of Streets.

Hammersmith.—That the application of Mr. W. G. Ingram for an extension of the period within which the widening of Heath-place, Uxbridge-road, Hammersmith, to 40 ft. was required to be carried out, be granted.—Agreed.

Lewisham.—That an order be issued to Mr. E. Van Putten sanctioning the formation or laying out of a new street for carriage traffic to lead out of Porson-street, Lewisham (for the Council of the Metropolitan Borough of Lewisham).—Consent.

Lewisham.—A deviation from the plan sanctioned for the formation of a new street to lead out of Porson-street, Lewisham (for the road, Lewisham (Messrs. J. Jenkins and Sons for Mr. J. Martin).—Consent.

Hackney, North.—That an order be issued to Mr. G. H. Lovegrove sanctioning the formation or laying out of a new street forming an approach to six buildings erected upon a site at the rear of houses on the east side of Iron-road, Hackney (Mr. R. E. Maskall).—Consent.

Wandsworth.—That an order be issued to Mr. J. C. Radford sanctioning the formation or laying out of new streets for carriage traffic out of the west side of Gwendolen-avenue and south side of Hazlewell-road, Putney (for Lord Westbury).—Consent.

Space at Rear.

Battersea.—Certain alterations to premises on the north side of Green-lane, Battersea (Mr. F. Banister for the Committee of the Battersea Liberal Club).—Consent.

Westminster.—A modification of the provisions of section 41 with regard to open spaces about buildings, so far as relates to the proposed erection of "Hopkinson House," upon a site abutting upon Vauxhall-bridge-road, Edward-street, and Douglas-street, Westminster, with an irregular open space at the rear (Mr. R. S. Ayling for the Brabazon House Company, Ltd.).—Consent.

Westminster.—A modification of the provisions of section 41 with regard to open spaces about buildings, so far as relates to the proposed erection of a block of buildings on the site of No. 62, Vincent-square, Westminster, with an irregular open space at the rear (Mr. R. S. Ayling for Miss E. M. Smith).—Consent.

Lines of Frontage and Space at Rear.

Paddington, South.—A projecting porch and bay window in front of No. 35, Albion-street, Hyde-park, and of an additional story on the back addition of such building (Mr. S. Skrimshire for Mrs. Moncreiffe).—Refused.

Space at Rear and Means of Escape.

Newington, West.—A building upon a site on the eastern side of Newington-causeway and southern side of Union-road, Newington, with an open space about such building and means of escape in case of fire from the fifth (top) story of such building (Mr. W. G. Scott for Lord Radstock).—Refused.

Alterations to Buildings.

St. George, Hanover-square.—A building on the site of St. George's Chapel, Albemarle-street, St. George, Hanover-square, and to alterations to No. 27, Albemarle-street (Mr. C. G. Miller for Messrs. Viola, Ltd.).—Refused.

Artizans' Dwellings.

Battersea.—Three intended dwelling-houses to be inhabited by persons of the working class, and proposed to be erected, not abutting upon a street, on a site at the rear of houses on the east side of Stainforth-road, Battersea (Mr. E. Camell for Mr. F. Priddis).—Refused.

"ACID" AND "BASIC PROCESSES."

SIR,—I shall be much obliged if you will inform me, through the medium of your journal, the difference between the terms "acid process" and "basic process," as applied to the manufacture of steel.

T. F. D.

[*.* In making steel by the "acid process," the lining of the converter, or of the furnace as the case may be, consists of highly siliceous material, such as ganister, which is capable of acting as an acid at high temperatures, and of fluxing when in contact with basic substances.

In the "basic process" of steel-making, the lining is composed of dolomite (double carbonate of calcium and magnesium), or of magnesium carbonate.

As originally employed, the Bessemer converter was lined with ganister, and the steel produced was made by the "acid process." So long as pure hematite pig iron was used, this form of lining presented no disadvantage, but the need for utilising iron made from phosphoric ores led to the adoption of a basic lining, the reason being that the elimination of phosphorus is adequately effected only in the presence of a base capable of forming a stable phosphate with the oxidised phosphorus. Similarly, an open-hearth furnace, such as that used in the Siemens-Martin process, may be worked with an "acid" or with a "basic" lining.—Ed.]

The Student's Column.

NOTES ON PORTLAND CEMENT.

CHAPTER V.—SOUNDNESS.

ONE of the most important tests to which cement is subjected is that for its constancy of volume or soundness. This test cannot safely be carried out by a novice, and in the hands of an expert, extreme care must be taken. The greatest difficulty encountered is in the making of the pats. In all kinds of material testing the preparation of the specimen and the method of conducting the operation are as important in their influence on the result as the character of the test itself. This is particularly the case with Portland cement. To carry out the test, pats of neat cement about 3 in. diameter, $\frac{1}{2}$ in. thick at the centre, and tapering to thin edges at the circumference are made on a glass plate, and, as in the other tests, the paste should be of normal consistency, thoroughly mixed, and the pat worked well to get rid of air bubbles. Unless care is used in trowelling, strains may be introduced into the mass which develop cracks. A good plan is, after moulding, to tap the glass gently, which re-arranges the molecules, making a more uniform pat free from tension strains. Since Fajja introduced his hot-water apparatus, hot water or boiling tests have been universally used. In the Fajja test the pat is placed immediately after making into the apparatus and steamed at a temperature of 100° to 105° F. till set; it is then placed in water and kept for the remainder of twenty-four hours at a temperature of 115° to 120° F.

For Michaelis's test the originator gave precise instructions for carrying it out. He specified that "a clear pat of Portland cement made upon filter paper on a glass plate" should be allowed to harden in air and water for twenty-four hours. At the expiration of this time it was to be put into water of normal temperature and gradually brought to the boil, at which point it was to be kept for three hours. The pat thus treated should be firm, hard, and free from cracks. Since Michaelis introduced his test it has been shown by several experimenters that unsoundness due to excessive amount of magnesia is not developed much under six hours. There are numerous other hot tests for soundness, chief of which are:—

(1) Devall's. In this test pats of cement are allowed to set, then placed in a steam bath and heated for twenty-four hours at a temperature of 80° C. This is quite as severe a test as Michaelis's and in some instances the author has found slight movement in pats thus treated, while the same cement has stood Michaelis's test perfectly. This, however, may have been due to the preparation of the test pieces.

(2) Heintzel's ball or glow test. Balls are made by working the cement paste in the hands. They are then allowed to set sufficiently to take only slight impression of the finger nail. They

are then placed on thin sheet-iron and heated over a Bunsen burner, at first gently, and as the balls dry the heat is gradually raised till no more steam is given off. The balls should remain firm and hard.

(3) Tetmajer's test is very similar to Michaelis's, only balls instead of pats are prepared and boiled for six hours.

(4) Prüssing's compressed cake test. The cement is mixed with from 5 to 8 per cent. of water, then placed evenly in a mould and subjected to a pressure of 50 atmospheres. The cakes taken from the moulds are allowed to harden twenty-four hours, precautions being taken to prevent drying. The cakes are then placed in cold water for from two to twenty-four hours, then placed in a hot-water bath of 90° to 100° C. According to the originator of the test, cakes which showed no change after being four hours in hot water were generally considered of sound cement. If after twenty-four hours no visible change had taken place, then the cement was certainly sound under hardest conditions, and, if these cakes showed also particularly good strength, then these cements were good as regards this quality. It is almost impossible to obtain a cement which will stand this test, the tendency to warp being due to the manner of preparing the cakes.

About eight years ago the author experimented with a large number of cements with the view of obtaining quantitative results for "soundness." The change of volume in briquettes which were boiled or steamed was measured by means of Michaelis's micrometer and the briquettes then tested for tensile strain. The results, a few of which are shown in the table, were very interesting, but not reliable, owing to the large number of cements of that day being unfit to stand the hot test.

Much difference of opinion seems to exist as to the value of hot tests, as many cements which have failed to pass such tests have stood well in concrete work. It is generally accepted that a cement which will stand this test can safely be used, but should not be condemned on its failure to pass it. At present the only reliable test for soundness is to place a pat of neat cement in fresh water of normal temperature, where it should remain for about twenty-eight days, and examined from time to time for signs of movement. When this test is carefully carried out and the cement shows signs of "moving," it should not be used until a further test is made of the aerated sample. In many cases movement is caused by the extreme freshness of the cement, and can be overcome by aeration.

Test Tube or Bottle Test.—In this test the cement paste is poured into a bottle or test tube till it is completely filled and free from air bubbles. It is then allowed to set, and if, at the expiration of seven days, the vessel remains uncracked or the cement does not shrink it is considered sound. This is a very misleading test, and so many sources of error are possible that it should never be attempted except by an expert. The greatest care is necessary in getting the cement paste into the bottle or test tube and even then other causes than expansion through free lime may cause the glass to crack, such as changes of temperature.

"Marmalade Pot" or Temperature Test.—A most misleading test, and one which causes the manufacturer much unnecessary trouble, is

that advocated by Mr. G. F. Deacon a few years ago, and familiarly known as the "marmalade-pot" test. Mr. Deacon described it as "a perfectly simple and exhaustive test for free lime which can be made in a few minutes." It is as follows:—"A band sample of cement, a small vessel of water, a marmalade pot, and a thermometer are left together for a short time to acquire a uniform temperature. The cement is then gauged in the pot as quickly as possible, with just sufficient water to render it plastic, and the thermometer, being immediately pressed into it, the initial temperature is recorded. If within fifteen minutes the rise of the thermometer exceeds 2° F., or within sixty minutes 3° F., the cement is further exposed before use." A large number of cements have been tested by the author for rise of temperature during setting, and in most cases the samples showing the greatest increase have been perfectly sound under the hot-water test. The diagram shows the results of four samples thus tested. A, B, and C were sound after steaming for twenty-four hours at 80° C., while D was badly cracked under similar treatment.

Mr. D. B. Butler, in his paper on "The Finer Grinding of Portland Cement and the Comparative Value of the Coarser Particles," described some experiments to ascertain the relation between the setting properties of cement and the heat evolved during setting, and also how far the theory was correct that little or no increase in temperature pointed to the absence of free lime "that is a 'sound cement.'" Samples were tested in the Faija apparatus. One sample which showed an increase of 9° F. in sixty minutes during setting, when ground

extremely fine showed an increase of 29° in thirteen minutes, and the fine grinding had rendered it perfectly sound. Several samples of unsound cement were secured and re-ground. Greater increase of temperature was shown on gauging the re-ground samples than the original ones, but the fine grinding had rendered them nearly or quite sound when subjected to the Faija test. One sample specially prepared containing a large amount of free lime, showed an increase of 17° F. in thirty-five minutes during setting. The same sample mixed with 2 per cent. gypsum and rendered very slow setting increased only 1° F. in fifteen minutes and was still unsound. A large number of similar cases might be cited to show the absurdity of this test as one for "soundness." Unsound over-limed cements are generally slow setting and evolve little heat. It is the coarse grain containing free lime, which slake only slowly and expand after the cement is set, which are dangerous. The rise of temperature when cement is mixed with water is less due to the heating of the free lime than to the crystallisation of the cement compounds. The heat evolved by the latter action is much greater than from the slaking of free lime.

GENERAL BUILDING NEWS.

CHURCH, NEAR LLANDRINDOD WELLS.—The foundation-stone has just been laid of the new church for the parish of Dissorth, which is being built near Crossway, Howcy. The architect is Mr. R. Wellings Thomas, Llandrindod Wells; and the contract has been entrusted to Mr. S. Arthur Bounds, also of Llandrindod Wells. The church will stand on a site 67 ft. by 22 ft., and it will be built of stones from Brynhir Quarry.

NEW CHURCH, SKWEN, CARLISE.—The foundation-stones were recently laid of a new parish church, which is to be erected at Skwen. The building will accommodate some 350, and is to be built of Morriston pressed bricks, with biscuit-coloured terracotta dressing. The style is Gothic. A organ chamber and vestry are provided. The architect is Mr. J. C. Rees, and the contractors, Messrs. Price Brothers, of Carlisle.

PRIMITIVE METHODIST CHAPEL, HOLMWOOD, SHEFFIELD.—The foundation-stones were laid a short time ago of a new Primitive Methodist chapel at Holmwood. The total cost of the work will be about 1,850l. The new chapel has been designed, in the Gothic style, by Mr. W. Cecil Jackson, of Chesterfield. The walls will be faced with red bricks, and will have stone dressings. The building, which will comprise a main hall, choir, and two vestries, will provide accommodation for 375 worshippers. There will be two front entrances and vestibules. The open timber roof will be covered in with blue slates. The timber work and furniture will all be of pitch-pine. The windows will be glazed with stained glass. The builders are Messrs. Brailsford and Randall, of Hasland.

PRIMITIVE METHODIST SCHOOL-CHAPEL, SHEFFIELD.—A new Primitive Methodist chapel and Sunday school are to be erected on site in Abbeydale-road, Sheffield. The plans for the buildings have been prepared by Messrs. Hall and Fenton, architects, Sheffield.

SCHOOL, YORK.—A new Council school which has been erected on the Poppleton-road, York, to meet the elementary educational requirements of the Poppleton-road and Leema

road districts, was opened on the 5th inst. The actual cost of the school, which has places for 1,200 children, has been 21,952*l.* The school is built of plain brick, in the Early Georgian style. The school, out-offices, and yards occupy an area of about 1½ acres. In the school there are nineteen separate classrooms of sixty each, a central hall for the upper school, and marching hall, as well as a gymnasium. Mr. W. H. Brierley, of York, is the architect.

SCHOOL, COWIE.—At Cowie, near Bannockburn, the St. Ninian's School Board have built a new school from the plans of Mr. Donald Walker, Stirling. The building has cost 4,500*l.*, and gives accommodation for 308 pupils.

ROYAL ALBERT MEMORIAL COLLEGE, EXETER.—The Corporation of Exeter have agreed that application shall be made to the Local Government Board for a loan in respect of the proposed additions to the "Royal Albert Memorial College," for which plans, etc., are to be forthwith prepared by Messrs. Tait and Farvey, of Exeter, for the approval of the Board of Education and the Local Government Board.

SOUTHALL-NORWOOD FREE LIBRARY.—The foundation-stone was laid recently of a new library for Southall and Norwood. The Surveyor of the Council, Mr. R. Brown, prepared the plans, and the tender of Messrs. Ferguson and Co., of Tottenham and Carlisle, for the building, was accepted. The building has a frontage of 50 ft. to the street. The entrance to the library will be at the centre of the building, and there will be rooms on either side. The entrance is under three arches. The facade will be faced with Leicester red bricks, with buff terra-cotta dressings, the entrance arches being supported by Corinthian columns. Over the arches will be a terra-cotta panel, with the words "Southall-Norwood Public Library."

Just thereon, and above the centre window, in the first floor, will be a terra-cotta panel commemorating the name of the donor of the library (Mr. Carnegie), the whole surrounded by a terra-cotta pediment. The building stands 18 ft. from the roadway, and in front will be ornamental wrought-iron railings. On the right of the entrance there will be a ladies' waiting-room, about 19 ft. by 15 ft. 6 in., and on the left there will be the entrance to the book store and lending library. The reading-room will be 43 ft. long by 25 ft. average width. Leading from the reading-room there will be a reference library, 20 ft. by 23 ft. 6 in. The whole of the floors, with the exception of the entrance hall and lavatory, will be of pitch-pine wood blocks, the hall being laid with mosaic. There will be a lecture hall, 53 ft. square, and a committee room, the same size as the ladies' waiting-room, on the ground floor. The whole of the building will be heated by hot water. The internal fittings will be of pitch-pine wood.

THE HOTEL METROPOLE, SOUTHEAD-ON-SEA.—The new Hotel Metropole, Southend-on-Sea, was opened recently. The building, which has cost upwards of 300,000*l.* to erect, has been built from the plans of Mr. James Thompson, architect. The furnishing has been carried out by Messrs. Goodall, Lamb, and Leitchway, of Manchester, and by Messrs. Blozmann, of London.

NEW FIRE STATION, KENSINGTON.—The memorial-stone of the new fire station, which is being erected in Clarence-mews, Kensington, was laid a short time ago. The plans for the work have been prepared by Mr. W. E. Riley, architect to the London County Council, and the contractors are Messrs. Kerridge and Shaw. The total cost, inclusive of site, will be about 19,430*l.*

DRILL HALL, WALSLEND.—A drill hall for the 2nd V.B. Northumberland Fusiliers has been erected at Walslend. It is 75 ft. by 10 ft., and has cost about 1,750*l.* On the basement there are armory, clothes-room, sergeants' mess, orderly-room, and stores, while on the first story there are the officers' mess, clothes-room, and stores, together with balcony overlooking the hall. The building is constructed of red brick and corrugated iron, and ground is in reserve on which to put up a caretaker's house and reading and recreation rooms for the men. Mr. M. H. Graham, of Newcastle, was the architect, and the contract has been carried out by Mr. Weir, of Howdon-on-Tyne.

REFUSE FURNACE, KENSINGTON.—The foundation-stone of the new furnace-house, in Woodland, Kensington, was recently laid. The work is being carried out by Messrs. Goddard, Massey, and Warner, whose scheme and tender was accepted upon the advice of Mr. William Weaver, the Borough Engineer, and Sir A. R. Binnie. The building will contain twenty furnace cells, having a total cubical capacity of 11,110 ft., capable of dealing with 450 tons of refuse per twenty-four hours, the

refuse being carted up inclined planes to tipping platforms on the top of the furnace cells. At the back of the cells storage hoppers, in which refuse awaiting combustion would be placed, will be provided. The chimney shaft will be 156 ft. high. Two steam boilers are to be erected in connexion with the furnaces, each working at a pressure of 160 lbs. to the square inch, from which power will be supplied to machinery for the utilisation of the clinker refuse, and also the necessary heat for the disinfecting *apparatus*. The cost of the scheme will be 39,513*l.*

APPOINTMENTS.

UNIVERSITY OF LEEDS.—At a meeting of the Council of the University of Leeds on the 10th inst., the Council appointed Dr. George Wilson, A.M.Inst.C.E., to the newly-created Lectureship in Civil Engineering in the University. Dr. Wilson is a graduate in science of the Victoria University, having been a student at Owen's College, where he gained the Ashbury scholarship in engineering. He had two years' experience as a member of the engineering staff of Sir Leader Williams, then chief engineer of the Manchester Ship Canal. He was subsequently appointed demonstrator in the Whitworth laboratory of Owen's College, in which post he has had ten years' experience. In 1902 the Council of the Institution of Civil Engineers awarded him the Telford Premium for experimental work on lateral pressure in sand and its alteration by water.

FOREIGN.

FRANCE.—The architectural department of the Paris Municipality is about to undertake, in co-operation with the Commission des Monuments Historiques, some important works of restoration at the church of St. Gervais. The principal object of the work, which will cost about 135,000 francs, is the repair or rebuilding of the nave buttresses. In the crypt of the Madeleine, where some work is going on, has been found the tomb of Vigon, the original architect of the building, which, according to the intention of Napoleon, was to have been a "Temple de la Gloire" and not a church. The tomb was concealed under a pile of stones, and is to be opened out and restored. The jury in the competition for the "Monument de l'Union Postale Universelle," to be erected at Berne, has chosen from among 122 competitors the design by M. René de Saint-Marcieux. The design shows a group of five female figures, representing the five continents, circling round a terrestrial globe, and passing messages from hand to hand. Below is seated the heraldic image of Berne. Important works for the improvement of the port of Havre are to be undertaken, at a cost of 34 million francs. The General Council of Finistère has voted a sum of 247,000 francs for the enlargement of the Prefecture of Quimper. The Chamber of Commerce of Limoges has voted a sum of 240,000 francs for the installation of a "Hôtel des Services." The jury in the competition for a statue of Jeanne d'Arc, to be erected at Arras, has declined to recommend any one of the designs for execution, merely awarding premiums to the three best designs.

The Municipal Council of Paris has offered to the town of Riom, the birthplace of Desaix, the statue of the celebrated Republican general which was formerly in the Place Dauphine, and was removed at the alterations made in the Place in 1874. The monument, which is in a rather dilapidated condition, consists of a stele with an inscription, surmounted by a bust of Desaix, which is being crowned by a figure in the dress of a Roman warrior. The general design of the monument is by the architect Percier, the bust and the figure were executed by Fortin. The work is at present in the Art Museum at Auteuil. M. Waldeck-Rousseau, whose death has been recently announced, was not only a politician of the first rank, but an enthusiastic lover of painting and sculpture, and enjoyed the regard of many artists, especially of Falguère, of whom he was a faithful friend. He himself possessed great talent as a painter in water-colours.

AUSTRIA.—The monument to the artist Canon, to be erected in Vienna, will soon be completed; the statue is being executed by the sculptor Professor Weyr. The new Surgical Hospital, at Vienna, is now in course of construction; the work is to be pushed forward as much as possible, and it is hoped that a portion of the building will be fit for use by January next. The foundation-stone of the new Catholic church at Zeltweg is to be laid on August 21; the architect is Herr Hans Pascher.

SWITZERLAND.—The Second International Congress for the Promotion of Draughtsman-

ship was held on August 2, when twenty-one states were represented by over 900 delegates.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—Messrs. Candy and Co., Ltd., have removed their offices and showrooms from Mansion House Chambers, 11, Queen Victoria-street, E.C., to 87, Newman-street, W.

ST. PHILIP'S CHURCH, REGENT-STREET.—Mr. James Green, in his capacity of arbitrator for the claim preferred by Messrs. J. Lyons and Co., against the Ecclesiastical Commissioners, has just made his award in respect of the wine vaults and cellars beneath the church. The award amounts to 10,400*l.* in respect of the leasehold interest of that company, who claimed about 6,000*l.* more. The church will shortly be pulled down, in pursuance of an Act recently passed in that behalf, for the sale of the site and materials.

SITE OF CHRIST HOSPITAL, LONDON.—The estimated cost of constructing the new street, with sewer and subway, across the new vacant site, is estimated at 45,000*l.*, of which sum the Corporation of the City will contribute 25,000*l.* The ground has been acquired for purposes of the General Post Office, and, in lieu of the projected thoroughfare to relieve the traffic along Newgate-street, steps are being taken for a widening of King Edward-street.

ARBITRATION INQUIRY.—An arbitration inquiry was held at the Surveyors' Institution, Westminster, on the 10th inst., before Mr. E. A. Cruning, sole arbitrator, respecting a claim brought by Messrs. Kirk and Randall against the Office of Works for the balance of money alleged to be due to them under their contract as builders for the erection of the new Post Office Savings Bank at Kensington, which has been in occupation of the department for over a year. Mr. English-Harrison, K.C., and Mr. J. A. Scott appeared for the claimants, and Mr. Montague Lane, K.C., and Mr. Askwith represented the Commissioners of Works. A number of legal points were raised as to the interpretation of the contract, but no witnesses were called. At the conclusion of the arguments, which had occupied two days, the arbitrator consented to state a case for the opinion of the High Court.

THE INTERNATIONAL FIRE SERVICE CONGRESS.—The British representation for the International Fire Service Congress, to be held at Budapest, comprises a special Commission formed by the British Fire Prevention Committee, with Mr. Horace Folker, of the National Fire Brigades' Union, and Mr. Ellis Marsland, District Surveyor, as honorary secretaries. The Commission, besides participating in the Congress at Budapest, will report on the fire preventive arrangements of Vienna, Munich, Frankfurt, and Cologne. The Commission, which is ten in number, includes:—Mr. Edwin O. Sachs, Chairman of the British Fire Prevention Committee (as chairman of the deputation), and Lieut. Colonel Fox, Vice-President of the N.F.B.U. The work under consideration at the Congress has special relation to the Baltimore fire, fire prevention in theatres, factories, and mills, to the question of mechanical life-saving ladders and fire alarms. At a meeting of the International Fire Service Council, to be held at the same time as the Congress, the question of universal statistics and other matters will be considered.

THE BATH STONE FIRMS, LTD.—The annual excursion of the employees of the Bath and Wiltshire district of the Bath Stone Firms, Ltd., took place on Saturday last to Plymouth. Three special trains were engaged, and conveyed about 2,000 to the town. Some of the directors and the whole of the office staff accompanied the party.

CANDLER MEMORIAL DRINKING FOUNTAIN, BROCKWELL PARK.—As originally purchased and laid out, Brockwell Park comprised some 55 acres. It was bounded on the Brixton side by 43 acres of building land, and in July, 1899, it became known that this land was in the market. At once a local committee was formed, and ultimately the purchase price was subscribed, and the whole space preserved for the use of the public. This result was largely due to the zeal of Alderman Samuel Horak Candler, the vice-chairman of the Park Extension Committee. At his death it was felt that some memorial of his efforts should be erected in the open space. A fund was opened, and, with Mr. Albert Larking as hon. sec., a drinking fountain was erected at the Water-lane entrance to the park, and this has just been unveiled. The fountain, erected to the designs of Mr. A. W. Sheppard, architect, John-street, Adelphi, is of grey and red granite, capped with York stone, and bears on one panel a bronze portrait medallion of Mr. Candler, and on the other an inscription. The work has been carried out by Mr. J. Whitehead, of Rochester-row, London.

CAPITAL AND LABOUR.

THE YORKSHIRE BUILDING TRADE.—The federated master builders of Yorkshire are anxious to put an end to the possibility of strikes and lock-outs in their trade in the county, and, with this object, have suggested to the men a "closer union scheme." They desire that in future all disputes in the Yorkshire building trades shall be submitted to a Board of Conciliation and Arbitration, the constitution and detailed operations of which they propose shall hereafter be decided upon in accordance with the wish of these peace-loving employers, the bricklayers, masons, and carpenters and joiners have discussed the "principle of arbitration and conciliation" at their branch meetings, and have taken a vote on the question. The result is that an overwhelming proportion of Yorkshire bricklayers and masons in favour of such a tribunal, while, on the other hand, the members of the Yorkshire branches of the Amalgamated Society of Carpenters and Joiners have expressed their disapproval of the scheme by a majority of 1,595, only 512 voting in its favour, as compared with 1,907 against. Of the seventy branches of this union, a dozen had a majority in support of the idea, these including the largest branch in Sheffield, which voted unanimously in its favour. The eight Leeds branches gave a unanimous vote against. This decision, however, cannot be taken as final, as it is said that the carpenters were misled by an unofficial statement in which it was hinted that official statement in which it was hinted that one point of the "Closer Union Scheme" would be permitted to work for any but employers connected with the Master Builders' Federation. The head officials of the Amalgamated Society of Carpenters and Joiners now recognise that this communication was unofficial, and in their monthly report they say: "We deplore this action because we are convinced that the interests of members can best be promoted by cultivating a closer union between their employers and themselves, and we hope that if the opportunity again offers itself a more liberal view will prevail, and that our society will emerge from the isolated position it now occupies in respect to this question. Now that the air has been cleared, and it has definitely and officially been declared that all details are hereafter to be discussed and determined, the carpenters and joiners of Yorkshire are not likely to lose much time in falling in line with their brother workers in the trade.—*Sheffield Independent.*

PATENTS OF THE WEEK.

APPLICATIONS PUBLISHED.*

15,811 of 1903.—F. G. P. PRESTON and G. C. RALSTON: *Simultaneously-operated, Multiple-cam Devices for Operating and Fixing in Position Bulk-head Doors, and other Doors, Ships' Side Lights, and other Windows, Cylinder Covers, and other Covers.*

This consists in the combination with a door, window cover, or ring, and the frame or part with which it is to make joint, of a number of pivoted cams, means for connecting the cams, and means for simultaneously operating said cams for the purpose of pressing the door tightly against the frame.

17,842 of 1903.—J. J. JACKSON: *Holders or Rope Grips for Elevators, and Conveyors, and Lifts.*

An elevator or conveyor for elevating or conveying grain and other substances or articles, means for connecting the buckets, plates, bars, or other equivalent parts, of the elevator or conveyor, with the ropes or bands, consisting of gripping devices or clamps attached to or formed on the said buckets, plates, bars, or their equivalent parts, comprising a gripping bolt or plug, and a wedge or key arranged to operate in connexion with said bolt or plug.

17,845 of 1903.—J. J. CARTWRIGHT: *Fixed or Portable Cooking and Warming Apparatus.* A fixed or portable cooking and warming apparatus, wherein solid fuel is burned, consisting in the construction and application of a perforated fire-box, suspended in an air chamber, the supply of air to which is controllable, in combination with a closed and hollow-lined roasting chamber open to the said perforated fire-box.

19,860 of 1903.—E. J. PARRISH: *Means for Supporting Window Sashes, etc.*

Means for supporting window sashes, etc., consisting of a front plate having flanges thereon, a rectangular opening in the upper part of the front plate, corner slots in the

lower part thereof, a flattened V-shaped back-plate pivoted at its upper end, bearings at or near the upper end of the rectangular opening for the pivots of the back-plate, a projection upon the front-plate for preventing the pivots of the back-plate jumping their bearings, a roller working in the recess, formed by the back-plate at the rear of the rectangular opening, said back-plate forming a path for said roller, a spring for holding the back-plate up to its work, abutments on the front and back plates for the spring, a bar for tightening the spring working into the corner slots, and a recess in said bar to receive the spring and to prevent the lateral movement of the bar.

20,042 of 1903.—H. PARKER and W. H. BAKER: *Fire Cheek or Fire Brick for Domestic Stoves and Ranges.*

According to this invention, the cheek is formed hollow, with internal baffle-plates or louvres of substantial substance, preferably of a shape approximating to two sides of a triangle, the points of each projection projecting within the groove formed to cause the incoming air to take a serpentine course, so to retard its passage, so that it may be acted upon by passing over the sides of the heated projections, and so become heated before its exit. Near the top of the cheek is a lateral opening to deflect the air over top of oven or boiler. When in position the bottom of cheek is open for inlet of air from ash-pit.

20,421 of 1903.—F. HOWETT: *Manufacture of Artificial Stone.*

This invention relates to the manufacture of artificial stone, and more particularly to the manufacture of such stone slabs and other articles from refuse destructor ashes. The invention consists in treating the refuse destructor ashes with a chemical solution which will render the sulphur contained in the ashes incapable of having any injurious effects on the cement employed in the manufacture of the artificial stone. In the manufacture of artificial stone, according to this invention, the refuse ashes and chinker, after being broken up, but before being mixed with the cement and other well-known ingredients, are thoroughly well washed with a solution of chloride of calcium and soda or potash.

223 of 1904.—E. HURN: *Method of Circulating Hot and Cold Water by Power.*

This invention consists of an internal or external screw inserted in a pipe, worked by power, whereby the circulation of water is accelerated, and all difficulties of circulation overcome. Its operation is as follows:—A revolving screw is inserted in the floe pipe immediately over the boiler or circulator. This screw is worked by belt and pulleys, driven either by motor, gas engine, or steam power. The high speed of this screw causes a greatly accelerated circulation of the water. It also overcomes the balance of power, thus surmounting all dips, in the circulation, thereby enabling any building to be warmed as easily with boiler placed in the roof as in the basement.

1,649 of 1904.—W. BALS: *Door Locks.*

A device for preventing accidental opening of door locks, comprising in its construction a star-wheel with several teeth, fixed to the stationary door wing or door post, and a spring-actuated retaining pawl for the star-wheel, in combination with a specially-shaped door latch.

2,771 of 1904.—J. FIDDIS and J. F. WATT: *Sprinklers for Extinguishing Fire.*

A fire sprinkler, consisting in the combination with a water pipe having a discharge outlet, of a friable bulb or dome normally closing said outlet, means for fracturing said dome, devices for normally supporting said fracturing means, but automatically releasing the same on abnormal rise of temperature.

8,460 of 1904.—A. URMACHIER: *Frames for Concrete Building, and other purposes.*

This relates to a boarding frame for the manufacture of beton structures, the essential feature of which is that, by means of vertical and horizontal bars, united by tubes and pegs, there is formed a frame divided into squares which are lined with short boards of a uniform size, the boards being held or locked together by U-irons and handles, but may be removed without interfering with the frame.

9,944 of 1904.—F. J. M. M. DUCASTEL: *An Agglutinant or Cement, and Method of Manufacturing the same.*

A process for manufacturing an agglutinant intended to replace lime and cement in all their applications, which consists in the treatment with heat in a rotary furnace provided internally with rollers, on the one hand of a preparation of lime or cement, and on the other hand of a given but variable quantity

of silicate, silicates, or even carbonates, these materials being crushed separately and mixed at the moment of their entrance into the said furnace, where, in a state of extreme sub-division, they are subjected to the action of gas.

10,235 of 1904.—E. C. MAHONY: *Portable Wall Sections for House-building.*

A knock-down house, consisting in the construction of its walls in portable sections, each comprising a basic frame on the outer side of which is a covering of weather boarding on a sheathing of impermeable material, and on the other side of the frame a wall lining of interior finishing, with an intervening air space between the outer and inner lining, and means for bonding such sections to one another to the house foundation sill, and to the roof structure.

TERMS OF SUBSCRIPTION.

"THE BUILDER" (Published Weekly) is supplied DIRECT from the Office to residents in any part of the United Kingdom at the rate of 10s. per annum (6s. numbers) PRE-PAID. To parts of Europe, America, Australia, New Zealand, India, China, etc., at 12s. per annum. Remittances (payable to THE BUILDER) should be addressed to the Publisher of "THE BUILDER," Catherine-street, W.C.

SUBSCRIBERS IN LONDON and the SUBURBS, by PREPAYING at the Publishing Office, 10s. per annum (6s. numbers) or 4s. 9d. per quarter (3s. numbers), can obtain receiving "The Builder" by Friday Morning's Post.

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

MEETINGS.

SATURDAY, AUGUST 20. Northern Architectural Association.—Visit to Sunderland. OCTOBER 6 and 8.

Visit of the Royal Institute of British Architects to Newcastle-upon-Tyne.—The following amongst other arrangements are being made in connection with the visit of the Institute to Newcastle: The Northern Architectural Association Reception Committee will receive the visiting members of the Institute at the County Hotel, at 8.0 p.m., on October 6th. His Worship the Mayor of Newcastle will receive the members at 10.0 a.m., on October 7th. After which, about an hour will be devoted to the reading and discussion of a paper on Specialism in Architecture. The President of the I.B.A. will take the Chair. The Cathedral and the Trinity House will be visited. The Northern Architectural Association will entertain the visiting members at luncheon at the County Hotel, Newcastle-street, at 8.0 p.m. Arrangements will be made for those members who wish to do so, to visit during the afternoon of Friday, places of interest in the immediate neighbourhood. In the evening a dinner will be held, and on Saturday, October 8th, arrangements will be made for those who desire to do so, to visit Hexham Abbey and the Roman Station at the Chesters, Chollerford, etc.; also the New Shipbuilding Sheds at Messrs. Swan & Hunter's, Wallsend.

TO CORRESPONDENTS.

H. M. T.—F. C. (Below our limit). NOTE.—The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors. We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, manuscripts, or other documents sent to or left at this office, unless he has specially asked for them. Letters or communications (beyond news items) which have been duplicated for other journals are NOT DESIRED. All communications must be authenticated by the name and address, and whether for publication or not. No notice can be taken of anonymous communications. We are compelled to decline pointing out books and giving addresses. Any commission to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance. All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

PRICES CURRENT OF MATERIALS.

* Our aim in this list is to give, as far as possible, the average prices of materials, not necessarily the lowest. Quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

BRICKS, &c.

Table listing prices for various types of bricks and building materials, including Hard Stocks, Rough Stocks, Grizzles, Facing Stocks, Shippers, Flattons, Red Wire Guts, Best Farnham Red, Best Red Pressed, Harboun Facing, Best Blue Pressed, Staffordshire, Do. Bullnose, Best Stourbridge, Fire Bricks, Slazed Bricks, Best White and Ivory Glazed, Stretchers, Headers, Quoins, Bullnose, and Flats, Double Stretchers, Double Headers, One Side and two Ends, Two Sides and one End, Splays, Chamfered, Squints, Best Dipped Salt Glazed Stretchers and Header, Quoins, Bullnose, and Flats, Double Stretchers, Double Headers, One Side and two Ends, Two Sides and one End, Splays, Chamfered, Squints, Second Quality White and Dipped Salt Glazed, less than best.

BRICKS, &c.—(continued).

Table listing prices for Thames and Pit Sand, Thomas Ballast, Best Portland Cement, Best Ground Blue Lias Lime, and Grey Stone Lime. Includes a note about the cement or lime being exclusive of ordinary charge for sacks.

STONE.

Table listing prices for Bath Stone, Portland Stone, Brown Whitbed, White Basebed, and Annaster in blocks. Includes a note about York Stone—Robin Hood Quality.

Table listing prices for Scapelled random blocks, 6 in. sawn two sides landings to sizes, 6 in. rubbed two sides, 3 in. sawn two sides, 2 in. to 2 1/2 in. sawn one side slabs, and 1 1/2 in. to 2 in. ditto.

Table listing prices for Scapelled random blocks, 6 in. sawn two sides landings to sizes, 6 in. rubbed two sides, 3 in. sawn two sides, 2 in. to 2 1/2 in. sawn one side slabs, and 1 1/2 in. to 2 in. ditto.

Table listing prices for Scapelled random blocks, 6 in. sawn two sides landings to sizes, 6 in. rubbed two sides, 3 in. sawn two sides, 2 in. to 2 1/2 in. sawn one side slabs, and 1 1/2 in. to 2 in. ditto.

Table listing prices for Scapelled random blocks, 6 in. sawn two sides landings to sizes, 6 in. rubbed two sides, 3 in. sawn two sides, 2 in. to 2 1/2 in. sawn one side slabs, and 1 1/2 in. to 2 in. ditto.

SLATES.

Table listing prices for 20 x 12 best blue Bangor, 20 x 12, 20 x 10 first quality, 20 x 12, 18 x 8, 20 x 10 best blue Port-madoc, 16 x 8, 20 x 10 best Eureka untinting green, 20 x 12, 18 x 10, 16 x 8, 20 x 10 permanent green, 18 x 10, and 16 x 8.

TILES.

Table listing prices for Best plain red roofing tiles, Hip and Valley tiles, Best Broseley tiles, Do. Ornamental tiles, Hip and Valley tiles, Best Rubson red, brown, or blushed do. (Edwards), Do. Ornamental do., Hip tiles, Valley tiles, Best Red or Mottled Staffordshire do., Hip tiles, Best "Rosemary" brand plain tiles, Best Ornamental tiles, Hip tiles, Valley tiles, Best "Hartmill" brand plain tiles, sand faced, Do. pressed, Do. Ornamental do., Hip tiles, Valley tiles.

WOOD.

Table listing prices for Deals: best 3 in. by 11 in. and 4 in. by 9 in. and 11 in., Deals: best 3 by 4, Battens: best 2 1/2 in. by 7 in. and 3 in. by 7 in. and 3 in. by 8 in., Battens: best 2 1/2 by 6 and 3 by 6, Deals: seconds, Battens: seconds, 2 in. by 4 in. and 2 in. by 6 in., 2 in. by 4 in. and 2 in. by 5 in.

WOOD (continued).

Table listing prices for Foreign Sawn Boards, Fir timber, Secondals, Small timber, Swedish balks, Pitch-pine timber, and Joists' Wood.

New Irrigation Projects for Egypt and the Soudan.—II.

LAST week we dealt with the various questions propounded by Sir William Garstin relative to the control of the Upper Nile. It is scarcely necessary

to point out that as the Soudan and Egypt proper must derive their supplies of water from the same sources, and as the prosperity of both countries depends entirely upon the one river, any important irrigation scheme projected for one country has a definite bearing upon the other. The ostensible object of the Report by the chief of the Public Works Department is to consider the improvement of the Upper Nile, but, as a matter of fact, the Blue-book goes beyond the subjects indicated in the title. For the sake of consistency, however, the discussion of works chiefly connected with Egypt is continued in appendices to the volume.

We now turn to the consideration of the main irrigation projects for Egypt, which, in the opinion of Sir William Garstin, are "advisable for execution within a not very remote future." The mild verbiage of the extract in the foregoing sentence is evidently intentional, for Sir William repeats in the present Report, what he has said on previous occasions, that the execution of large engineering works in Egypt is not

extremely urgent, with the solitary exception of an adequate escape for the Nile during unusually high floods. The various schemes proposed are recognised to be desirable, and properly so, for their realisation would largely increase the wealth of Egypt. We go a little beyond the studied moderation of official language, and suggest that some at least of the projects actually are urgent, although not vital to the financial stability of the country. In support of this contention we cite the fact that, although the Assouan Dam was only completed at the end of 1902, the whole of the water furnished thereby has already been apportioned, and the Irrigation Service has been compelled to refuse applications for water. The world, and Lancashire in particular, wants cotton of that variety which no country can produce better than Egypt, and yet, to quote the words of Sir William Willcocks,* "the Egyptian landowners of 1½ million of acres are compelled to wait perhaps for many years, while every country under the sun which can grow cotton is trying to acclimatise their special product, and they themselves are doomed to sit idle."

Those who read between the lines will see by the following extract that Sir William Garstin is fully aware of the advantages to be gained from the execution of further large engineering works for increasing the supplies of water to cultivators. He says:—"The desire to acquire fresh land in Egypt is general, and is becoming keener. An increase to

the cultivated area must also increase the revenues. If the Egyptian Government is prepared to face a large expenditure, then I see no reason for delaying the execution of the more important projects, and I have no doubt whatever that the results obtained will fully warrant such a decision if taken."

Before discussing any such schemes we will refer briefly to the question of flood escape. So many years have passed without the occurrence of a dangerous flood that the danger to Northern Egypt at such a time may appear to be a remote contingency. Sooner or later, however, another high flood will come, for past records show that the intervals between abnormally high floods never include many years. Owing to the extension of cultivation, the improved methods adopted, the increase of population, and the augmented value of land, the damage consequent upon a breach in the banks of the Nile would be far more serious in the present day than was the case in former times. Therefore it is imperative that a considerable sum should be expended in the provision of means for carrying off the surplus waters of dangerously high floods. If this precaution be neglected there will inevitably come a disaster that will carry ruin and desolation throughout the land. Two methods are now proposed for the provision of escape power: (1) The construction of an escape canal leading to the Wadi Rayan depression in the Fayoum, and (2) the remodelling of the Rosetta branch of the Nile. Both these projects receive attention in Appendix I. of the Report.

* "The Assuan Reservoir and Lake Moeris," 1904.

Department. In the first place, it is necessary to take into account the volume of water which it is now proposed to serve for irrigation purposes in the Sudan. The amount so apportioned is equal to 200 cubic metres per second, and an abstraction from the river during the winter months will not be without its influence on the scheme. As a matter of fact, two alternative projects are proposed by Sir William Willcocks: (1) A reservoir to hold two milliards of cubic metres with a single channel for filling and discharging; (2) A reservoir to hold three milliards of cubic metres with separate inlet and outlet channels.

In a supplement to Appendix I. of the Report, Mr. Webb, Inspector-General of Irrigation in Upper Egypt—making use of figures furnished by Mr. Verschöyle, Inspector-General for Lower Egypt, as to river discharges—shows that after deduction for the Soudan the smaller reservoir proposed could not be filled by means of the Khir Yusuf during the winter months in a year of minimum supply, and that even under a mean year the filling of the reservoir would be difficult and might practically affect navigation in the river. Further, he points out that in order to supply the Yusuf Canal it would be necessary to maintain a head of 4.5 metres above the Assiout barrage, a course that would in his opinion entail the construction of a subsidiary downstream reservoir similar to those recently built by Sir Ambury Brown below the Delta barrage, together with remodelling works in the Khir Yusuf and the upper reach of the Rahimieh Canal. Therefore, in order to render the smaller project feasible, it appears necessary either to increase the supply passing Assouan during the winter or to abandon the idea of providing the supplies proposed for the Blue Nile region. With regard to the second, larger project, Mr. Webb considers that the scheme is quite feasible, as the reservoir could be filled every year by a flood water, and even in very low floods like those in 1899 and 1902. Mr. Webb also criticises the dimensions of the feeder and outlet canals proposed by the originator of the scheme. However, so far as the principle of either project is concerned, there seems to be no essential difference of opinion between Sir William Willcocks on the one hand and Mr. Webb on the other. The recent proposal to withdraw water for the Sudan is a matter that might be dealt with by increasing the flow of the Nile by measures such as those discussed in our article of last week, and the dimensions of the feeder and outlet canals for the new reservoir are simply details, although they may affect the cost of the work very considerably.

There remains, however, one point for consideration which is of much importance, namely, the uncertainty as to whether, when the reservoir is full, the high water level maintained will not gradually cause infiltration through the levee separating the Wady Rayan from the Fayoum. About this there are differences of opinion. Sir William Willcocks states definitely that there will be no infiltration, pointing out that the present Fayoum was formerly full of water standing 63 metres higher than the bottom of the Wady Rayan, and

remained so for thousands of years. He argues that if there had been any serious infiltration from the ancient Lake Mœris there would have resulted a considerable lake in the Wady Rayan which could not have escaped the notice of the numerous travellers who have visited the district in various ages. Other authorities, including Sir Benjamin Baker and his colleagues on the Technical Commission, have expressed the fear that infiltration might result, and, taking everything into consideration, Sir William Garstin comes to the conclusion that a thorough geological examination of the country is desirable before definitely recommending the execution of the project.

Before leaving the question of the Wady Rayan it should be mentioned that in many respects this depression would constitute an admirable site for a flood escape, but we are inclined to agree with Mr. Webb, who points out that, "if the Wady Rayan is to be considered as a flood escape, it would be advisable to still further widen the inlet canal." The late Colonel Ross calculated the minimum discharge of a Nile flood escape at 100,000,000 cubic metres a day. Such a discharge would necessitate a canal of very large section and very heavy expenditure which, the Report says, would only be warranted were no alternative means available. This consideration leads to the third proposal, namely, the remodelling of the Rosetta branch of the Nile.

In his recent pamphlet Sir William Willcocks recommends that both branches of the river should be so improved as to diminish the danger from flood. The insecurity of the country against a very high flood is only known to those responsible for guarding its banks, and we have already stated that immunity from dangerous floods cannot be expected to continue. During high floods, the Nile is considerably above the level of the land, which is protected by embankments stretching from Assouan to the sea. In Upper Egypt a very high flood is fully 1 metre above the land, on the Rosetta branch of the Nile it is 2 metres, and on the Damietta branch as much as 3.5 metres in some places. The Damietta branch is practically little more than a canal, and Sir William Willcocks considers the wisest policy would be for the Government to take the Rosetta branch and call it the Nile, regulating upon the

Damietta barrage as though the Damietta branch were an ordinary canal. He proposes that the section of the Rosetta branch shall be brought to a uniform width by means of spurs, and the banks thrown back where necessary, so that this channel may be able to carry a much larger discharge without danger to the country. It should be added that the desirability of avoiding an excessive discharge in the Damietta branch has long been recognised by the responsible chiefs of the Irrigation Department, and the only thing necessary with regard to this waterway would be to regulate it by means of the Barrage, so that the discharge should not exceed that of a normal flood. In the opinion of Sir William Garstin, it would certainly stand this without any serious risk to the country, more especially if a sufficient sum were spent in strengthening the banks and in training works. He says with regard to the Rosetta branch, "If it is to act as a flood escape, and I agree with Sir William Willcocks that it should be made to do so, then, as he says, it must be put in thorough order and remodelled throughout its length."

Apart from auxiliary works for the efficient distribution of water, and, above all, of drainage works which are absolutely indispensable corollaries to irrigation canals, the conversion of lands from basin to perennial irrigation, the reclamation of areas still unfit for cultivation, and the regular operations of the Irrigation Service, we have now touched upon all the important irrigation works projected or foreshadowed in connexion with Egypt and the Soudan.

Let us next summarise the various undertakings mentioned in the Report, some recommended for immediate prosecution, others for execution after a few years, and others as proper objects for inquiry. In the table following we include the estimated cost of each project, these figures being subject to the reservation that they are, as Sir William Garstin says, "nothing but approximations, based for the most part upon rough calculations, and that consequently they do not possess much value." Definite estimates will of course be prepared later, from which accurate ideas of the cost and value of the various schemes can be obtained. In the meantime we may fairly assume the amounts set forth to be quite near enough for general guidance.

TABLE SHOWING NEW IRRIGATION PROJECTS FOR EGYPT AND THE SOUDAN.

No.	Description.	Chief Object.	Estimated Cost.
1	Remodelling Rosetta and Damietta Branches of the Nile	To provide flood escape	£E. 900,000
2	Raising of the Assouan Dam	To increase storage capacity by 1,000,000,000 cubic metres	500,000
3	Bahr-el-Gebel:— (a) Construction of New Channel (b) Remodelling of Bahr-el-Zaraf	To increase water supply for Egypt and the Soudan	5,500,000 3,400,000*
4	Wady Rayan Reservoir	To store water for Lower Egypt and to serve as a flood escape	5,700,000†
5	Conversion of 750,000 acres in Upper Egypt to Perennial Irrigation	To utilise additional storage in Assouan reservoir	3,000,000‡
6	Two Barrages in Upper Egypt	To facilitate distribution of additional water stored in Assouan reservoir	2,000,000
7	Canal and Drainage Works in Lower Egypt	To utilise additional supplies contemplated	1,000,000
8	Regulation of Lakes Victoria and Albert	To provide further water for Egypt and the Soudan	2,000,000
9	Barrage on Blue Nile	To develop the Eastern Soudan	1,000,000
10	Ghezreh Canal System on Blue Nile	"	2,000,000
11	Reservoir near Rosaires on Blue Nile	"	2,000,000
12	River Cash Scheme	"	500,000
13	Reservoir Project on Abbara River	"	—
14	Reservoir Projects on Rivers Dinder and Rahad	"	—
15	Reservoir Projects on Upper Valley of Atbara River	"	—

* This is merely an alternative. † The cost, as estimated by Sir William Willcocks, is only 2,600,000£. E.
‡ This item is stated at 5,000,000£. elsewhere in the Report, apparently in error.

Beyond the undertakings mentioned in the foregoing table, it must be borne in mind that, as previously stated, at least 1,000,000*l.* has still to be spent upon conversion works in Middle Egypt, so as to permit the complete utilisation of the water held up by the Assouan Dam at its present height. As this expenditure forms part of the previous irrigation programme connected with the Nile Reservoir Works, the item is not included in the table, although the funds have still to be provided by the Egyptian Government.

Considering the relative urgency of the works mentioned in the table, we must first emphasise the fact that, while the needs of Egypt proper are of paramount importance, the Soudan ought not to be neglected. This point to some extent affects the order in which the works are recommended for execution. Again, some of the projects are at present in a very nebulous condition, and cannot be regarded as being more than mere suggestions for inquiry. Lastly, we must remember that, even if the whole of the plans were prepared, and the funds were available, the works could not be completed for many years to come, partly because it would be necessary to preserve a certain natural sequence, and partly because extensive auxiliary works in the form of weirs, regulators, irrigation canals, and drainage channels would have to be executed after the completion of each item in the large programme now before us. Subject to such reservations as these, we may point out what portions require relatively early treatment and what portions may advantageously be left for future consideration.

Having regard to the urgent necessity for protecting the highly-cultivated lands of Egypt from disaster in the event of dangerously high flood, we are thoroughly justified in placing the remodelling of the Rosetta and Damietta branches in the first place, and the raising of the Assouan Dam second, although, as suggested by Lord Cromer, the two works might be dealt with simultaneously. If no special provision were contemplated for the Soudan, we should be inclined to support Sir William Willcocks in advocating the formation of a reservoir and flood escape in the Wady Rayan, and in assigning the third place to this project. The determination of the Public Works Department to take early steps for the development of the Soudan naturally indicates the improvement of the Bahr-el-Gebel as the project next in order to the two already mentioned. Having increased the discharge of the Nile by obviating waste in the Sudd regions, it might certainly be advisable to construct the proposed reservoir in the Wady Rayan, and then, adding the storage capacity of the reservoir to that of the Assouan reservoir, enough water would be stored within the boundaries of Egypt to suffice for the irrigation of every acre of cultivable and reclaimable land. Sir William Garstin at present appears to assume that the improvement of the Bahr-el-Gebel may furnish enough water to render unnecessary the construction of the Wady Rayan reservoir, but possibly he is also taking into account the extra discharge to be obtained by regulation of the Great Lakes. At any rate he does not include the item

among his present recommendations. No one can predict how long it will be before the two projects on the Upper Nile can be realised, and one most favourable feature about the Wady Rayan scheme is that the site is right in the midst of civilisation and readily accessible for the introduction of labour and materials. Assuming no geological difficulties are shown to exist, the construction and filling of the reservoir could be completed within a period estimated by Sir William Willcocks at four years; and by Mr. Webb at seven years. The water stored would then be available for Egypt while more ambitious undertakings were in progress, and when additional supplies from the upper waters of the White Nile become so ample that the Wady Rayan will no longer be required as a reservoir it will constitute an efficient flood escape, as Lake Mœris did in ancient times. The point here discussed is of much importance and clearly deserves consideration.

Turning attention to the Soudan, we cannot do better than quote the words of Sir William Garstin, who says, "The money that may be spent in that region upon development is practically unlimited." At the present time water and irrigation works are wanted to a limited extent for the encouragement of agriculture by the existing population. But it is undoubtedly the fact that the Soudan is not yet ready for the introduction of irrigation works upon a large scale. For many years to come the chief want of the country must be population. As, however, no progress will be possible until a commencement has been made, all the projects mentioned are to be studied without delay, and those which promise even a moderate amount of success will be put in hand as soon as the necessary funds become available.

Sir William Garstin has prepared three estimates which we have summarised in the following table:—

NEW IRRIGATION PROJECTS RECOMMENDED.

No.	Description.	Estimate I.	Estimate II.	Estimate III.
		£.	£.	£.
1	Rosetta and Damietta Branches	900,000	900,000	900,000
2	Assouan Dam	500,000	500,000	500,000
3	Bahr-el-Gebel	5,500,000	3,400,000	5,500,000
4	Conversion of Upper Egypt Basins	3,000,000*	3,000,000*	2,500,000
5	Barrages in Upper Egypt	2,000,000	2,000,000	1,000,000
6	Canal and Drainage Works, Lower Egypt	1,000,000†	1,000,000†	500,000
7	Regulation of Great Lakes	2,000,000	2,000,000	2,000,000
8	Barrage on Blue Nile	1,000,000	1,000,000	1,000,000
9	Ghezireh Canal System	2,000,000	2,000,000	500,000
10	Reservoir at Rosaries on Blue Nile	2,000,000	2,000,000	500,000
11	River Dash Scheme	500,000	500,000	500,000
	Total	20,400,000	18,300,000	12,900,000

* Stated at 3,000,000*l.* on p. 175 and 5,000,000*l.* on p. 176, the latter apparently in error. † Omitted in Estimates I. and II., as given in the Report. ‡ One barrage only.

For some reason, not experienced in the Report, the item for the execution of canal and drainage works in Lower Egypt is omitted from Estimates I. and II. in the original. We have therefore added the cost of these works in each case, so that the three schemes may be comparable, and, as in the previous table, we have put the cost of conversion works in Upper Egypt at the figure first stated in the Report. Estimates I. and II. include the projects which Sir William Garstin selects as those most suitable for execution, leaving the others mentioned in his Report for subsequent consideration. It will be observed that No. II. is the same as No. I., with the exception of the item relative to the Bahr-

el-Gebel, the cost of the new channel being included in the former and that of improving the Bahr-el-Zaraf in the latter. Estimate No. III. deals simply with works considered to be urgent, but a footnote in the Report says, "The only really urgent works to my mind are Nos. 1, 2 and 3. These involve an expenditure of 6,900,000*l.*"

We have now to see what return may be anticipated from the expenditure involved. Sir William Garstin says that this is not easy of calculation, especially so far as the Soudan is concerned, for it is impossible to predict how soon the revenue will reach the maximum, corresponding with the ultimate expenditure. Taking Estimate No. I. as the basis of calculation, the results are as given below:—

APPROXIMATE ANNUAL RETURNS IN LAND TAX FROM EXPENDITURE IN ESTIMATE NO. I.

UPPER EGYPT:—	£.	£.
- Basin Land Converted	375,000	
- Land Irrigated by Pumps	30,000	
LOWER EGYPT:—		
- Land Brought under Cultivation	800,000	1,205,000
THE SOUDAN:—		
Ghezireh Lands	350,000	
Lands on the Gash	50,000	
Land in the Nile Valley North of Khartoum	100,000	500,000
Grand Total		£1,705,000

Assuming the correctness of the figures, the return upon capital would be about 8·35 per cent., without taking into account the increased value of the land brought into cultivation or the increase in the railway and custom receipts. The increase in the value of land would be very considerable. In Egypt alone, two million acres remain for improvement, two-thirds of this area having only flood irrigation, and one-third being entirely without irrigation. Sir William Willcocks, who, in addition to his long office

experience, has acquired useful commercial experience as the managing director of a land and irrigation company, estimates that the value of these lands would be increased by 30*l.* per acre perennially irrigated. This means an addition of 60,000,000*l.* to the national wealth. Taking Estimate No. I., and debiting the Soudan with 2,000,000*l.* only of the cost of works on the Bahr-el-Gebel and at the Great Lakes, we have, in round figures, 13,000,000*l.* for Egypt and 7,500,000*l.* for the Soudan. Then, over and above returns in the form of land tax and other receipts, Egypt would obtain 60,000,000*l.* for an expenditure of 15,000,000*l.*; there is no reason why a similar

satisfactory result should not be attained in the Soudan by careful and judicious outlay.

The possibilities opened up by the projects discussed are vast almost beyond conception. No doubt the details of the various schemes may have to be modified as further information is rendered available, but the general programme surely indicates the lines of development to be followed. Sir William has clearly earned the gratitude of Egypt by the care and conspicuous ability with which he has created the subject, and, if successfully accomplished, the works foreshadowed in his Report will increase the wealth of the country beyond the dreams of the most sanguine, and at the same time will constitute a splendid monument to the engineering genius of the present era.

THE PRESIDENTIAL ADDRESS AT THE BRITISH ASSOCIATION MEETING.

MODESTLY describing himself as an amateur, Mr. Balfour delivered on Wednesday last week one of the most admirable presidential addresses which has been contributed to the proceedings of the British Association within recent years. The subject chosen, "Reflections Suggested by the New Theory of Matter," necessarily involves the consideration of difficult and abstruse problems, and the task of preparing an address upon such a subject, for delivery before a critical audience, would be thought sufficiently formidable, even by a professional scientist. In his address, Mr. Balfour deals almost entirely with speculative physics. He shows that during the last hundred years the views of scientists have been much modified, not merely by such far-reaching discoveries as the atomic and molecular composition of ordinary matter, the kinetic theory of gases, and the laws of the conservation and dissipation of energy, but by the more and more important part which electricity and the ether occupy in any representation of ultimate physical reality. To-day we have new theories of matter. There are some who think that all material substances, whatever be their outward form, or atomic constitution, are but electricity itself, the atoms themselves being made up of electrical monads. Others go a step farther, and suggest that these electrical monads may be but a modification of the universal ether. Whether this final unification be accepted or not, it is clear that electrical monads cannot be considered apart from the ether, upon which, indeed, the electric theory of matter depends. If this theory be accepted, we must admit the presence of inconceivable amounts of internal energy, confined within the atoms of apparently inert matter. This aspect of the question is admirably expressed by Mr. Balfour in the following words:—"We can then no longer assume that if the internal energy of a sun were as far as possible converted into heat, either by its contraction under the stress of gravitation or by chemical reactions between its elements, or by any other interatomic force, and that, were the heat so generated to be dissipated

as in time it must be, through infinite space, its whole energy would be exhausted. On the contrary, the amount thus lost would be absolutely insignificant compared with what remained stored up within the separate atoms." The stupendous forces lying within and around us, if modern views be correct, may never be of utilitarian value, but they will continue to stir the imagination and to excite the wonder of mankind. All theories of the kind are, however, purely speculative. No one even knows what electricity actually is, nor has the existence of ether been experimentally proved. The unification of physical nature is a most alluring idea, but Mr. Balfour very justly asks whether there is any legitimate reason for expecting that the material world should be a modification of a single medium, rather than a composite structure built out of sixty or seventy elementary substances eternal and eternally different. Reverting to the electric theory of matter, Mr. Balfour shows that it carries us into a new region of thought. In accordance with its teaching, matter is no longer matter, and the atom is merely the theatre in which electrical monads perform their operations. Thus we come to a point which is forcibly expressed by Mr. Balfour in the following manner:—"We claim to found all our scientific opinions on experience; and the experience of which we found our theories of the physical universe is our sense perception of that universe. That is experience; and in this region of belief there is no other. Yet the conclusions which thus profess to be entirely founded upon experience, are to all appearance fundamentally opposed to it; our knowledge of reality is based upon illusion, and the very conceptions we use in describing it to others, or in thinking of it ourselves, are abstracted from anthropomorphic fancies, which science forbids us to believe and nature compels us to employ." Mr. Balfour here puts his finger on a difficulty that cannot be removed until more light is available. Men are still groping for the truth, assisted by a mere glimmering ray of light, and until the hidden secrets of nature are made clear, we must rely for daily guidance upon the phenomena which afford the bases of various departments of applied science. The aspirations of the pure scientist are more exacting than those of the practical scientist. Hence, those who employ matter in engineering and constructive science, may be content to act as if steel, stone, and timber were actually steel, stone, and timber, and to disregard the possibility of their possible electrical or ethereal constitution. We regret that space will not permit more detailed reference to Mr. Balfour's fascinating cosmical speculations, which will be appreciated by all true scientists, even if some of the views expressed may be not entirely accepted.

SHAFTESBURY AVENUE, W.C.—It is stated that Mr. W. G. R. Sprague has been appointed to prepare plans and designs for a theatre, to be erected for Mr. and Mrs. Seymour Hicks, as proprietors, upon the northern side of Shaftesbury Avenue, upon the area bounded by Wardour, Rupert, and Little Rupert streets. The lessee is Mr. Charles Frohman, and the plans will provide for a suite of offices in the upper part of the new buildings.

NOTES.

Live Rails. IN view of the constant occurrence of serious accidents from live rails and overhead wires, it seems clear that the Board of Trade will have to take steps for the protection of the public. Few people will agree with the writer of an extraordinary letter published in the *Times* on the 20th inst., that the public must be educated to take care of themselves, and must leave the pavements at their own risk of treading on live iron covers or rails. This has certainly not been the trend of modern legislation, and although it is true that many of the accidents recently reported have occurred through unauthorised persons trespassing on railway lines, it must be borne in mind that the employees themselves are entitled to protection from unidentified live rails. An unfenced hidden danger, such as this, is entirely at variance with the legislation for factories, under which employees are safeguarded against all dangers on such premises, and on docks and wharves; and we trust similar legislation will soon be passed to prevent this constant recurrence of electrical accidents.

The Motor-dust Problem. NOT only ordinary users of country roads but also the inhabitants of roadside dwellings are beginning to cry aloud for protection from the clouds of dust raised by every passing motor-car. We have ourselves, in common with many of our readers, suffered much from the dust-raising capacity of motor vehicles; but, in spite of personal inconvenience, we are rather inclined to look upon these as blessings in disguise. They have already served to emphasise the fact that our main highways are unsuitable for present-day requirements, and have made it clear that instead of consisting of stone and mud, or stone and dust, according to the season of the year, road surfaces should be consolidated with proper binding material. It is obviously the duty of local authorities and their professional advisers to find materials of construction suited to the requirements of the travelling public. Tar macadam, oiled roads, and roads treated with patented compounds, all afford relief from the dust nuisance, and are available for adoption in all parts of the country. Additional expense must certainly be incurred in connexion with any improved system of construction, and this constitutes the chief difficulty in the way of reform. Non-motorists are fairly unanimous in thinking that motors should be taxed so as to provide the necessary funds; but, on the other hand, motorists contend, and with some show of reason, that the pounding of horses' hoofs, and the grinding action of iron-tired wheels, are the primary causes of the dust, which is afterwards raised by the wind, and by other vehicles, as well as by motor-cars. It seems, therefore, that the proper course would be to tax all classes of the community alike. But whatever be done, the character of our road surfaces must inevitably be changed, and the sooner this truth is realised the better it will be for everyone concerned.

Electricity
and
Matter.

THE article on the "Electric Theory of Matter" by Sir Oliver Lodge, which we mentioned recently in our review of *Harper's Monthly Magazine* for August, is worthy of more than a passing notice. He states very clearly the modern electric theory of matter, and gives an outline of its historical development. Maxwell stated thirty years ago that he was ignorant of the precise nature of electricity, but that possibly it might be a form or aspect of matter. Modern theory goes a step farther and says that matter is composed of electricity and of nothing else. Of the "positive" electricity in matter the theory says little, but of the "negative" electricity it makes many definite assertions. Negative electricity consists of excessively minute particles, generally called electrons. In a vacuum tube these electrons fly from the negatively charged terminal, and when they hit anything the impact is appreciable and considerable heat is produced. It is not easy to stop these electrons. A thin sheet of aluminium is practically transparent to them, but a heavy metal, like platinum, is opaque, and the impact produces both light and Röntgen rays. Radium is continually giving off three kinds of rays. The beta rays are formed of electrons and are identical with the rays in a vacuum tube. The gamma rays are a kind of ethereal pulse similar to light rays, and the alpha rays are formed of atoms apparently belonging to a new substance. By measuring the deflection produced by a magnet on the alpha rays Rutherford predicted that the radium emanation was probably helium, and this has been verified by Sir W. Ramsay. It is natural therefore that scientists should regard the surprising results deduced from the mathematical theory as possibly representing the true facts of the case. It has to be remembered, however, that although Newton's corpuscular theory of light explained practically all the ordinary phenomena of light, yet it failed to survive the crucial test devised by Arago. Hence we should not be surprised if some new discovery did not make a profound modification of the modern theory necessary. It seems to us that the fatally weak point in modern theories is their presupposition of an ether in which the electrons of infinitesimal volume vibrate. We would be the last to depreciate the wonderful work done by J. J. Thomson and his pupils at the Cavendish Laboratory, Cambridge, but there seems to us to be a possible danger that the attractiveness and beauty of the hypotheses may lead scientists to neglect some of the less showy theories of the past which still need to be completed and may furnish results of great practical importance.

The
Buda Pesth
Fire Congress.

ONE of the most useful results of the recent International Fire Service Congress in the Hungarian capital was a series of recommendations, drawn up in the form of a resolution which is to be addressed to all the Governments of the world. The relation of chemistry to fire prevention is very properly emphasised, for fire itself is an evidence of chemical action, which can best be

checked or neutralised by scientific aid. It is recommended that the owners of mills and factories should be required to organise private fire protection services for the extinction of fires in their first stages, that they should be compelled to notify the authorities of all outbreaks occurring on their premises, and that the danger of fire should be systematically combated by the enforced adoption of fire-resisting construction. Due importance is attached to the use of non-flammable materials in theatres and kindred buildings, and to the employment of fire-resisting decorations in such structures. Finally, the universal application of fire-signal systems in all urban, suburban, and rural districts is strongly advised. There is nothing very novel in the foregoing proposals. They are obviously in accordance with the dictates of common sense, but will never be generally adopted unless made compulsory. Hence the chief value of the resolution seems to be that it will bring the whole subject before the attention of those having the power to make laws and regulations.

Recent
Wind Storms
in America.

WE are told that the tornado is an evidence of the process of adjustment by which the atmosphere regains its stability. This may be satisfactory as an explanation, and the final result may be equally so, considering the matter solely from the standpoint of the physicist. But mere spectators, whether they be property owners or not, rarely enjoy the operations by which equilibrium is restored. This opinion is freely entertained in the United States at the present moment, where we are sorry to find severe storms have occasioned widespread damage and serious loss of life. Experience has shown that no structure, however strongly built, is strong enough to withstand the enormous power of the wind in the funnel of a tornado, and the recent evidences of this fact are particularly striking. Last week property to the value of 400,000*l.* was destroyed at St. Paul, Minnesota, and a steel bridge crossing the Mississippi was practically wrecked, one of the masonry piers being cut asunder by the force of the wind. In the city of Minneapolis, although the storm lasted but fifteen minutes, buildings were unroofed, the fronts of houses were blown bodily in, and a lofty building occupied by private inhabitants was blown down, 200 persons being reported as having been killed by the collapse. The violence of the recent storm at St. Paul is shown by the statement that the tornado moved on its course at the rate of 80 miles an hour, a speed quite irrespective of the velocity of the currents in the tornado-funnel itself.

Proposed
Canal
Amalgamation.

PUBLIC interest is slowly being awakened to the importance of preserving and improving the internal waterways of this country. Manufacturers in Lancashire, in Cheshire, in the Midlands, and in the west of England have been working for some time in the interests of the canals, assisted by various Chambers of Commerce and members of Parliament, among whom Sir John Brunner may be particularly mentioned. The question of a

public trust for canals was lately proposed, strange to say, by the chairman of a large railway company, and the same idea was again discussed by Colonel Roys, M.P., at the meeting of the Rochdale Canal Company held in Manchester recently. It is satisfactory to learn from the remarks of this speaker that the Liverpool Chamber of Commerce proposes to take the matter up seriously, and to bring it before the meeting of the Associated Chambers of Commerce in Manchester. The canals touching that centre certainly seem to present favourable features for the arrangement of an amalgamation. A combination of the Rochdale Canal with the Leeds and Manchester, the Bolton and Bury, the Bridgewater, the Calder and Hebble, and the Ashton Catwisp canals would provide facilities for an enormous manufacturing district, of which Manchester is the natural centre. While we do not for a moment wish to imply that this is the only favourable opening for amalgamation, it would certainly be a most excellent field for such an enterprise, especially in conjunction with a well-organised scheme of electric haulage.

The
Water Supply
Problem
in Paris.

IT is well known that the existing water supplies of Paris are not only inadequate in quantity, but that the supply of drinking water is far from satisfactory in quality. Only last week the authorities found it advisable to issue notices to the inhabitants recommending the boiling of all water intended to be used for drinking purposes. The necessity for increased supplies of better quality has long been recognised, and the question becomes more serious year by year. It is satisfactory to learn, therefore, that a deputation from the Municipal Council is now on its way to Germany with the object of ascertaining the methods adopted in connexion with the water supplies of Berlin, Hamburg, Frankfurt, and other large German cities. We do not know whether a similar visit is contemplated to this country, but we think that a week or two spent in examination of the various waterworks of London would well repay the time and expense involved. Considering the comparatively unfavourable character of the sources from which the water of London is obtained and the excellent quality of the water supplied, it is quite evident that the engineering and administrative methods adopted must be thoroughly worthy of imitation by our neighbours across the Channel.

The Convent
of St. Clare,
East London.

THE destruction of the London and North-Western Railway Company's premises by the recent fire which broke out at Haydon-square brings to light some remains that one or two newspapers of last week erroneously described as appertaining to the Priory of Holy Trinity. The fragments consist of two windows and a blocked-up doorway in the wall of Holy Trinity Church in the Minories, which was established there after the dissolution of the religious house of St. Clare, or *Sorores Minores*. The dedication of the church to the Holy Trinity betrays Cunningham and many subsequent writers into confusing the Convent of St.

Clare with the Priory of the Holy Trinity at Aldgate, on the remoter side of Leadenhall-street. The Priory was established by Queen Mathilda in the first decade of the XIIIth century, and as a religious foundation may be said to be now represented by the Church of St. Katharine Cree. The Convent of St. Clare had a later origin, having been founded nearly 200 years afterwards for Sisters of the Order of St. Clare by Blanche, Queen of Navarre, who became the wife of Edmund, Earl of Lancaster. The later name of the neighbouring street is a corruption of Minorettes, by which style the nuns of St. Clare were commonly known.

NOTES AND SKETCHES IN SOUTHERN ITALY.—II.

ASCOLI PICENO.

ASCOLI "Piceno" (for there is another Ascoli near Melfi) is situated in the valley of the Tronto, near the junction of the Castellano with that river, so that the walls rise from a picturesque ravine on both sides of the city, which is pleasantly situated in an amphitheatre of hills, and bristles with many towers, which are more varied in form than those of the celebrated San Gimignano "dello belle torri." It is the ancient *Asculum Picenum*, and still retains many signs of its antiquity. It was the capital of the Picentines, and Pliny says that it existed before the transplanting of the Sabines. According to Florus it was one of the principal cities of the federation of anti-Roman Italy. In 299 B.C., however, Rome allied herself with Ascoli against the Etruscans, Samnites, and Senones, but the weaker party went to the wall and Ascoli was subdued by Rome. It rebelled, and took a prominent part in the Social war, giving the signal by killing the proconsul and other Romans. For this it was sacked by the Consul Strabo, and was afterwards made a *municipium*, and from that time remained faithful to Rome. In mediæval times it belonged to the Lombard League, but after a time became Gibelline. It had a stormy and exciting

history until the end of the XVth century. In 1185 it threw off its bishop's yoke and proclaimed itself a Republic. Innocent III. excommunicated it in 1192, and two years after it returned to its allegiance, but welcomed the Emperor Henry VI. with festival. Then it rebelled against the imperial authority and was sacked in 1242 by Frederick II., so returned to allegiance to the most powerful and was allowed to build a fortress near the mouth of the Tronto, which was completed in three years, and so excited the jealousy of Fermo that long wars ensued between the cities with much damage. After that it struggled to maintain its liberty against Galeotto Malatesta, Francesco Storza, and others. The latter stayed some time in the city and tried to stamp out suspected conspiracies by erecting quite a grove of gallows. In 1482 it bought the right to call itself a Republic from Sixtus IV. at the price of an annual tribute of 3,000 scudi. The usual struggles between the principal families followed, and in 1535 during an *émeute* the Palazzo Comunale with its archives was burnt. In 1540 Paul III. sent a commissary and built the fortress of Porta Maggiore, but in 1555 the governor was killed and the Pope took away every privilege from the town and re fortified the ancient Pelasgic citadel. It regained some of its privileges under Gregory XIII. in 1573, and, except for the excesses committed at the time of the French Revolution, has passed an uneventful existence since then.

The important antique remains include portions of the walls, the Porta Romana anciently called Binata, from its two equal arches standing side by side, through which the Via Salaria passed, and the Ponte di Maestro Cecco, a Roman bridge also belonging to the Via Salaria. Another bridge, with one fine arch bestriding the ravine, called the bridge of Solesta, is also recognised as Roman; a double gate was erected on it on the city side in 1230 to solemnise the peace between Fermo and Ascoli. There are three other bridges, one of which (the Ponte Maggiore), of three arches and 160 ft. high, was built in 1373 by Massimo and Nicoluccio Ravvolto, Ascolan artificers. Near the Porta Maggiore is the fortress built by Galeotto Malatesta in 1349, remade by Antonio San Gallo and now a prison. The fortress built by Pius IV. on the ancient fort called the Cassero is now called "La Pia." There are also some small remains of a theatre

and an amphitheatre, and on the hill above the town the church of the Annunciation, with its conventual buildings (now an agricultural college), occupies the site of the Ascolan baths, and a great palace of the prefect Polimius, the substructures of which are enormous masses of brickwork. The ancient aqueduct has been repaired, and supplies the town with good water. Other buildings occupy antique sites. The cathedral is said to have been built on the ruins of a temple of Hercules: the original substructures are still visible; and S. Gregorio Magno is said to be on the ruins of a temple of Vesta.

The Palazzo Anzianale, the ancient Communal palace, occupies the site of the ancient Palatium Album, the dwelling of the counts and governors, and contains a small museum in which are antique inscriptions, etc., many of which may also be seen incrustated in the walls of houses. It is at one side of the Piazza Aringo, near the Cathedral and Baptistry. The present façade dates from the XVIIth century, but last year the removal of some walls which cut up a portion of the interior into small rooms disclosed the ancient Loggia del Arringo in which the Council of 800 met to discuss public affairs. It is believed to have been built towards the end of the XIIth century, travertine being the material used, though some of the columns appear to have been of brick, plastered. The capitals are cubiform, slightly moulded, as are the bases. There are fourteen columns with corresponding wall pilasters, which support a triple series of round arches about 25 ft. high. The vaulting is quadripartite. The interior of the cathedral has been highly decorated in modern times. In a chapel on the right are several pictures by Crivelli of considerable merit (his pupil, Pietro Alamanni, also worked in Ascoli). The Annunciation by him now in the National Gallery was painted for the Ascolan church of SS. Annunziata to commemorate the concession of communal government by Sixtus IV. which arrived on Lady Day; after which the Annunciation became the official festival of the city. S. Enidius kneels beside the angel and bears Ascoli in his hands.

The town was the outpost of the Pontifical States towards the kingdom of Naples, and has a good deal of XIVth-century Gothic and Early Renaissance architecture in it as befits a place

Ascoli Piceno: Roman Bridge and Mediæval Fortress, now a Prison.

SS. Vincenzo ed Anastasia, Ascoli Piceno.

which was of importance in those times. The church of SS. Vincenzo ed Anastasia illustrated, bears a date, 1389, on a stone by the south door. The side doors are both of this period, but the west door appears to be earlier. There is a clerestory of small two-light windows, four on each side, which have the Byzantine block above the capital and small round arches, and the Campanile, which is contained in the rectangular plan, has similar coupled arches with widely sloping caps. Round arches without mouldings are within, resting on square piers with small impost; the eastern end is apsidal. Another curious church is S. Giacomo, square in plan and without external apse, though the masonry of the east wall shows a large pointed arch. It has a small wheel window in this wall with twisted colonettes radiating to round arches without mouldings. The west door has a damaged fresco above it in the lunette, and resembles that of SS. Vincenzo and Anastasia in design, with two twisted columns in the angles and a dogtooth among the arch mouldings. The design of the scroll of the archivolts is very XIIIth century. The side doors had pent-house roofs and are simpler; all are of the XIVth century. The Campanile here is also contained in the plan, and has round arched openings and a conical top above the cornice.

The great church of S. Francesco at the end of the Piazza del Popolo, built in 1269 by Antonio Viperà, has its façade on the "Trivio." The central door has a fresco in the lunette over the door and foolish lions mounted on pillars at the sides. Ranges of elaborately twisted and chevroned pillars are in the jambs, and the arch is flanked by pinnacles, with four rows of sunken empty panels of curiously varied shapes at the top. Those of the side doors have three rows only. The carving of ornament is rich and rather Byzantine in treatment, using the drill a good deal and sharply cut. At the top of each side-band of ornament is a bull's head. The door on the south is somewhat similar, but is surmounted by a Renaissance addition, with very tolerable effect; close to it is the charming Loggia de' Mercanti, a very pretty Renaissance arcade. The interior is very fine and simple in proportion, spacious and quite undecorated. An arcade of five lofty pointed arches serves the nave, then comes a transept, in which the aisle wall is pierced with a double arched triforium and arcade below. There is an octagonal dome with four large and four small sides, with a blind arcade of pointed arches within and small pendentives below. The apse is six-sided and vaulted, and in three of the sides are simple windows. The vaulting of both nave and aisles is quadripartite,

that of the nave on a higher level, springing from pilaster strips. The lower stories of the two towers which flank the apse open into the church by similar arches to those in the end of the transepts. The window tracery of the side walls much resembles the quaint shapes of SS. Annunziata, Solmona. Externally the effect is fine and masculine, with broad surfaces and few mouldings. The Piazza del Popolo is surrounded by a XIVth-century arcade, reminding one of Verona or Padua. There is but one story above it and then Ghibelline battlements of brick, shown above the Loggia de' Mercanti in the drawing. In the middle of one side is the Palazzo del Comune, restored after the burning in 1535, but still retaining the earlier tower. The Baptistry is very early, probably of the IXth century. The ground plan is a square and at the angle arc pendentives making the upper part octagonal, with an arcade of three arches on each side, except at the west where there are four, beneath a small roof cornice. Beneath each group in the continuation of the square wall is a small window with impost. Below that on the west side a discharging arch shows. There are doors on the east and south sides and a few antique fragments are built into the walls. The roof, of flat slope, is crowned by a little pinnacle pierced with pointed arches. The door on the east is square-headed, has simple mouldings, and is flanked by square-headed panels; above all three features are triangular sinkings. The south door has a round arch with lintel below formed of a fragment of Comacine interwoven pattern; on the left jamb is a kind of cap, on the other rough volutes. The architrave moulding is rather flat, but much more elaborate than in the other door.

Another interesting ancient building is the Casa Longobarda, which appears to be really of the VIIth or IXth century, and retains much of its original appearance. On the upper story there are four double arched windows with central colonettes, the caps to which are queerly shaped and roughly cut, and one has a carved base. One of these windows was ornamented with "scodelle" on the jambs and on the walls near to it. The door is at present round-arched without mouldings, above it is a square-headed window and there is one to the left of the door with sickle shapes and letters carved on the lintel in low relief. The upper windows have a cable moulding and fillet round the arches, and the spandrels of three of them have carvings very slightly modelled, with the ground sunk round the outline. The first has a castle and two anchors, the second two trees, quite modern in their simplicity and lack of design, the third animals and a bunter chasing them. Above runs a twisted band into which

the gargoyles sink. On the side towards the street are also sinkings for "scodelle" and fragments of an interwoven band now displaced. The roof is a lean-to against one of the towers of the mediæval Ascolan nobility, of which there were once 20, with a small square window at the top and ornaments grouped about a round sunk panel. Above the tower door a triangular sunk panel occurs, with a slit across cut through the wall for light. There are many Renaissance houses, both early and late, with delightful picture-frame-like windows carved with arabesques, balconies, and loggias.

Cola del Amatrice, painter and architect, was born in the Ascolan territory, and there a painting by him in S. Francesco, but its most distinguished citizen was Pope Nicholas V. His name was Girolamo di Massio and he was of noble family. He lived long at S. Francesco as a monk and became general of the Franciscans some time before his election to the papacy in 1288. He presented many things to churches and monasteries of Ascoli, and accepted the office of Podestà. The cope which he sent to the cathedral was stolen in 1902, but rediscovered in the collection of Mr. Pierpont Morgan, but S. Francesco still has a cross by him preserved in a reliquary made in the XVth century. The cross is of gilded copper with arabesques in flagee, and the reliquary is of silver gilt with sharply-pointed domes and twisted colonettes on a copper gilt base ornamented with translucent enamels of violet colour. It is the work of the Ascolan Pietro Vanni, whose productions may also be seen at Osimo, Bovino, Amatrice, and Castiglione according to M. E. Bertaux. The treasure of the cathedral contains an altar frontal of silver of the second half of the XIVth century with a number of New Testament subjects in relief in oblong panels, perhaps the work of a local artist; an Italian XIVth-century coffret in ivory, octagonal in plan, and carved with the history of Paris; a reliquary of the arm of S. Emidius, and a silver statue of him at the end of the XVth century. S. Emidius, Germain of Treves, the first bishop of Ascoli, is still the patron saint. The reliquary of the arm is also attributed to Pietro Vanni; it is borne on a high base hexagonally starlike in plan, of silver partly gilt and enamelled. Its length figures are engraved in medallions on a foot. The statue is by the same hand, cast the *cire perdue* process, and delicately chased afterwards. The border of the cope has subjects engraved on it. There is also a silver statue of the Virgin of the second half of the XV century, ascribed traditionally to the Florentine Curzio Compagni, a XVIIth-century Cross designed by Vasari, and an altar for

Ascoli Piceno: Loggia de' Mercanti and Door of S. Francesco.

roidered in silk, with figures of saints, also of the XVth century. At S. Pietro Martire is a beautiful little angel of French XIIth-century workmanship. XVIIIth-century work is not referred to here, but those who like it will find plenty in Ascoli. F. H. J.

THE ARCHITECTURAL ASSOCIATION EXCURSION.*

Thursday: Milton Abbey.

The train was taken from headquarters at Sherborne to Blandford station, where the brakes of the party. Passing through the town the country is soon reached, and a drive through some really beautiful scenery took the party to the beech woods surrounding Milton Abbey, the church and house nestling together and partly surrounded by lawns and shady groves. The party were shown over the House and Abbey Church, which, from the absence of a nave, probably reminds one of the collegiate churches of Oxford. Nothing now remains of the town which once stood grouped round the Abbey, and to-day the deer peacefully browse over the site formerly occupied.

Early in the reign of King Athelstan a monastery was founded at Milton. This King, at the beginning of his reign, owing to false suggestions that his brother Edwin was plotting just his life, caused him to be sent to sea in an open boat, with only a single attendant. Prince, overcome with despair at his danger, jumped overboard; but his attendant, amid great anger, swam ashore with the corpse. The King, repenting, did seven years penance at the spot and afterwards founded the Abbey. Whether this legend be true or not one cannot say, though much doubt has been thrown upon it. Considerable remains of the Abbey may still be traced, and it does not appear to have been treated with the ruin and havoc which generally attended religious houses immediately

after their dissolution. It formed a long square and stood upon somewhat rising ground, close by the church. The north front, according to Hutchins' "History of Dorset," was a very low, ancient row of buildings with small narrow windows, probably the monks' dormitory. You entered by a large gate into a small court surrounded by irregular buildings; passing this you entered the hall through a porch. This hall, which still exists, is a stately and magnificent old room, almost exactly a double cube: it is 53 ft. in length; at the higher end is a date, 1498, when the building underwent repair. Fortunately when the House was rebuilt by Sir William Chamber this old hall was judiciously preserved, and is in its original state, with a splendid hammer beam roof in six bays, with moulded and curved supports to its purlins; the intermediate trusses are supported by lions. It is a very perfect specimen of a monastic refectory. In one of the rooms hangs a most interesting plan, "An exact Survey and Plan of the Manor of Milton Abbas, 26 Aug. 1652, Philip Byles surveyor." The Abbey Church was restored in 1865 under the supervision of Sir G. G. Scott.

Piddleton Church.

Here the party had luncheon amid somewhat homely surroundings, and the brakes drove to the town of Piddleton, where the church was inspected. It consists of a chancel, nave, and south chapel, the tower being on the west side. The font is an interesting example of unusual form, with an interlaced diaper pattern, possibly dating from the XIIth century. The interior is very quaint, and the original disposition of Jacobean pewing, recalls the days of our great-grandfathers and the long discourses they were obliged to listen to. The south transept arch is panelled exactly like Sherborne Abbey, and, indeed, this characteristic was very noticeable in several of the churches visited, all of which had no doubt obtained their inspiration from this great mother church. The windows are of good tracery and irregularly spaced. On the south side of the nave an

extremely interesting chantry contains several monuments to the Martin family, with several remarkable alabaster figures; one especially under the nave arch is of great interest to the student of armour, and dates from the latter part of the XVth century.

Waterson House.

From here the drive was continued to Waterson House, where the party were entertained to tea. This house is said to have been built by Thomas, second son of the first Viscount Bindon; later it belonged to Sir John Strangways. The house is three stories in height, with gables and a high-pitched roof. On the south side is a Jacobean porch with round archway flanked on either side by Doric columns; above, the porch supports a quaint semi-circular bay running to the second story and surmounted by an open balustrade. On the east side of the house is an interesting gable of Jacobean design, which has been unfortunately much marred by later insertion of square windows.

After inspecting the House, the party drove on to Dorchester, where the train was taken to Yeovil, and a drive of a few miles brought the party to their headquarters.

Friday: Yeovil Church.

This was the red-letter day of the excursion, and an early start was made from Sherborne for Yeovil, where the party visited the parish Church of St. John, situated in the older part of the town. It dates from an early period. The building now used as a sacristy is of Early English date, but the main fabric is principally Perpendicular in style. The tower is at the west end, and there is a wide nave, with aisles, transept, and a chancel of considerable length. The tower is of a simple design without the usual pinnacles. The parapet is rather different from the ordinary type, and consists of perforated panels with cusped heads. The nave of the church is on a level with the chancel. The same treatment is apparent in the aisles, the windows being in recesses between the stone shafts which support the roof trusses. The church is well lighted with five-light windows, owing to which feature it has been termed the "Lantern of the West." The nave arcade is of slender proportions, and is continued through the entire length of the choir but not the chancel. The brass lectern is an original one of a fine bold type.

Tintinhull Village.

The drive was then continued to the quaint village of Tintinhull, a typical medieval village, just over two miles from the ancient town of Ilchester. The Fosse-way runs from one end of the parish to the other. In the time of Edward the Confessor the manor was held by the Church of Glastonbury, though how it became in her possession is a matter only of conjecture. There are a very complete set of church records, which shed much light on the history of the place, dating from the early XVth century. The church is a very small one, without aisles. The tower is situated on the north side of the nave. The principal features are Early English, but some of the windows belong to the perpendicular period. The porch has a simple arched stone roof, with massive ribs. Many of the hench euds are ancient. Adjoining the churchyard a gateway leads to the rectory, part of which appears to be of early XVIIth century date.

Then some of the party visited an old house in another part of the village, quite a gem of its period, originally an early XVIIth century building; a classic front was added possibly in the days of the Woods of Bath, or even earlier. It recalls the best classic traditions of Inigo Jones; the windows have mullions and transoms. The whole is surrounded by a charming formal garden, which owes much to the taste of its present owner. On the west front are two grass courtyards, with good stone piers, and hard by is a howling alley, with several other enclosed gardens. The delights of colour kept many of the party at this house, but others found much of interest in the old-world village and varieties of cottage buildings. A halt of about two hours was made here, and then the excursionists drove on to Montacute, where Mr. Phillips most hospitably entertained the party to luncheon.

Montacute House.

On one side of the village green is the entrance to Montacute House, and following an avenue we find ourselves before the beautiful west porch of the mansion. This consists of an ogee arch surmounted by a beautiful panel of richly-carved Italian workmanship; two

* Concluded from last week.

vigorous putti support the armorial bearings of the house, set within a lozenge; angle columns, rising to a quatrefoil parapet, are surmounted by fantastic statuettes upon twisted columnar bases. The craftsmanship displayed in the enrichments is of a most delicate and elastic character. The whole front shows by its refinement of detail and simplicity the very best traditions of the period. This porch and its adjoining wings were brought from Clifton Maybank House, which was visited on Wednesday. Extracts from the manuscript accounts of the building are still preserved, wherein the then owner of Montacute says, "1786. On May 2, my wife and self attended the sale of materials of Clifton House, then pulling down. We bought 600 ft. of plain ashlar stone for Cattistock—the porch, arms, pillars, and all the ornamental stone of the front—to be transferred to the intended west front of Montacute, besides which we purchased the chimney piece in the withdrawing-room, some windows, some wainscote, lead, marble, etc." "1787. Proceeded briskly with my building the west front, and on June 16 I was enabled to pull down the scaffolding. This year was remarkable for building the west front of Montacute." It is not often that an addition annexed to an old building in this fashion is a success, but certainly in the case of Montacute the addition has added much to the appearance of the façade.

Montacute House was built by Sir Edward Phillips, Queen's Sergeant, Master of the Rolls, and Speaker of the House of Commons. The famous quarry of sandstones on Ham Hill, not many miles away, supplied the material, and the building operations extended over a considerable period, having been commenced in 1580, and only finished twenty years later. The plan of the house is simple, being that of the letter H. The two long fronts face north-west and south-east. What perhaps strikes one most is the great height of the building; it has four floors, all of them containing noble rooms. The balustrade of the before-mentioned addition to the west front is broken by a series of griffins and other heraldic animals, supported on fluted and twisted shafts, with mouldings giving a sharp and brittle appearance to the façade. The designer has also very successfully succeeded in breaking the sky-line with an effective open balustrade, with the usual Elizabethan pyramid blocks on the intermediate piers. The long, narrow, lights of the windows serve to emphasise the lofty character of the building. This is particularly noticeable in the south-east front, where considerably more than one-half of the entire front consists of window space. The two projecting wings of the south-east façade enclose an oblong paved space raised slightly above the garden level. Above, in niches, is a series of the nine worthies. The great size of the house gives evidence of the hospitality our forefathers of Queen Elizabeth's days knew so well how to dispense, aptly illustrated in the two inscriptions: one on the front entrance, "And yours my friends," and another over the garden porch, "Through this wide open gate, none come too early, none return too late." There are many fine old family portraits in the house, and at one end of the great dining hall the old Somersetshire fashion of Skinmetry or Skimmenton riding is depicted, in which the victim for certain misdeeds is condemned to be carried round the village on a pole. We were told that this custom had not yet entirely died out. The party were shown round the interior of the house, and the great gallery on the top floor with its two huge semi-circular oriel windows was of great interest.

In the house is preserved a rare specimen of the handwriting of Inigo Jones, being a receipt for 100*l.* paid to him by Sir Edward Phillips, Master of the Rolls, for money disbursed in connexion with a masque presented before the Court at Whitehall in 1612.

The garden is one of the greatest of Montacute glories; moreover, it has attained an exalted place in the annals of English gardenage. Though by no means of large extent, its design embodies many of the best features of the age of its creation, and very successfully combines the architecture and character of the house with the immediate surroundings. The wing walls thrown out from the main building, the noble terrace overlooking the lower garden, the old-world pond, with its balustrade and fountain, and the quaint pavilion, all reflect the architectural style of the house. Avenues

extend across the park in several directions, the two principal ones leading to the two principal courts. The present entrance is on the north-west side of the house. The former entrance forecourt was on the opposite or south-east side. This court now, diverted from its original purpose is enclosed on all sides, but old drawings show the wing walls extending beyond the garden-houses into the park. These enclosing balustraded walls are about 7 ft. high, with piers placed at short intervals, enclosing obelisks. Mid-way between the main building and the garden-houses the continuity of the wall is interrupted by small circular stone pavilions, each consisting of six stone pillars, supporting an ornamental soffit, with open cupola above, formed of three stone ribs joining at the top. This is again surmounted by a finial of interesting stone circles. The garden-houses are very quaint and beautiful specimens of their kind, and their equals could hardly be found in England. The beautiful tints of the lichen-covered walls, the greys and greens of the ogee-shaped slated roofs, their round bays, pillared angles, and curiously-shaped parapets, make a very beautiful picture, and one which not a few of the party made more than a mental note of. The upper garden extends on the south-west side of this court, and on the opposite side is a large sunken garden, overlooked by a broad terrace, extending around all four sides. In the centre is a fountain pond, enclosed by a balustrade, its angles accentuated by obelisks, round which a happy colony of white pigeons ceaselessly flutter to and fro. So enamoured were the party with the charms of the Jacobean architecture and the lovely garden, that the whole of the afternoon was spent at Montacute House, but some few found out other interesting features in the village grouped round the green not far from the house.

The Priory was founded by William, son of Robert, Earl of Moreton, half-brother to the Conqueror; it has now almost entirely disappeared, the only remains that now exist being the old gatehouse.

The founder owned a castle on the conical hill—"Mons acutus," from which the name of Montacute is derived. Reginald, Chancellor to Henry I., enlarged the monastery, and at the same time converted his castle on the hill into a chapel, dedicated to St. Michael. Scattered round the neighbouring fields are many remains of the ancient abbey foundations, and no doubt Montacute House itself was largely built from the ruins. The gatehouse appears to have formed part of a suite of offices, for it has spacious apartments on the east side consisting of two stories, and also a handsome chamber over the gateway. The gateway is very high, probably so constructed for the hay waggons coming to the Abbey farm. On the south front are two octagonal turrets, the lower one leading to the first floor of the adjoining house, the other to a room over the arch and to the leads. Montacute was the only Clunian house in Somersetshire, and before 1415, when the alien priories were suppressed, Montacute, on renouncing its allegiance to Cluny, was allowed to continue its work until the general suppression in 1539.

The church at Montacute has a splendid Perpendicular tower, which has been added to its west end; it is not so tall or stately as many of the Somersetshire towers, but the work is very graceful; a staircase turret runs up the whole way and springs from the ground.

The church itself is, however, essentially of an earlier type, and has a good Norman chancel arch of three orders. The principal part of the church belongs to the Transition period between Early English and Decorated; the south transept arch belongs rather to the former style, the north to the latter. Probably all are parts of one renovation, between the accomplishment of the various portions a great deal of time being allowed to elapse.

Not far from Montacute is the diminutive village of Odcombe, the native village of the celebrated traveller Coryat, who upon being shown the palace of the Elector of Cologne at Bonn, and asked whether there was any palace in England equal to it, said, "There is one in mine own county of Somersetshire, even the magnificent house of my most worthy and right worshipful neighbour and Meeenas Sir Edward Phillips, now Master of the Rolls, in the town of Montacute, so stately adorned with the statues of the nine worthies, that may be at least equally ranked with this of Bonna if not something preferred to it."

Preston Plucknett.

Next the party drove to Preston Plucknett, where there is a fine old mediæval house, the earliest part of which dates from the latter half of the XIVth century. Owing to alterations made in the interior, many of the most interesting features have been destroyed, but in the exterior an elegant octagonal chimney, with open work at the top, has been preserved.

Close by the house is a barn standing at right angles; it is a fine specimen of the XVth century. The roof is the original one, and is in good condition; it is very probably of Spanish construction. Part of the old finial on the apex of one of the gables still remains. This is also the site of a grange of Bernondsey Abbey. The remains form a very picturesque group of buildings, especially the hall, groined porch, and the barn. There is also an octagonal chimney with double tiers of pierced panels, now no longer in use.

This little place, quite one of the tit-bits of the whole excursion, practically completed the visits away from headquarters, and Friday evening was spent in the usual convivial manner. After dinner a smoking concert was held in the Digby Hotel, and votes of thanks were passed to the President of the Association for having presided over the meeting and also to the two honorary Secretaries, whose indefatigable energy contributed so largely to the success of the tour.

Sherborne.

Saturday was devoted to seeing the sights of Sherborne, as most of the members were obliged to leave during the afternoon, and first of all the grand old Abbey church was visited.

A good deal of information with regard to the archaeology of Sherborne Abbey was contributed by Professor Willis to the *Journal of the Archaeological Institute*. As it now stands, Sherborne is externally a rather lofty, though not very long church of late date, built of freestone from Hamdon Hill and quarries near the town. Here and there Norman details are apparent in the exterior, and more especially in the interior, the crossing arches being Norman except the east one; but there is much more Norman influence in the interior even as it now stands than is apparent at a glance. The early foundation is of the Saxon period, and to that succeeded in due time the Norman church, of which there now remains the crossing piers and the portion of the tower below the roofs, the lower stage of the south-west porch and some minor portions. A Lady chapel was added in the Early English period. About 1436 the work of rebuilding the choir was commenced on the Norman foundation, and also a new upper stage to the tower, and it was about this period that a fire took place which was a notable incident in the annals of the church. The church has been restored under the supervision of Messrs. Slater and Carpenter. The interior of the nave, which has been very carefully restored, presents a fine and unusual effect. It has exceptionally solid arcades of the Perpendicular style. The impost is marked by a small eap to one of the roll mouldings on either face, a rather unusual treatment, and one so small that it hardly strikes the eye. The wide hollows in the piers are given an unusual effectiveness by being made to assume the appearance of a succession of shallow niches by the introduction of trefoil heads at regular distances. The unusually massive character of the piers for their date arises from the fact that, as at Winchester Cathedral, a great proportion of the masonry of the Norman piers was retained as a core and cased with the later stonework. The vault is a remarkably fine and effective one of the date when the assemblage of ribs was just beginning to suggest the form of a complete fan vault, the plan of the main compartment assuming a polygonal form. The crossing is wider from north to south than from east to west; on three sides it has Norman arches with plain square soffits, springing from caps of the ordinary type, with coupled wall shafts below; the western arch is segmental, the north and south ones stilted. The north transept is very similar in character to the nave; the south transept has a fine, massive timber roof of larch. The great south window of this transept was designed by Pugin. The tower at Sherborne has gone through many perils, and in 18 measures had to be taken to preserve it, and to secure the safety of the peal of bells which is said to be the heaviest swinging peal in England (The largest bell weighs nearly 3 tons.) In an issue of April 3, 1897, we published an account

of the Abbey, together with a plan and exterior view.

The domestic buildings of the Abbey were arranged on the north side on a site now occupied by the Grammar School; the principal buildings were grouped round the cloister court, in the centre of which stood the conduit, now removed to the market place. The cloisters were built by Abbot Frithie in 1349-1371, but almost all traces of them have now gone and their position is occupied by the lawn of the headmaster's house. On the east side of the cloisters stood the monks' dormitory with chapter house below, the day room, parlour, and slype; on the north side were the refectory, abbots' lodging, and kitchen, and the west side was entirely taken up by the Guesten hall. The original Sherborne school occupied a site at the east end of the Abbey church. The present building dates from 1670, when the Governors began to rebuild the schoolroom, which had existed since 1555. It is supposed that the foundation of the school is contemporary with the Abbey, and therefore in 1905 the school will have been in existence 1200 years. In 1540 the old schoolhouse of Sherborne was granted by Henry VIII., together with the rest of the monastery, to Sir John Horsey, who afterwards sold the Abbey church to the town, and the monastic buildings were leased to the Governors of the school. In 1550 Edward VI. refounded the school upon the petition of the townsmen and inhabitants of the whole neighbouring county.

Next the castle was visited by a few members who were more archaeologically inclined, but there are not very extensive remains to be seen now. This closed the programme of the tour, which many members will number amongst the most interesting which have been undertaken.

PLAN OF JUMIÈGES ABBEY.

By the kindness of Mr. Phœnix Spiers, who has supplied us with the materials, we are enabled to give this sketch plan of Jumièges. Illustrations of the building appeared in our issues of August 6 and 13.

THE DRAINAGE OF A HOUSE.*

SO LONG as cast iron pipes can be kept free from corrosion they may be regarded as being satisfactory for drainage purposes. Corrosion, however, soon sets in, with the result that the velocity of flow of the sewage matter in the pipes is seriously impeded, and the efficiency of the drain is lost. To counteract corrosion several expedients have been adopted, of which the best known is Dr. Angus Smith's solution; then there is the Bower-Barff process of forming a magnetic oxide of iron on the surface of the pipe; and lastly, by lining the pipe with what is termed *glass enamel*.

A short time ago the writer got the various

* Part of an abstract of a paper by Mr. Samuel Smith, read at the recent Glasgow Congress of the Sanitary Institute.

preservatives on cast iron pipes tested with a weak solution of sulphuric acid, and the following are the results:—

The first experiment was made on a glass enamelled pipe, and, on being immersed in a 1 per cent. solution of acid, the enamel was immediately affected, and at the end of twenty-four hours the enamelled skin resembled a piece of damp blotting-paper.

The next experiment was made on a pipe treated by the Bower-Barff process, but this time a weaker solution was used, 1 part acid to 200 parts water, and the result was that all the oxide was removed. The acid acted upon the pipe whenever it came in contact with it.

The last experiment was made on a pipe coated with Dr. Smith's solution. This pipe was also immersed in a 1/2 per cent. solution, and at the end of twenty-four hours the skin was all peeling off.

It may be argued that a system of house drainage is not required to stand the action of acids, and that the above tests are no guide as to the suitability of cast iron pipes coated with one of the preparations mentioned for the carrying away of soil and waste from our dwelling-houses. The writer, however, holds the opinion that a drain should be able to stand the action of any liquid which may be poured into it. No objection on this point can be made against fireclay pipes, if first quality pipes be used. At the same time as the experiments were made on the cast iron pipes, a fireclay pipe was immersed in a 5 per cent. solution of acid, and the acid had no effect on either body of pipe or glaze.

An advantage of cast iron over fireclay piping which is brought forward is the ability of cast iron piping to stand hydraulic pressure; but is this required? The following tests to find the pressure that a drain pipe requires to stand, and the strength of a fireclay pipe, were made for the purposes of this paper:—

A wash-down closet was tested with a pneumatic pump and the pressure found necessary to break a water seal of 2 in. deep was 120 lb. per square inch, while to break a seal of 3 in. deep required a pressure of 145 lb. per square inch. A 4-in. diameter fireclay pipe was tested up to a pressure of 45 lb. per square inch, but showed no signs of porosity at the faucet. This test showed that a fireclay pipe will stand a heavy internal air pressure before bursting, but to find the exact pressure that a pipe would stand and still be air-tight another pipe of the same size was taken and tested. The pressure was gradually increased at intervals of ten minutes, from 5 lb. till a pressure of 3.3 lb. was reached, and the mercury in the manometer remained steady at that pressure for twenty-four hours. From this we may judge that this pipe was capable of standing a pressure of 3 lb. per square inch, or fully twenty times the pressure required to break a 3-in. seal of a wash-down closet. This is a sufficient margin for all practical purposes.

To test the efficiency of embedding a fireclay pipe in concrete, a second quality pipe was put under a pressure of 5 lb. per square inch, but it was so porous that the mercury in the manometer fell 3.5 in. in twenty minutes. The pipe was then encased in 6 in. of concrete, and, at the end of three days, the test was again applied with the following result. The pressure was applied gradually at intervals of half an hour, commencing with 5 lb. of pressure. There was no sign of leakage up to 3 lb. of pressure, but when 4 lb. per square inch of pressure was applied, the mercury fell 1 of an inch during half an hour. From this it will be seen that a 6-in. layer of concrete round a pipe makes the pipe sufficiently air-tight.

A further test of the strength of fireclay pipes was made, this time by hydraulic pressure. They were tested up to a pressure of 250 lb. per square inch without showing signs of fracture, but showed signs of porosity in one pipe at 60 lb. of pressure, and in another at 100 lb.

Another argument against the use of fireclay pipes, is their liability to fracture through any unequal settlement of the ground on which they are laid or of the building they pass through. The liability to fracture through unequal settlement of the ground on which they are laid may be overcome by the laying of a bed or layer of concrete underneath the pipes, and if the ground is very soft or unequal, the writer would suggest that by the use of ferro-concrete it may be overcome. If sufficient size of openings is formed or left in the walls, and these openings are properly linteled over with a space between the lintel

Jumièges Abbey.—Plan.

and the pipe, there is no fear of any damage being done to the piping through any settlement that may take place in the building.

Another point of importance in connexion with the laying of fireclay pipes is the nature of the joint and the material to be used for making the joint. By the introduction of faucets such as the Hutcheson or the Fitzpatrick faucets, a more satisfactory joint can be made than is possible with the ordinary spigot and faucet pipes, even although rope-yarn is used. The writer recommends that nothing but a slow setting cement, thoroughly cooled and aërated, be used, and that it will be well staved into the joints so that all the air in the cement be forced out, and a thoroughly air and water-tight joint will be the result.

We are all familiar with the objections to cast iron being used for the trunks of elosets and for sinks. The same objections can be applied even more forcibly against the use of cast iron pipes that are to be buried underneath the ground, when fireclay pipes, as has been shown, can be got which will make a tight enough job and be more satisfactory, as there is no fear of corrosion, and you can empty any kind of liquids into them with no fear as to the result.

While efficiency is the point to be looked at in planning a drainage scheme and selecting the materials for the same, the question of cost has also to be taken into consideration. On looking into the comparative costs of fireclay pipes laid in the manner here suggested, including costs of concrete, and of cast iron piping coated with Dr. Smith's solution, or straight piping, exceeds that of fireclay by from 15 to 20 per cent. The increase in the cost of bands and branches is 50 to 60 per cent., while on traps it is 300 per cent. It will thus be seen that, for a drain laid with fireclay piping, the advantages of being more efficient and economical can be claimed.

The writer would suggest that fireclay pipemakers test their pipes to say 60 lb. of hydraulic pressure, and sell their pipes with a guarantee that they will stand that test. If this were done the users of pipes, in the knowledge that they were getting a satisfactory article, would readily pay an additional 10 per cent. on the cost of them, and the result would be more satisfactory to all parties concerned. Improvements have been made in recent years on fireclay pipes, and further improvements could and would be made if makers saw that it was to their advantage to do so, through there being a demand for a superior article.

Illustrations.

ST. GEORGES DE BOSCHERVILLE.

THE chronology of the Church of St. Georges de Boscherville has been much disputed. De Cammont held that the present church is that which was built between 1050 and 1066 by Raoul de Tancarville, and the French Society of Archaeology in 1849 put up on the aisle wall a marble slab with an inscription to that effect. But a comparison with such early Romanesque work as that of Bernay and Jumièges makes this date entirely inadmissible. A more advanced date was proposed by Georges Bouet in an important paper on the church in the "Bulletin Monumental" for 1867, and has lately been accepted by M. Besnard—viz., that the church was built between 1075 and 1090. In opposition to this, it may be urged that it is far more advanced in style than St. Nicholas, Caen, which is known to have been built in 1083; for the style of work there would seem to be an interval of twenty or thirty years between St. Nicholas and St. Georges. Characteristic features of XIIIth century work abound. The church is admirably lighted, the windows and the bays being broad. The joints of the masonry are fine. The piers have their members scientifically disposed with reference to their load, six columns supporting the two orders of the pier-arches, one the transverse arch of the aisle vault, the remaining one being carried up as the roofing or vaulting shaft. Throughout the church the tendency is not to carve but to mould each arch; those of the crossing, the ground story, the transept galleries, the triforium, the clearstory, and many of the windows have roll-mouldings of considerable refinement, such as may be paralleled perhaps at Norwich, but hardly in Normandy. The capitals, too, are of advanced type; the scalloped

cap is frequent, and Corinthian capitals abound of much higher type than those normal to Normandy in the XIth century, which consisted of little more than four clumsy volutes, with the band of acanthus usually omitted. Nearly all the bases also have the spur-ornament, which in England, at any rate, is rare till the XIIIth century is well advanced; those of St. Peter's, Northampton, which can hardly be earlier than 1135, and the crypt of St. Peter-in-the-East, Oxford, are early examples. M. Besnard appears to see the force of this cumulative evidence for a XIIIth century date. He tries to dispose of it by assuming a general *rajeunissement* of the whole church at a later period than 1090; but though this might apply to the carving of capitals and archivolts, it can hardly be assumed that the windows were enlarged and the arches moulded at a later period; in any case, wide joints of the XIth could not be converted into fine joints of the XIIIth century. And, as we know that William, son of Raoul de Tancarville, supported by Henry of England and Archbishop Geoffrey of Rouen, "volens ecclesiam sancti Georgii ampliare et meliorare," converted the collegiate establishment of secular canons into a convent of Benedictine monks in 1114, it is probable that this gives us the initial date for the building of the church. But since the monks, requiring dormitories, refectory, etc., at once, may have first built their claustral buildings, retaining for a time Raoul's XIth century church, the present church may quite possibly be a work of the second quarter of the XIIIth century. In our own country, when regular were substituted for secular canons at St. Frideswide, Oxford, where there was an existing church still probably in substantial repair, it was the claustral buildings that were built first.

In the interior the XIIIth century vaults are not shuttled by flying buttresses, reliance being placed on the great thickness of the Romanesque walls. The disposition of the vaulting shafts is exceedingly curious. At present each one appears to terminate at the sill of the clearstory, but in reality every other shaft is continued through the vault up to the top of the clearstory wall, so that the vaulting shafts originally were alternately long and short. Of the shorter vaulting shafts in the nave the fourth and sixth have retained Romanesque capitals. All the others have had new capitals inserted when the present vaults were built. It would follow that originally the tall vaulting shafts supported tie-beams, but that the short ones carried gabled semi-circular transverse arches. The same roofing system was in use at Cérisy-la-forêt and at St. Vigor, Calvados. The treatment of the triforium stage also is remarkable. Instead of the great cavernous arches of Cérisy and St. Stephen, Caen, the arcade consists of four arches not embraced under a containing arch; and, owing to the omission of this latter, the triforium stage is low; so the proportions of the interior are rather those which later found favour in the Gothic interiors of the Ile de France and in England at Westminster and Beverley, where the triforium tends to occupy one-sixth, the clearstory one-third, and the ground story one-half of the internal elevation, rather than those which were more usual in Romanesque churches. It is to the ratio of the dimensions of the three internal stories that the success of the interior of St. Georges is largely due. We may compare the triforiums of the Abbaye-aux-dames, Caen, and of St. Saviour's, Southwark. Again, like the Abbaye-aux-dames and unlike the Abbaye-aux-hommes, Caen, there are no windows in the back wall of the triforium. All this is characteristic rather of XIIIth than of XIth century design. It is curious that in the nave the triforium arcade consists of a series of cells neither communicating with one another nor with the triforium chamber behind.

As regards the supports, none of the shafts are carved, none are grooved or banded, all are smooth. This may be because they are not monoliths, but in coursed masonry. In the ornament employed the predominant motives are the fret, chevron, and cable. The bases are mainly variants of the Attic base, and are remarkably clumsy, both in design and execution. The windows are of uniform design, with shafts in the jambs, both externally and internally. The buttresses of the aisles and clearstory are flat strips rising to the eaves, and their angles are shafted, as at Norwich and Peterborough; the apses have columnar buttresses. In the aisles, clearstories, and

transepts the abaci of the window shafts are continued as strings; there is also a continuous string beneath the aisle windows. The corbels of the corbel-table present a great variety of bold Romanesque sculpture. The orientation of the church is from south-east to north-west. The most important work on the church is the quarto of M. Besnard, architect, published in Paris, 1890. It contains plans, sections, and many engravings; the text is full and accurate; the plans are without scale, do not agree with the text, and contain inaccuracies. A valuable criticism of M. Besnard's monograph, by Dr. Coutant was published in 1899 at Sotteville-les-Rouen. Plans and sections are also given in the second volume of Ruprich-Robert's "L'Architecture normande." The illustrations of St. Georges in Cotman's "Normandy" are useful, having been taken before an unnecessarily drastic restoration, in which the plaster was stripped off, the ashlar, columns, mouldings, and sculpture worked over, and the jointing emphasised—one of the evil deeds of the Commission of Historic Monuments.

SKETCHES WITH THE ARCHITECTURAL ASSOCIATION EXCURSION.

THESE sketches are given in connexion with the annual excursion of the Architectural Association, our report of which is continued this week on another page.

A COUNTRY HOUSE.

THIS house was designed for a site near Havant, on the main road between Chichester and Portsmouth.

The reception-rooms look south towards the sea—six hundred yards away—and one end of Hayling Island.

The garden extends from the house to the shore. There is a walled garden on the west and a kitchen garden and stables on the east.

The walls are of red brick with thick joints; the windows are either leaded lights in iron casements with stone jambs, etc., or wooden double-lung sashes painted ivory white, and the roof is tiled.

CHARLES J. BATHURST.

Correspondence.

UPSALA CATHEDRAL, SWEDEN.

SIR.—In the Cathedral of Upsala, Sweden are a number of sepulchral monuments, two at least of which are of considerable interest.

The Lady Chapel, east of the choir, is the burial place of Gustavus Vasa. His monument is a massive altar tomb of large dimensions on the top slab of which are three recumbent effigies, the centre one being Gustavus himself, and on either side two of his wives. The cart is about 1565. The style of the monument is thorough English Renaissance, and the material English alabaster from Chellaston, Derbyshire. The sculpture is good, and the orphrey enrichments on the dresses are of precisely the same delicate character as we find on Queen Elizabeth's, Mary Queen of Scots', and similar monuments in Westminster Abbey and elsewhere in England.

The other of special interest is a large and pedestal monument, with statues life-size of John III. This is said to be in marble, and is stated in the guide-books, etc., as having been executed in Italy in Italian marble. It is supposed to have been wrecked on its way from Leghorn to Sweden, and, after various vicissitudes, to have finally reached Upsala.

Now, my firm opinion about this monument is that it is the same as the first—viz., the material is English alabaster, and the workmanship English. Sweden has no alabaster rocks, and the material is not Italian.

I could imagine that from medieval times to the English Renaissance there was probably a Chellaston, Derbyshire, a continuous "atelier" of sculpture; and it is a question if the same remark does not apply to the Isle of Purbeck and statues in Purbeck marble, which have precisely the same mannerisms wherever found in places however remote. W. BRINDLEY.

BRICK-BUILT STRONG-ROOMS.

SIR.—Perhaps you or some of your readers would kindly tell me where to put my hand on descriptive particulars of the best and most up-to-date methods of constructing an ventilating brick built strong-room—say 9 ft. by 6 ft. by 12 ft. high—for the purpose of securing valuable documents, etc., against fire. AN ARCHITECT.

THE CAMBRIAN ARCHÆOLOGICAL ASSOCIATION.

its Society held its annual meetings at Cardigan during the week ending the 20th under the presidency of Mr. J. W. S. Bund, F.S.A. There was a large assembly of members and friends.

Cardigan Church, Priory, and Castle.

The first excursion was to the places of interest within the town of Cardigan. At an early period there was established here a house of Benedictines, a daughter house of the fish abbey of Chertsey. It was founded by Rhys ap Gruffudd, a Welsh prince of considerable ability, and a great thorn in the side of Henry II., who conferred upon him the title of "Prince of South Wales." Rhys was the founder of the Premonstratensian house of St. Mary in Carmarthenshire, and the reviver and founder of the Cistercian abbeys of Llandaf (Whitland) and Strata Florida. One of these foundations he endowed munificently, and it is clear that he not only entertained favorable opinions of the results of monkish discipline, but was desirous of obtaining the advantages that arise from free competition by giving the popular orders of his day a chance of doing their beneficent influence throughout the region subject to his hereditary rule. Rhys died in the year 1195. The priory of Cardigan was probably established by him shortly before his death. From the silence of Giraldus it may be inferred that it was not in existence in the time of Archbishop Baldwin and his suite when he visited Cardigan, and Giraldus preached a crusading sermon with his usual fervency at the bridge head. But as the priory was certainly founded by Prince Rhys, it may have been started in consequence of the bishop's visit, for Gerald, in enumerating the results that flowed from his discourse, states that it had been determined to commemorate the event by the erection of a "capella" "juxta caput pontis," and that many miracles had occurred therein. If the priory was built upon the Cardiganshire side of the river it could not have stood exactly at the head of the bridge, this site being not quite suitable for a church requiring surrounding lands; however, the position was already occupied by a castle, so that the founders had to fix a situation upon the banks of the river some little farther westward, and here, there can be little doubt, Rhys established his commemorative monument to the eloquence of Giraldus. But, whether that consisted only of a "capella," or whether the intent had been extended into the construction of a small stone house, it is certain that not a fragment exists on the site of the present church. The only ancient portion of the latter is the chancel, and this is of the early part of the thirteenth century, though some of its details are of the Late Decorated character. The chancel arch is, however, of the subsequent style, and gives the true date of the work. The east end was probably intended to be vaulted, for a century later there remained in the chancel walls a number of arches of which two only are at present visible on either side of the chancel arch. One represents the face of a man, the other of a woman supposed to be the unfortunate Margaret of Anjou, probably in error. The east window is an early example of Perpendicular rather poor design. It was once filled with stained glass, of which only a few fragments remain in the topmost lights. In the north wall is an ogee-headed and pinnacled window. A low door in the north side of the wall gave access to the leads. The central buildings were to the south of the church, extended almost to the river's brink, and were approached from the church by a walled arched doorway now closed. A barn house called The Priory standing a few feet to the south-eastward of the church is supposed to be built upon the foundations of the priory buildings, and its cellars, being rounded, were stated in a paper read upon the occasion to indicate that the priory was built before the year 1125. The house is, however, not in line of the earlier buildings, though its eastern portions were probably constructed at the time of the suppression of the priory, and out of its ruins. Traces of the priory have been met with whenever work has been done on the south side of the church, and it was stated that on the enlargement of the priory of the modern house in a westerly direction four years ago, a solid road-bed 2 ft. thick was discovered. It is probable that

excavations under the guidance of a trained ecclesiastical architect or antiquary would reveal the position and character of the chapter house and different domestic offices, and it is interesting to learn that the site of the cloister garth is still known to old Welsh residents as "y rhen ardd," the old garth. In the heyday of its fortunes the priory possessed a potent relic which brought much gain to the house, namely, a waxen taper, called Our Lady's taper, that never decreased in size or became extinct. An interesting document relating to this relic is printed in Wright's well-known "Suppression Letters," which states "that the image now situate in the church of Cardigan, which was used for a greater pilgrimage to this present day, was founde standinge upon the ryver of Tyne, and her some upon her lappe, and the same taper her ynge in her hande. The said ymage was caryed from thens into Christes church of Cardigan, and the sayd ymage would not tarry there, but was founde thre or fowre tymes in the place where now ys bylde the church of our Lady, and the taper burnynge in her hande, which contynned styll burnynge the space of nyne yeres, without wastynge, untill the tyme that one forsware hymselfe thereon, and then it extincted, and never burned after. That since the ceasinge of hurynge of the sayd taper, it was enclosed and taken for a greater relyque, and so worshipped and kyssed of pygrymes, and used of men to sweare by in difficult and harde matters, wherof the advantage amounted to greate sommes of money in tymes passed, payenge yerly of the same xxii nobles for a pension unto thabbot of Chersey." The church referred to as Christ's church is probably a chantry chapel which is known to have existed in the parish, but does not appear to have been within or annexed to the priory church. It survived the priory by a few years, but fell at the opening of the reign of Edward the Sixth. The priory itself seems to have reached a low ebb just before its suppression, for when Leland visited it, it contained but two monks, and its annual revenue according to the *Valor* was only 13*l.* 4*s.* 9*d.*

Of Cardigan Castle so little exists that it is difficult to form a satisfactory opinion of either its character or its date. It stood at a sharp bend of the river Tivy, and guarded the crossing, which must always have been effected at this spot by ford or bridge. It stands on a natural eminence, and as the key to the lower reaches of the river must always have been a place of importance from the earliest times; hence we read in the Welsh chronicles of constant conflicts for its possession, and so long as its defences were easily destructible, we have little chance of meeting with remains of its earlier existence. But when the Norman had effected a sufficiently permanent occupation to permit of the construction of a stout stone castle he was enabled to make good his position, and to build his defences in a manner that has, in some measure, defied the destructive agencies of time and gunpowder. The castle, of which the few remains still exist, was built in the thirteenth century, being probably the work of William Marshall, Earl of Pembroke, the great opponent of Llewelyn ap Iorwerth, Prince of Wales, who is historically known to have occupied Cardigan in 1240. The present ruins consist of two drum towers connected by a strong curtain wall. Speed's view shows the curtain continued around the sides of an irregular triangle, with the gatehouse at the eastern or shorter side, but most of these buildings have been removed to make room for a modern dwelling. There is, however, a portion of one of the gateway towers at the back of the house, and some of the cellarage is unquestionably the original basement, beneath which again is said to be a dungeon, now closed. The castle played a small part in the civil war of Charles I., after which it was almost entirely demolished. On one occasion the celebrated divine, Dr. Jeremy Taylor, was imprisoned here, and it is thought that he alludes to his detention at Cardigan in the preface to the "Liberty of Prophesying," where he says:—"In the great storm which dashed the vessel of the Church in pieces, I was cast on the coast of Wales, and in a little boat thought to have enjoyed that rest and quietness which in England I could not hope for." Papers on the antiquities of Cardigan were read—on the church by Mr. H. M. Vaughan, on the priory by Mrs. John Pritchard, and on the castle by Mr. S. G. Adams.

Mount Church.

This was unquestionably the most interesting

of the parish churches seen during the meeting. Its situation is one of the most romantic that can be conceived, standing as it does at the foot of an isolated hill that rises to about 300 ft., and descends precipitously on its seaward side into the St. George's Channel. The nearest village lies far away, and the only habitations visible are a few scattered homesteads. At the foot of the Mount (so called *par excellence* from the singularity of its shape and position) is a tiny creek floored with exquisite sand, the very spot to strike the imagination of a British hermit; yet the name of an early Christian is associated with the parish. The church is dedicated to the Holy Cross, an invocation that is proof, first, of the near presence of a wayside cross of unusual local reverence; and secondly, of the complete loss of the name of the early Cymric saint with which it must have been associated in the earliest days of its history. The building consists only of nave and chancel without structural division. The windows are modern insertions, but a fragment which can be detected on the external eastern face shows that the eastern gable was once occupied by a two-light Late Decorated window. There was also a single-light window at the eastern end of the south wall: this is now closed. The western gable is crowned by a rude bell cote. The roof, though it has been partially renewed, is still an interesting specimen of late XVth century timbering in an unusually good state of preservation considering the remoteness of the locality, the humidity of the atmosphere, and the severity of the western gales. The font is of very early date, having for its base what looks like part of the stem of a churchyard cross. The bowl is almost square, and large enough to admit of the immersion of an infant. The paten is pewter and of unusual shape. This parish was within modern memory the scene of a popular gathering on the first Sunday of the year. The inhabitants of the surrounding parishes were in the habit of meeting on that day to indulge in all manner of rough outdoor sports, held, it is alleged, in commemoration of a victory gained by the Welsh over the Flemings on this spot. In confirmation of the story a mound about 100 yards from the church is pointed out, which has yielded a quantity of human remains. Seeing, however, that the Mount itself bears clear traces of early circumvallation, and that animal bones are found intermixed with human in what is no doubt a prehistoric burial place, it is much more probable that the Mount was a Goidelic settlement, and that the gatherings alluded to were survivals of practices that are known to have been general in Wales in Elizabethan times. The story of the Flemings is probably due to a lively imagination working upon false etymologies, there being a Nauty Flyman, the *Flyman* dingle, close by.

Penbryn Church.

Penbryn lies about three miles northward of The Mount, and is situated in almost as romantic and beautiful a spot. It has been restored. It consists as usual of nave and chancel only, which in this instance are not in line. The chancel arch is acutely pointed, and broken only by a shallow chamfered slab, which looks as though it was not occupying its first position. On the south side of the chancel is a sepulchral niche having a pointed arch. The interesting pewter alms-dish provoked some comment; the maker's name appeared to be Mowe, and its date 1697, the last figure being indistinct. A paper on the church was read by Mr. Pryse Williams.

Prehistoric.

On the rising ground above Penbryn church stands the Dyffryn Bern stone, the inscription upon which reads: "Corbalengi Iudit Ordous," the last word being regarded as connected with the tribal name of the Ordovices. Of Castell Nadolig, a camp of Romano-British character, where a Late-Celtic bronze spoon, now in the Ashmolean Museum was found, but little could be made in the time, though the fact that in this parish has also been discovered a coin (figured in Gough's Camden) of the regular British type based on the gold stater of Philip of Macedon, would seem to make a thorough examination of the ground desirable. Justice was also not done to The Gaer, a fine earthwork, where a *motte* of precisely the type which is being ascribed to Norman castle builders is associated with an inner and an outer enclosure.

Presidential Address.

In the evening the members of the Association were treated to a formal reception by the Mayor

and Corporation of Cardigan at the Guildhall of the town. After the social function Mr. J. W. Willis Bund delivered his presidential address, which was mainly concerned with the ethnological and cognate problems presented by the early history of South Cardiganshire. The discourse was exceedingly able and original, and bristled with new and debatable points which are likely to give rise to much discussion when the discourse is published in its entirety. The word "Llan" is well known to enter into the composition of a large number of the names of the parishes of Wales, and has always been taken as equivalent to the word "church"; thus "Llanfair" is always Englished as "the Church of St. Mary." Mr. Bund contended that this was a late usage, the original signification being that of fort or military camp, which forts were the work of invaders from Ireland. St. David, instead of being a Brython of the noble stock of Cunedda, was said to be a Goidel, and the member of a tribe which, in 500 A.D., still practised polyandry. With a view to settling the many ethnological difficulties that Wales presented, he called upon the Cambrian Archaeological Association to undertake the preparation of lists of the prehistoric forts and tumuli of Cardiganshire.

Second Day.—Nevern Church, Crosses and Castle.

Nevern is well known to antiquaries of the great cross, known as the Cross of St. Brynach, which stands within its churchyard. It has also become known to the profane vulgar since its arrival at the lowest depth of pictorial degradation, namely, of representation upon halfpenny picture postcards. It is admirably illustrated in *Archæologia Cambrensis* for 1866. There is a puzzling inscription in minuscule letters on the front of the cross. The church has been restored. It consists of a western tower, nave and chancel, the latter being too large for the former. The lower portion of the tower is original, but the upper stages have been modernised, and an ineffective west window, consisting of four short round-headed lights, has taken the place of perhaps an early English lancet. A doorway of that period, unquestionably original, is placed on the north side. The font is modern. On the eastern side of the chancel arch are two transept chapels, one on each side of the church; and, probably in imitation of this feature, two similar chapels have been thrown out on the western side of the arch. The easternmost chapel on the south side, known as the Warren chapel, was probably erected late in the XIIIth century. It has a priest's chamber lit by a beautiful quatrefoil of this date in its eastern gable, but the chapel beneath was vaulted with rather coarse work during the Perpendicular period. A low doorway in the south-western corner of the chapel leads to the chamber above, and this stairway was the scene of one of the most interesting finds of recent years in Wales. It should be observed that in addition to the great cross of St. Brynach already mentioned the churchyard of Nevern contains a stone bearing an inscription in Latin and Ogam, the ancient Goidelic script. There is also known to have been within the church yet a third stone inscribed with the word "Johannis," but this has disappeared. In examining the steps just referred to, it was noticed by the Ven. Archdeacon of Montgomery that one of the stones above his head bore upon its exposed face a peculiar form of twisted ornament. Later, he drew the attention of Mr. Romilly Allen to this, and upon Mr. Allen going to look for the stone, he mistook the one to which he had been directed, and set about examining the uncovered face of the stone lying next to that of which he was in search. He at once perceived the presence of Ogam marks upon the exposed angle, and thus discovered a fresh inscription. The Ogam lettering reads ECUANMA, the last two characters no doubt standing for the word MAQUI, that is, "Ecnan, the son of—." It is of course impossible to say whether the marks are continued round the other angle, as is frequently the case, or whether there is not also an inscription in Roman letters on one of the other faces of the stone. It is, moreover, by no means certain that the neighbouring supporter with the peculiar incised ornament may not prove to be the lost "Johannis" stone. A good paper on the church was read by the Rev. Isaac Morgan, vicar of Eglwysrwrw. A short distance from the church is a plain, equalled cross cut into the living rock, with a natural ledge below on which devout travellers

kneel; and upon an adjacent height are the remains of a small castle, which has been so thoroughly dismantled that it is impossible to dogmatise upon its age or extent.

Newport (Pem.) Church and Castle.

This little town arose upon the building of a strong castle on the slope of the neighbouring hill by a descendant of Martin de Turibus. It became the head of the marcher lordship of Kemmes, carved out by the valour of that warrior, and the privilege of naming its mayor, which its founder reserved to himself, continues to be exercised by Sir Martine Lloyd, Bart., the present representative of its marcher lord. The ancient Welsh name of the town is Tref-draeth; the township of the strand, in allusion to the splendid sweep of open beach which spreads away on either side; but to its Norman founder it was a "new port," or burgh, in contradistinction to the vill, probably Nevern, from which he had removed the headship of his barony. The ruins of the present castle are those of a building of the first half of the XIIIth century, placed on a levelled spur of the hill, where a small stream could be utilised for the purposes of the moat. The main entrance faced the north, and a strong curtain ran along in a westerly direction to a tower at the north-west angle. Thence it was continued to the south-westernmost corner, where was another tower of which hardly any masonry remains, and still further to a tower rising from a square base at the south-eastern corner. Here the ground slopes abruptly to the little stream before mentioned. It is now impossible to say how the supply of water to the moat was controlled, or whether there was any means of communication with the opposite bank on this side of the castle. The south-eastern tower probably contained the residential apartments, which has preserved its distinctive features to a greater extent than any other part of the building, though it would be difficult, if not impossible, without some excavation to determine their different uses. A basement chamber the groined roof of which is supported by a central pillar of Late Decorated character, is popularly spoken of as the dungeon, but is more likely to have been the cellar. The gateway has been incorporated into a modern house, which has been built against it to face the courtyard, now a charming grassy lawn, and this part of the castle was accordingly not inspected.

The church has been thoroughly and effectually restored, so that the only feature of ancient date still remaining is the fine western tower. The buttresses are good examples of the regular Perpendicular type, dying off into the tower face just beneath a very striking corbel table which carries a deep and imposing battlement. In the south-western buttress immediately below the second weathering is an unoccupied niche, and at the same distance below the third slope is a female head. There is a good deal of heraldry about the tower which no member of the party could interpret. About half-way up the western face are two shields each bearing a chevron and perhaps some other charge, while the label around the western door is terminated with shields showing a chevron, and the outer members of the door mouldings are also finished off at the ground level in the same manner. The lowest stage of the tower has a slight batter. The tower stairs are carried up in a square projection on the north side, and are lighted by slits and, at the second opening, by a quatrefoil. Internally there is little of interest beyond the font, which is a good example of the massive Norman fonts that seem to have been general throughout the district. The chalice is dated 1574, and is of good pattern. The tower opens into the nave with an acutely pointed arch, as in the case of Nevern, and in the space under the tower is a fine sepulchral slab of the early part of the XIVth century. On its upper part is the head of a young female wearing a wimple brought tightly beneath the chin, and a plain band across the forehead. Below is a floriated cross of great beauty and finish. The inscription running round two sides of the slab is as follows:—" + Cos: ane; git: icl: dev: del: alme: eit: mercie." The first two words, of the reading of which there can be no question, have always been a puzzle to antiquaries, and all kinds of manifestly inadequate suggestions have been offered of their meaning. The writer of the present notice begs to offer another, which does not at any rate violate probability. It is that they stand for the modern "Ceans aine": "Within

here lies the eldest: God have mercy upon his soul." The person commemorated was probably the senior of several sisters, and the heraldic emblems upon the exterior of the tower were doubtless considered sufficient to point to his family and lineage without the necessity of more personal designation. The Rev. Isaac Morgan read a paper upon the church.

Prehistoric.

The next visit was to the Pentre Evan cromlech, the largest example of this form of sepulchral monument in the kingdom. Sir Henry Howarth made some interesting remarks upon the subject of early burials. This is the only ancient object in Wales that has been scheduled by the Board of Works under the Ancient Monuments Act. As an instance of the silent but unceasing work of nature, it may be observed that a member of the Association who was present stated that she had visited the cromlech over half a century ago and though mounted on a horse fifteen hands high she was then not able to touch the ca stone with her hunting crop, whereas now she could do so on foot with a walking-stick; the neighbouring farmhouse of Pentre Evan is a building, now a barn and stable, which contains some rudely splayed windows and an early, probably original, roof. It is apparently of the time of Henry VII.

After luncheon an arduous climb was undertaken to the summit of Carn Ingli, a height of about 1,250 ft., on the upper slopes of which is an enormous camp of the same character as Tre'r Ceiri, in Carnarvonshire. The latter has been the scene of excavations by the Rev. J. Baring-Gould and Mr. R. Barnard, the former of whom read a paper at the Portmadoc meeting of the Association. The conclusion of the excavators, namely, that Tre'r Ceiri was probably constructed in the first century of the Christian era, was stoutly contested upon that occasion, so that the visit to North Pembrokeshire was looked forward to with interest, as several of the principal heights of the Preeley range are crowned with stone camps of similar construction to, and almost as large in area as, the Carnarvonshire example. Carn Ingli is a splendid example of its class, and astonished the visitors by its extent, its strength, and the complexity of its arrangements. The upper slopes of the hill are strewn with enormous masses of stone and of ruined buildings. The cursory examination which the party could give to this splendid prehistoric fortress cannot be said to have advanced the stock of knowledge relating to its age and builders, but its extreme rudeness renders the belief difficult that it was erected during the period of the Roman occupation, or that the great people would have permitted its construction. Of recorded history it has none. The party next drove to Lwyngwair, where Mr. J. B. Bowen entertained them to tea.

Thursday.—St. Dogmael's Abbey.

The little village of St. Dogmael's (Walling Llandudoch) lies on the Pembrokeshire side of the Tivy, about five miles from the embouchure of the river. It thus fell within the lordship of Kemmes which the strong arm of Martin de Tours won from the Welsh in the first half of the XIIIth century. Following the prevailing custom of the early Norman leaders, he established a religious house at St. Dogmael's, or, as it may be, enlarged and enriched an existing British foundation. His new monastic settlement he annexed to the Benedictine abbey of Tiron, in France, and he and his son endowed it liberally with lands. The earliest charters of the house have been published by Mr. Round. The buildings, now above ground, though mere fragments, are clearly of different dates. A roofless edifice, the first of which the visitor arrives, has been termed a refectory by Fenton, the historian of Pembrokeshire, but careful scrutiny will show it to be of much earlier date than the other portions of the ruin. It is without doubt part of the original Norman church, though it has lost almost all clues to its identification. Its most interesting feature is the remains of its stone roof, which was carried upwards in a graceful curve. This building runs east and west, and measures about 40 ft. by 20 ft. The height to the apex of the roof is about 30 ft. It is now a few feet, and has been considerably knocked about in its long and scarier of degradation down the ages. An orifice in the south wall, now closed, appears to have originally been of the early Pointed style as is also the west door. A small niche on the

side probably marks the position of the chancel, and it is not perhaps entirely fancy that signs of the drain in a partly broken stone building is huddled, but these have been so red, or are so hidden by ivy, that it is impossible to make out their original character. The stonework externally is extremely good, an excellent effect being obtained by courses of large stones of a different colour to the ordinary rubble. No trace of any conventional buildings of the same period as this church is visible, nor is there any indication in the ground around of a direction in which they would have to be sought. About two centuries later than the construction of this edifice the convent must have had itself in flourishing circumstances, for a totally fresh establishment was built a few rods north-westward of the first church. The plan of the new foundation can be made out in fair success, for the ruins consist of the east front, and north wall and transept of the priory church. Fifty years ago there would not have been clear indications of the eastern end, but the full extent of the church in this direction is now only a matter of conjecture. The west window, which was of great value, has lost every vestige of tracery. The north transept was altered at a later period, and probably transformed into a mortuary chapel; the lower portion of a beautiful fan-tracery of still springs from a fine corbel. This transept is somewhat too shallow in proportion to the length of the nave. It contains two recesses for tombs. Of the conventual buildings none have survived, save a fragment of walling at the south-east corner of the cloister common to the original church. The latter was probably retained as the parochial church, but does not appear ever to have been structurally connected with the later edifice. It is much to be desired that researches into the documentary history of St. Dogmael's priory should be undertaken, and in particular that the first account of the priory's revenues compiled after its dissolution should be transcribed, as it would probably throw much light upon points that are at present not susceptible of explanation. The president of the Association drew attention to the far too luxuriant growth of ivy over the eastern end of the later church, and suggested that it should be judiciously pruned. Within the priory grounds stands an ancient stone containing inscriptions in Latin and Ogam commemorative of one Sagramnus, the son of Cuno-mus. Other slabs bearing crosses of early date are scattered around, and the altar stone stands upright, half buried in the ground. The remains of what must have been a splendid sepulchral tomb have been formed into a sort of gateway in front of the adjoining house.

New Castle Enllyn.

A small military work most probably occupied on very early times the tiny peninsula situated at this spot by an extremely sharp bend of the Teify, where are now the remains of a military gateway of the period of Henry VII. Every other part of the castle has been reduced to shapeless grass-hidden masses, though the conformation of the ground itself admits of its reconstruction. The peninsula is roughly triangular in shape, having the river protecting the two longer sides. The eastern or landward side was defended by a deep out, fed from both arms of the river and by transforming the peninsula into an island. There were probably outer defences where the ground fell away to the level, but these have left not a wrack behind. The masonry of the gateway towers is poor and late, and it is without doubt the work of Sir Rhys ap Thomas, the knight to whom the success of Bosworth Field was largely due. The castle was the seat of the unfortunate Sir Rhys ap Iffludd, the grandson of Sir Rhys ap Thomas, and certain disturbances that occurred here in the early part of Henry VIII.'s reign led to the young knight to the scaffold. A somewhat inadequate paper on its history was read within the courtyard of the castle by Mr. C. Roberts, but its architectural features were not alluded to, nor any effort made to recall its recent renown. Sir Henry Howarth, however, after a few general remarks upon military architecture, initiated a very interesting discussion on the question of the date and constructors of the moated mounds which are found all over the country, and which were attributed to the Anglo-Saxons by the late Mr. G. T. Clark. This view has recently been attacked with much ability and learning by Mrs. Armitage in the *English Historical Review* and other

journals, and by Mr. J. H. Round, the contention being that all such mounds are Norman in construction, and consequently of later date than 1066. Mr. Edward Owen being called upon for a few remarks, observed that while unable to speak of the applicability of Mrs. Armitage's conclusions to English mottes, he found considerable difficulty in accepting them as true of the moated mounds of Wales. Even if the English examples were ultimately proved to be pre-Norman in date, it was quite clear that they must be placed towards the end of the period; and, regard being had to the influence of Norman manners upon the court of Edward the Confessor, and to the imperative necessity that faced the Norman barons directly after Hastings of securing their possessions as rapidly as possible, it was not merely likely, but highly probable, that the undoubted advantages of a residence upon a motte, whether crowned by wooden or by stone defences, would out of the sheer necessity of the situation lead to their construction. He was therefore unable to meet Mrs. Armitage's argument so far as it was based upon the mottes of England. But difficulties at once arose when the theory was applied to Wales. Scattered up and down the Principality are artificial mounds surrounded with deep moats, in some instances filled with water at the present day. Some of these, such as the splendid example which has given its name to Moat Lane, have never borne a stone tower, though they were doubtless defended by stout wooden barricading. Others like Brynllys, on the English border, have a more or less perfect stone keep. The point was that many of these mounds are found in places where it can be historically demonstrated a Norman baron had never penetrated to. It was possible that at Rhuddlan and at Cardiff the mound and tower were both Norman, because it could not be denied that the Normans had reached those places before the close of the XIth century, and that the exigencies of their dangerous situation would call upon them to adapt existing defensive works, or to construct new ones. But this could not be said of the precisely similar moated mound at Dolhenmaen, in Carnarvonshire, visited by the Association last year, or of many other instances that could be adduced on ground that the Norman, *qua* Norman, had never trod. Until it could be shown, either that the Normans had been able to occupy for a sufficiently long period to construct the enormous moated mounds the sites of these erections in various parts of Welsh Wales, or that the Welsh had copied a form of defensive post which, it is admitted, was soon superseded by more elaborate stone structures, he was unable to regard Mrs. Armitage's views as affording the true explanation of the Welsh mottes; and if they did not apply to Wales there would seem to be grounds for doubting them altogether. Lieut. Colonel W. L. Morgan, of Swansea, took the opposite view, arguing that there were differences between the mottes of England and the moated mounds to which Mr. Owen had referred; but he did not enter into details of the dissimilarities upon which he insisted.

Cenarth Church.

This church, which is situated in the county of Carmarthen, is practically new, and, judged as such, is a charming example of a modest country church. The only relic of a bygone age is the font. In size it differs from the square and massive Norman fonts, of which many are still in use in the district, and for this reason several of the visitors were inclined to consider it to have originally been a free standing font or stoup. It is ornamented with five heads, arranged at four equal distanced spaces, there being accordingly two heads in one space. The spaces are connected by a cord, which droops into a curve between each facet. The churchyard contains a famous Ogam stone, which at one time stood over the grave of the favourite charger of a neighbouring squire, and at a still earlier period seems to have occupied a site called Temple Druid in a far away Pembrokeshire parish. How it found its way across the Precelly hills, to find an honoured home within the confines of Carmarthenshire, has provoked the curiosity of Professor Rhys, but found no explanation from the assembled antiquaries. After tea upon the lawn, the valuable collection of coins, manuscripts, and early printed books, for which Cenarth Vicarage is celebrated throughout Wales, was examined. Just below the church the Tivy flows noisily over rocks that attempt to bar its course, and is spanned by an interesting bridge. A few cottages are grouped around the bridge end, one of which, by reason

of its possession of a good oaken roof with trefoiled openings between the timbers, may possibly have been a tiny chapel and dwelling of the guardian of the bridge.

Cilgerran Castle and Church.

The strategical value of the river Tivy to the Norman invaders of the district is shown by the line of castles constructed by them at favourable spots along its banks, of which those of Cardigan and Newcastle Emlyn had already been visited by the antiquaries. The most important, however, both from size and position, was that of Cilgerran, which, unfortunately, came in for inspection at the close of a long day. It stands on a tall cliff overlooking the river, at this point at its finest, and it gave to Turner one of his most glorious inspirations. Like the other castles which have been named, the plan of Cilgerran is adapted to the irregularities of the site, and balance of parts or symmetry of design is, therefore, not to be looked for. But the admirable manner in which the position has been utilised makes this an interesting example of a pre-Edwardian castle, and its details call for thorough and careful study. One feature in which the baronial castles of the Principality differ from the great achievements of the first Edward is the much more restricted area or their outer defences. All the great Edwardian fortresses of North Wales were carefully planned with the view of defending the towns over which they threw a protecting eye, and the manner in which the town defences were arranged as an integral part of the general plan of the different castles is, in each case, of great interest, not alone to the student of military architecture, but to him who regards only the care with which these nascent municipalities were fostered and protected. Cilgerran castle was not planned to guard a tiny town. What was outside its moat was of little concern to the fierce noble whose chief purpose was to provide himself with the best defence he could construct against his enemies, and who allowed such of his followers as lived without its walls to fare as best they could in the day of trouble. There is an excellent description of the castle by Mr. Clark in the 1859 volume of "Archæologia Cambrensis," which has not been reproduced in his well-known book, and it must suffice on this occasion to draw attention to that account, as enough time was not given for the mastery of the peculiarities that the irregular plan of the building occasioned.

Cilgerran church is yet another instance of the drastic restorations to which most of the edifices of the district have been subjected within the past half century. It consists of a nave with south aisle, chancel and western tower. The latter, which is for the most part original, is of the regular South Cardiganshire and North Pembrokeshire type. This church, however, possesses a western door of good, though plain, Early English character. The churchyard contains a Latin and Ogam inscribed stone.

Friday-Bridell Church.

There was nothing in this practically modern and uninteresting edifice to delay the party; but an Ogam stone, of which every churchyard in this neighbourhood seems to possess a specimen, was examined and dilated upon.

Moel Trigarn, &c.

This was the *pièce de résistance* of the day's programme. It is a large stone camp of the character of Carn Ingli, seen on the preceding Wednesday, stationed on an eminence of the Precelly Hills. The summit of the hill, which is 1,200 ft. above sea level, is crowned by three stone cairns, which has given the height its distinctive appellation. The mountain is clothed to its crown with coarse grass, and it is thus relieved of the stern and barren aspect of its neighbour, Carn Ingli, and of its congener, the Carnarvonshire Tre'y Ceiri. In design it does not differ from those camps, but some of its details are peculiar to itself. A discussion arose on its probable age; but notwithstanding that both Mr. Edward Laws and Colonel W. L. Morgan agreed that it was of the Late Celtic period, they differed much on the question whether it fell early or late in that period. Many of the hut circles have been excavated by Mr. Baring Gould, and a full account of the objects then unearthed, accompanied by good illustrations of the camp, is given in "Archæologia Cambrensis" for July, 1900.

The party next drove to Clydai church, where are no less than three inscribed stones. At Capel Colman the programme was exhausted

by an examination of Maen Colman, a monolith bearing a rude cross within a circle, and on the reverse side another cross of different form.

At the evening meeting on Thursday an interesting and valuable address was given by Mr. W. Riley, of Bridgend, on the results of excavations undertaken by him into prehistoric mounds scattered over the low-lying land around the mouth of the river Ognore in Glamorganshire. The human and other remains, mainly of the Early Neolithic period, which had been disinterred by Mr. Riley, were brought by him for exhibition to the antiquaries at Cardigan, and Mr. Riley's discourse was followed by a very able demonstration by Professor Hepburn, of the Cardiff University College, of the cranial and anatomical peculiarities of Neolithic man, as evidenced by the skeleton then produced. This example showed a man of brachycephalic skull, having great brain capacity and physical power. In the tumuli which he had opened Mr. Riley found quantities of the objects usually associated with Neolithic dwellings, together with one or two fresh forms that were unknown to so experienced a prehistoric archaeologist as Mr. Elward Laws, F.S.A., of Tenby. In several instances the mounds contained secondary interments, apparently of the later Neolithic period, and the neighbourhood also yields relics of the Bronze and Early Iron ages.

Another paper by Professor Anwyl of the Aberystwyth University College, dealt with the "Early Settlers of Cardiganshire." It was an able and careful *résumé* of the sum of modern knowledge upon the question, but it contained none of the suggestive, if risky, conclusions of Mr. Willis Bund's presidential address.

On Friday evening the usual complimentary votes were passed, the most deserved being to the honorary local secretary, the Rev. D. H. Davies, Vicar of Verwiz, who had been indefatigable throughout the meeting in attending to the comfort of the visitors. Shrewsbury was selected as the rendezvous for 1905.

THE CONSTITUTION OF PORTLAND CEMENT FROM A PHYSICO-CHEMICAL STANDPOINT. By Clifford Richardson. (New York: Research Division, Testing Laboratory, Long Island City, N.Y.)

APPOINTMENT.—A meeting of the Samford Rural District Council was held at the Board Room, Tattingstone, recently, when the Clerk, Mr. Arnold J. Haward, read the report of the committee appointed to consider the subject of the appointment of a building surveyor. The committee reported to the effect that Mr. Henry J. Wright, the Sanitary Inspector to the Council, should be appointed to the office. After discussion this was agreed to.

The Student's Column.

NOTES ON PORTLAND CEMENT.

CHAPTER VI.—FINENESS.

PROBABLY one of the first tests to which cement is subjected is that for fineness of grinding. The manufacturer in passing through his mill, or the user on receiving a fresh consignment, will, almost unconsciously, pick up a pinch and rub it between his fingers to test its fineness.

The demand for finer ground cement is on the increase, a few years ago 10 per cent. residue on a sieve of 2,500 meshes per sq. in. being the general rule; now 5 per cent. on a sieve of 10,000 meshes is not uncommon.

Still, the value of fine grinding does not appear to be appreciated by users generally. Cases have been known where builders have pronounced a cement over-ground.

Nothing could be more absurd. A cement cannot be too finely ground, as the larger the percentage of flour, the greater its capacity for carrying mortar; that is, concrete as strong may be made with half the quantity of a finely-ground cement that would be necessary of a coarsely-ground one. This fact is not appreciated by all builders, the same quantity of cement being used in mortar regardless of the fineness.

A cement having a residue of, say, 10 per cent. on a 50 sieve will show an increase of 20 per cent. in tensile strength if ground fine enough to all pass through this sieve; but it is in sand tests that the increase in value due to fine grinding is seen. As each particle of sand requires to be covered with a thin coating of cement, the more finely ground the latter is, the thicker the cementitious coating and, therefore, the stronger the mortar will be bound together.

It is generally believed that the coarse particles in cement have no cementitious value, but this is not the case. The author has made small blocks of the particles held by a 76 sieve, which after being in water used for storing briquettes some months have attained considerable hardness. This was thought to be probably due to the deposition of hydrate of lime from the briquettes in the pores of the blocks; but experiments carried out by Mr. D. B. Butler conclusively prove that the coarse particles have in themselves some cementitious value.

Mr. Butler separated the coarse particles into three degrees of coarseness, and to make certain that no fine cement dust was held by the particles, they were washed thoroughly by decantation till the washing water was clear. The coarse particles thus prepared were made into briquettes, which were broken after being six and twelve months in water. The results are shown in Table I.

lower tensile strains than the original samples did.

Mr. Butler's experiments prove—

(1) That the coarse particles of cement are not inert, but have a certain value according to their size.

(2) That fine grinding of cement reduces its cohesive power, but greatly increases its adhesive power.

An instance of the cementitious value of the coarse particles in cement was brought forward by Mr. G. L. Anderson in the course of a discussion on a paper read before the Society of Engineers.

Mr. Anderson experimented with briquettes about a year old, made of cement which had been originally ground to a fineness of about 5 per cent. on a 50 sieve. He ground them up without recalcination or other treatment, so as to all pass a 76 sieve and leave a residue of 16 per cent. on a 180 sieve, and made briquettes of the resulting powder. The neat briquettes stood a tensile strain of 403 lb. per sq. in. after seven days, 415 lb. after twenty-eight days, and 435 lb. after three months. The sand tests gave strains of 224 lb. after twenty-eight days, and 300 lb. after three months.

Fine grinding greatly quickens the setting time of a cement. According to Le Chatelier's theory, the setting is due to super-saturation, so that, the more finely a cement is ground, the more readily it dissolves and the quicker the deposition of the crystals. The fineness of grinding should always be taken into account when judging the setting properties of a cement. The demand at the present time is for a fine cement, and at the same time a slow-setting one. These two characteristics are antagonistic, a finely-ground cement meaning a quick setting one, according to the degree of fineness, unless artificially rendered slow setting. This may be done by suitable aeration, and engineers and contractors should make allowance for this. The author has seen specifications in which it is stated that the cement shall be ground very fine, the setting time not to be less than three hours and the volatile matter not more than 1 per cent. This is almost an impossibility unless at great expense or artificial means of slowing the setting is resorted to.

Fine grinding of a cement undoubtedly checks to a considerable extent the tendency to "blow." Unsoundness of a cement is caused by one of three faults in manufacture—viz., the coarse grinding of the raw material; over-lining or excess of lime; under-burning. In each case free or loosely-combined lime is the result. The first two are the most dangerous, as the free lime is enclosed in the hard-burned particles, and it may be months before their effect may be felt. Unsoundness from under-burning is easily overcome by aeration. The benefit of the fine grinding of the cement, therefore, is that the uncombined lime which would other-

TABLE I.

Size of Particles.	Held by a 50 x 50 Sieve.		Passed 50 x 50. Held by 70 x 70.		Passed 70 x 70. Held by 120 x 120.	
	6 Months.	12 Months.	6 Months.	12 Months.	6 Months.	12 Months.
Sample A	150	160	200	200	250	330
" B	95	120	110	180	175	290
" C	90	120	110	170	190	280
" D	90	140	115	137	192	200
" E		180	190	292	330	420

Having proved that the coarse particles had some cementitious value, various samples were procured to try the effect of fine grinding and the presence of the coarser particles had on the strength of the cement. Tensile tests were made of each sample—first, in original state; second, ground very fine; third, coarse particles substituted by sand of similar size.

The effect of the fine grinding was greatly to increase the cementitious value, as seen by the sand tests. The neat tests in some cases gave higher results for tensile strain after seven days, but not increasing much thereafter, and in others the tensile strain after seven days was not so good as that of the original samples. An explanation of this might be found in the fact that the fine grinding made the samples so quick-setting that time could not be allowed to make the briquettes properly, and a large excess of water was required in gauging. In each case the substitution of sand for the coarse particles gave

rise to the coarse particles is easily overcome by aeration or is hydrated on gauging the cement with water, and is thus rendered harmless.

Of all the tests to which cement is subjected, that for fineness is probably one of the simplest and yet one which causes much friction between the manufacturer and the user. This is due to the want of uniformity in carrying out the test. A weighed quantity is sifted on a sieve having a certain number of holes per sq. in., and ascertaining the quantity which will not pass through. In England there is no recognised standard as to the thickness of wire of which the gauze of the sieves are composed, and then again there is no agreement as to the length of time the sifting should be continued. The thicker the wire, the smaller the holes, and consequently, the greater the residue will be.

In America and on the Continent the standard adopted is that the thickness of the wire shall be one-half the size of the opening. In Table II.

It will be seen the thickness of wire of various sieves and the size of the opening according to is standard.

TABLE II.

Number of Meshes per Inch.	Thickness of Wire.	Width of Opening.
	Inch.	Inch.
0 x 1800018	.0037
0 x 1200028	.0055
0 x 1000032	.0067
0 x 700044	.0087
0 x 500068	.0132
0 x 400084	.0167

The length of time during which sifting is performed has considerable effect on the results obtained, especially on the finer sieves. The author considers that no time limit can be given unless a standard method be employed. An operator using a sieve of, say, 6 in. diameter and sifting 100 grammes will take longer to get all the fine particles through than one using a sieve of, say, 10 in. diameter; then, again, two operators never sift alike; one may be quick in the movements of the sieve, another slow, and several other personal differences might be cited. The author considers

that the sifting should be continued till no appreciable quantity passes through the sieve. After this, prolonged sifting only grinds the particles one against the other and on the wire of the sieve so reducing some small enough to pass through the holes.

When the fineness on various sieves is required the most suitable method is to sift the material at once through a "nest" of sieves—that is, one within the other, the sample being put into the coarsest sieve and passing down to the finest. Sieves having a cover should be used, as it is very easy when sifting in an open bin to bounce some of the particles over the side. Where a number of siftings are done

daily, a mechanically-driven sieve is very useful and gives good results, especially for the manufacturer to use as comparisons.

Sieves should be examined frequently to see that none of the wires are displaced or broken, thus giving larger apertures, and, again, the wires of sieves which have constant use get worn thin, larger apertures being the result; or, if the sieves are damp when used, the fine cement will stick to the wires and so clog the holes. If the cement is damp, it should be dried in an air-oven and any lumps broken by gentle rubbing or pressure; in fact, some operators recommend drying all samples before sifting.

Sifting a sample of cement to determine what residue is left on a standard sieve, and so judge of its fineness, is not quite satisfactory.

As the cementitious value depends on the amount of flour in a cement, and it is practically impossible to make a sieve fine enough to determine this, many attempts have been made to find a substitute for the sieve test.

Mr. W. F. Goreham's flourometer appears to be the nearest approach to solving the problem. The diagram given on this page shows the apparatus.

A is a cylindrical vessel open at both ends, and when in use stands on a base-plate, which closes its lower end. Into a hole in the side is soldered one arm of a breeches pipe B. The other arm outside the cylinder is clamped to a conical glass vessel C, at the bottom of which is fixed a small metal cone. The top of this pipe is closed, and through the cover passes a tube E, which can be connected to a supply of compressed air. All the joints are made tight with indiarubber washers, to prevent the escape of flour or air into anywhere excepting the vessel A. To test a sample of cement, the necessary weight is placed in the glass vessel C and the apparatus clamped tightly. A current of air is passed down the pipe E, when the flour is carried upwards and eventually into the cylinder A. What is left in the vessel C is weighed, and so the flour calculated.

The air pressure depends on the material tested and the size of the apparatus. There appears to the author to be many possibilities of error in the apparatus, but, at any rate, when used in conjunction with the sieves, some valuable results can be obtained.

OBITUARY.

MR. J. HUNT.—Mr. Josiah Hunt, of 6, Queen Anne's-gate, Westminster, died on August 21, at the age of seventy-nine. Mr. Hunt was formerly in partnership with the late Mr. John Batstone, and for about twenty-five years they together carried on practice as quantity surveyors; this partnership was dissolved in 1875; since then Mr. Hunt continued the practice by himself until about six years ago, when failing eyesight caused him to retire.

GENERAL BUILDING NEWS.

CHURCH, OSMASTON-BY-DERBY.—The foundation-stone of the new Church of St. Oswald has just been laid by Sir Robert Rodney Wilmot, Bart., at Osmaston. The present scheme is for erecting only a portion of the church. The building, when completed, will be grouped round a quadrangle, having the church on the south, the schools on the west, and the vicarage on the east. In the centre of the quadrangle will be a large stone cross, from which paths will radiate to the various entrances. The first contract is for erecting two bays of the nave, with side aisles, and the chancel and side chapel with small stone and brick groined ceiling opening from the south aisle, corresponding with the north transept. The width of the nave will be 20 ft., and it will have an open timber roof, which will be surmounted by a floche directly over the chancel arch. The extreme width across the nave and aisles will be 42 ft. 6 in. The materials will be chiefly brick. The present contract will give seating accommodation for a congregation of about 200 people. The architects are Messrs. Currey and Thompson, of Derby, and the builder is Mr. R. Weston.

NEW MISSION CHURCH, POOLSBROOK, DERBYSHIRE.—The foundation-stone was recently laid of the new mission church which is being built at Poolsbrook. Messrs. McAllister and Tench, Cambridge, are the architects for the work, the builder being Mr. S. Stone, of Staveley. The total cost will be about 900.

NEW PRESBYTERIAN CHURCH, PORTSTEWART, IRELAND.—The memorial-stones were laid recently of a new Presbyterian church at Portstewart. The plans were prepared by Mr. Vincent Craig, C.E., of Belfast, and the builder is Mr. James Kennedy.

RESTORATION OF TRINITY HOSPITAL CHAPEL, LEICESTER.—The restoration and rebuilding of Trinity Hospital Chapel, Leicester, is now nearing completion. The architects, Messrs. Goodacre, recently made a survey of the chapel, and the following is an extract from their report:—"The chancel is generally in a fair state of repair, and it is only proposed to re-slate the roof of the chancel, together with the vestry leading out of the chancel. Some small repairs are also required to the roof. New spouting is to be fixed to the eaves, and the bellcot is to be repaired and painted. The portion forming the nave and transept of the chapel is in a very unsatisfactory and dilapidated state, and generally beyond repair. The whole structure is very damp. It is proposed to leave the old granite walls standing, and keep the building on exactly the same dimensions as at present. The third brick wall on the west side of the south transept is to be taken down and rebuilt with granite. Two new windows are to be inserted in the walls, and the present windows restored. All the granite walling is to be cleaned and pointed externally. The doorway in the north transept is to be built up on the inside with granite, and the buttress to be carefully restored. It is also intended to build the piers and arcade on the same lines as the original, and to put a new roof over the nave on the same lines as that over the chancel, thus opening up the old chancel arch. The floor is to be laid with wood blocks on a foundation of cement concrete. The old seats are to be removed. They are very rotten, and quite beyond repair; it is proposed to replace them with suitable seats or chairs. The chapel is also to be fitted with a service of gas pipes and brackets, and the building will be warmed by continuing the heating arrangements in the hospital into the chapel. Every care will be taken to preserve all old features of the original work. It is estimated that the restoration will cost about 1,000*l.*"

SCHOOL FOR DEAF AND DUMB, LIVERPOOL.—The new Council school for deaf and dumb children is situated in Olive-street, almost opposite the old institution. It has a frontage both to Olive-street and Crown-street of 120 ft. There are separate entrances for the boys and for the girls, from their respective playgrounds, and access is at once obtained to a hall, 28 ft. wide and 33 ft. in length, with a clear height to the tie-beams of the roof of 24 ft. In this hall the scholars will be marshalled, drilled, and inspected. Surrounding the hall are eight separate classrooms, with windows on the outside walls, whilst glazed partitions divide the classrooms from the hall. By means of two fireproof staircases, one for the boys and the other for the girls, a projecting gallery overlooking the hall is reached. This gallery connects with eight other classrooms modelled on the same plan as the classrooms below. On this floor are provided an assistant head teacher's room, and two rooms for male and female teachers respectively. The head master's room is on the ground floor. The architects are Messrs. G. Bradbury and Sons. As regards the alterations in the old institution, which will now only be used for the boarding and the home life of the children, the plans of Mr. Bradbury embraced the conversion of the large schoolroom, 40 ft. by 50 ft., to the purposes of a recreation-room for the boys, whilst the experiment is being tried in this room of providing each boy with a locker in which to deposit his personal belongings. A similar room is provided for the girls, who will have a room 40 ft. long by 20 ft. in width. In order to effect other improvements, so as to bring the institution up to date, the committee purchased a number of houses in Stanley-place, which have been demolished in order to allow of the admission of more air and sunlight into the playgrounds and buildings. Two other houses in Olive-street which were also purchased, are being converted into a laundry, and above the laundry there will be sleeping accommodation for the laundry maids, who are deaf and dumb, and former pupils of the institution. There is also a swimming bath lined with white tiles. One room, 25 ft. square, is also being converted into a bathroom. Each floor in the building is connected with two fireproof staircases. Electric lighting is also introduced.

SCHOOLS, GRIMSBY.—New school buildings have just been opened at Grimsby by Sir G. Doughty. They occupy a site bounded on the north by Harold-street, and on the south by Castle-street. The buildings cover an area of about 1½ acres in extent, and give a total accommodation for 1,460 children in the following departments:—Mixed school, 1,160; infants' school, 300; manual instruction room, laundry, and cookery centre. The premises comprise a mixed school, two stories high, fronting Harold-street, on the central hall

system, the ground floor having a large central hall, with two classrooms of same, which can be thrown into large hall when occasion requires by removing sliding partitions. To the right and left of central hall run corridors with four classrooms at either end. At the extreme ends of the buildings are arranged cloak-rooms, lavatories, teachers' rooms, and main entrances for junior and senior boys and girls; also stone staircases leading to the first floor school which is similar in every respect to the ground floor, having another central hall building. The reading-room is 50 ft. by 20 ft. In a central position between this room and the dining-room, with an area of 20 ft. by 15 ft., is the provision shop, or stores. There are lifts connecting the shop with the kitchens in the basement. The dining-room, 80 ft. by 41 ft., contains two ordinary fireplaces and a cooking fire, with lodgers' scullery. The kitchens, sculleries, pantries, and stores are in the basement. In the basement are also numerous lockers and storerooms for the accommodation of the things belonging to the boarders at the home. On the upper floors, approached from the large main staircase by three independent gangways, are the sleeping cubicles. These are arranged in groups for easy working and control. There are also two other stone staircases for exit in case of necessity. In view of any possible outbreak of fire, all the floors and staircases are fireproof. The number of cubicles for which arrangements were made in the original design was over 300. Over the billiard-room is a large flat roof, which it is designed shall be for the use of the men who sleep in the home, and who will thus be afforded an opportunity of getting fresh air.

THEATRE ROYAL, HALIFAX.—This theatre, which is now being rebuilt, occupies the site of the old theatre, including the old Shakespeare Hotel, the shop adjoining, and four cottages, etc., in Shakespeare-street. The site is rectangular and open on three sides. The auditorium is 54 ft. deep and 57 ft. wide within inner walls, and outside these are corridors and staircases 5 ft. wide up to outer wall. The ceiling will be about 50 ft. above the pit floor. The roof over the auditorium will be carried by steel principals in one clear span. The proscenium arch is 30 ft. wide and 30 ft. high, and the stage has a clear depth of 37 ft., and a width of 69 ft. The height of the grid is 50 ft. above stage floor. There are seven dressing-rooms provided for the artistes in close proximity to the stage, each fitted up with modern sanitary requirements. The staircases throughout the house are fireproof, as well as the partitions to the dressing-rooms. The theatre will accommodate about 2,000 people. The building has been designed and is being carried out by Messrs. Richard Horsfall and Son, architects, Halifax.

FREE LIBRARY, WALKLEY, SHEFFIELD.—The foundation-stone of the Free Public Library at Walkley, which, as far as the building is concerned, is the gift of Mr. Andrew Carnegie, was laid on the 9th inst. Mr. H. L. Paterson, of Sheffield, is the architect. The building is at the corner of South-road and Walkley-road, advantage having been taken of the site to place the main entrance at the angle. This takes the form of a circular portico, and gives access to the vestibule, 9 ft. wide, out of which open on the right and left respectively, the women's reading-room and the men's reading-room, the latter facing South-road, and the former facing Walkley-road. At the end of the vestibule opposite to the entrance are folding doors leading into the lending department, which fills up the angle between the men's and women's reading rooms. A curved counter separates the public space from the book store, which will be large enough to contain stacks for 15,000 books. These stacks will be arranged radiating. The committee and librarians' room is placed on the Walkley-road front, beyond the women's reading-room. Lavatories for the public as well as for the staff are provided. The building will be faced with rockies from the Bole Hill quarries, with Stoke stone dressings, and the roof will be slated. The floors will be laid with wood blocks on concrete. A dado of glazed brick will be provided in the vestibule, and the lavatories will also be lined with glazed brick. The interior woodwork will be pitch-pine varnished. It is proposed to heat the building by hot water at low pressure, and this will be combined with the ventilation, so as to secure efficiency in both. The contract for the work has been let to Messrs. D. O'Neill and Son, of Sheffield, the amount being 3,258*l.* 10*s.* and the glazed bricks are being supplied by the Wortley Fire Clay Company.

MISSION HALL, TURNBRIDGE WELLS.—The opening of the new Wesleyan Mission Hall, which has been erected in Hill-street, Turnbridge Wells, took place on the 17th inst. The building is of red brick, and accommodation is provided for 270 people. Mr. C. H. Strange was the architect of the work, the builder being Mr. Jarvis.

A PEOPLE'S PALACE, LIVERPOOL.—The "Workmen's Hostel," erected on the site of the old St. James's Market, Great George-street, out of the moneys of the David Lewis Trust Fund, is now, says the *Liverpool Daily Post*, open for the reception of lodgers. The building has its main frontage in Great George-place, its side fronting to Nile-street, and its back in Rathbone-street. The cost of building and furnishing it, it is understood, is about 100,000*l.*, and the structure has been erected from designs and under the superintendence of Mr. J. Francis Doyle, architect, Liverpool. The main frontage extends to 174 ft. The side frontage in Nile-street has a length of 146 ft. In all, the site of land embraces 220 ft. by 176 ft. The buildings are set back from the boundary some 21 ft. The materials used in the facing of the main outer walls are a special brick and terra-cotta, with green slates on the roof. The main entrance to the public hall and club-room is from Great George-place, and is 12 ft. wide. This means of ingress has a hall 50 ft. by 20 ft., arched and finished in tiles and faience. The public hall, which is 90 ft. by 42 ft., and 35 ft. high, is in the centre of the building, and will accommodate upwards of 600 persons. It is complete in its appointments, with separate stage entrances from Rathbone-street, stage boxes, gallery, and greenrooms for both sexes. Provision has been made for eleven sources of egress. All the staircases and floors are fireproof. The social club consists of a number of large rooms, a billiard-room, 67 ft. by 30 ft., two committee-rooms, three social

clubrooms, 50 ft. by 26 ft., and also a special clubroom and toilet facilities for females. To the south of the clubroom in the same site space has been left open for the erection of a gymnasium, 132 ft. by 54 ft. The "Workmen's Home" section of the building is approached and entered through turnstiles from Nile-street, off Great George-street. Just over the threshold the visitor finds himself at the office, and adjacent to this is the master's house. The quarters assigned to the superintendent are in the north-east corner of the building. The reading-room is 50 ft. by 20 ft. In a central position between this room and the dining-room, with an area of 20 ft. by 15 ft., is the provision shop, or stores. There are lifts connecting the shop with the kitchens in the basement. The dining-room, 80 ft. by 41 ft., contains two ordinary fireplaces and a cooking fire, with lodgers' scullery. The kitchens, sculleries, pantries, and stores are in the basement. In the basement are also numerous lockers and storerooms for the accommodation of the things belonging to the boarders at the home. On the upper floors, approached from the large main staircase by three independent gangways, are the sleeping cubicles. These are arranged in groups for easy working and control. There are also two other stone staircases for exit in case of necessity. In view of any possible outbreak of fire, all the floors and staircases are fireproof. The number of cubicles for which arrangements were made in the original design was over 300. Over the billiard-room is a large flat roof, which it is designed shall be for the use of the men who sleep in the home, and who will thus be afforded an opportunity of getting fresh air.

WAREHOUSE AT THE N.E.R. NEW BRIDGE STREET STATION, NEWCASTLE-ON-TYNE.—In connexion with the extensive improvements now being carried out at New Bridge Station one of the features is a good warehouse, now in course of erection. This warehouse, which has been designed by Mr. William Bell, Architect of the North-Eastern Railway Company, is entirely built of ferro-concrete, or the Hennebique Patent System. The dimensions of the New Bridge-street warehouse are 450 ft. in length, 130 ft. in width, and it will be 92 ft. in height. The basement is to be used as a low-level and the ground floor as a high-level goods station, the two levels being connected by wagon hoists. There will be six sidings on the ground floor into which the goods trains will be run for loading and discharging. As each loaded wagon may weigh upwards of 42 tons, this floor will have to support an enormous load when several trains are in the station at the same time. The pillars supporting this floor had to be a few as possible so as not to interfere with the heavy traffic in the low-level station; this rendered very large spans necessary for the main beams. Some of the beams in the building, having a span of 52 ft., are to be tested after completion under a superload of 400 tons, and each of the main pillars has to support over 1,100 tons. The first floor will be used for storage of goods; the second floor and part of the other floors are specially set apart for the storage of flour. The roof will be flat. The contractors are Messrs. Joseph Howe and Co.—*Newcastle Chronicle*.

FOREIGN.

FRANCE.—At the church of St. Germain l'Auxerrois, Paris, the frescoes painted by Joseph Guichard, from 1842 to 1845, have been undergoing restoration. These frescoes, which form the decorations of the chapel of Saint Landry, represent on the one side St. Landry founding the Hôtel Dieu; and on the other side, St. Landry providing food for the people of Paris.—At the Jardin des Plantes, Paris, the old monument called the Pavilion Chevrouil, dating from the time of Buffon, has been restored.—A competition has been opened for the selection of the best type for the small pavilions which are erected along the boulevards at Paris, on the occasion of the fêtes at Christmas and on the annual national holiday.—The church at Bussy Lettrée (Marne), an ancient and fine monument, has been seriously damaged by lightning.—A committee has been formed at Saint-Jean (Haute Vienne) for the erection of a monument to Corot, who was particularly fond of this district, and has illustrated many of its scenes in his pictures.—A railway track has been formed between the terminus station of Fayet-St. Gervais and the summit of the Aiguille-du-Gouët (Haute Savoie). The carriages are furnished with a cog-wheel system.—A new theatre is to be built at Vannes (Morbihan).—A new hospital is shortly to be built at Dunkerque.—A competition has been opened at Lyons for a block of artisans' dwellings.—M. Gustav Geffroy, the art-critic, has been created an Officer of the Legion of Honour; and the grade of Chevalier has been conferred on M. Georges Picard, the painter who so ably decorated the Galerie Lobau at the Paris Hôtel de Ville, and on M. Deverin, architect in the Department of Monuments Historiques.—The death is announced, at the age of fifty-six, of M. Louis Prêtre, whose name was well known among French artists and who for many years filled the office of Commissaire-Général of the Société des Artistes Français (Old Salon). M. Roybet has introduced his portrait in several well-known pictures.

GERMANY.—The memorial to the Emperor Frederic which is to be erected on the new bridge before the Emperor Frederic Museum is to be unveiled on October 23; the statue was the work of the late Rudolf Maison, of Munich.—A book is being published in

HOTEL, RYTON.—The new hotel, built for the firm of James Deuchar and Co., Ltd., situated at the junction of the Carlisle-road

in entitled "The English House" (Das nische Haus), by Hermann Muthesius; the book is to appear in three volumes, and will contain an exhaustive description of English terrace houses, their situations, their external and interior decorations, their gardens, etc., which are further explained by numerous illustrations.—The new Hospital for Inebriates at Beuthen, designed by the architect E. and G. Zillmann, is completed.—The architect Herr Ludwig Hofer has de- signed the plans for the Natural History Museum which the Senkenberg Natural Re- search Society is erecting in Frankfurt; the building is to cost 1,200,000 marks.

AUSTRIA.—The ancient Poor House in Vienna is to be demolished, as, owing to the sinking of the pavement, one floor is already below the street level; the new Poor House is to be erected on a different site. The Military Geographical Institute at Vienna is progressing under the management of Herr Stigler and Siedeck; the building cost 2,000,000 kronen.—The Roman Museum at Deutsch-Altenburg, on the Danube, was opened in the presence of the Emperor; the building was designed by Hermann Ohman and Kirstein, and cost 106,000 kronen.

SWITZERLAND.—The Museum at Bern is to be transformed into a building, suitable for use of the "Kantonalbank"; the work is being carried out by the architect Herr A. Schindler, of Zurich, and is to be completed in September, 1905.—A church and a statue in memory of the Empress Elizabeth are to be erected at Geneva.—The building of the Art Gallery at Zurich has been entrusted to the firm of Curgel and Moser, in Zurich.

MISCELLANEOUS.

CALIFORNIA TIMBER.—In a report sent home by Mr. Bennett, British Consul at San Francisco, dealing with the trade and commerce of the State, it is mentioned that the receipts of pine, spruce, and fir lumber from California, Oregon and Washington were 365,653,142 ft. of Redwood from all California mills, valued at \$55,555,555 ft. Of this nearly 10,000,000 ft. was sent to Australia, 2,250,000 ft. to the United Kingdom, and nearly 5,000,000 ft. to Mexico. The Californian redwood is described as being "the most important timber product of the State. Redwood burns with difficulty, charring as a rule, and is practically oblivious to decay when used in damp places. It is one of the most durable woods known, and is greatly used in railway and engineering construction, and frequently for the lining of the great tunnels of the Ontario Power Company at Niagara, but the recommendation was not acted upon."

ROMAN REMAINS. CAERWENT.—Within the last few days discoveries have been made at Roman city of Venta Silurum (Caerwent, Monmouthshire). The south gate has been discovered, and an inscribed stone has been found to light. The city was rectangular in form, and had one entrance near the centre of each of its four sides. Remains of all that part on the south were previously known to exist, while the site of the south wall was supposed to be marked by a lane which here passed through the city walls. The gate itself has, however, come to light 50 ft. further west, and forms a most interesting parallel to the north gate. Each had an internal and an external wall, with a span of about 9 ft., the outer being to a great extent preserved. The south gate, which has the spring of an arch on each side, while the north gate the spring on one side only. Between the two arches was a rectangular space with a ceiling, over which must have passed a walk which led along the top of the city walls. The gateway had been blocked with a stone-work in Roman times. The inscribed stone which has been discovered is a dedication to Mars by M. Nonius Romanus, was set up in the year 124 A.D.—*Birmingham Daily Post.*

MEMORIALS IN LONDON.—A tablet has just been affixed on the front of No. 67, Wimpole-street, W., where Henry Hallam lived during the period 1819-40; the house is that which Hallam mentions in a well-known stanza in "The Gateways to London"—"The much-severed cradle of the birthplace of Lord Beaconsfield seems to be now determined by the fact that a similar tablet has been placed in the wall of No. 22, Theobald's-road, formerly King's-road, near Bedford-row. The places which contend for that honour are St. Mary Axe, No. 2, James-street, and No. 6, on the west side of the Salisbury-square; but it appears that the tablet did not remove to the last-named

house until some years after Lord Beaconsfield's birth in 1804. A tablet has also been affixed to No. 1, Devonshire-terrace, at the corner, north-west, of Marylebone-road, to commemorate the residence there, in 1839-51, of Charles Dickens.

DRURY-LANE THEATRE.—The theatre will be closed until next Christmas for the carrying out of certain structural alterations and improvements, in accordance with the terms of the award recently made by Mr. John Slater, F.R.I.B.A. Mr. Slater was appointed by the First Commissioner of H.M. Office of Works to act as arbitrator between the London County Council and the directors of the Theatre Royal, Drury-lane.

IMPROVEMENTS IN STEPNAY AND THE VICINITY.—The Borough Council of Stepney have unanimously decided at a special meeting held a few days ago, to carry out a widening of the western portion of Great Alie-street, Whitechapel, in which their offices are situated, in connexion with the scheme for a widening of Mansell-street, and to put in force the provisions of Michael Angelo Taylor's Act (of 1816) for the acquisition of the property required for the improvement. Two-thirds of the cost will be borne by the London County Council, whose recommendations for a further widening of Narrow-street, near Dowson's Dock, Limehouse, are under consideration of the Borough Council.

BRITISH WEIGHTS AND MEASURES.—A provisional committee of the British Weights and Measures Association, formed for the defence, standardising, and simplifying of British weights and measures, has just been constituted. The committee, which consists of ten members, includes Mr. A. H. Adams, of the Sturtevant Engineering Company, London; Mr. R. Kaye Gray, President of the Institute of Electrical Engineers; Mr. Henry Lovatt, of Wolverhampton, builder and contractor; and Mr. Thomas Parker, of London and Wolverhampton, consulting engineer, who is now engaged upon the electrification of the Metropolitan Railway line and rolling stock.

THE ORDNANCE SURVEY.—The annual report of the Ordnance Survey for the twelve months ended on March 31 has just been issued. The revised outline maps, to the 1-in. scale, of the United Kingdom are now completed and published; the completion is also announced of the revised four-mile outline map of the United Kingdom, as well as of the coloured four-mile map, together with the ten-mile revised map, in both outline and colour, with hills, of England, Wales, and Scotland. Rapid progress is being made with the two-mile map of England, and the 1-in. coloured map of England and Wales is finished. The report states that the authorities will revise the 1-in. outline maps of the United Kingdom at intervals of fifteen years, having finished the current series with the maps of Ireland, which were published in the course of the period under review.

UNIVERSITY COLLEGE SCHOOL.—For the new school buildings a site has been acquired in West Hampstead, at the junction of Arkwright-road and Frognal. It is proposed to expend an estimated sum of 50,000*l.* upon the erection of buildings to accommodate 450 boys, with provision for extension hereafter to accommodate 150 more.

CAPITAL AND LABOUR.

EMPLOYMENT IN THE BUILDING TRADES.—According to returns supplied by sixty-eight Employers' Associations, whose members are estimated to employ about 83,500 building operatives of all classes, and by trade unions, with an aggregate membership of about 180,000, employment in the building trades generally continued dull during July, and, on the whole, showed little change as compared with June. It was, however, rather worse than a year ago. With bricklayers' employment is reported as dull, and about the same as a month and a year ago. It is moderate with masons in England, but dull in Scotland. With carpenters and joiners employment is bad. The percentage of unemployed trade union carpenters and joiners was 57 at the end of July, compared with 63 in June, and 33 a year ago. Employment with painters generally has been dull, and about the same as a month ago in England, but worse in Scotland. It is worse generally than a year ago. With plasterers and plumbers employment has been bad. The percentage of unemployed trade union plumbers was 104 at the end of July, compared with 99 at the end of June, and 67 a year ago. With slaters and tilers in England and Ireland employment continued dull, but in Scotland they were fairly well employed.—*The Labour Gazette.*

Legal.

WEST END ANCIENT LIGHT DISPUTE.

In the Vacation Court on Wednesday, counsel applied, *ex parte* to Mr. Justice Bigham, on behalf of the plaintiff in the case of Milton v. Maskelyne, for an interim injunction over next Wednesday, restraining the defendant from increasing the height of his building so as to obstruct the plaintiff's ancient lights. The learned counsel stated that, if the defendant's building operations were allowed to go on uninterrupted until Wednesday next, his building would by then be completed, and it was unusual for the court to order a building to be pulled down when once it had been put up. If his lordship looked at the affidavits which had been filed, he would find that there was an agreement to submit the question to arbitration.

His lordship: Are you issuing a writ notwithstanding the agreement?

Counsel: Yes. If the judge finds that there is not in the letters a sufficient agreement, then we shall rely on our common-law rights to restrain the building.

His lordship asked what the building complained of was.

The learned counsel replied that it was the St. George's Hall, in Langham-place, the plaintiff's building abutting on the south side of the defendant's building.

In the result, his lordship declined to grant the injunction, but gave the plaintiff leave to serve notice of motion with the writ for Wednesday next.

PATENTS OF THE WEEK.

APPLICATIONS PUBLISHED.*

12,168 of 1904.—J. KOCKS: *Covers for Key-holes.*

This invention relates to a cover for key-holes, the object being to obviate the disadvantages appertaining to keyholes, in that it is impossible for a listener not only to listen to the conversation occurring in a room, but also to see through the keyhole into the room. The invention consists in placing over the key-stem, before insertion of the key into the lock, a disc or plate of elastic material.

12,985 of 1904.—J. W. CRAVEN and J. H. CRAVEN: *Machinery for Making Briquettes, Bricks, Blocks, and Tiles, such as Briquettes of Artificial Fuel, or Bricks or Blocks of Sand and Lime, etc.*

A machine for making briquettes, bricks, blocks, etc., consisting of a horizontally-arranged mould-table, in combination with a vessel, or mill, immediately above the line of travel of the moulds, and provided with an opening, with which the moulds successively come into coincidence, and with blades or fillers rotating in opposite directions, so as to equally pass the matter from the said vessel or mill through the said opening into the said moulds.

20,057 of 1903.—E. B. L. MORRIS: *Automatic Fire-Extinguishing Appliances.*

This consists in the combination of a pair of valves of different areas, connected by a hollow spindle working on a guide, means for allowing water to enter the spindle when the valve is opened and enclosing it there so that the valve is prevented from closing again.

12,439 of 1904.—F. HUBBER and W. G. HIGGS: *Electric Fire Alarm, and the like Signalling Apparatus.*

An electric fire alarm, and like signalling apparatus, consisting in the combination of a mechanically-operated ring of contacts with relay, line, and battery connexions, said ring of contacts being brought into operation by means of an electro-magnet operated by a push, or automatically, whereby a predetermined number of intermittent synchronous impulses will be transmitted.

16,003 of 1903.—P. TIMOFFEEFF: *Construction of Pavement, Covering, or Flooring for Roadways, Pathways, Floors, Stairs, Ships' Decks, Permanent Way of Railways, etc.*

A new paving, flooring, or covering for roads, pathways, floors, stairs, ships' decks, railways, etc., consisting of basket-like, flat structures, formed by either plating or weaving metal strips or wires, or by means of stamped and perforated steel, or other suitable metal, such structures being formed open on one side with shallow side edges, so as to be adapted to be bedded firmly with their open sides downwards upon the ground or upon a layer of sand, or the like.

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

MEETINGS.

SATURDAY, SEPTEMBER 3.
ociation of Municipal and County Engineers.—
nd District Meeting to be held at Birmingham,
and Rea District Drainage Board's Works.

OCTOBER 6 and 8.

id of the Royal Institute of British Architects to New-
-upon-Tyne.—The following, amongst other arrange-
s, are being made in connexion with the visit of
stitute to Newcastle: The Northern Architectural
ation Reception Committee will receive the visiting
embers of the Institute at the County Hotel, at
n, on October 6th. His Worship the Mayor of
astle will receive the members at 10.0 a.m., on
er 7th. After which, about an hour will be
sed to the reading and discussion of a paper on
icism in Architecture." The President of the
S.A. will take the Chair. The Cathedral and the
ty House will be visited. The Northern Archi-
tural Association will entertain the visiting mem-
bers on the 8th at the County Hotel, at
n. Arrangements will be made for those mem-
bers who wish to do so, to visit during the afternoon
nday. Places of interest in the immediate neigh-
hood. In the evening a dinner will be held, and
aturday, October 8th, arrangements will be made
those who desire to do so, to visit Hexham Abbey
the Roman Station at the Chesters, Chollerford,
and the New Shipbuilding Sheds at Messrs.
& Hunter's, Wallsend.

TO CORRESPONDENTS.

B. (Below our limit).—A. G. (Amounts should
be stated).

NOTE.—The responsibility of signed articles, letters,
papers read at meetings rests, of course, with the
author.

We cannot undertake to return rejected communica-
tions; and the Editor cannot be responsible for
missings, manuscripts, or other documents sent to or
at this office, unless his name has specially asked for
return.

Letters or communications (beyond mere news items)
which have been duplicated for other journals are NOT
RESERVED.

All communications must be authenticated by the
name and address of the sender, whether for publica-
tion or not. No notice can be taken of anonymous
communications.

Contributors are compelled to decline pointing out books and
magazines to a contributor to write an article,
to execute or lend a drawing for publication, is given
subject to the approval of the Editor, who retains the right to reject
unsatisfactory. The receipt by the author of a
copy of an article in type does not necessarily imply its
acceptance.

All communications regarding literary and artistic
matters should be addressed to THE EDITOR; those
relating to advertisements and other exclusively busi-
ness matters should be addressed to THE PUBLISHER,
not to the Editor.

PRICES CURRENT OF MATERIALS.

Our aim in this list is to give, as far as possible, the
average prices of materials, not necessarily the lowest.
Quantity and quality obviously affect prices—a fact
which should be remembered by those who make use of
this information.

Ancient Egyptian Building.

IN his latest contribution to the history of architecture,* M. Choisy returns to the consideration of a subject he had already treated in his general history published in 1899. He simplifies his description, however, of Egyptian architecture, and puts forward a new theory to account for the undulating curves found in the crude brick walls at Abydos and Karnak. In the more detailed account he gives of the Egyptian methods of building vaults and domes in unburnt brick without centring, he shows many varied methods of strengthening the vaults which have not hitherto been noticed. By far the most important part of the whole work is that devoted to stone construction, in which M. Choisy deals with the quarrying and transport of materials—the raising of and fixing in position the great blocks of stone used in the Pyramids and Temples, and the precautions taken when lowering the same into their position, as also those for the obelisks and for the porteulises in the pyramids. His description of the processes employed comes virtually to us as a revelation, and shows a knowledge of engineering which is far beyond that which could be imagined as possessed by one of the earliest races of mankind.

The chapter which deals with the waving curves in brick is illustrated by many photogravures at the end of the book, the first four of which, at Philæ and Esneh, represent undulating courses in masonry to which M. Choisy's new theory would not apply. It had generally been supposed that these courses were precautions taken against earthquakes, but M. Choisy points out that in some cases such walls are found on the natural rock where there could be no fear of a settlement. In his "History of Architecture" M. Choisy pointed out that when building walls the masons made use of a stretched cord to regulate the course levels, a system employed from time immemorial down to the present day, but to suggest, as he does in his History, p. 19, that as the cord sunk in the middle the course followed the sinking—"Le cordeau fléchit en son milieu: le lit suit la flexion du cordeau directeur"—does not appeal to us.

In his present work he puts forward another theory which is more reasonable, though whether it can be proved in every instance is doubtful. As there is no rainfall in Egypt, a wall in that country in crude or unburnt bricks did not require that protection which was given to it in other countries, as, for instance, the layers of burnt brick, or tiles, on the top of the walls, and the stucco casing given to the sides in Greece and Rome; but, when in the proximity of water, M. Choisy points out that certain hygrometric changes take place—the moisture from below is drawn up into

the brickwork by the heat of the sun during the day, whilst at night the condensation of this moisture causes the bricks to swell and dislocate the wall; or if built on an incline, gives a tendency to slide downwards. M. Choisy points out that the concave bed would prevent the latter, and by leaving open joints at the junction of the concave and convex beds these would simply close up at night. There are, however, undulating courses found in brick walls at Abydos which are far distant from the river or any inland lake to which this theory would not apply, and certainly in the walls represented in the first four photogravures the moisture could not affect the masonry, nor could it well be drawn up through the same to the crude brick above, so that further research is required here.

When, however, we come to the account given by M. Choisy of the transport of large blocks of stone, and the raising and bedding them in their position, not only is the evidence given of the most convincing character, but it is the result of observation which it was open to anyone to make; no excavations were required, everything was above ground, and the features to which M. Choisy calls attention have been seen by hundreds of travellers without any attempt to follow their meaning or object before he entered the field.

The theory commonly accepted, that the blocks of stone were hauled up inclined planes of sand which were afterwards removed, had its origin in a traditional custom which is sometimes

* L'Art de bâtir chez les Égyptiens. Par Auguste Choisy. 5m. J. Fo. Paris: Edouard Rouveyre; 1901.

Fig. 1. The Rocker.

actually employed at the present day. One of the columns in the Great Hall at Karnak was taken down stone by stone, and, after a new solid foundation had been laid, was rebuilt by the same method, there being from 100 to 150 men, women, and children employed in raising the mound and afterwards removing it. But this system, M. Choisy points out, could not have been followed in the case of the erection of the great Pylons, sometimes over 100 ft. in height, as there would be no room for the inclined planes of requisite length. Moreover, with an inclined plane in the proportion of one in height to only two in the base, 500 men would be required to haul up a stone weighing 15 tons, and where could those 500 men have been posted? On the inclined plane itself their feet would have slipped, and there would be no room on the narrow platform of the pylon. This led M. Choisy to the conclusion that the stones must have been raised in the same way as they were on the pyramids, where the scaffolding, if it may be so termed, existed in the natural construction of the pyramid itself; that is to say, the stones were raised step by step either by means of levers of various kinds or by an apparatus which he calls the *ascenseur oscillant* (rocking cradle). This cradle consisted of two beams of timber of segmental shape, which were framed together with stout wooden bars (Fig. 1). Numerous models of this apparatus have been found in the tombs, and they have always been assumed to be centerings for an arch or vault; but M. Choisy points out that all their arches and vaults were built without centering, so that they must have served some other purpose. On to this cradle, according to his theory, the blocks of stone were shifted by means of an inclined plane, and then by the use of levers and small blocks of stone introduced one side or the other as the cradle was rocked the stone was gradually raised, and ultimately shifted on to the upper bed. In the case of the pyramids the height of the step varied from 4 to 5 ft. Herodotus, quoting the description given him by the priests as to the erection of the pyramids, says that: "The blocks were raised from one stage to the other by means of machines made of short pieces of wood"—a description which, in the main, agrees with M. Choisy's supposition, and with his conjectural illustration, shown in our Fig. 2 (page 82 in the book). In support of his theory, so far as the erection of the pylons is concerned, M. Choisy calls attention to the remains of the temporary step platform which was erected in the great court of the Temple at Karnak, and as those remains are shown in two photogravures on Plate XIV., and must be known to every traveller, there can be no dispute as to their existence. As this pylon was erected about 700 B.C., twenty-six

centuries have elapsed since this temporary staging was built. The remains have generally been supposed to be works of late date raised when the courts were taken possession of by squatters, but the illustrations show a series of walls parallel to one another with steps setting back, a construction of no use as a habitation. In pushing his inquiry further M. Choisy ascertained that in the side portico, which this mound partially masked, the capitals of the columns have been left *en bloc*, or, as he says, "brut," and Plate XV. shows us one of these capitals, the stones of which have never been worked down. As will be seen in Plate XIV., the temporary scaffolding consisted of a series of walls parallel to one another and built up against the pylon; as the pylon rose in height, the walls may have been built further out and stone slabs laid across or steps from wall to wall. M. Choisy, however, on p. 90, gives a diagram in which the base of the staging was built out to its full depth at first. In his conjectural restoration on p. 89 it will be seen that this series of platforms was raised to its full height only in the centre of the pylon wall (Fig. 3). The Egyptian masons having raised the stones in the centre, lowered them down to the sides; that is to say, they made use of the stone courses of the pylon itself, and this may have been done in some cases by commencing the erection of the same at one or both ends. That this was done in the case of ordinary walls we gather from M. Choisy's diagram on p. 96, in which the ordinary stone courses serve as steps, up which the blocks were raised.

The last chapter in M. Choisy's book, which deals with the transport and raising into position of monoliths, is perhaps the most remarkable, because it not only describes how these huge blocks—sometimes weighing over 200 tons—were quarried, taken down the Nile long distances and raised into their position, but shows the minute precautions which had to be taken when lowering them into position, as in the case

of obelisks, or bedding them side by side as in the roof of Karnak (where some of the stone slabs weigh 40 tons each), with so close a joint that it is impossible to insert a sheet of paper between the adjoining blocks.

On the pedestal which carries the obelisk brought from Luxor in the Place de la Concorde, at Paris, has been engraved a diagram showing how the obelisk was first raised and then lowered into its position, a work which taxed the resources of the French engineer. From the number and size of those erected in Egypt, however, with no explanatory diagrams of the way in which the work was done, we must assume that the precautions which the Egyptians found it necessary to take were the result of many experiences and perhaps failures. Queen Hatasu, the daughter of Thothmes III., boasts that one of the larger obelisks, over 100 ft. high, which she set up at Karnak, was quarried at Assuan, brought down the Nile (about 150 miles) set up on its pedestal and gilded, all within the short space of seven months. On p. 124 M. Choisy gives a diagram showing how he considers the obelisk were raised and lowered into their positions, and he puts forward the theory that, in order to avoid the risk of fracture of the base, circular cylindrical sacks of sand were employed on which the obelisk descended. When these sacks were cut the sand ran out, allowing of the gradual descent of the obelisk on its base. This theory is substantiated by the fact that on the top of the pedestals from which obelisks have been taken are small semi-circular grooves, in which the empty sacks sunk, and he shows various types of grooves all destined to avoid a sudden sinking of the obelisk. M. Choisy also describes the way in which the immense blocks of granite were lowered in the corridors leading to the tomb chambers, in order to close them after the body of the king had been deposited. These blocks were temporarily supported by wooden posts, and before removing these, sand sacks were piled up underneath, and then cut through one after the other. The last section of the chapter is devoted to the methods adopted in Greece, Assyria, and Palestine for the hauling, raising into position and building of the monoliths employed in those countries, and M. Choisy refers us to the descriptions given by Vitruvius and Pliny of the systems adopted in the Temple of Diana at Ephesus, which differed materially from those employed by the Egyptian masons.

Fig. 2. The Rocker in Use.

Fig. 3. Temporary Step Walls for Raising Materials.

We have only been able to deal in this article with some of the leading problems put forward in M. Choisy's work; although compressed into a small compass—for there are only 135 pages of text, and about twenty lines in a page—the result of his researches might be expanded into several volumes. The book is illustrated with over 100 diagrams, which explain his theories in the simplest and clearest manner, and the addition of the forty-eight photogravures at the close of the work is of special value, because they represent views which the ordinary photographer would not deem worthy of taking, but which prove that in the greater number of cases the theories put forward have a most substantial basis of fact.

In selecting the author of this book as the recipient of the Royal Gold Medal this year, the Institute has added a very distinguished name to their list. M. Choisy has contributed materially to our knowledge of the construction of bygone ages, which, as a rule, has never been properly approached by the ordinary historian. His early training as a mathematician and engineer specially fitted him for the researches to which he has devoted the greater portion of his life, and his accurate powers of observation and his acute reasoning faculties have led to a most successful and interesting result.

THE SANITARY INSTITUTE.—The usual course of educational lectures for sanitary officers will be commenced at the Parkes Museum on Monday, September 12, the succeeding lectures following on Mondays, Wednesdays, and Fridays up to November 25. Among the lecturers are Mr. E. J. Steegmann (on Elementary Physics and Chemistry); Mr. J. Priestly (Sanitary Law); Messrs. W. C. Tyndale, J. Wright Clarke, and A. Saxon Snell (various constructional subjects); and Mr. J. E. Worth (Water Supply and Sewage Disposal). The usual course of visits of inspection and demonstration commences on September 17 with a visit to the Wimbledon Sewage Works. Full particulars can be obtained from the Secretary, at the Parkes Museum, 72, Margaret-street, W.

THE REPORT OF THE COMMITTEE ON WORKMEN'S COMPENSATION.

THE recently-issued Report of the Departmental Committee on the law relating to Workmen's Compensation is one of the most thorough and valuable reports which has been made for a long time. It gives a clear impression of the results of the present law, of its strong and of its weak points, and it indicates distinctly the means which are required for its improvement. Briefly stated, two main points stand out pretty conspicuously; the first is that on the whole the existing law has worked satisfactorily, even allowing for some defects; and the next is that the trend of business and of law as based on recent legislation is towards an inevitable end—namely, that the workman shall receive in all cases a reasonable indemnity against pecuniary loss by injuries sustained in the course of his employment, and that the employer will have to protect himself against severe loss by the system of insurance—a system which is becoming more and more, in all sorts of ways, an essential part of modern life.

Since 1897, it must be borne in mind, a fundamental change has taken place in the legal relations of employer and employed; that is to say, the employer in a large number of cases has become liable to pay compensation to a workman who has been injured, without a breach of contract or of any negligent act on the part of the employer. One must realise now that the question for the future must be, not whether the workman should continue to have a legal right to be relieved from some portion of the loss caused by industrial accidents, but what amendments are required in the law providing for that relief, as regards the general method and detached means of affording it; whether any and what changes are required in the extent or

limit of that relief, or in the security for its provision and maintenance; and whether similar privileges should be extended to classes of workpeople "not now within the law." No legislation can, of course, give an injured workman complete compensation. All that can be obtained is that some portion of his loss should be borne by the employer—in the last resort of course by the general public. The Report is so full and at the same time so concise, that it is impossible to do more here than indicate some of the most interesting questions which it raises. Its careful perusal will well repay the time spent on it by any one interested or concerned in this question.

As regards the question of litigation, it is satisfactory to find that though there has necessarily been much of it, the Committee consider that actual fighting in the law courts "has been very small when compared with the great number of cases settled by agreement, without any recourse whatever to legal aid or to proceedings in court." Thus Colonel Bird, Chairman of the Builders' Accident Insurance Company, says that the cases taken into court are 1½ per cent. of the claims. The public is accustomed to read day by day reports of these cases, but it is not in possession of the number of accidents and claims. Satisfactory, however, as this state of things is, the Committee clearly are of opinion that by some amendments of the law the percentage of litigation to claims can be still further reduced. For example, as our readers well know, much litigation has taken place in regard to the meaning of the expression "by means of a scaffolding" in relation to the work of construction or repair, to the meaning and extent of the word "repair," and to the limitation of the benefit of the Act to building, some part of which exceed 30 ft. in height. We take these as instances of the ground of litigation. Many similar points arise in regard to other than building operations. But the trend of the Report will be clearly seen by the recommendation of the Committee in regard to this part of the Act. "We see," they write, "no effective remedy for these anomalies unless employment in building operations is brought altogether within the Act, and the distinctions depending upon height of building, use of scaffolding, employment of machinery, and character of work, are entirely done away with. Some objections on the part of the employers have been raised to this proposal, and they are not without force; they apprehend great increase of claims for small accidents, which ought not to come within the Act." But the protection at hand to the employer is the system of insurance, and, therefore, the Committee conclude that "on the whole the arguments for extending the Act so as to cover all building operations must prevail, . . . building operations should include work upon all erections upon the surface, including the work of preparing for and carrying out the foundations, for the erection, and be irrespective of the material used in construction." This is the conclusion which we have over and over again pointed out was the inevitable result of the existing law: Injustice to certain classes of workmen

by their exclusion from the benefits of the Act cannot be counterbalanced by less inconvenience to certain classes of employers by their non-liability, and the small contractor can protect himself just as well as the large contractor by means of this system of insurance. Nor need the small employer be unduly apprehensive because the Committee have come to the conclusion that "the pecuniary burden imposed by the Acts upon the employer has not been excessive." The introduction of so fundamental a change as was created by the legislation of 1897 and 1900 must necessarily have caused some dislocation of the ordinary modes of business; but time works its accommodations, and so the extension of the principles of the Acts will be less noteworthy than the first step in the change caused by their becoming law. But the mere fact that an employer is legally liable to pay compensation to his workmen does not necessarily give him the funds so to do, and the Committee evidently foresee that a further extension of the principle of compensation will be urged by giving the workman some kind of security for his compensation. At present an insolvent employer, or an insolvent insurance company, may defraud a workman of compensation. The idea of the Committee appears to be that the State at some future time may have to establish some kind of system of National Insurance and enact regulations in regard to the formation and conduct of insurance companies. This would not be so difficult a matter as to guarantee in any way the solvency of an employer, which is a difficulty which can only be met "by the substituting for the personal liability of the individual employer the security of a fund, the solvency of which was for all practical purposes assured." At present we think the time has not arrived for dealing with this part of the question; the main point is to simplify in the immediate future the law so as to lessen litigation, and enlarge the benefit of recent legislation so that all classes of workmen may equally be sharers in its advantages.

The advantages of the Act have, however, apparently not been felt by all workmen, for the Committee note that the tendency of recent legislation has been "to increase the difficulties of old men finding and retaining employment," and to lessen the employment of weak or partially maimed persons. In relation to these several classes it may be that the Act can be amended so as to lessen the liability of the employer in such cases, and thus to give them more chances of obtaining work. "We suggest," say the Committee, "as a minimum in the case of old persons, 5s. per week for injury, and, in the case of death, leaving dependents 25l." This is a point of great social importance, which will no doubt receive consideration; for the tendency to restrict employment to young and vigorous men only tends to make more acute the problem of old age relief generally. As we have already said, we can do no more than indicate some of the conclusions of this admirable report—a document which must remain invaluable for a long time to come.

We may, however, refer briefly to yet another point of a general character,

namely, the effect of the Acts on the safety of workmen. Here the Committee come to the conclusion, and we can do no more than state it briefly, that the operation of the Act of 1897 has not had any marked or ascertainable effect one way or the other upon the safety of workmen. If anything, it would seem that the tendency of the Act has been rather against the increase of safety, because there appears to be an inclination on the part of justices not to exercise their powers of inflicting fines on a high scale for breaches of the Factory or other Acts, where bodily injury has been sustained in consequence of a breach of a statutory obligation. It is clear that the Legislature did not intend that compensation to a workman in such a case should take the place of a fine for breach of a statutory duty; and if it is proved that magistrates take this view of the law, it should be pointed out to them by the Home Office that they are acting wrongly. Here, again, is another instance of the far-reaching effect of the recent legislation, which has so vitally affected the position both of employers and workmen.

A NOTE ON THE LAW OF LIGHT.

THE case of *Kine v. Jolly*, recently decided by Mr. Justice Kekewich, is one of extreme importance in regard to the law of light, since it is the first case in which the right of parties to an injunction has had to be considered since the decision of the House of Lords in *Colls v. Home and Colonial Stores*. We have in these columns already drawn attention on several occasions to the important change in the law effected by this decision of the House of Lords, since no longer is any practical obstruction of light sufficient to give the party setting up ancient lights a right of action, but the obstruction has now to amount to a nuisance—that is, to such a deprivation of light as to render the premises substantially less fit for the purposes of occupation or habitation; moreover, the judgments in the House of Lords raised some doubts as to how far the remedy of mandatory injunction was appropriate in such cases, in place of a simple decree for damages.

The decision in *Kine v. Jolly* is of especial interest, since in the first place a mandatory injunction had been granted, but stayed pending an appeal. Before the appeal came on for hearing, the decision in *Colls v. Home and Colonial Stores* had been delivered in the House of Lords, and, consequently, the Court of Appeal remitted the action to the Court below for a re-hearing under the altered condition of the law. The plaintiff had a house at Acton, and complained of an infringement of ancient lights by the erection of a house adjoining. Taking the several heads of claim separately, it was proved that the drawing-room was deprived of direct sunlight; but since it remained a well-lighted room, fit for the purposes of a drawing-room, the learned judge was constrained to find at the second trial that no cause of action was proved within the decision of the House of Lords. No better illustration could be offered of the change now effected in the law;

every householder must consider the loss of direct sunshine a serious detriment to a house, and one which affects its saleable and letting value; yet, since no one is any longer to be deemed to have an absolute right to all the light, such a deprivation gives no right of action, but is *damnum sine injuria*. The morning-room offered greater difficulties; it remained a room sufficiently well lighted to be used as a morning-room, but the learned judge found it had sustained such a loss of cheerfulness that the obstruction amounted to a nuisance; and, moreover, the damage being substantial and affecting one of the most useful rooms of the house, and the defendants being in possession of full knowledge that ancient lights existed, and the plaintiff having acted fairly with no view to extortion, the court considered this to be a case for a mandatory injunction and not for damages alone.

One other point remains to be noted. There was some objection to the light to the hall, an obstruction which the judge found would not in itself constitute a nuisance, but which, in conjunction with the obstruction of light to the morning-room, was held to amount to a nuisance, since the learned judge decided that under the new ruling the obstruction to the house as a whole must be regarded.

The court urged the parties to come to terms if they were dissatisfied with the judgment; but, in the interests of the general public, we trust these important questions may soon come before the higher tribunals for decision, and the rights of parties receive clear definition.

NOTES.

THE address delivered by Municipal House-owning. Dr. William Smart before the British Association last week, in which he dealt with the subject of the housing of the poor, should be read with considerable interest. Professor Smart has been for two years engaged on a commission which has been investigating this question in Glasgow. It is to be observed that the Professor is strongly against municipal house-owning, except in very special circumstances. The competition of municipalities with private builders, the Professor considers, would tend to positive diminution in the supply of houses and a consequent general rise in rents. Moreover, the supply of houses to the poorer classes under the market rate the Professor considers to have all the objections of a rate in aid of wages with a tendency to lower wages. The only legitimate field for municipal house-owning, it appears from the Professor's address, is the re-housing of certain classes of the community who have been allowed to live in slums through the neglect of the municipalities themselves, and who are willing to submit to certain restrictions with a view to improving their social status. There are interesting observations on the productive value of healthy houses with reference to wage-earning capacity and consequent ability to pay high rents, and we commend the whole of this address to those municipalities

who are engaging in somewhat reckless re-housing schemes with small regard to the value of the sites thus occupied and the other economic conditions which appear to have received such careful consideration in Glasgow.

Coal Production. THE annual statistical tables concerning coal production, of which the latest has just been published, contain figures of considerable interest. The total known coal production of the world now is estimated at 790 million tons. In 1901 it was estimated at 700 million tons. Of this 230,334,000 tons have been produced in the United Kingdom, representing 5½ tons per head of the population. The largest coal production seems to be that of the United States—320,983,000 tons of the same denomination (2,240 lb.) as ours, but representing less than 4 tons per head of the population. The average value of the coal in this country was 7s. 8d. per ton, being about the same as in the year 1899. In 1900 it stood at the high average of 10s. 9½d. In the United States, comparing the same dates, however, the average price of coal has risen from 5s. 3½d. in 1900 to 6s. 6½d. in 1903. The exports from the United Kingdom show a considerable increase despite the coal duty, being now 63,804,000 as compared with 58,405,000 in 1901. In the same period the export from the United States seems to have remained stationary at about 8 millions, but it is important to observe that the import into the United Kingdom is but 3,000 tons, leaving the excess of exports 63,802,000; whereas the import into the United States is 3,350,000 tons, leaving their export only 4,954,000 tons. In the above figures, however, the bunker coal of ships in foreign trade is included in the United Kingdom, but not in the figures for the United States. The whole report contains much most interesting statistical information.

Reading-room. CONSIDERABLE dissatisfaction is expressed with the New Buildings, British Museum, decision of the authorities to close the reading-room during the winter and spring months at 7 p.m. instead of, as has been hitherto customary, at 8 p.m. During the summer months the reading-room is closed at 7 p.m. The new regulation, which practically dismisses readers at 6.45 p.m. throughout the year, affects, besides the regular readers, a numerous class who, whilst pursuing their ordinary vocation or business during the day-time, have been enabled to avail themselves of the valuable privilege of visiting the reading-room for an hour or so in the evening for purposes of study or reference. We think, too, that if a similar concession were accorded to frequenters of the Prints and Drawings department, which is now closed at 5 p.m., the increased facility would be greatly appreciated. The demolition is in progress of the houses on the south side of Montague-place for an extension of the Museum on the northern side of the old reading-room, by the erection of a building that will form an annexe to the library and to the exhibition galleries. The frontage in Montague-place will, for the present, be 380 ft. in length; the

complete scheme, prepared in the Office of Works, comprises two corner extensions or wings, and eventually the whole area between Montague-street and Bedford-square, as acquired from the Duke of Bedford, will be covered. The new block, to be erected in harmony with Sir Robert Smirke's general scheme, is to contain five stories, consisting of a basement for storage, a sub-ground floor for storage and for receiving and packing rooms, a ground floor of galleries, with a mezzanine for use of students and for general purposes, and an upper floor to be devoted to galleries and additional rooms for students. The initial plans were made at the Office of Works in the course of last year. Subsequently a group of names of architects was submitted by the Institute to the authorities, who have chosen from that list Mr. J. J. Burnet, of Glasgow, as architect for the buildings in Montague-place.

The Execution of Architectural Design. A PAPER upon this subject in the July and August numbers of the *Journal of the Franklin Institute* will probably interest our readers. As the author himself suggests, the title might be more appropriate if changed to "The Carrying Out of Architectural Purpose," although in the sense implied in his paper the "purpose" may be originally conceived by someone who is not necessarily an architect. In the second part of this paper the author deals at some length with the difficulties attending the selection of a contractor, who, as the active worker, always dominates the contract for good or ill. The problem is far more difficult in the present day, when sub-letting is general in the case of all important works. It appears that in the United States there have been signs of late in favour of a new method of dealing with large contracts—that is, for the architect to take the place of the general contractor, and so to deal directly with the various firms who carry out the work. Something may be said for direct control of this kind, but we are sure that it should not be assumed by the architect if he is to preserve that independent and disinterested position which is so desirable in the interests of clients and of the profession generally. The paper to which we refer is too long for detailed notice, but it contains many points that are worthy of consideration.

New Process for Fireproofing Wood. A SYSTEM for rendering timber fire-resistant has recently been awarded the Elliott Cresson medal by the Franklin Institute, in consideration of the fact that the invention presents a signal and most notable advance on previously-used methods. The most prominent features of the apparatus adopted by the inventor relate to the means of closing the end of the impregnating cylinder and of filling this vessel with liquid under pressure. The disadvantage of the usual form of hinged door is that it prevents the attainment of sufficient pressure for the thorough impregnation of the wood. In the new apparatus this objection is avoided by means of an internally-seated gate, or valve, operated

by hydraulic power, making it practicable to obtain pressures of from 400 lb. to 1,500 lb. per square inch. Again, it is usual to fill the cylinders by high-pressure pumps, the shock caused by which tends to injure the fibre of the timber, particularly at the higher pressures. In the apparatus now under notice an accumulator is used, designed so that it not only maintains a uniform pressure, but serves as a cushion for the pumps and as an indicator for determining the saturation point. In the report published by the Franklin Institute it is stated that by this process a saturation ranging from 25 to 100 per cent. can be secured without apparent detriment to the physical qualities of the wood, and that timber properly impregnated with sulphate of aluminium by the process will resist the point of a Bunsen burner for over eighteen hours—a very much longer time than wood treated by other processes. In our opinion, the great merit of the method is to be found in the mechanical details, which are clearly calculated to facilitate the rapid, thorough, and safe impregnation of the timber for treatment.

The Morris Canal, New Jersey. ONE of the most famous engineering works in the United States is the Morris Canal, constructed about the year 1825, between Phillipsburg on the Delaware River and Jersey City, a distance of rather more than 100 miles. Upwards of thirty-three years ago the canal was leased to the Lehigh Valley Railroad Company, and, in consequence of increasing competition from railways, which in America accept freight at lower rates than do canals, the waterway has been very little used of late. At the present time, in addition to being in a bad state of repair, the canal is an obstacle to much-needed public improvements, and has been condemned in the report of an expert commission. Owing to the growth of vested interests in the United States, it appears that the abandonment of the canal will cause far more trouble and delay than its original construction.

"American Sewer Design and Construction." A PAPER with this title was read by Mr. J. S. Hodgson at the annual meeting of the Incorporated Association of Municipal and County Engineers. It deals almost exclusively with the main drainage works at Boston, Massachusetts, and although in the main English engineers have little to learn from it, there are two or three points which are worthy of notice. One of these is the importance now attached in America to the entire separation of the rainfall from the sewage, although this separation is not completely effected in Boston. The reduction in the size of sewers, which follows from the adoption of the separate system, is of course an important consideration; in the drainage designed by American engineers for the city of Havana in 1900, out of a total of 12½ miles of sewers, 89 miles were only 8 in. in diameter. Another point worthy of mention is that the main drainage of Boston and the surrounding towns was undertaken by the State of Massachusetts. This is a method which might with advantage be adopted by some of our

county councils for congested areas, the cost being apportioned between the various districts in which the sewers are laid.

In one important respect the Hudson River tunnel, through which the Pennsylvania Railroad will ultimately pass, differs essentially from those hitherto adopted. The cast-iron rings are to be built up of segments in the usual manner, but at intervals of 15 ft. cylindrical piles will pass through the bottom with a sliding watertight fit, and upon the piles will be supported beams and stringers, together with the rails and ties of the permanent way. As the piles are to be taken down to solid rock or driven to a satisfactory bearing, the permanent way will be independent of the cylindrical shell of the tunnel. The load of the moving trains will be borne directly by the stringers and transmitted by them to the piles. Thus the stringers will act as bridges, and the piles as bridge piers, while the tunnel tube will be entirely free from serious shock and vibration. This method of design is rendered necessary by the unstable character of the river mud in which the tunnel is to be constructed, for, although the silt is of sufficient firmness to keep the tunnel itself in perfect alignment, it was thought that if heavy trains were allowed to bear directly upon the shell of the tunnel their weight and impact would in all probability cause settlement and establish bending stresses that would result in fracture and leakage.

LETTER FROM PARIS.

M. CAVEL, the architect to whom was entrusted the difficult task of enlarging the Bourse without detracting from its architectural harmony, has been awarded the Cross of the Legion of Honour; a well-merited recognition for an admirable piece of architectural work, both as regards design and construction.

Paris offers at present a spectacle which recalls the days when Baron Haussmann was proceeding with his task of transforming the city, after a somewhat too drastic fashion, into its modern aspect. There is not one of the arrondissements which is not at present, at some point or another, turned inside out by the bands of workmen engaged on the Metropolitan railways. But this upheaval of streets, which will in the end prove a public advantage, will not last as long as under the rule of the celebrated Prefect of the Second Empire. The work connected with line No. 2, between the Place de l'Étoile and the Place d'Italie, is now far advanced, but the opening of the line depends on the completion of the viaduct at Passy, the metallic portion of which has been pushed out as far as the centre of the larger arm of the Seine. The finish of the upper works of the bridge will take a year more; and by about September 1905 we may expect to see a train service over the viaduct of Passy. This line will be completed by an embankment from the Place d'Italie to the Pont d'Austerlitz, with a bridge over the Seine which will be completed at the same time as that at Passy. On line No. 3, from Concelles to Meulmontant, the intermediate stations are finished, and the line may be expected to be opened in October. But the neighbourhood of Père Lachaise has a very treacherous soil, requiring careful treatment which renders the work very slow. The line No. 4, from the Porte d'Orléans to Clignancourt, is in rapid progress at its two extremities; and the centre portion, which runs under the Seine, will be shortly taken in hand. In another quarter, the line No. 5, from the Strasbourg terminus to the Pont d'Austerlitz, is in progress, and completion is promised in 1906, as also with line No. 6, from the Cours de Vincennes to the Place d'Italie. Line No. 7, from the Palais

Royal to the Place de Danube, will be commenced next year, as also No. 8, from Anteuil to the Place de l'Opéra. For the moment, this assemblage of railway works causes great inconvenience in the streets. Many omnibus lines have had to alter their routes, many streets are altogether blocked, and parts of the city are inaccessible except through sloughs of mud.

Works undertaken from purely archaeological motives are going on in other places. We have already referred to the excavations which the "Vieux Paris" Committee has been carrying on near the Collège de France. In its turn, the Société de la Montagne Sainte-Généviève has made some interesting discoveries at the Place du Panthéon, at the corner of the Rue d'Ulm, on a site on which have been unearthed vases full of Roman coins, as well as gravestones of the XVIIIth century, bearing inscriptions in Hebrew characters—a very rare incident among Parisian antiquities.

At another point, the Municipal Administration of Paris is carrying out an excellent piece of work. The Cour de Carrousel, such a mere desert at present, is to be completely transformed in the portion adjoining the Tuileries garden, which is to be continued as far as the wickets leading from the Rue de Rivoli to the quays, and surrounded by a balustrade with the Arc de Triomphe as its centre. It is to be regretted that, while such an improvement is being carried out, there should be constant complaints of the wanton injury done to the statues in the gardens. It has been hitherto impossible to discover the authors of these acts of vandalism; but the mischief has gone so far that the Municipal Fine Arts Department have thought it well to remove from the "gardens Carpeaux" a fine group of Ugolino and his children, and place it in the Louvre, where it will be secure from such injury as has been done to the marble statues representing "The Nile" and "The Tiber," near the large basin.

At the junction of the Avenue de l'Observatoire and the Rue d'Assas the works have been commenced for the erection of the monument to the memory of Dr. Tarnier. This is the joint design of M. Scellier de Gisors, architect, and M. Denys Puech, sculptor; it consists of a marble with relief (exhibited at the last Salon), surrounded by an architectural setting in a fine and broad style. The monument is to be unveiled at the end of November.

The Académie des Beaux-Arts has agreed to a proposal emanating from M. Bernier, the architect, that the sum of money intended for the Prix de Rome in painting, which was not awarded this year, should be handed over, as a travelling scholarship, to M. Prévost, a pupil in architecture of MM. Guadet and Paulin, who had previously obtained the second Grand Prix in architecture, but is debarred from competing further owing to his being above the limit of age. The proceeding is somewhat irregular, but it is regarded as an opportunity of recognising and rewarding the acknowledged talent of M. Prévost, who has only been put out of court by a formality.

M. Longerey, architect, has received from the Director of the Department of Assistance Publique a commission to erect, on a site of about 4,000 square metres formerly occupied by the prison of La Roquette, a block of building containing furnished apartments for bachelors. The Hôtel will contain 510 living rooms, grouped under fifty sections; and around these will be arranged dining-rooms, reading-rooms, baths, etc., for the whole establishment. M. Longerey obtained a premium in the last competition for "Habitations à bon marché," and this building will in fact be the realisation of his competition design.

In spite of the historical and architectural interest of the Château d'Issy, designed by Pierre Bullet, and in spite of the efforts of the Commission des Monuments Historiques, the maudate for its destruction has been given; it is already in process of demolition, and streets are to be laid out over the fine park designed by Le Nôtre. It is likely to be the same with the domain of the Château des Maisons-Lafitte, the work of Mansart, which is offered for sale.

At the Trianon the balustrade of the attic, with its panels of red marble alternating with the colonnettes supporting the decorative vases and figures of cupids, has had to undergo a thorough repair; it was the part of the work that had suffered most from the effects of time. At both the Trianons the necessary repairs have been carried out under the direction of M. Marcel Lambert, the architect who has also had in hand for the last ten years the restoration

of Versailles, which it is hoped will be completed this year.

M. Marius Vachon has been claiming for Pierre Chambiges the honour—generally attributed to Boccador—of having been the first architect of the Hôtel de Ville. The question was referred to the Municipal Council of Paris, which has decided to place an inscription on a panel on the building, embodying its architectural history. The Société Centrale des Architectes naturally took an interest in the matter, and their President, M. Nénot, has communicated to the Comité des Inscriptions Parisiennes the following suggested text for the inscription, which will probably be adopted:—

"L'HÔTEL DE VILLE
commencé vers 1633, d'après la modèle
de Dominique de Cortone dit "le Boccador"
Re-édifié vers 1635
sur les plans de Pierre Chambiges
Maître des Œuvres de Maçonnerie
de la Ville de Paris
continué et achevé en 1628
par Guillaume Pierre & Auguste Guillain
Maîtres des Œuvres de Maçonnerie
de la Ville de Paris
Agrandi par Godde & Lesueur
Architectes de 1837 à 1848
Incendié en Mai 1871
a été reconstruit par Th. Ballu architecte
en chef et de Perthes architecte
de 1874 à 1882."

THE BRITISH ASSOCIATION MEETING.

BEFORE coming to the presidential address which served to open the proceedings of the Engineering Section of the British Association meeting on August 18, we think it desirable to make some mention of the address delivered by Professor Horace Lamb to Section A. In some respects this constitutes an answer to the questions brought forward by Mr. Balfour, and which were discussed in our issue of last week. Professor Lamb dealt at length with the part played by Professor Stokes in the development of mathematics and physics, and then examined the points of contrast between modern lines of thought and the teachings of the school of which Stokes may be taken as the representative. In the present day it is no longer thought that the world is constructed in accordance with an absolutely geometrical design, and, as Professor Lamb said, "We no longer hope by levers and screws to pluck out the heart of the mystery of the universe." While recognising the fact that the systems of geometry, of mechanics, and even of arithmetic are merely instruments to aid the study of nature, Professor Lamb holds the opinion, with which most of our readers will probably agree, that it would be quite out of the question to relinquish these aids, and to rely upon mere speculation for knowledge as to the essential nature of matter, and the manner in which it is organised in the world we inhabit. To the scientist, as represented by Professor Lamb, the world has become a more wonderful place than ever, that will supply subjects for scientific research for ages to come. Mr. Balfour, who was present during the address, said that it touched questions that were not merely for the professional mathematician, for they cut down to the very roots of those speculations, to which men were being driven, as to the foundations of our knowledge of the natural world.

The address of Mr. C. A. Parsons to the Engineering Section brings us back from empirical spheres of thought to the hard details of daily life. Taking "Invention" as its subject, Mr. Parsons pointed out in his opening remarks that a happy change of feeling towards inventors had been evidenced during the last century. Private individuals had devoted more and more time and money to the work, and scientific associations, municipalities, and Governments had afforded valuable facilities for the purposes of research. Such measures as these have undoubtedly furthered the cause of invention, but they have had an even more important result by influencing the application of scientific methods to engineering practice. We are glad to see that Mr. Parsons took exception to the popular idea that invention is a happy thought occurring to an inventive mind. This erroneous notion, we regret to say, is one that seems to prevail among a certain class of professional inventors who make the way of progress more difficult by hawking impracticable or worthless patents in every likely or unlikely direction. Mr. Parsons told his hearers that almost all important inventions had been the

sult of training, laborious research, and long-continued labour, and that the after perfection of an invention for general use often involved facilities as great and required for its accomplishment as much skill as the invention itself. The truth of these remarks is sufficiently proved by the history of the steam engine, the gas engine, the steamship, the locomotive, the motor-car, and, we may add, of the steam turbine, to the improvement of which Mr. Parsons has devoted the greater part of his life. Proceeding to discuss the question of legislative assistance for the inventor, Mr. Parsons asked whether more could not be done for the protection of patents, and for their assistance when attacking difficult problems. It is certainly the case that the only protection afforded to some valuable inventions is in connexion with details of construction, with the result that those who do most frequently get nothing, some obtain inadequate returns, and only the very few secure satisfactory results. Another point of importance is the absolute difference exhibited by the British Patent Office as to the novelty of inventions submitted. An enormous amount of time, money, and disappointment would be saved if the practice of the Patent Office in this country were assimilated to that adopted in the United States and Germany, where, as Mr. Parsons pointed out, the patent is advised after the lodging of his provisional specification of the chief anticipatory claims, dead or alive. The present state of things is humiliating in the extreme for a nation occupying the position that Great Britain does in the world.

After the presidential address in this section, Mrs. Ayrton, M.L.E.E., the only lady who has been admitted to membership in one of the leading engineering institutions of this country, delivered a lecture on "The Origin of Sand Ripples," a subject which has for a long time been in a state of obscurity. By the aid of diagrams and apparatus, consisting of tanks of water with wind in the bottom, the lecturer showed that the forward and backward movement of water over sand would cause small ridges to become visible on the surface and to increase in height and number as the oscillation continued. The effect appears to be that water flowing immediately over any ridge revolves in a spiral vortex, sweeping the sand back towards the ridge, while the higher water falls down over the vortex and brushes the sand forward away from the ridge, so that at a certain point the sand is being swept in both directions. At this point there is the beginning of a new furrow, while the sand is pushed up by the water flowing obliquely over the vortex forms the nucleus of a new ridge. No inference is to be drawn from the observations of Mrs. Ayrton is that, contrary to accepted opinion, a steady flow of water in one direction cannot produce sand ripples, but will obliterate such previously existing in the sand over which it passes. We ought here to refer to the lecture delivered on the succeeding evening by Professor George Darwin, on "Ripple Marks and Sand Dunes," a subject including that already discussed. The lecturer, as mentioned by Mrs. Ayrton on the previous evening, took the first step some twenty years ago towards the elucidation of the genesis of sand ripples, and his recent lecture explained how ripple marks might be produced in a circular vessel containing water and a layer of sand, the effect being due to eddies in the water. The theory of Professor Darwin is similar to that of Mrs. Ayrton, except that he demands two eddies for the production of a sand ridge, while hers requires but one eddy. The more important part of Professor Darwin's lecture was devoted, however, to the discussion of sand dunes, formed by the eddies in moving air and water. Some of the dunes described and illustrated are waves of inequalities transverse to the wind, and others are longitudinal. The practical utility of this subject is sufficiently obvious, for the protection of cultivated land from the encroachment of sand and the control of drifting snow are matters frequently demanding the attention of agriculturists and others. During the same day the Engineering Section was mainly occupied with the discussion of problems connected with internal-combustion motors. Mr. Dugald Clerk first read a paper entitled "Flame in Internal-Combustion Motors," this being undoubtedly the most important point at present demanding inquiry of those engaged in the design of such engines. As in the James Forrest lecture, reviewed in our columns a few weeks ago, Mr. Clerk invited the aid of the physicist for the accurate determination of flame temperatures, an operation of great

difficulty and upon which available data are very incomplete. It is satisfactory news that a committee of the Institution of Civil Engineers has been appointed to consider the whole question of the thermo-dynamic standard for internal-combustion motors, and we join with Mr. Clerk in hoping that the committee will also make it their business to deal with flame temperatures and their determination. Professor Harold Dixon contributed a paper on "Exhaust Gas Calorimetry," dealing with the specific heat of gases at high temperatures, and expressing the opinion that carbonic monoxide could not be consumed at very high temperatures, as dissociation would thereby be effected. During the course of the subsequent discussion Sir Andrew Noble stated that in experiments he had made at high pressures the specific heat of gases had not varied so much as he had expected; but the fact that variation was observed is a confirmation of the German conclusion, expressed by Dr. Schröter, that specific heat depends upon pressure as well as upon temperature.

One of the most interesting papers read at the Monday sitting of the Mathematical and Physical Section was that of Dr. Glazebrook on "The National Physical Laboratory." A valuable work brought to a successful termination in that institution is the construction of a number of mercury standards of resistance. Dr. Glazebrook commented upon the fact that, although the Electrical Standards Committee of the Board of Trade had recommended "that a material standard constructed in solid metal should be adopted as the standard ohm, and should, from time to time, be verified by a column of mercury of known dimensions," the first opportunity for such verification was only afforded ten years later through the instrumentality of the National Physical Laboratory. The announcement was made in the same contribution that the law had been there deduced "that on similar structures the resultant force due to a uniform wind is simply proportional to the square of the linear dimension." The attention of manufacturing engineers was particularly directed to the facilities offered by the laboratory for the solution of problems occurring in everyday work. Some instances of such assistance already afforded were mentioned by Dr. Glazebrook, among these being examination of the causes producing differences in the tensile strength of steel test pieces cut from different parts of a plate, investigation into the effects of violent shear on an iron plate, the experimental explanation of difficulties in making bronze castings, and work in connexion with the photometry of electric lamps. For the purpose of assisting engineers to secure interchangeability in screws, a special lathe has been built under supervision by Messrs. Armstrong, Whitworth, and Co., and this lathe is now installed in a constant-temperature building at the laboratory. Dr. Glazebrook stated in his paper that examination of the screw of this lathe showed that the error nowhere exceeded 0.0001 in. in the 3 ft. of its length. This is a result of which the designers and makers may well be proud. A striking proof of the practical value of the National Physical Laboratory is afforded by the following extract from a German technical publication:—"Our German instrument-making trade has every cause to watch carefully the development of the National Physical Laboratory, and to take timely precautions before the advantage which it has already secured against English competition are too seriously reduced." Sentiments of this kind show at once the keen perception of the intelligent foreigner and the advisability of supporting more liberally the institution under the competent direction of Dr. Glazebrook.

Passing now to the meeting of the Engineering Section on Monday, we find that electricity formed the basis of all the papers and discussions. Mr. A. A. Campbell Swinton first read a contribution on "Electricity from Water Power," a subject which we are glad to see brought into prominence. At the present time it appears that the total capacity of the hydraulic electricity works in Great Britain is not more than 11,906 h.p., of which 7,000 h.p. is represented by the plant of the British Aluminium Company at Foyers, N.B. This installation is now being enlarged, and Mr. Campbell Swinton says that in the course of a month a further output of 2,000 h.p. will become available. A most interesting project now in course of realisation is that of the North Wales Electric Power Company, whose first installation will derive power from Lake Llydaw, on Snowdon. This

lake, receiving water from Lake Glaslyn, has an area of 5½ million sq. ft., and a catchment area of 1½ square miles in one of the most rainy sites in Europe. By the construction of a dam, the surface of the lake will be raised about 20 ft., and water will be drawn through a tunnel 600 ft. in length. The total fall utilised will be over 1,100 ft., and it is estimated that 8,200 h.p. will become available. The same company also propose to establish a similar plant in the Conway valley, with nearly double the horse-power of that on Snowdon. Another extensive scheme, involving about 6,000 h.p., has been projected in connexion with Loch Sloy, between Loch Long and Loch Lomond. The object of this enterprise is to generate and transmit energy at 40,000 volts to the industrial areas along the Leven and the Clyde, including the towns of Dumbarton, Helensburgh, Renton, and Alexandria. The foregoing memoranda serve to indicate that efforts are at last being made to utilise natural sources of power in this country. Mr. Hawksley and General Webber, speaking in the discussion of the paper, were quite right in saying that in Great Britain difficulty may be experienced in securing continuous supplies of water for power purposes, but that is no reason why the best use should not be made of all the suitable sites. Messrs. C. H. Merz and W. McClellan next read a joint paper on "The Use of Electricity on the North-Eastern Railway." The authors gave a useful account of the power station and system adopted in the Newcastle district, and pointed out that the Company, instead of endeavouring to retain the short-distance passenger who is now attracted by electric trams, intend to develop suburban traffic, and to deal as efficiently as possible with inter-urban traffic. As we have remarked on previous occasions, the North-Eastern is one of the most enterprising among British railway companies, and the programme here indicated shows that the conditions that will govern traffic in and around large towns and cities have been intelligently appreciated. The remaining papers brought before the section on Monday need not be specifically mentioned, as they related to special branches of inquiry chiefly interesting to engineers concerned in the design and manufacture of electrical machinery.

On Tuesday, those attending the meeting of the Engineering Section had an opportunity of listening to the views of Sir Hanbury Brown, on "The Control of the Nile." The author is one of the small band of Anglo-Indian irrigation engineers who joined the staff of Sir Colin Scott-Moncrieff in 1884, and has been connected with the Egyptian Irrigation Department until his retirement this year. Egypt owes much to the energy and skill of Sir Hanbury, who was the first engineer to deal effectively with the Nile flood, and who, by the construction of the Delta subsidiary weirs, increased the head of water held up by the barrage from 13 ft. to 20 ft. As a review of the means adopted up to the present date for making Egypt "produce more," the contribution to which we now refer may be studied with advantage by all who are interested in the subject. Comparatively little is said concerning the new projects discussed in our issues of last and this week, apparently because the paper was written before the publication of Sir William Garstin's Report, and for the reason assigned by the author that more detailed consideration of these schemes would extend beyond available limits. Sir Colin Scott-Moncrieff remarked during the discussion that Egypt was really a small country, for the desert on either side of the Nile Valley was no more a part of the land of Egypt than was the surrounding ocean a part of England. The view of Egypt thus presented helps to make clear the extremely remunerative character of irrigation works in that country, and at the same time points to the limited area within which such undertakings are practicable. A somewhat similar branch of engineering was brought before the same sitting by the report of the Mersey Tidal Régime Committee, read by Mr. J. N. Schooldred, the secretary to that body. From analyses prepared by Mr. Edward Roberts, of the Nautical Almanac Office, it appears that the tides at Liverpool have scarcely undergone any change during the past forty years. This conclusion is confirmed by the comparative examination, made by Mr. Schooldred, of the tidal curves themselves for the years 1803, 1893, and 1874. In addition to their general interest, these results ought to be

of value to the port of Liverpool. We come next to a paper having particular bearing upon the practice of our readers. This contribution was one by Mr. J. H. Wicksteed, descriptive of "A Universal Testing Machine of 300 Tons for Full-sized Structural Members." Although it can be scarcely supposed that a machine of this type will be largely used by building contractors, or included among the instruments bought necessary for the equipment of an architect's office, the results obtained by its aid in testing establishments will be available to all. The machine described will admit columns 88 ft. long by 3 ft. 3 in. square in cross section, or beams 20 ft. between supports by 6 ft. 6 in. deep by 3 ft. 3 in. wide. It will shear 8-in. by 2½-in. bars of mild steel, and break steel wire ropes of 3 in. diameter. The apparatus makes autographic stress-strain diagrams for all such tests, and its sensibility, with a pull of 100 tons, is stated to be 1 in 10,000. The desirability of employing a machine for full-sized tests in preference to ordinary loading becomes obvious when it is remembered that the cost of 300 tons of accurate dead-weights would be more than 2,000*l.*, while the cost of applying them would be very heavy. The next paper, by Professor J. O. Arnold, dealt with the fracture of structural steel under alternating stresses. By means of a machine devised by the author, the remarkable fact was elicited that the resistance of structural steel to rupture under rapidly alternating stresses was inversely proportional to the rate of alternation. Another important result of the tests was the observation that one side of the plate became brittle and the other tough under alternating stresses, and the author arrived at the conclusion that, when steel had once acquired distinct brittleness, it could not be restored by heat treatment short of remelting. Mr. R. A. Hadfield afterwards brought forward a paper on the "Production of Magnetic Alloys from Non-Magnetic Metals," exhibiting a sample of an alloy composed of copper, aluminium, and manganese. The author demonstrated the magnetic character of this specimen, much to the surprise of his audience. As an alloy of copper and aluminium is non-magnetic, the contributing cause of the anomalous result mentioned must be manganese. That manganese should have this effect is extremely curious, for it is known that this metal will transform steel from a highly-magnetic to a non-magnetic substance. Another singular circumstance noted was that, while the manganese produced magnetic properties, the characteristic of reversibility appeared to be due to the aluminium. The startling discovery discussed by Mr. Hadfield, and stated by him to be really due to Dr. F. Heusler, adds one more to the many obscure points connected with the magnetisation of metals. After the reading of a note by the same author on the mechanical properties of iron and its alloys at very low temperatures, the business of the Engineering Section was brought to an end.

Speaking generally upon the business of this department of the meeting, we may say that, with the exception of two or three contributions, there was no attempt to present engineering science in a popular form. Although not calculated to interest the general public, this course is in every way commendable as conducing to the objects for which the British Association was founded. The authors of papers, as well as those members who took part in the discussions, devoted their attention to the consideration of practical science, and showed no disposition to be led away into the realms of speculative philosophy so strongly evidenced by Mr. Balfour's address and by the proceedings of more than one section of the recent gathering.

THE ACTION OF LIGHTNING STROKES ON BUILDINGS.*

IN a paper entitled "The Protection of Buildings from Lightning," which was read at the Glasgow meeting of the Association in 1901, the author mentioned the establishment of the Lightning Research Committee, organised jointly by the Royal Institute of British Architects and the Surveyors' Institution, who have since investigated a very large number of occurrences from the reports furnished by their observers. It was decided after the first year to confine the Committee's investigations to buildings which were fitted with conductors,

* A paper, written for the British Association meeting at Cambridge, by Mr. Killingsworth Hedges, M.Inst.C.E., Hon. Secretary Lightning Research Committee, Royal Institute of British Architects.

and, following this course, the reports on about forty protected buildings affected by lightning have been summarised by a sub-committee, and are having the attention of the General Committee, who will in due course issue a report.

The principal causes of the failure of the usual style of lightning rod as fitted on the buildings investigated appear to be due to the following:—(1) Insufficient number of conductor and earth connexions; (2) the absence of any system of connecting the metallic portions of the buildings to the lightning conductor, especially the interconnexion of the finials, rain-water pipes, and gutters. In the author's opinion the frequent damage by side-flash from the conductors might be lessened by running a horizontal conductor along the ridge, or along the parapets of all the roofs, somewhat after the method which is almost universally adopted in Central Europe.

The lightning strokes may be divided into three classes:—(1) Those where the conductor conveyed a portion of the flash to earth, but the side-flash to other unearthened metallic conductors damaged the building; the practice of running the conductor round the projecting masonry, often taking sharp bends, doubtless facilitated the deviation of the current from its direct path to the earth. (2) In several observations a metallic roof of large area received the flash, consequently became highly charged, and the single conductor failed to convey the whole of the stroke, a portion of which took a circuitous path—for instance, through a speaking-tube and an electric bell wire. (3) A flash struck the building at two points simultaneously, a lightning conductor taking one part of the stroke, but damage was caused by the other portion selecting an unprotected part of the roof.

Earth Connexions.—With a few exceptions these had the defect common to nearly all earth-plates which are simply buried in the ground close to the foundations of a building, and owing to drainage soon became dry, consequently are of very high resistance. Architects as a rule object to sufficiently deep holes being made near a structure; consequently the permanently moist ground is not reached. The tubular earth designed by the author does away with this objection, and can be kept moist by leading a small tube to the nearest rain-water pipe.

Interconnexion with the Metal Work of a Building.—Although the utility of the external metal was specially put forward in the report of the Lightning Rod Conference in 1882, their recommendation has been apparently disregarded in all the cases under review. The Cayeish Laboratory (No. 64) stroke, which was fortunately unattended with danger owing to the gas in the gas-pipe which formed the path of the current being turned off, would not have taken this circuitous path had the leaden roof been connected to the conductors which ran down the tower only, also to the rain-water gutters and pipes, which should have been interconnected at the bottom and properly earthed. Again, at Bedford (No. 88) last year, St. Paul's Church was seriously damaged by the flash leaving the single conductor on the tower by the water on the roof and passing thence to earth by means of the rain-water pipes. In this case it is interesting to note that the lead pipes were not fused, but their round section was changed into an oval one; the iron water-pipes were broken. This incident and No. 68 (St. Pancras Church, Euston) show clearly that the damage was due not to direct stroke, but by a portion of the flash leaving the main conductor and taking a circuitous path round the unconnected metal work outside and inside the buildings.

Observation No. 2: Kea Church, Truro.—The copper sheathing of the spire, owing to its great capacity, could not discharge through the one excellent conductor to earth, consequently the flash divided, part going by the conductor and part by the alternative path formed by the copper covering of the spire to a rain-water pipe, thence sparking through a parapet wall to lead flashing down another pipe, and then along a very small copper wire used for training plants, to the main conductor. Similar effects were noted in Steers Lighthouse (No. 54) and Devaar Lighthouse (No. 56), the divided flash in the former leaving the conductor for a telephone wire and in the latter for a speaking-tube. In these observations the conductors may be said to have acted to a certain extent, and if the structures had been entirely unprotected the damage would have been greater,

but by proper attention to the necessities of each case, and increasing the number of the conductors, the risk would probably be nil, as there would be a definite path for the lightning to take.

Quite the most interesting case is that at Possingworth House (No. 67), struck in June and again in August, 1902, although the roof fairly bristled with air terminals, every chimney being protected, mostly with its own conductor and earth connexion. It is probable that on the second occasion the flash divided, one part selecting a chimney stack, which it damaged, bending the air terminal to an angle of 45 deg., while the other, neglecting the many points fell on an unprotected stucco much lower than the chimney and went to earth by the iron frame of a conservatory, showing the unreliability of a number of independent conductors, which should have been interconnected by means of a horizontal wire led along the ridge; this would in all probability prevent any serious damage.

Sir Oliver Lodge has shown by an interesting experiment that a column of hot air is often selected by a flash although a lightning rod may be affixed to the side of the chimney. Most of our large stacks have a band of metal to which the air terminals are fitted, and from these two conductors should be led to earth. The method adopted in Germany appears to be simpler, and consists of a heavy iron frame rising to a sufficient height above the stack, and continued at the apex so as to form an aigrette. That lightning may prefer the smoke issuing from a chimney was shown by the stroke at the East London Waterworks, Sunbury, last year, the flash doing some damage to the capping before it arrived at the standpipe inside, which was a perfect earth in that it was in direct connexion with the company's mains.

The general conclusions arrived at by the author are that there is very little advantage in placing isolated rods on an ordinary building, unless it has a high tower. A church, for instance, with a spire should have at least two conductors from top to earth. Even then, if any other part of the structure happens to be in the path of a discharge from a cloud to the ground, the stroke may disregard the protected towers or spire and fall on the building, choosing some lower point. If the suggestion put forward by Sir Oliver Lodge at the Bath meeting in 1888 were more closely followed, and the conductors so arranged that they form a protective network over all the roofs, a flash would in all probability be received by some portion of the system and pass without harm to the ground by one of the numerous earths to which the network would be connected.

The insurance offices appear to disregard the question of adequate protection, and are quite content if the single conductor which has not prevented serious damage, for instance, to a church is replaced, and, moreover, take no steps to have the earth connexion tested periodically; also the few unconnected lightning rods erected on our national museums, picture galleries, and other public buildings contrast most unfavourably with the more scientific methods adopted on the Continent, more especially in Germany, where in some districts the local authorities have issued rules as to the erection and testing of lightning conductors, to which the various public bodies have to conform, and in some cities householders are subject to penalties if the system is allowed to get out of order.

TIDESWELL CHURCH RESTORATION.—One of the most important undertakings in connexion with the restoration of the ancient church at Tidswell has just been carried out—viz., the removal of the modern gallery erected about 1825, and which so disfigured the arch, the beautiful transitional window, and the groined arch, are now once more revealed to view. The work of removal of the gallery and north porches has been voluntarily done. The removal of this gallery has revealed little of interest in the way of antiquity. A "squint," a few feet above the belfry door, has been reopened, and in several places the walls show signs of ancient decoration and inscriptions. Two boards found beneath angels' heads painted thereon. The gallery, for the most part was not of that substantial character as was anticipated, and some of the timber was quite rotten and not removed too soon. The architect for the work is Mr. J. Oldrid Scott, of London. The work of preparing the carved oak porches is being pushed on with—*Derbyshire Advertiser.*

RESERVOIR CONSTRUCTION.*

Storage Reservoirs with Earthen Embankments. (a) The Impervious Core below Ground.—Various types of Construction and their Cost.—This point has been dealt with since concrete is used on more than one occasion recently been declared to be the cheapest type.

Owing to the great uncertainty as to the permeability of the natural strata on the water side of the core and for other reasons, this cannot be designed on rational lines, hence there are numerous types of construction, differing very widely, evolved mostly from the accumulated experiences of various practitioners. It may consist of rubble masonry (a type very little used in this country); cement concrete; lime concrete; clay puddle; or a combination of puddle with concrete or brickwork. When formed of concrete (the concrete, of course, stopping some distance before the surface is reached), the core is, in the majority of cases, about 6 ft. wide till it widens outwards, either by battering or stepping, to receive the superposed puddle core and consists either 5 to 1 cement concrete or 4 to 1 lime concrete with the matrix richer at wet spots. When formed of clay puddle the core has a thickness equal to one-fourth to one-third the depth of water impounded, and reduces downwards rapidly till a minimum width of from 10 to 12 ft. is reached, after which it is parallel. In many cases the puddle rests on a concrete sboec.

Another type of puddle core is protected on its sides and bottom by means of concrete. Besides the above main types of construction there are, of course, numerous minor types. In considering the costs of the various types, it will be assumed that concrete materials and puddle can be obtained at reasonable prices. Assuming a depth of water in reservoir of 70 ft. and a length of trench of 60 ft., the cost per lineal yard of the various types of construction would be approximately as under:—

Table with 3 columns: Description, £, s. d. Includes sections for CEMENT, CONCRETE TYPE; LIME, CONCRETE TYPE; CLAY PUDDLE TYPE (10 ft. trench); CLAY PUDDLE TYPE, WITH CONCRETE SHOED; and COMBINATION TYPE OR PUDDLE SANDWICHED BETWEEN CONCRETE.

From the above it will be seen that under no ordinary circumstances can the "concrete" type be cheaper than the "puddle" type. There can be little doubt, however, as to the superiority of the "concrete" type, but numerous failures emphasize the absolute necessity for the employment of the highest qualities of materials, firmmanship, and supervision in its construction, and in the case of direct labour the supervision should be more efficient than if the work were contracted for. Unless the above conditions can be absolutely guaranteed, clay puddle forms by far the safest filling for the reservoir.

(b) The enormous depths to which some reservoir trenches have recently been sunk, and a paper by Mr. G. Mitchell prepared to be read at the Annual Meeting of the Incorporated Association of Municipal and County Engineers, held at Shrewsbury, 14, 15, and 16. These costs are to be taken as applying to no particular locality but as rough general averages for comparative purposes.

the element of uncertainty as to their efficiency even after these great depths have been reached, especially in twisted strata, have led the author to consider whether the reservoirs could not have been constructed more economically and efficiently by methods not involving trench sinking. Several such cases have been investigated following the method adopted in tightening the Randymere Reservoir, Whitby, and the author found that after making large allowances for contingencies this method of construction came out much cheaper than any other.

The following are some of the advantages possessed by this method, viz. :—

- 1. The embankments do not require any fine selected material, in fact, the stonier they are the better, and therefore are very cheap to construct; moreover, as the inner slope is not saturated with water, the section of the embankments can be much reduced.
2. The reservoir is much cleaner, and there is no trouble with vegetation on the banks; shallow parts at the upper end can be readily cut off so as to increase the average depth.
3. Reservoirs could be constructed irrespective of the geological strata. Thus many favourable sites for reservoirs could be utilised where it would be hopeless to attempt to make reservoirs in the ordinary way.

In too many cases the location of reservoir embankments is determined entirely from surface indications, the underlying strata being guessed at from the small portions of consolidated strata withdrawn from boreholes of small diameter, the engineer trusting to luck to find a decent bottom at a reasonable depth. Trial shaft sinking (by which alone a sound judgment can be made) is frequently postponed till the water authority is committed to a contract and as a fresh site means a fresh Act of Parliament, the site is adhered to, no matter what the final cost of the structure may be. The author believes that in such cases the above method of construction will often well repay investigation.

(c) Position of Valve Shaft.—The valve shaft is frequently built almost entirely exposed, but for economy with equal efficiency it should undoubtedly be placed entirely in the solid ground for the following among other reasons, viz. :—

If exposed, it means that the shaft is usually an ornamental octagonal tower of masonry, and in order to secure water-tightness under the extremes of temperature, the shaft must be lined with cast-iron cylinders; a long foot-bridge is also necessary as an approach. There have also been cases of the valve tower being injured by movement of the earthwork of the embankment. All the above contribute to render an exposed valve shaft very expensive, and it possesses no advantage whatever over a shaft built entirely in the solid. The valve shaft should be built immediately on the water side of the impervious core of the embankment; a little scheming will generally determine suitable positions for the various draw-off pipes without much disturbance of the natural strata.

(d) The great variation in the top width of puddle walls calls for comment. The top width in many of the older reservoirs was only 4 ft., while during the last ten years in deep reservoirs where first-class puddle and backing have been used, the top width has varied from 6 to 14 ft.—the latter being surely very extravagant. The amount of cover given to the puddle wall is also most important. In many large reservoirs it is as small as 14 in., which is far too small considering the great danger of the puddle wall cracking, and the comparatively trifling expense of adding a foot or two to the height of the embankment.

So great is the danger should a drought be succeeded by a very heavy flood, as happened in the north of England a few years ago, that the author believes it would be worth while to have a pipe laid across every important embankment, so that the roadway might be kept moist in dry weather, and so keep the top of the puddle wall in good condition. The cost of this in most cases would be infinitesimal, as springs can be caught on the higher ground near most embankments. The same idea could be applied to masonry dams where so severe stresses are developed in the masonry by changes of temperature. A stream of water could be kept flowing continually over all exposed masonry. The water thus flowing out of the reservoir would not be wasted, as it would form part of the compensation water.

(e) Within the last nine years there have been constructed three reservoirs at the terminations of three of the largest aqueducts of this country, the capacities varying from 700 to 120 million gallons. The types of construction are: (1) earthen reservoir, with puddle wall, lined on embankments only; (2) concrete reservoir, with vertical retaining walls and brick and asphalt lining; (3) earthen reservoir, with puddle wall, completely lined with concrete and pitching.

Considering that all three waters are practically identical in character, it seems strange, in view of the enormous economies possible by the adoption of the first type, that the other two types should have been used, particularly the second, the author not being aware that there is any advantage in vertical walls. Doubtless "circumstances alter cases," but there is a limit to the application of even that truism.

(f) Till recently the author was led to believe that the advantage of numerous decanting pipes in deep reservoirs was universally admitted, but having occasion to visit a deep reservoir under construction he found that the whole of the water was intended to be withdrawn from near the bottom, and he would be glad to hear this point discussed.

Service Reservoirs.

(a) Circulation of the Water.—Too little attention seems to be given to the prevention of stagnation of the water in service reservoirs in this country; on the other hand, some foreign engineers seem to have gone to the other extreme.

In some cases for the sole object of cramming all the valves together, the inlet and outlet pipes are within a few inches of each other, with the result that there is no chance of circulation.

Considering the small extra expense involved the inlet and outlet pipes should be so arranged that there is as much circulation as possible. The inlet pipe should discharge well below the surface, and if there are several inlets and outlets they should be spaced well apart and at various levels. Floating outlets are sometimes used in covered service reservoirs, but the author believes that, generally speaking, these are a mistake. Very often the water entering a covered reservoir is slightly warmer than that in the reservoir owing to its passage through a surface condenser or exposure to the air, and hence has an inclination to rise to the surface. The result is, that if a floating outlet is used, the incoming water is skimmed off without mixing with the rest. Generally speaking, unless there is a great deal of suspended matter in the water, floating outlets should not be used, as most service reservoirs are sufficiently shallow to preclude the possibility of the upper part of the water being superior in clearness to the lower part in any perceptible degree.

(b) Ventilation of Reservoirs.—The author believes that in many cases too much ventilation has been provided for covered reservoirs, as there is the chance of objectionable matter being introduced through them. To guard against this, it has been proposed to put some filtering material for the air into the ventilators.

Generally speaking, the capacity of service reservoirs is such that with even the maximum rate of inflow the water level rises very slowly and forces the air very gently through the ventilators, and there is exceedingly little risk of any dangerous uplifting effect on the roof. It hence seems rather absurd to see, as are sometimes seen, as many as thirty ventilators on a small reservoir.

NETHY BRIDGE INSTITUTE, N.B.—The new institute which has just been built at Nethy Bridge was opened recently. The institute contains two recreation-rooms, which can be united in one for meetings, the hall being then capable of seating 250 people. There is also a library and reading-room, etc. The building was designed by Mr. Mackenzie, architect, Edinburgh.

CONGREGATIONAL SCHOOLS, BRIGHTSIDE, SHEFFIELD.—On the 25th ult. the foundation-stones of new Congregational Sunday schools were laid. The site is at the rear of the present chapel and it has been decided to erect a large assembly hall, 50 ft. by 23 ft., with a gallery at one end. There will be eleven smaller rooms, including a library, a young men's room, and young women's room. The other eight rooms will be utilised as classrooms for the scholars. The building is constructed to accommodate 500 persons. Messrs. Henry Boote and Son are the contractors, and Messrs. C. J. Innocent and Son the architects.

JASPER AS A BUILDING STONE.

In the works of classical writers, jasper is described as a translucent stone, generally of an emerald-like green. Most probably the jasper of the ancients included stones now regarded as varieties of chalcedony and agate. But, in addition to the stone intended in the account of that city whose light was said to be "like unto a stone most precious, even like a jasper stone, clear as crystal," there was a variety known as Egyptian jasper, much used in ancient art, and found near the Nile in nodules having bands of red, yellow, or brown. According to modern nomenclature, jasper is an impure form of silicon dioxide, and may be defined as an opaque, close-grained variety of quartz, the colour of which is red, brown, purple, heliotrope, or old gold. The most usual colours are red and brown, the former due to the presence of peroxide of iron and the latter to the same oxide in a hydrated condition. The modern jasper is found on a large scale in the Lake Superior district, and has been known to exist in very considerable quantities in Scotland and North Wales. Practically no use of this beautiful material has been made in decorative and constructional building work, owing to its exceptional hardness, which is quite ten times that of granite, and renders impossible any efficient treatment by the ordinary tools of the stone-cutter.

By means of a newly-patented method, however, it is possible to work the stone without difficulty, and we had an opportunity last week of witnessing some practical tests of the first machine erected in this country for dressing and moulding stone under the system in question. This machine, invented by M. Jaspert, of Paris, has been installed at the works of Messrs. Kirkpatrick Brothers, Trafford Park, Manchester, these works being operated in conjunction with the business of the Jasper Company, of London. The general construction of the machine will readily be understood by the following description. It consists of two parts, the first being a heavy vertical frame resembling that of a drilling or boring machine, and the second includes a horizontal bed like that of an iron turning-lathe, having a reciprocating table upon which the stone is clamped. The vertical frame is fitted with a spindle driven by means of a belt at a speed of 2,000 revolutions per minute, and the lower end of the spindle is screwed for the attachment of an abrasive wheel, composed of corundum and other substances. The wheels can be made of any desired proportions and shape to suit the class of work and the thickness of the slab to be dressed or moulded, and the spindle can be raised or lowered as desired within certain limits. The horizontal bed is fixed in front of the frame carrying the abrasive wheel, so that the reciprocating table, with a movement resembling that of a planing-machine bed, may cause the whole length of the stone to pass in front of the wheel for treatment. For the purpose of adjustment, the upper end of each of the two pedestals supporting the bed is cast in the form of a socket, which is bored out to fit the turned end of a pillar secured to the under-side of the bed. Consequently, the height of the reciprocating table can be raised or lowered to suit the thickness of the stone to be worked. The table has an angular adjustment for chamfering the edges of slabs, and is provided with screw gear very similar to that of a slide rest, so that the stone can be brought up to the abrasive wheel, and drawn away from it when the work has been finished. This transverse movement would enable the attendant to regulate the depth of each cut at will, but, in practice, the cut is automatically regulated, the depth being $\frac{3}{16}$ in. for each longitudinal travel of the table. The forward and backward motion of the table is effected by means of a screw fitted in the horizontal bed and connected with a shaft driven by one of two belts, one open and the other crossed. Reversal of the motion of the table takes place automatically at the end of each stroke, when an arm projecting from the under side of the table comes into contact with a collar attached to a horizontal rod connected with the striking gear of the driving belts. A loose pulley is fitted between the two driving pulleys, but the motion of the travelling table can be instantaneously stopped by a lever, which disengages the nut working along the actuating screw in the bed. It will be seen from this description that after the slab of stone has been correctly placed in position, the whole of the

operations are automatically conducted. The only work left for the attendant is to look on and at the proper time to stop the machine, when the moulded slab can be taken away.

During our recent visit to Trafford Park, this machine was tested with various kinds of stone, including Portland stone, Carrara marble, Mexican onyx, and red Welsh jasper. The object in each case was to form a 2-in. decorative mould on the face of the slab, and the results are briefly stated below:—

Portland stone.—Length of slab, 5 ft.; speed of travel, 6 ft. per minute; depth of cut, $\frac{1}{16}$ in. Time occupied, 9½ minutes.

Carrara marble.—Length of slab, 18 in.; speed of travel, 6 ft. per minute; depth of cut, $\frac{1}{16}$ in. Time occupied, 6½ minutes.

Mexican onyx.—Length of slab, 3 ft.; speed of travel, 6 ft. per minute; depth of cut, $\frac{1}{16}$ in. Time occupied, 10 minutes.

Red Welsh jasper.—Length of slab, 2 ft. 6 in.; speed of travel, 6 ft. per minute; depth of cut, $\frac{1}{16}$ in. Time occupied, 48 minutes.*

The quality of the work performed is excellent, the surface being geometrically true, and so smoothly finished that no further dressing is requisite beyond the raising of the polish. In the case of the Mexican onyx, the result was particularly satisfactory, especially as this stone invariably presents flaws, which constitute a serious obstacle to shaping by hand tools. As may be expected, the working of hard stones must cause a certain amount of wear on the periphery of the cutting wheel, but in the ordinary way the only evidence of this is a slight reduction of diameter in course of time. If, however, the shape of the mould becomes altered owing to the presence of exceptionally hard layers or bands in the stone, the original profile can quickly be restored by re-turning in a lathe. We may here mention that the abrasive wheels are usually supplied by the patentees in cylindrical form, the moulds required being cut at the works of the user. The new machine is said to be equally suitable for working granite, the speed of travel for this stone being 3 ft. per minute. It is curious that the speed for jasper (6 ft. per minute) should be the same as that for Portland stone and marble, and it would be interesting to know the reason for this apparently anomalous circumstance. The Jaspert machine is made in various sizes for working table tops, mantel pieces, and small architectural details, and, as in the case of the machine here described, for dealing with slabs weighing several tons.

We are informed that further adaptations of the abrasive compound are contemplated, and that it will be applied to saw blades, rubbing beds, and other stone-working appliances. Jasper is now being quarried on an extensive scale at Aberdaron, not far from Braichy-Pwll, the "Land's End" of North Wales, and it is believed that the further development of the patent to which we have alluded will render generally available a new building stone, combining more beautiful colouring than marble, and possessing greater strength and better weathering qualities than granite.

THE KLEINE FLOOR SYSTEM.

MANY patented systems of floor construction suffer from the drawback that they involve the employment of specially-manufactured sections of steel and of special forms of brick, terra-cotta, or similar materials. When this is the case, the cost of construction is undesirably increased by the conveyance of materials to the site, as well as by the comparatively high prices of special products. The essential features claimed for the type of flooring here described are:—(1) That, as ordinary bricks and simple sections of steel are employed, the cost is reduced to a minimum; (2) that the floor can be built in wide spans without the aid of joists, thus saving their cost; and (3) that it possesses in a marked degree fire-resisting and sound-resisting properties. Although quite new in the United Kingdom, the Kleine floor has been largely used in Germany for the past twelve years, and we are informed that the imperial and municipal authorities have adopted it very extensively in Berlin and elsewhere in Germany.

On Tuesday last we availed ourselves of an opportunity of inspecting the construction of three spans of this flooring, one of 16 ft. and two of 6 ft. 9 in. between supports. The method followed is extremely simple, and, when

the details have once been settled by the architect, any bricklayer can perform all the work required with the greatest ease and rapidity. Let us assume that a floor panel has to be built between two main girders placed 16 ft. apart. In the first place, the lower flange of each girder is enclosed by a strip of expanded steel or galvanised netting. Then a light platform is formed over the area to be covered, for the temporary support of the work, this platform being of boards which need not be nearer to each other than, say, 1½ in., and its upper surface being about an inch lower than the under side of the girders. A course of bricks on edge is then laid in cement mortar between the girders, the two end bricks being roughly rebated, so that the under surface of the course may lie on the supporting platform, and thus project below the level of the flanges of the girders. A strip of steel, say, 2 in. wide by $\frac{1}{2}$ in. thick, is next placed along the side of the course of brickwork upon a layer of mortar that serves to raise it about 1 in. above the board. After this has been done, a second course of bricks on edge is laid, thus enclosing the strip of steel. Two similar courses of brickwork are then laid above the others, but without the addition of the steel bar. Several double courses, the bricks laid flat, with steel bars between the lower courses, are then built and, after them, another series of four courses of bricks on edge as before. The process is continued until the required space is entirely covered. It should be observed that the steel bars are supported on the flanges of the main girders at each end, and that the courses of bricks on edge form stiffening ribs for the floor, the spacing of the ribs being varied according to circumstances. The lower flanges of the main girders are protected by cement mortar plastered into the gap left by the rebated bricks. In the case of short spans, all the courses may be laid flat in the ordinary manner. Another mode of building floors upon the Kleine system is to employ hollow bricks, made similarly to the Hempstead bricks which were recently described in our columns, the advantage there secured being reduction of weight and labour. If made of sufficient depth, a single layer of hollow bricks will suffice for the entire thickness of the floor, thus saving further time in construction. The under surface of the floor can be plastered in the usual way, and the upper surface may be finished with concrete and cement or covered with any suitable material, such as wood-block flooring, terrazzo, or floor boards.

It will readily be understood that examination of constructional details during the progress of work and inquiry into the questions of mechanical strength and physical properties are functions that cannot be performed simultaneously. For this reason, we are unable at the present moment to express any definite opinion as to the strength, fire-resisting, or sound-resisting qualities of the new floor system. We are satisfied, however, that the employment of steel in the manner described will afford considerable resistance to tensile stress in the area below the neutral axis of the construction, and, assuming all details to be properly settled with due regard to the weight to be carried, there is every reason for believing that the claims of the patentee may be fully justified by practical tests. So far as concerns resistance to fire, there is no doubt whatever that any floor built of brick is sure to give satisfactory results. We are informed that a full test of this floor system under heavy loads will be made in the course of a few weeks, and we may, therefore, have occasion to make some further reference to the subject. In conclusion, it should be stated that the inventor claims that his floor can be built so cheaply as to compare favourably in cost with ordinary timber floors, such as are almost invariably found in dwelling-houses. If this claim can be substantiated, there will certainly be great future for the system we have here discussed.

JOINT ISOLATION HOSPITAL, NORMANTON DISTRICT.—Contracts were let on Friday last week by the Hospital Committee for the Normanton and District Joint Isolation Hospital to be built at Featherstone for 13,977. The hospital is intended to serve the districts of Normanton, Castleford, Featherstone, Wetherby, and Altofts, and comprises administration block, laundry, two fever pavilions, a canteen pavilion, an isolation pavilion, porter's lodge, and discharge block, and is for 100 beds. Mr. W. Hamilton Fearnley, Featherstone, is the architect for the work.

* Owing to lack of time, we were only able to be present during the first fifteen minutes of this test.

EXHIBITION OF HANDICRAFTS AT HASLEMERE.

THERE was an interesting exhibition at Haslemere last week, when the six handicraft societies which have in recent years been held there, held their first annual exhibition. The exhibition was interesting from an architect's point of view, for the furniture and work which was shown, as well as for church hangings, pottery, and tiles. Many architects experience the difficulty of getting such embroidery or hangings with any balance of living art about them, or of mixed textiles of any sort that will stand wear and remain permanent in colour. The shop-sold article, both in furniture and weaving, is made by machines human or artificial, with a result that it is almost a universal belief that good and permanent furnishings for our houses cannot now be obtained. The reason, of course, is that no machinery can ever supplant the handicrafts; until that lesson is learnt people will go on spending their money on things that are cheap and fashionable at the time bought, which are in reality dear at any price, because they are both of a fashion and of a craftsmanship that passes away. We do not wish to support those who would show us the stoniest stones of construction and hold them as a type of beauty. Simplicity has its place in art, the humblest object can show an ingenuity of construction or be decorated with the richest forms of decoration so long as it retains those qualities of beauty, fitness or grace that justify its existence; and it is rarely one of the pleasantest duties of an architect to discover individual craftsmen who do what they are about. Architects know a deal about all the trades, but they cannot do everything. In furniture, for instance, knowledge of the nature of different woods is vital to right design, and in weaving and embroidery there are the same kind of technical questions, which no design on drawing-board can take into account. The inference is that, though the architect should control the furnishing and decoration of a house that he has planned, intimate co-operation is necessary to bring it to a successful issue. An exhibition at Haslemere was in this respect an interesting and instructive, and if kept up it has been begun, may do a great deal towards forwarding the interest of handicrafts.

A PROPOSED BRUGES RESTORATION.

OF the old city gates of Bruges still extant, the greatest interest has of late been centred on the Porte d'Ostende, perhaps the least ornate. Many of the Bruges restorations have been based so far on the celebrated plan by Marc Gheeraert, dated 1562, which Mr. Wrale discovered in North Germany some years ago.

Why the Porte d'Ostende rather than any of the others—Maréchalé, Ste. Croix, and de Gand—has been chosen might puzzle architects, for more scope for effect lies in the other interesting gates of the city; but the proposed restoration is owing to the great docks recently made between there and the "Bassin," and the altering of the course of the Canal d'Ostende, and the building of a new "Quartier." Round the base of the old gate, however, so as to still have it surrounded by water, for effect's sake, a "foot-bath" has been formed, with quaint result ("Bain-de-pieds" is the local nickname for the new arrangement).

There are many residents for and against the restoration, and there have been lengthy discussions of a lively nature on the matter, in and outside the Conseil Communal, and much ink and paper has been used between the members of the ruling bodies (Conseil Communal, Conseil Provincial, and the State), all of whom go shares in public matters where financial considerations come in.

By the sketch herewith, from Gheeraert's plan of Bruges, an idea of what the old gate was like in the middle of the XVIIth century may be obtained. What the other side of the gate was like must be left, unfortunately, to the imagination, but the whole effect was undeniably picturesque.

No doubt the foundations of the demolished gates could be found *in situ*, if looked for.
J. A. R.

ARCHITECTURAL SOCIETIES.

ARCHITECTURAL ASSOCIATION.—We are asked to remind those of our readers who are interested in architectural photography that the photographic competition organised by the Architectural Association Camera and Cycling Club closes on October 1, on or before which date all photographs for the competition must be sent in to Mr. Gilbert H. Lovegrove, the

Hon. Secretary of the above-named Club. The competition is confined to sets of photographs adapted for the purpose of architectural study, and is open to members of the Architectural profession, and all members of the Architectural Association. Each set should consist of not more than twelve prints, and should illustrate one subject or class of subjects; but a competitor may submit any number of sets. The photographs will have to be approved by the Committee of the Architectural Association Camera and Cycling Club as having reached a fair standard of technical excellence, and will then be finally adjudged by a gentleman, not a photographer, who is an expert in architectural tuition, and who will be chosen by the President of the Architectural Association. A prize value three guineas will be awarded to the best set of prints, and will take the form of hooks or apparatus.

ARCHAEOLOGICAL SOCIETIES.

BUCKS ARCHAEOLOGICAL SOCIETY.—For the annual excursion of this Society, which took place on August 23, a part of the northern end of the Vale of Aylesbury was selected; and in the course of a long day's touring, many objects of ecclesiastical and domestic interest were seen. It is noteworthy that an unusual consistency was found in the general scale and extent of the churches and in the character of the other buildings visited. After leaving the county town, the party of forty halted at Quarrendon to inspect the ruins of the Chapel of St. Peter, formerly a chapel of ease to the parish church of Aylesbury. Enough remains to tell a sad tale of wilful neglect of a fine mediæval monument; this beautifully-proportioned fabric no longer cries out for authoritative protection, for it is past reclaiming. Various illustrations were produced to prove that in the earlier half of the XIXth century roofs covered the complete structure, but the subsequent destructive agencies of man, he it deplored, and of nature have demolished the larger part of the chapel. There still exists, however, a part of the XIIIth century north arcade and some XVth century insertions in the outer north walls to demonstrate how perfect a specimen of the building arts of the Middle Ages is lost. At Hardwick the church of St. Mary was found to contain much of an attractive nature to archaeologists. The nave arcades suggest a rebuilding of the church in early times, for the arches, caps, and shafts do not in any way harmonise, and the moulded shafts appear to be latest in date of the three features. The decorated south door, the XVIIth century mural monument to Sir Thomas Lec, the active honesty of the tower arch, and the Jacobean communion table were all points claiming special attention. The XIXth century operations here, as indeed in most of the Bucks churches, leave much to be desired, and in all future true restorations the work of that period should invariably be the first to be removed. The church of St. John at Whitechurch proved to be somewhat larger than other examples in the district, and is principally Early English in character. A double piscina and triple sedilia in the chancel are of special interest, but the general effect of the interior is much marred by the unpleasant colour applied to the walls. Two exquisite specimens of Jacobean woodwork are to be seen in the oak halster-almshouse and in the sliding font cover, the latter an adroit arrangement of chains, pulleys, large turned wooden weights, shaped brackets, and turned finials. The mid-day interval with lunch was here entered upon, followed by a business meeting, presided over by Mr. A. L. Liberty, of Great Missenden. An inspection was made of the earthwork marking the site of the castle of Hugh de Bolbec, built about 1145, and which was finally demolished at the close of the Civil War. At Whitechurch several cottages are to be seen of remarkable interest. A late XVIIth century plastered house with brick stables adjoining and the timber-framed schoolhouse with an arched end to the ground story are specially fine. At Oring, the church of All Saints was found to be a very compact and satisfactorily-proportioned fabric, and may be said to have excited the general admiration of the visitors. The main lines of the fabric are XIIIth century work; the north arcade is incomplete, with only one bay, which opens into a very short north aisle. The XVth century oak roofs have unusual struts rising from carved oak corbels, but all the parts are in excellent scale. Perhaps the

The Architectural Association Premises, Tufton-street (the Old Architectural Museum Front).

most important church in the neighbourhood is St. Mary's at North Marston, dating principally from the XIVth century. The Perpendicular chancel is said to have been built from the offerings of pilgrims to the shrine of Sir John Schorne, who was Rector from 1290 to 1314; on the north side is a vestry, with watching-chamber above it. The chancel was restored by Queen Victoria in memory of an inhabitant with miserly instincts, who left property to Her Majesty. This work was carried out under the direction of Sir Digby Wyatt, but the value of the interior is destroyed by the crude colouring and design of the reredos and west window. Much of the mediæval work, however, repays careful examination. Granborough Church was the last, and, curiously enough, the least attractive of the very interesting series visited during the day, and it is worth remark that each of the churches possessed a western parapeted tower, amongst other features, similar in design.

THE ARCHITECTURAL ASSOCIATION PREMISES.

We are indebted to the Secretary of the Architectural Association for the loan of these two engravings, illustrating the exterior and one of the interiors of the new home of the Architectural Association. The exterior is, in fact, the old front of the Architectural Museum in Tufton Street, built in the days of the Gothic revival, and familiar to many in a former generation; but, standing as it does in so out-of-the-way corner of London, it may be worth while to remind our younger readers of the aspect of this monument of the enthusiasm of the Gothic revival. It is likely to be a building better known in the future than it has been in the past, now that it shelters the new life and activity of the large Society which has taken it over.

The other illustration shows the interior of one of the rooms for study.

The interior of the building has been almost entirely remodelled, in a very solid and substantial manner; but there is still much to be done before its final arrangement is reached.

ENGINEERING SOCIETIES.

SOCIETY OF ENGINEERS.—The present year being the jubilee of the Society, the Council have decided that it shall be celebrated by a conversazione. The date is fixed for November 16, at the Royal United Service Institution, where the Society's ordinary meetings are held. On this occasion the museum of the Institution will be thrown open to members and their friends, including ladies. Invitations to the conversazione, with detailed particulars, will be issued in due course.

to the free library, towards the cost of which Mr. Carnegie has given 10,000*l.* On the first floor is a secondary school and the top floor devoted to art. The large north windows of the art school governed the design, producing a somewhat novel combination.

The contract now completed by Mr. F. O. Minter is for 34,730*l.* Mr. Hindson was the first clerk of works and Mr. Hanley the second. The finishing to the basement remains to be done, and the fire station, at the back, to be built.

DESIGNS FOR THE DECORATION OF A PUBLIC BUILDING.

THESE are designs made by two students of the Royal College of Art, South Kensington, Mr. W. J. Stamps and Mr. Lancelot Crane.

The students were asked to make a design suitable for a mural decoration for a public building, it being suggested that each should choose a subject connected in some way with the neighbourhood in which he lived or of which he was specially interested.

Mr. Stamps, who lives in an iron-works district, has suitably chosen "The steel hammer." Mr. Lancelot Crane selected the interesting and suggestive subject of the choice of the emblems of the Houses of York and Lancaster; a subject we do not remember to have seen treated in painting before. The conditions of photographic reproduction have reduced the white and red roses of the original, nearly the same tint, so that one point of the illustration has been lost; but the incident does not affect the general design.

Illustrations.

WAR MEMORIAL, HAILEYBURY COLLEGE.

THIS is the design by Mr. Reginald Blomfield for a South African war memorial to be erected at Haileybury College, reproduced from the architect's own free and effective pen-drawing which hung in this year's Royal Academy.

Owing to Mr. Blomfield's absence from town we are unable to give his own description of the design, or of the materials of which it is composed. From the appearance of the drawing it is evidently either stone or marble with bronze decorative additions. The general intent and symbolism of the design are too obvious to need comment.

Mr. Blomfield's thorough acquaintance with Renaissance work has enabled him to reproduce its spirit in the free and sculptural lines of the base or podium which carries the obelisk, while preserving at the same time a certain originality of treatment.

COUNCIL CHAMBER, DEPTFORD TOWN HALL.

THIS room occupies the centre portion of the north front of the building on the first floor. It is 72 ft. long by 33 ft. wide. The dado and furnishings are in fumigated oak and the upper part in plaster.

The sketch is taken from the Public Gallery.

TECHNICAL INSTITUTE, EASTBOURNE.

THIS building was opened on August 8 by the Duke and Duchess of Devonshire.

An open competition was held in 1899, and won by Mr. Philip A. Rolson, the late Professor T. Roger Smith being appointed by the then President of the R.I.B.A. to act as assessor.

To meet the wishes of the Council, the original design was considerably altered and the cost thereby increased. The main floor is devoted

SCHOOLS, HOLYSTONE, NORTHUMBERLAND.

The new Council schools at Holystone, near Backworth, are one story in height, and consist of two departments—viz., infants and elder scholars. The mixed department comprises a central hall with separate entrance and hat and cloak rooms for boys and girls on the north side, and two classrooms on the east and west sides of the hall. Each classroom contains accommodation for a class of sixty children, while provision is made, by means of movable partitions, for a class of forty-six in the central hall. The infants school is built up against the east wall of the main school, and comprises school-room, 32 ft. by 20 ft., classroom for forty-four, marching corridor, 13 ft. wide, and cloakroom and lavatory accommodation. Covered playsheds at the usual offices are provided on the north side of the playground. The schools are heated with hot water pipes. The elevations are executed in red bricks, and the roofs are slated. The whole of the work has been done by Mr. Nichol Ritchie, contractor, Whitley Bay, from the designs and under the superintendence of Messrs. Oliver, Leeson, and Wood, architects, Newcastle.

Plan of Country House: Mr. C. J. Bathurst, Architect (see last issue).

PLAN OF A COUNTRY HOUSE.

This is the plan of the Country House by Mr. C. J. Bathurst, of which two views were given in the plates in our last issue.

The plan, as will be seen, is rather unusual character; the long corridor is an effective ornamental feature, but the boudoir and the recessed drawing-room seem rather insufficiently lighted, and we notice the often-repeated mistake in house-planning of having a right-hand light on the kitchen fireplace, instead of a left-hand one. There is no compass point; presumably the garden front faces south. It is, however, an interesting attempt at a special character in a house plan.

Books.

Hydraulic Power and Hydraulic Machinery. By Professor Henry Robinson, Professor Emeritus of Civil Engineering, King's College (London), M.I.C.E., M.I.M.E., M.L.E.E., F.S.I., etc. Third edition, revised and enlarged with sixty plates and numerous illustrations. London: Charles Griffin and Co., Ltd. 1904.

Since the modern hydraulic power system was developed some fifty years or more ago by the late Lord Armstrong, its use has been extended in many fields of industry, and during recent years water-power has been employed for many purposes other than those mentioned in the first and second editions of Professor Robinson's well-known handbook. Books written by men who are really proficient in the subjects discussed are always possessed of distinctive value, and in the example now before us an additional feature of interest to be found in the fact that the earliest experiences of the author in hydraulic engineering were obtained when acting as an assistant to Lord (then Sir William) Armstrong. We do not so much as refer to the preliminary discussion of "Discharge Through Orifices," "Flow of Water Through Pipes," and kindred matters, except for the purpose of remarking that due attention is paid to recent investigations embodied in the transactions of the Institution of Civil and Mechanical Engineers and of the American Society of Civil Engineers. These transactions refer chiefly to the importance of the water-mains in an adequate manner, and instances are cited showing the serious diminution of discharging capacity and other desirable results which follow the accumulation of deposits in pipes and the absorption of iron compounds by the water conveyed. The

results of some experiments by Mr. Weston, described in the transactions of the American Society of Civil Engineers, are also quoted showing the effect produced by the sudden closing of valves against water in pipes. In the first series of experiments, the author tells us that water at an average static pressure of 70 lb. per square inch flowed through lengths of pipes thus:—"111 ft. of 6-in. pipe, 53 ft. of 2-in. pipe, and 99 ft. of 1½-in. pipe to a 1-in. outlet pipe, with a ¼-in. orifice. In this case the velocity was 0.15 ft. per second in the 6-in. pipe and 5.30 ft. in the 1-in. pipe. Upon closing the orifice (which was effected in 0.16 of a second) the force of the ram in pounds per square inch was 129.2 lb. in the 1-in. pipe, 127 lb. in the 1½-in. pipe, and 14.5 lb. in the 6-in. pipe." Similar results were obtained in other experiments, some of which showed important reduction of ram force when an air vessel was connected to the pipe system. These tests were a most useful series, and the notes upon them given by the author should be much appreciated by his readers.

After discussing "The Accumulator" and some recent developments of that device, Professor Robinson commences in earnest the detailed consideration of hydraulic machinery as applied in modern engineering practice. We need not traverse the whole of the ground covered by the author, and will confine ourselves to some notes relative to new material introduced in the pages of the present edition of his work. Among hydraulic presses may be mentioned an advantageous type of forging press, in which the application of two cylinders, one near each end, permits the weight and width of the upper framework to be reduced to a minimum. In this press, also, a groove is turned in the mouth of each cylinder to receive the packing leathers, so that the ram, instead of the cylinder, is the surface which works against the packing leather. The advantage of this is that, as the ram is always exposed to view, any scratches can be detected at once, whereas when the packing leather is fixed to the ram any "grooving" that takes place will be on the inside of the cylinder, where it cannot be seen and is always difficult and expensive to rectify. An item of considerable interest is the description of the swing aqueduct by which the Bridgewater Canal passes over the Manchester Ship Canal. Numerous hydraulic lifts of modern construction are noticed in succeeding sections of the book. Among them we may mention the Otis elevator, the Glasgow Harbour elevators, wagon lifts for railway companies, grain conveyors, and the Waygood lift. Professor Robinson also describes the

hydraulic lifts used on the City and South London Railway. These are still retained, but we may remark that in recent extensions of the line electric lifts have been installed. Some excellent views are given of hydraulic hoists and cranes for docks and on board ship; and among recent examples of hydraulic power the author cites the machinery at the Tower Bridge and dock-gate machinery at Liverpool and elsewhere. Those interested in the application of hydraulic power to machine tools will find an account of some appliances of the kind, chiefly hydraulic riveters of various types. Among pumping engines we may specially single out the description of a recent installation carried out by Messrs. Easton and Co. for the Tasmania Gold Mining Company in order to permit water to be pumped from the depth of 918 ft. Another interesting section, devoted to the "Worthington Pumping Engine," describes the characteristics of the recently-installed high duty engines at the East London Waterworks, and includes a summary of some results brought before the Institution of Mechanical Engineers in February, 1903. The use of hydraulic power in tunnelling, hydraulic brakes, hydraulic jets for pile sinking, pump dredgers, hydraulic pile drivers and pile screwing apparatus, hydraulic excavators, water meters, water wheels, and turbines are among the remaining branches of the subject discussed in this most excellent work.

The Application of Electric-Motors to Machine-Driving. By ANDREW STEWART, A.M.I.E.E. Special Edition. London: S. Rentell and Co. 1904.

AS OUR readers are aware, the application of electricity to the transmission of power is no new thing, but the system is not so generally adopted as it ought to be. In large works, where power has to be provided at widely separated points, the employment of electricity provides a simple and effective means of avoiding the losses arising from miles of steam pipes connected with various outlying steam engines, or the excessive consumption of fuel resulting from the use of separate steam boilers in different departments. But in small and compact establishments, where all the machinery to be driven is situated within easy reach of the main engine, it is not so clear that advantage will follow the adoption of electrical driving. Our readers are more or less concerned with the design and management of establishments complying in the main with the two cases mentioned above. Architects have frequently to consider the needs of public institutions where power is required in various buildings scattered over a comparatively large area, while builders and contractors have similarly to apply power for the purpose of erecting such buildings, or for the needs of their own works. Again, the attention of both architects and builders is constantly occupied by the requirements of smaller institutions and commercial establishments where all the machinery is situated near to the source of power. The two points generally considered in connexion with electrical driving are (1), initial cost as compared with the mechanical transmission of power, and (2) economy of working. Some useful information on both these points is contained in the handbook to which we now direct attention, and which also gives particulars of the most approved methods of electrical driving, and of the auxiliary appliances for the control of such systems.

Society of Engineers: Transactions for 1903. London: E. and F. N. Spon, Ltd. 1904.

MOST of the matter in this volume has already been reported in the Press, and the more important papers and discussions have been noticed in our columns. Readers have now an opportunity of studying the various contributions at leisure, in conjunction with the tables and diagrams which are bound with the Transactions. The paper by Mr. Butler on "Certain Vexatious and Fallacious Cement Tests now in Vogue" is of importance as demonstrating the absolute fallacy of the temperature test, a point which is emphasised by tables and a plate including two sets of figures reproduced from photographs. Figs. I. to IV. represent pats of cement which evolved considerable heat during setting, and yet passed every known test for soundness; while Figs. V. to VIII. show pats which evolved no heat during setting, and yet were utterly unsound and

worthless. Architects, as well as engineers, will find useful material in the contribution by Mr. Ernest R. Matthews on "Electric Light Stations, their Design and Arrangement," a paper which deals exclusively with structural work and is illustrated by five folding plates containing plans and sections of buildings suitable for such establishments. Other papers worthy of perusal are those upon "Motor Transport for Goods," by Mr. Douglas Mackenzie, and "Mechanical Stokers for Electricity Generating Stations," by Mr. Albert Gay. The volume concludes with a general index for the period 1857 to 1903.

Sea Coast Erosion and Remedial Works. By T. ALLONSON-WINN, M.Inst.C.E.I. London: St. Bride's Press, Ltd. 1904.

PUBLIC interest in the subject of coast protection is by no means on the decrease, although in many parts of the country the ravages of the sea appear to be regarded with comparative indifference. The pamphlet to which we now refer is reproduced from four consecutive articles which appeared in the pages of our contemporary *Public Works*, and the author, who has devoted much time to the study of marine engineering, propounds a theory which presents a new aspect of the foreshore protection problem, and is worthy of careful consideration. Interest is added to the pamphlet by a series of short notes upon some two dozen coast lines, on most of which the author has been professionally engaged.

Oxted, Limpsfield, and Edenbridge, with their Surroundings. By GORDON HOME. London: The Homeland Association, Ltd. 1904.

AS INDICATED by the title, this addition to the Homeland Handbooks deals with that delightful tract of country so essentially "English" in all its features at the junction of the three counties of Surrey, Kent, and Sussex. Crowhurst Place and church and the fine castle at Hever (now closed, unfortunately, to the public) are included. Lingfield, with its interesting church and village, although but a short distance south of Crowhurst, is omitted; no visitor to this district should, however, miss seeing it. The guide is excellently illustrated with reproductions from photographs and drawings by the author.

Holy Trinity Church, Rothwell, Northants. By H. CAYLEY, M.A., A.R.I.B.A. Kettering: W. E. and J. Goss.

ROTHWELL is perhaps best known for its market house—now repaired and in use; but this pamphlet serves to draw attention also to the very interesting church, and gives a good account of its various architectural features in order of date. The illustrations consist of two full-page photographs and a ground plan. The latter, which has been apparently very carefully measured, would have been of still greater value had it not been reduced quite so much in reproduction. The various dates of the church, so far as they show on the plan, should also have been marked on it; it would have been easier to follow in the letterpress the numerous changes and alterations which this interesting building has undergone.

Single Entry Book-Keeping for Builders. Edited by PAUL N. HASLUCK. London: Cassell and Co., Ltd.

THIS useful little manual is a reprint of a series of articles originally appearing in the *Building World*, and is simple, fairly comprehensive—and cheap. The novice who contemplates opening a set of books, will perhaps be dismayed at the number declared to be necessary. The list is certainly a long one, but, as the business of a builder and contractor is practically a combination of several industries, this is unavoidable. At the close of the book, a chapter (No. IX.) is devoted to a simplified system for small builders; and another to book-keeping for Builders' Foremen, in both of which some very useful hints are given.

The title suggested for one of the books mentioned in Chapter IX. (Invoice Book) clashes with Chapter VI. In the former case the book thus entitled is described as a summary of all bills or accounts sent out, whereas the Invoice Book of Chapter VI. is a record of goods purchased. The alternative title for the last-named, shown at page 8 (Bought Book), appears preferable, and would obviate confusion.

The compiler anticipates "a future" for this

work, and in the copious examples given the year 1909 is employed throughout. Here and there, however, are indications that this date replaces an earlier one. Thus at page 75 occurs January 1, 189-; while at pages 82 and 84 the dates, September 16, 1898, and September 19, 1909, both relate to the same job. The examples themselves are clear and concise, and can be readily followed.

NOTES ON PORTLAND CEMENT.

CHAPTER VII.—WEIGHT PER BUSHEL AND SPECIFIC GRAVITY.

THE weight-per-bushel test is a relic of the early days of Portland cement when it was sold by the bushel, and is of no value to the user, as it is chiefly governed by the fineness of grinding and the age of the sample. A cement a year old weighs about 15 per cent. less than when it is new. All that can be said for the test is that it is a rough way for the manufacturer, who knows what his cement of a certain fineness should weigh, to keep a check on his burning.

There are several apparatus for determining the weight per bushel, the object of which all are that the cement shall fall into the measure in a steady, uniform stream from a given height. It is evident that if the cement is shovelled in it will weigh more than when lightly filled.

The best-known apparatus is that designed by the late Sir John Coode. It consists of a hopper carried on a frame, into the apex of which is fitted an elongated cone. The cone is supported by four horizontal pins fixed to the sides of the hopper. The space between the cone and the outlet of the hopper is $\frac{1}{2}$ in. wide, so the cement, which is fed into the hopper, passes therefrom in a steady stream. The top of the bushel measure is 18 in. from the outlet of the hopper, and the cone projects 9 in. below this outlet. When the bushel measure is full, the cement is struck off level with a straight-edge. Of course, it is evident that no jarring of the measure is permissible till after it is filled and struck off level.

The weight per bushel is now being abandoned for the specific gravity test, which is much more reliable and not affected by the fineness of grinding. The age of the sample, however, affects the results, a cement after six months' aeration showing a decrease of from 4.5 to 8 per cent. of its original specific gravity. This is due to the cement taking up moisture and carbonic acid from the air.

Cement being acted on by water it is impossible to estimate the specific gravity in the ordinary way by weighing in water. It is therefore necessary to use a liquid having no action on cement. The most generally used are turpentine and petroleum.

The method used by some operators is to estimate the weight of liquid displaced by a known weight of the cement and calculate the specific gravity of the latter therefrom, an ordinary specific gravity bottle having a perforated stopper and a liquid of known specific gravity being used. The specific gravity is calculated thus:—

$$\text{S.G.} = \frac{\text{Weight of cement} \times \text{S.G. of liquid}}{\text{Weight of liquid displaced.}}$$

One of the oldest apparatus is that devised by Mann (Fig. 1), whose description is as follows:—

It consists of a small glass vessel, holding, when filled to the mark A on the neck, a given quantity of liquid, and of a glass pipette furnished with a graduated stem and stopcock, and containing, when filled to the mark B on its upper extremity, a volume of liquid equal to that held by the first-mentioned vessel minus the quantity displaced by 1,000 grains of the densest substance intended to be examined. In using the gravimeter, the pipette is filled to the mark B with paraffin, turpentine, spirit of wine, or any other liquid which does not act on the cement (preferably paraffin); 1,000 grains of

the cement are then introduced to the smaller vessel, which is placed under the pipette and filled to the mark A. Before this is quite completed the vessel may be corked and the contents shaken to remove any air bubbles that may be entangled in the cement. The height of the column of liquid remaining in the pipette determines the specific gravity, which can be at once read off on the graduated stem.

Schumann's apparatus (Fig. 2), which is in use on the Continent, consists of a graduated tube A ground into a small flask, the graduations being from zero to 40 ccs. divided into tenths of a cubic centimeter. To estimate the specific gravity of cement with this apparatus, the tube is fixed into the neck of the flask, and paraffin introduced until flask and tube are filled to the zero mark; 100 grammes of cement are then introduced down the tube and the reading taken. This gives the volume of liquid displaced by the 100 grammes of cement from which the specific gravity is calculated thus:—

$$\text{S. G.} = \frac{100}{\text{Volume displaced.}}$$

The temperature should be the same at each reading, and for this purpose the apparatus is placed in water of constant temperature.

Candlot devised a modification of this apparatus (Fig. 3). It is the same in every respect, only the top of the tube terminates in a bulb. The *modus operandi* is as follows:—A quantity of paraffin is put in the bulb so that when the flask is attached and the apparatus reversed the flask is filled as far as one of the first graduations. The apparatus is again reversed, so that the liquid flows back into the bulb, and 100 grammes of cement are put in the flask. The apparatus is again reversed, the liquid flows back into the flask, and the displacement caused by the cement is read on the graduated tube.

Fig. 4 shows an apparatus designed by Le Chatelier and recommended by the French Commission des Méthodes d'Essai des Matériaux de Construction. It consists of a flask of about 120 ccs. capacity. About half-way up the neck is a bulb of exactly 20 ccs. capacity indicated by marks above and below it. Commencing at the mark above the bulb the neck is graduated from zero to 3 ccs. in tenths of a cubic centimeter. The method of using the apparatus is as follows:—The flask is filled with the necessary liquid to the mark below the bulb; 64 grammes of cement are weighed and introduced to the flask down a funnel until the liquid rises to the zero mark on the neck. The flask is then immersed in water of the same temperature as the liquid, and more cement added, if necessary, to bring the liquid up to the zero mark. The remainder of the cement is then weighed, and the quantity that has been introduced to the flask corresponds with the weight of cement equivalent to 20 ccs. of water. This weight divided by 20 gives the specific gravity.

Keat's specific gravity flask consists of two bulbs, one above the other (Fig. 6) the neck of each being marked. The bottom bulb is of any capacity, but the capacity of the upper one between the two marks is that of 1,000 grains of water at normal temperature. To do an estimation with this apparatus, the lower bulb is filled with the necessary liquid to the mark on the stem, and the weight taken. The cement is then introduced till the liquid rises to the upper mark. The flask is immersed in water of the same temperature as the liquid, and, after allowing time to cool, more cement added, if necessary, to bring the liquid to the upper mark. The weight is again taken. The difference between the first and second weighings gives the weight of a bulk of cement equivalent to 1,000 grains of water, and the specific gravity is this increase, divided by 1,000.

In apparatus like that of Schumann's, the difficulty in getting the cement down the long narrow stem, and in that of Keat's and Le Chatelier's, the cooling of the liquid and adding small quantities of cement to bring the liquid to the required mark, introduce sources of error.

To obviate this a flask was devised by Messrs. Stanger and Blount (Fig. 5). It is practically the same as Le Chatelier's, only the stem is straight and graduated in tenths of a cubic centimeter from the bottom to the top. To the bottom mark the volume is 64 ccs. and to the top mark 67 ccs.; 50 ccs. of liquid are measured into the flask by means of a pipette then 50 grammes of cement gradually added. After bringing to a constant temperature, the

At first sight, it appears a very simple operation to estimate the specific gravity of cement. It is a scientific test, and a very small error in the manipulation will give a result far from correct. If a chemical action is set up between the cement and the liquid employed, wrong result will be obtained.

Of the liquids generally used, turpentine which has been thoroughly dehydrated is the best, but even this liquid after standing for a few days in contact with cement evolves a gas, which can be shaken out by gently tapping the flask. Cement has a still stronger action on turpentine, and with it the cement clogs and closes air, which is difficult to get rid of.

The author knows of one engineer who uses kerosene and petroleum as the liquid. The cement is introduced to the flask, it is allowed to stand for hours, sometimes overnight, for the second weighing. By this time the liquid has swelled through the evolution of gas which is held in the cement. This engineer seldom gets a specific gravity greater than 1.2 and more often under 3.

Xylol is a liquid which has recently come under the author's notice, and gives good results. The cement drops through it without entangling with air, and there is absolutely no action between it and the cement, even after standing overnight. Xylol is very volatile and requires careful handling.

Mann, in describing his apparatus, gives spirit wine as one of the liquids which can be used. At this is worthless in testing cement for specific gravity, as it contains about 15 per cent. water. Whatever liquid is used, it should be absolutely free from water. If necessary hydration by distillation or some chemical absorbent of water must be resorted to.

A point which should be taken into account in determining the specific gravity of cement is the amount of aeration to which it has been subjected. Some operators dry the samples in an air-oven before weighing, to drive off the moisture, but the greater part of the moisture taken up by cement combines chemically with it and can only be driven off at a red heat, and a carbonic acid which is absorbed can only be expelled at a still higher temperature.

All graduated apparatus should be calibrated before use, to make certain the markings are correct. A very small error in the volume of liquid, such as a drop or two, will give a considerable error in the specific gravity. For a number of years the author used a 50-cc. pipette which held 2 to 3 drops in excess, and allowance had to be made for this.

Another point worth noting is that apparatus

which is constantly used for measuring off turpentine should not be left for any considerable time without cleaning, as the turpentine deposits a skin of resin on the glass and so reduces the volume of the measure.

OBITUARY.

MR. ELLISON.—We regret to announce the death, on August 17, at his residence, No. 22, Mannering-road, Liverpool, of Mr. Christopher O. Ellison, aged seventy-one years. Mr. Ellison was the senior partner of the firm of Messrs. C. O. Ellison and Son, of Liverpool, architects and surveyors. Mr. Ellison had an extensive practice in the northern counties, and the firm were among the eighteen who were invited by the London County Council to submit competitive designs for the erection of working-class dwellings upon a part of the site at Millbank, as cleared by the demolition of the convict prison; in February, 1894, they gained the first premium for the North Wales Counties Asylum, at Denbigh; in our columns of November 27, 1897, we described and commented upon their invention, "the O.B. closet," for minimising the noise of the flush. Messrs. C. O. Ellison and Son were architects of the new Infirmary in Smithdown-road for the Toxteth Guardians, Liverpool (1893-4), and of the extensive additions thereto made five years subsequently; of Bevington House, for the People's Homes Co., at Bevington Bush, Liverpool, begun in June, 1898, and opened for 450 lodgers on January 11, 1900, with provision in the plans for 650 beds when completed, and established after the plan of the "Rowton Houses" in London; and of the Bradstock Lockett Home at Stockport for Crippled Children (1901-2). They prepared the plans and designs for the Town Hall in Hamilton-road, Birkenhead; the Eye, Ear, and Throat Hospital for Shropshire and Wales in Marivance, Shrewsbury (1891); hospitals at Belper and Boodle; and, in Liverpool, of the Eye and Ear Hospital, in St. Paul's-square; the artisans' dwellings (1890) for the Corporation; the Adelphi Hotel, in Ranelagh-place, W.; the Adelphi Bank; and the Eye and Ear Infirmary, in Myrtle-street. They were the architects of several Board schools in Lancashire, and of churches in some of the large towns of Yorkshire, W.R., in Rugby, Newcastle-on-Tyne, and elsewhere, and of the promenade at Douglas, in the Isle of Man. We may add that Mr. Ellison, an enthusiastic volunteer, was mainly instrumental in the founding and establishment of the 1st Lancashire Engineer Volunteer Corps, Liverpool; on his retirement from the command of the regiment, in 1875, he was appointed its honorary colonel, and eleven years ago he was presented with the "V.D." in recognition of his long service in the auxiliary forces of the Crown.

MR. LANSDOWNE.—We have also to announce the death of Mr. E. A. Lansdowne, member

of the firm of Messrs. Lansdowne and Griggs, of Metropolitan Bank-chambers, Newport, Monmouthshire. In conjunction with the late Mr. Thomas M. Lockwood, of Chester, Mr. Lansdowne prepared the plans and designs for the town hall and municipal offices, Newport, of which we published three illustrations, with plans, on August 29, 1885—in the competition he and Mr. Lockwood won the first and second premiums, respectively, and they were ultimately appointed to be joint architects of the building; Mr. Lansdowne was also employed as architect (1893-4) for the alterations, with improvements, of the Duffryn, at St. Nicholas, near Cardiff, for Mr. John Cory, J.P., etc. Of the principal architectural works carried out by him and his partner, Mr. H. J. Griggs, we may instance the following:—The institute and mission hall at St. Nicholas, Cardiff; extension of the British Schools in Park-street, for the Blaenavon School Board; additions, etc., to the workhouse buildings at Panteg, and at Griffithstown, for the Pontypool Union Guardians; the cottage hospital, for accident cases, with operation theatre, convalescents' day-rooms, and three wards, near Hillside House, Ebbw Vale, Mon.; hotels at Tredegar Junction and Casrphilly (the King's Arms), for Griffiths Brothers, Ltd.; the schools near Crumlin and (for 400 children) at Lower Garndiffaith, Pontypool, for the Trevechin School Board; the School at Pontnewynydd; and the parish hall in Risca-road, Newport. Amongst their most recent works are comprised the enlargement, etc., of the Williams Endowed Schools at Caerleon; the Infants' School at Garndiffaith; the rebuilding of the Three Salmons Inn, at Bassalley, for Lloyd and Yorath, Ltd.; an extension of the Gwehelog School, near Usk; the rebuilding of the Greyhound Hotel, at Christchurch, near Newport; the church institute and school for St. John the Baptist Church, Newport; and the Tredegar Arms Hotel, at Pill, Newport.

MR. JOSEPH MASTIN.—After a painful illness, the death took place on Saturday last, at his residence, 256, Fulwood-road, Sheffield, of Mr. Joseph Mastin, head of the Sheffield firm of builders and contractors, 15, Cavendish-street. The deceased, who was sixty-six years of age, was a native of Shropshire, and came to Sheffield about forty-five years ago, starting business on his own account ten years later. For the last twenty-two years his place of business was in Cavendish-street, and during that time he has erected many large buildings in the city.

STAINED GLASS AND DECORATION.

REDECORATION OF THE ASSEMBLY ROOMS, BATH.—The redecoration of the Bath Assembly Rooms is now being undertaken. The rooms, which were originally erected from the designs of the younger Wood, are being restored under the supervision of Mr. Stanley D. Adhead, architect.

GENERAL BUILDING NEWS.

CHURCH TOWER, ARMLEY, LEEDS.—Twenty-seven years after the consecration of the church, the tower of St. Bartholomew's, Armley, Leeds, has just been completed. The church itself, by the side of which stands the original building erected in 1630, was built at a cost of 25,000*l.*, and was consecrated in 1877. The base of the tower was at that time carried 75 ft. above the ridge of the roof, being a total elevation of 153 ft., and was left incomplete through lack of funds. The new tower has been erected from the designs of Messrs. Walker and Athron, the architects of the church, Mr. J. T. Wright being the contractor for the masonry. Altogether, the tower with spire is a little short of 200 ft., and on the apex is a gilt knob surmounted with a gilded iron cross 9 ft. high.

WESLEYAN METHODIST CHURCH AND SUNDAY SCHOOL, HEBDEN BRIDGE, YORKSHIRE.—The foundation-stones of the new Wesleyan Methodist church and Sunday school at Hebden Bridge, have been laid. The buildings are estimated to cost 4,500*l.* The ground floor provides for a large school-room, a young men's room, infants' room, and nine class-rooms, with heating accommodation; while the chapel above will seat 500 people. The premises will be lighted by electricity. Mr. W. H. Cockerott, of Hebden Bridge, is the architect. The work is being carried out by the following contractors:—Masonry work, Messrs. H. Mortimer and Sons, Hebden Bridge; carpentry and joinery, Mr. Robertshaw, Greenwood, Hebden Bridge; slating and plastering, Messrs. Wrigley and Son, Hebden Bridge; plumber's and glazier's and heating work, Messrs. Boulton and Kershaw, Mytholmroyd; concretor's work, Messrs. Greenwood and Son, Halifax.

NEW PRIMITIVE METHODIST CHURCH AND SCHOOLS, WALSALL.—The foundation-stones were laid recently of the new Primitive Methodist church and schools which are being built in Stafford-street, Walsall. The buildings are being erected from the plans of Messrs. John Wills and Sons, of Derby and London, and will accommodate a congregation of 650 persons. The general design is late English Gothic. There will be a tower and spire. The front of the building is being faced with best red Accrington bricks, and the dressings are being executed in terra-cotta. The glazing is in cathedral leaded lights. The cost of the buildings, which will also include a school with assembly room and five classrooms, will be 4,550*l.* The builders are Messrs. Henry Gough and Son, of Wolverhampton.

NEW SCHOOL, TULLIBODY, N.B.—On the 20th ult. a new school was opened in the parish of Alloa, at Tullibody. The building is built to accommodate 320 pupils. The total cost being 4,100*l.* Messrs. Thomas Frame and Son, architects, Alloa, prepared the plans for the work.

PARISH HALL, SUNDERLAND.—The foundation-stone of the new Sunday school and parish hall, which is to be erected in Fulwell-road, Sunderland, in connexion with All Saints' Church, was laid on the 20th ult. The plans for the new building have been prepared by Messrs. W. and T. R. Milburn, and the work is being carried out by Mr. J. R. Birney. The cost is 1,500*l.*

PUBLIC LIBRARY, KEIGHLEY.—The opening of the Carnegie Public Library, at Keighley, took place on the 20th ult. The new building occupies a site in North-street. It has been erected with slight modification from the plans submitted by Messrs. A. McKewan and James A. Larn, of Birmingham, and placed first by Mr. Leonard Stokes, the assessor, out of the 146 competitive designs sent in. Sufficient land is provided on the south side for extensions, and the important rooms—viz., the lending library and news-room, and reference library, have therefore been placed on that side. The premises are designed in a free treatment of Early Renaissance. The ground floor contains the lending library and news-room. The library has accommodation for 40,000 volumes, and the news-room will seat about 150 readers. Access to both is obtained from the entrance hall. The reference library, with accommodation for 100 readers; the patent library, and the book-room are on the first floor. All the walls are plastered, and the principal rooms have tile dadoes. The floors are of solid wood blocks, with mosaic work for the halls and passages. Red deal, stained green, has been used for the woodwork, but the furniture throughout is of fumed oak, dull polished. The rooms are lighted by electricity, with a separate system of gas-lighting in case of emergency. Local stone has been used for the outside structure, and the roofs are covered with green Fibberthwaite slates. The stone carving was executed by Mr. Alex

Smith (Keighley). The work has been carried out under the superintendence of Mr. Robert Midgley, one of the Corporation building inspectors, as clerk of works. It is anticipated that the total cost will not exceed the sum of 10,000*l.* given by Mr. Carnegie.

BUSINESS PREMISES, HALIFAX.—New business premises have been erected in Commercial-street, Halifax, for Messrs. Alexander Scott, Ltd. The principal contracts have been carried out as follows:—Masonry, Messrs. Crawshaw and Sons, Ripponden; joiners' work, Messrs. Moore and Sons, Clifton; plumbing and glazing, Mr. T. Boccock, Halifax; electric light, Messrs. H. Nunn and Co., South Parado; fibrous plaster ceiling and painting, Messrs. Jonas Binns and Son; iron and steel work, Messrs. Wood and Co., Manchester; plastering, Mr. Bancroft, Halifax. The architect was Mr. W. Clement Williams.

NEW PREMISES, BANBURY.—New business premises are to be erected at the corner of the town hall buildings, at Banbury. The work is to be carried out from the plans of Mr. W. E. Mills, architect.

NEW OFFICES OF THE GLASGOW CLEANSING DEPARTMENT.—The Glasgow Cleansing Department have moved into new premises in Cochrane-street. The premises have been remodelled under the supervision of Mr. M'Donald, the City Engineer.

ALTERATIONS TO THE TOWN HALL, LEEDS.—The reconstruction of the orchestra and ante-rooms at the Leeds Town Hall is now being carried out. The old structure has been removed, with the exception of the platform, and it is being replaced by a larger orchestra, which is of classic design. The seating accommodation has been arranged for a chorus of 354, and a band of 221. Previously there were only permanent seats for 300. The existing doors on each side of the orchestra will open into a square vestibule, and folding-doors will be fixed between the ante-room and the hall. Two retiring-rooms for principals have been provided under the platform, and also a band-room, the latter being on a level with the crypt. Additional facilities have been planned for reaching and leaving the orchestra. Mr. J. B. Fraser, architect, Leeds, planned the alterations, and the cost is estimated at 1,200*l.*

NEW HOSPITAL, NEWCASTLE.—At the annual meeting of the Newcastle Throat and Ear Hospital, held on the 17th ult. it was proposed that a new hospital should be erected at a cost of 4,500*l.* Mr. Parsons, architect, of Newcastle, has prepared the plans for the proposed work.

ISOLATION HOSPITAL, PONTYPRIDD.—The opening of the isolation hospital erected by the Pontypridd District Council at Llantwit Fardre was performed by Sir Alfred Thomas, M.P., recently. The hospital is situated on the right-hand side of the road leading from Ponteg to Llantwit Church. The hospital is built in terraces in four separate blocks, consisting of an administrative block, with accommodation for matron and for nurses; two separate pavilions, each containing a six and four bed ward, nurses' kitchen, lavatories, bathrooms, and other necessary offices, and the laundry block, which consists of washing and ironing rooms, disinfectant and disinfecting rooms, mortuary, and accommodation for ambulance van. The total cost of the buildings is 6,700*l.* The work has been carried out from drawings prepared by Mr. Edward Rees, late Surveyor to the Council, acting in conjunction with Dr. Howard Davies, the Medical Officer of Health. The contractor was Mr. William Davies, Hopkinstown, the clerk of works being Mr. W. J. Davies, Pontypridd.

FREE LIBRARY, IKESTON.—The Ikeston Free Library has just been opened. The new building occupies a site in the Market-place. It is designed in the Renaissance, and is built of red brick and stone. On the ground floor are a porch, space for cycles, entrance hall, lending library in the centre, with the news-room and ladies' room on the right, and reference library and magazine room on the left. On the first floor, which is reached by a stone staircase, are two rooms for students' library and patent library, with a storage gallery round the upper portion of the lending library. The librarian's house is situated in South-street, and includes a librarian's room in communication with the lending library. The staff-rooms (for both sexes), unpacking-room, magazine store, book store, heating chamber, coals, etc., are approached by a separate entrance from South-street. The building has been fitted with polished oak fittings. The borrowers' counter is 40 ft. long. The book stands and shelving will hold about 19,000 volumes; and the main rooms on the ground floor will accommodate 110 readers. The whole building is lighted throughout with electric light. The building was erected by Mr. Thomas Barlow, of Nottingham, to the

designs of Messrs. Hunter and Woodhouse, of Belper and Derby.

EXTENSION OF NORTHWICH INFIRMARY.—A mid-Cheshire memorial of the late Queen Victoria, the foundation-stone was laid on the 25th ult. of an extension of the Victoria infirmary. The work, which will involve an outlay of about 5,000*l.*, has been designed by Mr. C. E. Bolshaw, architect, Southport, and C. E. Crewe. It will provide for twelve additional beds, together with nurses' duty-rooms, operating and anaesthetic rooms, offices, sitting-rooms, etc. The annex will be coupled up with the existing institution, and the opportunity will be taken advantage of to establish the patients' rooms (now upstairs) on the ground floor.

SHOPS, VAUXHALL BRIDGE-ROAD.—A block of shops, with residential flats over, is to be erected on the site of Nos. 253 to 256, Vauxhall Bridge-road (Victoria street end). The buildings to have a roof garden approached by electric lift. The elevation will be carried out in red brick, with brick carving and terra-cotta dressings. Messrs. Palgrave and Co., Westminster, are the architects.

BUSINESS PREMISES, DUBLIN.—The reconstructed premises of Messrs. Charles L. Rea and Co., in Grafton-street, Dublin, have just been opened. Mr. Lynn, architect, Belfast, designed the building, and the contract was carried out by Messrs. Laverty and Co., Belfast.

NEW ARCADE, BEDFORD.—The building of the new arcade between High-street and Harpur-street, Bedford, is now in progress. The work is being carried out by Mr. Cornelius Haynes, contractor, of Kempston, from the plans of Messrs. Usher and Anthony.

APPOINTMENTS.

THE CROWN SURVEYORSHIP.—The appointment of Surveyor to the Crown, rendered vacant by the recent decease of Mr. Arthur Green, who was formerly a member of the late firm of Archer and Green, has been conferred upon Mr. John Murray, F.R.I.B.A., of John-street, Adelphi.

VICTORIA AND ALBERT MUSEUM.—Consistently upon the retirement, through superannuation, of Major-General Festing, C.B., F.R.S., the President of the Board of Education has appointed Mr. W. I. Last, A.M. Inst. C.E., Senior Keeper of the Science Division of the Museum, to be Director of that division. Mr. Last has been senior keeper, with the special charge of the Engineering collections, during some years past. He gained the senior Whitworth Scholarship in 1877, and in 1887 the Watt Medal of the Institution of Civil Engineers.

CITY AND GUILDS TECHNICAL COLLEGE.—Professor W. Ernest Dalby has vacated the chair of Mechanical Engineering and Applied Mathematics at the Technical College, Finsbury, upon his appointment to the Professorship of Civil and Mechanical Engineering at the City and Guilds Central Technical College, Exhibition-road, S.W. in succession to Professor W. C. Unwin, F.R.S.

SANITARY AND ENGINEERING NEWS.

PROPOSED NEW DOCK FOR ABERDEEN.—Mr. R. Gordon Nicol, C.E., Harbour Engineer, has prepared, for the consideration of the Harbour Board, a scheme for a new dock on the Links, for the accommodation chiefly of the timber trade. The dock will be situated on the Links and foreshore behind the shipbuilding yards and to the north of Footdee-square, with an entrance from the tidal harbour on the east side of Poca Jetty. It will form a tidal basin 1,600 ft. long, with a width of 250 ft. at one end, and 500 ft. long at the other, while the depth will, in the first instance, be taken out to 15 ft. at low water of ordinary spring tides, and be deepened afterwards when found necessary. It will be protected from the sea by a strong embankment wall, extending from the beach battery to the North Pier, and the area thus reclaimed from the foreshore will provide space for the landing and storage of timber. For the construction of the dock about 16 acres of ground on the Links will have to be acquired from the Town Council, and 25 acres of foreshore from the Crown. Mr. Nicol estimates, provisionally, the cost of the dock and sea wall at 125,000*l.*, which will require to be added to the cost of the necessary land.

WATER SUPPLY, CHRIST'S HOSPITAL.—The Governors of Christ's Hospital are about to carry out the extension of their water supply by sinking a deep shaft and driving storage adits. The work will be carried out by Messrs. Duke and Ockenden, waterworks contractors, of London and Littlehampton.

DOCK IMPROVEMENTS, PENNAN, N.B.—Foundation-stone was laid recently of the pier at Pennan, which completes the scheme of improvement planned by Mr. James Brown, C.E., Aberdeen. The new structure is 356 ft. long, and the cost is estimated at £800.

SEWERWORKS EXTENSION, NEWBURGH, N.B.—A scheme for the provision of a supply of water to the hill district of Newburgh, and for the purification of the whole of the town's supply, which has been in process of construction since March, under the superintendence of Messrs. Sang and Lockhart, C.E., was opened recently. The filtration of the water is accomplished by means of self-cleansing pressure filters.

FOREIGN.

GERMANY.—The façade of the new town hall in Dresden is to be built according to the designs of the architect, Herr Karl Roth, of Chemnitz, but the ground plans by Herr Roth are to be utilised. The Society of German Architects and Engineers will hold an annual meeting at Düsseldorf from September 11 to 14.

AUSTRIA.—Professor Karl Edler von Ottenthal on August 2 at Brünn, in his sixty-ninth year. The restoration of the "Minoriten" church at Vienna, which was entrusted to the architect, Professor Luntz, is being now carried out by Herr Ritter von Giacomelli. A new theatre is to be built at Vienna, which will be opened next spring. Herr Wilhelm Schöner is architect for the barracks that are to be erected at Bozen.

SWITZERLAND.—Herr G. Wülflke, architect, died at Zurich on August 13. The Mont-Cenero Railway has been open since August 13. The Swiss Society of Electricians held a meeting at St. Moritz on August 21 and 22; 150 members were present and fifty firms were represented.

MISCELLANEOUS.

COMPENSATION AWARD.—In his capacity of arbitrator, Mr. Ralph Clutton has just announced the terms of his award, amounting to £8,110*l.*, in respect of a claim preferred by John Murray, of Albemarle-street, Piccadilly. The controversy arose in the course of the construction of the Great Northern, Piccadilly, and Brompton Railway Company's line and the building of a station in Dover-street, with a consequent disturbance of Mr. John Murray's property and business.

THE CLOISTER OF ST. BARTHOLOMEW'S, WESTMINSTER.—Complete legal possession has been obtained of the stables in Barlow Close in which are buried the remains of the XVth century cloister on the north side of the Church of St. Bartholomew the Great. The work of restoration will be proceeded with by, firstly, clearing away the level ground, in an area of about 45 ft. by 110 ft., which now rises to within a short distance below the capitals of the columns; the building was mutilated for the building of billiard-rooms when the remains were conserved for stabling purposes. The arched gateway which formed an entrance into the cloister from the belfry tower, near the south-west corner, is at present bricked up, but it will be opened and restored to its original use.

DRURY-LANE THEATRE: L.C.C. REQUIREMENTS.—In moving the adoption of the report at an annual meeting of the Theatre Royal, Drury-lane, on Wednesday, Mr. T. H. Birch, chairman, referred to the extensive alterations which are now being carried out at the theatre. He said that, owing to the work being to be completed before the Christmas pantomime season, the theatre would have to be closed during the whole of the autumn, so the usual autumn drama would not be performed. Mr. Birch declared that while they were in the height of their last pantomime season, certain members of the London County Council went out of their way to make allegations against the safety of the theatre, and even taking the trouble to verify the same on which they based their conclusions. Many of the requisitions of the Council were very unreasonable and exacting character, they were informed by the Superintendent-Architect to the Council that even if the whole of the requirements were complied with, they would not be satisfied. Mr. Birch went on to deal with the appeal made by the directors, and its result in the appointment of John Slater, F.R.I.B.A., as arbitrator. The result of arbitration had been the disallowing of many of the requirements and the modification of others, but as it was the cost of the works ordered by the arbitrator would be about 20,000*l.* or 25,000*l.* Mr. Arthur Birrell, the managing director, speaking on

the same topic, said that the County Council had used the fire at Chicago as a lever, but such a fire as that could never occur at Drury-lane.

CAPITAL AND LABOUR.

GLASGOW MASON'S STRIKE.—A meeting of the men was held on the 25th ult. in the Albion Halls, Glasgow, to consider the proposed arbitration, which was the outcome of the preceding day's negotiations between the labour representatives of the Corporation and the Lord Provost. It is stated that, after a prolonged discussion, it was agreed by a large majority to accept the masters' terms of 9*d.* per hour. A deputation was appointed to proceed to the headquarters of the federated employers in order to sign an agreement in accordance with the decision. The strike now at an end lasted for about six weeks. At the outset over 2,000 men were affected, but during the last few weeks of the strike fully half of these were restarted owing to several employers agreeing, conditionally, to the demands of the operatives.—*Scotsman.*

Legal.

ANCIENT LIGHT DISPUTE.

In the Vacation Court on Wednesday Mr. Justice Bigham again had before him the case of Milton and another v. Maskelyne, on an application by the plaintiffs to restrain the defendant from so building in Langham-place, W., as to obstruct the plaintiffs' ancient lights.

Counsel stated that the parties were coming to an agreement, and asked that the motion should stand over for one week. The application was granted.

REMOVING OLD MATERIALS AT ILLEGAL HOURS.

On Tuesday at the Guildhall (Summons Court), before Mr. Alderman Simmons, George Tatum, builder, of Walerston-street, Harrow-road, appeared to a summons for causing certain materials—namely, old bricks—to be removed from a building in course of demolition during prohibited hours.

Police-sergeant Robt. Wilson deposed that at 120 on the 14th inst. he was in Arthur-street West, when he saw defendant's men carrying baskets of old bricks and shooting them into a cart. Having spoken to defendant's foreman some days previously, he went to defendant, who said his men were not acting in defiance of the law. On the previous day (the 17th) Mr. Tatum had gone down to the police station and read the by-law under which the summons was taken out.

In answer to defendant, witness said he was sure the men were carrying old bricks, and he called Constable Martin, who corroborated his statement.

Defendant said as soon as he knew it was illegal for him to remove old building material after ten o'clock in the morning he stopped his men working at ten o'clock. It was a loss to them and to him. The loads complained of were old rubbish from the foundation and the wood from the hoarding. The building in question had been pulled down inside the hoarding. He was under a contract to get it all cleared away, and in default was liable to a penalty of 20*l.* per week. Messrs. Mowlem had been at work in Arthur-street West for three weeks, and that had hindered him. In answer to the Alderman, defendant said he had been thirty-three years in the trade. It seemed almost worth it, a brick to pull down in the City. The Alderman said this was the first case under the new by-law for the regulation of pulling down buildings. It only came into force in July. The summons would therefore be dismissed, with a caution.

PATENTS OF THE WEEK.

APPLICATIONS PUBLISHED.*

14,374 of 1904.—D. F. HENRY, JUN.: *Continuous Kilns for Burning Fireproofing Tile, and other Clay Products.*

This consists in the combination of a kiln, having slotted walls, ware supports, movable in the kiln one above the other, each support consisting of tubular members united at their ends by manifolds, a tubular extension on each manifold projecting through the kiln slots, a combined water chamber and hanger at the outer end of each of said extensions, water supply and discharge means for each

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

of said chambers, and carrying means to which the combined chambers and hangers are pivotally secured.

20,789 of 1903.—J. BLACKBURN: *A Channel Way and Covers for Footpaths to Prevent Accumulation of Refuse.*

A footpath channel way, and cover therefor, consisting of a channel way of suitable section having plain vertical sides, a short, fixed covering at one end, with an aperture formed therein for receiving a down spout, one or more nuts, plates, or the like connected to, or integrally formed with, said channel way, and with or without one or more ridges formed on the tops of said sides; a removable cover, having a tongue at one end and a number of projections, and with or without a recess or recesses formed upon its underside, and provided with one or more counter-sunk holes, said cover being adapted after slipping said tongue beneath said short fixed covering of the channel way to be dropped in position thereon, and thereafter secured by one or more screws engaging said cover and nut or nuts, or the like.

22,512 of 1905.—W. HALL: *Street, and Similar Lamps.*

A street or similar lamp, fitted with a tube or pipe, terminating directly, or by branches, over a burner or burners within the lamp at one end, and at the other end extending up into a double-walled head part outside the lamp, and such head part, or its inner wall, formed with an opening, and with the space between its walls open to the atmosphere, the parts being so proportioned and arranged as to suit both for ventilation and lamp-lighting purposes.

22,769 of 1905.—N. PERFIGNANI and E. CANDLOT: *Kilns for Burning Cement, Lime, etc.*

A kiln for the burning of cement, lime, and the like, consisting of a circular grate arranged round the kiln below the combustion zone, the said grate forming cylindrical shaft and being surrounded by a casing, provided with openings for stirring the charge in the kiln.

30,003 of 1904.—G. STADE: *Process and Devices for Filtering Liquids.*

A process for filtering liquids by the utilisation of filtering material arranged at its natural incline, which process consists in causing the liquid to be filtered to first describe an angle at its escape from the filtering element, instead of being caused to flow in a straight course upon the inclined face of the filtering material, the angle causing the liquid to impinge against a solid body, so that the force of the forwardly-rushing current of liquid is broken at the said body, and is distributed in such a manner that the incline of the filtering material is prevented from taking up the main pressure at a single place, the said pressure being instead of that evenly distributed for the entire surface of the incline.

4,022 of 1904.—J. H. HATZEL, J. KREUZIGER, and P. MAACK: *A Moulding box for Forming Perforated Cement Bricks.*

This invention relates to a moulding-box for forming perforated cement bricks. It has for its object to overcome the disadvantages existing in similar moulding-boxes hitherto known by permitting the readier removal of the moulded bricks. In the ordinary boxes, as at present constructed, pins for effecting the perforation are fixed to the base of the moulding-box, so that the bricks could not be pushed out of the mould sideways, but had to be lifted off the pins by raising the base-plate, by means of a treadle arrangement. This inconvenience is avoided in this moulding-box.

7,227 of 1904.—A. BIBERFELD: *Decorative Building Block or Plate.*

A process for the production of building plates or blocks which consists in cutting out and shaping to the requisite design a fabric of wire or the like and causing crystals of candy alum, rock-salt, sulphate of copper, sulphate of iron, and the like to form thereon.

13,934 of 1904.—C. FOSTER: *Scaffolds, and the Method of Erecting the same.*

A scaffold consisting in the combination of a set of flexible cables, platforms supported thereby, outriggers from which the cables are suspended, and means for making the cables fast to the said outriggers at points between their ends, the upper portions of the cables extending beyond the outriggers, whereby such portions are arranged to be continued upward and suitably supported without interfering with the platforms below such outriggers.

17,029 of 1903.—W. A. C. WALLER: Apparatus for the Manufacture of Cement Blocks or Slabs.

An apparatus for manufacturing cement blocks or slabs, consisting of a mould having one or more moulding chambers, each of which comprises a bar forming one side of the chamber, two plates on opposite sides of the said bar, connected together and adapted to move relatively with said bar, means for effecting such relative movement, two hinged doors forming opposite sides of the chamber, and a removable bar forming a fourth side of the mould.

18,157 of 1903.—W. JONES: Domestic Fireplace. Grates or mantel register grates prepared with openings at the sides to show tiles, for effectively fixing enamelled slate panels or panels of any other material over the said openings, the said means consisting essentially in fixing one end of a shaped strip of steel or other suitable material to the grate by means of a screw and nut, and by tightening up the nut to bring the other end of the strip to press upon the panel, and thereby hold the same securely in position.

18,412 of 1903.—S. RANGELEY: Method of and Apparatus for Polishing the Surfaces of Flags, Ashlar, and the like.

The object of this invention is to abrade and polish the surfaces of flags, window mullions, door jambs, blocks of ashlar, and the like. The invention consists in placing flags and the like in suitable frames in such a manner that, by giving a reciprocating motion to one of the frames, the outer faces of four flags or the like can be polished simultaneously, the necessary friction for abrasion being obtained by the weight of the flags and frames themselves.

18,786 of 1903.—J. TOMLINSON and S. ABRAM: Ventilators.

The manufacture of louver ventilators from plastic material in one piece by pressure, consisting in forming the cores on top and bottom dies of the mould for producing the louvers of uniform configuration, each having one side vertical to the face of the die, and one inclined side so proportioned and disposed that the vertical sides of the upper die slide against those of the lower die as the article is being pressed.

20,184 of 1903.—LOCKEBIE and WILKINSON, LTD., and C. F. GRAY: Door Furniture.

This consists in the combination with the door furniture of a washer mounted loosely upon the spindle, and having means of attachment to the face of the door upon the side of the adjustable handle so as to form a stop or face against which the inner side of wedge washer butts.

21,103 of 1903.—A. CORTI: A Composition for Removing Lacquers, Varnish, Oil Paint, and the like, and Process for the Manufacture of the same.

A process for the manufacture of a composition or paint for removing lacquer, varnish, oil varnish, oil paint, and more especially burnt lacquers, which consists in stirring into a mixture of alcohol or acetone and petroleum and soft soap, a mixture of slaked lime with potash or soda without water.

21,236 of 1903.—R. S. BRANFORTH and W. B. DAVIS: Metallic Buckets, Baths, and other Washing Utensils.

A bucket, bath or other receptacle having a piece cut out from one side to form an opening, a pocket or opening closed on all sides save one, and the open side of the pockets fixed to the edges of this opening to form a soap tray.

13,857 of 1904.—D. BOWIE: Apparatus for Ensuring Safety in the Working of Hoists, Lifts, and the like.

An apparatus for ensuring safety in the working of hoists, elevators, and the like, which consists in providing vertically-sliding safety gates closing the gangways that lead to the hoist at the bottom, a trip device near the bottom of the hoist, and means for connecting said trip device with the safety gates moving part of the hoist as it nears the bottom strikes the trip device and raises the gates clear of the gangway, or permits them to close by gravity on the ascent of the cage.

14,624 of 1904.—H. ALLES: Wall Hook or Hold-fast for Pipes.

A wall hook, consisting in combination of two curved members adapted to clasp the pipe between them, one of said members being rigidly secured to the wall or the like, and the other of said members being hinged to said first member, and a lever pivoted to said first member, and adapted to engage a projection or the like on said second member, so as on turning said lever on its pivot to bring said members together to clasp said pipe.

14,656 of 1904.—R. G. HOWSON: Water-closets, Lavatory basins, and the like.

Water-closets, lavatory basins, and the like, consisting in the provision of carrying brackets upon the wall upon which they are to be mounted, and pins, bars, or plates upon the closet basin, or the like, and means for securing the latter upon the brackets and against the wall.

14,944 of 1904.—J. NELSON: Hinges.

A hinge consisting of the combination of flaps for fixing same, and knuckle portions with pin or pins for connecting the separate portions thereof, and second flaps or extensions provided with or without indiarubber blocks or pneumatic cushions on one or both flaps.

3,538 of 1904.—A. PROBST: Ceiling and Flooring.

A floor and ceiling in which the sides of each hollow block are provided with corrugations adapted to engage with the corrugated sides of the adjacent blocks characterised, that the joints between the corrugated sides of said blocks are formed over wires fastened to the floor-beams, and carried down the centres of cross-beams, said wires being adapted to relieve the weight of the hollow blocks upon the said cross-beams.

TERMS OF SUBSCRIPTION.

"THE BUILDER" (Published Weekly) is supplied DIRECT from the Office to residents in any part of the United Kingdom at the rate of 5s. per annum in advance. For all parts of Europe, America, Australia, New Zealand, India, China, Japan, and elsewhere, the rate is 7s. 6d. per annum. All orders should be addressed to the Publisher, J. MORGAN, at the Office of "THE BUILDER," 25, Abchurch-lane, London, E.C. 4.

SUBSCRIBERS IN LONDON and the SUBURBS, by prepaying at the Publishing Office, per annum (52 numbers) or 4s. 9d. per quarter (13 numbers), can ensure receiving "The Builder" by Friday Morning's Post.

PRICES CURRENT OF MATERIALS

* * Our aim in this list is to give, as far as possible, the average prices of materials, not necessarily the lowest. Quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

Table with columns for material types (e.g., Hard Stocks, Rough Stocks, Facings, etc.), prices in £ s. d., and quantities. Includes sections for GLAZED BRICKS, STONE, and HARD YORK.

TO CORRESPONDENTS.
F. R. H. (Amount should have been stated).—F. P. —T. W. (Below our limit).

NOTE.—The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications, and the Editor cannot be responsible for drawings, manuscripts, or other documents sent to or left at this office, unless he has specially asked for them.

Letters or communications (beyond mere news items) which have been duplicated for other journals are NOT DESIRED.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

We are compelled to decline pointing out books and giving addresses.

Any commission to a contributor to write an article, or to execute or lead a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

TENDERS.

Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Thursdays. [N.B.—We cannot publish Tenders unless authenticated either by the architect or the building-owner; and we cannot publish announcements of Tenders accepted unless the amount of the Tender is stated, nor any list in which the lowest Tender is under 100*l.*, unless in some exceptional cases and for special reasons.]

* Denotes accepted. † Denotes provisionally accepted.

The Church of Prittlewell.

THE Church of St. Mary, of Prittlewell, is by far the most important building in the Hundred of Rochford, which occupies the south-eastern corner of

Essex, and is rightly considered to be one of the finest churches that the county possesses.

There was a church here at the time of the Domesday Survey which was evidently one of some importance in pre-Norman days. The entry pertaining to it is of an unusual character, for it states that "to the church of this manor thirty acres of another estate were added by two men."

The Priory of Prittlewell was founded by Robert of Essex for the residence and support of Cluniac monks in the 11th century; it is usually said, *temp. Henry II.*, but it was more probably first founded in the reign of Henry I. The priory stood a little distance to the north of the parish church, and was quite independent of it. It is necessary to say a few words as to the priory, of which there are practically no remains extant, as the parish church is sometimes assumed to have been that of the Cluniac monks. Contrariwise it would have been quite irregular for them in any shape or form to serve it, although the rectory and great tithes of Prittlewell, in conjunction with those of several other parishes,

were conferred on the priory about the time of its foundation. The parish church was served by an episcopally instituted vicar; no monk could have held the vicarage save by special dispensation.

Although Prittlewell Priory had a considerable endowment, which was at its own disposal, it was but a cell of the important priory of Lewes, which was the leading Cluniac house in England. It had no full conventual rights of its own, for the priors of Prittlewell, right down to the days of the Dissolution, were always nominated by the prior of Lewes instead of being elected by their own monks. Prittlewell had to pay a mark of silver to Lewes every recurring feast of St. Pancras as a token of subserviency, but save in this respect and the appointment of prior it seems to have been allowed to administer its own affairs. When the commissioners of the Abbot of Cluni visited Prittlewell in 1276 (the Cluniac houses were visited every three years) there were fifteen monks. The visitors three years later found fourteen monks "living good and regular lives, observing the rule of their order, and properly conducting the Divine offices"; they reported that the prior had just had to rebuild his church, but that the other conventual buildings were in good repair. At a visitation of the next century it was found that the monks numbered twenty-four; their church must have been of considerable size, as there were four daily masses.

The foundation charter of the priory names the parish church of Prittlewell first among a variety of gifts, and states

that this grant included everything in land and tithes that was held by the three priests of Prittlewell. These three priests were probably those who served the mother church of Prittlewell, and the two churches of Sutton and Eastwood, which were then parochial chapels.

The church of St. Mary is finely proportioned and consists of chancel with south chapel, nave with south aisle, south porch, and western tower. The interior dimensions of the chancel are 37 ft. by 23 ft. 6 in.; of the Jesus chapel, 24 ft. 10 in. by 19 ft. 3 in.; of the nave 98 ft. 10 in. by 23 ft. 6 in.; and of the base of the tower 15 ft. by 14 ft. 6 in. The interior measurement of the porch is 9 ft. 10 in. by 9 ft. 4 in., and the parvise over it 11 ft. 6 in. by 11 ft.

There was a church here of some importance, as has been already remarked, in Saxon times. In the north wall of the chancel, which is a somewhat puzzling and complex structure of differing dates, half of a round-headed archway turned in Roman tiles may be noted. There is a strong presumption that we have here a remnant of the pre-Norman church.

There was evidently a considerable enlargement or rebuilding of the parish church of Prittlewell in the earlier Norman days. This would most likely be accomplished by Richard of Essex at the time when he founded the adjacent Cluniac Priory. It is possible that the work then accomplished consisted in the adding of a large Norman nave to the hitherto small Saxon church, the latter being utilised as a chancel.

Prittlewell Church : View from South-east.

This church underwent a strenuous restoration in 1871, at the hands of Mr. Christian; it was re-opened for service on April 4, 1872. During the progress of the work three round-headed Norman windows were opened on the south side of the nave, which had given light to the church before the south aisle was built.

This aisle was first thrown out early in the XIIIth century, as is shown by the construction of the three pointed arches supported by massive piers at the western end of the nave. The arcade between the nave and south aisle consists of six bays, but the three arches nearest the east end are of undoubted XVth century work, and supported on very light octagonal piers. Above these three arches, and in the corresponding space in the raised north wall of the nave, clearstory lights have been inserted.

The story of this alteration is fairly easy to read. About the time of Edward IV. (1461-1483) the parish authorities, in conjunction, doubtless, with the prior of Prittlewell, resolved on a handsome reconstruction and enlargement of the church. The tower was then built, the south aisle enlarged, a south porch built, and the chancel with the south chapel reconstructed. To give more grace to the interior of the church it was resolved to rebuild the south arcade, particularly as the XIIIth century arches had been pierced through the Norman walling after a somewhat clumsy fashion. But this work was never finished; it began at the east end,

and when half done came to an abrupt end, probably through failure in funds. Hence arises the singular contrast between the western and eastern halves of this arcade as it now stands. A particularly handsome piece of work that was then accomplished was the embattling of nave, aisle, chapel and chancel in chequered work of alternate squares of stone and flint.

The windows and buttresses of this church throughout are of late XVth century style, though there are traces on the north side of certain alterations of the XIVth century. The tracery of a three-light pointed window of the nave near its east end is obviously XIVth century work, but it was renewed during the 1871 restoration, and we could not ascertain whether or no it is a reproduction of its predecessor.

It is fortunately possible to date with some precision not only the building of the tower but of the interesting Guild Chapel at the east end of the south aisle. Thomas Warde, by will of 1469, directed Agnes his wife to pay 3s. 4d. towards the building of the south aisle. The word aisle was not infrequently used at this period for what we generally term a chapel, and this was probably a bequest to the extension of this aisle to form the Jesus Chapel. John Hoke, of Prittlewell, desired by his will of 1505 to be buried in "the new Ile of Jhu," and bequeathed to it 40d. There was an old-established guild or fraternity of Jesus in connexion with this parish, possessed of a considerable

endowment, and re-established on improved basis in the time of Edward IV. The Jesus priest acted as assistant priest or curate to the parish, and was also schoolmaster; but school and were swept away by the legislation of Edward VI. The chantry roll entered prior to its confiscation, put its annual value at 7*l.* 1*s.* There were "T. wardens, one master, one priest, a certaine bretherne and sisterne therto to finde a priest called Jesus priest ever by license of King Edward the first Fowerthe. And one Sir William Redbothum, clerke, of the age of fifty-three yeres, of honest conversation, a teachithe a scole their, having no other lyyunge, is now incumbent thereof. The seid priest singithe within the sa church of Pritwell."

The south porch is of good construction but sadly overweighted with exuberant ivy, which is already working mischief on the south and east sides. The square-headed windows on each side are brickwork. There is a projecting stair turret in the west angle of the porch to give access to the upper room or parvise doorway into it is within the church. The south door within the porch is a fine, well-carved example of XVth century woodwork in excellent condition; it has a good latch-ring, as well as a large closing-ring, often, but quite mistakenly termed a "sanctuary" ring.

The most striking feature of the church is the exceptionally fine western tower of greystone. It is of four stages

d is supported by diagonal buttresses four set-offs, which reach to the top of the third stage. A good and unusual effect is produced by the angles of the permost stage above the buttresses being boldly chamfered. The battlements, which are ornamented with a squere of flint and stone, rise from a slightly corbelled stringcourse. At the angles are octagonal battlemented pinnacles, which are crowned with richly decorated finials.

There is a good west doorway to the tower, with squared hood-mould and pinnacles in the spandrils; there is no large left on the south of these shields, but on the north bears a Latin cross. Immediately over the doorway runs a band of chequered work. Above this is a three-light pointed Perpendicular window, the tracery of which has been preserved. On each side of this window, at a level with the spring of the arch, is a small image niche, deeply recessed. There is also a projecting image bracket about 5 ft. from the ground, on each side of the west doorway. On the north and south faces of the tower there is a single deeply-recessed image niche immediately above the centre of the west stringcourse. There are small single-light windows on the four sides of the third stage, though that on the north side is concealed by a clock-face. The bell-chamber windows are of three cinquefoiled main lights under somewhat recessed arches. Any sound student of English architecture would be inclined to date this tower about the middle of the XVth century. Documentary evidence shows that such a surmise is correct. The tower, which was probably long time in building, was approaching completion in 1469. In that year Thomas Warde, yeoman, of Prittlewell, by will 6s. 8d. towards the construction of the pinnacles of the tower of the parish church. Another benefactor the same year left 40s. by will for a like object.

Against the lower stage of the south side of the tower four corbels, that were formerly supported a lean-to building of some size, may be noted. From this turret there was a doorway into the church at the west end of the south aisle. At this building was a chantry house for the priest of the Jesus Guild is a likely supposition; it was here probably that he held his school.

The tower has for a long time been celebrated for its fine ring of bells. In 1840 it enjoyed an unenviable reputation owing to the fierce disputes, involving the production of pistols and knives, between the vicar (Dr. Nolan) and the parishioners, which ended in legal proceedings. These happier times the ring has been ceased from eight to ten bells, in honour of Queen Victoria's jubilee.

The font is one of unusual construction, of peculiar interest. It is of octagonal shape and 2 ft. 7 in. in diameter. Six of the concave sides or panels bear sculptured ornaments. The panel facing east bears a rood, which is now much decayed; other panels have respectively a Tudor rose, a half rose, a dimidiated rose and a pomegranate, a chevron between a fleur-de-lis, and the unusual, if not unique, design, at this date, of a heart between two spears in saltire, which was

probably intended as a symbol of the Passion. The coat of arms most likely represents the family of the donor, but it is almost hopeless to attempt its identification without the tinctures, for a chevron between three fleur-de-lis was borne by so many families; perhaps it may be for Fansbawe, who had extensive Essex possessions about this period.

This font is obviously towards the end of the third pointed or Perpendicular period. The cognisance of the conjoined halves of a rose and pomegranate helps, however, to assign a more precise date. This combination of the Tudor rose and the pomegranate of Aragon points to that fateful and irregular marriage, fraught with immeasurable consequences to England, the cause (humanly speaking) of the Reformation and the breach with Rome. On November 14, 1501, Henry VII.'s eldest son Arthur, a lad of fifteen, was married in St. Paul's Cathedral to Catherine, the seventeen-year-old daughter of Ferdinand and Isabella, the sovereigns of Aragon and Castile. Prince Arthur died in April, 1502, and in June, 1503, his widow was betrothed to his brother Henry, then barely twelve years of age. The marriage ceremony did not, however, take place till June, 1509, when Henry VIII. was united to Catherine of Aragon at St. Paul's, and crowned at Westminster Abbey. The date of this font is probably just after the accession of Henry VIII., before he had begun that career which made him, as has been cynically observed, "a professional widower."

On the west side of the pier of the arcade nearest to the tower is a small niche, which may have served as a depository for the chrysmatory, or vessel with the holy oils which were used at baptism.

To the north side of the altar of the Jesus chapel is a large mutilated image niche, that has had a groined canopy and projecting bracket. There can be little or no doubt, judging from analogous cases, that here stood a large figure of Our Lord, with the orb in his left hand, and the right hand raised in blessing.

The monuments of this church, are unusually few. In the north-west angle of the nave is reared up a large early XIIIth century stone grave-cover with chamfered edges, and a cross in relief; it was found during the restoration.

On the north side of the church, near the pulpit, is a boldly lettered mural tablet of alabaster and coloured marble, of curious orthography, which is thus inscribed:—

"Here lieth buried Mary Davies the wife of Richard Davies (the sonne of John Davies the elder of Middleton in the County of Salop Esq.) Esq. of the Body Extraordinary unto his Majesty. Shee was the eldest daughter and heire of Richard Cocks of this parishes Esq. the sonne of John Cocks Esq. by Elizabeth his wife, one of the daughters of the Right Honorable Thomas Lord Wentworth Lord Chamberleyn to King Edward the 6. Shee departed this life without issue borne one the 2 day of September Anno 1623."

In a circular frame above is a shield bearing four quarters of Davies impaling quarterly of Cocks. The crest is a boar passant, collared; the pig is somewhat clumsily carved, and by one heraldic note-taker has been turned into a hippopotamus! A grant of arms was

made in 1587 to John Cocks, of Prittlewell, grandfather of Mary Davies.

The east window of the Jesus chapel is filled with most valuable and highly interesting stained glass, to which a romantic interest is attached. About the close of the XVIIIth century, during the terrible troubles that afflicted France, an Englishman purchased the coloured glass of the south-west window of the noble church of St. Ouen, Rouen, to save it from destruction. This glass, carefully packed away in cases, remained in a cellar near Colchester almost forgotten for about seventy years, in the possession of the Neave family. Soon after the incumbency of the present vicar began (Rev. T. O. Reay, 1880), to whose assiduous care the present good condition of this fabric is so much indebted, this foreign glass was placed by Lady Neave in this window to the memory of Sir Arundell Neave, Bart., who died in 1877. Glass experts put the date of this series of glass pictures, twelve in number, between 1500 and 1540. Some of the designs are exact reproductions of the drawings of Albert Durer. They all illustrate scenes from the Old and New Testaments. The latest, which does not harmonise with the rest, is the Blessed Virgin and Child in a handsome Renaissance border. The most striking of the Old Testament scenes is the death-bed of David, with the crowning of Solomon on a smaller scale in the background. The picture of "Behold the Lamb of God," on the banks of the Jordan, is a fine composition and beautiful in detail. It is somewhat curious that this excellent and interesting glass escaped notice by Mr. Lewis Day in his recent work on "Stained Glass."

In this chapel there is a handsome large panel of Jacobean carving which forms the front of a case for altar frontals, but it has no ancient connection with the church, having been purchased and put to its present use by the vicar.

In the churchyard are a large number of window mullions and other moulded stones discarded during the too vigorous restoration of 1871-2.

INVENTIONS AND THEIR NOVELTY.

THE Patents Act of 1902 embodied two highly important amendments of the Patent Law, the one relating to compulsory licences and the other to the examination of the novelty of inventions on applications for patents. The first amendment relating to compulsory licences has already come into operation, while the second amendment relating to the examination of the novelty of inventions is, by an order of the Board of Trade just published, to come into operation on January 1 next. On and after that date all applications for patents upon which complete specifications have been filed will be subjected to an examination for the purpose of ascertaining whether the invention claimed has been wholly or in part claimed or described in any specification of an English patent published within fifty years next before the date of the application. The expert examining staff has been largely increased in view of the additional work thus rendered

necessary; the new procedure will affect all applications for patents that reach the "complete specification" stage, and each specification will be examined for the purpose of ascertaining whether the invention has been either wholly or in part described or claimed in any previous specification, other than a provisional specification not followed up with a complete specification, published in this country during the fifty years next preceding the date of the application. The official search will be conducted amongst the classified specifications and abridgments which have been prepared to cover the period beginning in 1855. In the spring of last year the Comptroller-General visited Berlin to see the methods adopted in Germany for pursuing inquiries into novelty, and he also caused himself to be informed of the system which has been adopted by the Patent Office of the United States.

This amendment of the law cannot fail to have a substantially beneficial effect. Until now, the examination at the Patent Office has been strictly confined to formalities, and it has always been open to an inventor to make any claims he might choose, without regard to their novelty; so that thus it has always been a matter of some difficulty to determine exactly what an inventor was justly and properly entitled to. By the institution of an examination as to novelty of an inventor's claims, this anomaly will be largely remedied, and it will only now be possible for an inventor to make such claims as are justified in view of the state of the art at the time he files his application. The result of such an examination would obviously be no guarantee as to the novelty of an inventor's claims, for the examination prescribed is strictly confined to the English Patent records. Any anticipations of an invention that may have been previously published in scientific and technical papers, or in the records of scientific and technical societies, will not come into question. Neither will any anticipations contained in the specifications of prior foreign patents published in this country before the date of an application here. So that thus the grant of a patent under the new conditions will hardly be a conclusive guarantee of the novelty of the invention or of the validity of the patent granted; and, in point of fact, this is specially provided for in sub-section 9 of section 1 of the new Act, which prescribes that the examination shall not be held in any way to guarantee the validity of any patent, and that no liability shall be incurred by the Board of Trade in connexion therewith. But still an examination, restricted as it will be to the English Patent Records, will be of considerable public advantage, for it will certainly render impossible the protection or the re-patenting of old inventions; and, having regard to the fact that the English Patent Records are fairly representative of the progress of the manufacturing arts, the result of the search may be taken as *prima facie* evidence of the novelty of the claims that are allowed having regard to it.

Although the examination prescribed under the new law is thus not thorough and conclusive, yet it undoubtedly will,

to a very large extent, effectively serve the purpose of preventing flagrant impositions upon the public in the exploitation of old inventions. In accomplishing this purpose, the procedure provided by the new Act will be particularly useful, inasmuch as the Comptroller of Patents will have power to order in the complete specification filed on an application for patent a reference to the specifications of any prior English patents that describe or claim any part of the invention claimed by the applicant; so that thus a notice will be given to the public in the applicant's own specification as to the limits of his invention, having regard to the prior English patents. The Act, however, provides that the applicant may amend his specification to avoid the prior patents that may be cited in anticipation of his claims, and the power to order a reference to the prior patents is only enforced in event of the failure of the applicant to properly amend his specification and claims having regard to them; so that thus no hardship is ordinarily likely to result in the insertion of these compulsory references.

It is to be observed that under the new law no examination as to novelty will be conducted on a mere application for provisional protection, but the period of nine months' provisional protection hitherto granted will, on and after January 1 next, be reduced to six months, in order to permit of the examinations being completed for the applications to be accepted within the statutory period of twelve months from the date of the application, according to the existing law.

The present proposals, it must be admitted, do not compare favourably with the examinations as to novelty of inventions adopted in other important countries of the world, such as the United States and Germany. In both these countries, for example, the examination extends to all the published Patent Records of all countries, and to all available information published in the text-books, periodicals, and transaction of scientific and technical societies in all the principal countries of the world. It is, however, doubtless impracticable, even if it were advisable, at once to establish in England a more extensive examination approximating to that in vogue in the countries mentioned; but the restricted examination now prescribed is a reform that can easily be developed step by step until it is practicable for the Patent Office to conduct a rigorous and exhaustive examination in regard to the novelty of all inventions submitted for protection; so that thus reliable testimony may be afforded, by the grant of a patent, that the novelty of the invention has been proved.

GUILDHALL, DEVONPORT.—Repairs and re-decorating, and some structural alterations, are to be carried out at the old Guildhall at Devonport, which has been for some time in a rather dilapidated condition. The interior and exterior are to be painted, old paintings taken down and cleaned and the frames regilt, and some alterations are to be made in the jury boxes in order to render the courtroom more commodious. The work will be carried out by Messrs. R. W. Pitcher and Sons, at a cost of 4287, under the supervision of Mr. J. F. Burns, the Borough Surveyor.

NOTES.

Hampstead Heath.

It is very gratifying to find that the money has been collected to enable the Hampstead Heath Extension Committee to purchase the 80 acres of Wyld's Farm, near the intended station of the Tube railway, so as to prevent the portion of the Heath from becoming, if it undoubtedly would have become, a collection of streets and small houses in the vicinity of the railway station. The collection of the money in time to secure the purchase has, however, only been brought about through the trustfulness and generosity of various persons of means who have guaranteed, in sums of from 500. to 5000., the amount of the 4,000 necessary to make up the purchase money. Londoners ought to feel greatly indebted to those who have thus come forward to save the scheme when no time was left for further collection from the general public; but it should be remembered that they expect to be, and ought to be, repaid, and that therefore it is still the duty of those who enjoy Hampstead Heath to give their aid, as each can afford, towards wiping out a debt to those who have trusted in the public to repay them. The land purchased eventually to be transferred in perpetuity to the London County Council.

Continuing the work which has been cut off the Isle of Wight from the mainland.

the sea now threatens to separate the north-west corner of the island by forming a channel from Freshwater Bay to the valley of the River Yar, which enters the Solent at Yarmouth. Although the cliff between Freshwater Bay and the Needles rises to a height of nearly 500 ft., the bay itself lies in a dip of the coast line. Years ago the adjoining land was protected by a concrete sea-wall, but a large portion of this was destroyed during heavy weather in February, 1899. No attempt has been made to restore this wall, and as a natural consequence, a considerable fall of cliff has taken place, a road has been washed away, and, as stated above, the sea now threatens to break through to the Yar valley. From a recent Local Government Board Report, it appears that the position is one of some gravity, and that, unless prompt measures are taken, Totland and Freshwater may soon be cut off from the rest of the island.

No doubt exists as to the nature of the remedy for the present state of affairs; the only trouble is that the local authorities are unwilling to incur the expense of protecting the lands under their jurisdiction, and suggest that the burden should be laid entirely on the inhabitants of Freshwater. The Local Government Board, in forwarding their report, tries to smooth away difficulties by suggesting that a contribution might be obtained from the Hampshire County Council. How long the local authorities will continue to bargain no one can predict, but one thing seems to be certain, that, unless haggling soon gives place to action, a good slice of the rate-payers' area will be eaten up, and serious damage will be done to the new sewage works on which thousands of pounds are being spent.

NOTWITHSTANDING the sadly-changed aspect of its lower reaches, the River Lea maintains its popularity as a pleasure ground among the inhabitants of East Essex, Essex, and Hertfordshire. Early times the river was of far greater importance, for old writers tell us that it was once navigable by ships as far as London. Lambarde says:—"It hath long tyme borne vessels twenty myles up the head, for, in the tyme of King Alfrede, the Danes entered Leyland, whence King Alfrede espied the channell of the ryver might be such sorte weakened that they should not be able to returne. He caused, therefore, the water to be abated by two trenches, and setting the London-ship upon them, he made their battell, in which they lost four of their captains." These Danes had doubtless taken their ships to the fort constructed upon the present site of Ware, protected by the "weare," which bears its name to the town. By the time of King Alfrede, the waters were retarded and the Danish ships left high and dry. In more recent times, the river has played a part in connexion with the defence of London, for in *The Times* of September 5, 1804—a time when Napoleon was preparing for the invasion of England—it is recorded that Rennie, acting under instructions from the Duke of York, constructed a singular floating battery at the Four Mills, Bromley, for the purpose of "sustaining the water at the level of high water," apparently the object of placing an obstacle in the way of an invading army. The battery consisted of a vessel which could be sunk, by means of a valve in the bottom, so as to fit a groove formed in the bottom of the river. On the completion of this defensive work was ordered by the Duke of York, Mr. Rennie and several well-known military engineers, who afterwards rode up the river to observe the effect produced, as the "fishing house"—probably the White Hart at Temple Mills, a house frequented by anglers in the East-End. As reference is made to the operating sluices at Stratford, and the Ham Bridges, the Temple Mills, and Lea Bridge," it is clear that the sluice-gate influenced the various channels of the Lea across the marshes, and not the Navigation Cut, constructed about 1772, which gives free communication from Lea Bridge to the meadowhouse. In the present day our opinions upon the subject of defensive works differ as much from those of a few years ago as from those of the time when good King Alfrede reigned in England.

MORE than twenty years have elapsed since an exhibition fully representative of the gas industry in all its branches has been held, and so many changes and improvements have since taken place in the methods of using gas for lighting, heating, cooking, and power purposes that the Institution of Gas Engineers, in co-operation with the leaders of the gas industry on the Continent and in America, has decided to open an International Gas Exhibition at Earl's Court, London, in

November next. The exhibition is to remain open from November 19 until December 17, and is to serve as an object-lesson for the general public as well as for architects, municipal engineers, and surveyors. The best methods of using gas for street-lighting, for lighting public halls, shops, and private dwellings, and for heating and cooking will be shown. It is also intended that the exhibits shall include models of artisans' dwellings supplied with gas by the prepayment system, and models of apartments used by professional men, merchants, shopkeepers, and private householders, suitably fitted with gas-consuming appliances. Arrangements will be made for the delivery of cooking lectures, with practical demonstrations, as well as for scientific and popular lectures, and prizes are to be offered for artistic gas fittings. The exhibition will be registered under the Patent Acts, for the encouragement of inventors, who will be invited to exhibit models and drawings of their inventions. It is proposed to divide the exhibits into the following seven groups:—
 (1) Lighting. This group will include all kinds of burners, brackets, and lanterns for all descriptions of lighting; (2) cooking and heating; (3) motive power, showing gas applied for pumping, ventilating, printing, driving dynamos, etc.; (4) gas applied to industrial purposes, showing appliances for traction, japanning, lacquering, enamelling, brazing, etc.; (5) science in relation to the gas industry—exhibits to include photometers, calorimeters, pyrometers, leakage detectors, etc.; (6) residual products; (7) engineering in connexion with gas manufacture, distribution, and measurement. The Advisory Committee is remarkably well constituted for the task it has to perform, and we have little doubt that the exhibition will be a success, but we would suggest that when adjudging the competitions for "artistic" fittings the judges appointed should be men who command respect as artists.

In the case of *Robins v. Goddard* Mr. Justice Farwell had to consider the rights of parties under a building contract which was in the form sanctioned by the Institute of Architects. The architect had given his certificates as the work progressed, and the contractor was suing the building owner on those certificates, which embraced the whole of the work, including extras. The defendant admitted the amount due under those certificates, but counterclaimed against the contractor for defective work and materials, and relied upon a clause in the contract which provides that "No certificate of the architect shall be considered conclusive evidence as to the sufficiency of any work or materials, nor shall it relieve the contractor from his liability to make good all defects as provided by this contract." The construction the Court put upon this clause was that it operated to prevent the certificates given by the architect during the progress of the work from being set up against the powers conferred upon the architect by the contract (clause 17) to order certain defects to be made good within a specified time of the completion of the works; but it was of no

use as a defence to this action, since the architect had given no direction as to any defects after the completion of the contract, nor made any order by whom the cost of making them good should be borne; and in consequence the action appeared to be almost an undefended one.

We have received from the Engineering Standards Committee an interim report containing "British Standard Tables of Copper Conductors and Thicknesses of Dielectric." We are informed that the tables published in this report are in their final form. We think that some of the ten resolutions arrived at could have been expressed more clearly, and a few more resolutions might have been added in order to explain the subsequent tables. For example, no definition is given of what is meant by the "lay" of a wire; and thus resolution 9, which states that "a lay, involving an increase of 2 per cent. in each wire, except the centre wire," really means something very different from what we imagine the Committee had in their minds. We also wonder, seeing that "lay" is mentioned, why "spiral" is not also mentioned. The latter is all-important in connexion with three-core cables. On p. 10 it is mentioned that the standard armoring for cables above 2 in. in diameter is to be "two layers of compounded steel tape," each 60 mils in thickness. The weight of this armoring will be many tons per mile, and as the iron surrounding two and three core cables is magnetised by the currents in the cores the eddy current and hysteresis losses will be large. Galvanised iron wires would form a far more suitable armoring, and we were glad to note recently that this armoring is being largely adopted in connexion with the mains for the new underground railways in London. The test pressures in this report are specified in a very unscientific manner. On p. 10 we read that "all test pressures may be applied either with alternating or direct current, the former to be at the standard frequency." We thought that it was well known that all insulating materials withstand much higher direct pressures than alternating pressures. The "Compagnie de l'Industrie Electrique et Mécanique" of Switzerland have recently published an exhaustive series of tests which prove conclusively that a material which will withstand a direct-current pressure of 24,000 volts will break down with 15,000 volts alternating. This is in entire agreement with our experience. In conclusion, we note that the Standards Committee have divided cables into "large sizes," "intermediate sizes," and "small sizes," and that, for example, a cable containing thirty-seven strands of wire, the gauge of which is apparently No. 14, may have a cross-sectional area of 0.2 or 0.18 of a square inch, depending on whether it is a "large" size or an "intermediate" size. No hint is given as to how the cross-sectional area will vary with the "spiral" of the core of a cable.

In the form of an "Interim Report" the Engineering Standards Committee have issued a final specification for tubular

Tramway Poles.

tramway poles, the settlement of which has been attended with more difficulty than was at first anticipated. It appears that the draft specification prepared by the Committee failed to meet with the approval of the makers, and that the various points of difference were not settled until they had been thoroughly discussed at a conference held at the Institution of Civil Engineers in June last. The standard specification provides for three classes of pole—light, medium, and heavy—and for two methods of construction, the overall length for all poles being fixed at 31 ft. One method is to make the poles in three lengths, or sections, either of solid drawn or of lap-welded steel tube, the diameters being such that the sections can be connected by telescopic joints, swaged together when hot. The other method is to make the poles of steel plate, rolled in one length and butt-welded the entire length. Outside diameters are specified for the three classes of pole in each of the two types, and the minimum thickness of metal is fixed at $\frac{1}{4}$ in. Drop and bending tests of simple but sufficiently severe character are prescribed for application to 5 per cent. of the poles supplied, and if one pole should fail to pass the tests a further 5 per cent. is to be examined, and the failure of one other pole will render the whole delivery liable to rejection. The specification seems to be particularly simple, but it should be observed that the selection of a pole suitable for any given duty is left entirely to the discretion of the responsible engineer.

The Motor Dust Problem. WRITING to *The Times* on August 31, a correspondent suggests that, in the interests of ratepayers who now "see their money literally hewn, scraped, and shovelled away," the dust nuisance should be dealt with at its source, by the adoption of materials such as are used on the Nottingham and Grantham main road. The materials in question really form a special type of tar macadam, which we mentioned in our "Note" of August 27, as capable of affording relief from the dust nuisance. Mr. E. P. Hooley, the County Surveyor of Nottingham, is responsible for "the grand stretches of dustless, mudless roads" cited by the writer of the letter to our contemporary, and it may interest our readers to hear that tar macadam has been used throughout the highways of Scarborough for many years, and by various towns in the Midlands. The Glasgow Corporation have also adopted the same material in place of cobble paving and ordinary macadam. Unfortunately, very little has been attempted in the South of England in the way of reform, but there are at last some evidences of awakened interest in this direction. The Croydon District Council have recently laid two short lengths of Hooley's patent tar macadam—one opposite the Vestry Hall, Mitcham, and the other near Hackridge Station. We have inspected the former of these examples during dry weather, and also immediately after the heavy rains of last week, and find the surface to be absolutely dustless and mudless. Further, we may refer to the highly satisfactory

results following the application of gas tar to a portion of the Reigate-road, close to Banstead Downs. While riding along this stretch a few days ago, we were passed by a motor-car which failed to raise the slightest trace of dust, although when entering upon the ordinary macadam beyond, the same car was immediately lost to sight in a dense cloud of dust. As we said before, there is no difficulty in stopping the dust nuisance; the fear of increased expenditure is the only deterrent. In this connexion, we may mention that Mr. Cooper, the Engineer to the Wimbledon District Council, states the cost of ordinary macadam in that district to be 9'15d. per yd. super, exclusive of watering and scavenging; while, on the basis of an estimate recently received by him, the comparative cost of tar macadam would be 10'5d. per sq. yd. He adds that there would be considerable saving both in watering and in scavenging. Hence we may fairly conclude that very little additional expenditure would be incurred in the long run by the adoption of the improved method of construction.

The Basingstoke Canal (Hants. and Surrey). THIS undertaking will be offered for sale by auction in the course of next month. The canal, which, whilst lately repaired, has been but little used for navigation purposes during many years past, was first projected in 1772, when it was proposed to make a canal from Basingstoke to a junction with an intended canal from Reading to Bray on the Thames. That scheme having come to naught, a body of thirty-three subscribers, under the style of the "Company of Proprietors of the Basingstoke Canal Navigation," obtained in 1778 an Act (18 Geo. III., c. 75) to raise 126,000*l.* for the construction of a canal thirty-seven miles long to the river Wey. In 1793 they obtained a further Act (33 Geo. III., c. 16) for raising additional capital of 60,000*l.*, having spent most of their resources upon the tunnel through Grewell Hill. The navigation was opened in 1796 for vessels limited to a beam of 13 ft. and a length of 72 ft., with a minimum burden of 15 tons. Beginning from the river Loddon near Basing village, the canal takes a level and winding course of twenty-two miles through Hampshire, passing Old Basing and Nateley, and in a tunnel nearly three-quarters of a mile long, cut through the chalk of Grewell Hill, whence, as well as from the Loddon, was obtained the principal supply of water for lockage, etc., and so to the river Deepford, passing by Odiham and Winchfield, skirting Dogmersfield Park, and thence by a long aqueduct across the valley to Crookham and Aldershot, where is the reservoir. That length of twenty-two miles had a top-level 38 ft. wide, and was 5½ ft. deep. Crossing the Blackwater river, which separates the two counties, at a point near Ash in Surrey, the canal bends northwards by Romping Down to Frimley, whence it turns eastwards to Pirbright, Horsell, and its junction with the Wey at a point between Weybridge and Byfleet. The latter portion, through Surrey, of which the course is now closely followed by the main line of the L. and

S.W. Railway, is fifteen miles in length and has twenty-nine equal locks, with total fall of 195 ft. between the Blackwater and the Wey. A side branch, miles long, and level, was made across Hook Common northwards to Turf Green near Strathfieldsaye.

Standards of Fire Resistance. THE British Fire Protection Committee send us a pamphlet (No. 82 of the publications) containing—in English, French, and German—a tabular statement of what they consider ought to be the standard of capacity to resist fire (1) floors and ceilings, (2) partitions and (3) doors. Each of these types of structure is again classified under the headings, including respectively structures calculated to afford "temporary protection," "partial protection," and "full protection." In the text it is explained that "temporary protection" implies resistance against a fierce fire for at least three-quarters of an hour; "partial protection," resistance for at least an hour and a half; and "full protection," resistance for at least two hours and a half. The tables do not attempt to define the details of structures which should satisfy the conditions—that would, indeed, hardly be possible, as new methods are being constantly introduced; they give, however, the duration and the kind of test which floors, partitions, etc., ought to pass in order to come under any one of the three headings. The pamphlet is accompanied by a letter, signed by the Chairman and General Secretary, calling our attention to the mis-use of the word "fire-proof" and "respectfully suggesting" whether it would be practicable to adopt instead the word "fire-resisting." To this we may be excused if we reply in the somewhat hoarse phrase—"Don't teach your grandmother." This view was laid down strongly in our columns, and the expression "fire-resisting" definitely adopted in place of "fire-proof," years ago by the British Fire Prevention Committee. We have ever heard of; and to have our advice solemnly offered to us at this time of day is rather amusing.

An Unsatisfactory Competition. AN advertisement has been sent to us, which has appeared in a Newcastle paper in which the Bewell and Fen District Council ask for competition designs for a Public Library to 4,000*l.*, offering premiums of 70*l.*, and 25*l.*, with the simple announcement "the successful plans to become the property of the Council." Nothing said of an assessor, and an architect wrote to ask whether one would be appointed got no reply. The premiums are liberal in proportion to the proposed expenditure on the building; but in every other respect this seems a competition to be avoided by judicious people.

CLUB PREMISES, LEMINGTON, NORTH HAMPSHIRE.—The new premises of the Lemington and Institute, Ltd., were opened on the 3rd inst. The building is of stone at the east and north sides, and brick at the west and south, and the cost will cost nearly 5,000*l.* The contractor is Mr. Harry Maughan, of Lemington, designs having been prepared by Mr. W. Maughan, of Hexham.

MAGAZINES AND REVIEWS.

THE *Art Journal* devotes an article to two painters of more promise than performance, Smetham and Allston Collins, both belonging to the early half of the last century; the latter a son of Collins the Academician, that painter of quiet and luminous coast scenes. Allston Collins was the original of the figure of the Huguenot in Millais's picture. Both Smetham and Collins were more or less associated with the pre-Raphaelite movement, or at least numbered some of their closest artistic friends among the brotherhood.

Smetham had some points of resemblance with Blake, of whom he was a great admirer. Both were painters whose aspirations seem to have been greater than their powers of realising them; indeed Collins "abandoned painting in despair" in his thirtieth year. His picture of "The Novice," which forms the frontispiece to the *Art Journal*, is however a fine and impressive work, as far as one can judge of it in black and white; a nun looking into a pond covered with water-lilies, with a very intricate and elaborate background of flowers and a hedge, on which patient execution of the pre-Raphaelite type seems to have been expended. Among the designs by Smetham which accompany the article, that of "The Enchanted Princess" almost unquestionably influenced the composition of Millais's "Ophelia." The two artists were well worthy of a kindly notice to keep their memory green. Mr. Cecil Smith, the new keeper of Greek and Roman antiquities at the British Museum, contributes an article on the interesting and rather novel subject, "Sunrise on Greek Vase-Paintings"; not of course realistic representations, but symbolical designs.

The *Burlington Magazine* contains an article on the house and collection of Mr. Edgar Speyer, in Grosvenor-street, which seems to include a most remarkable assemblage of pictures and works of decorative art. Among the illustrations is that of the splendid side-board in the dining-room, a partially modern one on XVIIth century lines, with two original Renaissance figures of boys worked in as part of the construction, and a small marble fountain basin of the same period, on a slender stem, placed in a niche in the centre. On this is a bronze group of a nude child with a swan, executed by M. Morel for this position, and having itself all the air of a piece of Renaissance work. "Notes on the decorative vase of Famille Verte (Chinese) porcelain," by Sir W. Bennett, is accompanied by full-page illustrations of two magnificent vases of this ware, one of which forms the frontispiece, and which leave one in no doubt as to their decorative "value." We agree with the writer in thinking that metal mounts on such vases add nothing to their decorative effect, and in fact, whether original or not (which seems often to be a doubtful point), clash somewhat with the character proper to porcelain. Mr. Lionel Cust and Professor Dolschütz, in No. III. of "Notes on Pictures in the Royal Collection," treat the subject of the portrait of Christ, one of a series of sacred pictures acquired by Prince Albert, and probably painted, we are told, by a Greek priest at Venice, about 1640. The point of the article is as to the resemblance between this and the earlier supposed portrait of Christ preserved in the chapel of the convent of San Bartolomeo degli Armeni at Genoa, now inaccessible, and only known through a copy of it made by Thomas Heaphy, and now in the British Museum. The claim for authenticity in the case of the Genoa portrait is of course purely legendary, and the subject narrows itself down to a question of the authenticity of copies of it. One feels it, however, to be not entirely impossible that these pictures may be the survival of some remote and rude representation of the head of Christ, if not contemporary, done from memory or from description handed down, probably somewhat modified and conventionalised by Byzantine taste. It seems a thread of possibility, but no more; nor is that question considered in the article.

The *Berliner Architekturwelt* contains an article written by Professor A. Gotthold Meyer, on "Two Textbooks of Palatial Architecture" (Zwei Lehrbücher Fürstlicher Baukunst). The first of these books, by Paul Decker, appeared in 1711, and the author confined his attention to residences or palaces suitable to "a great lord, who has to rule over his country and people, and whose high position must be indicated in the splendour of his state and residence." In order to carry out Decker's designs he would moreover have to possess

fabulous wealth. This constitutes the charm and also the danger of these idealistic plans. Neither the site nor the materials present any difficulties; ways and means are ignored, and it only remains for the artist to think of a sufficient number of buildings for all possible occasions, and, above all, to display a sufficient wealth of imagination; from this point of view Decker certainly succeeded. His work, however, is chiefly interesting as representing a phase in the history of Architecture, and does not bear any personal significance. About four generations later, Karl Friedrich Schinkel brought out a similar work, describing the plans of a residence, which, "whilst within easy reach of a large town, should contain within itself all the necessities and accessories for the highly-cultured life of its princely owner." Schinkel has less to say than Decker, for he maintains that "the explanatory word can only be an accompaniment. Here, the artistic representation of the object can be the only true mode of instruction." There is a marked contrast in these two conceptions of a palatial residence. Decker provides for festival halls, barons' halls, courts, playhouses, grottos and orangeries; Schinkel considers rooms for collections of brasses and coins, etc., a theatre for the representation of dramatic works, galleries for antique statues, picture galleries, a church, etc. One of Decker's designs is of the most fearful and monstrous *rococo*; Schinkel's, of course, are founded on Greek lines, and contain some fine architectural suggestions. Among the general illustrations two fronts by Herr Messel, of Berlin, in despite of some oddities of detail, show architectural character and expression.

In the *Architektonische Rundschau* two country houses by Herr Schutte, of Barmen, effectively illustrated in broadly-tinted elevations, may claim the praise (not often to be given to German country house designs) of being picturesque without eccentricity. But we have the latter element provided in the Villa Strollberger, by a Munich architect, a sort of nightmare of a house, with a plan twisted into all kinds of shapes, and in the street house in Eisenacher-strasse in Berlin (Herr Paul Jatzow), with its door cut out of the middle of a great circular framework, in the true style of German cleverness. But the most noteworthy thing in the number, in one sense, is the presence of a most daintily-executed little chromolithograph showing an interior in early Georgian style by Messrs. Heal and Son of London. It is the first illustration of English work that we remember to have seen in the *Rundschau*. Perhaps, having discovered the existence of an English furniture firm, we may even hope that the editor of the so-called "Rundschau" may some day recognise the fact that there are English architects.

Public Works is this month very much occupied with Glasgow; there are articles on "The Art Galleries and Museums of Glasgow," by Mr. James Paton, the superintendent of the Glasgow Art Galleries; on "The Glasgow Main Drainage System," by the City Engineer (Mr. McDonald); "Glasgow Municipal Telephones," by Mr. A. R. Bennett; on "Glasgow Botanic Gardens," and on the Glasgow Municipal Buildings, the latter by Mr. W. Macleod; it is merely descriptive, not critical. "Navigable Waterways in Belgium" is the subject of an article by Mr. Hertslett, the British Consul-General of Belgium. The article is a very interesting one, and shows how fully inland navigation is developed in Belgium. About 85 per cent. of the navigable waterways are under the direct control of the State, which is also a large shareholder in the canals conceded to private companies. There is a short article on "The Structural Aspect of the Housing Problem," specially in reference to Glasgow, by the City Engineer. The cheapest houses the Corporation have been able to build are 145 houses of two apartments, letting at 8*l.* a year, and 112 of single rooms letting at 5*l.* a year; built at a cost of 4*½*d. per cubic foot. These undertakings just clear themselves, but they do not provide for the poorest class. The writer says:—

"The only way in which the housing of persons of this class can be approached is to recognise that the habitations provided for them must be structures of a special type, wherein everything is reduced to the simplest form, and everything that is not absolutely indispensable must be discarded. A weatherproof shelter with ample space, water supply, and sanitary accommodation, but little more; the whole details so rigidly plain that some relaxation of the Building Acts may be required should the erection of the houses be resolved on; but a clean, healthy dwelling in every way preferable to the abodes of squalor and misery in which the aethermost units are huddled together at the present moment."

Mr. McDonald gives specimen plans of three types of block dwellings for this purpose, in double and single apartments, which are very compact; but the system of placing the bed in a recess of its own size is not healthy. It would be better to have a turn-up bed which would fold up into a shallow recess during the day, and stand out on the floor at night. Sleeping in the confined air of a recess means want of ventilation.

The *Antiquary* contains an article by Mrs. Cuthell on "The Manor-Houses of the Isle of Wight," partly historical in regard to families etc., partly descriptive in regard to the buildings themselves—Yaverland, Arreton, East Standing, and others. The article is to be continued. The subject is an interesting one, not only as all old houses are of interest, but because, as everyone who knows anything of "the Island" must have noticed, Isle of Wight architectural developments are peculiar and have strongly marked local characteristics. Mr. George Bailey contributes an article on "The Wynno Brasses at Llanrwst" which are attached to the wall of the Gwydr Chapel at St. Mary's, Llanrwst, which chapel, added to a church of the Perpendicular period, is credited to Inigo Jones. Illustrations of these brasses are given; they show portrait heads enclosed in square frames set lozenge-wise. The second, that of Lady John Wynne, furnishes a careful and detailed illustration of the head-dress, collar, and coiffure of a lady of the Charles I. period.

Blackwood, under the heading "Musings without Method," gives some trenchant comments on the result of the Chantry Bequest Commission—one of the many evidences which show how strongly the action of the Royal Academy in this matter has affected the best class of public opinion. We agree in spirit with the comment, except in regard to the writer's favourable view of the Committee's proposal to commission sculptors to carry out, in monumental materials, works only finished in plaster or clay; a proposal which we consider as essentially contradictory of Chantry's provision that no commissions were to be given. The writer expresses only what is the plain truth in his remark—"That the Trustees should buy one another's works at comfortable prices is no doubt convenient to them, but it is a direct violation of Chantry's wishes." The most noteworthy point in the article, however, is the warning which it gives that the public will not much longer put up with the Academy's policy of sublime indifference to all outside opinion. "So long," he observes, "as the number of shillings taken at the doors shows no decrease, the Academicians will regard themselves and their works as above and beyond criticism, even though a gentle acquiescence might be to their advantage. But if they remain obdurate, one day they will find less shillings in the till, and then at last they will realise that in their pride they have killed the goose that laid the golden eggs."

The *Fortnightly* contains an article on G. F. Watts by Professor W. Knight. It is not so much a criticism of his artistic work as a reminiscence of many of Watts's sayings and opinions on men and things; all of them interesting and characteristic, but not all very balanced or central in judgment. To tell a friend who had just returned from Rome, and whom he met at the exhibition of Burne-Jones's pictures in the New Gallery—"Well, in all Rome you saw nothing finer than this, nothing finer than this," certainly savours more of loyalty to a friend than of a sense of the proportion of things. Professor Knight hammers away over and over again at the point that Watts's persistent idea was to make Art a means of moral teaching. Watts undoubtedly thought so in the latter years of his life; he seems to have forgotten the days when he painted such a work as "Daphne"—one of his most beautiful and perfect productions, of which we hear nothing now, so much has this unfortunate idea of Art as a preacher taken possession of the minds of Watts's admirers. But what sane critic would put Watts's latter-day paintings of Eve, for instance, or his almost grotesque typical figure of "Woman," beside a work of such classic beauty as the "Daphne"? But there is no sane criticism about Watts at present; we have not seen an instance among the numerous magazine articles of anything like a serious and thoughtful attempt to discriminate between the greatness and defects of his work. Of the nobility and greatness of Watts's character, apart from his art, there can however be no two opinions. Professor Knight mentions some fine traits of

this; among others (what we have not seen mentioned before) his withdrawing, at the age of 74, from his right as an Academician to place his pictures; requesting to be judged by the Hanging Committee along with the outsiders, lest in his old age he should unconsciously have produced what would do himself or the Academy injustice. When one remembers the absurdities which certain aged Academicians continued to inflict on the public year after year, one cannot too much admire such a noble reserve and distrust of himself as Watts showed in thus acting.

To the *Monthly Review* Mr. T. Andrea Cook contributes an article "On the Romance of Coinage"; a slight sketch of some of the points of interest in coins and medals ancient and modern. He shows good reasons for thinking that our modern effigy of Britannia with the shield may be traced, in its main composition, to a medallion of Commodus. The motif occurs in a farthing of Charles II. and one of Anne, with differences of detail. The Britannia on the penny of 1800, though a little stiff and academic, is a better design, in decorative line, than that on the penny of 1901. The medal commemorating the sixtieth year of Queen Victoria's reign is contrasted with the medal of the French Republic, with its beautiful head with a crown of leaves; the two are typical of the two nations; the sober realistic portrait on one, the *spirituelle* ideal head on the other. But then, of course, a Republic can be symbolised and idealised, while a sovereign's coinage must show the sovereign's head. The same contrast is even more strikingly shown in the penny of 1902, with the King's head, and the French *sou* of the same year, with its lovely ideal head of the Republic again, a quite different design from the other, and even more fascinating. The point is, that in our own coin not the slightest attempt is made to treat the portrait head with any decorative accessories (except a row of dots round the rim of the coin); it is stamped blankly on the circular space, for which it appears too large, in the most prosaic and practical manner. The two coins emphasise painfully the difference between an artistic and an in-artistic nation.

The short article on "Radium: Its Properties and Possibilities," by R. J. Strutt, in *The National Review*, deserves to be widely read. It gives a clear and reasoned account of our present knowledge, and is more instructive than any of the books on radio-activity which we have read. It is not burdened with the names of unknown scientists who have obtained experimental results, apparently at hap-hazard, or whose brilliant and daring speculations on the nature of matter have startled authors. With the exception of Helmholtz, no scientist's name is mentioned. The article is imbued with the true scientific spirit. The temperate statement of the facts and the consistent explanations given by Mr. Strutt will be appreciated by every thinking reader. We were especially struck by the way he proves that radium is not a permanent metal, and how, by supposing that there is a constant evolution of radium in the sun, the millions of years of temperate warmth required by geologists and zoologists to account for the strata and the fossils in the earth's crust can be reasonably obtained.

Harper contains an article by Mr. G. W. Ritchey, Superintendent of Instrument Construction at the Yerkes Observatory (U.S.A.), on "Photographing the Star-Clusters." The article is accompanied by some fine photographs of star-clusters, included a view of the Pleiades group. It appears that the ordinary system of a clock-driven telescope to follow the object in the heavens is not sufficient for these delicate observations with very large telescopes, the movement of the telescope not being sufficiently perfect to give sharp photographs:—

"It is necessary to devise some means by which the astronomer can watch throughout the entire time of the exposure of the photographic plate, can detect any minute movement of the image of the celestial object from its proper position, and can instantly correct or compensate for such movements. There are several methods in use of accomplishing this hand-guiding or correcting; the most refined method is by the use of an attachment called the double-slide plate-carrier. The observer sits with his eye at the guiding microscope of the attachment, and with his fingers on the milled heads of two fine adjusting screws, and he is able to introduce with extreme accuracy and quickness any corrections which he sees are necessary."

Mr. Ritchey believes that when a reflecting telescope is constructed equal in power to the largest refractors, through which observations can be continued for a long term of years, we

may be able to observe and chronicle changes in the star clusters which are too slow to be detected by our present means.

The same issue contains an article on "Ravenna" by Mr. Arthur Symons, which however is of merely literary value—a record of personal impressions given in picturesque language.

In *Scribner*, under "The Field of Art," Mr. Russell Sturgis gives a description and criticism of the pediment sculpture of the New York Stock Exchange, by two American sculptors, Mr. J. Q. A. Ward and Mr. P. W. Bartlett, the original model having been by Mr. Ward. The New York Stock Exchange shows the façade of a Greek temple in the Corinthian style; on the pediment are a collection of a few figures on colossal scale and in very bold relief; mostly nude, the muscular development of the figures being, according to Mr. Sturgis, considerably and purposely exaggerated. The sculptor seems to have found the usual difficulty in dealing with the low angle spaces of the pediment, and his nude figures sprawled on the top of the cornice at this point are not very dignified. The whole thing however, seems from the illustrations to be a powerful piece of work; but the question is whether it is not all architecturally and sculpturally a mistake. What has the purpose of a Stock Exchange in New York to do with this Greek temple decoration? "Reminiscences of Sir Henry Stanley," by Mr. Montmency-Jepson, is a short paper which will interest many English readers.

The Century contains an article on "The Dinosaurs of the Bone Cabin Quarry," by Mr. H. F. Osborn. The Bone Cabin, in Albany, U.S.A., was discovered by Mr. Walter Granger of the American Museum expedition, in 1897. It contains bones of extinct animals of enormous size and length of limb and neck, of which some restorations are given, not so conjectural as might be hastily supposed, for the complete skeleton structure is there. The article is a very interesting one, and Mr. C. R. Knight's illustrations are admirable. "Japan's Highest Volcano," the subject of an article by Mr. H. G. Ponting, is not Fuji, which is extinct, but the highest active volcano, Asamayama. "Ballooning as a Sport," by Mr. G. de Geofroy, gives some practical experiences as to the conditions of ballooning, especially in regard to the modern quasi-dirigible balloon.

In *The Gentleman's Magazine* Mr. Dunlop-Wallace-Goodbody concludes his long article on Forum Julii or Fréjus, a very interesting historical summary, coming down to the day when the Cesar of modern times took up his temporary abode at Fréjus on his way to Elba. The same number contains an article by Mr. Vincent Heward, F.R.A.S., on the planet Mercury, summing up some of the results of modern telescopic information, among which is the fact (of which at least Schiaparelli, after a long series of observations, entertained no doubt) that the relation of Mercury to the sun is the same as that of the moon to the earth; the planet having no diurnal revolution, and presenting always the same face to the sun. On such a planet, exposed to a tremendous glare on one side and perpetual darkness on the other side, there can be at all events no life comparable to life on the earth; and probably Mercury, like the moon, is an arid waste.

The Pall Mall Magazine has an article on Montagu House, Whitehall, the Duke of Buccleugh's town mansion, with illustrations of some of the principal rooms, with their sumptuously decorated ceilings and cornices, and a description of some of the artistic contents of the house. Mr. Lewis Hind contributes an article under the title "A Day with Velasquez," commenting on the contents of the Velasquez room in the Prado Museum at Madrid, the central object of which is what the writer justly characterises as "the greatest historical picture mortal man has produced"—"The Surrender of Breda."

CONVALESCENT HOME, SHOTLEY BRIDGE, DERHAM.—A new wing of the John Spencer Convalescent Home for Sick Children at Shotley Bridge was opened a short time ago. The building is three stories in height, and will provide accommodation for sixty-five additional children, with dining-hall, kitchen, lavatories, and nurses' quarters. The work has been carried out under the supervision of Mr. D. M. Spence, architect, of Shotley Bridge, and the contractor is Mr. T. A. Turnbull, of Rowland's Gill.

THE ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

A MIDLAND Counties meeting of the Association of Municipal and County Engineers was held at Birmingham on Saturday, for the purpose of inspecting the sewage works of the Birmingham, Tame and Rea Drainage Board. The Birmingham works are of very great interest, by reason of their extent, and the important experiments in the bacterial treatment of sewage conducted by Mr. J. D. Watson, Chief Engineer, and the meeting brought together a large number of members from all parts of the country. Mr. A. T. Davis, County Surveyor of Shropshire, President, occupied the chair, and there were present Messrs. J. D. Watson (Birmingham), J. T. Eayrs (Birmingham), J. E. Wilcox (Birmingham), C. F. Wike (Sheffield), W. Harpur (Cardiff), R. E. W. Berrington (Wolverhampton), J. W. Brown (West Hartlepool), W. H. Hopkinson (Keighley), T. Schlund (Woolwich), R. Pierce (Singapore), W. Stubbs (Blackburn), T. J. Guilbert (Gloucester), H. Richardson (Hendonsworth), hon. sec., J. P. Norrington (London), A. H. Campbell (East Ham), F. W. Ruck (Maidstone), E. W. Holmes (Walthamstow), and others.

The morning was occupied with an inspection of the purification works at Minworth Grange, including the regulating chamber, Dortmund tanks, experimental bacteria beds, and primary and secondary percolating beds.

The President and members of the Association then drove to the Home Farm at Tyburn, where they were entertained to luncheon by Mr. J. D. Watson.

The President proposed the health of Mr. Watson, and thanked him for giving them an opportunity of going over the works, which extended to nearly 3,000 acres.

Mr. Watson, in reply, explained that they had a Drainage Board constituted by Act of Parliament, which included Birmingham—the predominant partner—Aston, Handsworth, Erdington, Smethwick, Sutton Coldfield, and one or two minor places, which had combined together or treating the sewage of a population of 860,000. Formerly the whole system was that of broad irrigation and downward intermittent filtration, but they were now changing it to the bacterial system, though they had a sewage very hard to septicise, as it contained a large amount of iron salts. While they were going in for bacterial treatment very largely, they were not dissatisfied with land treatment, from which they had obtained a purification of 92 and 93 per cent. Their idea was that if they could reduce the area on which they disposed of the sewage they would minimise the chance of nuisance, and they would not have so great a difficulty as to the area of land.

The district business was then transacted, and on the proposition of the President, Mr. H. Richardson, of Handsworth, was re-elected secretary for the Midland district of the Association.

Mr. G. A. Hart read a paper on recent experience in sewage and sludge disposal at the Salfley Outfall Works of the Birmingham, Tame and Rea District Drainage Board. He said the modifications which had been introduced from time to time into the general method of sewage treatment adopted at the Salfley Works during the last three years appeared to have a somewhat interesting bearing in relation to the general question of sewage and sludge disposal. In 1900 the outfall works then constructed for the tank treatment of the sewage and the disposal of the sludge at Salfley, consisted of:—First, an installation of three tanks for preliminary treatment of the sewage, called roughing tanks. Each tank averaged 328 ft. long by 94 ft. wide, and 5-64 ft. deep, having a total combined holding capacity of 3,216,100 gallons. Each of the tanks was rectangular in plan, with side walls constructed of brickwork, and had brick-paved floors, having a slight fall lengthways from the outlet towards the inlet end. They were divided into three sub-divisions by cross walls carried up to within 2 ft. of the sewage surface. The compartment at the outlet end consisted of one-half of the total capacity of each tank—i.e., holding about 500,000 gallons. The remaining two compartments of each tank were of equal size, and held about 250,000 gallons each. Floating scum-boards to prevent the passage of floating refuse, such as corks, etc., were fixed across the inlet end of the tanks. The contributory population to the outfall works was estimated at 707,000, and the average daily dry weather flow was estimated

at 21,000,000 gallons per day. The sewer inlets entered the tanks at a level of about 3 ft. above the floor, and the flow of the sewage was regulated through each of the tanks in parallel. After passing through these preliminary tanks the sewage was conducted into the second installation of tanks, termed finishing tanks. These were also constructed of brickwork, with brick-paved floors, having a fall from the centre line to the inlet and outlet ends respectively. There were sixteen of these tanks, each measuring 150 ft. by 50 ft. wide, with an average depth of 6.07 ft., having a total holding capacity of 4,539,500 gallons. The combined total roughing and finishing tank capacity at the outfall works therefore amount to 7,755,000 gallons. Sumps were constructed in the floors of the compartment of the tank for the collection of the sludge. A Priestman grab attached to a steam crane, travelling in a 4 ft. 3 in. gauge tramway, extracted the heavier lectrus, which was deposited in tip wagons, and at once removed and tipped in the form of a surplus soil bank in the immediate vicinity of the works. Early in 1902 the outfall works were extended by the addition of two further roughing tanks. They were of similar construction to the tanks previously described, holding about a quarter of a million gallons each, and four additional finishing tanks, and having each a holding capacity of 680,920 gallons. No further addition to the tank capacity of the works had since been made. The total combined roughing and finishing tank capacity at the present time was as follows:—Five roughing tanks, 5,610,150 gallons; twenty finishing tanks, 7,263,180 gallons; total tank capacity, 12,873,330. Simultaneously with the increase in the tank accommodation, storm-water filters of an area of half-an-acre each, and containing medium to the depth of 5 ft., consisting of screened gas coke, were constructed for the treatment of storm-water conjointly with the tank extensions. A cast-iron underground sludge main was permanently laid about 4 ft. deep, extending from the outfall works for a distance of 2½ miles through the farm-lands to Castle Bromwich. New buildings were erected containing two Lancashire boilers, each 30 ft. long by 8 ft. diameter, and the existing engines were rearranged and connected to a pair of belt-driven air compressors, which supplied compressed air to a series of four Shone's pneumatic ejectors, which were connected with the cast-iron sludge main. Two additional sludge pumps were installed in the engine-house for the purpose of extracting the sludge from each of the tanks. From the year 1872 to February, 1901, the general system of sewage treatment at the works consisted of chemical precipitation, followed by subsequent sedimentation in the two installations of tanks termed roughing and finishing tanks, the final tank effluent being subsequently treated on land. The cost of the lime treatment amounted, in the year 1900, to 4,332., which was equivalent to a cost of 11s. 6d. per million gallons of sewage treated. On account of the rapid increase in the volume of sludge precipitated by the liming process, it was decided to entirely suspend the liming of the sewage, and to commence the promotion of bacterial action in the tanks. It was predicted that it would be practicable by adopting a method of frequently and rapidly removing from the roughing tanks the sludge as it was deposited, to counteract the effect of some of the acidified discharges of sewage which periodically passed down to the works by increasing the effective tank space, and that an important advantage anticipated by the promotion of septic fermentation would be a reduction in the volume of sludge produced in the tanks, together with a saving in treatment at least amounting to the cost of the unslaked lime. To counteract this advantage it was anticipated that the tank effluent resulting from bacterial action and sedimentation would contain a much larger quantity of suspended matter than the chemically precipitated effluent had hitherto produced, and some anxiety was felt as to the result of the application of the unlimed tank effluent upon subsequent land treatment, and it was satisfactory to be able to say that as the result of further investigation upon this point extending over the last three years, it had been established that the land effluents had shown annually a gradual improvement. On the albuminoid ammonia and oxygen absorbed bases, in terms of percentage of purification upon crude sewage, this improvement was indicated by the following figures:—1901, albuminoid ammonia basis per

cent. 88, oxygen absorbed basis per cent. 88; 1902, albuminoid ammonia basis per cent. 92, oxygen absorbed basis per cent. 90; 1903, albuminoid ammonia basis per cent. 92, oxygen absorbed basis per cent. 93. The effect of the change in treatment from chemical precipitation to septic fermentation in the volume of sludge arrested in the tanks justified anticipation. As a result of fifteen months' observation, it might be stated that the reduction in volume of the sludge deposited in the tanks amounted to 58 per cent. of the total bulk, expressed in terms of cubic yards of sludge per million gallons of dry weather flow. The figures were as follows:—Lime treatment, 35.55 cubic yds.; septic treatment, 14.85 cubic yds. This method of treatment was consistently followed out until March, 1903, but a disturbing element which had an appreciable effect upon the treatment was introduced in 1902 by the addition of two extra roughing tanks and four finishing tanks. This additional tank accommodation, representing an increase of 66 per cent., increased the volume of sludge deposited in the tanks by 22 per cent., making the total volume of sludge deposited per million gallons of dry weather flow amount to 18.20 cubic yds. Simultaneously with the increased tank accommodation, a storm-water weir was constructed in the roughing tank effluent channel. The combined sewage and storm water was now treated together in the five roughing tanks, and the storm water after sedimentation being automatically diverted over the storm overflow weir for subsequent treatment on straining filters before its final passage into the river Tame. In its passage from the tank into the sludge suction-chamber the sludge was passed through an iron screen of about 1½ in. mesh, to which was attached a revolving rake which effectively extracted from the sludge the cloths, rags, and similar fibrous material. This method had proved most effective; its chief recommendation being that in lieu of a large quantity of elaborate screening machinery which would be required if this comparatively small percentage of fibrous material were extracted from the crude sewage, it had been found quite practicable to allow the material to deposit itself and remove it in bulk in a comparatively short time; the whole of one week's sludge being effectively screened and removed from each tank in about six hours. The average volume of liquid sludge removed per day from the tanks for the past thirteen months amounted to 590 cubic yds. per day on an estimated dry weather flow of 22,000,000 gallons per twenty-four hours, which was equivalent to 26.22 cubic yds. per million gallons treated. The effect produced by this system of frequent cleaning was to increase the volume of liquid sludge deposited in the roughing tanks by 44 per cent. The propagation of septic fermentation in the finishing tanks, together with the frequent cleaning of the roughing tanks, was continuously followed for a period of thirteen months. As the result of observations taken during that period it was conclusively established that, although the efficiency of the roughing tanks for sedimentation had been increased 44 per cent., the septic tanks gave unmistakable evidence of becoming inert. The most reasonable theory which the author could put forward to account for this phenomenon was to the effect that the increase in the effective roughing tank capacity produced such a degree of sedimentation that the greater bulk of the organic substances containing the fermentative organisms necessary to promote septic action were deposited as sediment in the roughing tanks, and the finishing tanks were therefore deprived of the elements upon which their septic action depended. To remedy this defect, in May, 1904, directions were given that the whole of the lighter organic sludge which was deposited daily in the roughing tanks should be pumped into the septic tank inlet channels. The quantity of sludge thus transferred from roughing to finishing tanks had been gradually increased during the last three months, and at the present time a volume equal to 30 per cent. of the total sludge deposited, was daily passed into the septic tanks. There had been no indication that the finishing tanks had attained their ultimate efficiency; the fermentative action was almost immediately restored, and was being gradually increased month by month. It was interesting to observe that, as a result of three and a half years' continuous septic fermentation in the finishing tanks, extending from March, 1901, to May, 1904, the residual products deposited therein during that period, and

which it had been deemed advisable to remove therefrom in the form of sludge, had only amounted to the volume of 25,000 cubic yds., that was a volume equal to half the holding capacity. The septic residuum was deposited on land in a layer of about 15 in. deep. It gave rise to no offence, no smell had been detected arising therefrom, and, after lying open and exposed to the action of the atmosphere for six months, and being ploughed over, it would be difficult now to differentiate between the appearance and characteristics of natural surface soil and this material. There appeared to be some foundation for the belief that many of the very real difficulties which attended the removal and disposal of sewage sludge might be alleviated by judicious tank treatment, and it appeared to be equally essential that the utmost care and regard should be given to detail in the application of the treatment; and to the design of those works dedicated to the various functions embodied in the treatment if results of an efficient and generally satisfactory kind were to be produced. The average yearly current expenses occasioned by the treatment of the sewage by chemical precipitation with lime and disposal of the sludge was 7,785l. 19s. 10d. The average yearly current expenses occasioned by the treatment of the sewage by sedimentation and septic fermentation was 3,092l. 3s.

Mr. A. Bryan, resident engineer, gave a description of the purification works in course of construction at Minworth Greaves. He said the works, being constructed by the Birmingham, Tame, and Rea District Drainage Board for the bacterial purification of sewage, were situated in Sutton Coldfield, and were distant some five miles from the outfall works at Saltley. The works in course of construction comprised:—(1) An intake chamber to form the connexion between the existing main supply conduit and the new works, in which was fixed an apparatus for automatically regulating the flow of sewage, so that in dry weather a constant volume would be delivered to the bacteria beds. (2) A series of silt or sedimentation tanks to remove the suspended and floating matter present in the septicised sewage. (3) An installation of primary percolating beds to effect a partial purification of the sewage. (4) The provision in the main effluent channel for the primary beds of a sedimentation tank to arrest the humus in the filtrate. (5) An installation of secondary percolating beds to complete the work of purification in the event of land not being available for the purpose. The works, with the exception of the 1½ acres of experimental beds, which had been constructed by direct labour under the author's supervision, were being carried out by contract by the following firms:—Constructional work, Mr. W. Cunliffe, Birmingham; cast-iron pipes, The Clay Cross Iron Company; sluice valves, Messrs. Guest and Chimes, Rotherham; special distributing pipes and flexible joints, Messrs. Jones and Attwood, Stourbridge; aerating floor, Mr. H. R. Mansfield, Church Gresley; medium (bricks), Messrs. Freakley and Co., Tipton; medium (granite), Jess Hartshill Granite Company, Atherstone. In many percolating beds recently constructed the bottom layer of medium had been composed of large material, the object being to allow the effluent to drain freely from the bed. In beds constructed on this principle the water, in finding its way to the channels, pursued a very erratic course through the intricate passages between the medium, and repeatedly changed its direction before it was clear of the bed. This must of necessity cause many small eddies and backwaters, in which the suspended matter, which had no great difficulty in finding its way by gravity to the bottom of the bed, was deposited in a gradually increasing quantity, which would in time render the lower portion of the bed useless for drainage purposes or for aeration, and the medium would consequently need to be taken out, cleaned, and replaced. The use of an open or aerating floor between the medium and the floor of the bed in a great measure minimised this defect. The effluent, after percolating vertically through the bed, was at once entirely removed from contact with the medium, and found a clear course open to the channels. The depth of water over the floor might be considerable, and still leave the necessary air space beneath the medium; thus, the floor of the bed might be laid to a flatter gradient and head economised. The suspended matter was carried by the flow into the channels and there dealt with. The author had found, first, that the use of floors provided with circular

boles was not satisfactory, as they became stopped up with portions of medium; and, second, that a flat floor had in some degree the defects of allowing the sediment to collect on the flat surface. It was also found at Saltley that the rough brick walls of the small channels forming the floor of the storm filter beds had become coated with mucilage, similar to that found coating the medium of the bed. To minimise these defects the author designed the curved tile used for the beds, and he thought that the smoothly-glazed round surface would allow the sediment to easily reach the slots, which were carried right down to the foot of the tile. The long, narrow slots could not become entirely filled by the medium, and that when the floor was carried through the walls of the bed the slimy coating and any heavy sediment could easily be flushed out, as the force of the flushing water was not destroyed by being allowed to spread out in all directions and become obstructed by the feet or supports of the floor. The distinct channels also induced a current of air, especially on windy days, and thus helped in dispersing the heavier gases generated in the bed. It was found after the beds had been resting for any length of time, that on restarting them the first trickle of effluent from the beds provided with aerating floors reached the channel in about thirty minutes, and from the floor covered with large slag in forty-five minutes; also that the flow from the tiles was general in about sixty minutes; whilst after two hours, about one-quarter of the circumference of the channel draining the slag portion of the bed was still dry. The effluent for some time was very turbid, and contained a large amount of suspended matter, the sediment in the effluent draining from the tile floor being two to three times greater than from an equal area of bed covered with slag. The sediment contained 26 per cent. of organic matter, chiefly broken-down mucilage from the bed. The amount of sediment from the beds appeared to increase somewhat rapidly every three or four weeks, and the oxygen absorbed increased at these times. This was no doubt due to the suspended matter making its way through the medium and collecting on the concrete floor until it was in sufficient quantity to be washed away. When the sediment made its appearance, the channels and tiles were flushed out and cleaned with drain rods, after which the effluent was again clear. The analyses of the effluents showed that a very high nitrification was obtained from the whole of the beds, and the author believed this was largely due to the provision of an aerating floor, combined with the use of a fairly large (3-in. gage) medium for the lower portion of the beds.

Mr. A. J. Dickinson (Birmingham) wished to know whether the putting of Westrumite on the roads of Birmingham had affected the quality of the sewage, and whether it could be identified in the analysis.

The President proposed a vote of thanks to the authors of papers.

Mr. G. W. Lacey (Oswestry), who seconded, said a good deal of information had been given as to the materials used in the bacteria beds. He wished to know whether the revolving sprinklers had been found satisfactory in work.

Mr. J. E. Willcox (Birmingham) remarked that the papers contained a great deal of valuable information, more particularly with regard to cost.

The vote of thanks was unanimously accorded to the writers of papers.

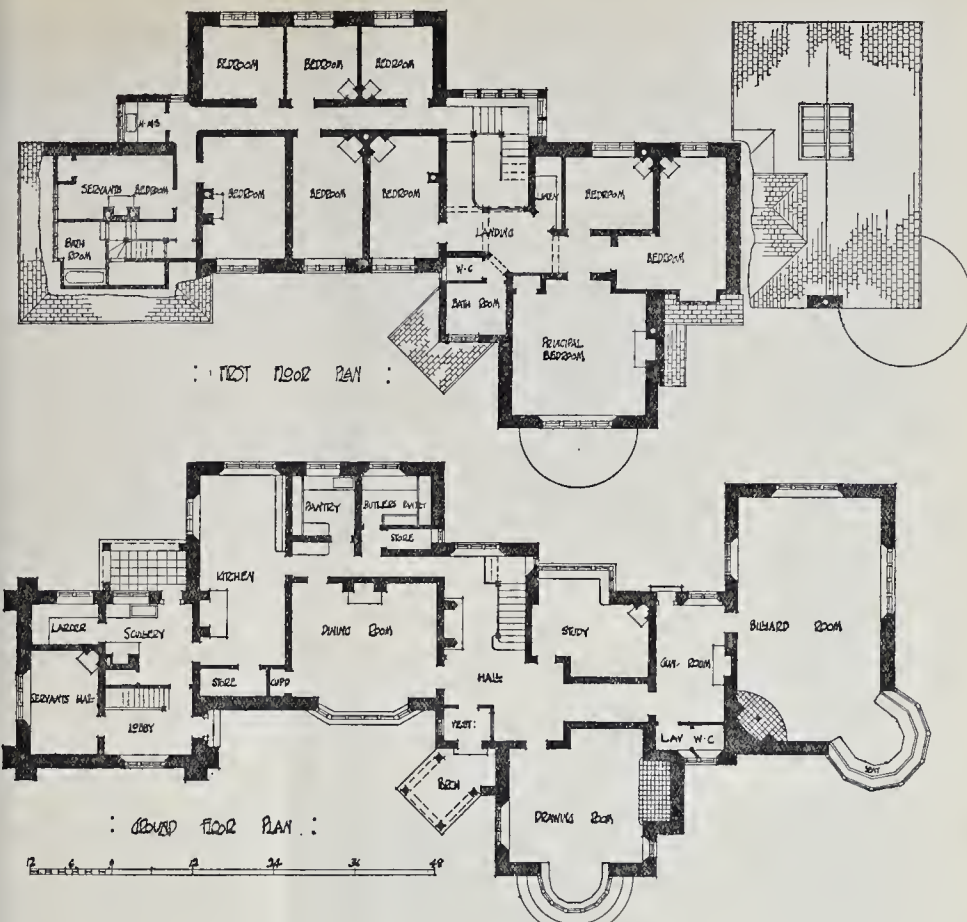

Mr. J. D. J. Roberts, architectural assistant, gave a description of the refuse destructor and electrical power generating station in course of erection at Saltley.

The remainder of the afternoon was devoted to an inspection of the Saltley works, including the sedimentation works, septic tank, sludge screening and sludge ejecting machinery, and the storm-water filters.

NEW SCHOOL, CARLISLE.—The new school which has been erected on a site at the corner of East Dale-street and Denton-street, Carlisle, was opened recently. The building is two stories in height, the ground floor being for infants and the first floor for senior boys and girls. There is a central hall and six classrooms on each floor. The total accommodation provided is for 720 children, 350 infants and a similar number of boys and girls who have passed into the standards. The total cost was about 9,000*l.* The architect was Mr. Brierley, of York.

House, Wolves Newton. Plans.

HOUSE AT WOLVES NEWTON, MONMOUTHSHIRE.
 This house was erected on a site overlooking a valley towards Abergavenny and the Sugar Mountain, a distance of about twenty miles. The entire walls are of stone and are externally covered with white rough-cast. All the internal woodwork, main staircase, and interior billiard-room (which has an open timber staircase) are in Bath stone. The roofs are covered with red Bridgwater tiles. The west view of the house was published in the issue for September 13, 1902. The view of this week was taken from the hill at the back of the building.
 The contractors were Messrs. E. Turner and Sons, of Cardiff.
 Mr. A. Jessop Hardwick, of Kingston-on-Thames, is the architect.

THE DRAINAGE OF A HOUSE.
 By W. R. PURCHASE.
 In your issue of August 27, pages 227-8, there is part of an abstract of a paper by Mr. Ernest Smith, read at the recent Glasgow Congress of the Sanitary Institute, re the above subject, in which the use of fireclay glazed drain-pipes is advocated in preference to any other material.
 You were kind enough to insert in your issue of last year (Sept. 19, 1903) a brief notice from me on "The Insecurity of Modern Drainage." Will you permit me again to make a few remarks on this important subject, from a practical point of view? As the build-

ing inspector to a Borough Council for the past twelve years, I have had on an average some three or four hundred new drains to test and approve each year; and prior to that for a few years was engaged in the supervision of a large pottery, where drain-pipes were chiefly made. This experience will, I trust, qualify me in some degree for expressing an opinion on this subject. I may perhaps add that I have no prejudice as regards the material used for pipes, beyond advocating sound and efficient drains, as promoting sanitation and thereby the health and well-being of the community.
 This new advocacy of the fireclay drain-pipe is undoubtedly a retrograde movement, and anyone familiar with the composition of these pipes will, I believe, agree with me that they have only a comparatively short life, and should on no account be used for conveying sewage matter.
 It may be stated that fireclay as a raw material is found in great abundance in the coal-measures beneath the several seams of coal, and is usually a waste product. The clay, when prepared, is capable of standing a high temperature without fusing or becoming soft, and is therefore called refractory; it has a very open grain, is porous except when protected by glazing, and is weak and brittle.
 The glazing is effected by throwing coarse common salt (chloride of sodium) into the fires and kiln at a time when a certain degree of white heat is attained; the salt is at once decomposed, the chlorine escaping as vapour, while the sodium combines with the silica of the clay to form a surface coating of glaze, which in reality is a fine film of glass, covering every part of the ware exposed.
 Fireclay is seen to a great disadvantage

when compared with stoneware made from the clays of the Lias formation, in which the ware is vitrified throughout, intensely hard, dense in texture, non-absorbent and impervious to acids. The salt glazing in stoneware is the actual material itself fused together, differing from all other kinds of earthenware. The great imperfection in stoneware is its brittleness, which for drains generally is fatal.
 The defects to which fireclay drain-pipes are liable are porosity and weakness of the material; cement in joints swelling and contracting; uneven expansion of concrete bed; careless filling in of trench by ramming, etc. In fairness, however, it should be said that some of these defects may be minimised if care is exercised in doing the work.
 Most of the large cities, boroughs, and towns in England have framed their building by-laws on those of the "Model By-laws" which are adopted by the Local Government Board; in these it states that the drain-pipes shall be "of glazed stoneware or of other equally suitable material." This, as interpreted, virtually excludes fireclay, as it cannot be from its nature equally suitable; its use by the Local Government Board is therefore prohibited.
 One of these fireclay drains came under my notice some few years since, in which the pipes used were supplied by a reputed London firm. The drain when laid would not stand the water test, and the result could be seen in the beads of water oozing through thickly all over the surface of the pipes. This drain, of course, was condemned and taken out, and stoneware pipes substituted.
 The author of the article, Mr. Samuel Smith, has made various tests with these fireclay pipes—viz., pneumatic, hydraulic, acid, etc.—

all of which have turned out apparently to his satisfaction. But has he not proved too much? For he admits in one case that a second quality pipe tested by the pneumatic pump was "very porous," and when encased in 6 in. of concrete, and the air pressure increased, there was still a leakage.

A further test of the strength of fireclay pipes was made by hydraulic pressure (which is the only agent that should be employed in testing), and even then the pipes were found to be porous. This is sufficient evidence, and tends to prove that pipes of this description are not fit to convey sewage matter.

The only point that can be conceded in their favour—and it is not always a meritorious one—is that they are cheap.

But is it any use pursuing this question of fireclay, or even stoneware, pipes further?

In my former letter I held (and it was not contradicted) that there was a consensus of opinion amongst observant men, sanitarians, and others, that the stoneware pipe as a material for house drains has in the past proved a failure; and although in theory the stoneware pipe forms a perfect drain, and should last for all time, yet, owing to its composition, and the physical agencies surrounding it, it has decidedly failed, especially in having no lasting properties.

My later experience since then still confirms that opinion, having again dealt with several decided failures.

My next point is the advocacy of cast-iron (porcelain-lined pipes), the best material we have at the present time for drains.

Mr. Samuel Smith states that "so long as cast-iron pipes can be kept free from corrosion, they may be regarded as being satisfactory for drainage purposes." But from the nature of his experiments on cast-iron pipes, and their preservatives, they are not to him satisfactory; although why a very weak solution of sulphuric acid attacked the glass-lined pipe, in one of his tests, it is difficult to say, when it is known that glass is not affected by the acid in question—in fact the acid is kept or stored in glass carboys, so that this glass-lined pipe was evidently a misnomer, and the test worthless.

Admitting some of these defects in cast-iron pipes, there is almost everything to be said in their favour—viz., superior strength and capability of resisting fracture, reduction in the number of joints (6 ft. and 9 ft. lengths compared with the 2 ft. and 3 ft. lengths of stoneware pipes), the greater security of the joints, which are run in molten lead, or Spence's metal, and do not injure the sockets by swelling, and are also absolutely water-tight.

The one objection, and perhaps the greatest, is their oxidation; this, however, may be yet overcome if our manufacturers will only rise to the occasion. The pipes, to be successful, should be glazed inside, and for this purpose they should be roughly bored through their entire length and to a defined gauge, then line with a coating of white porcelain enamel, burnt on so as to become almost an integral part of the iron, and left with a perfectly smooth finish. Large cast-iron baths, and other articles apparently more complex, are coated successfully with this porcelain, and the difficulty of treating cast-iron pipes in this way is not insuperable, especially with our advancing knowledge in metallurgy.

I should also like to reiterate what I formerly stated—that the drain of the future will be laid in a brick or concrete culvert, with stone cover and chambers for access, sufficiently large to admit a man (say, 3 ft. high by 2 ft. 6 in. wide) for the purpose of periodical inspection, so that the drain is at all times accessible and visible. The drain to be laid on blocks or bearers, about 9 in. above the floor of culvert, and at intervals of about 3 ft. apart.

At the least intimation or suspicion of anything being wrong with the drain, an examination can be made in a very short time, without cost, and it is at once seen whether the drain is doing its work safely and well or not.

It is admitted that this culvert system, and improved cast-iron drains, will add to the first cost, but it is a small matter compared with the advantage gained, and it is undoubtedly cheaper to incur this expense than to incur the expense of re-instating drains every few years, as at present found to be necessary.

The culvert may also be utilised for laying the water, gas, and electricity mains. This, too, would be a great advantage to a dwelling-house, as none of these mains should be covered

up and hid from view, as they are in a great many instances at present.

In conclusion, with all the advancement made in sanitary science, it seems a pity that a scheme such as this should not be universally adopted, for there can not be the least doubt that it would tend to the improvement of sanitation, and hence the health and well-being of the community.

ENGINEERING SOCIETIES.

THE INSTITUTION OF CIVIL ENGINEERS.—The Council of the Institution of Civil Engineers have, in addition to the medals and prizes given for communications discussed at the meetings of the Institution in the last session, made the following awards in respect of other papers dealt with in 1903-1904:—Telford Premiums to Arthur Hill, C.I.E. (Bombay), F. A. Hinley (Cairo), E. M. De Burgh (Grestyones), H. H. Dare, M.E. (Sydney, N.S.W.), William Marriott (Melton Constable), T. G. Gribble (London), W. H. Haigh (Cardiff). For students' papers the awards are—A "Miller" Scholarship, tenable for three years, and the "James Forrest" Medal to C. W. L. Alexander, B.E. (Birmingham); Miller Prizes to J. M. Clark, M.A., B.Sc. (Glasgow), L. G. Crawford (Barrow-in-Furness), W. H. Dickenson, B.Sc. (Jesmond-on-Tyne), William Lawson (Newcastle-on-Tyne), C. G. Du Cane, B.A. (Middlesbrough), C. Gribble (York), J. E. Lister (Sheffield), J. M. Kennedy (London), H. Middleton (Newcastle-on-Tyne), J. D. Morgan (Handsworth).

Illustrations.

NEW CHAPEL, HERTFORD COLLEGE, OXFORD.

THE present chapel of Hertford College is a building of modern date, too small for the numbers of the College.

It has been difficult to find space in the confined area of Hertford College for a larger chapel; but by sacrificing one block of rooms, which can be spared in consequence of the new building on the other side of New College-lane, and utilising a small piece of waste ground next All Souls' College, a considerable chapel can be provided, though only a small part of it, as shown in the illustration. The east end will be well seen from the garden of the Warden of New College, on which it will abut, and also less conspicuously from New College-lane.

The architect is Mr. T. G. Jackson, R.A., and the drawing from which the illustration is taken was hung in the Royal Academy Exhibition this year.

HAGGERSTON PUBLIC BATHS.

THE accommodation provided in these baths includes a large swimming-bath, 100 ft. long by 35 ft. wide, and of a depth varying from 3 ft. 6 in. to 6 ft. Seventeen men's and five women's first-class and forty-nine men's and nineteen women's second-class slipper-baths, an entrance hall, 28 ft. by 16 ft., with a central ticket office, public cloak-rooms, a large swimmers' club-room, a public laundry fitted with sixty washing troughs and drying-horses, and five hydro-extractors, mangling and waiting rooms, a boardroom, and, in the attic story, residential accommodation for the superintendent. The boiler-house, the heater-room, the establishment laundry, and the store-rooms are placed in the basement floor.

In planning the swimming-bath an attempt has been made to solve the problem of enabling a large body of spectators to obtain an entirely unobstructed view of the whole water area of the bath. The ordinary plan under which the galleries for the public overhang the bath platforms is a very defective one, and, even when their stagirs' built on the raking lines of steel cantilevers or carriages inclined at an angle of about 45 deg. (as in the case of the Hoxton Baths), galleries so arranged are not wholly satisfactory. In the present instance the spectators' seats are in three stages, the lowest of which is placed about 18 ft. about the level of the bath platform, the dressing-boxes, sixty-nine in number, being arranged immediately behind the top stage of the public seating,

which is planned to accommodate about 100 persons.

The engineering plant comprises 2 Lancashire boilers, 28 ft. long by 7 ft. diameter, connected with the requisite condense pumps, steam injectors, and delivery pipes, valves, etc.; a Green patent fuel economiser, fitted with an electric motor for driving the scrapers, two large tubular reservoir heaters, and electric motor for actuating the wash-house machinery, the ventilating fans.

The general heating is effected by radiators placed in the various rooms and corridors connected with a low-pressure hot-water heating apparatus.

The walls of the swimming-bath hall, suites of slipper-baths, the public and establishment laundries, and the public corridors and staircases are faced, and the bath tank with enamelled bricks supplied by the Far Iron Company.

The arched roof principals of the swimming bath are of steel encased in ribs of gun plaster, the lower portions of the lantern are of glazed terra-cotta, supplied by Leeds Fireclay Company, fitted with iron joints, and the upper portions have fixed roofs and domes.

The bath platforms are paved with pebble interlocking rubber tiling, the gallery stairs are of oak, and the enclosure of the slipper-baths are formed with slabs of St. Anne's marble.

Messrs. Kilby and Gayford, of 87, Worcester street, E.C., were the general contractors, the constructional steel-work has been supplied and fixed by Messrs. Homan and Rodgers.

The engineering plant was installed by Messrs. Z. D. Berry and Son, and Messrs. Hemmingway and Pitt carried out the electrical lighting; the ornamental metal-work supplied by Messrs. Beulham and Froude, Thos. Easley, Ltd., and the ship vanes by Mr. George Wragge.

The figures, in low relief, on the pediment of the main front were modelled by Mr. J. Scheuk and carved by Messrs. Martyn and Co.

Externally the buildings are faced with Lawrence's red bricks and Portland stone.

Mr. H. Barton was the general foreman, F. C. Saunders the clerk of the works, and A. W. S. Cross the architect. The total cost of the buildings was about 60,000.

ADDITIONS TO OLD MILL, ALDEBURGH.

THIS is an illustration which shows how an old windmill was converted into a dwelling-house.

In the old mill a dining-room, three bedrooms and a smoking-room were contrived, approached by a new entrance-hall and staircase. These rooms were circular on plan. On the ground floor a parlour 30 ft. by 16 ft., built towards the east and south, approached a circular corridor, and on the north side of it were erected the servants' offices, bathroom and water-closet were arranged on first floor. The walls were faced with red cast, and the roofs were tiled, except the old mill, which for lightness was covered with copper. The woodwork, except the doors and shutters, which were bright green, painted white.

The contractor was Mr. G. O. Knowlton, Aldeburgh, and the architect, from whom this illustration was taken, Mr. J. Briggs, of London.

HAILEYBURY WAR MEMORIAL.—Since the publication of this last week we have heard from the architect, and may add a few more pieces of information which we were unable to obtain before. The materials are Portland stone and bronze, the convex panels on the face of the podium being of bronze, those on the east and west sides bearing Latin inscriptions, those on the north and south sides respectively the words "South Africa" and the "Sursum Corda" is the school motto, and a winged heart over it the school crest. Sixteen bronze plaques above bear the names of sixteen battles for which clasps were issued. The original idea was to put a bronze figure of the ball at the top; but this was abandoned.

The work was executed by Messrs. Fry and Brindley, the design being, as already mentioned, that of Mr. Reginald Blomfield.

Manual of Forest Engineering for India. By CHARLES GILBERT ROGERS, Fellow of Cooper's Hill, Deputy-Conservator of Forests, Imperial Forest Service of India. Calcutta Office of the Superintendent of Government Printing, India. 1900-1902.

THE ordinary architect or engineer the term forest engineering" will scarcely convey an adequate idea of the numerous subjects which are discussed in the large and comprehensive manual issued by order of the Indian Government. The first volume is devoted to building construction, the second contains information that should be found useful to all who are interested in comparatively simple engineering problems, and the third relates to matters more particularly appertaining to the duties of engineers in the forest service of India, or in countries where similar conditions prevail. The manual is divided into the following parts, viz.:—(1) Building Materials. (2) Building Construction. (3) Road Making. (4) Bridges. (5) Transport of Timber. (6) Wells. (7) Construction of Embankments and Water Channels, River Training Works. (8) Demarcation of Forests. The scope of the work was laid down in 1893 by the Board of Control of the Imperial Forest School, by whom the opinion was expressed that the general arrangement of the manual should be in conformity with the syllabus of the course of forest engineering. But it was further decided that the treatise should be elaborated beyond the actual requirements of the school curriculum, so that it might be useful for reference to the officers of the Forest Department and to the public generally. Although Mr. Rogers is the author of this work, he has to some extent occupied the position of an editor, for, being empowered to correspond with Conservators of Forests throughout India, he forwarded drafts of the different parts of the manual to various officers, inviting them to criticise the information collected, to indicate whether it was in accordance with their own practical experience, to add information where necessary, and to suggest what parts of the information were thought to be useless to forest officers or at variance with local practice. The effect of this course of action has been to make the work representative of the experience of the department as a whole, rather than of the views held by a single individual.

In considering the treatment adopted by the author, it must always be remembered that the engineering works falling to the lot of forest officers or landed proprietors in remote regions must usually be executed in the cheapest possible manner, and with the aid of somewhat primitive appliances. Further, in most cases such materials of construction can be used as are obtainable locally, owing to the prohibitive cost of transport. This condition frequently precludes the adoption of rolled steel, or castings, and other manufactured products. Consequently the reader will find that most of the types of construction described are those in which timber and other materials obtained on the site can be serviceably employed, while structures involving the use of iron and steel are only occasionally mentioned.

In noticing a work containing nearly a thousand pages and more than four hundred illustrations we cannot refer in much detail to the various sections, especially in view of the many different classes of work considered. Volume I, is, so to say, self-contained, being devoted entirely to "Building Materials" and "Building Construction." Part I, like all succeeding parts, is divided into sections, which are practically chapters, and are subdivided into paragraphs, numbered for convenience of reference. Sections I, II, and III relate to stone, bricks, and tiles respectively, and the treatment adopted by the author includes features that are absent from ordinary textbooks on building construction and civil engineering. Remembering that forest engineers have to quarry and otherwise prepare stone for use, the author gives detailed directions as to the most suitable methods for adoption, and adds a useful list of the available varieties of building stone found in India. Similarly, he gives full particulars of the processes of brick and tile making, including a discussion of the means to be adopted for determining the suitability of an earth for such purposes. Section IV, on "Earth, Grass, and Bamboos," is brief but interesting. When proper selection

is made, earth is certainly a most suitable material for the erection of temporary buildings of small size. By choosing earth with a large proportion of clay the whole construction is practically converted into sun-dried brick, but, as recommended by Mr. Rogers, the best way of preparing the material for the erection of walls is to form sun-dried bricks, and to lay these in mud mortar, the entry of water into the top being carefully guarded against by laying one or two courses of burnt bricks at the top of the wall. Some interesting particulars are given of the manner in which the materials here mentioned are applied in different parts of India. In the central regions white earth found on the sites of old villages is said to be the best for the construction of walls, and to stand exposure to the weather for many years; while for making mud plaster the earth from ant-hills is recommended, as it is believed that white ants will never attack plaster so prepared. In Assam reeds or split bamboos are much used in conjunction with sand and lime plaster in the erection of temporary structures. In Burma bamboo is largely used in place of earth for temporary buildings, and in other parts guard huts, stables, and other structures are often built entirely of grass fastened to timber frames. Section V, entitled "Lime," is one of much importance. The sources of lime are indicated, and the process of manufacture is clearly described and illustrated. Very little space is accorded to Portland cement, for the reason that its use is considered unnecessary in India, except where great strength or rapidity of setting is required. The remaining portion of this section is occupied with applications of lime in the forms of mortar, concrete, plaster, whitewash, and distemper. Full instructions are given relative to the proportions and mixing of such compounds, and it would be difficult for anyone of ordinary intelligence to go far wrong in such matters if carefully following the directions of the author. "Timber," forming the subject of the succeeding section, is of equal importance, and is considered at some length. Although a good deal of attention is paid to points more particularly concerning those practising in India, there is much information in this section that should be appreciated by all who have occasion to make themselves familiar with the nature of wood, with the best season and methods for felling trees, and with the most approved methods of seasoning timber. The conversion of timber, the suitability of different kinds of wood for the various parts of a structure, the causes of decay, and the preservation of timber are among the other questions discussed in this excellent section of the manual, which is followed by another section descriptive of the more important timber trees to be found in different parts of the Indian empire, information that will doubtless be highly prized by forest engineers and others in that country. After Section VIII, dealing with paints and varnishes, the subject of "Carpentry and Joinery" is taken up, and, although a little out of place in Part I, it has been included therein, as the author tells us, simply for convenience of reference. Many of the joints described may be required either in the construction of floors and roofs, discussed in Part II, or in the construction of bridges, considered in Part IV, and so they could not be relegated to either of these portions of the manual. This difficulty might have been got over by constituting the section a separate part, which, although short as compared with the others, would have enabled the author to avoid the inconsistency now existing. The section itself is admirable, and its practical utility is much enhanced by the drawings with which it is illustrated. Most of the latter are reproduced to scale, and many of them include figured dimensions. But, in addition to describing various timber joints, this section contains a concise summary of some points relating to the physical properties of matter and the loads and stresses to which structural members are subjected, as well as particulars as to the design and construction of doors and windows of different kinds.

In Part II, Mr. Rogers treats of "Building Construction," commencing with foundations, and proceeding upwards to the roof. As may be anticipated, there is nothing very novel in the treatment to be found in this portion of the manual, except with regard to such points as are particularly applicable to Indian practice. In this respect the author has certainly succeeded in collecting a mass of valuable informa-

tion, which is presented in an admirable manner. Moreover, the various details of a building are most thoroughly dealt with, so that this part of the work is well worthy the attention of all requiring guidance in the design of temporary or permanent buildings of simple character. In dealing with lightning conductors, the author does not emphasise so much as could be wished the desirability of establishing a complete system of protection over all parts of a building. It is true that he says the lightning conductor "should be connected with the more prominent lines of the building, such as the ridges, hips, and eaves of the roof," but he gives no directions as to the manner in which the connexion should be carried out, or as to the fitting of points, or clusters of points, along the horizontal conductors. The provision of a conductor or conductors projecting "about 5 ft. into the air from one or more of the highest points of the building," cannot be regarded as sufficient for adequate protection under all circumstances, even if we accept the theory that "a lightning conductor will afford protection over an imaginary cone having the point of the conductor for its apex and a base on the ground, the radius of which is equal to twice the height of the conductor above the ground." But, as pointed out in the report of the Lightning Rod Conference, as long ago as 1882, the rule in question cannot always be relied upon. Again, the author says:—"Lightning conductors should, where practicable, be made of copper, as that metal conducts electricity very readily." This recommendation involves unnecessary expense, and need not be followed in forest lands where the air is free from the corrosive constituents found in the atmosphere of large cities. Iron is an excellent conductor, as efficient as copper if the sectional area is properly proportioned, and it can easily be protected from corrosion by galvanising. Another very important matter, rather lightly touched upon, is the earth connexion. The ordinary earth plate is recommended in the present treatise, but there are frequently objections to this device. It is often impossible to bury the plate deep enough to insure the constant presence of moist earth, and the connexion of the conductor with the plate generally becomes impaired after the lapse of a few years.

Volume II. is devoted entirely to those prime essentials of every new country—roads and bridges. In forest lands, roads and paths are required for various purposes, such as the transportation of produce, ordinary traffic, and for the use of inspectors. The education of a forest engineer in road-making is naturally of far wider scope than that obtaining in settled countries like Great Britain, and includes the design of "fair-weather roads," "cart roads," "dragging roads," "camel roads," "bridle paths," and "inspection paths." The forest engineer must also be prepared to deal with streams crossing roads in places where bridges are not required, and to cope with various difficulties which are never encountered by road builders in civilised lands. The science of road-making is most thoroughly discussed by Mr. Rogers in Part III. of his manual, and the instructions there given cover all theoretical and practical points necessary for study. In treating of "Bridges," in Part IV., the most simple forms of construction are selected as examples, for, as a general rule, Indian forest officers are rarely required to construct bridges of large span, and, owing to the fact that forest produce is chiefly carted across the beds of torrential streams during the dry season, bridges are not often built even strongly enough to carry loaded carts. These being the prevailing conditions, the author devotes most of the present section to "simple wooden bridges" and "simple wire-rope bridges," the remainder being occupied with the description of elementary forms of the cantilever bridge and a brief discussion of masonry bridges and culverts. Those who desire more advanced engineering can easily obtain it in various excellent text-books, but it should be pointed out that these do not profess to convey the minute and practical instruction as to actual details which are to be found in the manual now before us. In Volume III. there is a very complete treatise on the "Transport of Timber and Firewood," in which are considered methods of conveying material on ordinary roads or paths, on rolling roads, sledge roads, and tramways, in specially-prepared troughs and slides, and by wire-rope ways, as well as by water. To all who are

interested in these various means of transport, we commend the careful study of the manual itself. The remaining portion of Volume III. contains adequate information relative to the construction and management of wells, the construction of dams, weirs, and water channels, the protection of river banks, and concludes with a description of the methods to be adopted for that most important branch of work—the demarcation of forests. In addition, there are six appendices to this volume relative to examples of sledge roads, forest tramways, wet slides, and wire-rope ways.

It would be difficult to conceive a more complete exposition of the many duties pertaining to the forest engineer than the present work, which, as we have already said, possesses distinct value to various sections of the community, other than that to which it is directly addressed. Although not intended as a substitute for existing text-books on civil engineering and building construction, the manual possesses a distinct sphere of usefulness, for it conveys what may be termed supplementary information, which, in many cases will enable landowners and occupiers to execute simple engineering works in places where they are compelled to rely upon their own resources. As a text-book, it will be found of much value to students, especially to such as desire to prepare themselves for constructional work abroad. From beginning to end the work gives ample evidence of the great care bestowed on the compilation and arrangement of the material, and the manner in which the task of the author has been accomplished deserves the highest commendation.

THE PLUMBERS COMPANY'S DIAGRAMS; for the USES of Classes of Technical Education for Plumbers. (Published by the Plumbers' Company.)

TRADE CATALOGUES.

THE United Telpheage Company, of New York, send us two circulars describing and illustrating some applications of the "telpher" system. Strictly speaking, the word "telpherage" designates all modes of transport effected automatically by the aid of electricity, but as used by the company mentioned above it simply denotes a particular system intended for the conveyance of materials and merchandise for short distances. The first illustration in one of the circulars shows the telpher with a coke-quenching basket over the quenching tank in a gasworks; the coke is pushed from the ovens into the basket, hoisted, conveyed to the tank, quenched, and conveyed to the coke pile upon which it is dumped. All these operations are controlled from the ground level, the load being 12,000 lb., the speed of hoisting 60 ft. per minute, and the speed of conveying 800 ft. per minute. In this case the track is carried on rigid steel supports, but in an installation illustrated on the next page a wire ropeway is employed. The same circular illustrates several ingenious variants of this system, and the second circular describes an extensive plant erected in America for transporting bags of cocoa beans from a storehouse to the mill situated on the opposite side of a river. The track is supported on solidly built frames of Georgia pine, except where it crosses the river by the aid of a steel girder bridge. A train consisting of three trucks, one with a motor cab for the driver, conveys the material at an average speed of 700 ft. per minute, and performs as much work in a day as formerly required the employment of many men and teams of horses.

Messrs. R. Johnson, Clapham, and Morris, of Manchester, send us their catalogue of the Johnson-Ammon steel wire concrete lattice, which is made in rolls 6 ft. wide by 120 ft. long, or in panels or sheets to specified size. Being formed of hard steel wire, about $\frac{1}{8}$ -in. diameter, this netting is extremely strong, and as it is supplied in rolls the cost of placing it in position for concrete-steel construction is small as compared with that of arranging separate rods or sheets. The lattice is quite suitable for almost all forms of concrete and plaster work. One illustration in the catalogue represents the laying of the Johnson-Ammon lattice at the

Savoy Hotel extension, where it has been extensively used for the reinforcement of concrete floors.

The Lucal Light and Heating Company, of Glasgow, send us a reprint of the report made by Professor Watkinson upon their system of oil firing, as applied to a marine boiler at the Princes Dock Power Station of the Clyde Trust. Three of the Lucal patent burners were fixed in each of the two furnaces of the boiler, and the fuel used throughout was blast furnace oil, containing only 17,600 heat units per lb. It appears that the combustion was practically perfect and almost smokeless. The oil was sprayed by means of a steam jet, 0.21 lb. of steam being required for each pound of oil consumed. The average effective evaporation was 13.65 lb. per lb. of oil, which, considering the low calorific value of the fuel, the temporary and somewhat imperfect manner in which the burners were applied, and the unfamiliarity of the operators with the working of the apparatus, must be considered as an eminently satisfactory result.

Correspondence.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

STR.—It has been found desirable to defer to a future date the Institute visit to Newcastle and the annual dinner, which were to have taken place early next month.

W. J. LOCKE (Secretary).

HAND-POWER MORTAR MILLS.

STR.—Can any of your readers give me practical information of the utility of a hand-power mortar mill? Would it be of use for making mortar with furnace ashes? What is its average output?

I only want the mill for small jobs; sand is very costly to get in this district. If any reader has had practical experience with a hand-power mortar mill, any information he can give on the subject will oblige.

The Student's Column.

NOTES ON PORTLAND CEMENT.

CHAPTER VIII.—HARDENING AND TIME OF SETTING.

HE setting of cement is its change from a fluid to a solid state. The time taken for this change is the "time of set." Just as the composition of Portland cement is very indefinite, so the cause of this change has not been determined. By some the hardening process is supposed to be a chemical combination; others believe it to be a physical process. In reality, only two substances take part in the hardening of cement—viz., silica and lime. All the other constituents, as alumina, oxide of iron, magnesia, etc., although each playing a part in the process of hardening, strictly taken, are not capable of hydraulic action with lime.

Dr. Michaelis, in a paper read before the "Society for the Unification of Methods of Testing Technical Materials," advocated the view of a physical process. He says, "In order to gain an insight into the process of hydraulic hardening one must study first the influence of hydrate of lime on hydraulic silica, then upon alumina and oxide of iron, which three substances have been designated by the general term 'hydraulic factors.'" Dr. Michaelis's arguments were founded on the following facts:—If dried hydrate of silica be mixed at the ordinary temperature with lime paste, in a few minutes the mass is observed to coagulate and then to harden; if strongly-ignited silica be mixed with lime paste, then after a longer time, but still within twenty-four hours, the mass is seen to coagulate and gradually harden. If air-dried hydrate of alumina or ignited alumina in fine powder be mixed with lime paste, similar coagulation and hardening takes place. Lime paste treated in the same manner with finely-powdered ferric hydrate acts in the same way, but in a slight degree.

If lime-water kept saturated by suspending a piece of lime in it be allowed to act on hydraulic silica, a hard shell of hydrosilicic acid and a soft core of hydrosilicic acid is obtained. Hydrate of alumina is acted on in a similar

manner, giving hydroaluminate of lime and a core of hydrate of alumina.

With ignited ferric oxide no action takes place, but ferric hydrate forms a white crystalline substance in which the lime is only loosely held, so that it is quickly decomposed by water. Polarised light shows the hydro-silicate of lime to be a structureless mass and not crystalline. The hydro-aluminate and hydro-ferrate, however, prove to be crystalline compounds. The hydro-silicate of lime strongly resists the action of water, especially if not too rich in lime. On the other hand, hydro-aluminate of lime and hydro-ferrate are very easily softened and decomposed by water. Silica is, therefore, not only the most essential but, strictly speaking, the only constituent of cement which can be looked on as the hydraulic factor.

Lime-water enables silica, alumina, and oxide of iron to take up water of hydration, which hydrates are very rich in water. For example, silica thus treated will form a compound $5 \text{SiO}_2 \cdot 3 \text{CaO} + 40 \text{H}_2\text{O}$, which when dried over sulphuric acid will give a compound $5 \text{SiO}_2 \cdot 3 \text{CaO} + 5 \text{H}_2\text{O}$.

Finely-polymerised alumina treated with lime-water and pressed shows a composition $5 \text{Al}_2\text{O}_3 \cdot 7 \text{CaO} + 58 \text{H}_2\text{O}$, and when dried over sulphuric acid $5 \text{Al}_2\text{O}_3 \cdot 7 \text{CaO} + 23 \frac{1}{2} \text{H}_2\text{O}$. Lime paste consists of different hydrates, from the monohydrate to that with $8 \text{H}_2\text{O}$.

The process which takes place, therefore, when silica, alumina, or oxide of iron and lime paste are brought together is that water of solution is taken up, producing coagulation or setting, but that possibly the silica takes up water from the higher hydrates of lime, penetrates the lime paste, and separates out monohydrate of lime. In this expanding action the silica especially must penetrate the spaces previously filled with water, and in so doing envelop the lime molecules. Thorough combination with water cohesion is effected, which is greater if the water is absorbed from the gelatinous polyhydrate of lime, and the fact that the stable monohydrate of lime separates out in the hydraulic hydrates combines with them ensures solidification.

Pure clay ($\text{Al}_2\text{O}_3 \cdot 2 \text{SiO}_2 + 2 \text{H}_2\text{O}$) is too stable a compound to be acted on by lime hydrate, but, if heated to cause partial dissociation, will harden hydraulically.

With Portland cement the hydraulic hardening is very much more complicated. When mixed with water the aluminate of lime sets first, and under the influence of the separated lime the process of hydration, as just explained, goes on. Cement is to be regarded as silicate of alumina decomposed by lime. The quick setting is caused by the aluminate of lime, which takes up water immediately, giving out much heat; the slow setting is caused by the hydration of the silica and lime compounds.

Dr. Michaelis says that "the setting is solely a process of water absorption; the real strengthening results first from the union of hydrate of lime with silica, brought about by surface attraction, and from the crystallising compounds of lime with alumina and oxide of iron. This process takes place gradually, in proportion to the swelling and filling up of the interstices on the part of the lime compounds formed. Hence it appears to be a necessity that the lime should be present in excess during the absorption of water, for, if the silica has only completed its hydration under the influence of lime solution, it furnishes only a soft water mass; if, however, during its hydration it is surrounded with solid monohydrate of lime it consolidates.

According to Zulkowski, who holds that the greater part of cement consists of metasilicate of lime, when the cement is mixed with water the metasilicate is decomposed with formation of monocalcium silicate and hydrate of lime as shown by the equation:—

The hydrate of lime causes the monosilicate to swell, and the increase of volume causes bending to take place.

According to Rebuffat, the chemistry of the hardening process consists in the hydration of orthosilicate of lime with production of a body having the following composition:— $2 (\text{SiO}_2 \cdot 2 \text{CaO}) \text{H}_2\text{O}$. Hydration of calcium aluminate at the same time takes place. The lime in combination with the orthosilicate is set free and forms crystalline hydrate of lime. Metasilicate when present does not hydrate, but

into combination with the aluminate of forming double compounds.

ording to Le Chatelier, the structure cement is that of crystallised hydrate in a mass of hydrated monosilicate $[(CaO SiO_2) 2.5 H_2O]$ formed from the um silicate thus:—

Chatelier also advanced the view that phenomena of supersaturation plays an ant part in the setting of cement—that hydrated compounds formed on addition r pass through a state of solution. When solution has become supersaturated, lication or setting takes place.

iewing the theories propounded it will ed that the views of the different exper- ers are founded on their ideas regarding omposition of cement. Le Chatelier s that tricalcium silicate is the chief out, Rebuffat that it is calcium ortho- , and Zulkowski metasilicate. For want of a purely chemical process, and on und of failure of all attempts to prepare ilicate of lime in the wet way, Michaelis d to the view that the hardening was f a physical process depending on surface ion, similar to the dyeing or tanning s.

as prepared animal skin precipitates b hydraulically-expanded silica separates hydrate of lime in itself, forming a hard ul glue.

METROPOLITAN ASYLUMS BOARD.

first meeting after the vacation of the gers of the Metropolitan Asylums Dis- was held on Saturday last week at the e of the Board, Victoria Embankment.

FIRE HOSPITAL.—The Hospitals Com- reported having considered reports by gineer-in-chief on the condition of the one and fire alarm systems at this al. The reports stated that the fire ystem at the Upper Hospital was of ewhat crude nature, and the engineer sed that there should be a central ind- board, and that each block should have connected therewith. The cost of the s was estimated at 350*l.*, and, on the mendment of the committee, it was id to carry out the necessary improve-

WESTMINSTER ASYLUM.—On the recommendation e Works Committee, it was agreed to a small scullery to the matron's new- ers at this asylum. The cost was esti- at 80*l.*

THE OAK SCHOOL.—Plans, prepared by the gineer-in-chief, and showing the additional e accommodation which it is proposed to le at this school, were adopted.

OBITUARY.

JAMES SELLERS.—On the 3rd inst. Mr. a Sellers, architect, of Bury and Rad- died suddenly at his residence, Sunny t, Radcliffe. The deceased had erected d of the public institutions of Bury.

GENERAL BUILDING NEWS.

ST. PATRICK'S CHURCH, KILCAR, IRELAND.—The new h, which has been erected at Kilcar, was d on the 4th inst. The building is ed in the Romanesque style. The al walling is of local freestone from Quarries, and the nave arcade is of ame stone. The church affords seating modation for some 1,200 persons. The is spanned by a timber barrel vault, ill be stained a clear malachite green ightly varnished, the principals being d out in cream colour for decoration. arcade consists of six bays of circular rches, carried on circular cut stone- s, with moulded bases, the capitals d with Irish interlaced ornament. The ws are filled with lead lights in Celtic s, made by Messrs. Ward, of Belfast. oofs will be covered with small, thick, rey-green slates from the Killarney es. A feature of the west front is the ed entrance doorway and the three-light w over it. Messrs. Harrison, of Dublin, the contractors for the altar rails, and s. Fagan, of Dublin, for the wrought-iron e. The high altar has been executed by s. P. Sheridan, of Dublin. The architects Messrs. Doolin, Butler, and Donnelly, of n, and the contractors Messrs. Campbell on, of Belfast.

REPAIRS OF PARISH CHURCH, ACLE, Lincs.—The reopening of the Acle parish y, after being restored, took place y. The outside of the roof has been

stripped and retatched, and the underside of the roof timbers have been clad with oak boarding, adorned with carved bosses and moulded oak ribs. The walls, windows, buttresses, and copings have been repaired, and the walls coloured inside. A carved oak pulpit on stone base has been placed on the north side of the nave. The work has been carried out from designs by, and under the superintendance of, Mr. Herbert Green, architect and diocesan surveyor of Norwich, and the contractors have been Messrs. Chaston and Grimson, of Loddon. The fabric of the tower and north porch needs repair, and is the next work to be taken in hand. The cost of the work now completed has been about 600*l.* The estimated cost of restoring the tower is 350*l.*, and the north porch 200*l.*

NEW BAPTIST CHURCH, NEWPORT.—A new Baptist church was opened on the 1st inst. in Llanthwy road, Newport. The building, consisting of a school-hall with classrooms, occupies a site at the corner of Spencer-road. Messrs. Habershon, Fawcner, and Co., of Newport and Cardiff, were the architects. The building is in the Early English style, and is faced with local stone and Bath stone dressings. The school-hall is 55 ft. long by 32 ft. wide, and two vestries or classrooms are provided on the same floor. The rostrum and other woodwork are in pitchpine, and under the rostrum a baptistry is provided. The windows are glazed with cathedral-tinted glass. The contract for the building amounted to 1,897*l.*, and has been executed by Mr. Charles Shapland, contractor, Maindee.

WESLEYAN CHAPEL AND SUNDAY-SCHOOL, BENTHAM, YORKSHIRE.—A new Wesleyan chapel and Sunday-school was opened recently at Bentham. The interior of the chapel has a length of 66 ft., a width of 35 ft., and a height of 36 ft. Accommodation is provided for 300 persons. There are two aisles, with an organ chamber and choir seats at the pulpit end. The schoolroom is 48 ft. long by 24 ft. 6 in., and is divided into six classrooms. The buildings have been erected from plans prepared by Mr. J. F. Curwen, architect, Kendal, and the contractors were:—Mason work, Messrs. Brassington, Settle; joiner, Mr. Brear, Morecambe; plumber, Mr. Greenop, Bentham; painter, Mr. W. Holmes, Bentham; slater, Mr. Jackson, Bentham; plasterer, Mr. Anderson, Morecambe. The cost has been 3,000*l.*

NEW SYNAGOGUE, BELFAST.—The consecration of the new synagogue at Belfast took place on the 31st ult. The building stands on a site in Annesley-street. Access is obtained to the ground floor through a vestibule with tiled floor and dado. The seats are arranged so as to face the reader's platform, which is octagonal on plan, and was formerly used in the old synagogue. Accommodation will be provided for 500 persons on the ground floor, with a gallery holding 200 in addition. Above the vestibule is a minor hall approached from the gallery staircase. A simple treatment of the early round arched style, with stone dressings sparingly introduced, has been adopted. Brick pilasters are placed between the windows. A dado of blue bricks is used along Annesley-street, and the main porch is of cut stone. The windows have leaded lights, by Messrs. Ward and Parkes. The internal woodwork is principally of pitchpine varnished. Messrs. Musgrave and Co. Ltd., have installed their low-pressure system of heating. The electric lighting has been done by Messrs. Smith and Parkes. Mr. John Dowling has carried out the plumbing work. Messrs. James Henry and Son, Belfast, have carried out the contract. The architects are Messrs. Young and Mackenzie, while Mr. B. S. Jacobs, Hull, has acted as consulting architect. The cost of the work has been about 3,000*l.*

MARISCHAL COLLEGE, ABERDEEN.—The new entrance gateway of the Marischal College is being decorated with a heraldic scheme which will illustrate the history of the separate colleges and the united university. Seven coats-of-arms have been cut in simple relief in granite. In the centre of the archway is the coat-of-arms of the Aberdeen University. On the left side of it is the shield of Bishop Elphinstone, the founder and first Chancellor of King's College, the older of the two foundations, with the motto "Non confundar." On the right of the centre are the arms of George V., Earl Marischal, and his Countess, Margaret Home, the founders of Marischal College, the junior of the two foundations, of which the Earl became first Chancellor, with the motto "Veritas vincit." Above the shield is placed an earl's coronet. To the left of the Elphinstone shield are the arms of Old Aberdeen, the site of the older foundation, with the motto "Concordia res parvæ crescit." To the right of the Earl Marischal's arms are the arms of Aberdeen, the site of the younger foundation, with the motto "Bon-Accord." Then, to the left of the Old Aberdeen shield,

are the arms of Lord Strathcona and Mount Royal, the present Chancellor. The coat-of-arms has a baron's coronet above it, while below is the motto "Agnina duens." To the right of the Aberdeen shield is the coat-of-arms of the late Dr. Charles Mitchell, the greatest of recent benefactors to the university; above it an esquire's helmet, and below the motto "Spernit humana." Returning to the centre, there is the coat-of-arms of the united University of Aberdeen—quarterly, first King's College, second the Earl Marischal, third Bishop Elphinstone, and fourth Aberdeen, with the motto "Initium sapientiæ timor Domini." The whole of the interesting heraldic scheme was carried out from designs by Messrs. A. Marshall Mackenzie and Sons, architects, under the suggestions of Mr. P. J. Anderson, LL.B., librarian to the university.

PUBLIC BATHS, MANCHESTER.—Plans have been prepared by Mr. H. Price, the City Architect, for the proposed new baths which are to be erected on a site between Ashton New-road and Ashton Old-road, in the Bradford Ward, Manchester. The first-class males' swimming-bath will have a water area of 75 ft. by 30 ft. Along the gangways will be fifty-eight dressing-boxes. The second-class swimming-bath will have an area of 75 ft. by 35 ft. There will be seventy-seven dressing-boxes, and at one end of the bath there will be a dressing-room for children. Connected with each bath there will be the usual foot-baths and shower-baths. The wash-baths will be on the respective balconies, and there will be twenty-four first class and twenty-six second class. A further provision is a bicycle-room in the basement, which will be approached by means of an inclined way. There will be one swimming-bath for females, with a water area of 75 ft. by 30 ft., and fitted with sixty-five dressing-boxes and foot-baths and shower-baths. On the first floor over the entrance will be six first-class wash-baths, and on the balcony around the swimming-bath twenty-seven second-class wash-baths. To each set of wash-baths a toilet-room will be provided. The proposed buildings also include a public hall, 87 ft. by 50 ft., with seating accommodation on the ground floor for over 800 persons, and extensive platform. The gallery will seat eighty-one persons. Adjoining there will be a crush and lounge hall, 76 ft. by 21 ft. The large hall will have three extra exits at different parts. There will also be two ante-rooms. On the first floor there will be a room 42 ft. by 27 ft., which may be used for various purposes. A conspicuous feature of the new buildings will be a chimney 120 ft. high.

LIBRARY AND TECHNICAL INSTITUTE, BELFAST.—At the meeting of the Library and Technical Instruction Committee, held in the Town Hall, Belfast, on the 1st inst., a report was submitted by Mr. Samuel Stevenson relative to the progress of the new municipal technical institute. The following is an extract from the report:—"The contractors have now raised the building up to the level of the fourth story, and this means that they have built two storeys during the past nine months, or, in other words, 20,500 super. ft. of facing. The majority of the joists of this floor are laid, and a considerable portion of the concrete, the large beams over the central hall are in their places, and the joists on, and preparations are advanced for concrete, the principals for the chemical laboratory over same are all ready, and I hope that these will be in their places and the roof covered in by Christmas. The contractors have a large portion of the stonework for the fourth story ready to set. There has been a difficulty in procuring a number of large stones for angle pilasters, but this has been got over, and a cargo of large stones is expected in a short time. I may say that I visited the quarries to the north and about this morning. The floors of all the different stories are laid with concrete, and also the staircases, and this will much shorten the completion of the building when the roof is on. The caretaker's house is completed, and the asphalted roof over same, and hoiler-house, etc., are now being completed. For the past six months or so a part of the ground floor on the south side has been occupied by classes, and I expect that a much larger portion also will be completed, and will be ready for classes on September 7."

NEW BANKING PREMISES, DUBLIN.—The new premises of the Northern Banking Company in Grafton-street are now nearing completion. The frontage of the building is about 65 ft., and the height of the stonework is 73 ft. The building, which will include the bank proper, manager's house, and bank chambers, is a classic design with a Corinthian order. The hall is laid with mosaic, and a stone staircase leads up to the upper portion of the building. The work has been carried out by Messrs. Henry Laverty and Son, contractors, from the designs of Mr. W. H. Lynn, architect, of Belfast.

PUBLIC LIBRARY, BRANKSOME, DORSET.—The new library at Branksome was opened a short time ago. The building is situated at the corner of Shillito-road and Lake-road, on a site measuring 181 ft. by 102 ft. The exterior dimensions of the building are 69 ft. by 42 ft., and the ground around the building will be laid out as gardens. The exterior is faced with Milton brick, with Bath stone dressings, and the roof is of brown tiles. The entrance doors of panelled oak open into Lake-road. The hall, which is entered through swinging glass doors, is 66 ft. long by 26 ft. wide. The librarian's desk and enclosure faces the entrance, and on the left hand is the general reading-room, about 28 ft. square, and on the right the juniors' reading-room, 28 ft. by 16 ft., with the lending library at the rear, containing shelving for 6,000 volumes. Behind the central desk is the reference room and the librarian's room, with offices adjoining. The interior is arranged as one large hall with panelled roof, with dwarf glazed partitions, forming the separate departments. The architect was Mr. S. J. Newman, the District Surveyor, and the building has been carried out by Messrs W. E. Jones and Son, contractors, of Bournemouth.

NEW COUNCIL BUILDINGS, COWDENBEATH, N.B.—A site has been secured in High-street, Cowdenbeath, for the erection of new town council chambers. The property will have a frontage to the street of 52 ft., while the first floor will provide for the town clerk's private office and general offices, and the burgh courtroom, 29 ft. by 15 ft. Attached to the courtroom is the magistrates' apartment, while accommodation is provided for witnesses. A staircase leads from the centre of the entrance hall to the first floor, which is occupied by the council chamber, measuring 29 ft. by 22 ft. There are also offices and committee rooms. A heating chamber is situated in the basement. The front of the building will be finished in Dunfermline granite. The contractors for the various works are:—Mason, Mr. John Summerville, Cowdenbeath; joiner, Messrs. Bogie and Nicol, Kirkcaldy; plumber, Mr. Sidney Binning, Cowdenbeath; slater and plasterer, Messrs. John Paul and Sons, Cowdenbeath; tile work, Messrs. Haddow, Forbes, and Co., Edinburgh; steel work, Messrs. Blayden and Co., Glasgow; glazier, Messrs. John Haxton and Co., Kirkcaldy. The architect for the work is Mr. T. Hyslop Ure, of Dunfermline.

STAINED GLASS AND DECORATION.

NEW WINDOW, WELLINGTON CHURCH.—On the 17th a new east window at this church was dedicated. It is a three-light window, with a figure of Christ in the centre light, and figures of St. John the Baptist and the Prophet Isaiah. The left light contains the New Testament saints—St. Matthew, St. Mark, St. Luke, St. Mary Magdalene, St. Elizabeth, St. Peter, St. Paul, and St. John, with the Virgin Mary, while in the right light are Old Testament figures—Aaron, Daniel, Elijah, Joshua, Jacob, David, Abraham, Noah, and Moses. The window was designed and executed at the studio of Messrs. Mayer and Co., London.

SANITARY AND ENGINEERING NEWS.

THE WATER SUPPLY OF THE HARTLEPOOL.—The Hartlepool Gas and Water Company obtained powers a year or two ago to carry out considerable works for giving additional water supply to East and West Hartlepool, and have spent 68,000*l.* on the extension of works supplying water for commercial purposes, the other portion of the work being the enlargement of the storage for the West Hartlepool domestic supply, together with an additional pumping apparatus, and a new engine and engine-house. The new storage reservoir for the trade supply, on a site at Crookfoot, has a storage capacity of 200,000,000 gallons. A five-mile conduit will convey the water to the towns. The construction of the reservoir was carried out by Messrs. W. and J. Foster, of Hingley, at a cost of about 160*l.* per million gallons. The works were designed and carried out by Mr. Charles R. Fenwick, of Leeds, Mr. F. W. Sutcliffe having charge as resident engineer. For the domestic supply of West Hartlepool the bore-holes at Dyke House quarry, which are carried down into the limestone rock, give a supply sufficient not only for present requirements, but for those of a considerably increased population. By deepening the brick culverts running alongside the bore-holes and into which the water is discharged, additional storage is provided for a quarter of a million gallons. The work could only be carried out slowly, much of it having to be done under water. The contractors were Messrs Sudron and Laycock. The new pumping engine, working at twenty-seven revolutions per minute, is capable of

delivering into the storage tanks 200,000 gallons per hour, but the speed can be increased when requisite. The contractors for the whole of this apparatus were Messrs. Worth, Mackenzie and Co., of Stockton, all the work connected with the building and foundations having been carried out by Mr. H. S. Sudron, contractor, Hartlepool. The West Hartlepool extensions were designed and carried out by the company's engineer, Mr. Thomas Bowser.

FOREIGN.

FRANCE.—The Department of "Assistance Publique" has commissioned M. Roty, the celebrated artist in medal engraving, to produce a medal with on one face an allegorical group representing "La Bienfaisance confiant l'Humanité à l'Assistance Publique"; the other face to show a cartouche intended for the name and titles of the recipient of the medal.—M. Weerts, the painter, has been commissioned by the State to decorate the grand staircase of the Ecole des Ponts et Chaussées, in the Rue Saints-Pères. The scheme of decoration will include three vertical mural panels and a large ceiling panel, with allegorical figures symbolising Electricity, Navigation, Bridges, and Railways.—A new building is to be erected at Toulon for the Institute of Health there, at an estimated cost of 123,000 francs.—M. Sonnet, architect, of the town of Condé-sur-Noireau, has been commissioned to build a group of schools there, at an estimated cost of 118,000 francs.—A new *Mairie* is to be built at Saint-Just (Marne). M. Clement is the architect.—M. Gérard, architect, of Bordeaux, has been elected President, for 1904-1905, of the "Société des Architectes de Bordeaux et du Sud-Ouest." The Prefecture at Quimper (Finistère) is to be rebuilt from the designs of M. Vally.—The fine Hôtel de Ville at Tours, built from the designs of M. Laloux, was formally opened on Sunday last.—M. Homolle has sent a communication to the Académie des Inscriptions to the effect that he has discovered at Delos a splendid mosaic representing Dionysos armed with a thyrsus, and riding on a tiger. The work is judged to be of the date of about 300 B.C.

GERMANY.—The new Protestant church which was consecrated on the 31st ult. at Speyer has been erected by contributions from Protestants throughout the world in memory of the protest entered by the minority of the ancient German Diet on April 19, 1523, against the repressive policy of Charles V. which had been ratified by the majority of the Reichstag. The edifice is Gothic in style, and has been built after the designs of the architects, Flügge and Nordmann, of Essen. It has a length of nearly 79 yds., while the transepts are 45.85 yds. in breadth. The interior height of the central cupola is over 78 ft., while the tower which surmounts the porch has a height of over 327 ft. The whole edifice is constructed of grey sandstone, and in the porch already mentioned is a statue of Luther trampling, Bible in hand, upon the Papal bull. In the choir are stained-glass windows, the gift of the present Emperor.—The first premium for plans for new schools at Vegesack, near Bremen, has been awarded to Herr Lang, of Geestemünde.—A number of artists in Dresden have formed a Society of Artists for the Erection of Monuments, the aim of which is to enable the architect and sculptor to work together, each performing his portion of the work in such a manner that the unity of the whole design is preserved.—The Protestant Church at Speyer, which has been in course of construction since 1890, was consecrated on August 30; the church was designed by MM. Flügge and Nordmann.—The first Great Rhine-land Art Exhibition will be opened at Cologne on June 1, 1905.—A new synagogue is in course of construction at Berlin, from the designs of MM. Hoeniger and Sedelmeyer.—The Lutheran Church at Krefeld, designed by Professor Arnold in Romanesque style, is completed.—A new hospital is to be built at Munich, from the plans of Herr Schallner.

SWITZERLAND.—The ancient church of St. Martin, at Sempach, is being restored; the central aisle and the tower date from the Romanesque period, whilst the choir and other portions date from the XVIII century. On examination of the walls three different layers were discovered, each covered with paintings in the manner of its time.—The Town Hall at Bern, which has been rebuilt by Herr Wacker, was declared open on June 25.—The church at Rorschach, designed by Professor Müller, of Zurich, was consecrated on June 5.

THE TRANSVAAL.—The prevailing depression does not seem to affect materially the progress of building operations in and around Johannesburg. During the second quarter of

this year the Municipal Council passed for buildings to the approximate value 418,275*l.* The actual number of plans approved was 583, and represented 1,489 building alterations, and additions, with accommodation for 4,943 persons. To detail the items, there were 403 dwellings, 314 additions and alterations to dwellings, 563 rooms, 132 sheds, 100 stables, 106 shops, Johannesburg municipal, of course, takes the lead in building operations; but active work is also proceeding in the Vrededorp, Doornfontein, Bell-jeppes, and Turfontein districts. For fortnight ended July 25, 107 plans were proved. It is estimated that the building provided for under these plans will accommodate 575 persons, and the estimated cost, 86,000*l.*—*African Review.*

SYDNEY.—The design and tender of M. J. Stewart and Co. has been accepted for a new bridge over Sydney Harbour. It will be of the cantilever type, the main span 1,350 ft., the northern shore arm of the cantilever 530 ft. long, and the southern shore 500 ft. long. A trial cylinder has been taken to a depth of 90 ft. at the site of the northern pier to test the strata below the harbour, with the result that it has been decided to take the foundation down to the rock, and is proposed to form an island by filling a short distance above high-water mark, then to freeze the whole of the material lying the rock, so as to form a solid water-tight cylinder from the surface to the rock.

TRANSVAAL.—The new port of Famaagust approaching completion. The work has been carried out by Messrs. Wills and Co., of London, under the direction of Mr. H. resident engineer. In connexion with the port a small rail (or rather tram) way is being constructed through the length of the island, chiefly for the grain trade; but also hoped that the two improvements of island and tram may open the country to the world. Its natural beauties and archaeological treasures have only to be a little better known and tourists would flock to the shores of this enchanting island. The original estimate for Famaagust Harbour, made by Messrs. C. and Mathews in 1899, was 124,000*l.*; the way was estimated at 130,000*l.*; but it is understood the works are being carried out on a very much smaller scale.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—Mr. W. J. Laper, architect, has removed from 1, Raymond-buildings, Gray's Inn, to 1, Melina-place, St. John's Wood, N.W. Messrs. Benham and Sons are removing their showrooms from Nos. 50 and 52 to No. Wigmore-street, W.

THE ST. LOUIS EXHIBITION.—From the 25th inst. there is to be an International Congress of Arts and Science held at the St. Louis Exhibition. The organisers of the Congress desire to invite special attention to the opportunity which it offers their affects to meet and hear a great number of eminent men of learning. It is expected more than three hundred eminent scholars from Europe and America will deliver discourses on the various departments and sections of Congress, and that many hundred scientific communications will be made by those present.

THE RUSKIN MUSEUM, SHEFFIELD.—The annual report of the Ruskin Museum Committee states that the museum was open 615 days during the official year, and the total number of visitors was 47,357, as against 58,325 the year before, a decrease of 10%. This large difference is attributed to abnormal attendance during the holidays and Coronation festivities of 1902. During the past year the special exhibition took the form of a series of examples illustrative of the work of the old Italian masters, copied by artists who had worked under Ruskin. The examples proved a great attraction, and were thoroughly appreciated by many students and visitors throughout the year. A Supplementary Catalogue with descriptive notes was issued, two illustrated lectures were given by the curator on the collections. The museum was open during the winter months in connexion with the Free Public Lecture Scheme inaugurated two years ago. The lectures given by the curator last season were "Two lectures on the old Italian masters—'Florentine Painters' and 'Venetian Painters'—and three lectures on the art practice of John Ruskin—'Early Drawing—'Drawings for Illustration,' and 'Illustrations.' The lectures were illustrated by specially prepared lantern slides of the paintings and drawings, and five hundred tickets for the series were issued during the season, the lecture room being well filled on each occasion. An additional cast of the slides taken under Professor Ruskin's supervision

orative work of the Acanthus Arch of St. Mark's Cathedral, Venice, has been placed in a suitable case and placed in the gallery. During the year the buildings have been thoroughly overhauled and are now in a state of good repair. In addition to the collections, the following are of special note:—The volumes to date of the Library Edition of the works presented by Mr. George the literary executors under the late Professor Ruskin; a beautiful precious opal in the matrix and a set of Ruskin plates by Mr. George; reproductions of prints in the British Museum sent by the trustees; and the Medal in bronze, presented by Mr. Dyson, of Sheffield.

RAILWAYS AND LIGHT RAILWAYS.—We have the official circular for August of the Light Railways Association. It contains a copy of an interim report on machinery by the Engineering Committee, and also a series of answers to which will be of value to the Association. Their offices are at Clun Street, Surrey-street, Strand.

IMPROVED FELT.—Judging by samples sent by the manufacturers, the Patent Cloth Company, of Leeds, we believe intensive use will be made of the new felt now being introduced and manufactured in this country under the name of "watered felt." This is a cheap form of felt subjected to hydraulic pressure, the surface being impregnated with chemical solution intended to prevent the penetration of water and grease from above, and the surface of the felt with oil for the purpose of preventing the entrance of moisture from below. As we are not acquainted with the details of the chemical and special oil employed in the preparation of the felt, it is difficult to pronounce any opinion as to its efficiency, but the physical properties of the material itself appear to be satisfactory. In this connexion we may mention the mean results of some tests conducted by Messrs. Kirkaldy on three specimens of the felt. The original thickness was $\frac{1}{16}$ in., which was reduced, under a graduated compressive load, to $\frac{1}{32}$ in. on a load of 2,000 lb. per sq. ft., but on the removal of the load the thickness was found to be $\frac{1}{16}$ in., thus giving evidence of considerable elasticity. The felt is produced in a variety of degrees of hardness, and in different thicknesses, to suit various requirements. It is used in the construction of tramway rails, for minimising vibrations and partitions, and upon floors, for preventing the conduction of sound and heat, and for preventing the percolation of water, and is used in the construction of fireproof rooms and chambers for various purposes. It would be too much to say that any material impregnated with oil as fire-resisting properties, the absence of which militates somewhat against the adoption of this felt in building; but, even with this limitation, it is many purposes for which it may be profitably employed.

ANNUAL EXPLORATION FUND.—The annual meeting of the subscribers to the Caerwent Exploration Fund was held on the 1st inst., Mr. Martin, the reorganising president. Mr. Martin, the reorganising president, had been re-elected, and there was now only sufficient money to defray the expenses of the week's work. Mr. Swash stated that the report of the Corporation had again promised a contribution of 25l., and Mr. Ashby read a statement that the British Association had granted a special grant of 15l. to be expended on the exploration of the mound and of the objects of investigating, by an examination of the earth taken from the plant life of the Roman-British Museum, and works were afterwards inspected. Mr. Ashby, describing the found inscribed stone, the large houses are now being explored, and the very fine south gate, the complete excavation is prevented by the presence of the following special grants have been granted:—The Society of Antiquaries, 25l.; and Gloucester Archaeological Association, 50l.; Bath Club, 50l.; Iffon Antiquarian Club, 50l.; Monmouth and Caerleon Antiquarian Association, 25l.; Rhondda Antiquarians' Association, 50l.; Woolhope Club, 25l.; and the Cardiff Naturalists' Club, 15l.

GRANITE TIMBER FOR THE UNITED STATES.—Mr. W. Wardrop, writing from St. Petersburg, July last, states that the United States is Russia's best customer for timber, and supplies about one-quarter of the amount imported into the United Kingdom. The annual value of the trade is 1,000,000l. The export from Cronstadt

and St. Petersburg in 1903 was well above the average for the last ten years, and was only exceeded in 1901; more than three-fifths of it went to Hull, London, Leith, Crangemouth, and West Hartlepool; prices were, on the whole, higher than they had been for some years. From Finland the export of sawn wood is almost the same as in 1902, but there has been an enormous increase in logs and pit-props, the quantity of which has doubled. The Finnish Senate has authorised the exploitation of the forests in the extreme north of Lapland in an area of 2,500,000 hectares (about 6,200,000 acres), and it is proposed to begin by cutting down 8,000,000 to 10,000,000 trees.

NORWEGIAN STONE EXPORTS.—The export of granite from Norway was somewhat larger in 1903 than in previous years, but the prices were low. The export of hewn stone from Christiania is only an insignificant portion of the country's total export. The principal centre of the stone trade is in the southern part of Smaalen; in these quarries, however, Christiania capital is closely concerned. The value of the country's total export of granite in 1903 is estimated at something exceeding 165,270l., against 137,725l. in 1902. Of this sum the United Kingdom is the largest contributor, whilst Germany takes less each year, owing to Swedish competition. The three principal exporting places for hewn stone are, in order, Fredrikstad, Fredrikshald, and Sarpsborg.

DANTZIG TIMBER TRADE.—The timber trade of Dantzic, Mr. Consul Brookfield reports, has not yet quite recovered from the general depression of 1901, and shippers still complain of unremunerative prices. Owing to a deficiency of water in the Vistula, supplies from Russia reached Dantzic later than usual, and thus prevented some shippers from delivering their orders at the stipulated time. In August, too, the British demand for Dantzic wood began to slacken, and stocks accumulated accordingly. On the whole, however, there was plenty of activity in the timber trade. The supply in 1901 was 315,450 loads, valued at 661,355l.; in 1902 it was 191,450 loads, valued at 443,630l.; and in 1903, 308,450 loads, valued at 730,720l. In another part of his report Mr. Brookfield explains that the kind of wood most in demand for the British market was oak for railway sleepers.

ARTESIAN WELLS IN ALGERIA.—The sinking of artesian wells in Algeria goes on quietly, but continuously, in the south, and the efficacy of the work is said to be gradually changing the face of the country. Where nothing grew twenty years ago are now flourishing oases, planted with date palms, bringing riches to a people who formerly lived on what they could. An account recently published by the Algerian Government contains the following information:—The total depth bored in the province of Constantine from June 1, 1855, to June 1, 1902, represents 38,702 metres (126,943 ft.), divided as follows—360 trials of a total depth of 27,919 metres gave 435 beds of ascending water and 568 beds of gushing water, delivering together 352,000 cubic metres (840,782,000 gallons) of water per twenty-four hours; 257 trials for drinking water, representing a depth of 4,904 metres, gave 133 beds of ascending water, drinkable, and twelve beds of gushing water, the total delivery per twenty-four hours being 1,200 cubic metres (4,622,100 gallons); 177 trials for ordinary wells and forty trials of the strata for the foundations of bridges gave together 229 beds of very drinkable ascending water and three beds brackish. The very successful results obtained in Algeria in places where nothing on the surface denoted the existence of underground water may, it is suggested, be useful to countries where water is not visible on the surface. The bed of water has been struck at very different depths—from 79 to 150 metres. The subterranean water contains fishes, which have been thrown up through the boring tubes—they are quite blind. Fossils of all sorts have also been thrown up.

INSANITARY HOUSES IN HULL.—According to the report of the Medical Officer of Health, twenty-nine slum dwellings were demolished in Hull last year. Systematic inspection resulted in eighty dwelling-houses being reported upon as unfit for habitation and their owners being served with statutory notices. Only about twenty of these were repaired. Of the remainder, twenty-nine have been demolished and the sites cleared, and thirty-one converted into warehouses. Only in four cases, however, were legal proceedings instituted for the compulsory closure of the property.

PAN-CELTIC CONGRESS.—On the 31st ult. Sir William Prece presided at the afternoon section meeting of this Congress, which was devoted to papers and discussions on Celtic costumes, customs, and folk-lore. In the course of his presidential address, on "Egyptian and Celtic Lore and Worship,"

Sir William Prece said that there was a remarkable connexion between the religions, language, customs, and rites of the Ancient Egyptian and those of the Ancient Briton. Tacitus mentioned the mysteries of Germany as being similar to those of Egypt and Britain. Professor Rhys had shown, in his "Celtic Britain," that the Druids were so like Egyptian magicians that an old Irish writer called James and James Egyptian Druids. Not much was known of Druidism, for the early Celts had no written literature, for they adopted a literature they used the Roman script. The Ogam inscriptions were comparatively modern. Cæsar, Diodorus, Strabo, Tacitus, and Pliny wrote much about the Druids, who were the priests, judges, doctors, teachers, philosophers, scientists, and magicians of the Celts. They knew astronomy. They worshipped the Supreme Being, and they made the oak His symbol. Their only temple was an oak grove, an oak tree being their holy of holies. It was regarded not only as the emblem, but as the temporary residence of God, as Moses regarded the tabernacle in the wilderness. This was essentially an Egyptian idea. Every Egyptian temple had an inner sanctuary, the holy of holies, where the Deity was supposed to reside. The Druids taught an eternal life, and, like the Egyptians, believed in the resurrection for which they prepared. Professor Rhys had pointed out that the Celtic language was full of a pre-Aryan influence, and Professor Morris Jones had dealt ably with the pre-Aryan syntax in insular Celtic. The aborigines of Wales were probably savages, but they were ousted by the Iberians, who came there through Gaul and Spain from North Africa. The Celts and the Berbers were their survivors to-day in and near Egypt. Ethnology proved this by the shape of the skull, and philology confirmed it by the similarity of language. Ancient Egyptian agreed very closely with this pre-Celtic dialect, not only in the order of words in a sentence, the peculiar personal suffixes, the periphrastic conjugation of pronouns and propositions, the mode of word building, but in the remarkable use of letters and single syllables which had no equivalent in English and an apparent system of mutation. In many cases the coincidence was absolute. The verb in these languages came before the subject. This was not the case in any Aryan tongue. It is impossible to ignore this remarkable connexion or to resist the conclusion that Welsh and Ancient Egyptian were closely allied. The Eastern influence was seen in the formation of personal names. There was more that was Semitic in that practice than Aryan. The Aryan practice, as seen in Greek and Latin and continued in modern Europe, was quite different. Professor Rhys had said, "No evidence could well be more conclusive as to the former presence in these islands of a population of natives of non-Aryan origin." One more link—the Aryan race had been everywhere patriarchal, but the Berber and pre-Aryan race in Britain were matrilineal. The Pharaonic system of marrying one's sister led him to think that the matrilineal system existed in Egypt. When the king died in Berber or was deposed—a common occurrence—it was not his son who succeeded him, but the son of his sister. Again, the dress of the Druid and Egyptian priests were somewhat similar. Both rituals had mystic dances and arks or boats in their religious processions. The Druidical ark was a symbol of the Deluge and was undoubtedly Aryan in its origin. Like the Egyptians, who worshipped the bull, the Druids had Hu, the Royal bull, and Beuno, the ox of the ship, and both the Ancient Britons and the Egyptians worshipped the eagle and the wolf, rites which had, according to Davies, passed from Egypt, through Phrygia and Greece, into Etruria and Celtia.—*Times*.

THE SIMPLON TUNNEL.—Mr. Towsey, British Consul at Milan, in a communication to the Foreign Office, published on Monday last, observes:—"Reports from Domodossola state that 19,304 metres of the Simplon Tunnel had been pierced by August 1, that the daily progress made throughout the month of July was 670 metres, and that the total pierced in that month was 209 metres. On August 1, 426 metres had still to be pierced, but this had been reduced to 377 metres by August 7. Work has been suspended on the north side since last May, and has had to be carried on from the south side. It is now expected that the tunnel will be completely pierced by the middle of October, 1904, but naturally it cannot be opened to traffic before next year. The exhibition which was to have been held at Milan in 1905 to celebrate the opening of this tunnel has been postponed to 1906. Another international section has been added to those previously announced. It is described as a 'working hall for industrial arts,' and divided into the following categories:—(1)

Graphic arts and the manufacture of artistic and decorative paper; (2) artistic manufacture of metals and wood; (3) ceramic, pottery, glass; (4) textile industries and allied manufactures; (5) wallpapers, tapestry, worked and decorative leather, wall hangings, etc.; (6) industrial arts generally."

PRESERVATION OF TINTERN ABBEY.—The preservation of the east window of Tintern Abbey, which is part of a scheme for the general overhauling of the whole ruin, is now being carried out. Examination of the central shaft has shown that the stone has been so much affected by the weather that if it is taken down it is doubtful if it can be put up again. What shall be done is still under consideration, one project being to strengthen it by the addition of narrow steel bands placed close to the stonework. The other work of preservation takes the form of pointing the ashlar in many places and filling in the gaps between the masonry on the exposed summits of the walls either with cement or lead, for this will prevent the percolation of the rain. Above the east and west windows at the extremities of the nave are gables, pierced with smaller Gothic windows. These also are all being pointed, and any loose pieces of masonry will be fixed. The mullions and tracery of some of the windows to the south of the nave have been already strengthened. The work is being carried out after consultation with Mr. Waller, architect, of Gloucester.

Legal.

THE WEST-END ANCIENT LIGHT CASE.

In the Vacation Court on Wednesday the case of Milton v. Maskelyne was again in the list for hearing before Mr. Justice Bigham.

On the case being called on, counsel stated that the parties were gradually coming to an agreement, and they desired that it should stand over for one week.

His Lordship acceded to the application, remarking that it was time that the case vanished from the list.

ANCIENT LIGHT DISPUTE AT HADLEY.

The case of Scrivener and others v. Ager came before Mr. Justice Bigham in the Vacation Court on Wednesday on an application by the plaintiffs, the freeholders and occupier of No. 184, High-street, Hadley, near Barnet, for an interim injunction restraining the defendant until the trial from building on the site of No. 182, High-street, Hadley, so as to obstruct the light coming to an ancient window in the plaintiffs' premises.

In the result His Lordship directed that the motion should stand over until the trial, the costs being reserved.

PATENTS OF THE WEEK.

APPLICATIONS PUBLISHED.*

28,232 of 1903.—W. SHREVELL: *An Outward Opening Casement.*

An outward opening side-hung casement provided with extended or outwardly projecting joints or hangings, which, when open, create a space or opening between casement and frame, through which the outer side is easily accessible from within.

19,102 of 1903.—C. VON PECHY: *Locks or Fastenings for Doors.*

A lock or fastening for doors adapted to be opened or closed from a distance, comprising, in combination with the usual lock case and staple plate, a latch guided by a roller projecting through a horizontal slot of the latch, an angle lever pivoted in the lock case, a horizontal stud projecting from the end of the vertical arm of the lever and engaging with a vertical slot of the latch, a weight at the end of the other arm of the angle lever, a cord attached to the same end of said lever guided over rollers to the place from which the door is to be opened, a knee-joint arm projecting from the inner surface of the weighted arm of the angle lever, a casing in the lock case above the latch, a spoon-shaped bucket, pivoted in said casing, a loose ball in said bucket, an opening in the front wall of said casing, an arm of the knee-joint projection of the angle lever reaching behind the bucket and a blade spring above the casing to press on the angle lever when it is lifted.

19,559 of 1903.—A. P. TOWL: *An Adjustable Bracket for Shelves or other purposes.*

An adjustable bracket for supporting a weight, consisting of a socket or sleeve portion adapted to embrace the whole or a part of the section

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

of a standard, and slide thereon, and an outwardly-extending pivoted arm, which latter, at a point below the pivot, short of the elbow, is adapted to press on the surface of the standard through the medium of an interposed roller, block, ball, or other distance piece, and cause sufficient friction to prevent the downward movement of the bracket.

19,564 of 1903.—W. H. HOYLE and T. BARKER: *Hydraulic Appliances for Opening and Closing Gates and other Movable Structures which are acted upon by Hydraulic Rams or Pistons.*

The object of this invention is to dispense with the usual levers, connecting rods, and valves, and to substitute therefor a four-way valve with suitable inlets and outlets. In carrying this invention into effect a plug tap or valve is used with four portways, the said portways being formed in the plug at equal quarters of a circle in the periphery of the plug; the first portway leads to the second portway by a curved passage formed in the inner part of the plug or valve, thus forming a passage from the first to the second portway. A similar passage is also formed from the third portway to the fourth portway. The valve casing or valve body is formed with four ports, corresponding with the four ports in the plug.

20,438 of 1903.—E. R. FAWCETT: *Appliances for the Prevention of Hoist Accidents.*

This consists in the combination of two flaps or doors, one hinged or pivoted, to the hoist floor, and the other hinged or pivoted to the floor of the room, and placed in juxtaposition to each other.

20,504 of 1903.—W. C. HODGSON: *A Lifting Apparatus.*

A portable lifting apparatus, consisting of a wheeled frame supporting a pair of vertically-disposed tubes, one situated within the other, the inner of said tubes being adapted to be raised and lowered and maintained at any desired position, and having pivotally connected at its upper end a lifting arm, pole, or lever, provided with a hook or the like at one end, and a handle (with or without a balance weight) at the other, said lifting arm or the like having a series of holes formed therein for the object of adjustment.

20,517 of 1903.—C. McCALLUM and J. McGRUTHER: *Fixing of Pulleys, Electric Wires, and such like to Ceilings.*

Fixing electric wires, pulleys, and such like to ceilings, consisting in an attachment composed of an inverted dome or cup-shaped piece of metal formed with pointers and counter-sunk holes for fixing it to a ceiling, and having lateral or circumferential holes or apertures and a central hole for the insertion of the electric conductors for suspending an electrolier or lamp, or adapted for a pulley screw or screws in use with laundry bolts.

20,852 of 1903.—J. SOSS: *Hinges.*

A hinge comprising three parts, one of which consists of a plate having a longitudinal opening in one edge thereof and an oblong member arranged transversely therein and connected at the ends thereof with said plate, and a convex in cross section on one side and plane on the other, the convex side of said member being provided at the opposite ends thereof with segmental shoulders or projections having segmental grooves in the opposite faces thereof, and said member being also provided adjacent to one edge thereof, and on the convex side thereof with lugs or projections; another part consisting of a plate provided with a longitudinal opening in one edge thereof, and with an oblong member secured therein, and said member being segmental in cross section and provided at its opposite ends and on its concave side with segmental shoulders or projections, in the opposite face of which are formed segmental grooves, said member being also provided on its concave side and near the edge thereof with lugs or projections; the other member consisting of an oblong plate segmental in cross section and thickness at both ends and provided in each end with a segmental groove, said parts being connected and adapted to turn one upon another.

21,533 of 1903.—W. PEMBERTON and J. DYSON: *Boilers for Hot Water Heating Apparatus.*

This consists in the combination with a boiler for hot water heating apparatus of a vessel containing water heated by a flue from the boiler furnace connected to an internal flue or tube, passing to and fro in the water vessel and from thence to the chimney or smoke outlet.

21,540 of 1903.—J. JACKSON: *Lifts or Elevators.*

A lift or elevator, consisting in the combination of a collapsible or folding gate, a locking and releasing device by which the starting and stopping rope is locked and released, or

an electrical switch operating part is locked and released, said locking or releasing being connected with and operated by the vertically moving parts of the gate back or fixed portion thereof.

21,692 of 1903.—J. N. RUSSELL: *Hot Water Circulation Apparatus.*

A hot water circulation apparatus, consisting in introducing air or other equivalent gas fluid under pressure into the water in ascension pipe leading to the top tank, for purpose of accelerating the upward flow of water in said pipe.

22,450 of 1903.—TONKS, LTD., and W. SPA: *Casement Stays.*

A casement stay, the said casement stay assisting essentially of a slotted plate or hinged casement frame, the upper part of slot of which plate has in it a series of or recesses for a fastening gravity bolt or on a pin on the pivot stay or casement, to engage with and thereby lock or fasten the arm where the locking or fastening bolt knob is actuated by gravity alone or gravity supplemented by the pressure spring.

25,751 of 1903.—J. W. RICE: *A Portable Platform.*

This invention relates to a portable platform for the use of painters and others, and carried into effect in the following manner. A board is provided having about one-third of its length of greater width than the two-thirds, the wider part forming the platform. In the narrower part two slots provided in which run two balls connected above the board by a strap and below board by a cross-bar having two downward-pointing rods, wing or fly nuts being provided on the balls to enable them to be retained in any part of the slots. Below the front end of the actual platform is hinged one end of a three-sided strut, in such a manner that the inner end of the strut will be considerably below the inner end of the platform when the strut is opened, by straightening tie-bars having a rule joint in the centre of their length, having one end hinged to the strut and the other to the actual platform.

10,575 of 1904.—C. R. WILBERT: *A Valve Wash-hand Basins.*

A device comprising a basin provided with a discharge port, having vertically arranged recesses and a shoulder, a bushing provided with a flange adapted to rest upon the shoulder to support the bushing and to form a valve seat, vertically arranged ribs or bushing to engage the recesses to prevent bushing from turning, a frame extending across the bushing at a point adjacent lower end and adapted to prevent the passage of foreign matter through the bushing, screw-threaded stem centrally and vertically arranged upon the frame, a disc-shaped adapted to engage the flange to close discharge port, a sleeve depending from underside of the valve and adapted to ride on the stem, and a lever conforming to the contour of the interior of the basin and seat to the valve.

11,995 of 1904.—A. ZAEN: *Adjustable Combined School Desks and Forms.*

An adjustable form comprising, in combination with the usual uprights, a desk, a shelf, a seat, and a connecting beam, one end of which is fixed in the frame of upright, the other end being adjustably guided in a guide piece fixed on the lower end of the seat, a screw-bolt downwardly projecting from the seat through a longitudinal opening of the connecting beam, and a thumb-nut the lower end of the screw-bolt for securing the beam in its position with regard to seat.

14,011 of 1904.—C. McCALLUM and STEWART: *Portable Attachment of "Wrenches" and like Appliances to Bathing the like.*

This relates to the attachment of "wrenches" and the like to baths and the like, consisting of a metal bracket mounted on a wall above the bath by which a piece of wood supported and clamped rigidly in position for the accommodation and support of "wrencher," in combination with a semi-circular piece of metal for attaching the end of wood to the bath at its opposite end.

14,375 of 1904.—D. F. HENRY, JUNIOR: *Devices for Tile and like Mosaic Machines.*

This consists in the combination of a rotating mechanism, a palette or tray, and adapted to support the tile to be turned, a movable palette receiving and having position normally in the path of the rotating mechanism, means for retracting support, and means for returning the palette receiving position.

471 of 1904.—H. S. HALP: Combination of Bath, Lavatory Basin, Flushing Cistern, and Water Closet.

is consists in the combination with a basin a fixed flushing tank below said basin, and to which the same is adapted to discharge, water closet below and connected with said tank, a common supply pipe and connexions between the same said basin and tank, and a valve in the connexion between said pipe and tank.

650 of 1904.—P. RUSCHWEYH: Chimney-tops and the like.

chimney-top characterised by the upper wall being constituted by two parts, between which are arranged the weathercock and the arching rod guide, and which are connected by screws, the lower cowl being secured to said upper cowl, on the one hand, by means of lateral screws, and, on the other hand, by means of a retaining piece mounted on the upper cowl and having a wide head, in which the suction cone is constituted of several separate plates, the bent flanges of which as wind guide surfaces are detachably joined together, the plates or the lower extension of the chimney-top being detachably joined to the suction cone plates by means of screws, for the purpose of enabling the chimney-top to be easily taken to pieces and erected.

102 of 1904.—W. R. LESTER: Glazing Bars or Astragals for Roof Lights and Windows.

glazing bar or astragal, consisting of a central core of inverted T-form, and having vertical and a more or less horizontal member, steps upon the horizontal member, and a sheath enclosing the core, and having its projecting upwards from the edges of the sheath, and from the edges of the horizontal member.

650 of 1903.—J. PERRY: Construction of Wells and Cesspools.

his invention consists in lining the walls of wells for spring water and dumb wells or cesspools with earthenware pipes impervious to water, in place of brickwork, which, as is well known, permits surface water and drainings to percolate into the well.

568 of 1903.—J. G. CONDE (A. FERNANDEZ): Framework and Ventilating Devices for Tunnels, Shafts, Mines, or the like.

arrangement for lining the walls of tunnels, shafts, mines, and the like, comprising a series of frames connected together at intervals apart by longitudinal braces and braced plates, the latter preferably arched somewhat, in combination or not as desired with a cross girder or brace near the top of the frame for bracing the two side pieces together, and a legging for separating the side pieces from the space below the brace, so that the space above acts as a longitudinal ventilating shaft.

694 of 1903.—J. W. BROWN: A Flood Gully and Weir Chamber Combined.

his relates to means for carrying off storm water and preventing flooding, consisting of a usual or suitable gully furnished with a weir chamber, in combination with a weir, into which the water and obstruction are thrown by a grate surface suitably inclined towards the kerb.

181 of 1904.—P. STEENOCK: Manufacture of a Material Designed for the Production of Cement.

process of manufacturing a material designed for the production of cement, consisting in mixing beryllium compounds, difficultly soluble in water, and reacting with or decomposable by phosphoric acids or their acid salts, with like compounds of light metals, including zinc.

SOME RECENT SALES OF PROPERTY:

Table listing real estate sales with columns for location, date, and price. Includes entries for Worcester, Sussex, Gloucester, London, and various other locations.

Table listing property sales: De Beauvoir Town, Hoxton, 224 yrs, Oving, Sussex. Includes details like '22 yrs, gr. 7l. 10s., yr. 77l.' and prices like '£555'.

Contractions used in these lists.—F.g.r. for freehold ground-rent; l.g.r. for leasehold ground-rent; l.g.r. for improved ground-rent; g.r. for ground-rent; r. for rent; f. for freehold; c. for copyhold; l. for leasehold; p. for possession; e.r. for estimated rental; w.r. for weekly rental; q.r. for quarterly rental; y.r. for yearly rental; u.r. for unexpired term; p.a. for per annum; yrs. for years; la. for lane; st. for street; rd. for road; sq. for square; pl. for place; ter. for terrace; crs. for crescent; av. for avenue; gds. for gardens; yd. for yard; g.r. for grove; b.h. for beerhouse; p.h. for public-house; o. for offices; s. for shops; ct. for court.

MEETINGS.

MONDAY, SEPTEMBER 12. Institute of Sanitary Engineers.—Meeting of Organising Committee, 3 p.m. Examination and Literary Committee, 5 p.m.

SATURDAY, SEPTEMBER 17. Institute of Sanitary Engineers.—Visit to the Reading Waterworks.

Architectural Association.—Week-end visit to Kettering and district.

Northern Architectural Association.—Visit to South Shields.

TO CORRESPONDENTS.

NOTE.—The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, manuscripts, or other documents, sent to or left at this office, unless he has specially asked for them.

Letters or communications (beyond mere news items) which have been duplicated for other journals are NOT DESIRED.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

We are compelled to decline pointing out books and giving addresses.

Any communication to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

PRICES CURRENT OF MATERIALS.

** Our aim in this list is to give, as far as possible, the average prices of materials, not necessarily the lowest. Quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

Table titled 'BRICKS, &c.' listing various types of bricks and their prices per 1000. Includes 'Hard Stocks', 'Rough Stocks', 'Gizzles', 'Facing Stocks', 'Shippers', 'Flatness', 'Bed Wire Cuts', 'Best Paveham Red', 'Best Red Pressed', 'Hunton Facing', 'Best Blue Pressed', 'Staffordshire', 'Do. Balmose', 'Best Stourbridge', 'Fire Bricks'.

Table titled 'GLAZED BRICKS, Best White and Ivory Glazed' listing various types of glazed bricks and their prices. Includes 'Stretchers', 'Headers', 'Quoins, Bullnose', 'Do. Flatness', 'One Side and two Ends', 'Two Sides and one End', 'Splays, Chamfered, Squints', 'Best Dipped Salt Glazed Stretchers and Headers', 'Quoins, Bullnose, and Flats', 'Double Stretchers', 'Double Headers', 'One Side and two Ends', 'Two Sides and one End', 'Splays, Chamfered, Squints', 'Second Quality White and Dipped Salt Glazed'.

Table titled 'BRICKS, &c.—(continued)' listing various types of bricks and their prices. Includes 'Thames and Pit Sand', 'Thames Ballast', 'Best Portland Cement', 'Best Ground Blue Lias Lime'.

NOTE.—The cement or lime is exclusive of the ordinary charge for sacks.

Grey Stone Lime.....12s. 0d. per yard, delivered. Stourbridge Fireclay in sacks 27s. 6d. per ton at rly. dep.

STONE.

Table listing stone products: Bath Stone, Ancaster in blocks, Greenshill, Darley Dale in blocks, Red Corseshill, Clachburned Freestones, Red Mansfield, York Stone—Robin Hood Quality.

Table listing various stone products and their prices per cubic foot or per ton. Includes 'Scrapped random blocks', '6 in. sawn two sides landings to sizes (under 40 ft. super.)', '6 in. rubbed two sides ditto, ditto', '3 in. sawn two sides slabs (random sizes)', '2 in. to 2 1/2 in. sawn one side slabs (random sizes)', '1 1/2 in. to 2 in. ditto, ditto'.

HARD YORK—

Table listing 'Hard York' stone products: 'Scrapped random blocks', '6 in. sawn two sides, landings to sizes (under 40 ft. super.)', '6 in. rubbed two sides ditto', '3 in. sawn two sides (slabs random sizes)', '2 in. self-faced random flags', 'Hopton Wood (Hard Bed) in blocks'.

SLATES.

Table listing various types of slates and their prices. Includes '20 x 10 best blue Bangor', '20 x 12', '20 x 10 first quality', '20 x 12', '18 x 8', '20 x 10 best blue Port.', '18 x 8 madoc', '20 x 10 best', '20 x 12', '18 x 10', '18 x 8'.

TILES.

Table listing various types of tiles and their prices. Includes 'Best plain red roofing tiles', 'Hip and Valley tiles', 'Do. Ornamental tiles', 'Hip and Valley tiles', 'Best Runbou red, brown, or brimled do. (Edwards)', 'Do. Ornamental do.', 'Valley tiles', 'Best Red or Matted Stafford shire do. (Penkes)', 'Do. Ornamental do.', 'Hip tiles', 'Valley tiles', 'Best "Rosemary" brand plain tiles', 'Best Ornamental tiles', 'Hip tiles', 'Valley tiles', 'Best "Hartshill" brand plain tiles, sand faced', 'Do. pressed', 'Do. Ornamental do.', 'Hip tiles', 'Valley tiles'.

WOOD.

Table listing various types of wood and their prices. Includes 'Deals: best 3 in. by 11 in. and 4 in.', 'Deals: best 3 by 4', 'Battens: best 2 1/2 in. by 7 in. and 8 in.', 'Battens: best 2 1/2 by 6 and 3 by 6'.

COMPETITIONS, CONTRACTS, AND PUBLIC APPOINTMENTS.

(For some Contracts, &c., still open, but not included in this List, see previous issues.)

COMPETITIONS.

Table with 4 columns: Nature of Work, By whom Required, Premiums, and Designs to be Delivered. Includes entries for Kingstown (Ireland) U.D.C., Benwell and Fenham U.D.C., Wallasey Education Committee, Uxbridge Guardians, and Wallasey U.D.C.

Condition of the Philæ Monuments.

IN a recent article upon “New Irrigation Works for Egypt and the Soudan” we mentioned the proposal for the raising of the Assouan Dam, which necessarily involves the further submersion of the temples and other buildings on the bank. That this part of the large programme now put forward is likely to be carried out is evident from the despatch of Lord Cromer, who says:—“The first work which, I venture to think, should be undertaken, is the raising of the Assouan Dam.” Although it is too late to protest, there is every reason for vigilance as to the actual extent of existing submersion, and as to the probable effect of further submersion. We have already described in detail the measures taken for safeguarding the ruins from injury,* and, in a subsequent “Note,” to the favourable report given as to the success of the undermining works. At the same time, however, we drew attention to the disturbing statement by the Director-General of the Antiquities Department—M. Maspero—as to the absorption of water by masonry above the reservoir. Further information upon both these points is now available. Sir William Garstin has recently assured the

public that, thanks to the thorough and skilful manner in which the foundations have been consolidated, there have been no signs of subsidence, and that there appear good grounds for hoping that none will occur in the future. Other testimony is forthcoming from Mr. E. Naville, the eminent Egyptologist, who visited the temples last year after the water had subsided, and his opinion is the more noteworthy because he was one of those who protested most strongly against the submersion of the temples when the project was first mooted. The following quotations sufficiently express the impression received by Mr. Naville on the occasion of his visit:—“What a change in Philæ from formerly! One can no longer call the temple a ruin; it appears, except in matters of small import, like a structure erected quite recently.” And, again:—“One may ask himself whether, in certain respects, the temple of Philæ is not to-day in better condition than the greater part of the Egyptian buildings.”

The conclusions drawn by M. Maspero, from careful inspection of the buildings during last winter, are thus stated in a pamphlet published this year:—“The established facts regarding them are reassuring, and show us that the works undertaken to enable the temples to stand the test of the water have not been in vain. The first year has passed well, and I hope that the second year will bring us no disappointment.” He adds:—“The danger of failure through undermining action of the waters appears to be averted, thanks to recent works,

and the current, if not quite *nil*, is certainly so feeble during the period of immersion that one may consider its effects as negligible.”

Referring to the same point, Sir William Willecocks said in a recent lecture at Cairo:—“A great deal of the opposition to the annual inundation of Philæ, for four or five months per annum, came from a misapprehension. People confused the damage done by the salty percolation water, which filters up through the soil in flood time and works such havoc at Thebes, with the really preserving effect of the freshly-flowing Nile water. One destroys stone, the other preserves it. The retaining walls of Philæ temple, which are annually inundated for six months per annum, are better preserved than any other part of the temple. It is the same with all stone and brickwork on the Nile. The submerged parts are better preserved than the parts which are never submerged.”

The evidence we have quoted above leaves little, if any, room for doubt as to the efficacy of the underpinning works, and removes all feelings of apprehension relative to the possible deterioration of the masonry below the high water-level of the reservoir.

But another and more serious question remains to be considered; that is, the action of the water upon the surface of the stone above the water-line. All who have inspected the buildings since the reservoir has been in operation agree in stating that along this level there is a band of saturated stone, varying from

0.60 to 0.80 metre in height. As we have previously pointed out, the saturation in question is due to capillary attraction, and it is quite established that deleterious salts have made their appearance in the band. The only remedy suggested for this undesirable development is that the masonry should be thoroughly washed every year after the reservoir has been emptied. The salts are reported as being readily removable, but at the present time it is impossible for any one to say whether such treatment will effectually preserve the stone from disintegration. In the opinion of M. Maspero, who is an acknowledged authority, no reliable decision on the point can be made until four of five years have elapsed.

From the structural point of view, the raising of the dam will simply have the effect of shifting the saturated band to a higher level. The present band of salt will be washed off, and a new band established around the upper parts of the temple. Further, the continued stability of the buildings must be better assured by the removal of the danger zone to a higher level.

No one can possibly doubt that the further submersion of the temples will completely destroy what little remains of their picturesqueness during certain months of the year, which unfortunately are the very months when tourists chiefly visit Philæ.

Assuming the reservoir level is to be raised, the public have a choice of two evils. One is to accept the position as it will then stand, the island and its buildings practically lost to sight just when travellers want to see them, and possibly suffering deterioration as a result of their annual soaking. The other is to fall in with the suggestion made some time ago, presuming this to be still open, that the principal temple should be removed and re-erected on the adjacent island of Bigh, which stands high above the waters only a few hundred yards distant from Philæ. The proposal previously made was that 200,000*l.* should be handed over to the Antiquities Department to cover the expense of removal and re-erection, and we have no doubt the building could be transferred to a suitable site for this amount. But even if the work were successfully and artistically conducted, as we are sure it would be by M. Maspero, the result would be worse than unsatisfactory. As may be seen by the plan we published on a former occasion, the entire island is covered with buildings of more or less interest, and even if the whole of them were transplanted, they would be bereft of the surroundings which have become part and parcel of their existence by long-continued association. If one temple only were to be removed it might almost as well be re-erected in Cairo or South Kensington. On the whole, we are inclined to think that the temples should be left where they are, and that the proposed removal of one of them, even if the structure appeared to advantage in its new position, would be an act of Philistinism for which it would be difficult to find any excuse.

The whole subject is rather a sad one, to those who look to the past as well as the present of the world's history. The commercial benefit to Egypt of increased

irrigation is of course immense, and it may be thought that no archaeological considerations ought to be allowed to interfere with it; and in the case of many localities in the world this would be a perfectly reasonable argument. But Egypt is altogether exceptional. It is our great link with the pre-historic past; it is the book of early art and civilisation; nor do we yet know what more may be found in it. To obliterate and drown the monuments and relics of ancient Egypt, for the sake of the modern population, may seem to the engineer and the political economist a natural and laudable course of action. But it should at least be remembered that they are wiping out records of the intellectual history of mankind, which, once destroyed, nothing can ever replace.

ROBERT ADAM AND HIS BROTHERS.

THE Essay which gained the Architectural Association Essay Prize for the Session 1902-3, on "The Life, Work and Influence of Robert Adam and His Brothers," by Mr. John Swarbrick, after appearing in the pages of *Architectural Association Notes*, has been reprinted in pamphlet form, of which a copy has been sent to us.* Though in general we should not devote a separate article to the review of a pamphlet, Mr. Swarbrick's careful and well-written monograph on the subject, for which he deserves all credit, affords an opportunity for a consideration of a career which formed an important chapter in the history of modern English architecture, and to which there is nothing analogous in the modern developments of Renaissance architecture in any other country.

To weigh correctly the reputation enjoyed by the Brothers Adam, and to assign them their position among the architects of the XVIIIth century, is not, as Mr. Swarbrick confesses, an entirely easy matter. He has nevertheless attempted a short estimate of their influence, although the greater part of his essay is occupied with a comprehensive review of their work and career, compiled, as the appendix shows, from a great variety of sources. The task is difficult, it is further explained, in consequence of the diverse character of their undertakings. This, in a sense, is so. And it is perhaps only by considering their works as a whole, as the Adams themselves treated them, that we are likely to arrive at a result.

From the "Works of Robert and James Adam" the author selects a passage which may be taken as a manifesto of the Brotherhood:—

"The massive entablature, the ponderous compartment ceiling . . . almost the whole species of ornament formerly known in this country are now universally exploded, and in their place we have adopted a beautiful variety of light mouldings, gracefully formed, delicately enriched, and arranged with propriety and skill. We have introduced a great diversity of ceilings, friezes, and decorative pilasters, and have added much grace and beauty to the whole, by a mixture of grotesque stucco and painted ornament. . . ."

In effect they meant to imply, as we read it, that the style inaugurated by

* "The Life and Work of Robert Adam and His Brothers; being the Prize Essay of the Architectural Association for the Session 1902-3." By John Swarbrick, A.R.I.B.A. Hazell, Watson and Viney, London and Aylesbury.

Inigo Jones and Wren, or at least practised by their contemporaries, Chambers and Paine, was ostentatious and meaningless, and that they sought to produce a simpler effect, though the less telling, by a combination in wall of stucco and painted ornament, and may add, the general upholstery building, played no inconceivable part. And if we look round at what was to take place in literature, poetry, and in painting, we must recognise that the Adams were not alone in their quarrel with tradition. The polished style of the Essayists, giving place to the varied interests evoked by the story, told in the simple language of Goldsmith. The stilted vocations to the Muses, practised by earlier XVIIIth century poets, was supplemented by the more homely touches of Blake, while the pompous portraiture of Kneller was rendered ridiculous by the *naïveté* of Reynolds. And in architecture we cannot doubt the tendency was the same; but, unfortunately, there was no one great enough to grapple with the problems that architecture presented. The interest of the story meets an inadequate parallel in upholsterers' art, and the simple character of Blake and Reynolds finds no echo in the baldness of architectural features.

That Robert Adam was at heart a Romanticist pure and simple no one doubts who has studied his design for the Palace," which he made in Rome in 1758 before he commenced practice. Swarbrick properly points to it in evidence of a gift for aerial perspective of Vanbrugh school. It displays this gift and in an eminent degree. But further displays a luxuriance of position and an unclarified freedom in the handling of form that is a medieval in its sentiment though clear in detail. It was never intended for execution; but it is here one is inclined to think, and not at the somewhat tame proprieties even in the Admiralty screen, that the Robert Adam will be found. Baptiste Greuze was in the same class, elected to the French Academy. A diploma picture, entitled "Sept Severus and Caracalla," was passed, and he was elected on his merits as a "genre painter"; and the distinctly pointedly made nearly broke his life. That Adam would have been disappointed had his claims as an exponent of classic art been disputed, there can be no doubt, despite his openly expressed detestation of Palladio.

We look in vain amongst his drawings for some evidence of serious study abroad. Sketches of ruins standing in appropriate surroundings bear his initials, but these are rather the excursions of a dilettante, and there seems to be little to show that he studied or measured any work. He spent some years in Italy making the *grand tour*, as was essential at that time for anyone who claimed to be a person of taste. His brother James joined him abroad. James would also have been the better draughtsman of the two, and if we may judge from the design for the Parliament House, he made there as an essay, after the manner of his brother's design for the Palace," he was also the more orthodox in his views upon classic

e was also something of a figure draughtsman, if we may rely on the drawings for the decoration of the Parliament House as being entirely his own. But two expert water-colour artists accompanied the brothers on their tour, Clérissseau and Zucchi. Robert took lessons from the former before proceeding south. They were commissioned by Robert to make copies of the decorations to be found in Italian villas and palaces, and these are very beautifully executed. One or other, probably Zucchi, must also have been responsible for the drawings of the Palace of Biondino at Spalato, which were engraved by Bartolozzi, and published in a handsome volume with magnificent type as a dedication to the King, who is compared therein to Pericles, Augustus, and the Soudan, as patron of the Arts. The temple of Jupiter at Spalato appears in the Adam designs that make pretensions to importance. The "Design for the Palace" bristles with it. It appears in the "Design for a Parliament House," and the scheme for rebuilding Lincoln's Inn, which happily never took shape. It may be found also in the designs for country seats executed by the brothers at Kedleston, for instance, where it formed a part of the "improvements" to the design after the latter's dismissal. Robert Adam commenced practice privately before 1760, and was afterwards assisted by his brother James. There were other brothers in all, but John, who succeeded to his father's business in Edinburgh, and William, also an architect, do not seem to have been much concerned in the joint productions of the elder brothers. Robert held the personal appointment of Architect to the King, and with which the publication of the volume previously referred to may not be associated. This form of homage was one of the undesirable features of the age. Commissions flowed in from wealthy clients. Kenwood was erected for Lord Mansfield, Luton House for Lord Bute, and some work at Zion House was undertaken for the Duke of Northumberland. Clérissseau and Zucchi came to England to assist. Indeed much of the brothers' business must have been taken up by the management of their business, which included extensive operations of a speculative character. Among these were the Adelphi and numerous streets, such as Mansfield-street, Grafton-street, and Bedford-place. It was shortly afterwards found necessary to dispose of the Adelphi by public lottery. Nor was their enterprise confined to building alone. They purchased the right to deal in a patent cement, and became harassed by difficulties arising therefrom. We cannot help thinking that to their remarkable activity must be attributed some of the prestige which has fallen to the names of designers. Styles are not born in a vacuum, and there is much about the so-called "Adam style" of ornament, and the moulding of it, that may be attributed to a natural development in the decorative arts, to which the Adams gave advertisement by their numerous undertakings. The Octagon at Bath was erected in 1767 by an architect of the name of Lightfoot. It is a charming piece of work, an ornament retaining the strength of the virile times and being most skill-

fully disposed. It would in ordinary phrase be called "Adam style," but it has always seemed to us to be something very much better than the Adams ever did. As regards the fittings generally, also of the Adam period, if we look at Jones's "Gentleman's and Builder's Companion," published in 1739, we shall find the same forms; it is the ornament that is lacking. Multiplication of ornament is precisely the line that development at this point would take. The furniture and the decorative trades were exceedingly active at this time. Chippendale had created a fashion that was working itself out in a perfectly legitimate manner. Heppelwhite, Sheraton, Richardson, Wallis, Wyatt, these were all active in the cause. This branch of the Arts the Adams certainly helped forward, and their folios contain many designs by experienced hands. The rough drawings, made apparently by one or other of the brothers, seem to us as even barely suggestive, and would most certainly be quite inadequate for their purpose unless their translation were undertaken by experienced workmen. We therefore cannot agree with Mr. Swarbrick that the building and decorative trades were in so decadent a condition that they necessitated an infusion of "Adam" culture.

One feature in the decoration of the period is almost universally resorted to by the Adams—the introduction of isolated panels, containing groups either modelled or representing sculpture. This was very possibly an invention of their own, and when one studies the water-colour drawings made by Clérissseau or Zucchi, or indeed any artist who made up what he considered to be a scene typical of Roman topography, panels and fragments of ancient sculpture built into the walls in a negligent and picturesque manner, are never absent. These panels and medallions appear upon the façades and in the interior decoration of all the Adams' work, and the architecture is often entirely subordinated to provide a place to receive them. A device of this kind—usually the central feature of a façade—appears in their windows. Three openings are grouped in a recess which is surmounted by a semi-circular arch. They are covered by an architrave, and the semi-circular panel is filled by a medallion. It is when the architects get right away from the accepted classic forms that we find the expression of artistic judgment in the selection of detail. A certain boldness of design was no doubt often forced upon them by the economical necessities of their enterprises, but this is generally relieved by some bits of detail possessing charm. The houses in Mansfield-street are a type; plain brick structures with openings unrelieved even by the red brick arch and jambs of the Queen Anne builder; but the design of the entrances at once imparts to them a certain distinction. On the other hand, nothing could be more commonplace than the pseudo-classic of the Adelphi-terrace façade, usually attributed to James, and it may well have been in Mr. Gwilt's mind when he spoke of "depraved compositions." In their designs for mansions, of which Luton House may be taken as an example, they abandoned the principle of attached

wings set up by Vanbrugh, and pursued in by Paine and Leoni, preferring rather to group the accommodation in a single block. This arrangement presented the opportunity of placing a series of rooms communicating with each other through which a "vista" was obtained, the "vista" being a feature upon which the architects prided themselves. This may be said to be their main contribution to the possible varieties of planning.

Mr. Joseph Gwilt was perhaps too severe when he spoke of "the depraved compositions of Adam which were not only tolerated, but had their admirers." Yet it cannot be denied that there was something of a *feu de joie* both about their style and the manner of advertising it, following upon and ending a century of serious architectural endeavour. An eminent painter once said to his critics, "You tell me that I am a very bad painter, but you must at least admit that I have been a very successful one;" and whatever view may be taken of the Adams as architects, it must be admitted that they were very successful architects.

THE TRADES UNION CONGRESS.

THE thirty-seventh annual Congress of Trades Unions was held this year at Leeds, and its meetings have extended over a week, but the questions discussed have not been those which are principally associated in the public mind as being within the province of those bodies. It is clear that the Trades Unions are still smarting under the decision given by the House of Lords in the Taft Railway case, are pledged to secure legislation which shall override the effects of that decision; but nothing new has been said on this question, and it is apparent that the principle of making the Union funds liable in case of illegal action on the part of the Unions' governing bodies has been advantageous to the country at large, and especially to the working members of the Unions. It has done more to terminate the acrimonious feeling which was springing into existence between capital and labour on account of the aggressive action of the Unions in strikes, than arbitration or any other expedient hitherto suggested; and yet statistics show that the position of labour in relation to capital has not become in any way less favourable than it was before, and that the working members have drawn direct benefit from those peaceful relations.

Mr. Horsfall (who read a paper also before the British Association on the same subject) moved a resolution on Housing Reform and the question of slum areas. Although we cannot agree with the advanced Socialistic ideas expressed by Mr. Horsfall before the British Association, much is to be said in favour of some of his views in securing attention to the growth of new areas and suburbs so as to insure sanitary houses and a free influx of light and air. Unless the local authorities exert their powers in this direction, it is clear that the municipalities will have spent the public money in vain in pulling down bad houses in the congested areas and in erecting sanitary dwellings; for unless strict supervision over the extended areas is exerted, the

slums and rookeries will only spring up elsewhere. Dr. Smart pointed out in his address before the British Association, on which we commented in our issue of September 7, that this difficulty was already being experienced in Glasgow, where the question of municipal improvement in these respects has been most carefully investigated by a Special Commission. The real problem which requires solution is, how is this supervision to be effected without paralysing individual enterprise? The purchase and holding of large areas by municipalities, which (as mentioned elsewhere) is the system prevailing in Germany, would really be the best way of dealing with the problem, but it would probably meet with much opposition in this country.

It is disappointing that the Congress expressed no opinion on the recent Report of the Departmental Committee on Workmen's Compensation—a Report in which the divergent views of the employer and the employed have been so carefully considered, and the balance between them so skilfully maintained. The Shop Assistants moved a resolution that all legislative proposals applying generally to labour should be made to include shop assistants. It is to be observed that the Committee on Workmen's Compensation did not recommend the direct inclusion of shop assistants in the Act, yet it seems somewhat questionable whether the definition of "warehouse" suggested in the Report would not to some extent include them, since the distinction created by the Courts between wholesale and retail business in this connexion is intended to be abolished by the suggested definition. The only resolution made on this subject of Workmen's Compensation ignored the existence of any Commission, although it raised points fully considered by the Committee.

The usual resolutions were carried advocating a universal eight hours' day, and the compulsory employment of unemployed at "fair wages," though no suggestion is made as to how "fair wages" are to be ascertained or obtained if the laws of supply and demand are to be superseded.

THE CASE OF AYLESFORD BRIDGE:

PROTEST has been publicly made against an intention which was announced (though there is some reason to believe that it has now been abandoned) to destroy the picturesque old bridge at Aylesford and build a new and wider one in its place, with (presumably) a better gradient. The question brings up once again the often-repeated and often-debated question of practical convenience as against historical and archaeological interest. Archaeologists are too apt to overlook or undervalue the practical side of such questions; and we preferred to make our own inspection and inquiries rather than rely on the evidence of the representatives of the Society of Antiquaries and the Society for the Protection of Ancient Buildings.

Nothing could be more picturesque than the approach to Aylesford on foot from the railway station, along the towing path which skirts the head of the Medway. First we pass the beautiful old bit of

medieval building, part of the remains of the ancient Priory, and now called "The Friars," standing on the extreme verge of the stream and reflected in its water, as shown in our illustration (see lithograph plate). From this point the bridge and the little town cannot be seen; following the curve of the river a little farther, we come on one of the most picturesque scenes of its kind to be found in England: a small wharf opposite, with houses rising above it, and above them the church tower, which stands highest of all, and in the foreground the old bridge, with its wide centre arches and small side ones, spanning the stream and leading into the town. Our illustration, which is taken further down on the bank, from the other side of the bridge, does not give the best idea of its picturesque value. It is as seen from the side of approach from the railway that it shows best, as the foreground object in a composition of river, bridge, barges, houses, and church tower. As to the essential value of the bridge in the picture there can be no doubt whatever. Destroy that, and replace it by a modern bridge, and the charm would be gone for ever.

Is there sufficient practical excuse for doing this? Intelligent inhabitants who admire the old bridge, tell us that it is a considerable inconvenience; that it is an obstruction to the river traffic (though we saw several vessels pass under the central arch without being visibly "obstructed"), and that it is awkward for carriage and cart traffic; two carriages can just pass, but not very conveniently or safely (the parapet is not high), and of course the bridge rises up over the centre arch with that inconvenient gradient which is the common property of most ancient bridges in this country. If Aylesford were a large and busy place this would be a serious argument. But it is a very small place—hardly more than a village; and the street onto which the bridge abuts is not very much wider than the bridge itself. The serious complaint as to the bridge, in relation to carriage traffic, may perhaps come rather from owners of carriages residing in the country round, who occasionally have to cross the river that way. But this is surely but a small and occasional inconvenience, and might be put up with rather than destroy an almost perfect picture. In short, we recognise that there is a certain inconvenience in retaining the bridge, but we do not think that this amounts to sufficient to justify its removal when we consider its great picturesque beauty. Aylesford would lose far more than it would gain by the change.

According to Mr. Clinch's letter in the *Times* (which is our only authority for the statement), the Society for the Protection of Ancient Buildings have drawn up a large scheme for saving the bridge, by proposing a new cut across the flat land, following the chord of the long curve here made by the river, and a new bridge near the railway station. We would rather have seen this proposed as a navigation improvement independent of the question of the bridge at all. It would be a real improvement and convenience to the navigation, but it would cost a great deal more than building a new bridge, and it may be questioned whether the idea of

turning the channel of a river to save the bridge would not appear to a good man, people a rather absurdly illogical proceeding. But in itself it would be an improvement worth making, and would have the contingent advantage of leaving the bridge alone.

Another part of the Society's scheme, that the old bridge should be widened, the addition of timber foot-passing gangways at the sides. This is one of the curious instances of the manner in which archaeologists, in dealing with the matters, are constantly putting their selves in the wrong. The bridge is built on the old and usual plan of cutwater against each pier, forming triangular refuges at the road level. The proposed timber foot-ways would destroy the whole character of the bridge, without adding to the carriage way (which is the real difficulty); you might just as well remove it entirely as tinker with it in this way; and we are certain that if any one else had made such a proposal, the Society for the Protection of Ancient Buildings would have been the first to denounce them for "vandalism."

NOTES.

SCULPTURE and the Chantrey Trust. NOW THAT more elasticity has been afforded, by the decisions of the Special Committee, to the action of the new Trustees who will before long be appointed, may it not be possible to utilise whatever surplus are expended on sculpture for placing fine works of sculpture in our public parks and squares, instead of consigning them to the Tate Gallery? A comparison of our public parks with those of other cities, such as Paris, Berlin, Vienna, and even less important cities such as Stuttgart (where a fountain was a group from a fairy-tale subject fascinates all who see it), might convince Londoners how much might be done in this way, and how little has been done. Works in marble may be too costly, delicate to expose to the open air; but works in bronze, with stone or granite pedestals, can be so placed. Those that we already have are, with few exceptions, but poor affairs; why not use some proportion of the Chantrey fund towards procuring finer examples of modern English art? For one person who would see a work in a gallery there are a hundred who see it in a park or square, and it would have the advantage of open-air lighting and of architectural foliage as a background.

THE Lord Chamberlain's Theatre Rules. THE new rules have been issued by the Lord Chamberlain's office to the theatre managers. They are more comprehensive than heretofore, but they are equitable and reasonable, and no manager can take exception to them. There are two or three notable innovations, amongst these we think the most important is the rule ordering that the scenery of the stage be rendered and maintained "non-inflammable." This is fire prevention in the true sense. It is what has been recommended by those who have had most experience in these matters for many years, and in the earlier years, a rule, was only met with ridicule.

apparently required the Chicago theatre fire to bring about this change, but now that the change has been made, and the requirement has been put into effect, we trust the rule will be honestly observed, and that the makeshift of superficially applying patent paints and like will be replaced by a thorough impregnation of the highly-inflammable materials so often found on the stage. Another notable innovation is that the rules clearly specifies that response-trained firemen should be engaged at the stage. Further, we observe that the theatre manager is now compelled to report to the Lord Chamberlain and to the Fire Brigade any outbreak of fire, no matter how small. This again is a matter of the utmost importance, because the recurrence in such matters generally finally results to some serious misfortune. Although the Lord Chamberlain is to be congratulated on the new regulations, which certainly cannot in any way be deemed hardships to those engaged in theatrical enterprise.

MR. T. C. HORSEFALL, of Manchester (well known as a pioneer in many movements for the public good), calls attention, in an admirable letter in the *Times*, to the importance of carrying out new plans around large towns upon a well-arranged plan and in such a manner as to ensure that the suburban buildings do not assist in further choking the city. Considering that we have carried out many bit-by-bit improvements in London itself, with no reference to any comprehensive scheme and no forethought as to future laying of streets, it may seem rather putting the cart before the horse, as far as London is concerned, to speak of doing in the suburbs what we have so lamentably neglected in the city. But the development of a new suburb in a special locality at any rate affords an opportunity which can be dealt with to a certain extent separately, and without being complicated by the existence or absence of a general scheme. It is at any rate desirable to see that such a new locality is laid out with wide streets and with a deficiency of open spaces; if other urban neighbourhoods have been neglected, regardless of such considerations, at least let a new one not add to the congestion. For London it is we fear too late for any general scheme of suburban extension—so much has been already done independently of any such scheme, and the area to be dealt with is so vast. In provincial cities whose belt of suburbs lies within more manageable limits, we may well take up the idea of laying them out on a general plan.

CONTINUING the same subject, we may add that in Germany, for at least twenty years, every city of note has had its "development plan," according to which new thoroughfares have been laid out due regard to public convenience, to public health, and to the due arrangement of parks and squares. In large cities, notably at Berlin, these "development plans" have been accompanied by special legislation; but as a rule, special municipal powers, or the

ordinary municipal powers backed by special ordinances from the Home Office authorities, have been sufficient to obtain what was necessary in compelling the surrounding landowners to conform to the official plan. As a rule too, but very little opposition was met with as far as these landowners were concerned, for the systematic development of the suburbs was so obviously to their interest that most of them voluntarily gave up rights-of-way and even ground in order to facilitate the wishes of the authorities. The greatest authority on the subject of the development of cities is at present Privy Councillor Stuebben, an hon. corresponding member of the R.I.B.A. In the first instance, Cologne saw its splendid development under his tenure of office as City Architect, but he was also responsible for the development plans of a number of other cities. At the present moment he is acting as High Commissioner for the Prussian Government in the development of the town of Posen, where the old fortifications and military lands surrounding the town are being transformed to the uses of civic life. Any one who has watched the systematic development of German cities during the last two decades must have been struck by the benefits accruing from the principles observed in that country.

NO EXPLANATION is at present available as to the cause responsible for the mishap which occurred at Chatham Dockyard on Tuesday last, during the erection of the new 130-ton shear legs. The three massive columns, about 150 ft. long, forming the legs of the apparatus, were in process of being hoisted into position, and when they had been raised to a height of 70 ft. an iron bollard, embedded in brick and cement to a depth of 6 ft., was pulled from its foundations by one of the wire ropes connected with the hoisting tackle and swung into the midst of the machinery. In consequence of this failure, portions of the tackle gave way, another bollard was partially displaced, and the shear legs fell upon the baulks of timber by which they had previously been supported. The columns were seriously buckled, but the machinery and the men working upon and near it were protected from injury by the timber supports. Two men were seriously injured, one by the falling tackle and the other by falling with one of the columns, although happily no lives were lost. The suggestion is made that the bollards were supposed to be capable of withstanding double the strain that was actually placed upon them, but it is quite evident that there has been some miscalculation. When a bollard is employed in the usual way, for hauling vessels by means of hawsers, force is exerted in a direction perpendicular to the axis of the post. It may be that the calculated resistance was based upon this condition, and that proper allowance was not made for the different direction of the pull exerted during the hoisting of the shear legs. Investigation will doubtless throw light upon this misadventure, which is the more surprising when we bear in mind the great care always taken by dockyard officials to provide for the safe execution of engineering work.

AN important case bearing on this subject is that of *Foulger v. Arding*, decided in March, 1902. The word "impositions" inserted in the covenants in the lease which set out the liabilities respectively to be borne by landlord and tenant placed the burden of remedying a nuisance, on the requisition of the Public Health authorities, on the tenant. In our comment on this case (the *Builder*, March 22, 1902) we pointed out what words in a lease would probably suffice to remove all liabilities of such a nature from the landlord and place them on the tenant. We have from time to time given other instances of liabilities imposed, as, for instance, the expenses of making up streets under the Private Street Works Act, and have also shown how hardly this may bear on tenants on short leases. The latest development of the principle laid down in *Foulger v. Arding* only emphasises the necessity of landlords and tenants carefully considering what their respective rights and liabilities are to be, and settling the covenants in the leases accordingly. By section 101 of the Factory Act, 1901, after January 1, 1904, no underground bakehouse is to be used unless certified by the district council as suitable for the purpose. By subsection 8, where any premises have been let as a bakehouse, and the above certificate can only be obtained by carrying out certain structural alterations, the occupier may apply to the Court of Summary Jurisdiction to have such an apportionment made of the expenses of the alterations between himself and his landlord as may appear to the Court to be just, "regard being had to the terms of the contract between the parties; or, in the alternative, the Court may, at the request of the occupier, determine the lease." In two cases recently heard—*Goldstein v. Hollingsworth* and *Morris v. Beal*—it has been decided that where premises are let as a bakehouse—which has been interpreted to mean only for use as a bakehouse—the section applies, but that the expressions "impositions and outgoings" or "outgoings" alone in the lease, sufficed to place the whole burden upon the tenant, since, even if the Court of Summary Jurisdiction did make an apportionment, the landlord, by virtue of the lease, could recover his proportion back from the tenant. The very general nature of the words used in leases makes it extremely difficult for parties to determine their position in regard to their rights under specific Acts of Parliament such as the above.

At a meeting of the Parish Council of Yarm, near Stockton-on-Tees, it has been decided to commemorate the inauguration of the first railway in the world by placing a tablet on the front of the "George and Dragon" Hotel. It was in this building that a meeting was held, on February 12, 1820, for the purpose of deciding upon the construction of the Stockton and Darlington Railway, the pioneers of the movement being Mr. Benjamin Flounders and Mr. Thomas Meynell, both residents in the town. Mr. Meynell, the first chairman of the line, took a leading part in drafting the Bill which ultimately received the

Landlord v. Tenant.

Continuation of subject from previous page.

sanction of Parliament. The original proposal was to work the railway with horse-traction, but Stephenson's steam locomotive was afterwards adopted, and powers were obtained to use it for the purpose of haulage. It is stated that of the subscribed capital of 120,000*l.*, the amount of 17,000*l.* was raised by the inhabitants of Yarm. Remembering that the aggregate length of the world's railways is now more than 510,000 miles, the historic importance of the meeting is very evident. The visitor will find nothing suggestive of progress or change in Yarm. It is, without exception, one of the most delightfully old-fashioned towns in the land. Practically the only street is the broad Market-place, paved with cobbles, save where a narrow strip of macadam runs for the convenience of modern travellers. Near the middle stands the red-brick market hall, and the tall houses on either side present interesting examples of English architecture, and varied shades of rich but mellowed colouring. Among the many old-world towns of Great Britain, Yarm occupies a unique position, and the aspect of its fine old street is not readily forgotten.

The Irrigation Conference at Simla. It is to be hoped that the conference of irrigation experts at Simla, convened by the Government of India, may have the effect of encouraging and assisting the cause of irrigation. No branch of the administration has been more successful, for fully 30,000,000 acres have been added to the cultivated land of India, or more than one-fifth of the total area devoted to agriculture, and there are now in existence 43,000 miles of irrigation canals. In spite of the great progress made during the last twenty-five years, much remains for accomplishment. In Mysore existing canals require attention. In the Lucknow and Barahanki districts canals are much needed. The Deccan and Gujarat await further development, and there are many extensive regions where nothing but water is wanted to obtain plentiful harvests from lands that are now dry and scorched by an ever-hazing sun. Bengal still presents many openings for irrigation, and in Assam very little has been attempted hitherto. To give some idea of the immense opportunities for the irrigation engineer, we may state that upwards of 100,000,000 acres of land in the Indian Empire remain to be reclaimed and brought under cultivation. Whether carried out by the Government or by private enterprise, irrigation works offer a remunerative field for British capitalists and afford a sure and permanent protection against the risk of famine.

The Light Standard for Photometry. The important paper read to the British Association by Mr. Clifford Paterson, who is in charge of the photometric department of the National Physical Laboratory, on the ten-candle power Harcourt pentane lamp, will be read with great interest by gas and electrical engineers. The gas referees some years ago adopted the pentane lamp as their ultimate standard of reference, and the Parliamentary standard candle was formally rejected. It seems, however,

that the light given out by the pentane lamp is very far from being constant. Mr. Paterson has found that it varied with the height of the barometer and with the quantity of moisture present in the atmosphere. During his experiments the candle power varied between 9.4 and 10.4, that is, a variation of 10 per cent. It seems to us that in many cases the gas companies must have been unjustly fined for failing to keep the illuminating power of their gas up to the requisite standard. The results given prove that on damp days the illuminating power of gas is much less than on dry days, and that the lower the barometer the less is the illumination produced by a flame. No hint is given in the paper as to how the pressure of the carbon dioxide present in the air was determined. In the subsequent discussion, Professor Ayrton raised the question of the sudden and apparently unaccountable variations in the light that is sent out by electric glow lamps. These variations, as a rule, are very small, and experimenters have probably often put them down to the unavoidable errors of experiment. We have evidence that these irregularities do occur in some lamps, but they are only of theoretical interest, as they are rarely appreciable. They are possibly due to the carbon filament being badly fastened to the platinum wires.

The Screen at the Admiralty, Whitehall. It was officially announced in the House of Commons at the close of the Session that the First Commissioner of Works has under his consideration the removal of the wooden shutters from the screen in front of the Admiralty court-yard. The shutters—they are in fact sliding doors—were put up after the screen had been altered for the making of the two rectangular gateways. Robert Adam's plans and designs, 1760, show a continuous wall behind five disengaged columns in each half of the screen. That the screen was so built as Adam intended, with the two blocking walls, is clearly proved by an examination we have made of his large architectural drawing of 1760, of I. Cunego's plate, 1775, contained in Part IV. of "The Works in Architecture of Robert and James Adam, Esquires," three volumes, folio, 1773-1822, and of the prints by T. Malton and by Medland, after Miller, of 1795 and 1796. In or about 1827, when G. L. Taylor was Surveyor of Naval Buildings, etc., the design of the screen was mutilated, at the instance, it is said, of the Duke of Clarence (William IV.), by the insertion of a carriage gateway in each half of the screen and the removal of the middle column, the whole number of columns being thus reduced from ten to eight. Shepherd's drawing of that time shows the altered screen, but he delineates a blocked parapet between the piers of the original arched gateway, at the middle point of the screen, instead of the existing balustrade; the balustrade is depicted in the XVIIIth century views, and does not appear to have been changed. We may mention that, in a letter printed in our columns of October 12, 1895, Mr. E. W. Hudson cites a sketch by Taylor of the altered façade, "showing . . . a cast-iron lintel

replacing the stone entablature"; and that Adam built the former gateway and pavilions at the south end of the screen as an entrance into the house of the Earl of Kinnoull.

A STRUCTURAL RENOVATION of the entire exterior of the parish church of St. Alpheg, Greenwich, is about to be carried out under the superintendence of Messrs. Thomas Dinwiddie and Sons. The church was built in 1711-8 upon the supposed site of the death of St. Alpheg, archbishop and martyr. It is distinguished by some fine woodwork and an elaborate altar-piece having fluted Corinthian columns on its three sides supporting an entablature planned triangle-wise. The tower (1730) was designed by John James, to whom also is ascribed the body of the fabric, though by no account that portion is the work of Hawksmoor. In the former church was buried Thomas Tallis, the composer who died in 1585; the present church contains a monument to John J. Angstein, whose collection of pictures forms the nucleus of our National Gallery; and who lived in the neighbourhood and a monument to General Wok whose remains were brought thither from Quebec for interment in his father's grave. In the old church was set up a portrait on glass of Humphrey Duke of Gloucester, and amongst the brasses was one in memory of Tallis and his wife Joan, bearing a quaint epitaph recording his career in the reigns of Henry VIII. and his three successors on the throne. A rare print, lettered "designed by N. Hawksmoor, A.D. 1711," shows the former tower—since rebuilt by James—which escaped when the old church fell down. In the north aisle was buried Robert Adams, with an inscription, "Egregio viro Roberto Adam operum regiorum Supervisorio, architecturæ peritissimo, ob. 1595."

In a "Note" in our column of January 22, 1898, we directed attention to the spoiling of the continuous design of the houses in Stratford-place by the raising of a house (No. 6) on the east side, with a consequent breaking through of the range of the cornice and balustrade. We notice that scaffolding is erected in front of a house, No. 17, on the west side, and that the roof has been removed for a similar alteration of the façade on the side. The street, with the mansion at its further end, is now seen to great advantage from the recently widened end of Davies-street, and affords a handsome prospect from the latter thoroughfare. We may add that Stratford-place was laid out in the Mill Hill Field of the Conduit Mead estate, the property of the Corporation of the City of London, who granted a ground lease to Edward Stratford, whose son John was created Earl of Aldborough on July 9, 1717. The houses on the two sides and the Aldborough House, at the north end, were built in or about 1774, by Robert Adam, and constituted a self-contained example of his style upon a large scale, until its destruction, twelve years ago, of No. 17 at the south-east corner, upon the removal of the Portland Club to James's-square.

No 32, Cavendish-square, W.

THERE is now being pulled down a house which is associated with the careers and works of three eminent English portrait painters. The house, now numbered 32, stands on the south side of Cavendish-square, and having been suffered to fall into disrepair, is to be rebuilt. Constructed of red brick, it is one of the original houses erected on that side of the square. The square was at first laid out, as Oxford-square, in the Harley, now Lord Howard de Walden's, estate in 1717-18; though building operations were delayed for a while by the failure of the South Sea speculation. The house was occupied, until his death in 1770, by Francis Cotes, R.A., famed for his portraits in oils and crayons, who built and decorated the studio, an apartment some 18 ft. square on plan. To Cotes succeeded, during the interval 1775-1794, George Romney, to whom Sir Joshua Reynolds could refer as "the man in Cavendish-square." After Romney's retirement to Holly Bush-hill, Hampstead, the house was taken by Sir Martin Archer Shee, R.A., in 1798, the year of his election as an Associate Member of the Royal Academy.

THE BALTIMORE FIRE.*

The Baltimore Fire is one of, if not the most interesting fire, of recent years, for although it is re-demonstrated many facts with which we are already acquainted, it has furnished us for the first time with a most thorough and complete example of the behaviour of the modern steel framed building under a severe fire test; it has also shown the weak points in these structures and where greater fire-resistance may be effected in the future.

It has re-demonstrated that all forms of stone are bad fire-resistants, and should be but sparingly used in the structure of town buildings. It would of course be impossible to abolish it altogether from an architectural point of view, but where used it should be well backed with brickwork, so that any neutral may be effected without danger to the structures. Indeed, this fire has clearly proved that the only reliable materials are brick and concrete. The hollow tile floor construction of encasing to iron-work of which we have heard so much in certain quarters has largely failed, and would have failed to a greater extent had the fire been less extensive in area. The fire brigade had been enabled to put water upon this material, for it is to be remembered that the water test was absent, and we have only the result of intense heat without the sudden cooling.

It may be a cause of general satisfaction that the last system of construction has been wisely whereby the general fabrics may, after a serious conflagration, remain standing, and it is very little consolation to the individual occupier when he can at last turn to the scene of his former labours to find that all that remains of his office equipment in a building which at the outset he is assured was fireproof, is the conglomerate remains of a typewriter and a battered iron safe.

It seems to have been overlooked by the designers of these buildings that there was as much danger from the outside as within, and perhaps more so, and no provision, or at any rate very inadequate provision was made for an attack from fire on the exterior.

I am quite convinced that had these tall buildings been more adequately equipped with fireguards from without they would have saved the fire, not as a mere constructional detail as we see them to-day, but with more of an internal trim and contents saved from the burning element.

* A paper read at the Budapest Fire Congress, August, 1904, by Mr. Ellis Marsland, District Surveyor, London; Gen. Hon. Secretary to the British Fire Convention Committee.

Beyond I think in one case where external sprinklers were used at O'Neill and Co.'s store with marked effect. Wired glass seems to have resisted the ingress of the flames in a marked degree in the buildings where it was used, and has proved itself worthy of more general adoption, but it requires to be fitted into metal frames, and I think very useful experimental work could with advantage be conducted with this material to ascertain the best method of fixing, and also whether double thickness either in the same frame or an inner frame would be more effective. In the paper read at the Fire Prevention Congress at London in 1903, on the new Entrepôt Royal in Antwerp, the method of fixing adopted there was illustrated on page 58 in a paper read by Chief Officer A. Scheepers.

I am not so sure that wired glass is the best material that will eventually be adopted for this purpose of "exposure risk," but it appears to me to be the best material now available; what we require is a transparent material with a higher melting-point than ordinary glass, and it is for manufacturers who see the want to supply the need. This fire has clearly shown that the town building owner must not be allowed to construct his building in the cheapest and flimsiest manner, trusting to the efficiency of the fire brigade to protect him from his neighbour, or vice versa. It has again been demonstrated that however efficient the equipment and however devoted the personnel of the brigade may be (and I should like to take this opportunity of expressing my admiration for the fire fighting force on that occasion), with a high wind and the fire spreading in three or four directions at the same time, the task of extinguishing is superhuman. The building owner should by his construction assist the brigade to keep a fire at the outset within reasonable limits, or to retard its progress by sound fire-resisting construction. I have carefully examined the plan of the burnt area at Baltimore, and it appears to me that the building regulations want revision so as to limit the cubical contents of buildings. From a rough calculation I find that the cubical contents of the "Hurst" building, where the fire started, was between 700,000 and 800,000 cubic ft. (20,000 and 22,857 cubic metres), and when a building of this cubical extent becomes well alight its extinction without adjoining damage is a matter of great difficulty. What is wanted is a limit to the cubical extent, and any building of the warehouse or store class should be divided into compartments by vertical walls, and any communication between each compartment should be by double iron doors properly secured. I cannot help thinking that we in London have been saved from these disastrous fires by this means; we have on some occasions had similar conditions, viz., a fire in a crowded district with a high wind, but although considerable damage has been done, the fire has been stopped mainly by the vertical walls dividing up the buildings. The London Building Act limits the cubical contents of buildings of the warehouse class to 250,000 cubic ft. (7,142 cubic metres). It would, I think, be a great advantage in buildings of this class that all roofs be flat and of fire-resisting material. A flat roof is a great advantage to the fire fighting force. Reverting to the material of which fire-resisting floors and roofs are made, I have great faith in coke breeze or cinder concrete when properly mixed and reinforced with iron, and also as a protection to ironwork generally. My faith is from actual experience, which this Baltimore fire corroborates. We have at our testing-station the roof of one of our huts constructed of this material, and although beneath it we have conducted a number of tests, some of one, two, three, and four hours duration with a temperature gradually increasing to 2,000 deg., this roof is practically as good as the day it was erected. Hollow tile has shown its deficiencies, but concrete has yet to be defeated. One word as to staircases and lifts. All well-boles around such should be encased in brick, and all doors on to same should be made to close automatically, and the top should terminate in a light glass roof, easily broken in case of fire, and thus a shaft would be formed for the escape of smoke and flame, which would thus be prevented from penetrating other portions of the structure.

Thanking you, gentlemen, for so patiently listening to my remarks, I have to thank the reader of the former paper for the information contained therein.

UNION OF BENEFICES, LONDON, AND HOLY TRINITY, MINORIES.

ORDERS in Council have been made for ratifying many schemes recently prepared by the Ecclesiastical Commissioners. Two of the schemes relate to the churches of St. Saviour, in London-street, Fitzroy-square, and Holy Trinity, in the Minories. In the former case the benefices of St. John the Evangelist, Charlotte-street, and St. Saviour will be united, and the Church of St. Saviour will be converted for a Sunday School or other purposes, and the proceeds of the sale of the parsonage-house are to be applied towards the provision of a parsonage-house for St. George's, Enfield. St. Saviour's was built of brick, as Fitzroy Chapel, after designs by the brothers Adam, at the time when they laid out Fitzroy-square, of which they completed the east and south sides in 1792-4, and, having been altered for 1,000 seats by J. Peacock, was consecrated and re-opened in July, 1864. The union of the benefices of Holy Trinity, Minories, with St. Botolph, Aldgate, having been effected, the residue of the endowments of the former benefice are to be allocated to the incumbent of St. Mary, Stratford-by-Bow. Holy Trinity Church, at the east end of Church-street, formerly Little Minories, was built in 1706 to replace the Minory House chapel of the parish, about 5 acres in extent, and one of the Tower Liberties, that had been constituted out of the close and precincts of St. Mary's Abbey. That convent of Franciscan nuns was founded in 1293 for Poor Clares, or *Sorores Minores*, by Edmund, Earl of Lancaster, surnamed Crouch-back, and his second wife, Blanche, Queen of Navarre. Fragments of the abbey buildings have been found in the front, since modernised, of Haydon House, and after the fire of two or three weeks ago, in the north wall of the church, which was closed in January, 1899, and converted into a mission-room. After the surrender by Dame Elizabeth Salvage, last titular abbess, the property was granted to John Clerke, Bishop of Bath and Wells, the precincts became a colony of metal-founders and gunsmiths, and around the fountain was built Haydon-square, so named after Sir John Heydon, Lieutenant of the Ordnance. In the old church Edward I. deposited the heart of his mother, Queen Eleanor of Provence; the interments comprise those of Bishop Clerke, and some Scotsmen who fought on Drummoissie Moor, Culloden—an adjacent public-house in the Minories has the sign of "The Three Lords"—Edmund de la Pole, Earl of Suffolk, his wife, and their daughter, a nun of St. Clare. A relic used to be shown at Holy Trinity as the head of Lady Jane Grey's father, the Duke of Suffolk, who held the Minory House by grant from Edward VI., but there is reason to believe that the head belonged to Edmund de la Pole, Earl of Suffolk, whom Henry VIII. decapitated in 1513. The registers record the burials of Cornelius Dribbel, a Dutchman, "his Matle chief Ingencere" (October 16, 1633), who should share with Fontana the credit of inventing the microscope, and (1670) Colonel William Legge, King Charles I.'s faithful servant, who received a grant of the Minory, rebuilt as the King's House, from Charles II., and was Lieutenant of the Ordnance. His descendants, the Earls of Dartmouth, had a right to sepulture in the vault under the chancel. The inscription on the marble monument gives, wrongly, the date of his death as "1672." Sir Philip Sidney's body lay in state in the church, and was carried thence by the Grocers' Company to St. Paul's.

GLASGOW.—Mr. Roscoe Mullins's fine group of Isaac and Esau:—"Bless me even me also O my Father," which has been exhibited twice at the Royal Academy, in plaster in 1884, and in marble during the present year, is at present on view at the Sculpture Gallery, Kelvin-grove, Glasgow, where it will remain for twelve months.

PROPOSED COTTAGE HOSPITAL, MOFFAT.—The directors of the proposed cottage hospital at Moffat decided, some weeks ago, to approve of the plans prepared by Mr. H. W. Walker, architect, Edinburgh, and instructions were given to prepare working plans. In the interval some opposition has arisen to the adoption of the plans, and objection was taken to restricting the competition to two architects. At a subsequent meeting of the directors the plans referred to were disapproved of, and it was resolved to invite competitive designs.

OLD HOUSES
SHEPTON MALLET
SOMERSETSHIRE

OLD HOUSES, SHEPTON MALLET.

SHEPTON MALLET, which is about 5 miles from Wells, is a quaint old town. The chief interest to the architect lies in the church and market cross, both of which are well known; and there are several good examples of domestic work, the best being the houses shown in the accompanying sketch. They are in an excellent state of preservation and form, with their red-tiled roofs and steep-pitched gables; a picturesque group, but being situated in a very narrow street, some distance from the main road, are little seen. W. EATON.

Books.

Pioneer Irrigation: a Manual of Information for Farmers in the Colonies. By E. O. MAWSON, M.Inst.C.E., Executive Officer, Public Works Department, Bombay. With Additional Chapters on Light Railways, by E. R. CALTHROP, M.Inst.C.E., M.I.Mech.E. Illustrated by numerous plates and diagrams. London: Crosby Lockwood and Son. 1904.

THE title-page indicates, this book was written with the object of affording information to pioneer settlers on the subject of irrigation. The additional chapters on light railways may seem to be a little out of place, and perhaps might be more suitably presented in an extended form as a separate volume under the title of "Pioneer Railways." It is the fact, however, that irrigation and railways should go hand in hand whenever practicable, and for this reason we who are occupied in the development of irrigation in new countries will find the inclusion of this second subject both helpful and convenient. Chapters I. to IV. contain detailed instruction on various preliminary works connected with the supply of water, and, speaking generally, such undertakings are suggested as can be executed by an intelligent and resourceful settler unable to command professional advice or skilled labour. In Chapter I. the author gives some striking figures in proof of the value of irrigation. For example, he states that in South Africa the selling price of irrigable land not provided with water varies from 3s. to 3l. per acre, while when provided with annual irrigation it is worth from 20l. to 100l. per acre. Again, we are told that the fruit lands of Arizona and California are almost useless until they are watered, after which they become worth 50l. to 60l. per acre, while vines in good positions with first-class water rights are valued at 200l. to 300l. per acre. Particularly profitable results are quoted with respect to India and Egypt, the pioneer countries of irrigation. In America this department of agriculture has developed very much during recent years, and in South Africa the Government and the agricultural classes are at last beginning to think seriously of operations on a large scale. In Australia there are immense tracts of land, now subject to permanent or intermittent drought, and through which the rivers are allowed to carry away great volumes of flood water, that would be worth their weight in gold if intelligently stored and utilised. Much misery has been suffered, and is still being suffered, in some parts of Australia by neglect of irrigation works, and we are pleased to think that Mr. Mawson's work may have the effect of awakening many owners and occupiers of land to a sense of their obvious duty in this direction. Having disposed of preliminaries, the author deals with the construction of dams and weirs in Chapter II. Settlers in new countries generally make a point of choosing their homes near watercourses, and in any such situation the escape of water can be effected at comparatively little expense by the building of a weir, or the raising of a dam to form a reservoir. In the case of an overflow weir must be provided to permit the escape of surplus flood water. The proviso that no dam higher than 10 ft. above the bed of the stream should be built without professional advice, the author details the methods of construction suitable for adoption by pioneer farmers, giving sections of masonry, earth-filled, earthen and timber dams. Similar treatment is pursued in the case of weirs, and full account is given of "automatic weirs," the usefulness of which depends on the rapid and automatic opening of the sluice gates, which form a movable crest, when the river is in flood. Simple directions are also given for the construction of head gates, or regulators, for controlling the supplies of water to irrigation canals, and for preventing the flood waters of a river

from entering such channels and thereby causing injury to the banks. We may here observe that several views of dams and weirs illustrating this chapter represent undertakings of far too ambitious character for execution by settlers having no technical knowledge or experience, but this reservation must not be taken as applying to the more simple works, the construction of which is so lucidly explained by the author. The construction of irrigation channels, flumes, iron trough and pipe aqueducts should offer no great difficulty to the man who is accustomed to work upon land, and by following the rules given in Chapter III. the intelligent cultivator ought to be able to provide adequate means for the distribution of water stored in his reservoir or held up in the bed of the stream passing through his lands. Recognising the fact that sources of water supply are not always to be found on the surface, the author wisely devotes a chapter to "Underground Water," pointing out the value of wells, horizontal bores, and open galleries. The hints offered with regard to the first of these classes of work cover matter that is fairly well known, but the description of the methods to be adopted in making horizontal bores and open galleries will probably be found less familiar to many readers. It is pointed out that the most economical means of raising water from wells is by windmill pumps, which are very largely employed for irrigating fruit gardens in America, and, we may add, are now becoming general in this and other countries. Other types of pumping machinery are discussed in the same chapter, but as most of these involve the use of animal or steam power they are naturally to be avoided wherever possible. We now arrive at one of the most useful chapters in the manual. This, entitled "Methods of Irrigation," contains much excellent advice which the experience of the author thoroughly qualifies him to impart. The practical success of every method essentially depends upon knowledge. On this point we cannot do better than to quote the words of the author:—"The knowledge of the best way of applying water to the crop, and the amount necessary, forms one of the most important factors upon which depends success in irrigation operations. . . . Both the crop and soil must, therefore, be considered when determining the amount of water to be used in each case, and the exact quantity required can only be determined by experience. Until this experience has been gained there is a strong tendency to use too much water. This is the greatest mistake, and it is better to use too little water than too much." After further advice of this character Mr. Mawson describes and illustrates different methods of distributing water, and concludes the chapter with a reference to "Inundation Irrigation," and the conditions under which it may usefully be adopted. Passing over a short chapter on "Sewage Irrigation," which is a subject scarcely likely to interest pioneer settlers, attention will be briefly directed to the subject of "Automatic Sluice Gates," considered in Chapter VII. Apparatus of this kind is so constructed that as the volume of the flood increases or diminishes the sluice gates adjust themselves automatically to the flow, opening and closing in proportion as the volume of flood water increases or diminishes. With non-automatic gates there is always the risk that those whose duty it is to open the gates may neglect to do so in case of flood, and the attention of all cultivators of land may well be called to the type of apparatus fully described in this chapter. Mr. Mawson next devotes himself to the discussion of cultivation as applied to cereals, vegetables, and fruit trees, which, although a most important branch of work, does not here require more than passing mention.

With regard to "Light Railways," forming the subject matter of Chapters IX. and X., it may be said that such works are only second in importance to water supplies in the development of new countries, for they afford means by which agricultural products are greatly increased in value. It is scarcely to be expected that settlers will be able to build and equip even light railways without professional assistance, and undertakings of this kind clearly demand co-operation between the chief occupants of land along the proposed route and the inhabitants of the objective market or markets. Mr. Calthrop, the author of the two chapters here in question, has had considerable experience in connexion with the design of light railways, and the information he now gives should be sufficient to enable the layman to

appreciate the essential features of such means of transport, and to obtain a good idea of the most suitable types of rolling-stock for employment under different conditions.

In conclusion, we may say that throughout the volume the subjects selected are satisfactorily discussed in simple language perfectly intelligible to the non-technical reader. Mr. Mawson has succeeded in demonstrating how available water supplies can be applied to the irrigation of crops by means of comparatively inexpensive works quite within the reach of the class to whom his work is addressed, and Mr. Calthrop has conveyed in a similar manner much useful information with regard to railway transport. The numerous diagrams and other illustrations add greatly to the value of a work which will be read with profit and pleasure by those who are interested in the development of lands in arid and semi-arid regions.

Transactions of the Institution of Civil Engineers of Ireland (69th Session, to May, 1903). Vol. XXX. Dublin: Printed for the Institution by JOHN FALCONER. 1904.

ALL the papers reprinted in the present volume of transactions are of marked interest. Mr. Mark Ruddle deals with the electrical transmission and transformation of energy, a rival to old-fashioned methods so convenient and efficient that it already bids fair to oust its older competitors from many fields of work. The author devotes attention more particularly to the application of electricity to motive power in workshops and factories. An exhaustive paper on "The Destruction of Town's Refuse," by Mr. H. Norman Leask, will well repay careful study, and "Some Notes on Route Surveys with the Plane Table in Egypt," by Mr. J. T. Trevor Dillou should be read by surveyors who contemplate going abroad, as it contains many practical hints that are seldom conveyed in text books or courses of lectures. Mr. W. E. Lilly discusses "The Design of Plato Girders," pointing out that the rough and ready rules now in use and based on hypothetical conditions, lead to excess of material in the web of such members. The treatment as put forward in this paper differs considerably from that generally given in engineering treatises, and a method proposed by the author of treating the web section as divided into two parts for the purpose of calculation is quite new, and worthy of examination. Some points of great importance are raised in the instructive paper by Mr. Allanson-Winn, on "The Voughal Foreshore Protection Works; and Deep Sea Erosion on the East Coast of England." The author says:—"Local authorities too often consider only what they can see—falling cliffs, wasting beach, and broken-down walls, groynes, etc., for which they have paid heavily. They do not realise that the trouble is brought about mainly by the advance of deep water, and even when this is fully explained and proved they exhibit a tendency to ignore the facts because they are unpleasant ones." Mr. Allanson-Winn has devoted much time to the question of deep sea erosion, and the aspect of the foreshore protection problem which he here puts forward is distinctly novel, and demands at least the most searching investigation.

Builders' Hoisting Machinery, with Numerous Illustrations. Edited by PAUL N. HASLUCK. London: Cassell and Company. 1904.

AMONG the contents of this little handbook the mechanic or builder's foreman will find many items of useful information, conveyed in simple language and in a manner likely to be appreciated by all practical men. Simple lifting tackle, winches, crabs, and cranes of various types are described, and their details of construction discussed. In the last chapter the reader will find a brief but complete account of the different methods by which motive power is applied to the operation of hoisting machinery. The handbook comprises some eighty-three illustrations and a well-prepared index. It is an excellent manual for those desiring general, and more or less elementary, information upon the subject discussed.

Particulars of Docks, Wharves, etc., on the Thames. Compiled by CHAS. H. JORDAN, M.I.N.A. Second edition. London: E. and F. N. Spon. 1904.

THIS is a useful small publication giving in tabular form the particulars of docks and wharves on the Thames. Those of the docks

GROUND PLAN.

FIRST FLOOR PLAN.

Winsley House, Wilts.

give measurements, with the names of the proprietors and other particulars. The list of wharves gives name, situation, and proprietor's name. There is also a good series of maps of the reaches of the Thames below bridge, with the docks and the places situated on the banks. The whole is very well and carefully done.

BOOKS RECEIVED.

HOW TO COLLECT OLD FURNITURE. By Frederick Litchfield. (Geo. Bell and Sons.)

Illustrations.

NEW ROOF, MAGDALEN COLLEGE HALL, OXFORD.

THE new roof, shown in the illustration, replaces a poor plaster one of comparatively modern date, and incongruous character. The old stone corbels only remained, and signs of the pitch of the original roof were alone visible.

The roof is of English oak throughout and is covered with lead. The window in the eastern end of the hall had been walled up. It was found to be much injured, and it has been made good to what was probably the old design, and has been filled with good heraldic stained glass. A new fireplace has been put in the hall. The roof has been carried out by Messrs. Rattee and Kett, of Cambridge, from the design of Mr. G. F. Bodley, R.A.

WINSLEY HOUSE, WILTS.

This house has been erected upon the site of an old house, and is built entirely of stone quarried upon the site, the roof being covered with old stone tiles collected in the neighbourhood.

The plan is of a somewhat unusual form, and was determined by attempting in the first instance to alter and add to the existing house; the old work was, however, found to be in such a bad condition, that it became necessary

to entirely rebuild, the lines of the original plan being retained.

The ground floor contains a large hall, drawing-room and library, in addition to a kitchen and offices. The first floor has eight bedrooms and a large billiard room with an oriel window, and there are seven bedrooms on the second floor.

The contractors were Messrs. J. Long and Sons, and the clerk of the works, Mr. E. J. Trotman; the architects being Mr. T. B. Silcock and Mr. S. S. Reay, of Bath and London. The two views now published were hung in this year's Royal Academy Exhibition.

CHURCH OF S. CHAD, LONGSDON, STAFFORDSHIRE.

This church is being erected at Longsdon, near Leek. The foundation stone was laid by the Bishop of Shrewsbury in October last. The church consists of a nave, north aisle, chancel, priests' and choir vestries, and will accommodate about 350 people. Ladder-edge stone is used for the walling, and Red Alton and Roches stone for the windows, piers, quoins, and other dressings.

The general contractors are Messrs. Thomas and Henry Grace, of Leek. The architect is Mr. Gerald C. Horsley.

CONGREGATIONAL CHURCH, DOVER.

This church is built to accommodate the congregations of two smaller ones in the town. In accordance with the wishes of the Committee it is designed in the Gothic style of the XIVth century (treated in a somewhat free manner).

The walls are of Kentish rag with freestone dressings. The roofs are covered with local tiles. The woodwork generally inside is pitch pine. The seating, supplied by Bennetts, is of oam. The heating apparatus by Grundy, and the electric lighting by Wright and Sons, of Dover.

The site being very cramped, and seating accommodation required for 650, nearly the whole area is covered by the building; the windows in the side walls are, therefore, liable to be interfered with by adjoining owners. In order

to obtain light that cannot be so obstructed, a large window is placed in the east wall facing the street, and a sort of clerestory of windows formed in the roof; the principals are carried to the side walls, and are cased and rough cast outside, showing above flat as a kind of buttress.

The cost will be under 7,000*l.*, exclusive of site.

Messrs. R. and G. Brisley, of Dover, are the builders, and Messrs. Cresswell and Newnham and Beeston, also of Dover, the architects.

The drawing was exhibited at the Royal Academy this year, under the name of Mr. Newman only, as in the title on the plate.

DINING-ROOM, DALTON HILL, ALBURY.

This is a dining-room which formed part of some additions to Dalton Hill, Albury.

The work was carried out by Messrs. Mitchell and Sons, of Shalford, Guildford. The joined work is in fumigated oak; the windows are lead-glazed casements set in the stonework. Mr. Evelyn Hellicar was the architect.

AYLESFORD BRIDGE AND PRIORY.

The illustrations of Aylesford Bridge and the portion of the ancient priory now known as "The Friars," are from photographs, which we are indebted to Mr. Chinch, of the Society of Antiquaries. Aylesford Bridge, the only one that spans the river Medway between Maidstone and Rochester. It was built in the XIVth century, and though two of its arches have been made into one to meet the demands of later traffic, it presents a general appearance a likeness to the co-eval bridge across the river at Farleigh, about five miles above Maidstone. It was originally known at the ford on the British road, latterly known as the Pilgrims' "Way," along which tin ing were carried from the west of Britain to Rutupia or Sandwich haven. One can follow to-day the ancient, but now deserted, road which, as lately as the middle of the XVth century, was known as the "King's Highway," from Westerham to Shoreham (in Kent) Skirting the forest of Anderida and traversing

The Student's Column.

NOTES ON PORTLAND CEMENT. CHAPTER VIII. (Continued).

WHEN cement is mixed with a certain amount of water a plastic paste is formed which stiffens after a time and then hardens so as to resist slight pressure. According to Le Chatelier's theory of supersaturation, the time which elapses from the addition of the water till supersaturation takes place is the "initial set." When the cement cake resists a certain pressure it is said to be "hard set."

There are a number of methods of determining these points, none of which are entirely satisfactory, but the most generally adopted method is to bring a weighted needle of a certain section down gently on the cake. When it fails to penetrate to the bottom the "initial set" is said to have taken place; when it leaves no visible impression on the surface the

cement is "hard set." With quick-setting cement the "initial set" is clearly defined owing to rapid crystallisation; with slow-setting varieties the change is often so gradual that the point is not absolutely definable. The *modus operandi* is as follows:—

The cement is mixed with just sufficient water that after thorough mixing, so that all the particles become wetted, a stiff paste is obtained. This is spread on a clean glass plate into a cake about 1/2 in. thick, and tried from time to time with the needle till it is found to be set.

There are so many causes influencing the results obtained, and unfortunately in most specifications no particulars are given regarding the method in which the test will be carried out. With any sample of cement the same tester can obtain vastly varying results according to the method of manipulation, and a much wider range of results may be obtained when tested by different operators.

Some of the causes which influence the results are the character of the water, the amount of water used in gauging, the

temperature of water and air, the method of mixing, and the time taken for manipulation.

The results of experiments by the author to see what effect lengthening the time of mixing had on the setting time are given in Table I. The effect of different proportions of water is shown in Table II. The author has found that

when the mixing with water is done in a large porcelain mortar—that is, very efficient mixing—the setting time is much longer than when mixed with a trowel. The higher the temperature the quicker will setting take place, the chemical action being more energetic.

As the setting depends on the hydration of the compounds, the cement cake must not be allowed to dry, so should be protected from currents of air and from the heat of the sun. Especially between the temperatures of 40° and 60° Fahr. is the influence of temperature seen on the setting of cement, and it is very noticeable in testing that a difference of three or four degrees has a marked effect on the setting time.

often set more quickly when gauged with sea water than when gauged with fresh water. As pointed out in a previous chapter, Candlot recognised the presence in cement of a double compound of aluminate and sulphate of lime, a compound which he prepared artificially. From this he deduced the following theory:—

"It is well known that aluminate of lime is insoluble in a saturated solution of lime. If sulphate of lime and free lime are present together with aluminate of lime it follows that the combination of the sulphate with the aluminate can take place but very slowly, because the aluminate cannot become hydrated on account of the immediate solution of the lime. In Portland cements there always exists free lime, and this lime by dissolving prevents the hydration of the aluminate; the sulphate of lime, becoming dissolved in turn and not being able to combine with the aluminate, adds its action to that of the lime in annulling the function of the aluminate, and as it is to this salt that setting is attributable when it takes place rapidly, a slow-setting cement results. If the free lime by being sufficiently exposed to air becomes carbonated, at the moment the cement comes into contact with water the lime dissolves less freely, and nothing prevents the solution of the aluminate; the combination with the sulphate of lime can take place, and the sulpho-aluminate formed, as well as the excess of aluminate, by crystallising determine the rapid setting of the cement."

Candlot found in support of this theory that—
(1) A cement mixed with gypsum and slow-setting when gauged with fresh water set quickly when gauged with a weak solution of carbonate of soda (0.2 per cent.).

(2) A cement with gypsum added, and which has become quick-setting through exposure to the air, is rendered very slow-setting by the addition of a little quantity of slaked lime.

TABLE III.

Temperature ° F.	Setting Time when Gauged with 25 per cent. Water.			Temperature ° F.	Setting Time when Gauged with 25 per cent. Water.		
	Initial.		Final.		Initial.		Final.
	Minutes.	Hours.	Minutes.		Minutes.	Hours.	Minutes.
57	15	—	50	48	34	4	—
59	12	2	—	55	17	3	30
65	26	2	10	46	55	3	—
61	46	2	—	53	110	5	—
57	30	2	—	50	50	3	50
70	18	2	10	65	60	4	55
65	5	1	30	63	9	2	10
60	135	4	43	55	213	8	—
65	50	1	47	48	122	10	—
59	21	1	13	53	43	4	10

Assuming Le Chatelier's theory of supersaturation, it is evident that the more water is added to a cement the slower will its set be, as it will take longer for the water to become saturated.

There are several compounds which, when added to cement, affect its setting. Almost the only one used in practice is sulphate of lime in the form of gypsum, which slows the setting. The German Association of Cement Makers recognise the addition of this compound up to 2 per cent.

Candlot's researches show the effect of gypsum on the setting of cement. His conclusions were:—

(1) The retardation of set caused by the addition of gypsum varies according to the quantity employed.

(2) The action of gypsum is not always permanent, and it often happens that cements slowed by the addition become quicker-setting after aging, and one peculiarity is that they

NEW HEADMASTER'S HOUSE.—In a limited competition for a new house for the headmaster, Upper Latymer Foundation, Hammersmith, the designs prepared jointly by Mr. W. I. Chambers, of Chambers and Martin (London), and Mr. J. H. Brown (Fulham), have been selected by the governors, and the contract, amounting to 1,915*l.*, has been given to Messrs. Frank Harris and Co., of Barnsbury.

EXHIBITION AT VENICE.—The Sixth International Art Exhibition at Venice, under the auspices of the Municipal Council of the City, is to be opened on April 22, 1905, to remain open till October 31 of the same year. It is to include sculpture, painting, drawing, engraving, and decorative art. Notification of the intention to exhibit must be sent not later than January 1, 1905, to the office of the Secretary of the Exhibition, Municipio di Venezia.

TRADE CATALOGUES.

We have received from the Private Wire and Telephone Installation Company, Limited of 5, Palmer-street, Westminster, a series of leaflets describing their automatic intercommunication telephone system, the "house phone," and a description of the work under taken by their electric light department. They have introduced sundry improvements in their telephone system, and it should prove useful in municipal buildings, factories, etc. To get into communication with any desired room it is only necessary to depress the key opposite the required number. The "house phone" is a cheap form of combined telephone and microphone which can be fitted with little trouble to any existing system of electric bell.

Correspondence.

THE DRAINAGE OF A HOUSE.

SIR,—In your issue of September 10, Mr. W. R. Purchase criticises, from the abstract which you were kind enough to publish, the paper on the above subject that I read at the recent Glasgow Congress of the Sanitary Institute. Before commencing his criticism Mr. Purchase is kind enough to let us know of the qualifications which he has for acting as a critic. For the past twelve years, Mr. Purchase has been acting as a building inspector to a borough council, and previous to that was connected with a pottery, where they made drain pipes, so that, although he has tested on an average three or four hundred new drains each year, a goodly part of the twelve years he mentions will have been taken up in learning his business as a building inspector, and to judge from what he has written, he has still something to learn about the drainage of a house. I have had thirty-one years' experience, as an apprentice journeyman mason, foreman, builder, manager, and clerk of works; therefore should also be expected to have some practical experience of the subject, and the parties who asked me to contribute the paper had thought that I did know something about it.

If Mr. Purchase had been present at the congress he would have heard that I did not advocate the use of freelay pipes because they were made from freelay, but that I advocated the use of pipes made from a fre clay which was found to be suited for making a strong non-porous pipe.

Mr. Purchase says that "this new advocacy of the freelay drain pipe is undoubtedly a retrograde movement." Does anyone for a moment consider that a freelay closet, substituted for a cast-iron one, is a retrograde movement? or the substitution of freelay sinks, baths, lavatories, and urinals for cast-iron fittings of that description, can that be termed a retrograde movement? If not, then why should the substitution of a freelay pipe for a cast-iron one be considered a step in a backward direction?

Mr. Purchase is kind enough to describe how the glazing of an inferior freelay pipe is effected, but I have to ask him if, in his pottery experience, he never heard of a freelay pipe lined with a fluxing "skin," and having a D.D.V. (double dipped vitrified skin) on the outside. Mr. Purchase admits that the defects to which freelay pipes are liable can be remedied if proper care be taken in the laying of them, and with the material used. I am certain that anyone who has had experience of some of the sanitary regulations in cities and towns will admit that they are far from perfect, and will agree with me when I say that they should not be quoted as an authority, as to what materials should or should not be used.

I do not think that I have proved too much by my tests; it is only a person who, like Mr. Purchase, reads a meaning into them which was not intended, or fails to grasp my line of argument, that would make that statement.

Mr. Purchase says that "hydraulic pressure is the only agent that should be used in tests," but from his I beg to differ. It is not an internal hydraulic pressure that we have to guard against in house drainage, but an internal pneumatic pressure caused by a sudden increase of temperature in the pipe resulting from such a cause as a discharge of hot water into the drains. During my tests on pipes, I found that a pipe which stood a hydraulic pressure of 60 lb. per sq. in., with out the least sign of porosity, would not stand a pneumatic pressure of 2 lb. per sq. in. From this we may infer that hydraulic test is no guide as to whether a drain is airtight or not, and that the pneumatic test is the only one that can be relied on.

COMPETITION.

Mr. Purchase had read the abstract of ordinary care he would have seen that it did not experiment on a glass lined pipe, on what is sold, and as I thought was worn to all sanitarians, as a glass enamelled pipe. I am quite aware that the majority of acids can be stored in a glass carboy, but I am not aware of any pipe fender having come the difference of expansion, when heated to heat of glass and cast iron. A cast-iron pipe could be lined with stoneware in a satisfactory manner.

Mr. Purchase says that cast-iron piped with lead can be made perfectly tight. Has Mr. Purchase ever tested old pipes, laid in this manner, which had been subjected to an intermittent flow of hot and cold water, and found them tight?

Mr. Purchase advocates the use of cast-pipes lined with porcelain enamel. In Mr. Purchase's pottery experience, I have not been found that before a satisfactory melling mixture could be fused on, a temperature, ranging from 3,000 deg. to 100 deg. Fahr. was required in the kiln. Would I ask if this temperature can be applied to a cast-iron pipe?

will not follow Mr. Purchase into the part in this article which does not deal with what is in my paper.

SAMUEL SMITH.

GENERAL BUILDING NEWS.

NEW ROMAN CATHOLIC CHURCH, HULL.—The Catholic Church of St. Patrick, in Spring-ett, Hull, was opened recently. The new edifice is in the Romanesque style of architecture, and is built of red brick with stone sills. The nave and sanctuary combined are 100 ft. long by 24 ft. wide, north and south aisles of the same length, by 12 ft. e. The nave arching and the arches to sanctuary and side chapels are of stone, with carved capitals and moulded arches. The sanctuary floor is laid with Rust's vitreous tile, the steps are of idle stone with tiled risers. Sacristies, heating chamber, etc., are provided. The communion rails are in stone, with three wrought-iron gates and polished brass rails. The church will be heated on the low-pressure system, and lighted by electricity. Accommodation is provided for 550. The contractors were Messrs. G. Jackson and Sons, of Hull, the architects being Messrs. Brodriek, Lowther, Walker, of Hull and Bridlington.

RENOVATION OF ST. PETER'S EPISCOPAL CHURCH, PETERHEAD, N.B.—This church was lately reopened after having been extensively renovated. Besides the introduction of a pipe organ, the improvements include the erection of a new porch, the formation of an entrance at the west-end of the church, an adequate choir vestry, and the repaint and cleaning of the whole of the edifice. The joiner work has been executed by Mr. Messrs Taylor, jun., and the building work by Messrs. Wm. Stuart and Son. The organ, which is in a case of pitch-pine, stained dark, with front pipes gilded in old gold, has been built by Messrs. Wadsworth Brothers, Manchester, and cost 520l. The alterations were carried out from the plans of Mr. Marshall Mackenzie, architect, of Aberdeen.

ALTERATIONS TO THE PRESBYTERIAN CHURCH, DUNDEE, NORTHERMBERLAND.—After having undergone alterations, both externally and internally, the Cheviot-street, Presbyterian Church, Dundee, was reopened on the 4th inst. The alterations consist of a new tower at the west corner in the Gothic style, with a spire in the centre, rising to a height of 70 ft. above the ground. Traceried windows have been put in, with stained glass throughout. The walls have been raised 5 ft., and battlemented. The interior of the walls have been painted, the woodwork varnished, and the seats newly upholstered. The incense burner has been introduced, and lighting conductors have been connected with the highest points. The contractors for the work were:—Builders, Messrs. H. Elliot and Co.; Berwick; joiner, Mr. T. Lumsden; slat and plastering, Mr. J. Simpson; plumbing, Mr. J. Briggs; painting and glazing, Mr. G. Jackson, all of Wooler; upholstering, Messrs. W. Skelton and Co., Edinburgh. The work has been executed from plans prepared by Mr. Revell, architect, Alwick.

NEW WESLEYAN CHURCH, POLPERRO.—The Wesleyan church at Polperro was opened recently. The new building has a total length of 55 ft., and is 35 ft. 6 in. in width. Accommodation is provided for 350 adults or mixed congregation of 450 persons. The organ and choir are placed on a raised floor in the rostrum, and there are vestries for the minister and choir. The exterior is made to open outwards on springs. The general design is late English Gothic. The walls are of stone, faced with stucco, and the roof is covered with Cornish slates. The

timber is red deal, and the joinery, pitch-pine. The timbers of the roof have curved ribs and panelled work stained dark. The windows are glazed with cathedral leaded lights, and the heating is by hot water, the ventilation being on the natural system with fresh air inlets at the sides and extractor in the roof. The cost of the work, exclusive of land, is about 1,850l. The architects are Messrs. John Wills and Sons, of Derby and London, and the building work has been carried out by the following:—Messrs. Littleton and Blatchford, masons; Messrs. T. and T. Libby, carpenters and joiners.

CONGREGATIONAL CHURCH, TOOTING.—Work is shortly to be commenced on a new Congregational church, which is to be erected in Mitcham-road, Tooting. The building will be of hard red brick, with stock sides, and stone or terra-cotta dressings. It will be heated by steam, and lighted by electricity. Seating is to be provided for 800 people, about 300 of whom will be placed in galleries. A church parlour and vestries will also be provided. The architects are Messrs. Gordon and Gunton, the contractors being Messrs. Castle and Son, Clapton. The cost will be 5,500l.

ENGLISH CONGREGATIONAL CHAPEL, CAERPHILLY, WALES.—The new English Congregational Chapel, situated in Van-road, Caerphilly, was opened a short time ago. Owing to the difficulty of the site, the chapel is built with two floors. On the lower floor, with the main entrance in Goodrich-street, are arranged a church parlour, two vestries, and four large classrooms, together with kitchen and lavatory, etc. The chapel itself will accommodate 500 people without galleries. Provision is made for galleries to be erected at a future date. The structure is built in Late Gothic style. The walls are faced on the outside with blue Pennant stone, with Bath stone dressings. The interior is treated with pitch-pine arches carried on columns. The total cost of the building is about 3,000l. It has been built by Mr. J. Howells, from the designs prepared by Mr. W. Beddoe Rees, architect, Cardiff.

MOSQUE FOR LONDON.—According to the *Daily Mail*, Mr. Robert Williams, architect, has been commissioned by a Turkish Pasha to prepare plans for the erection of a mosque to accommodate the 2,000 Mahommedans estimated to reside in London. A feature of the edifice will be a minaret, whence the muezzin will call the faithful to worship. The plans have been sent to Constantinople for the approval of the Sultan.

NEW SCHOOL, PARKHEAD, GLASGOW.—The new school erected for the Glasgow School Board at Parkhead was recently opened. The building is built of red sandstone, covered with Westmorland slates. It is lit throughout with electric light. Accommodation is provided for 1,476 scholars. Messrs Macwhannell and Rogerson, architects, Glasgow, prepared the plans for the work.

NEW SCHOOL BUILDINGS, HUNTY, N.B.—The new wing which has been added to the Gordon Schools at Huntly was opened recently. The main walls of the building are of local granite, with dressings of Elgin freestone. The structure is two stories in height. The ground floor has in the centre a hall, containing a staircase with double flights, giving access to the first floor, and having at either end separate cloak-room and lavatory accommodation for boys and girls. On the east side of the entrance hall is a range of three classrooms, each seated for sixty pupils, with dual desks. The western side of the ground floor is given to the gymnasium, which is a hall measuring 76 ft. long by 25 ft. wide and 14 ft. high, fitted up with the necessary appliances. The first floor has a hall in the middle, with board-room and headmaster's and teachers' rooms at the ends, and a range of three classrooms. The nine classrooms provide accommodation for 540 pupils, and the gymnasium for nearly 180 more. The building is heated by hot water on the low-pressure system from a furnace in the basement. Playgrounds enclosed by iron railings are provided both for boys and girls. The architect is Mr. R. G. Wilson, Aberdeen, and the following were the contractors:—Mason, Robert Mitchell, Huntly; carpenter, James McKay; Huntly; plasterer, George McKay; Huntly; plumber, John Wilson, Huntly; painter, A. Robertson, Huntly; slater, Adam and Co., Aberdeen; heating, Mackenzie and Moncur, Edinburgh.

NEW SCHOOLS, DARNALL, YORKSHIRE.—New schools have been erected in Hammerton-street, Darnall. The schools consist of two blocks of buildings, one of which is to be used as an infants' school, whilst the other will accommodate the older boys and girls. The exterior walls of both schools are of Dunsford coursed rockies. Two towers are utilised for ventilating the mixed school, and the infants' building is provided with a ventilating turret. The mixed school, which fronts Ouseburn-road, affords accommodation for 500

children. There is an assembly hall, 66 ft. by 33 ft., around which are grouped nine classrooms, each 24 ft. by 25 ft., and 18 ft. high, and each separated from the hall by sliding panels. Over sixty children can be accommodated in each classroom. The central hall has a panel dado, and the classrooms are decorated with coloured cement dados, whilst the cloak-rooms and entrances are lined with glazed bricks. The infants' school, fronting Hammerton-street, is similarly arranged. It has an assembly-hall, 46 ft. by 16 ft., with six classrooms grouped round it. There are two entrances, with cloak-rooms, as in the mixed school. Messrs. Forsdyke, of Sheffield, were the contractors, and Mr. W. G. Hale was the architect for the work.

PERMANENT WAY STORES, DARLINGTON.—On a site, closely approaching to their main line to the north, the North Eastern Railway Company are now completing, at Croft Junction, about three-quarters of a mile to the south of Darlington, a new central permanent way stores for the accommodation of all the material required by the engineering branch of the central division of the North Eastern Railway system. Six loading banks, four of which are about 720 ft. in length and the remaining two about 580 ft., have been constructed. Offices have been established for the storekeeper, and a range of buildings has been erected for use, during the meal hours, of the staffs employed on the "banks." The undertaking has been carried out by the North Eastern Company's engineering department from the designs and under the personal supervision of Mr. J. C. Valentine, the District Engineer at Darlington.

BUSINESS PREMISES, CHEAPSIDE.—New premises have been erected at the corner of Paternoster-row, in Cheapside. The buildings have been carried out in Portland stone, in the Renaissance style, the main facade being broken by three oriel windows, the angle feature at the corner of the building being an oriel supported by a life-sized Caryatide. The whole block is surmounted by a dome resting on an octagonal base. The two lower stories, which are architecturally supported by bronze plasters, have been so designed as to be available either as large retail shops or as banking or insurance premises. The general contractors were Messrs. L. Whitehead and Co., while the architectural carved work was executed by Mr. Gilbert Seale. The architect was Mr. Delissa Joseph.

TOWN HALL AND LIBRARY, BOYNESS, N.B.—The new Boyness Town Hall and Carnegie Library was opened on the 14th inst. The building occupies a site on the Glebe Park. The ground plan is of cruciform shape with double transepts, the western ones being square and the eastern ones semi-circular, while the east end of the cruciform is square and the west end in semi-circular. The structure is divided into two sections immediately to the west of the eastern transepts by dual entrances and staircases, and by a common vestibule, which gives access to both sections of the building. The eastern section is devoted to the public library, and the western section to the town hall, which is equal in height to the two floors of the library, consists of area and gallery for the audience, and large platform for speakers or performers, and retiring-rooms for principals, chorus, and orchestra. The area is seated for 700 adults, and the gallery is seated for 390 adults on fixed benches, together seating accommodation for 1,099 persons, exclusive of the platform. The estimated cost of the buildings is 12,000l. The architect was Mr. G. Washington Browne, of Edinburgh.

NEW BUILDINGS IN SUNDERLAND.—At the meeting of the Sunderland Building Committee held on the 5th inst., fifty-four plans were under consideration. Amongst those approved were plans prepared by Messrs. Henderson and Hall for the River Wear Commissioners' offices, which are to be erected on a site at the corner of John-street and St. Thomas's-street.

VARIETY THEATRE, GATESHEAD.—Work is shortly to be commenced on the new Alhambra Theatre at Gateshead. The work is to be carried out by Mr. James Janson, contractor, Boldon, from the plans of Mr. Stuart S. Mould, architect.

FREE LIBRARY, PENARTH.—The foundation-stone of the new free library at Penarth was laid on the 10th inst. The building will be of the Elizabethan style, faced with Penarth stone, with Bath stone dressings. In the basement will be a boys' reading-room, 40 ft. by 18 ft., with lavatory accommodation, a stove, and heating apparatus. On the ground floor will be a hall and lending library, about 40 ft. square, with librarian's room, also a reading-room, 44 ft. long, and an average width of 23 ft. On the first floor will be a ladies' reading-room, 36 ft. in length, and an average width of 17 ft., and a reference library, 30 ft. by 18 ft. The Penarth District

Council have also under consideration a proposal to erect a caretaker's house at the far end of the library. The contractor is Mr. Fred. Bond, Cardiff, and the architect Mr. H. Snell, Penarth.

PUBLIC HALL, DARNALL, YORKSHIRE.—A site has been secured in Barnadistone-street, Darnall, for the erection of a public hall. The proposed building will be over 100 ft. long by 42 ft. frontage, and will hold 600 to 700 people. It will be provided with meeting-hall, committee-room, ladies' and gentlemen's cloak-rooms fitted with lavatories, and kitchen. The structure will be heated and lighted throughout. There will be a stage at one end of the hall, and a musicians' gallery at the other. Mr. A. C. Turnbull, architect, has prepared the plans for the work.

BANK PREMISES, SOUTH SHIELDS.—A new branch office of the York City and County Bank has been erected in Fowler-street, South Shields. The building is in the late Renaissance style. It has a granite base up to the window-sill level; the remainder of the ground floor is built in coursed ashlar, and the walls above are faced with thin Commendale bricks, with stone dressings. The principal entrance, situated at the corner of Denmark and Fowler streets, is under a heavy arched stone canopy, which carries a circular angle bay finished with a low turret roof. On the ground floor is the banking-room, panelled in mahogany to a height of 9 ft., the ceiling being of panelled plaster. Adjoining are the manager's room, safe-room, strong-room, and latrines. The first floor consists of a suite of offices with the entrance from Denmark-street, while the caretaker's rooms are situated on the second floor. The premises have been erected by Messrs. W. J. Robertson and Sons, South Shields, from plans prepared by Messrs. Clark and Moscrop, of Darlington.

NEW THEATRE, GLASGOW.—The new "King's Theatre," situated at the corner of Bath-street and Elmbank-street, Glasgow, was opened on the 12th inst. The outer walls of the building are of Lochbarriggs stone from Dumfriesshire, while the interior is decorated in marble, tile work, and fibrous plaster. Seating accommodation is provided for about 2,000 persons. The lower floor contains the pit and orchestra stalls, accommodating about 700 of the audience, and on the same floor are a scene dock, artistes' dressing-room, etc., manager's offices, refreshment saloon for the pit, and pay-boxes at each of the various entrances. The second floor includes the dress circle, seated for about 300, with two private boxes on each side, the foyer, crush-room, grand staircase, and saloon for the dress circle and stalls, with additional dressing-rooms for artistes. On the third floor the upper circle has seating accommodation for over 300 persons, and there are two private boxes, one on each side of the proscenium opening, also a saloon, artistes' dressing-rooms, etc. The fourth floor consists of the gallery, to accommodate 700, a saloon, and various small rooms. On each floor are cloak-rooms and lavatories. There are separate staircases to every floor. The principal entrances are from Bath-street, while from Elmbank-street are two entrances to the pit and two to the gallery. The contractors were Messrs. Morrison and Mason, and the architect was Mr. Frank Matcham. The cost has been about 50,000.

NEW COUNCIL OFFICES, HINDLEY, LANCASHIRE.—The new public offices which have been erected by the Hindley Urban District Council were opened recently. The premises are three stories in height. The ground floor contains offices for clerk, assistant clerk, collector, assistant collector, medical officer, overseer's and school attendances officer's rooms, and waiting-rooms. The first floor contains council chamber, committee-room, chairman's parlour, surveyor's drawing office, private office, and plan-room, and a spare room. The attic contains rooms for the caretaker, and the basement contains nuisance inspector's office, pay office, and men's waiting-room, heating apparatus, and rooms for future offices or store-rooms. There is a front or side entrance from Wigan-road, and also an entrance from Cross-street. The elevations are built of red pressed bricks, with Yorkshire stone dressings. The contractor for the building was Mr. D. A. Ablett, of Wigan, and the work has been carried out under the supervision of the architects, Messrs. Heaton, Ralph, and Heaton, of Wigan. The total cost of the building, including furnishing, etc., was 7,318.

TENEMENT BUILDINGS, DUNDEE.—Tenement properties are being erected in Blackness-avenue, Dundee. The buildings, which are being put up by a syndicate, will consist of four four-roomed houses, twenty-four three-roomed houses, and four two-roomed houses. All the houses will have oriel windows, and will be lit by electricity. The following contractors have been selected:—Mason work, Messrs. James Binny and Co.; joiner work, Messrs. W. and R. Brownlee; plumber work, Mr.

David Brown. The other contracts have not yet been settled. For the same syndicate six blocks of superior tenement property have been erected at Baxter Park-terrace. The tenements are erected on the west side of the park, and consist of forty-eight houses of three and two rooms. Four of the tenements are composed of three rooms and two rooms, the three rooms having baths and hot and cold water, and the two rooms hot and cold water, sculleries, and lavatories. Two of the tenements consist of two-roomed houses, with baths, lavatories, hot and cold water, etc. The baths in the houses are vitreous enamelled American baths, and are open. The contractors were:—Mason work, Messrs. James Binny and Co.; joiner, Messrs. W. and R. Brownlee; plumber, Mr. David Brown; painters, Messrs. James Mackay and Son; plasterers, Messrs. Reoch and Kilgour; grates, gasaliers, etc., Messrs. G. H. Nicoll and Co. Mr. James Sibbald, architect, designed both properties.

DISTILLERY EXTENSIONS, BADENOCH, N.B.—Contracts are about to be accepted for additions to and improvements on the main building of the Dalwhinnie Distillery, as well as for the erection of more workmen's dwellings, and for the introduction of an additional supply of water by gravitation. It is estimated that the contemplated outlay will amount to some 2,000, or 3,000. Mr. A. Mackenzie, C.E., Kingussie, is the architect for the new works.

NEW LIBRARY, GLASGOW.—The Kingston District Library was opened on the 8th inst. The building occupies a site in Paisley-road, and includes, besides the library, a series of public halls and the district police office. The front elevation is of red stone. A corridor leads to the library, which is in the rear of the main building, and is two stories in height. On the ground floor are the lending department, the general reading-room, and a reading-room for boys and girls. The designs for the work were prepared in the City Architect's department, under the supervision of Mr. McDonald, by Mr. Horn.

NEW ISOLATION HOSPITAL, LANCASTER.—A new isolation hospital for men and fever block are to be erected at Lancaster County Asylum. The plans for the work have been prepared by Messrs. Willink and Thicknesse, architects, Liverpool, and the tender of Messrs. J. Hutch and Sons, Lancaster, which amounts to about 22,000, has been accepted.

SANITARY AND ENGINEERING NEWS

MONTROSE WATER SUPPLY.—The Montrose Town Council have recently had under consideration a report from Messrs. Henderson, of Glasgow, in regard to the water supply. During June there was a scarcity of water at Kinnaber, and it was considered whether the supply could be supplemented by an artesian well. Messrs. Henderson stated that if the bore was put down where they indicated the chances were in favour of tapping a large supply of water. Not only would the bore act as a test power for proving the quality of water, but would at the same time be sufficiently large to be of practical purpose. The subject was adjourned for further consideration.

FOREIGN

FRANCE.—The Paris Municipality has caused to be erected at Pere Lachaise a monument to the memory of workers who died in the service of the City of Paris. This monument, which was designed by the late M. Dupré, the architect, consists of an obelisk, by which stands a veiled figure of a woman depositing a crown; the figure is by M. Denys Puech.—M. Bernstamm, the sculptor, has completed the model for a monument to Paileron, the author of so many well-known plays. It will be erected in the Parc Monceau, and consists of a stele supporting the bust of Paileron, before whom a female figure lays a garland of flowers; this figure is supposed to be a portrait of Jeanne Samary, who, at the Théâtre Français, was one of the principal interpreters of the works of Paileron.—A monument to the memory of Daubigny, the landscape painter, has been erected by public subscription at Anvers-sur-Oise.—There has been some new destruction among the ancient monuments of Avignon. This time, however, the offenders are not the municipal authorities, but the military engineers, who have destroyed the ancient cloister of the convent of the Celestins, which had in recent times been used as a military prison.—The Société Archéologique of the South of France has succeeded in saving from destruction the XIIIth century gateway enclosed in the fortifications of the picturesque town of Cordes, founded by the Counts of Toulouse.—A steel bridge is to be built over the Rance between Port Jean and Port St. Hubert, near Dinan.—A Presidential decree has been issued

authorising the establishment of a local school of architecture at Rouen.—The death is announced at the age of seventy-eight, of a distinguished collector, M. Emile Peyre, who has left a splendid collection of medieval and Renaissance furniture and woodcarving is valued at 1 million francs. It is said that this remarkable collection has been left as a legacy to the Musée des Arts Décoratifs.

ALGERIAN ONYX MARBLES.—Mr. Scratchley, British Vice-Consul at Philippeville, reports that the onyx quarries at Ain Smava are at the present time worked. This industry, he says, suffers principally from the cost of labour, the difficulty of finding skilled marble workers. The competition with marbles imported from Europe renders it difficult to develop the quarries as one could wish. The onyx marbles from Ain Smava, which are the hands of a house at Marseilles, are sent to France to be dressed, and come back to the place of origin if required. It is easy to understand that, under these conditions, builders prefer buying marbles ready dressed from Europe; yet, as regards quality a beauty, nothing can be finer than some of the onyx. The quarries cover 7,500 acres, and the beds are very thick, varying in width from 6 ft. to 55 ft. The following are the principal qualities found:—Golden, with a seam, 33 1/2 wide; cloudy, 13 ft.; African breccia, 13 ft.; red African 10 ft.; red agath, 10 ft.; dark, 10 ft.; 8 in.; Jasper agath, 7 ft.; onyx, 5 ft.; rose agath, 3 ft. The five to six seams can produce columns from 12 ft. to 15 ft. in length, which is very rare in onyx marbles. Eight of these monolithic columns have been prepared at Marseilles for the Roman Catholic Cathedral at Westminster, which they are now in doubt in position, as others are in preparation. If they are anything like the onyx employed at the Tower Hall of Constantine, they are, says Mr. Scratchley, worth the trouble of going to sea. An order from America for columns of 33 1/2 to 39 ft. in length was received, but the difficulty is to get blocks of this size down to the sea. The very heavy railway rates also against profitable operations.

GRANITE INDUSTRY IN BRITISH INDIA.—According to a statement in the *Indian Review* a new industry has recently been developed among the granite quarries of Palovaram, in the Madras Presidency, viz. the manufacture of granite pillars, colonnades, etc., and stone sets for paving streets and for houses. The enterprise, although yet in its infancy, is already employing over a thousand native artisans, all the cutting and polishing being done by hand, without the aid of a machinery.

MISCELLANEOUS

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—Messrs. W. B. Wilkinson and Co., fire-proof floor specialists, concrete paviors, and artificial stone manufacturers, of London and Newcastle, are removing their London business from 1, Victoria-street to new offices at works which they have erected at the junction of Townmead-road and Imperial-road, Fulham, close to the river and to the Chelsea gas station.

EAST LONDON CHARITIES.—The administration of the local Henderson Charity, founded for the benefit of the parishioners of St. George-in-the-East, will shortly be remodelled in terms of a scheme framed by the Charity Commissioners to alter their scheme made eleven years ago so as to empower the trustees to grant pensions of from 10s. to 12s. a week jointly to married couples, with a pension of from 7s. to 10s. a week to the survivor in each instance. The Borough Council are about to add the site of the old engine-house, which has lately been assigned as a residence to aged parishioners, to the burial ground in Hackney-road, in which it stands, and to erect, in its stead, a new home in Nightingale-road, Wood Green, where the Shore-ditch Charity Trustees have recently built some almshouses. The latter buildings supplied three elderly St. Luke's, which were founded in the latter half of the XVIIth century, and of which the site was purchased from the trustees for the new police-station.

NORWEGIAN TIMBER TRADE.—It is reported officially that the export of timber from Norway in 1903 was nearly 9 per cent. more than in 1902, and, as prices were generally good, the timber industry brought to the country between 600,000 and 700,000, more than in any year before. The following table gives the total export of timber for the last three years:—Planned timber, 1903, 665,079 cubic metres; 1902, 598,568 cubic metres; 1901, 565,741 cubic metres. Sawn timber, 1903, 585,561 cubic metres; 1902, 536,174 cubic metres; 1901, 468,847 cubic metres. Hewn timber, 1903, 118,416 cubic metres; 1902, 105,696 cubic metres; 1901, 67,937 cubic metres. Round timber, 1903, 572,003 cubic metres; 1902,

375 cubic metres; 1901, 510,940 cubic metres. Staves, 1903, 88,394 cubic metres; 2, 85,506 cubic metres; 1901, 91,760 cubic metres. Laths, 1903, 102,867 cubic metres; 2, 93,416 cubic metres; 1901, 99,999 cubic metres. From Christiania about the quantity worked was 222,502 cubic metres, compared with 202,472 cubic metres in 1902, and 200,792 cubic metres in 1901. The principal exporting trades of timber unworked or half-worked are Sweden, Christiania, Drammen, Fredrikshald, Porsgrund, Christiansand, Larvik, Sandnessjøen, and Arendal; and of worked timber, Drammen, Christiania, Skiens, Sarpsborg, Porsgrund, Arendal, and Fredrikshald. The bulk of the timber worked and unworked in 1902 to the value of 2,096,033—goes to the United Kingdom; and France, Belgium, Germany, the Netherlands, and Denmark are the next largest consumers. The Vice-Consul Fredrikstad, one of the chief centres of this industry, reports that business has been good, and, on the whole, profitable, whilst a good trade was maintained with the Cape. From the west coast of Norway there was a good market in 1903 for almost all sizes, but, notwithstanding the good selling prices, the trade in sawn timber is reported as not giving a return, owing to the very high prices for the last years. It is probable that, owing to the mills having had to pay higher prices for their log supply for the current year, prices will still continue to be high.

CHURCH OF ST. ANDREW, HOXTON.—Dr. Stram, K.C., Chancellor of the Diocese of London, has granted a faculty for the carrying out of some improvements and repairs of the church of St. Andrew. The new works will consist of an estimated cost of 1,000*l.*, the removal of the west gallery and stairs, a porch in gable at the west door, a choir vestry with an gallery, and a rearrangement of the organ chamber, choir seats, and desks so as to provide for a total of 570 sittings. The church is built in Canal-road, Hoxton, in 1864-5, and the plans and designs by Mr. C. A. Long, in the Early English style, the organ being by Hollichs.

PICTURE POST-CARDS OF BATH.—Messrs. B. J. F. Meehan, of Bath, send us a set of picture post-cards of "Old Bath," reproduced from drawings by David Cox. These are some of the notable buildings of Bath, accompanied by figures in the costume of the period when Bath was a centre of fashion. They are interesting and well produced.

VICTORIA HISTORY OF THE COUNTIES OF ENGLAND.—The resignation is announced of Mr. H. A. Doubleday as joint editor with William Page, member of the Council of the Society of Antiquaries, of the Victoria County History. Mr. Page had been appointed general editor of the series of volumes which are issued from time to time, and form most valuable complement to the existing standard county histories.

THE OLD INN, HIGHGATE.—The Old Red Inn at Highgate has just been pulled down. It had been a famous hostelry in its day, being frequented by travellers on the road at North-road, and by graziers and cattlemen on the last stage of their journey with their cattle to the market in West Smithfield. It was also one of the many inns at one time in London in number—where was observed the early ribald custom of "swearing on the inn," for which were used a pair of either stag's or stag's horns mounted upon a staff. *Hone's Every Day Book*, vol. ii., 1841, will find an illustration after a woodcut by George Cruikshank of the ceremony at the inn, and Crown, on Highgate-hill, with a description of its observance, which says that the usage first obtained, it seems, at the old inn-house, whither, in the XVIIIth century, thousands of quality would ride from town to be entertained and so made free of Highgate. The gatehouse, which stood across the road at the entrance into the forest, where tolls were received for the Bishops of London, was pulled down in 1769, and replaced with a turnpike gate. Dwelling houses are to be built on the site of the inn.

NEW PUBLIC BATHS.—Messrs. W. E. Dole and Co. ask us to mention that skylights in the building (illustrated in our last issue) are glazed on their patent "Invincible" system.

THE LARGEST GRAVING DOCK IN ASIA.—Exploring the new Colombo Harbour Extension Works, Mr. A. R. Slater, the Assistant Secretary of Ceylon, states that they are making good progress. The amount spent during the year 1903 was nearly Rs. 3,000,000, giving the total expenditure on the present works up to Rs. 15,426,575, the grand total expenditure since the commencement of the west breakwater in 1875 having been 31,042,771. The new breakwaters are now advanced towards completion, and it became necessary in 1903 to decide the question of the width of the entrance to the harbour between the old or south-west breakwater

and the island or north-west breakwater. After full consideration the width was fixed at 800 ft., with the concurrence of the consulting engineers, the admiral, and the Harbour Board. The narrower entrance appears to be convenient for navigation, but it is considered that a width of 800 ft. will be sufficient for the largest steamers to enter the harbour. It is anticipated that the new graving dock will be open in 1906. The original estimate of cost was Rs. 5,218,390, and the Admiralty and the colony agreed to provide this amount in equal shares. Subsequently, however, it was decided to increase the length of the dock from 500 ft. to 700 ft., and as the Admiralty were unable to increase their contribution the whole additional cost—23,700*l.*—is being borne by the colony. The dock, when completed, will be the finest and largest in Asia, and, indeed, will probably challenge comparison with any of the dry docks available for the use of His Majesty's Navy. The Merewether dry dock at Bombay, the No. 1 dry dock at Hong Kong, and the dry dock No. 3, now under construction at Singapore, are 500 ft. long on the floor, or 200 ft. shorter than the Colombo graving dock, while, although the docks under construction at Gibraltar and Malta are to have lengths of 850 ft. and 750 ft. respectively, it must be remembered that they are really double docks. The depth over all the Ceylon dock at high water will be 32 ft., which also compares favourably with the depths of the docks at Bombay, Singapore, and Hong Kong. The breadth of the graving dock will be 85 ft. at the entrance. The longest ships in the Navy—the *Good Hope* class—are 500 ft. long; the broadest—the *King Edward* class—78 ft. long, while none draw more than 27½ ft. The Colombo dock will therefore easily accommodate the longest and largest British war vessels for many years to come. As regards merchant ships it will take anything afloat, with the exception of the new boats on the Atlantic line, but none of these is ever likely to be seen at Colombo.

NATIONAL ASSOCIATION OF HOUSE PAINTERS.—The eleventh Annual Convention of the National Association of Master House Painters and Decorators of England and Wales will be held in Manchester next week, the proceedings commencing on Monday. An exhibition of manufacturers and of apprentices' competition and international studentship competition drawings will be opened in St. James's Hall, Oxford-street. On the evening of the 19th the President of the Association (Councillor James Higson, of Salford) will hold a reception in the hall. Mr. J. D. Crace, President of the Institute of British Decorators; and Mr. R. Glazier, Head Master of the Manchester Municipal School of Art, will deliver addresses on special subjects, and various papers will be read by others. The annual dinner is fixed for the Wednesday evening, at the Midland Hotel.

A FLAME-PREVENTING FLUID.—The Snowdon's Flame-Preventers Company send us a sample of their fluid for rendering substances which have been steeped in it (according to directions given on the label) non-flammable. Some articles sent to the new specimens which had been treated by the fluid, fully bear out what is claimed for it. Bits of wood which had been steeped in it entirely refused to burn; and some pieces of light textiles, which would ordinarily have burnt up in a moment when held over a flame, merely blackened. The manufacturers claim that with this chemical compound, the invention of Mr. F. Seaton Snowdon, and to which they have given the name of "Snowdon's Preventer," it is possible to render every variety of flannel, cotton and woollen goods, silks, satins, laces, curtains, muslins, bed-hangings, ladies' and children's clothing, matting, paper, wood of every description, and, in short, every inflammable substance, absolutely flame-proof. The tests we have been able to make seem quite to bear out the claim.

LOCAL GOVERNMENT BOARD INQUIRY AT BOOTLE (LANCASHIRE).—Mr. H. P. Boulnois, C.E., an Inspector under the Local Government Board, held an inquiry on the 8th inst. at the Bootle Town Hall with reference to the applications of the Council for the following loans:—940*l.* for public conveniences, 4,600*l.*, widening Linacre-lane Canal bridge, 3,000*l.*, construction North Docks subway. The Town Clerk explained that the 940*l.* was required for the erection of three conveniences in three places in the borough—viz., Stanley-road Canal bridge, Coffee-house bridge, and Irlam-road. The conveniences would be placed in the main thoroughfares. The estimated cost of each place would be—Stanley-road, 600*l.*; Coffee-house Bridge, 210*l.*; Irlam-road, 130*l.*; total, 940*l.* The Town Clerk, proceeding to the next application, said the sum of 4,600*l.* was required for the construction of a new bridge over the Leeds and Liverpool Canal in Linacre-lane. The neighbourhood was rapidly developing, and Linacre-

lane was one of the main outlets for traffic from the north end of Bootle. He thought there could be no doubt that in years to come the lane would be one of the principal arteries for traffic in that neighbourhood. The old bridge still remained, and was a great obstacle to traffic. It was only 10 ft. wide, and had a span of only 24 ft. The whole of the widening of the road had been completed with the exception of the bridge in question, and what was proposed to do now was to pull down the old bridge and erect a new one with a width of 72 ft., with improved levels, which gave easy gradients on both sides of the bridge. The sum of 3,000*l.* was required for the construction of a subway under the North Mersey goods yard of the Lancashire and Yorkshire Railway and leading to the North Docks. The execution of the work had already been sanctioned by an Act of Parliament. The subway would be 83 yds. in length, 6 ft. wide, and would be illuminated and drained. The Town Clerk admitted the difficulties that stood in the way of patrolling the subway if it was kept open all through the night. The Inspector said he thought it was a great risk for the Corporation to take in regard to the matter. The Town Clerk said he could only admit the difficulty, and it was proper that the Local Government Board should know of it. Subsequently Mr. Boulnois proceeded to inspect the several localities mentioned.

WAR MEMORIAL, RHYL.—The memorial erected by public subscription to the soldiers from Rhyll who fell during the late South African War was unveiled on the 5th inst. The memorial consists of a base of two steps of Yorkstone, a pedestal of Kenmay fine-aid Scotch granite, on which is the inscription, in leaded letters, the whole being surmounted by the figure in Carrara marble of a soldier, representing the Royal Welsh Fusiliers, with reversed arms. It was designed and executed by Mr. C. Chatham, sculptor, Rhyll.

CAPITAL AND LABOUR.

JOINERS' STRIKE, NEWCASTLE.—A dispute has arisen between the joiners employed in connexion with the erection of the new infirmary and the Building Committee, which has had the effect of causing the joiners to come out on strike. It appears that the grievance is not with the contractors, but solely with the Building Committee, who, it is stated, have given part of the joiners' work to cabinet-makers, and because of this alleged encroachment the joiners ceased work.—*Newcastle Daily Chronicle*.

Legal.

CASE UNDER THE LONDON BUILDING ACT.

WHAT IS A "BUILDING"?
In the South-Western Police Court, before Mr. Lane, K.C., on Monday last, Mr. Lawton, District Surveyor for West Wandsworth, summoned Mr. Peter Bleines, of Garrat-lane, for erecting a one-story stable at the corner of Wilna-road and Farlton-road without having previously given two clear days' notice, under section 145 of the above Act. Mr. Hanne, solicitor, appeared for the defence.

It appeared that in January last the defendant inquired of the surveyor the height to which he could raise the fence walls, as he wished to protect the windows of his property from the roughs of the neighbourhood, and the defendant was informed that by section 201 he could raise the said walls to a height of 7 ft., but that no building could be erected against the walls, as, owing to the position, a building would be illegal. The surveyor watched the premises, and discovered that quite recently a building had been erected 18 ft. long, 10 ft. wide, and 7 ft. high, and used as a stable. The surveyor then gave the defendant the option of taking down the building, but the latter declined, whereupon the surveyor intimated that he should first take out a summons for neglect as to notice, and then proceed as to irregularities.

It further appeared that the building was not wholly dependent for its support from the surrounding walls, some uprights and cross-timbers having been fixed to carry the corrugated iron roof, and the defence appeared to disregard the existence of the walls in relation to the building.

Mr. Hanne to the surveyor: Do you say that a notice must be given for a greenhouse? The surveyor: Not if the greenhouse is detached from other buildings.

Mr. Hanne: We are not treated in the Act to a definition of a building.

The surveyor: No. Mr. Hanne: What is your definition of a building?

MEETINGS.

SATURDAY, SEPTEMBER 17.
Architectural Association.—Week-end visit to Kettering district.
General Purposes and Finance Committee, 3 p.m.
Architectural Association.—Visit to Consett Works, 3 p.m.
Promises, 3 p.m.

SATURDAY, SEPTEMBER 24.

Incorporated Association of Municipal and County Engineers.—District Meeting at Withington, near Manchester.

TO CORRESPONDENTS.

THE.—The responsibility of signed articles, letters, papers read at meetings rests, of course, with the authors.
We cannot undertake to return rejected communications, and the Editor cannot be responsible for forgery, manuscripts, or other documents, sent to or at this office, unless he has specially asked for them.
Letters or communications (beyond mere news items) which have been duplicated for other journals are NOT REEDED.
Communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.
Contributors are compelled to decline pointing out books and addresses.
We commission to a contributor to write an article, execute or lend a drawing for publication, is given only on the approval of the article or drawing, when sent, by the Editor, who retains the right to reject unsatisfactory. The receipt by the author of a copy of an article in type does not necessarily imply its acceptance.
Communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, 4, Abchurch Lane, London, E.C. 4.

PRICES CURRENT OF MATERIALS.

Our aim in this list is to give, as far as possible, the true prices of materials, not necessarily the lowest, and quantity obviously affect prices—a fact which should be remembered by those who make use of our information.

Table listing various materials and their prices. Includes sections for BRICKS, &c., SLATES, TILES, and WOOD. Prices are listed in £ s. d. format.

BRICKS, &c.—(continued).
Thames and Pit Sand, 7 3 per yard, delivered.
Thames Ballast, 6 0 "
Best Portland Cement, 30 0 per ton, "
Best Ground Blue Lias Lime 21 0 " "

NOTE.—The cement or lime is exclusive of the ordinary charge for sacks.

Grey Stone Lime, 12s. 0d. per yard, delivered.
Stourbridge Fireclay in sacks 27s. 0d. per ton at rly. dpt.

STONE.

BATH STONE—delivered on road wagon, s. d.
Bathons, Paddington Depot, 1 6 1/2 per ft. cube.
Do. do. delivered on road waggon, "
Nine Elms Depot, 1 8 1/2 " "

PUBLIC APPOINTMENTS.

Table with 4 columns: Nature of Appointment, By whom Advertised, Salary, and Applications to be in. Includes entries for Bermondsey Borough Council, Harsley R.D.C., etc.

Those marked with an asterisk (*) are advertised in this Number. Competitions. — Contracts, iv, vi, viii, x. Public Appointments, —

PRICES CURRENT.—Continued from page 301.

Table listing prices for METALS (continued), including Soft Steel Sheets, Cast Iron, etc.

Table listing prices for LEAD, etc., including Sheet, Pipes, and various grades.

Table listing prices for ENGLISH SHEET GLASS IN CRATES, including various thicknesses and quantities.

Table listing prices for OILS, etc., including Lined Oil, Turpentine, and other oils.

Table listing prices for VARNISHES, etc., including Pale Oak, Copal, and other varnishes.

TERMS OF SUBSCRIPTION.

"THE BUILDER" (Published Weekly) is supplied DIRECT from the office to residents in any part of the United Kingdom at the rate of 10s. per annum (52 numbers) PREPAID. To all parts of Europe, America, Australia, New Zealand, India, China, Ceylon, &c., 20s. per annum. Remittances payable to J. MORGAN, should be addressed to the Publisher of "THE BUILDER," Catherine-street, W.C.

SUBSCRIBERS IN LONDON and the SUBURBS by prepaying at the Publishing Office 10s. per annum (52 numbers) or 4s. 6d. per quarter (13 numbers), can ensure receiving "The Builder" by Friday Morning's Post.

TENDERS.

Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Thursdays. [N.B.—We cannot publish tenders unless authenticated either by the architect or the building-owner; and we cannot publish announcements of tenders accepted unless the amount of the tender is stated, nor any list in which the lowest tender is under 100l., unless in some exceptional cases and for special reasons.]

* Denotes accepted. † Denotes provisionally accepted

AMERSHAM.—For grammar school, for the governors of Dr. Challoner's Grammar School, Mr. H. Beldi, architect. G. Darlington, Amersham* £5,268

BRADFORD.—For Sunday Schools and parochial institute (contracts 1 and 3), for the Parish of Saint Clement, Bradford, Yorks. Mr. H. E. Priestley, architect, 17, Bertram-road, Bradford. Quantities by architect:— Mason's Work: O. Booth & Son, Great Horton* £1,120 0 0 Joiner's Work: W. Pickering, Bradford* 573 7 9 Slater's Work: T. Nelson & Son, Manningham* 178 0 0 Plumber's Work: J. W. Bates, Bradford* 96 0 0 Painter's Work: G. Smith, Great Horton* 219 10 0 Bradford* 49 15 0 Total £2,236 18 0

BRIDLINGTON.—For partial remaking, etc., Sewerby-crescent. Mr. S. Dyer, architect and surveyor, 29, Quay-road, Bridlington. J. Ellis* 18 15 0 J. Edmund & Co., 422, Market & Son, Bridlington* 235 0 0 J. N. Davidson* 396 Rington* £323

BURGESS HILL.—For erecting stabling, etc., at Depot, Chilton-road, for the Urban District Council:— Box & Turner, 2353, 0 0 A. Downer, Burgess Hill* 342 15 6 W. Orman* 330 10 0 W. Bryant* 330 10 0 gess Hill* £312 0 0

CARDIFF.—For erecting an electric light sub-station at Adelaide-street, at the Dock, for the Corporation. Mr. W. Harpur, Borough Engineer, Town Hall, Cardiff.— M. D. W. Davies, St. Mary's-street, Cardiff* £1,830 19 7

CARDIFF.—For 190 yards of wrought-iron unclimbable fencing at Cathays Park, for the Corporation. Mr. W. Harpur, Borough Engineer, Town Hall, Cardiff:— Rubery & Co. £293 11 6 Mountford, Phillips & Co., Ltd., 270 15 0 W. A. Baker & Co., Ltd., 243 11 9 W. Rowe* 213 11 9 Llansantant* £140 6 4 G. Kyte & Co. 212 6 8

CHIPPING CAMPDEN.—For water supply works, Campden (Contract 2), for the Rural District Council. Messrs. Wilcox & Raikes, engineers, Union-chambers, 63, Temple-row, Birmingham:— Reid Bros., £2,418 0 0 T. Vale & Sons, G. M. Kerry & Co., 2,105 0 0 J. Riley, 1,831 3 5 W. H. Smith & Sons, 2,070 0 0 Rowell & Sons, Rogers & Wood, 1,896 0 0 Chip-ping Norton* 1,801 4 0 J. E. Witte .. 1,850 0 0

CHIPPING CAMPDEN (Glos.).—For waterworks (Contract No. 1), for the Rural District Council. Messrs. Wilcox & Raikes, engineers, Union-chambers, 63, Temple-row, Birmingham:— J. & R. Ritchie, Ltd., £1,252 2 3 Yarrow & Co., 1,204 0 0 A. G. Clarke, 1,196 16 8 Staunton Ironworks Co., Ltd., 1,146 10 0 T. Spittle, Ltd., 1,143 11 8 T. Sca Foundry Co., 1,136 4 3 Cochran & Co., 1,118 11 5 Stavley Coal & Iron Co., Ltd., nr. Chesterfield* 1,093 18 3 J. & S. Roberts, Ltd., 1,077 15 9 D. Parsons & Co., 1,029 4 11

CRUMLIN.—For sinking wells and providing pumps at Crumlin, for the South Dublin Rural District Council. Mr. T. J. Byrne, A.R.I.B.A., surveyor, etc., 1, James-street, Dublin:— P. Stevens* This work is tendered for on schedules; the price of a P. Hoaly will cannot therefore be known until it is completed. J. Grace, 124, Coombe, Dublin*

DRIFFIELD (Yorks.).—For constructing a main sewer at the east end of North Frodingham Village, for the Rural District Council. Mr. T. Carson Beaumont, C.E., surveyor, Driffield:— A. Leason* £195 0 0 J. W. Hall* 2163 0 0 W. Leason & Son* 185 0 0 T. Cammidge, R. Fisher* 180 10 0 N. Frodingham* 179 10 0 J. Dunn* 118 17 3 ham*

EAST SHEEN.—For alterations to Nos. 65 and 67, Sheen-lane, Mortlake, for Mr. J. W. Saunders, Mr. R. B. Rowell, architect, Triangle-corner, East Sheen, S.W.:— S. N. Soole & Son £302 0 Hayes & Co., St. Leonard's-road, East Sheen, S.W. £248 0 Speecheley & Smith 278 10

EPPING.—For erecting Council Buildings in High-street, for the Urban District Council:— J. W. Hall* £907 10 0 A. Knight £940 0 0 H. Wells & Sons 990 0 0 T. Keen* 939 12 6 C. S. Foster & G. Whiffin, Son* 985 0 0 Coopersale, T. Ahmad & Epping* 748 5 0 Son, Ltd.* 975 0 0 [Accepted provisionally.]

HARTSHORNE.—For pulling down old bridge in Green's-lane, and erecting a new bridge, for Hartshorne and Seals Rural District Council. Mr. A. Lewis, surveyor, Smisby, near Ashby-de-la-Zouch:— E. Clarke* £295 0 0 Woodville* 295 10 0

HEREFORD.—For the erection of cycle and motor works and alteration to premises, 116, St. Owen-street, for Mr. A. W. Marriott. Messrs. Grooms & Battington, architects and surveyors, Palace-chambers, King-street, Hereford. Quantities by the architects:— P. Cooke* £1,508 15 4 W. Powell* £1,122 10 0 Bolt, Davies, & Co., 1,335 0 0 C. Cooke, Hereford* 1,108 0 0 W. Bowers & Co., 1,130 13 0

HERTS.—For Baptist Church, Breachwood Green, Welwyn, Herts. Messrs. George Baines and R. Palmer Baines, 5, Clement's-lane, Strand, London, W.C., architects:—

Table with 2 columns: Estimate A and Estimate B. Items include F. Gough & Co., D. Parkins, T. & E. Neville, C. Miskin & Sons, F. Newton, W. G. Dunham, T. Almond & Son, Ltd., Goldhawk & Son, S. Redhouse, Mallet & Wood, Grove-road, Luton.

HESWALL (Cheshire).—For the construction of Dawson road, for the Wirral Rural District Council. Mr. T. Davies, 33, Kingsland-road, Birkenhead;— R. T. Amery, S. Hutton, Bowdon; £650 Parkgate; £686 10 R. Hughes, Brimstall; 625 † Not accepted, being above the estimate.

IPSWICH.—For the erection of receiving wards at the Workhouse, Woodbridge-road, for the Guardians. Messrs. Brown & Burgess, architects, Prince's-street, Ipswich;— S. A. Kenny, Bursell-street, Ipswich; £1,377

MAWNAN (near Falmouth).—For erecting a country house and stables at Higher Treose, Helford River, for Mr. H. Coode. Mr. B. C. Andrew, architect, Biddeford's Court, St. Austell;— S. Treharne, £4,194 0 A. Carkeo, £2,951 0 C. & J. Harris, 3,278 16 J. Collier, Truro, 2,282 0

MILLISLE (co. Down).—For main sewerage, outfall sewer, flushing tanks, &c. for Lord Dunleath. Mr. J. Russell, C.E., 22, Waring-street, Belfast;— J. A. Gordon, £590 H. McNeilly, £370 J. Graham, Jun., 442 Path, Clarke, & Son, 370 M. Green, 442 H. Alexander, 4 J. Ross & Son, 438 Waring-street, Belfast; J. Quinn, 397 fast, £365

PLYMOUTH.—For electric light installation at Municipal Technical School, for the Education Authority. Mr. H. J. Snell, architect, 11, The Crescent, Plymouth;— Messrs. Heath & Co., Plymouth, £550

PLYMOUTH.—For fitting up hot water heating apparatus and gas installation at the Technical Schools, for the Education Authority. Mr. H. J. Snell, architect, 11, The Crescent, Plymouth;— W. T. Hocking, Plymouth, £820

RETFORD.—For the erection of residence, London-road, for Rev. Justice Chapman. Messrs. Byre & Southall, architects, Chapelgate;— G. Fenton, £3,274 C. Jones, £2,666 G. Hopkinson, 2,183 F. Fenton, 2,024 G. Ledger, 2,166 T. Hopkinson, 2,023 G. Hurst, 2,131

RICHMOND (Yorks).—For relaying pipe sewer, etc. for the Corporation. Mr. T. H. Bailstone, Borough Surveyor, Richmond;— J. Spark, 30, Marshall-st., Darlington, £126 13

ROBERTON (N.B.).—For 11 miles of cast-iron pipes and a concrete-covered service tank, etc. for the District Committee of the Upper Ward of the County of Lanark. Messrs. Warren & Stuart, engineers, 94, Hope-street, Glasgow;— R. C. Crawford, Strathaven, £534 8 4

B. NOWELL & Co.,

Stone Merchants and Contractors. Chief Office.—Warwick Road, KENSINGTON, Norway, Guernsey, and Leicestershire Granite, Kerb, Pitching, and Yorkshire Stone.

ESTIMATES GIVEN FOR EVERY DESCRIPTION OF ROAD MAKING.

ROMSEY.—For the erection of an iron bridge over the stream at Tut's Bridge, West Wellow, and making up approaches, for the Rural District Council. Mr. C. W. Chiddy, Romsey;—

Table with 2 columns: Estimate A and Estimate B. Items include G. F. Hurst & Sons, Roles & Sons, F. Osman, P. Douglas & Richards, P. Tryhorn & Son, Salisbury.

SELBY.—For laying 1,105 yards of 12-in. stonewares pipes, &c., for the Urban District Council. Mr. Bruce McGregor Gray, A.M.I.C.E.;— J. T. Short, £349 5 10 J. Smith, £241 17 4 J. Slinger, 298 12 11 Selby, £241 17 4 T. Bell, 296 9 9 G. Hird, 241 1 1 A. Speight, 245 1 3

STANFORD-LE-HOPE (Essex).—For executing street works, for Essex Rural District Council. Mr. S. I. Adams, surveyor, Weston-chambers, Southend-on-Sea;— G. W. Cooke, £3,992 11 3 J. E. Truman, £2,999 0 0 W. E. Westgate, 3,465 0 0 Buxton & Jenner, 2,693 0 0 G. J. Anderson, 3,157 2 1 W. Hes, 2,509 0 0 T. Bruty, 3,071 1 10 J. Jackson, 2,325 0 0 Wilson, 3,047 17 8 Gate, ..

STOCKTON-ON-TEES.—For alterations and additions to Children's Home, Hartington-road, for the Guardians. Mr. John Rosham, surveyor, Flukes-street, Stockton-on-Tees;— J. Coulllard, £468 5 11 R. Johnson & G. E. Grey, 456 3 2 Sons, £433 17 6 T. Brown, 446 0 0 W. G. Atkin, J. G. Robson, son & Son, 443 2 8 Stockton-on-Tees, 427 12 7 G. Race & Sons, 440 0 0

WAREHAM.—For water supply works, for the Corporation. G. Chatterton, engineer, 6, The Sanctuary, Westulaster, S.W.;— T. Deewra & Son, Balls Pond, London; £5,770 18 11

WHITSTABLE.—For the erection of new infants' school, Crownwell-road, Whitstable, for the Kent Education Authority. Mr. A. A. Kemp, architect;— G. W. Welby, £4,500 A. S. Ingelton, £3,877 Shury Building Co., 4,180 (Gant & Co.), 3,422 T. Porter, 4,140 Amos & Foad, 3,350 T. Gotsdiner, 4,074 E. Solly, 3,270 *Recommended for approval to the works committee.

The Ancient Buildings of Nippur.

It is hard to say what reasons led up to the building of the great Temple of Bel and its adjoining city at such a site as Nippur. We know, of course, that the Shatt en-Nil, one of the finest waterways of the Mesopotamian canal system, ran past the city; and we may conjecture that in early days some kind of stream flowed there; but even so, why should the exact spot have been selected rather than one further north or south? There is no rise in the plain to account for the builders' preference; the country lies away in all directions flat as a table-top, the only break in its level being the mounds that cover the ruins of ancient cities, of which it is safe to say none were older than Nippur. In probability chance had much to do with the founding of the city. For the reason the site became intimately associated with the cult of the god; from the seedling of a primitive temple or altar erected in his honour the temple gradually grew and spread, in the earliest days of which we know anything certain as yet it was the venerated sanctuary in the land, when at last the outworn worship of Bel was cast aside, the ruins of his temple formed a convenient form for the erection of other buildings.

supposing that the site was occupied six or seven thousand years before Christ; it is certain that it was still the scene of man's dwellings so late as 800 A.D., although it had sunk to an insignificant position early in the IIIrd century; and it was not utterly abandoned until two hundred years later. Throughout the long centuries of its history, during which it was the scene of much activity in the way of building and restorations, its architects must have been greatly hampered by the lack of any material other than the Mesopotamian mud. In the north stone could be obtained with comparative ease, but at Nippur there was nothing but the mud and clay available. When, in addition to this fact, we remember the extreme antiquity of the site, and consider that the early builders had no experience acquired from other nations to aid them, being, in fact, pioneers in the building world—instead of wondering at the crudeness of their structures, we are forced to admire the success they achieved in face of the difficulties that confronted them. In order to present a picture of the buildings thus far uncovered by the American expedition which has been excavating at the mounds it is necessary in the first place to describe the materials used in their construction. It will then be seen how the lack of stone and the scarcity of suitable timber necessitated clumsy makeshifts and fettered the ambitions of the architects, forcing them into narrow channels that led to the evolution of a style in which ponderosity took the place of grace,

and massiveness was substituted for beauty and finish. For our purpose the history of the site may be divided into three periods:—(a) Before Sargon (c. 3,800 B.C.); (b) from Sargon and his son, Naram-Sin, to Ashurbanipal (668-626 B.C.); and (c) post-Babylonian. In dating the buildings the different styles of bricks used have proved extremely helpful. Naturally the inscribed bricks are usually easy to determine; but the uninscribed specimens also, especially the burnt ones, show considerable variations at different periods. To enter into the peculiarities of the differing types and to give even average dimensions of them would take up too much space for the limits of this article. It must suffice to give a few examples and to mention the chief characteristics of those used in the buildings described. The earliest builders doubtless used sun-dried bricks only; but, though the precise date at which the art of burning bricks was first practised at Nippur cannot be given, it is certain that it was a very early one. It is a point worthy of mention that the pre-Sargonic burnt bricks in point of size and shape are much more like the standard of to-day than were those of a later period. The first examples were 8 $\frac{3}{4}$ in. by 5 $\frac{3}{8}$ in. by 2 $\frac{1}{2}$ in.; the next, 10 $\frac{1}{4}$ in. by 7 in. by 2 $\frac{1}{2}$ in.; then comes a larger but flatter brick, 11 $\frac{1}{2}$ in. by 7 in. by 1 $\frac{3}{8}$ in.; and, finally, 12 in. by 7 $\frac{3}{4}$ in. by 1 $\frac{7}{8}$ in. In the first examples the shape is peculiar, for one face is markedly convex, and on the lump there is generally a deep thumb-mark

(and sometimes as many as four), probably intended to give a better grip for the mortar. In subsequent examples the thumb-mark becomes less pronounced and a longitudinal mark, made with the finger-tip or with a cut reed, appears in conjunction with it. Finally, the thumb-mark disappears entirely, and two or more of the reed-marks take its place. In some examples the bricks are marked along their edges with a depression, which seems to have been made either with a finger or a reed when they were being taken from the mould. In building drains and wells, for which they were largely used, the bricks were usually set on edge and at an angle, alternate courses sloping in opposite directions, and thus forming a kind of herring-boning; and it may be noted that in early Babylonian writing the sign for "brick" represents rows laid in this fashion. These bricks were usually laid in mud, but in watercourses and at certain spots where extra strength was required bitumen was employed, being brought, no doubt, then as now, from the famous springs at Hit. That the builders were quite alive to the superior qualities of stone is shown by the fact that it was employed for the foundations of the earliest gateway that was uncovered, where blocks of gypsum set in bitumen occur in the foundations. They also exhibited considerable skill in making vertical and horizontal drains and sinks of terracotta, U-shaped channels for watercourses, drain-pipes of various shapes and sizes, and large vases and jars.

In the second period a great change takes place. The burnt bricks are henceforth always made in a square, or nearly square, mould, and, losing all trace of convexity, become flat. Moreover, they very generally are stamped with a short cuneiform inscription setting forth the names and titles of the king for whom they were made, while no example of an inscription on a pre-Sargonic brick has been found at Nippur. The inscription was nearly always placed on one of the larger faces of the brick, which was carefully laid face downwards (except in the case of such bricks as were re-used by later builders); but at least one brick was found with an inscription* upon its edge. Stone makes its appearance in the form of finely cut and polished door-sockets. A few glazed bricks of the time of Ashurbanipal were found by Dr. Peters, the first director of the American work. And bitumen is employed liberally, especially in the construction of watercourses and aqueducts.

In the last period burnt bricks are not so commonly made use of, and those employed are generally old ones obtained from the earlier structures, but in certain parts we find specially-moulded ones. The unbaked bricks are often made of material obtained by breaking up older ones, and in very many cases contain coins, beads, cylinders, and objects of a similar character, which were doubtless intended as amulets and offerings to secure good fortune to the building. In some instances plaster is used as a finish to the walls and for stuccoing.

Until the work of excavating is carried

further it will be impossible to offer more than a few detached notes upon the pre-Sargonic constructions, for in nearly all cases they lie buried deep beneath the buildings of a later period, nearly a score of distinct strata being discernible at some parts of the site. But sufficient remains have been uncovered already to show that at a very remote period the civilisation of Nippur was in an astonishing state of advancement. One of the most interesting discoveries made was that of an arch which was certainly constructed about six thousand years ago. It was built in connexion with the highly-elaborated system of drainage of the Temple of Bel, and served to protect two pipes (each about 8 in. in diameter) which carried the water from different directions to a point within the temple enclosure. In passing it may be noted that numbers of small pipes, specially moulded in T-form, were discovered in the neighbourhood of this drain, and that Dr. Hilprecht, the scientific director of the excavations, considers that they were "joints intended to unite terracotta pipes meeting each other at right angles." The twin pipes were made up from 2 ft. sections laid and jointed in clay and protected by walls of brick from which the arching sprung. The arch was built with burnt bricks (12 in. by 6 in. by 2½ in.) of a light-yellow colour. Its curve was effected by the simple process of forming the joints between the bricks of wedges of the clay which was used as mortar; and above its crown was a small pipe, apparently intended to drain off any water that might soak through the soil and threaten the arch itself. The vaulting was strengthened by a pier in the centre which carried a horizontal support; and that this strutting was a well-considered addition to the primitive bit of building was clearly demonstrated when upon its removal the arch itself settled seriously under the heavy weight above it. Apparently the drain had caused some difficulty to later builders, for above it we found a most solidly-built foundation, in the form of an L, with the angle corresponding to that of the ziggurat above it. This foundation block was built with particularly well-made crude bricks (averaging 16 in. square by 3½ in. thick), its arms were about 12 ft. thick, and it was 11 ft. in depth. Above the end of the vaulted drain and parallel with the face of the ziggurat ran a dwarf wall or curbing of pre-Sargonic burnt bricks, its base being 10 ft. above the bottom of the drain. This probably marks the boundary of one of the earliest enclosures of the temple; and it seems extremely likely that the two pipes of the drain met originally at the angle of the ziggurat of the corresponding period; for we shall see that the latter building was frequently enlarged by successive kings and governors. Within the enclosure and to the west of the drain stood a rectangular structure, built of crude bricks laid in bitumen, with a slightly-hollowed top, which has been shown by Dr. Hilprecht to be a crematorium.

The evidence of the trenches indicates that in these very early days of its history the temple was comparatively a small building. That the ziggurat existed before Naram Sin is beyond

doubt, but it is impossible to say present how large it was or what it was built of crude brick only, or the later structures, was faced with burned bricks. It will therefore be advisable to leave all description of the temple proper to a later paragraph, merely pointing out that the features of the building were present throughout its history, although its dimensions were slightly varied from time to time.

But before leaving this period mention must be made of the gateway which was discovered in the line of the city to the north of the temple, for it is to show what the pre-Sargonic builders could do with their unhandy bit of stone. It lay beneath the present level of the plain, and unfortunately much of the material used in its construction had been removed by later builders; happily of the lower portions a considerable amount remained, and there was just enough of the opposite side left to enable us to determine the width of the opening and to gather a clear idea of the plan of the gateway. The wall itself was built of crude bricks, but the gate opening was of baked bricks. Its face projected beyond the main line of wall, and from front to back of the gate was a distance of 35 ft. The centre lay a roadway, 12 ft. wide, for the use of vehicles and beasts of burden; while on either side was a narrow way, 4 ft. wide, for pedestrians. In the central portion, the road, sloped gradually upwards from the exterior, and was paved with bricks, and at its ends there seems to have been a stone curb for the gate to close against. In this portion of the structure and the edges of the footways lay the foundations of gypsum blocks which has been mentioned above. On either side of the roadway the walls of the footways were built with a batter, and a dwarf wall ran along the side of the walk near the road. The footways themselves were approached by short flights of steps, which the tread of each step is slightly narrower than the one below it. An important point to be mentioned is that the stone is slightly wider at its foot than at its head, being narrowed by stepped receding courses. This characteristic feature of Babylonian gateways was found in a more advanced stage in all the entrances to the temple and will be noticed lower. The gateway had plainly been rebuilt at a later period (but still pre-Sargonic), when the original construction of the wall had been somewhat altered, as was shown by the difference in the axes of the two stairways. It is probably a period of three or four hundred years elapsed between the building of the first and second gates, for there is a difference in their levels of nearly 10 ft. In the second structure the bricks are larger than those of the earlier period, but its character was quite similar to both periods, it is almost certain that a moat or canal lay outside the wall, and the gateway was probably approached by means of a bridge.

The remains of the second period are by no means complete, sufficient material is already at hand to form an intelligible picture of the temple and certain other buildings of importance. It is necessary to observe

* Of Shagarakti-Shuriash, King of Babylon (circa 1350 B.C.).

Fig. 1. Sketch Plan of Temple of Bel (restored in accordance with Dr. Hilprecht's Theories).

Outer Court. Inner Court. Ziggurat. Approach to Do. Shrine of Bel. House of the God. House for Honey, Cream, and Wine. H—Storage Vaults. I—Gates. J—Water Conduits. K—Water-Courses. L—Chapel of Bel (one of many in this outer court).

NOTE.—A and F are to a great extent unexcavated, and the position of G is somewhat conjectural.

However, that in the short account given how it has been impossible to select the buildings of any particular period for description; for we are compelled to fill up the gaps in one period by the materials of others; but the conservatism of the builders, who were ever desirous of keeping the character of the place as constant as possible, enables us to make such restorations with so much certainty that the picture given may be regarded as quite reliable in essential points.

The temple proper consisted of two courts, the outer one being open to worshippers, while the inner one was reserved for the priests and servants of the god (A and B, Fig. 1). In the inner stood over a score of shrines, or houses of the gods, who were worshipped at Nippur. In the latter were a great ziggurat (C, Fig. 1), the House of Bel (F, Fig. 1), a store house "for honey, cream, and wine" (G, Fig. 1), and possibly some smaller buildings. These two courts were encompassed by a wall, which is called in the inscriptions *Imgur Marduk* (Fig. 1).

At the sides and rear of these two courts stretched a very large enclosure. Behind the second court there lay outbuildings, more storehouses, servants' quarters, and so forth; and at the east angle, in all probability, stood the residence of the *patesis* of Nippur and the dwellings of the upper priests. These three sections—the two courts of the temple and the adjacent compound—which evidently constituted the sacred quarter of the city, lay on the east bank of the Shatt en-Nil, and were enclosed by *Nimit Marduk*, the outer wall. Whether the rest of the city was walled or not yet been ascertained, but probably was not. The position of *Nimit Marduk* varied but slightly at different

periods of the city's history; and that of *Imgur Marduk* was most likely constant—at any rate after the days of Naram Sin. It was in the line of *Nimit Marduk* that the pre-Sargonic gateway was discovered, and doubtless an entrance stood at practically the same spot throughout the succeeding centuries. Like the gateway, the wall itself was rebuilt from time to time, but the principal remains discovered by us belong to the time of Naram Sin (c. 3750 B.C.) and of Ur Gur (c. 2700 B.C.). Both the royal builders used crude bricks for the bulk of their work, Naram Sin employing huge specimens (19 in. by 19 in. by 3 in.), most of which were stamped, while Ur Gur's were much smaller and unstamped; but a finely-built water conduit was discovered at an outer angle of the former king's structure, built with burnt bricks laid in bitumen; and it is extremely likely that the gateways at least were faced with the same material.

Nimit Marduk was an imposing wall, solidly constructed, and worthy of its purpose. Its exterior was broken up by buttresses, spaced about 30 ft. apart, averaging 11 ft. in width and 2 ft. in depth. Both faces were built with a batter, and both were plastered with mud and clay. Its thickness in the days of Naram Sin remains undetermined, owing to the poor state of preservation of its inner face, but it was probably over 30 ft. In Ur Gur's time it was about 25 ft. 6 in. thick at its base. Nowhere does sufficient height remain to show the top, but it was probably about 20 ft. wide, and, on the bases of pictorial representations of similar structures, we may conclude that it was finished off with a battlemented parapet.

The best preserved portion of *Imgur Marduk* is found in the wall which separated the two courts of the temple. This is built of small crude bricks (about 8½ in. by 6½ in. by 3¼ in.), and, like the outer wall, has a batter and is divided by equally-spaced shallow buttresses into a series of panels. The lower portions of the gateway in this wall are well preserved. After the usual Babylonian custom its faces were decorated with narrow vertical panels, and it was

narrowed by means of stepped recessing, the gateway itself being only 6 ft. wide, while the width between the pylons was 14 ft. In the thickness of the walling upon either side of the gate was a small chamber, apparently intended for the use of the door-keepers. The door turned upon a metal shod pivot, resting in a door-socket, which was built round with burned bricks specially moulded for the work. The royal builders were always extremely proud of their door-sockets, and were careful to inscribe their names and titles upon them. The one found in position at this entrance was originally used by Ur Gur, and its inscription, which Dr. Hilprecht has kindly interpreted for me, runs:—"To Bel, King of the countries, his king, Ur Gur, the powerful champion, King of Ur, King of Shumer and Accad, E-kur, his beloved temple, has consecrated." Ekur, it should be explained, was the old name of the temple, and "king of the countries" is simply another expression for "ruler of the world." The socket itself, as we found it, had been re-used, probably by Ashurbanipal, who placed it in position for his own entrance (Fig. 2). The doorway appears to have been approached by a causeway built up in shallow slant-steps of burnt brick. Inside the door stood a circular pedestal, built with shallow slabs of stone, and a curious tank, or box, of burned bricks; and the jambs of the doorway, at the later period, at least, were of burned brick.

In the wall behind the ziggurat (N.W.), and in line with this gate, we found a second one, of similar construction, but smaller and somewhat less elaborate; and there is every reason to suppose that a third gate of the same nature stood in the south-east wall of the outer court. This, of course, would be the entrance used by worshippers at the temple, who probably landed at a quay on the canal which branched off from the Shatt en-Nil in this direction, and joined the moat referred to in connexion with the pre-Sargonic gate.

Within the second enclosure, and at its west angle, was placed the ziggurat, or stage tower. It consisted of five platforms or stages, on the topmost of which

Fig. 2. Photograph of Door-Socket

stood a shrine of Bel; but at the present day traces of two stages only can be made out with any clearness, owing to the operations of later builders and the ravages of time. As has been observed already, the ziggurat grew from quite small beginnings, many kings helping to enlarge and improve it. Ur Gur faced it with burned brick and widened its causeway by adding walls of the same material on either side; later kings patched and repaired it, at the same time frequently laying a new pavement over the courtyard; and in Ashurbanipal's time it was a huge mass, 190 ft. by 128 ft. on plan, with panelled faces and cased throughout in burned brick. Its longer sides were the north-west and south-east. On each of its shorter sides was a watercourse (J, Fig. 1), similar to those structures found by Loftus at Warka, which he describes as buttresses (*comp.* "Chaldea and Susiana," p. 167). They were constructed in burned brick, set in and finished with bitumen, and they drained the different stages of the ziggurat into a channel at its base (K, Fig. 1), which seems to have led to a shallow basin at the rear, whence another watercourse conducted the water outside the temple walls. The approach to the different platforms was placed on the S.E. face, nearly centrally; but it was not opposite the gateway, lying slightly to the south-west. It also was cased in burnt brick, and its walls had a slight batter. No remains of steps were found, but it is tolerably certain that the approach was made by stairs and not by a simple slope (D, Fig. 1).

In the north angle of the court stood the "house of Bel," the earthly residence of the god and his consort, Beltis. This building still awaits excavation; but we know that its outer walls were faced and panelled with burnt brick, and that bitumen was used liberally to make them waterproof, thus ensuring a dry dwelling for great Bel; and in the south-west façade two doorways have been discovered, one about 10 ft. and the other about 5 ft. wide. Also it is apparent that within the house were many small chambers and apartments, divided by walls of crude brick, and that some of them served for store chambers for the most valuable property of the temple. Between this house and the south-east wall of the court stood the "house for honey, cream, and wine." No actual remains of this store have yet been brought to light, its existence being known only by means of inscriptions; but my own belief is that it was built parallel with the courtyard wall, and to the right of the gateway, where traces of foundations of burned brick walling and steps were discovered (G, Fig. 1).

Lack of space forbids of any further description of the temple buildings. But sufficient has been written to show that the excavations have already served to alter several ideas that have hitherto been held with regard to Babylonian temples. The mere fact of the god having a "house," a shrine and a chapel in close proximity, is a significant point to note; and we can now see plainly that the ziggurat was not the only important part of the temple; but the discussion of such questions hardly falls

within the scope of this article. It is unfortunate that the old buildings should have suffered as they have at the hands of later builders, for though they still present many interesting features, there are others, such as their decorative treatment internally and the manner of finishing off the tops of the gates and walls, concerning which we know practically nothing. What we do know may be summed up thus:—(a) The temple consisted of the two courts and their contained buildings. (b) The courts were paved with burned brick pavements, across which in various directions ran waterways, some formed of terra-cotta pipes or channelling set in brick, some only of brickwork lined with bitumen. (c) The outer court held many chapels dedicated to different gods and goddesses, but the inner one was kept for Bel alone, of whose buildings the ziggurat and the "residence" taken together may be regarded as the most holy portion of the temple. (d) While the walls of the courts were of crude brick only, the principal buildings were faced with burnt bricks. (e) The drainage of the temple was carefully considered and well devised. (f) The architects aimed at impressing beholders of their work by size rather than beauty and proportion; and (g) they very commonly failed in such matters as setting out their walls at right angles, but in point of strength they achieved wonderful success.

The library and schools of the old city lay on the same side of the Shatt en-Nil as the temple, but a branch canal separated the two quarters. The secular buildings were constructed almost entirely in crude brick, burned being used only occasionally for door jambs and thresholds. The impression gained from a study of the rooms thus far excavated (about eighty) is that they belonged to a number of distinct houses, opening off from narrow streets. They

vary in size from about 9 ft. by 4 ft. to nearly 30 ft. by 15 ft. Although they were used for such important purposes they must have been dark and cramped; it appears that very little pains were used to make them attractive, and nowhere did we find a second storey. In some of the rooms we found ledges of brickwork covered with bitumen, which served as shelves for the clay tablets that constituted the library of the ancient university; but in all likelihood wooden shelves also were provided, and such numbers of tablets as have been discovered already could hardly have been stored on the ledges alone. It is noteworthy that even in the small apartments the walls are not at right angles in the majority of the rooms, an observation that applies to most of the shops and houses discovered in other portions of the site also. Because these buildings were nearly always constructed of sun-dried bricks, it is an extremely difficult matter to excavate them satisfactorily, for their walls, when first uncovered, look exactly like the debris which fills the chambers, and consequently the Arab workmen frequently cut away portions of them. In the future excavations it is to be hoped that better results will be attained by improved methods of working.

In many cases the old builders seem to have gone about their work in a very haphazard style. Frequently they do not dig foundations at all, as is indicated in the case of a retaining wall of the cemetery to the west of the Shatt en-Nil, where the difference of level of the lower courses shows quite clearly that the bricks were laid immediately on the surface of the plain. And this, be noted, was in the case of a fine wall constructed in specially well-made burnt bricks, provided with drains, and extending for a length of over 500 ft.

The mound which covered the library

Fig. 3. Tomb Constructed in Burnt Brick beneath a Chamber on Outer Walls of Parthian Fortress.

Fig. 4. Longitudinal and Cross Sections of Tomb.

Buildings had been used as a burying ground, and in it tombs of all periods were discovered. One which should be mentioned was a corbelled structure similar to that discovered by Taylor at Highgate, which has been so frequently illustrated. The Nippur example was about 20 ft. by 12 ft., and we found the remains of a stairway leading to it, built of burnt brick, and exhibiting the same stepped recesses as were found in the city gateway. Other interesting

- G—Water Jars.
- H—Food Platters.

tombs were the barrel-vaulted ones of the Parthian period, which were frequently plastered inside with fine white plaster. Some of them had pavements of brick sloping downwards to their side doors. A fine example of this class was found beneath the floor of a chamber on the outer walls of the great temple which the Parthian invaders erected over the old temple. Figs. 3, 4, 5 illustrate this tomb, which lay beneath a second chamber, counting upwards, in the S.W. wall of the fortress. Fig. 3 is a block plan showing its position with regard to the wall-chamber, Fig. 4 gives cross sections, and Fig. 5 shows the details, etc.

BENEFIT SOCIETIES AND WORKMEN'S COMPENSATION.

THE comments passed upon the operation of the Workmen's Compensation Acts at the recent conference of Oddfellows held at Leicester are deserving of attention at a time when the working of these Acts and their possible extension are under consideration. It must be remembered that the views there expressed were the views of working men in connexion with the Benefit or Friendly Societies managed by themselves or their representatives. They point out that the Workmen's Compensation Acts are causing a serious drain on the funds of these societies, and for two reasons—firstly, because a man who formerly returned to work within a day or two after slight injury now remain at home until they are completely recovered, and the committees tend to compel them to work until complete recovery because of the immense sum such a course has on the compensation received by them under the Acts; secondly, because it tends to shorten the period during which men are considered to be able-bodied, and throws men out of employ at an earlier age or for slight infirmity.

The Oddfellows, in consequence, appeal for legislative assistance, because their Parliament has passed legislation the

tendency of which is to throw men out of employment. The Committee appointed by the Home Office, in their Report on the Workmen's Compensation Acts, have suggested remedies for the latter of the two grounds of complaint set out above, but in our opinion the first objection has never received sufficient attention, although it is of primary importance. The direct tendency of the Workmen's Compensation Acts is to prevent a man from getting well and to prevent his returning to work. If he is for a time totally disabled, it is his interest to remain so until he is so much recovered as to be able to earn his old wages; unless he can earn a sum considerably above his compensation, idleness and half wages are more seductive. The same reasoning applies to the partially disabled. The Friendly Societies, which are admittedly most excellently and economically administered by the men for the men, have always recognised this tendency of human nature, and therefore when a man comes upon the funds he is placed under surveillance and strict rule; he is not allowed to walk more than a certain distance from his home; he is not allowed out after a certain hour; in other words, the relief he receives is given under restrictions. No such drawbacks attend the receipt of compensation under the Acts; a pension of half-pay can be enjoyed with complete liberty. Now, since the rules of the Benefit Societies have been framed by the men in their own interests, it would appear highly reasonable that the Legislature should have taken a leaf out of their book, and we cannot but regret that this view was not dealt with by the Departmental Committee, and that they with their experience should not have suggested some scheme to bring some kind of similar restrictions to bear on persons in receipt of compensation. As it is, the Compensation Acts work in some respects disadvantageously with the Benefit Societies, since the Societies hesitate to stop relief as long as a man is in receipt of compensation; and the Benefit Societies work to the disadvantage of the Workmen's Compensation Act, since in many cases where compensation is being received the arbitrator tries to encourage a man to make some exertion by reducing compensation, but the reduced compensation plus the sick pay still enables a man who is inclined to malingering to continue in idleness.

BONE ALABASTER, MARBLE, AND ONYX.—Mr. De la Croix, British Vice-Consul at Bone, Algeria, writes that the district is renowned for alabaster of the same density as the alabaster of Valterra (Tuscany). The stone, of great transparency, takes a fine polish, and can compete with the finest alabaster of Italy and Scotland. An important marble and onyx quarry, situated at Ouled-Rahmoun, is being worked by a French company. The colours are golden onyx, clouded onyx, notched onyx, red onyx, African red, pink granite, and other varieties—black, yellow, etc. Many of these marbles are similar to those used in ancient monuments of Rome and Carthage.

WAR MEMORIAL, WARWICK.—A memorial tablet, which has been placed in the Collegiate Church of St. Mary, Warwick, in memory of the men of the Warwickshire regiments who fell in the South African war, was unveiled on the 17th inst. The tablet is composed of white and black marble, and has been designed by Mr. Albert Toft, sculptor. The cost was 300l.

NOTES.

The Housing Problem.

It is to be hoped that the correspondence which is now going on in the *Spectator* may do something to quicken public interest and knowledge in regard to the housing problem in rural districts. It is evident from this correspondence that landowners who are anxious to build cheap but yet good cottages are greatly hampered by the by-laws of local authorities. In one instance a landowner was not allowed by the local authority to build some model cottages of wood, because the authority considered that it would be unfair to those who had built cottages of more costly material. The main thing is that cottages at once sanitary and roomy, irrespective of material, should be erected in rural districts where they are required. The fact that wooden cottages cannot last so long as stone or brick is, in some respects, a positive advantage, for then, as times change and internal improvements become understood, new buildings can be erected. It is often a disadvantage to the rural poor that old brick cottages exist, because they cannot, either as regards sanitation or comfort, be brought up to a modern standard. The whole subject of rural housing requires investigation by a Royal Commission, on which experts should be placed. Local authorities who have got it into their heads that cottages should necessarily be of a particular material will require something like Governmental pressure to admit a larger variety of material into their district. The inelasticity of rural by-laws also requires impartial consideration. No subject is of greater importance than that of the housing of the working-classes in our rural districts, and it cannot be too soon taken in hand by the Government.

Trade Disputes.

REFERRING to the statement we made last week of the satisfactory relations which exist between capital and labour since the decision of the House of Lords in the Taff Vale Railway case, we may quote from the latest memorandum issued by the Labour Department of the Board of Trade for August. This Report, although it shows that the labour market was on the whole dull, with a decrease in wages affecting some 355,000 workpeople—a condition of affairs usually conducive to trade disputes—discloses the fact that the total number of workpeople involved in such disputes was only 12,969 as compared with 29,523 in August of last year. The changes in the rate of wages were arranged by conciliation boards as regards 246,000 workpeople, and as regards 109,300 workpeople by direct arrangement between the employers and employed; and out of the latter figure of 109,300 the disputes were arranged without a stoppage of work, except in seven cases, affecting only 4,000 persons. These figures are a tribute both to employers and employed, and also show that, in the absence of the paid agitator, the relations between capital and labour are capable of pacific adjustment in the interests of both.

Ben Nevis
Observatory.

QUITE apart from its value as a conversational topic, the science of meteorology is of national importance, and universal regret must be felt at the announcement made that the observatory on Ben Nevis will be finally closed next month owing to lack of the necessary funds. The unique position of this establishment, at the highest point in the United Kingdom, lends a special interest and gives a peculiar value to the records there obtained. After Greenwich, the observatory is the most important in the whole country, and one that certainly ought to be maintained at the public cost. Unfortunately, the richest Government in the whole world appears unwilling to provide the small annual sum necessary to save the observatory from extinction. The Treasury has been asked for a grant of 600*l.* to defray that part of the annual expenditure of 1,000*l.* which has hitherto been met by subscriptions, but will not contribute more than 350*l.* This is a sorry exhibition of cheese-paring policy. Undoubtedly there are many calls upon the public purse, but it will be nothing less than a national disgrace if the parsimonious methods of Treasury officials are allowed to prevail in the present instance. At this season of the year it is difficult to bring pressure to bear upon the responsible Ministers of the Crown, and permanent officials cannot be expected to act on their own initiative. Hence the chief hope for the continuance of the observatory seems to rest upon the prospect of private support, and as the amount lacking is only 250*l.* per annum, there should be no difficulty in securing the requisite funds if the directors would reconsider their decision not to make any further appeal to the public. Time now presses, and if anything is to be done prompt action is absolutely essential.

The Dee
Embankment.

FOR some years past the officials of the London and North-Western Railway Company have been aware of the perilous condition of the embankment which protects their main line between Holywell and Mostyn, in Flintshire. Owing to the action of sandbanks, the tide in the estuary of the Dee now sweeps portions of the embankment, and a considerable breach in the outer defences has recently been made near Llanerchymor. Between the railway and the sea wall is a strip of land some 200 yds. wide, and as this lies below high-water level it is in imminent danger of inundation, a matter of importance to the owners, but still more important to the railway company. The circumstances leading up to the present critical position are worthy of note. It appears that the Dee Conservancy Board were unable to undertake the works necessary for the preservation of the sea wall owing to the limited extent of their financial resources, and that terms could not be arranged for joint action by the landowners and the railway company, each party apparently thinking the other should bear the greater share of the expenditure involved. Finally, the railway company found it absolutely necessary to take action, and resolved to build a new embankment close to the line, leaving the land to its fate. Thousands of tons of stone, clay and earth have been

transported to the site for the construction of a sloping bank from the permanent way to an adjacent ditch. The work is now well in hand, but, in consequence of the recent breach in the embankment, the position is distinctly critical. It is much to be regretted that the money being spent by the railway company could not be applied to the construction of new works on the river front, thus saving both the land and the railway line. We fear that each side has been playing a game of bluff, with the result that a large slice of the country will be lost.

The
Amenities of
the Thames.

THE Board of Trade have refused to grant their sanction to the projected construction by a trading company of what would be practically a dockyard on Lot's Eyot, a short distance above Kew Bridge, and opposite Kew Gardens. At present the island forms one of a group which partially conceals from view, from the south shore, the unsightly wharves and buildings along the river-side at Brentford. The frustrated scheme had been propounded by the Thames Steam Tug and Lighterage Company, who wanted to take Lot's Eyot for their barge building and repairing works. A petition has been addressed to the Thames Conservancy by the residents of Hampton Wick against the threatened disfigurement of the river-side by the construction of a wharf in a portion of the grounds of Cambridge House. The grounds lie opposite Canbury Gardens, which were laid out at a considerable cost by the Corporation of Kingston, to whom, together with the Hampton District Council, the ratepayers appeal for the preservation of the natural beauties of that reach of the Thames. Steps are being taken to enlist the co-operation of the East and West Ham districts in furthering a movement set on foot by the Stepney Borough Council to secure some sites which still remain vacant, and so to preserve them as open spaces on the left bank of the lower reaches of the river. The Borough Council seek to arrest the gradual closing-in of the Thames in the East-end of London, and, whilst opportunities yet offer, to provide means of public approach at various places on the bank, with open spaces for resort along the shore.

The Great
Antwerp
Fire.

THE extent of this fire has only become apparent after further detailed particulars have come to hand, and the area has been appreciated. Practically ten acres were at one time or other covered by burning petroleum, and two large petroleum stores are entirely wrecked. As to the originating cause of the fire, nothing has yet transpired; but as far as the spread of the fire is concerned, it is obvious that, although a considerable number of safeguards were practised and even required, the negligent manner in which these safeguards were applied led to disastrous results. Thus, the surrounding walls of one of the petroleum stores were too weak and had bad foundations. In the walls of another store openings were left through which the petroleum percolated. Some three years ago we dealt with another great fire at Antwerp

at the Royal Storehouses, and there, the extent of the calamity, that is to say the spread of the fire, was mainly due to neglect of precautionary measures. We hear that the warehouse district with the exception of these Royal Storehouses, which have now been rebuilt, is very much behind the times as far as fire protection is concerned; and, taking the history of Antwerp fires of recent years, combined with the state of affairs that still reigns, we should not be surprised if this town were some day to be the scene of a far greater calamity. It is perhaps one of the worst features of Antwerp building that some of the structures are among the most dangerous.

Hotel
Darlington
Collapsing.
New York.

DISCUSSION on the paper read in April last by Parsons before the American Society of Civil Engineers has brought forward a number of useful expressions of opinion by various well-known American engineers. It may be remembered that the Hotel Darlington was a twelve-story building constructed on the "cage" system, in which all the weight is carried by the columns, these being cast iron. Although cast iron is by no means to be recommended for the columns of a high building, the failure does not in itself prove anything against the material. Imperfect design and poor workmanship were responsible for the disaster. The columns were not designed with due regard to eccentric loading, bracing for wind strains and for stresses due to the use of hoisting machinery. In the absence of the metal in the flanges of the columns was honeycombed, and the bolting was both loose and inadequate. The New York Building Code is in many respects good, but it is a somewhat difficult matter to draft laws so as to cover every contingency, and the Darlington mishap has demonstrated the existence of several weak points in the code. The chief lesson it teaches is the folly of permitting buildings to be erected without intelligent supervision, and the great weakness of the New York code is that it provides no means of compelling the employment of competent professional aid. Perhaps the best criticism of the code is that it "pretends too much to engineering," and has led unqualified persons into the practice of "designing according to law." By making provisions of a general character with safeguards none but properly qualified men will be able to undertake important works, upon which the safety of the community rests. The position in New York can scarcely be considered satisfactory at the present time, especially in view of the remark made by a prominent American engineer that "many buildings in this city are in danger of collapse at any moment." On the whole we prefer what are sometimes called "obsolete British methods."

Wireless
Telegraphy.

THE theory of wireless telegraphy has been considerably advanced by the publication of Hertzian Waves, by Professor Lodge of Oxford, which has just been published in the *Proceedings of the Royal Society*. Hertz, who was the first to detect the electro-magnetic waves in 1887,

er, which Maxwell had predicted, also worked out Maxwell's equations and drew curves showing the propagation of the waves. Professor Love redraws some of these diagrams, and shows that they are to be modified very considerably. One of his results is that Hertzian waves can only exist when there is a magnetic and electrostatic field across which they can travel. For example, radio waves are transmitted across the Atlantic, Faraday's lines of electric and magnetic force must previously exist between the receiver and the transmitter. The oscillations are set up at the spark of the transmitter electrostatic lines of force are broken off, forming closed loops, which push aside the existing lines of force as they expand outwards with the velocity of light. Professor Love has drawn very clear diagrams of wave disturbance in the ether, showing how the loops come into existence and the shapes they assume as they expand. The arithmetical calculations involved in drawing the curves must have been a very tedious, but the result is worthy of the labour, for, to practical men as well as scientists, Professor Love's results are of the greatest value, and a study of them will show the reason why it is necessary to connect some cases to earth the antennae of the receiver and the transmitter, and in other cases this is unnecessary. It is interesting to note that all Professor Love's results are deduced from Maxwell's mathematical equations.

The Preservation of Timber.
SOME notes on the preservation of timber, presented by Mr. J. R. Baterden, at a meeting of the Newcastle-on-Tyne Association of Students of the Institution of Civil Engineers, are of interest to our readers, although primarily relating to timber used in engineering works. It is well known that most kinds of wood, if well seasoned and properly protected, will last for centuries. For instance, household furniture and timber used in the ground last almost indefinitely, and engineering structures, such as timber quays in water free from marine worms, will remain in good condition for fifty years or more. The author points out that decay is most likely to commence in those portions of structures which are affected by variations of weather and temperature—sometimes dry, sometimes wet—and in places where there is no current of air. Decking, where dirt lies along the joints and keeps the timber moist, is of more than ten years can scarcely be expected. This is accounted for by the fact that moisture encourages fermentation of the sap, a process that is retarded by warmth. Hence the exclusion of humidity should be the first care of all who use timber, and the second is to adopt means for preventing the process of fermentation. Although demanding a good deal of attention to seasoned timber, Mr. Baterden makes some interesting notes on other forms of naturally treated wood, referring in detail to the "Haskinizing" process. This form of treatment has the advantage that it does not involve the extraction of sap, but is based upon the solidification of the natural constituents of the

material, while destroying the germinative principle inherent in the sap, and sterilising all forms of organic life.

Cement Construction in Canada.
A NOTICEABLE feature in connexion with building operations in Canada is the extensive use made of cement and concrete. In Toronto it is now the usual practice to construct the entire foundations of private residences of concrete, and the same material is largely employed in building vaults, bridges, and other structures. In the Exhibition Park, Toronto, several buildings have been erected of hollow concrete blocks, which lend themselves to suitable architectural treatment and ensure solidity of construction. Concrete has also been employed in building many large grain elevators, and for the formation of foot-walks in cities, towns, villages and hamlets throughout the country. For water reservoirs and cisterns, sewers, and even coffins and burial vaults, concrete is largely used by the Canadians; but concrete-steel construction appears to have made little headway in the country up to the present time. Considering the rapidly extending adoption of the new material in the United States, this backwardness on the adjoining country is somewhat surprising.

Barnet Hospital Competition.
AS WILL be seen under the head of "Competitions," the Barnet Isolation Hospital Committee, to whose proceedings reference has been made more than once in our columns, have made their awards in this competition, having persisted in their refusal to appoint a professional assessor. The long discussion on the subject, as reported in the *Barnet Times*, shows how much they needed professional advice, both to assist their very confused ideas as to what was to be the next step, and also to instil into them some notion of their duties towards competing architects, as may be gathered from the remarks of the Chairman, to the effect that if the Local Government Board and the County Council did not pass the plans, their duty would be to take up some other plan or set of plans; "but they were not bound to either Nos. 46 or 28" (the plans placed second and third) "or any other number in the list of over 50 sent in. They would be left with a perfectly free hand, and could select any which were sent of the 50 odd, or choose from any other source outside the competition." That is to say, the "over fifty" architects who had competed would be thrown over *en masse*, and their whole labour and chances wasted. If that is the Committee's idea of the way to treat competitors, no wonder they did not want to be bridled by an assessor, who would not have left them this kind of "perfectly free hand."

Bewell Public Library Competition.
Two or three weeks ago we commented on the unsatisfactory nature of this competition, in which pretty large premiums were offered, but with merely the bald statement that "the successful plans would become the property of the council," nothing being said of an assessor; and we indicated that it was probably a competition to be avoided.

Our suspicions seem to have been more than justified. From a cutting that has been sent to us from a local paper, it appears that one of the members of the council has openly expressed himself as to the object of the advertisement:—
"Our plan is to get a good set of plans, and after assuring ourselves that they were all in order and the measurements correct, we could engage a clever clerk of works, who would see the work carried through according to these plans. Thus we would save all the architect's fees, which is a heavy item, and the work would be as well done as though we had an architect supervising."

That is not unfrequently the real object in advertising a competition, but we never saw it expressed with such cynical frankness before. The council may depend upon it that not a single architect of position or merit will respond to such an invitation.

Houses of Historical Interest: London.
IN furtherance of the movement for distinguishing the homes of eminent men and women, the Duke of Bedford has caused tablets of bronze, with suitable inscriptions, to be affixed upon the fronts of No. 65, Russell-square, and No. 11, Bedford-square—occupied respectively by Sir Thomas Lawrence, P.R.A., during the twenty-five years that preceded his death in 1830, and Henry Cavendish, investigator of chemical and natural science, and the first to calculate the mean density of the earth. A memorial tablet has recently been set up at No. 14, York-place, Baker-street, where Pitt resided in the interval 1803-4, during the Premiership of Addington, and which he quitted to resume the seals of office for the last time. A similar record will be made in respect of No. 6, Frith-street, Soho, where William Hazlitt died, Charles Lamb being in the room, on September 18, 1830; of No. 48, Welbeck-street, Marylebone, the home of Thomas Young, M.D., who rivalled Champollion in his elucidations of the ancient language and hieroglyphics of the Egyptians, discovered the interference of light, and expounded, in 1804, the theory of capillary attraction; and of No. 34, Gloucester-square, Bayswater, where lived George Stephenson.

The Photographic Salon.
THE twelfth Annual Exhibition of the Photographic Salon, at the Dudley Gallery, if it no more convinces us than its predecessors that photography is an "art" in the same sense as painting, serves to show what a number of different kinds of effects can be obtained by the judicious photographer. "Winter's Mantle" by Mr. Gleason (11), and "Road to the Old Farn," by Mr. Mitchell Elliott (12), show what delicate snow effects photography can give; while Mr. Steichen, in "The Big Cloud" (116), produces a most powerful effect with the representation of a large cumulous cloud over the horizon of a nearly black moor-land; but a painter would have got the same effect without losing so much of the detail of the foreground and middle distance. The same photographer exhibits a life-size head of G. F. Watts, with the Rembrandt-ish effect of strong light and shadow of which Mrs. Cameron set the first example in photographic portraiture. Mr. G. Davison's "Early Morning at Aele" (69), is most happily arranged in regard to pictorial composition; and Mr. H. Wild, in his

little afternoon scene on a sea-beach, "November" (207) has produced a poetic effect of declining day. We have so often spoken of the neglect of architecture in photographic exhibitions, that we must specially notice and approve the five small but well-selected and clearly executed small photographs of architectural subjects by Mr. Frederick H. Evans. This is a class of subject to which photography is particularly well adapted, and in which it is most valuable; and we hope to see more of Mr. Evans's work of this kind. There are two or three attempts at using photography for nude studies, removing them from realism either by a special tint in imitation of crayon, as in Mr. Le Bègue's "Sanguine," or by throwing them partly into shadow, as in "The Toilette of Gabrielle," by Messrs. Haweis and Coles; but considerations of decorum must always stand in the way of any extensive use of photography in this class of subject, except in the matter of life studies for the use of painters, which of course are not things for exhibition. That is another point in the superiority of painting over photography; a painter treats the nude figure conventionally; photography only treats it realistically.

It appears that two Frenchmen, Dr. Pellegrin and M. E. Petit (an architect), have proposed a system of building houses on turning platforms, so that questions of aspect and prospect can be settled at the

will of the owner. The platform is to be moved by the agency of a gas or oil engine. It is a scheme which obviously could only be applied to houses of small size, and must have many drawbacks even in that case; and belongs in fact to the type of human operations which may be irreverently classified as "fads."

NOTES AND SKETCHES IN SOUTHERN ITALY.—III.

SAN CLEMENTE IN CASAURIA.

The church of S. Clemente in Casauria is practically all that now remains of an abbey which was at one time celebrated and rich. It stands at a distance of a few kilometres from the little village of Torre de' Passeri, which takes its name from a tower from the summit of which a light was displayed to guide travellers in crossing the river Pescara, the ancient Aternus, which is near (Torre dei passi, Turris passuum). At one time the river divided into several arms and thus made the land upon which the abbey was founded an island, and that there are and were times when the fording of the river was dangerous is proved by the present condition of the pretty winding ravine down which the river runs. There was a lofty bridge by which the road crossed the river at a considerable height. This was broken down by the stream some time ago, long enough for the sloping roadway which led down to it to have been cultivated as a garden, and great masses of wall as large as the side of an ordinary house lie in the stream, testifying to its power when raging in flood. A slab which lies in front of the church bears part of an inscription recording the repair of a bridge near here in Roman times, and fragments which appear to have belonged to it are scattered here and there, which proves that the river had a bad reputation long before it drowned Sforza Attendolo at the ford nearest the sea. The Roman settlement was called Interpromium, and

in the atrium in front of the great west is a decayed inscription which records certain citizens of Sulmona had reconstructed the "ponderarium" of the village or district of Interpromium which had been cast down by an earthquake. In the time of Lucretius, in 1786, the inscription was more easily legible and he gives it as follows:—

cives Sulmonii, Primum, et Fortunatus huc Ponderarium, Pagi Interpromini vi Terremotus, Dilapsum, a solo Sna, pecunia, restituerunt.

To the left of the atrium or porch is a wall which was once vaulted, but is now open to sky and filled with antique fragments, beneath which a rank growth of weeds has sprung. Here are fragmentary inscriptions, statues, altars, and various portions of architectural ornaments. Walls were built at some distance across the room dividing the space, and are mainly formed of architectural fragments. In one of them bits of a mosaic pavement have been seen, and many portions of inscriptions, sometimes a few disjointed letters, sometimes whole words. Here are also stored a many pieces of Romanesque and medieval carving—caps, portions of a small rose window, etc.

The church had a Benedictine monastery attached to it which was founded by Emperor Lewis II. in 871 in thanksgiving for the driving of the Saracens out of Italy, the island called Casauria," so that the monastery preceded the monastery and had nothing to do with its riches or splendour. In 872 he obtained the bones of S. Clement, who was thought to be able to save those who fell into the Pescara and were drowning, since he had been drowned for his belief in Christ, and deposited the church which was then dedicated to Holy Trinity. They were brought from Rome attested by various miraculous occurrences placed before the high altar on May 27 certain Audegado ceded much of his property to the monks for the building of the monastery and in 874 it is referred to by Count Eriberto

S. Clemente in Casauria: West End.

S. Clemente in Casauria: Interior.

lt. The Emperor largely endowed the monastery and gave the abbots the right to use imperial sceptre instead of pastoral staff, holding it in the right hand, which Ughelli takes as a unique concession. The first abbot was named Rommo, priest and monk of the church and monastery of S. Mauro on the hill of Amiterus. Of this IXth century church nothing remains but the crypt. The twelve columns which support the vaults are antique, one of them fluted and very dwarf. The caps of the four which support the apse vault are Corinthian. A piece of the original pavement has been found, and shows that the crypt was never any loftier. In the apse is a rough stone altar on a pedestal, round the walls remains of a bench, and on the plastered vault rough scrolls of dark green with spots of a brown low looking like twirling serpents. It has five small naves vaulted with quadripartite vaulting, and is approached by two narrow stairs. In 920 the monastery was sacked by the Saracens. The monks approached Berengar, who gave them the power to elect an abbot, but the rebuilding took fifty years, and appears to have exhausted their resources, for in 1025 Abbot Guido found the place in a deplorable state. He obtained many privileges and grants from the Emperors Conrad and Hugo, and dying in 1045, left the monastery much better. Five years later Abbot Domenico for the first time asked the Roman pontiff for a "privilegium" against bishops, archbishops, counts, barons, and all those who wished to have power in the monastery. Leo IX. was

then returning from his unfortunate expedition against the Normans, and subsequent history shows that the "privilegium" was of very little avail against them. In 1074 Abbot Trasmondo fortified the "Castello" outside, also renewed the church of S. Pelino, and commenced to restore that of S. Panfilo in Sulmona. "Not content with the humility of the former church built by the Emperor Lewis, he built a new church in the place which is still called 'ad sanctos novos,' to which he obliged the congregations to move, wishing, if he had time and God willed it, to transfer the blessed Clement there." Between 1076 and 1079 the Norman Count Malmazetto put Trasmondo in prison and sacked the church and monastery, and when he came out he retired to his bishopric of S. Pelino, where he died and was buried, the monastery remaining waste. Malmazetto at last was imprisoned by the Lord of Prezza, and died in 1097. He was buried in the crypt. Abbot Grimoald obtained from Urban II. the pastoral staff in lieu of the imperial sceptre. He commenced the restoration of the buildings. Under Paschal II., successor to Urban, in 1104, a cardinal named Agostino had the tomb opened to see whether the monastery really possessed the body of S. Clement, and a body was found with a descriptive inscription in letters of gold. Grimoald made the altar, and the body was put into it, and it was sealed with lead and with iron, being dedicated in 1105. A small piece of the body was retained and placed in a reliquary. The great authority for the history of the abbey is the "Chronicon

Casauriense" now in the Bibliothèque Nationale in Paris, which was composed by the monk Berardus and written by a Magister Rusticus at the end of the XIIth century. The glory of the monastery culminated under Abbot Leonato, who was elected in 1155 and built the atrium in 1176. After his death and that of his successor, Abbot Joel, to whom the fine bronze doors are due, it began to decay.

The high altar stands under a baldacchino of stucco on four columns, which appear to be early XIVth century, raised on two steps. It is a Christian sarcophagus of the IVth or early Vth century, and through a hole the IIIrd century tomb of Greek marble, carved with floral ornament, can be seen, which is no doubt the one placed in the altar in 1104. On the top step is an inscription in Roman letters of the XVth century, probably a copy of the earlier inscription. It runs:—

Hic requiescit
Sanctus Clemens S. Petri Discipulus
Et a B. Petro secundus
qui jussu Trajani Imperatoris
Ancora ad ejus collum ligata
tuit in pelago demersus.

The sarcophagus was partially cleared of the cement which overlaid it by Sig. Calore, who has charge of the building, and under whose careful eye investigations and excavations are proceeding. It has three subjects in front with wavy flutings between. The central subject shows an "orante" sustained by two angels. The base of the Easter candlestick

is probably early, a detached inscription gives a date, 1202, and name, Magister Berardus, "ocopus fierifici." The church was damaged by earthquake in 1348, and the present candlestick was put upon the old base when other restorations were effected. It consists of a column of the stone of Pesco Sansonesco, with an elegant cap of Gothic foliage, which bears upon its abacus (which is decorated with a band of mosaic) an hexagonal prism crowned by six spiral colonnettes. On the prism are Cosmati inlays. Above the colonnettes is another cap and another imperfect prism above. At S. Maria d'Ara Bona there is a somewhat similar candlestick. There is a long inscription on the base of the upper part of the ambo, which is strange in design, showing great vigour of projection in the details. At the end of the inscription the name of the sculptor occurs, "Frater ergo Jacobus tibi martir supplicio Clemens. Istud opus recepit atque mihi soli Clemens. A. Pop. +." Probably he was of Popoli. He may also have worked on the facade. The ambo at S. Felino is probably also his, being much like this. The church is a Latin cross in plan, nearly 150 ft. long, and about 63 ft. broad in the transepts and 50 ft. in the nave. There are eight pointed arches with piers, the piers level with the large arch. The nave is of the full height only above these, and is built of a fine local stone called "pietra gentile," from Valle S. Maria, near Pesco Sansonesco. On the outside this higher part has three round-arched splayed windows on each side; a string runs round them at a little distance and unites them horizontally. Colonnettes rise from the springing of this arch, dividing the wall into equal spaces, and a crowning cornice of little arches and a dentilled string above is so arranged that three rest on corbels between each couple of columns. The arches are pointed, and a rosette is beneath each. The apse has the same kind of arcading, but with round arches, of which the colonnettes enclose two instead of three; in the centre are six corbels above a square-headed moulded window, with the usual Apulian beasts on corbels below it. The outside of the crypt shows a small pointed window flanked by two circular discs in high mouldings, and others in the flat wall. Abbot Leonato's wall is outside the ancient wall of the crypt, and has therefore closed the other original windows. The windows at the end of the aisles are round-headed, and have projecting hood moulds,

with columns and caps. After the earthquake of 1348 they built a great arch and wall to close the high nave, and in the XVth century the present bell-tower was built to replace the ruined ancient sacristy and campanile.

The general design of the atrium is shown in the drawings. It appears probable that there was once an oratory over it, converted into cells at a later date. The square windows appear to be XIIIth century. Probably the whole was altered after the XIVth century earthquake with old material. Only one of the lions which supported the columns remains, the other vanished during some badly-managed restorations before Sig. Calore came into power. On one of the caps may be seen the abbatial sceptre, and above it the symbols of the four Evangelists. Those of the central arch bear the figures of the twelve apostles; above, on the curve of the arch, are several figures with inscribed scrolls—Rex Salomon, Sanctus Clemens, an angel, and Rex David. A pointed arch cornice runs beneath the windows. The vaulting arches to the church and the arches above the doors are slightly horseshoe in shape. On the architrave of the central door is the history of the foundation of the church and monastery and the translation of the relics of S. Clement, and in the lunette S. Clement enthroned, with SS. Phœbus and Cornelius on the right and Abbot Leonato on the left holding a model of the church; rosettes and leaves like the ambo fill the corners. Above the left door is a relief of S. Michael, with the dragon on a square stone inserted; on the right is a Virgin and child, copied from a Byzantine original and inscribed *MP ΘΥ*. On the jambs of the central door are figures beneath canopies, very French in style; and on the outside of the apse is a capital with vine leaves studied from nature. Sig. Calore believes that French workmen were employed and compares the church with S. Benoit-sur-Loire, and the XIIIth century Provençal churches.

The bronze doors are very interesting, though not so early as others of the same type elsewhere in South Italy. They were probably made for Abbot Joel in 1191. There are seventy-two square panels, with bands between and rosettes. The panels were inlaid in patterns with gold, which, of course, has vanished. The top row shows four figures of abbots, with rosettes in the corner panels outside them. Beneath these rosettes are a series of three-

towered castles, with a list of the places to which the abbey had jurisdiction, which read to the bottom row. The other panels are filled with interlacing figures, rosettes, circles, a crescent moon with a star over, and another with a cross, both in circles. In the fourth row from the ground the handles occur, twisted and held in fliers' mouths. Oriental influence appears strongly in details both of ornament and subject, but one of figures is inscribed Abbot Joel, and since Rd. of Melfi made the doors of the tomb of Edmond at Canosa, near the beginning of the century, which also show Oriental influence very strongly, there seems no reason for supposing that they are not the work of Italians.

F. H. A.

AN ULTRA-MODERN GERMAN VILLA.

This illustration of a villa built at Tirkirchen, near Munich, from the designs of Munich architect, Herr Rank, is reproduced from a recent illustration in the *Architectonische Rundschau*. It is an example of curious forms of development of modern German taste in domestic architecture, and give also the plan.

THE ARCHITECTURAL ASSOCIATION VISIT TO KETTERING DISTRICT.

The sixth and last visit of the summer series of visits was made, for the week-end, to the interesting district around Kettering, on Friday, the 16th inst., to the following Monday morning, and was well attended, particularly by the photographers of the Association. Meeting at St. Pancras, the party left at 5.45 p.m. and found comfortable quarters awaiting them at the Royal Hotel, Kettering.

On Saturday morning, the 17th, in glorious sunshine, the party left for a long round, personally conducted by Mr. J. A. Gatch of Kettering, whose unequalled knowledge of the building of Northamptonshire, and whose valuable assistance in the preparation of the programme were placed at the service of the members. Passing *en route* the interesting church of Barton Seagrave, with its Norman doorway and remains of the early church, we reached Islip. This charming Perpendicular church, dedicated to St. Nicholas, is remarkable for good proportions and tall, elegant spire, and the peculiar plan of the piers of its nave arcade—a narrow strip of masonry placed axial north and south, and having engaged column east and west of it to support the group of mouldings of the arches. This peculiarity is seen repeated in several neighbouring churches; evidently a local type of masonry executed at this period. A mural tablet, on the southern wall of the tower, to the memory of Dame Mary, wife of Sir J. Washington (d. 1624), proved interesting. Other features worth notice were the octagonal font and the stoup inside the south door.

A short drive of two miles brought us to the village of Lowick, the church of St. Peter receiving our attention, chiefly for its Perpendicular lantern tower, at the west end of the church, and its old glass, with the monument of the XVth century. The octagonal lantern, with its group of twelve pinnacles, each crowned with a weather vane, is carried on the thick walls of the square tower, small squinch serving to carry the canted sides. The sedilia both of the chancel and the chapel north of the chancel, were good specimens of the style. But the interest here centred more particularly on the fine tombs (1) of Ralph Greene, 1411, with its alabaster effigies of himself and his wife Katherine, and (2) of Edward Stafford, Earl of Wiltshire, 1499, in the south chapel (of Our Lady). The former lies between the chancel and chancel aisle, and the figure of the Lord of Drayton is in armour, grasping the hand of his wife, the head-dress of the female figure being the rich but exaggerated mode of dressing the coiffure which obtained at the period. The beautiful work in the canopies heads of this tomb, with the band of angel figures in niches surrounding the tomb below, forms a delightful specimen of early XVth century carving. Fortunately the indenture entered into between the employer and her masons is still in existence, and relates how the widow Katherine, retained two "kervers"—to wit, Thos. Prentys and Robt. Sutton—to execute before the feast of "Pasques," anno 1420, "bein honestement et profitablement," the

S. Clemente in Casavria: Interior of Atrium.

ptuous tomb of alabaster, and find the
erial, for the sum of 40l. sterling.
the other tomb, of the Earl of Wiltshire,
died in the closing year of the XVIIth
ury, is also a very beautiful and rich piece
ork. The marginal inscription, with its
scrolls dividing the words, is a remarkable
e of lettering, worthy of the most careful
rd. The sides of the feet of the effigy are
ported by two small and quaintly-carved
ces of kneeling monks. A third tomb, a
slab with brasses let into it, is that of
ary Greene, of a date intermediate between
ie above mentioned, 1467, and shows us
figure clothed in a tabard. The north
a has some very fine and rich stained glass
he upper half of each window (the lower
ig plain), and dating perhaps a century
er than the windows in which they are
red.

he inexorable summons from the whipper in
he party bore us away from this most interest-
structure, to repair for refreshment to the
telry of the White Horse, and immediately
r to proceed to Drayton Manor, lying in the
k quite near (the seat of Mrs. Stopford
kville), where the party was hospitably
died, and after a conducted survey of the
misses, left to wander at will. It was here
had the benefit of Mr. Gotch's antiquarian
arch, and a plan he had prepared, chron-
ologically coloured, served to elucidate the
ory of the house. Once a manor, seized
n the Saxon owner by the greedy conqueror,
passed to the De Veres in the time of
ry II., the first Earl of Oxford (Aubrey)
ag, we know, its owner; and it remained

with the De Veres till one Sir Walter took to
himself the name of Drayton, in the reign of
Richard I. His descendant, Sir Simon de
Drayton, received, 1328, a licence to crenellate,
and proceeded to erect the house with enclosed
forecourt, that we now see, much altered
indeed, but easily traceable. Walpole wrote
to his friend Montague in 1763:—"The front

is a brave, strong castle wall, embattled and
loopholed for defence, . . . the mansion
all towers and turrets, . . . not a rag
in it under forty, fifty, or a thousand years old."
The great hall, the solar adjoining, and the
front buildings were Simon's work, and it was
interesting to know that the old roof of the
hall is still preserved intact, but invisible,

Villa, Thalkirchen. Plan.

because of the plaster ceiling inserted at a lower level.

Henry Greene, in 1450 (he was afterwards the Earl whose tomb we had seen at Lowick), altered, and indeed, rebuilt the greater part of the house, and no more was apparently done till in 1584 it was again enlarged by Lewis, third baron (1572-1601), and this Elizabethan work is perhaps the best portion of the house. John Thorp is said to have been entrusted with the execution of his scheme. This comprised the entire north-east wing, with its vaulted cellars, the two wings of the courtyard, and the front overlooking the pleasure. When Lady Mary Mordaunt married the Duke of Norfolk, much improvement was done, and we see the magnificent ironwork of *cir.* 1700, in gates, railings, and grilles, bearing her cypher. Tizon was then in his prime, and although no connexion with him can be traced, probably his craftsmen executed some of the work. Then it was that the interior of the hall was remodelled; the façade of the courtyard added, and the front portion improved. Lady Mary's second husband was Sir John Germain, who came over with William III., and has left us the magnificent gardens, with their terraces, ponds, balustrades and lead vases, as well as the colonnades of the forecourt. The present owner has done much to restore the beauties of the place, and everywhere is her loving care apparent. We left with much regret, time being short, and pushed on to Weekley Rise, for a pleasant rest in Mr. Gotch's delightful garden. After tea, the party proceeded by the fields to see the church of St. Mary, Weekley, and the almshouse, or Montague Hospital. The church is decorated, containing an effigy tomb of Lord Chief Justice Montague, who died in 1556, the father of the Sir Edward who founded the almshouse, dated 1611, with its quaint motto:—"What thou doest do yt in fayth," and the hexameter from Ovid' below the sundial, "Tempora labuntur tacitissime senescimus annis" ("Time flows, and we grow old tho' silent years"). The building has a fine doorway and gable over, still in remarkably good repair, but only two occupants remain. When they are gone the charity will presumably lapse.

Immediately adjoining the church and almshouse is the park gate of Boughton, whose ample avenues laid out by John the Planter, afforded a pleasant stroll before reaching the house, owned by the Duke of Buccleuch. It was the first Duke of Montagu, Ralph, who built the house, and incorporated parts of the previous Elizabethan structure, and the second, John (the Planter), who beautified the demesne, enlarged the work of his predecessor, and left us the wings of the large house, one of which is still unfinished. A lengthy perambulation through the state rooms brought to a close the first day's programme, and so back at dusk to our hotel.

Sunday broke even more fine and sunny than the day before, and an early start enabled us to get to Geddington before the hour of service. The village is picturesque, and boasts a good group in its bridge, cross, and church, all in close proximity. The cross is one of the Eleanor crosses, a XIIIth century relic, but differing from the others at Northampton and Waltham, and probably from those formerly at Charing, Cheap, Duustable, Stony Stratford, and Lincoln. But the statues on the Geddington cross are clearly by the same hand as those at Northampton, perhaps by John de la Bataille, the records and accounts of the executors being still extant; but there is no trace of the Geddington one in these. Its peculiarity consists in being triangular in plan, standing on a hexagonal base; and the canopies sheltering the figures are carried on slender shafts in front of the figures, which results in partially concealing the sculpture, to its detriment. These crosses, originally nine in number, were all erected between 1291 and 1294.

Passing on to Stanton, we made a brief survey of the church, which has a well-proportioned spire and a good font, and is linked with a tradition of the surrounding Rockingham forest. Proceeding on our route, we passed the quarries whence is obtained the Weldon stone; their output appears limited, judging from superficial evidence, but it must not be forgotten that from time immemorial has this stone been worked. Kirby Hall and even old St. Paul's being built of it. So also are many Cambridge colleges, St. Dunstan's in Fleet-street, and others. But to the uninitiated let it be said that the Weldon and the Ketton stone are one and the same.

Passing slowly through Great Weldon, the better to observe its little lodge (illustrated in Mr. Gotch's book) and its many interesting houses, we drove along by Deene Park (Lady Cardigan's) to Kirby Hall, where the inexorable official allowed us three brief but busy hours. Its departed magnificence has been often described; its present neglected statelessness cannot be described here. It should be seen and pondered over. Perhaps the unfortunate selection of its site was its condemnation, but in spite of drawbacks, it remained habitable down to 1820.

The mansion, built by "Hunfree Stafford," remains very much as he left it; John Thorpe's plan is still to be seen in the Soane Museum, and on it he records "I layd ye first stone, A^o 1570." It was sold to Sir Christopher Hatton in 1575, the year Stafford died, but circumstances prevented him from viewing his purchase till 1580, and his successor, another Sir Christopher, employed Inigo Jones to add to and beautify the work of Thorpe. His additions were not of an extensive character, only insertions being made to the north and south sides of the quadrangle, a staircase (now destroyed), a gateway in the outer court, the side entrances, and a few other minor features. The terraces, gardens, bridge, even the church, are gone, without more than mere traces and the house itself is rapidly becoming a ruin; but a small amount of timely care will preserve its solitary grandeur for many years.

Our allotted time having run out, and being unable to visit Grettton, which was on our programme, we drove on to the picturesque and charmingly-situated village of Rockingham. The castle was not to be seen on a Sunday, but we obtained a peep of the massive embattled gateway, dating from 1275.

We diverged, on our homeward journey, to Rushton, but the shades of night had fallen ere we reached it; so on to Kettering.

The Association must be congratulated on the success of the visit; a week-end, once in the year, affords good opportunity of both study and social reunion, and when the members have the assistance of such ciceroni as Mr. Gotch, eminent but genial withal, such visits cannot fail of success, the weather always permitting.

Illustrations.

"SCIENCE AND ART": RELIEF.

HIS panel, which was exhibited at the last Royal Academy during the present year, is one of a series of five panels representing the Arts and Crafts, to be placed in the marble staircase leading to the ballroom in the "Grosvenor," Glasgow.

The architect of the building is Mr. Geo. Bell, of Glasgow. The sculptor is Mr. Albert H. Hodge, of London.

COUNTY HALL, NORTHALLERTON.

THIS building is in course of erection for the North Riding of Yorkshire County Council. The design was selected in a limited competition ten years ago, Mr. A. Waterhouse being the assessor. The original plans have been remodelled to meet more recent requirements, and have been designed with a view to future extension.

A feature has been made of the hall and grand staircase leading to the anteroom and council chamber, in which Hopton Wood stone is being largely used. The building is faced with red Leicestershire sand stock bricks and stone from the Hollington quarries, and the roofs are to be covered with thick light-green Westmorland slates.

The contractors are Messrs. J. Howe and Co., West Hartlepool, and the architect is Mr. Walter H. Brerley, of York.

The drawing was hung in this year's Academy.

PENN HOUSE, WESTON, NEAR BATH.

THE designs shown herewith are a scheme for remodelling a house built in the "Italian Villa" fashion about forty years ago.

The existing house stands on sloping ground, with its principal aspects to the south and west. The main entrance is on the east side, and on the north side are the stables, designed by the late Mr. J. M. Brydon.

The scheme of remodelling has been to some extent governed by the plan of the old building,

part of which is to remain, and this has necessitated the position of the hall, which is intended to be top-lit. The walls are of Bath ashlar.

A start has been made with the billiard room wing, and the work is being carried by Messrs. Jacob Long and Sons, of Bath, from the designs and under the superintendence of Mr. Reginald Blomfield, of London.

The drawing was exhibited at the Royal Academy this year.

BLACKWOOD HOUSE, BYFLEET, SURREY.

THIS house is now being built in Den Park, Byfleet. The walls are of brick, and 14 in. thick above the plinth, and covered with cement rough-cast. The roof-tiles are of a pattern to imitate old. The framing of the verandah is of teak.

In the hall the panelling is of basswood, stained and oiled, and this and all the other pieces are being made by Mr. J. White, of Pymble Works, Bedford. The floors of the billiard-room, kitchen, etc., are of wood laid by the Acme Woodblock Flooring Co., Messrs. J. Garrett and Son, Balham, architects, and the architects are Messrs. Sutcliffe and Sutcliffe, London. The illustrations sent to us under the name of Mr. G. L. Sutcliffe, which only was ther-fore attached to the plan.

THE BRITISH FIRE PREVENTION COMMITTEE'S VISIT TO BUDAPEST.

AS ALREADY chronicled, the British Fire Prevention Committee organised a small expedition to attend the Budapest Fire Congress to which the Executive Officers had received an invitation, in return for the hospitality to Hungarian visitors at the Fire Prevention Congress held in London in 1903. The delegation included officers of the National Fire Brigades' Union, representing the Committee, that body, which had received a similar invitation. The Commission numbered ten, and away from England for seventeen days, besides visiting Budapest made several important inspections on the return journey, namely at Vienna, Munich, Nuremberg, Frankfurt, and Cologne.

Of the papers read at Budapest, there were two on the Baltimore fire, of which we already published one by Mr. Ellis Marsden; there were two on Theatre Safety; one on Fire Alarms; one on Mill Protection; and one on the Chemistry of Fire Protection, which might be deemed to be of interest to the British world.

The following were the resolutions adopted out of the discussion of these papers, which should be of interest to architects, and in preparing them we consider that particularly relating to the Mills and Factories should receive the careful attention of the Home Authorities.

RESOLUTIONS.

"Mills and Factories.—1. These should be provided with properly organised private brigades to meet the early stages of an emergency, and these brigades should be officially inspected at regular intervals.

"2. Any fire or alarm of fire in a mill or factory, however slight, should be immediately reported to the local authority, with the view of preventing similar occurrences; and failure to immediately make such a report should be heavily penalised.

"3. The preventive measures against possible outbreak of fire in mills and factories should be increased by a more systematic development of the structural regulations defining watchmen's duties and responsibilities.

"Theatres.—It is absolutely essential that stage scenery and properties be rendered inflammable in a reliable and permanent manner, and that all the constructional parts of a stage be of a fire-resisting character.

"Chemistry of Fire Protection.—The greatest attention should be given to the chemistry of fire protection, in the interests of fire prevention.

"Fire Alarms.—The public authorities should give greater attention to the installation of modern fire alarm systems in the minor urban and rural districts."

Of the above resolutions, those relating to non-inflammability of scenery and the chemistry of Fire Protection in some degree overlap, but we are glad to see that this question of chemistry for the purposes of Fire Prevention was given an important position at the Budapest gathering, for it has been too long neglected with the result that much has not yet been done which might long ago have been accomplished. The Conference was followed by a mee-

the International Fire Service Council, which Mons. Cazier (France), Mr. Sachs (England), Count Szechenyi (Austria-Hungary), Herr Westphalen (Germany) were elected Presidents for the ensuing first four years. The seat of the Council again fixed at Luxembourg. It will thus be seen that also on the International Fire Service Council the building was duly represented, for besides the English representative being an architect, Herr Westphalen is by profession a building surveyor, and has only of later years become Fire Chief of Hamburg.

Among the work which the Council will probably be taking in hand will be the consideration of an International Fire Service Dictionary, which not only the fire service terms, but any general building terms, may probably be included.

The Commissioners visited the scene of the large store fire at Budapest, and also the flour mills. But perhaps the most important visit at Budapest was the one paid by the Commission to the Royal Opera House, which has the first stage erected on the "Asphaleia" scheme and which is equipped with sprinklers. These sprinklers were put into action for the benefit of the Commissioners, the entire stage being flooded from top to bottom with a complete deluge of water.

As to Budapest generally, the development of the city has been much marked of late years. Innumerable new public buildings have been erected, and their façades are of considerable architectural importance. The new Royal Palace at Buda is now complete, and is also a very fine example of its class.

At Vienna, those members of the Commission

who had visited it before did not find any very great progress in the development of that city during the last ten years; but such of the new buildings as were being put up are certainly of very substantial character, and all showed a full appreciation of the value of a good architectural frontage. From the Commissioners' point of view, the visit to the new Gerngross Stores, which were in the course of completion, and to the Court Theatre were probably the principal events. The Fire Brigade is undoubtedly a splendid one, but it lacks well-built stations.

At Munich the Commissioners certainly saw a great deal that was new and of first-class character. The new retail stores in course of erection there, for Messrs. Emden and Messrs. Tietz, were buildings of high order, carefully designed, well and rapidly constructed, and unique of their kind. They were of considerable

Penn House: Plan and Elevation previous to the Alterations. (See page 316.)

architectural pretensions, and the architect's design had been well conceived and executed. The architect of both these places is Prof. Littman, who was also the architect of the new Regent Theatre, which is situated outside the town proper, and which was visited by the Commission. The large new fire station was also of considerable architectural merit, and far above the average of this class of building.

At Frankfurt the party visited the new stores of Messrs. Schmoller. This, although still in the builders' hands, was in full working order, and very clearly showed the whole principles on which the stores are now laid out. It is obviously wise that these buildings are dealt with abroad under separate or special regulations by the local authorities, both as to building and maintenance. The fire risk of these buildings is enhanced by the enormous cubic extent occupied without due separation into individual risks. The new Municipal buildings were structures calling for the comment of the Commission, as also a number of the new public buildings, such as the post-office.

At Cologne there was seen an excellently built fire station, most carefully planned, and very charmingly though simply decorated. There was also the usual new store building (belonging to Messrs. Tietz), but of more than ordinary interest, owing to the many exceptional technical devices used in that building.

In the two last-named cities, Frankfurt and Cologne, as also in Nuremberg, which was visited by the Commissioners, there were new theatres, which they went over most carefully. The one at Nuremberg was still in course of construction; the other two were completed. The Nuremberg one and that of Frankfurt were from the designs of Herr Seeling, the well-known German theatre architect; the one at Cologne is designed by Herr Carl Moritz, who is an adherent of the "Art Nouveau" School. All three theatres contained much that was instructive, though little that was essentially novel, i.e., novel as compared with what was to be seen some ten years ago when the evolution in theatre-building in Germany was taking place. All three were built by their respective municipalities; the Nuremberg one for both opera and drama, the other two for drama only. The municipalities who own them are to be congratulated on the very splendid buildings they have got, and, as far as we can judge, obtained at a very moderate expenditure, for the amount of work involved.

Speaking generally, throughout the journey the Commissioners were struck by the care taken in the construction of the buildings, notwithstanding the rapidity with which they were run up, and by the great interest shown by owners, whether business men or Corporations, that their buildings should be of architectural pretensions and be admired as works of architecture by their fellow citizens.

In conclusion, we should remark that the Commission had the benefit of having the whole of its programme most carefully mapped out in advance, with the aid of the British Consular Officers, and that the local authorities did their best to show the visitors what they wished to see. It is also needless to add that the Foreign Municipal Officials were most hospitable, as this is well known to all who have had occasion to visit the Continent.

Mr. Sachs acted as Chairman of the Commission. Mr. Ellis Marsland, of the Fire Prevention Committee, together with Mr. Horace Folker, of the National Fire Brigades' Union, acted as joint Hon. Secretaries. It is anticipated that a detailed illustrated report of the journey will be shortly issued by the British Fire Prevention Committee, and the publication will probably take the form of one of its usual red books.

OLD SCARBOROUGH.—A protest has been addressed to the *Times* against the proposal of the Corporation to remove the ancient market-cross from its present original site. As the writer further animadverts upon the alteration of the old names of some of the streets—for instance, "Merchants'-row" (the settlement of the Flemish traders) to "Eastborough"; "Blackfriarsgate" to "Queenstreet"; and "The Common" to "Victoria-road"—we may remind our readers that, on August 27, 1892, we published a historical article upon Old Scarborough, wherein mention is made of the places cited together with an account of the origin of the several "gates," the word "gate," for "street," being indicative of Danish occupation.

THE JUNIOR INSTITUTION OF ENGINEERS:

SUMMER MEETING IN GERMANY.

PERHAPS the decision that Germany should be the location of the present summer meeting of this society may have been regarded by some of its many friends as of too ambitious a character, but the great success of the gathering has justified in a most ample manner the Council's selection of the rendezvous. They had no doubt counted upon a warm welcome from the German engineers. It was unmistakably so, the members being received with the greatest kindness throughout the extensive tour, which included Dusseldorf, Oberhausen, Benrath, Elberfeld, Hanover, Berlin, Mariendorf, Charlottenburg, Leipsic, Frankfurt-on-Maine, Hanau, Homburg, and the Rhine.

The proceedings opened on August 13, when in the evening at the fine Municipal Concert Hall at Dusseldorf the civic authorities tendered greetings on the Institution's first entrance to the Fatherland. Associated in the ceremony as hosts were the Institution of German Iron Founders, the Lower Rhine District Association of German Engineers, and the Dusseldorf Institution of Architects and Engineers. Mr. Samuel Cutler, jun., the Junior Engineers' chairman, on this occasion and at other times gave fluent utterance in the Teutonic tongue to the Institution's acknowledgments, as did also Mr. F. R. Durham, of Frankfurt-on-Maine, the Hon. Secretary of the meeting.

The following day was spent in an inspection of the Dusseldorf Exhibition, under the guidance of Mr. Emile Hess, its engineering features, of course, receiving special attention. Next morning an early train was taken for Oberhausen, where are situated the great iron, steel, and engineering works of the Gutehoffnungshutte. Two divisions were formed for visiting them, one proceeding to the blast furnaces, steel works, rolling mills, etc., the other to the steel, iron, and metal foundries, engine and bridge works, etc. There appeared to be plenty of work under execution, and an extensive addition to the rolling mill was in course of building. After being entertained to luncheon in the Works Club House, the members went to the Benrath Crane Works, which is one of the largest of its kind in Europe and has attained such a well-merited reputation for the excellence of its products. Both steam and electricity are employed as motive power. The methods of testing the various parts, systems of erection, and other details were fully explained to the visitors.

On leaving Dusseldorf the party made for Elberfeld for the purpose of seeing the Langen Mono-Rail Suspended Electric Railway, which presents so many novel points of engineering interest. In this system the carriages are hung and travel from an overhead rail, which may be fixed at any level above ground or may be carried along the roof of a brick tunnel or iron tube. Another example occurs at Loschwitz, near Dresden. The Elberfeld line has a length of eight and a quarter miles and has been in operation since March, 1901. It now carries about 10,000,000 passengers per annum. Under the guidance of the engineers a complete inspection of the line was made, including car-sheds, power-house (current is supplied from the municipal works), stations, etc. In the afternoon the members arrived at Hanover, where on the next day the first visit was to Messrs. Korting Brothers' Works, erected in the year 1871, and now giving employment to 2,500 hands. The chief products are gas-engines, appliances for steam-users and manufacturers, pumps, boilers for steam and water heating, radiators, etc. Some special experiments with Korting injectors, steam-jet elevators, condensers, blowers, pulsators, etc., were carried out. The Korting ejector condenser is well known in England, over fifty electric-light and power stations being fitted with it. An interesting application of the spray nozzle was illustrated as it would be employed in cooling condenser water. It was also applicable to laying dust in colliery workings, purifying air of public buildings, damping tobacco, etc., cleaning blast and producer gases. Some powerful gas-engines were seen in the erecting shop, both of the Otto and the Clerk cycle. The former are built up to 200 h.-p. in one cylinder, and the latter single-acting up to 300 h.-p., or double-acting up to 1,500 h.-p. in one cylinder. The largest installation (40,000 h.-p.) of the Korting double-acting Clerk cycle engine is at the Laekawanna Steel Works. The importance of the heating engineering department of Messrs.

Korting may be gathered from the fact that annually 5,500 tons of castings, 1,500 tons wrought-iron tubes, and 33,000 valves are made use of. Hospitable entertainment followed the visit, and the Hanover Engine Works were then inspected.

They were founded in 1835 and have developed to such an extent that about 2,000 workmen are now employed. The manufacture of locomotives forms the principal work carried out, that department having been started in 1875. The total output to date has been close on 4,300, and forty engines can be fitted up simultaneously. The electric central station, with engines of 1,500 i.-h.-p., attracted special attention, and various processes with heat tools, etc., were arranged to be going on during the members' tour of the works. The toast of the "Hanoversche Maschinenbau" having been observed on leaving, the members then made their way to the Westinghouse Brake Company's Works, the construction and operation of the brake being fully explained, with the aid of an experimental apparatus such as installed at the London depot, King's Cross. The Hanover Gas Works were then entered, that the Pais electro-turbine gas recharging machine might be seen at work. The rapidity of its action was most striking, as the machine has only just been introduced. It is not possible to give definite results of working at Hanover for any length of time. In carriages which were kindly provided by Mr. L. Korting, the engineer of the Works, a who, by the way, is President of the German Association of Gas and Water Engineers this year, the members then had a most enjoyable drive to Herrenhausen; the fountain display a notable feature of the beautiful grounds was seen.

Mr. Korting also acted as cicerone to the members on the following morning, when the Zoological Gardens, provincial museum, and other places were visited. In the afternoon came the journey to Berlin, which was reached at about seven o'clock.

Friday morning was occupied by a most interesting visit to the Berlin Electric Overhead and Underground Railway and to the works of Messrs. Siemens and Halske. Assembling at the Potsdamer Platz station of the railway, the party were met by the engineer, and taken by train to the terminus of the Hirsch Warschauer Brücke. The car depot and workshops were shown, and after proceeding by rail from Schleischer Thor to Moecken Brücke the members walked over the bridge to the power station of the railway. The plant here consists of three Borsig engines of 1,200 h.p. maximum, and an engine of 1,800 h.-p. by the Gorlitzer Maschinenfabrik. The dynamos are directly coupled to the engines and are shaft generators for 800 kilowatts at 750 volts, constructed by Siemens and Halske. After going through the junction triangle the party took train again to the terminus of the line, and the Students' Union Club at Charlottenburg were entertained to luncheon by Messrs. Siemens and Halske, their works being visited in the afternoon.

In the large machine shop of the works the preparation and mounting of the various parts of dynamos, motors, etc., was seen. Other shops were occupied with resistances, starters and regulating resistances, apparatus for lifts and accessories for lifts and cranes, switchboards and switches, high-current apparatus, cut-outs, and line articles. The manufacture of arc lamps was also shown, and in the testing-room a highly interesting collection of different types of lamps were seen running. The Institution's summer dinner was successfully held in the evening at the Central Hotel, Berlin, the opportunity being taken of presenting to Mr. Durham a leather writing case suitably inscribed in expression of the members' appreciation of his valuable services as Hon. Secretary. On the following day the Mariendorf Gas Works of the Imperial Colonial Gas Association were visited in the morning, and the Royal Technical High School at Charlottenburg in the afternoon. The works are of the most modern description and afforded the members an excellent example of the latest practice in that class of work, having been completed as recently as the autumn of 1901. Special features consist of the coal handling plant, inclined retorts, coke conveying machinery, naphthalene washer, cyanogen washer, overhead loading station for the ammoniacal liquor, etc. A new holder was seen in course of erection by the Berlin haltische Co. The whole of the side sheets

be riveted by pneumatic riveters, air-compressing plant having been put down for the purpose. At the Charlottenburg School, where unfortunately there were no technical guides to the members round, perhaps the most striking feature was the large laboratory containing representative gas, oil, and steam engines of every type, aggregating over 800 h. p., with responding boiler power, by means of which students could test under actual working conditions every kind of motive power plant. A visit concluded the programme of the first week.

On Monday afternoon, August 22, the party left Berlin for Leipzig, remaining there Wednesday, when they went on to Frankon-Maine. On the invitation and under guidance of Mr. W. H. Lindley, an English engineer who has achieved great distinction on the Continent, the Water and Electricity works at Frankfort and the Sewage Works at Au, all of which were designed and carried out by him, were inspected. The arrangements made for these visits were most excellent and might well be followed in this country. It was pleasant to the members going over each work, Lindley, with the aid of diagrams and drawings, gave a general description in the form of a lecture. Members were thus in possession of the general characteristics of the undertaking in a much better position for seeking any special information having reference to their own branch of work. A fact which may not generally be known which was elicited in the course of the visit was that Mr. Lindley is largely due to the introduction into Germany of the steam turbine of large power.

On an excursion to Homburg took place on Friday afternoon, when the director of the visit conducted the members over the old and new buildings, where baths of every description were obtainable; the eight mineral springs and pumping plant for raising the water for use in the baths were also seen. On the historic Mans Terrace dinner was served in the evening, followed later by the fireworks of the annual Summer Festival. It was a delightful experience altogether. The next day the members travelled by train from Frankfort to reach to join the Rhine express steamer for trip to Bonn, and thence by train to Cologne, so as to be in time for the visit to Cologne. It should be mentioned that two extra visits occurred, at Berlin to Mr. W. Pittler's Experimental works, and the other to Messrs. Pittler's Lathes at Leipzig.

APPLICATIONS UNDER THE LONDON BUILDING ACT.

The Building Act Committee of the London City Council, at a meeting held on the 18th inst., dealt with the following applications for the London Building Act, 1894. The names of applicants are given in parentheses:—

Lines of Frontage and Projections.
Paneras.—Erection of a projecting clock over the Oxford Vaults, Kentish Town-road, Paneras, shown on the plans submitted Messrs. Murray and Co.).—Consent.
George, Hanover-square.—Erection of a window in front of No. 3, Deanery-street, Lane, St. George, Hanover-square Messrs. G. Trollope and Sons and Golls and Co. Ltd., for Mr. J. G. Joicey).—Consent.
Wandsworth.—Erection of buildings on the side of Streatham High-road, Streatham, the Streatham Lodge estate (Mr. P. C. G. G.).—Consent.
Bethnal Green, North-east.—Erection of buildings on the south side of Old Ford-road, Bethnal Green, between Nos. 12 and 30, with access to an advanced line of frontage Messrs. Davis and Emanuel for the East Dwellings Company).—Consent.
plam.—Retention of a wooden porch at 233, Queen's-road, Battersea (Messrs. Ilin Brothers).—Consent.
plam.—Retention of porches to eight sets of residential flats on the west side of Under-sweep, Battersea, between No. 1, Lavender-sweep and Limburg-road (Mr. I. L. George).—Consent.
ny.—Erection of projecting piers and cornice and an oriel window at Winchester-street, London-wall and Old Broad-street, (Mr. J. Belcher for the Trustees, Executants and Securities Insurance Corporation).—Consent.
Wolwich.—Erection of a porch at No. 1, Forest Hill-road, Lewisham (Mr. H. M. G. G.).—Consent.
enwick.—Erection of canopies to twenty-two houses on the east and west sides of Paddy-gardens, Old Charlton (Messrs. Wood and Rye).—Consent.

Lewisham.—Erection of an addition at the rear of No. 37, London-road, Forest Hill, to the line shown upon the plan submitted (Messrs. Dorrell Brothers for Mr. A. J. Dorrell).—Consent.
Marylebone, West.—Erection of an enclosed porch with steps and a wooden hood at No. 50, Maida-vale, St. Marylebone (Mr. T. F. Green for Mr. L. W. Green).—Consent.
Mid-land.—Erection of a wood and iron sign in front of the "Black Boy" inn, Mile-end-road (Mr. W. Husband for Mrs. E. A. Coake).—Consent.
Wandsworth.—Erection of porches to six semi-detached houses to be erected on the east side of Upper Parkfields, Putney (Mr. J. C. Radford).—Consent.
Wandsworth.—Retention of a projecting pent roof at No. 21, Lyford-street, Wandsworth-common (Messrs. J. A. J. Woodward and Sons for Mr. C. T. Coggin).—Consent.
Wandsworth.—Retention of a wooden porch and balcony and two bay windows to a building on the west side of Gwendolen-avenue, Putney (Mr. J. C. Radford for Mr. W. R. Williams).—Consent.
Woolwich.—Erection of porches in front of Nos. 59 and 60, Shrewsbury-lane, Plumstead (Messrs. J. H. and F. F. Hutchings).—Consent.
Woolwich.—Erection of a shop and studio on the north side of Eltham-road, Lee, at the corner of Meadowcourt-road (Mr. G. E. Clay for Mr. R. B. Daines).—Refused; undesirable to permit the existing frontage in Eltham-road to be disturbed.
Finchley, Central.—Erection of a proposed building on the site of Nos. 61 to 71 (odd numbers), inclusive, Collier-street, Pentonville (Mr. S. D. T. Pettit for Messrs. Everett and Co.).—Refused; for same reason as preceding.
Hackney, Central.—Erection of buildings on the south side of Darnley-road, westward of No. 1, to the line shown upon plan submitted (Mr. J. Hamilton for Mr. A. B. Salmen).—Refused; for same reason.
Hackney, North.—Erection of a one-story office building on the north side of Manor-road, Stoke Newington, eastward of No. 4, to the line shown upon plan submitted (Messrs. Turner and Holditch for Mr. H. M. Nurse).—Refused.
Islington, West.—Erection of a one-story shed at the rear of No. 21 and 23, Victoria-road, Holloway, to abut upon Chalfont-road, to line shown upon plan submitted (Mr. H. O. Ellis for Mr. G. R. Tiddall).—Refused.
Kensington, North.—Erection of a covered way at No. 24, Dawson-place, Kensington (Mr. J. W. Simpson for Mr. T. B. Wirgman).—Refused.
Kensington, South.—Erection of a one-story shop on the forecourt of No. 11, Beauchamp-place, Brompton-road, Kensington (Messrs. G. E. Hart and Co. for Mr. E. A. B. Wearing).—Refused.
Lewisham.—Erection of one-story shops in front of Nos. 86, 88, 90, and 92, Brownhill-road, Catford, to line shown upon plan submitted (Mr. T. A. Boughton for Mr. J. Allen).—Refused.
Westminster.—Erection of one-story shops in front of Nos. 79, 81, 83, and 85, Victoria-street, Westminster, to line shown upon plan submitted (Mr. B. Woodall for Mr. H. Webley).—Refused; it is considered undesirable to sanction the erection of the proposed shops on land at present in use by the public.
Width of Way.
Bethnal Green, South-west.—Erection of an addition to No. 453, Bethnal-green-road, Bethnal-green (Messrs. Harrington and Ley for Mr. J. Smith).—Consent.
City.—Retention of a one-story building on the western side of Swan-street, Aldgate, with the external walls at less than the prescribed distance from the centre of the street (Mr. A. Whitelaw for the London and North-Western Railway Company).—Consent.
Westminster.—Application of Mr. T. Kissack for an extension of the periods within which the re-erection of the rear portion of No. 6, Buckingham-gate, Westminster, at less than the prescribed distance from the centre of Stafford-place, was required to be commenced and completed.—Consent.
Woolwich.—Erection of houses with bay windows on the east and west sides of Back-lane, Artillery-place, Woolwich, and the widening of Back-lane as shown on plan submitted (Mr. H. O. Thomas).—Consent.
Deviations from Certified Plans.
Finchley, Central.—Certain deviations from the plan certified by the District Surveyor so far as relates to the proposed re-erection of No. 85, Goswell-road, St. Luke's (Mr. A. Young for the Improvements Committee of the Council).—Consent.
Holborn.—Deviations from the plans certified by the District Surveyor so far as relates to the proposed erection of a building on the site of Nos. 20 and 22, Neal-street, Holborn,

as shown upon plans submitted (Mr. M. T. Saunders for Messrs. Watney, Combe, Reid, and Co.).—Consent; but that the applicant be formed that the above consent must not be taken as in any way approving the water-closet shown on the ground plan, which is not in accordance with the Council's by-laws made under the Public Health (London) Act, 1891.
Strand.—Deviations from the plans certified by the District Surveyor so far as relates to the proposed re-erection of Nos. 48 and 49, Jermyn-street, St. James's, as shown upon plans submitted (Mr. W. Woodward for Mr. S. T. Miller).—Consent; but without approval of the pavement lights and vaults, which will require the sanction of the local authority.
Width of Way and Lines of Frontage.
St. George, Hanover-square.—Erection of a stone, iron, and glass porch at No. 73, South Audley-street, St. George, Hanover-square (Mr. P. Waterhouse).—Consent.
Strand.—Erection of a projecting clock and two oriel windows at Nos. 41 and 43, Wardour-street, Shaftesbury-avenue (Mr. H. M. Wakley for Mr. W. Clarkson).—Consent; but without approval of the pavement lights shown on the deposited plan.
Brecon.—Erection of two wooden oriel windows at No. 7, Crooms-hill, Greenwich, in the position and as shown upon plan submitted (Mr. H. Bugden for Mrs. E. C. Crook).—Consent.
St. George, Hanover-square.—Erection of a one-story shop at No. 2, Princes-row, Buckingham-palace-road (Mr. E. Stevens for Mr. H. G. Pett).—Refusal; within the prescribed distance from the centre of the roadways.
Brixton.—Erection of buildings on the site of Nos. 422 and 423, Coldharbour-lane, Brixton (Messrs. W. and J. Peacock for Mrs. Lockhart).—Refused; less than prescribed distance from centre of street.
St. Pancras, West.—Erection of a water-closet on the forecourt of Nos. 13 and 14, Miller-street, Camden-town (Mr. T. F. Strutt for Mr. H. Ward).—Refused.
Line of Frontage and Construction.
Deptford.—Erection of a building to be used as a greenhouse and cycle-shed in the garden at the side of No. 144, Breakspere-road, Brockley (Messrs. Jenkins and Sons for Mr. H. J. Morris).—Consent.
Width of Way and Temporary Building.
Rotherhithe.—Retention of a wood and iron coffee-house at the Rotherhithe-tunnel works on the north side of Rotherhithe-street, Bermondsey (Messrs. Price and Reeves).—Consent.
Working-class Dwellings.
Battersea.—Three intended dwelling-houses to be inhabited by persons of the working class, and proposed to be erected, not abutting upon a street, on a site at the rear of houses in Stamford-road, Battersea (Mr. E. Cannell).—Consent.
Width of Way, Space at Rear, and Projections.
City.—Deviations from the plans certified by the District Surveyor so far as relates to the proposed erection of a building on the site of Nos. 4 and 6, Cophthall-avenue, City (Messrs. E. Runtz and Ford for Messrs. J. Chessum and Sons).—Refused.
Line of Frontage and Space at Rear.
Wandsworth.—Erection of two buildings on the north-west side of High-street, Tooting, westward of Selkirk-road—extension of time (Messrs. D. Watney and Sons).—Consent; Messrs. Druces and Attles (similar application) to be informed of this decision.
Space at Rear, Means of Escape, and Projections.
Strand.—Deviations from the plans certified by the District Surveyor so far as relates to the proposed erection of a building on the site of Nos. 29 and 30, St. James-street, and Nos. 25, 26a, and 27, Bury-street, St. James's, with projecting balconies and porch next St. James-street (Mr. L. W. Green for Mr. J. Claxton).—Consent; but not approving the water-closets in the basement, which do not appear to comply with the Council's by-laws made under the Public Health (London) Act, 1891.
Means of escape in case of fire proposed to be provided in sixth story of same new building.—Consent.
Formation of Streets.
Wandsworth.—Formation of new streets for carriage traffic out of Tooting-bee-road and Upper Tooting-road, Upper Tooting, Wandsworth (Messrs. Lucas and Sons for Mr. F. W. Lucas, Mr. E. Lucas, and Mr. H. Erickson).—Consent.
Hackney, North.—Laying out of a new street for carriage traffic to lead from Amhurst-park-road to Stamford-hill, Hackney (Mr. C. Cheston for Mrs. E. M. Kelsey).—Consent.
Hammersmith.—Extension of the period within which a new street to lead from

Scrubs-lane to Hithel-road, Hammersmith, was required to be clearly defined and thrown open to the public (Mr. E. Collins).—Consent.

Haverstock.—Extension of period for the new street, to be named Howitt-street, to lead from Haverstock hill to Glenilla-street, Hampstead (Mr. C. T. Bentley).—Consent.

Battersea.—Variation from the plan sanctioned for the formation of two new streets at the rear of proposed buildings on the east side of St. John's-road, Battersea, between Battersea-rise and Beauchamp-road, so far as relates to a reduction in the number, and an alteration in the size, of the stables and stores in such new street.—Consent.

Greenwich.—Retention until August 23, 1905, of temporary gates at each end of the new street to lead from Kidbrook-grove to St. Germain's-place, Blackheath.—Consent; houses in the street not to be inhabited until all gates and barriers removed.

Clapham.—Laying out for carriage traffic of a street to lead from Kendon-road to High-street, Clapham (Mr. J. Donkin for the executors of the late T. G. Foster).—Refused; street not being of the full width of 40 ft. clear.

Wandsworth.—Laying out of new streets for carriage traffic on the Fisher-estate, between Leigham-court-road and Valley-road, Streatham (Mr. J. S. Gabriel).—Refused; no direct communication, and portions of the gradients steeper than 1 in 20.

Formation of Streets and Lines of Frontage.

Norwood.—Formation of six new streets for carriage traffic on the Sanders-estate on the west side of Denmark-hill and east side of Poplar-walk, Herne-hill (Messrs. R. Ellis and Son for Mr. R. A. Sanders).—Consent.

Erection of buildings on a piece of land on the east side of Poplar-walk and south side of Fernside-road, Herne-hill, to abut also on proposed new streets (Messrs. R. Ellis and Son for Mr. R. A. Sanders).—Consent.

Space at Rear.
Southwark, West.—Modification of the provisions of section 41 of the Act, so far as relates to the proposed erection of a cartshed, and three stories over, on the east side of Gravel-lane, Southwark, to extend over part of the open space at the rear of a stable building on the north side of Orange-street (Mr. E. Carritt for Mr. J. Sainsbury).—Consent.

Wandsworth.—Modification of the provisions of section 41 with regard to open spaces about buildings, so far as relates to the proposed erection of a building on the south side of Vaux-road, Tooting, with an irregular open space at the rear (Mr. W. Bartholomew).—Consent.

Space at Rear and Means of Escape from the Top of High Buildings.

Newington, West.—Modification of the provisions with regard to open spaces about buildings, so far as relates to the proposed erection of a building on the site of Nos. 17 and 19, Newington-causeway, Newington, at the corner of Union-road with an irregular space at the rear and to extend above the diagonal line (Mr. W. Gilbee Scott for Lord Redstock).—Consent; and also as to means of escape in case of fire.

Means of Escape from the Top of High Buildings.

City.—Means of escape in case of fire proposed to be provided on the fifth and sixth stories of a proposed addition to Winchester-house, Old Broad-street and London-wall (Mr. J. Belcher for Trustees, Executors, and Securities Insurance Corporation).—Consent.

City of London.—Means of escape in case of fire, proposed to be provided on the topmost story of Liverpool, London, and Globe Insurance Company's premises, at the corner of Lombard-street and Cornhill (Mr. J. Macvicar Anderson for the Company).—Consent.

St. George, Hanover-square.—Means of escape in case of fire, proposed to be provided on the fourth story of the Oriental Club, No. 13, Hanover-square (Mr. T. H. Watson for the Club).—Consent.

Buildings for the Supply of Electricity.
Bow and Bromley.—Plans for the construction of a pit or vault in front of the Glauco-street generating-station (Mr. H. Heckford for the Council of the Metropolitan Borough of Poplar).—Consent.

Woolwich.—Plans for the construction of an addition to the engine-room at the electric light station, Globe-lane, Woolwich (Mr. F. Sumner for the Council of the Metropolitan Borough of Woolwich).—Consent.

Marylebone, West.—Plans for the construction of two cooling towers at the generating-station, Richmond-street and Salisbury-street (Mr. A. Wright for the Council of the Metropolitan Borough of St. Marylebone).—Consent.

Cubical Extent.
Lewisham.—Erection at the Century Works, Conington-road, Lewisham, of a covered way

to unite the test-room block with the main shop, by which uniting the buildings will exceed 250,000 cubic ft. in extent (Messrs. Elliott Brothers).—Refused.

Dwelling-houses on Low-lying Land.

Camberwell, North.—Licence granted to the Metropolitan Borough Council of Camberwell for the erection of dwelling-houses on low-lying land situated in Beckett-street and Bailey-street, Camberwell, in accordance with plans submitted on their behalf by Mr. W. Oxtoby, Borough Engineer).—Consent.

Southwark, West.—Licence granted to the Housing Committee of the Council for the erection of a building on low-lying land in Webber-row site, Southwark, in accordance with the plan submitted on their behalf by Mr. W. E. Riley, Superintending Architect of the Council).—Consent.

COMPETITIONS.

BOYS' SCHOOL, DOUGLAS, ISLE OF MAN.—At a meeting of the Building Committee of the Douglas School Board, held recently, the Committee considered the report from Mr. E. R. Robson, of London, the architect appointed to advise the Board on the competitive designs sent in for the proposed new school in Demesne-road. Mr. Robson reported that in his opinion the designs submitted under the motto "Stabit" (the authors being Messrs. Bottomley, Son, and Wellbourn, of Middlesbrough) for a central hall school were the best sent in. The Committee recommend that the designs of Messrs. Bottomley, Son, and Wellbourn be accepted by the Board, subject to the conditions issued to architects in connexion with the competition.

BARNET ISOLATION HOSPITAL.—The committee have accepted the plans named "Economy," by Mr. J. Hugh Goodman (Reading); and have awarded the premium of 30 guineas to Messrs. Woodrow and Hilsdon (Chancery-lane, London), and the premium of 20 guineas to Messrs. Nicholls and Hollyday (Birmingham).

PUBLIC LIBRARY, WHITEHAVEN.—In the above competition the first premium has been awarded to Messrs. Greig, Fairbairn, and Macvicar, 31, York-place, Edinburgh; the second to Mr. W. A. Mellon, City-chambers, York; and the third to Mr. C. E. Hatchinson, 11, John-street, Bedford-row, London. The designs were to be on view at the Town Hall, Whitehaven, from Thursday to Saturday of the present week.

"THE DRAINAGE OF A HOUSE."
SIR.—Will you kindly allow me briefly to reply to Mr. Samuel Smith's letter in your last issue (September 17) re above?

My article, criticising Mr. Smith's paper, was not written with the object of showing the width of my own knowledge or the narrowness of another's, but simply to foster a desire to elicit intelligent discussion on the best methods of sanitation as applied to house drainage.

It has brought forth a reply from Mr. Smith, which shows, at least, a want of courtesy in descending to personalities. His strictures, however, are wide of the mark, and as I do not consider any good purpose is achieved by recrimination, I must therefore decline to be drawn into any disputation with him.

In conclusion, I may add I do not resent the judicious criticism of anything I have written, and still less do I want to force my views on anyone who disagrees with them.

NOTES ON PORTLAND CEMENT.
CHAPTER IX.—THE USE OF:

REAT strides have been made in the last ten years in the manufacture of cement, and, although it is used for most purposes of building, etc.,

at one time lime was the cementing material employed, it cannot be said that a proportionate advancement has been made in its proper use and one often hears the expression that it is expensive, whereas, by judicious use, it may be employed cheaply and profitably.

The opinion so often expressed that a tenuous cement is bad is true only in instances, the cause of failure being generally attributable to improper handling.

Newberry says, "the first consideration in preparing cement concrete is to combine materials in such proportions as to produce the greatest possible density. This is accomplished by using just enough of the finer material to fill the voids in the coarse material. The percentage of voids in the latter should in all cases be carefully determined. This is most simply accomplished by the use of a metal box 1 cubic ft. capacity. This is filled with material to be tested, well shaken down, struck on one corner until it rises even with the surface and the weight again taken. The difference in the weight of water filling the voids of material. As 1 cubic ft. of water weighs 62.5 lb., from the weight of water found the percentage of voids can be calculated. In case of sand this method will not answer, as it is difficult to completely fill the voids of sand with adding water. The voids can, however, be readily calculated from the weight of a cubic foot of the material. The specific gravity of quartz sand is 2.65. A cubic foot free of voids would therefore weigh 2.65 x 62.5 = 165.6 lb. The weight of a cubic foot of well shaken down, is, however, found to be 112 lb., a difference of 53.4 lb. The proportion of voids is therefore $\frac{53.4 \times 100}{165.6}$ or 32.3 per cent.

"The calculations of the proportion in which the materials are to be mixed is as follows. Let us assume a sand with 32.3 per cent voids and gravel with 35.9 per cent. To fill the voids in the gravel with sand we shall require 35.9 volumes of sand to 100 volumes of gravel or 1 to 2.8. To fill the voids of the sand with cement we shall require 32.3 per cent. of cement to 100 parts by volume. The theoretical proportions will thus be cement, 11.6; sand, 35.9; gravel, 100; or, 1 to 3.1 to 8.6. It is a common practice to increase the proportion of sand more or less above that calculated to compensate for imperfect mixing, to obtain a concrete of greater strength. This, however, is an error. There is one proportion, and one only, which a given sand and stone can be mixed to give the minimum of voids. This is the proportion in which they should always be mixed, whether a rich or poor concrete is required. Cement 1, sand 3.1, gravel 8.6 may seem a poor concrete, but, in fact, is good, the secret of the quality being the correctness of the proportions.

"A small variation in the amount of sand gravel will convert it into an inferior concrete. To improve the strength, cement only should be increased, the increase of sand would weaken the concrete; properly proportioned concrete of 1 to 3 to 8½ is stronger than sand cement mixture of 3 and 1."

For concrete work the quality of the sand, gravel, or stone has much influence on the finished work. The sand should be clean, sharp, not too fine, and, if containing admixture of clay, it should be washed. If it is not generally recognised that a very small percentage of clay has great effect in making poor concrete. The gravel or stones should likewise be clean and hard. Soft material is unsuitable for good work. The material should be free from clay or mud. On one occasion the author had the investigation of a complaint that the cement supplied for a certain work would not set. On proceeding to the work it was easily seen where the fault lay. The cement was being used for fireproof floors, the aggregate supposed to be coke breeze. This, however, was not the case, but the aggregate contained nothing but cinders from a refuse destructor containing all kinds of rubbish, which formed a mud on the addition of water. When the cement was mixed with good, clean coke breeze it set quite satisfactorily.

one of the chief points to be observed in the preparation of cement mortar is that mortar which has commenced to set should not be mixed again by the addition of more water, or the engineering properties will be destroyed. On account of this, it is important for the consumer to know the setting time of the cement being used.

Unfortunately, it often occurs that the already set mortar is mixed with more water, which is unjustifiable complaints that the cement does not set well and that it will not harden. The consumer would do well to indicate to the manufacturer the time of setting of the cement required and the use to which he proposes to put the cement; in this way a great many complaints might be avoided.

A paper read before the Institution of Civil Engineers in 1887 on "Concrete Work under Water," the late Mr. W. R. Kinnipie advocated the use of what he termed "plastic concrete" for such work. This concrete was prepared and allowed to partially set before being deposited under water. Mr. Kinnipie claimed that by means of the cement lost but little of its strength, that where currents existed there was a chance of the cement being washed out of the aggregate, and the excessive proportion of cement otherwise required to allow for that being washed away was avoided. Mr. Kinnipie's experiments went to show that concrete of 1 to 1, after setting out of water for eighteen hours and then rammed into moulds, will form a monolithic mass when afterwards placed in water; but that the strength of this mass will vary much depend upon the time allowed for setting before deposition. If only eight hours were allowed between mixing and deposition, there is practically no reduction in strength, but with a longer interval the strength is gradually reduced, and at about eighteen hours it is little more than half.

This subject was investigated by Faija, who read a paper before the Society of Engineers in the Effect of "Sea-water on Portland Cement." He designated Mr. Kinnipie's concrete as "reset concrete," and stated that such concrete, to be of value, must be made with slow setting cement, and it must be broken up and pressed *in situ* at a particular period during its period of setting. His experience was that the breaking up of reset concrete and the re-gauging could be done at the moment when, by ramming, the original water of gauging can be brought to the surface. If that time was exceeded, and concrete, on being broken up and rammed, would be subject to the dissolving action of sea-water. Faija's experiments confirmed this view, and the noticeable point in them was that with quick-setting cement the reset concrete always showed a very considerable diminution in strength, whereas with slow setting the loss was not so great.

Working with concrete which has commenced setting is a very dangerous practice, no doubt accounts for some of the failures which the cement has been blamed.

Another point, in preparing concrete, which deserves attention is the addition of a proper amount of water. By the use of too much or a soft porous concrete is obtained, the cannot be properly finished off, and sealing takes place.

Too little water will give a weak concrete, the top will be rough and wear badly. As an indication of the wide variation in the use of water in mixing concrete, the replies to a thirty-five railroad companies to a circular inquiry from the Committee on Concrete of the American Association of Railway Superintendents of Bridges and Buildings, in evidence. These replies show that ten use a dry mixture, five a moderately dry mixture, sixteen a moderately wet mixture, and four a wet mixture. According to the report of the Committee, a dry mixture is one requiring repeated ramming to bring moisture to the surface, and a wet mixture one which sets when slightly rammed.

For the benefit of their own practice, the engineering and building department of the Chicago, Milwaukee, and St. Paul Railway conducted the experiments on this subject.

Two boxes, each a cubic yard in capacity, were carefully made and balanced on bridge girders, with a short piece of rail on the outer side of each stringer, and a third piece of rail placed across and under the other two at a central point between the two boxes. The boxes were then made to balance by hanging weights to the light end. In one box

was placed a very wet concrete, and in the other a dry mixture. The concrete was made of 1 part cement, 3-2 parts gravel, and 3-6 parts of crushed limestone. The gravel was composed of 51 per cent. of sand, which made the actual proportions about 1 part cement, 2 parts sand, and 5 parts stone. The water used for the wet mixture was 82 per cent. of the volume of cement used, and for the dry mixture 44 per cent. The latter mixture, by hard ramming, could be made to quake slightly, and moisture could be seen on the surface of each 6-in. layer. It took thirty-five minutes to fill the box with dry concrete, and twenty minutes to fill the other with the wet mixture. As soon as the boxes were filled, the central rail was shifted until the cubes balanced. It was found necessary to move the rail 0-3 ft. towards the wet cube, showing that the wet concrete weighed 9-7 per cent., or 340 lb. more than the dry mixture.

When the concrete had set and the frame was removed, the difference in the appearance was very apparent. The face of the cube of wet concrete was smooth and compact, while that of the dry cube was full of voids and very rough, notwithstanding more labour was expended in placing the dry mixture. The cubes were allowed to stand on the balance thirty days, and observations taken to see if the loss of excess water in the wet concrete would appreciably diminish its weight, but no such loss could be observed. The cubes were then broken by drilling 6-in. holes across the centre of the top and side surfaces, and bursting open with plugs. It was found that the wet concrete was much harder to break than the other; and the cube of dry concrete broke vertically down to the centre of the cube, and then the fracture followed the horizontal layer, which marked the top of the first batch of concrete deposited.

The interior of the wet cube was a solid, compact mass, with most of the pieces of stone broken across along the line of the fractured cube; while the interior of the dry cube was full of voids and a much larger percentage of the stones were pulled out instead of being broken, as they were in the wet mixture. The results of the tests show (1) that a moderate excess of water is not injurious; (2) more labour is necessary in mixing and placing a dry concrete than a wet one; (3) it is impossible to get a dense concrete without using what is, theoretically, an excess of water.

The idea that a dry concrete gives the best results no doubt comes from the fact that in laboratory tests the best results are obtained when a minimum of water is used, but the conditions prevailing in the testing-room are widely different from those which exist in practical working.

For instance, in the testing-room every precaution is taken that none of the water used for gauging is abstracted from the cement, while in actual work the concrete may have to be laid on porous soil, through which some of the water will soak away, or the aggregate may be of a porous nature and absorb some of the water intended for the cement.

OBITUARY.

MR. BATY.—The death, in London, is announced of Mr. Sebort Conrad Elton Baty, Director of Public Works in Mombasa, East Africa Protectorate, aged thirty-eight years. Mr. Baty was the second son of the late Rev. J. Baty, of Roehampton. Having graduated at Cambridge University, whither he proceeded from St. Paul's School, he was appointed land surveyor in the Mauritius, and after two years' service in that capacity was appointed, in 1892, Government Surveyor and Superintendent of Public Works in Seychelles.

MR. ENFIELD TAYLOR.—We have also to announce the death of Mr. H. Enfield Taylor, of Chester, who carried on an extensive practice as a civil engineer in Cheshire and North Wales. Mr. Taylor was engineer to the great Orme Tramway, Llandudno, and to the Hawarden Waterworks Company; he held the appointment of acting conservator on the Board of the river Dee Conservancy, and during a long period was managing director of the Chester Race Company.

SIR THOMAS BROWNE MEMORIAL.—Mr. Henry Pegram, A.R.A., is appointed sculptor of a statue to be erected in the Haymarket, Norwich, to the memory of the author of "Religio Medici," "Hydriothaphia," "Garden of Cyrus," and other works. Sir Thomas Browne, *obit* 1682, was buried in the church of St. Peter, Mancroft, in that city, but his remains have since been disturbed.

GENERAL BUILDING NEWS.

NEW PARISH CHURCH, SHERFIELD ENGLISH, HAMPSHIRE.—The new parish church at Sherfield English was recently consecrated. The design of the building is of late XVth century Gothic style, cruciform in plan, with chancel, choir, nave, north and south transepts, and north and south aisles, with a porch on the north side, and a heating chamber under the south transept. The church is planned to seat 180 worshippers, the nave, aisles, and choir only being utilised for seating, the north transept being at present used as an organ chamber, and the south transept as a vestry. The outside extreme length from east to west is 38 ft. 6 in., whilst the outside extreme width through transepts and choir is 51 ft. 6 in., and through nave and aisles 40 ft. 6 in. The height from ground-level to top of vane on spirelet is 37 ft. The church is built principally of red bricks, with dressings of Chilmark stone. The whole of the internal stonework is Bath stone. The tower has a square lower stage, rising into an octagon, with angle pinnacles with carved finials and flying buttresses, and two tiers of traceried openings filled in with slate louvres, the bells being placed in this part of the tower. All the windows have traceried heads. There is a peal of eight bells, made by Messrs. John Taylor and Co., of Loughborough. The floor has been laid with Cloisone ornaments by the Arrolithic Company. The artificial lighting is by oil lamps of forged iron and copper, the lamps being suspended by forged iron chains from the apex of the intrados of each arch. The greater part of the structural work of the church was carried out by Messrs. W. Roles and Sons, of Romsey, after which they transferred their contract to Messrs. Jenkins and Sons, Ltd., of Southampton and Bournemouth. The work has been carried out from the designs and under the personal superintendence of the architect, Mr. Fred Bath, Salisbury. Mr. W. Taylor, Salisbury, was the clerk of works.

NEW ROMAN CATHOLIC CHURCH, CATFORD.—The new Catholic Church of St. Cross, which, with a presbytery adjoining, has been erected in Sangley-road, Catford, was opened recently. The materials employed were brick and Portland stone, and the style of the building is Romanesque. Accommodation is provided for about 200 persons. The work has been carried out from plans provided by the late Mr. F. W. Tucker.

PRIMITIVE METHODIST CHAPEL, NEW SELSTON, YORKSHIRE.—On the 14th inst., the foundation-stones of a new Primitive Methodist chapel were laid at New Selston. The building is to cost 600l. The contractor is Mr. J. T. Brown, of Nottingham, the architect being Mr. J. Antcliffe, of Draycott.

NEW ROMAN CATHOLIC SCHOOL, COWDENBEATH, N.B.—A new school, which has been built in Stenhouse-street for the purpose of providing education for the Roman Catholic children in Cowdenbeath, was opened recently. The building was designed by Mr. W. Birrell, Kirkcaldy and Dunfermline, and provides accommodation for 400 pupils. Two doorways at either end—one for boys and the other for girls—open into a central corridor, off which there are eight classrooms. By means of Stone's patent sliding partitions the corridor and classrooms can be transformed into one hall, which outside of school hours it is intended to use for church purposes. The desks and other furnishings have been provided by James Bennet, Glasgow. To a height of several feet the walls are finished with varnished woodwork. Two cloak-rooms are provided besides private rooms for the principal teachers. Play-sheds have been erected in the playground. The cost of the work is 3,000l. The following are the principal contractors:—Builder, Andrew Wilson, Cowdenbeath; joiner, Wm. Simpson, Kirkcaldy; plasterer, John Paul and Sons, Cowdenbeath; painter, Andrew Allison, Cowdenbeath; plumber, Alex. Rolland and Co., Dunfermline; heating (by hot-water pipes and radiators), Dilworth and Carr, Preston.

NEW SCHOOLS, BURRADON, NORTHUMBERLAND.—On the 17th inst. new council schools were opened at Burradon Colliery. The building has been erected on the central hall principle, and provides accommodation for 750 boys and girls. Three classrooms are placed on the west side of the hall, while two long corridors run at right-angles to the hall, and from these are entered seven other classrooms, including cookery-rooms, teachers' room, cloakroom, and lavatories. The whole has been designed by Mr. W. Bedlington, architect, Newcastle, while the contract has been executed by Mr. Amos Gray. The cost of work has been 9,000l.

BUSINESS PREMISES, BRISTOL.—The reconstruction of the premises of Messrs. E. S. and A. Robinson, at the corner of Victoria-street and Redcliff-street, Bristol, has now been completed. The work has been carried out

by Messrs. Cowlin and Son, from plans prepared by Messrs. Oatley and Lawrence.

NEW WAREHOUSE, BRISTOL.—A new tea warehouse has been erected on Redcliff Hill, Bristol, for Mr. F. Budgett. The building has a frontage of about 60 ft., and is of Carr brook bricks. The electrical work has been carried out by Messrs. P. Jolin and Co., Bristol. Messrs. Wilkins and Sons were the general contractors, and the architect was Mr. H. C. H. Tarr, of Bristol.

NEW OFFICES, BIRMINGHAM.—The new offices of the Wesleyan and General Assurance Society in Steelhouse-lane, Birmingham, have been completed. The premises are of classic design, the principal elevations being constructed with Portland stone and grey granite, with red granite columns, the roofs being covered with green Westmorland slates. The structure covers an area of 12,500 sq. ft., having a frontage to Steelhouse-lane of 100 ft., and to Slaney-street, 120 ft., the total height from lowest floor to ridge being 120 ft. The sub-basement is used as a heating chamber and provisional space for future electric generating plant. The basement is arranged as a stationery store, etc. The ground floor office is approached from Steelhouse-lane by a portico entrance, the clerks' entrance being also from Steelhouse-lane. The entrance lobbies and principal doors, also counters, panelled dados, etc., are of polished teak, and the interior columns and pilasters are Scagliola marble. The board-room, manager's rooms, committee-room, and other private offices are upon the first floor, and approached by a flight of granolithic stone stairs, the entrance hall and corridor being paved with marble terrazzo, and dados lined with glazed tiling and oak. The remaining space upon first, second, and third floors are fitted up for a staff of clerks. A hydraulic passenger lift runs from the level of sub-basement to the highest floor, also three small hand lifts for the various departments. The caretaker's rooms occupy part of upper story. The building is lighted by electricity, the main switch-board being fixed in the basement with main switches to control lights upon each floor. The heating is by means of low-pressure hot water, about two miles of pipes, equal to 4 in. diameter, being used. The strong rooms have a superficial floor space of 3,252 sq. ft., and are fitted up with iron doors, racks, and shelves, which were supplied by Mr. John B. Field. The heating has been carried out by Messrs. G. N. Haden and Sons; the electric lighting by Mr. Walter S. Vaughton; the internal plumbing and sanitary work by Mr. Edward Hill; the external plumbing by Messrs. W. Woodfull and Son; the electric fittings by Messrs. S. Heath and Son, all of Birmingham. The hydraulic and other lifts were supplied by Messrs. Archibald Smith and Stevens, Battersea. The builders are Messrs. John Bowen and Sons, of Birmingham, and the architects Messrs. Ewen Harper and Brother, also of Birmingham.

FEVER HOSPITAL, LEEDS.—The new Leeds Fever Hospital is to be opened shortly. The hospital has been built on the one-storied pavilion principle, the various buildings being isolated from each other, the connexion being by covered ways, beneath which runs a continuous subway for carrying pipes and electric wires. The principal covered way is a quarter of a mile long. There are about twenty pavilions, each of which contains thirty beds, divided into wards of fourteen beds each, and two single-bed wards for private patients. A feature of the new pavilions is that they are raised on arches 5 ft. above the ground, and in the resulting open space beneath the floors run the water pipes and electric wires. Workmen will thus be able to make repairs and sweep the chimneys without entering the wards. Under normal conditions accommodation will be afforded for 240 scarlet fever patients, sixty diphtheria, 104 enteric, and forty-eight isolated cases—making a total of 452, whom it is possible to treat at the same time. Apart from the pavilions, there are administrative and residential blocks. The nurses' home contains accommodation for 100 nurses, and seventy female servants will be lodged in the servants' home. There will be in addition a male staff of over thirty, and sixteen cottages have been provided for married servants. The other buildings include waiting and discharge rooms, operating theatre, laboratory, mortuary, ambulance stables, laundry, and kitchens. There is a water and clock tower 110 ft. high. About 30,000 gallons of water are stored in the tower in case of a failure of the ordinary supply from the city mains. The buildings are of brick, with stone dressings, and electricity, generated on the spot, will be used throughout. Within a short distance of the fever hospital stands the smallpox hospital. This institution has been occupied for some months. There are here three main pavilions, affording accommodation for ninety smallpox

patients and fourteen isolation cases, in addition to nurses' and servants' homes and administrative buildings. There is no engine or boiler-house at this hospital, as it will be worked from the fever hospital. The contract for both hospitals was obtained for 200,000, by Messrs. H. Arnold and Sons, of Doncaster. The architect is Mr. Edwin T. Hall, of London, and Mr. A. Turner represents the Leeds Corporation as clerk of works.

WORKMEN'S CLUB, USHAW MOOR, DURHAM.—The new club premises for workmen which have been erected at Ushaw Moor were recently opened. The building occupies a site in Station-road, and has cost 7,000. There are a bar, sitting-rooms, and a hall capable of seating 700 people, also library, reading and billiard rooms, and other rooms for games. Mr. George Ord, of Durham, was the architect, and Messrs. Walton Brothers, of Crook, the builders of the new premises.

PUBLIC LIBRARY, MOTHERWELL, N.B.—The memorial-stone of the new Motherwell public library was laid a short time ago. The building is situated in Clyde-street, and will consist of a lending library of 50,000 volumes, reading-room for 100 readers, juvenile room, reference library, ladies' room, lecture-hall and museum, recreation-room, etc. The architects are Messrs. Greig, Fairbairn, and Macniven, Edinburgh.

YOUNG MEN'S CHRISTIAN ASSOCIATION PREMISES, BIRMINGHAM.—The new premises of this association, which are being erected at Dale-road, Birmingham, are now nearing completion. The building is designed in the Renaissance style, the principal features being the entrance arch and the oriel windows. The patent casements are filled with leaded glass of graceful pattern. The structure has a frontage of 93 ft., and is five stories high, with a double basement. There is an oak-tiled vestibule and a reception-hall, or "lounge," 53 ft. by 31 ft. Opposite the entrance is an arcade supported on scagliola pillars, and the centre will be occupied by an ottoman. There is a lecture-hall, which is 53 ft. by 35 ft. A larger hall is to be erected, when funds are available, on a piece of land reserved for it on the left of the existing hall. Opening out of the reception-hall is the assistant secretary's office, and a staircase leads down to the two dining-rooms and smoking-room, the walls of which are covered with cream and blue tiles. The main staircase, which is fireproof and provided with wrought-iron banisters, leads to the reading-room on the first floor, the walls of which are coloured a neutral grey, the floor being polished pitch-pine. The tables and reading-desks will be of fumed oak, and the seats will be upholstered in green pegamoid. On the same floor is the religious meetings-room, and there are also offices for the general secretary, accountant, and clerks. On the next story higher is the educational department. A separate staircase leads to the hostel, which comprises about forty bedrooms of various sizes, and a boarders' sitting-room. There are bath-rooms and lavatories on each floor. The rooms are all lighted by electricity, and there are electric bells in each of the bedrooms. A well has been prepared for a passenger lift, and service lifts are already provided. The furnishing contracts have been shared between Messrs. Chamberlain, King, and Jones, and Messrs. Holliday, Son, and Co. The gymnasium is situated at the back of the main building, and its floor space is 83 ft. by 55 ft. The gallery is designed to serve as a running track, about twenty laps to the mile. The accessories to the gymnasium include a plunge-bath, needle-baths, and spray baths. The work has been carried out by Mr. William Bishop, of King's Heath, from the plans of Messrs. Ewen and Alfred Harper, at a cost of over 30,000.

NEW WATERSIDE DEPOT, VICTORIA AND ALBERT DOCKS.—The Great Western Railway Company have opened a new waterside depot at the south side of the Victoria Dock, near the water channel leading to the Albert Dock. The following is a list of the contractors:—Steel work, Messrs. Cross and Cross, Walsall; electric cranes, etc., Messrs. Crompton; construction of wharf, The London and Tilbury Lighterage Constructing and Dredging Company. The plans were prepared in the Great Western Railway Company's engineer's office at Paddington.

NEW ALMSHOUSES, WOOD GREEN.—The new almshouses, which have been erected in Nightingale-road, Wood Green, were opened recently. The buildings have been erected by Mr. C. Gray Hill, from plans prepared by Mr. A. W. S. Cross, architect.

BANK PREMISES, BYKER.—The opening of a new branch of the savings bank at Byker took place a short time ago. The banking-room, with strong-room and lavatory, occupies the whole of the ground floor, with the main entrance in Shields-road and the exit in Heaton-road. The design is Renaissance in

treatment, and is faced with buff terra-cotta and brick on a polished granite base. The roof is covered with green slates, and floors are chiefly of wood on steel girders. The banking-room is warmed by hot-water radiators. The contract has been carried out by Mr. E. P. George, Newcastle. The contractors were: Messrs. Kirk and Dickson, slaters' work; Matthew Charley, plumbers' work; John Chapman, plaster work; James Small, painter and glazier's work. The granite, mosaic floor, hardware, structural door, and heating apparatus were supplied by Messrs. Emley and Sons. Mr. Richley acted as clerk of the works, and Stephen Piper, Newcastle, was the architect. The total cost of the building has been at 6,800. The electric lighting arrangements were entrusted to Messrs. Robson and Co., Newcastle.

STAINED GLASS AND DECORATION

BOLTON.—Under the instructions of Messrs. Pott, Son, and Hennings, of Bolton, stained-glass memorial windows have been erected in the Delph Hill Wesleyan Church. The artist was Mr. W. Camm, of Smethway. **WEST HARTLEPOOL.**—Two memorial windows have been erected in the Park-road Presbyterian Church, West Hartlepool, in memory of the late Sir William Gray and Alderman Lauder. The Gray window, which was designed by Lady Gray, the subject being "The Sower" and "St. Paul Preaching at Mars' Hill." The family arms are in tracery. The Lauder window, the gift of Colonel Lauder, J.P., and Mrs. Pymon, a latter of whom unveiled it, was similar character and treatment, having "The Christian Soldier" and "The Christian's Grin" as figure-subjects, with the family arms in the tracery above. The windows were from the studio of Mr. W. Camm, Smethway.

SANITARY AND ENGINEERING NEWS

SEWAGE AND DESTROYER WORKS, HYDE. At the meeting of the Manchester branch of the Association of Managers of Sewerage Disposal Works, held recently at Hyde, I. T. Horrocks read a paper describing sewage and destructor works now in operation at that town. In the course of remarks he said that the original works were designed and carried out by Mr. J. Mitchell, the Borough Surveyor, and were formally opened in August, 1895. They comprised a destructor building and sewage works buildings, with the necessary engines, pumps, and machinery. He then gave a detailed account of the treatment to which the sewage was subjected, and remarked that the treatment did not meet with the approval of the Joint Committee, who began to pressure upon the Corporation to improve their ways. Various new experiments were tried, and eventually it was decided to give the bacterial process a trial. Accordingly after conferring with Mr. C. Whittaker, Sewage Engineer of Accrington, it was resolved to construct a small experimental plant, and this was in operation upwards of two years, and uniform good results were obtained. In 1901 the Sewage Works Committee had under consideration the advisability of obtaining independent expert opinion as to the wisdom or otherwise of adopting this system of sewage treatment on a permanent basis. As a result of their deliberations Mr. Frank Scudder, F.I.C., F.C.S., of Manchester, was invited to test the Whittaker and Bryant filter under control, subject the same to such tests as he deemed, and report upon same when satisfied. Mr. Scudder, in his report, expressed the opinion that the Whittaker and Bryant filter was the one best adapted to the circumstances obtaining at Hyde Sewage Works, and upon this favourable report the Council felt justified in adopting the system on a permanent basis. In the meantime a scheme had been formulated for the conversion and extension of the existing works, at an estimated cost of over 22,000, and was presented to the Local Government Board, eventually obtaining the body's conditional consent. The new extensions were commenced in April, 1902, a few were now nearing completion. The whole of the new work had been carried out by Mr. Mitchell, he (Mr. Horrocks) acting as clerk of the works. Mr. Horrocks then gave a description of the present-day plant, and went on to state that, having regard to the fact that Hyde sewage is exceptionally bad, the development, or should he say development, of the scheme, would be watched with interest by many authorities and other persons interested with sewage disposal. The final effluent was excellent, and remarkable free from smell, and he believed, sufficient innocuous to pass into any river. The total area of the Borough of Hyde was 3,072 acres.

the population at the last census was 66,000,000, calculated upon an average flow of 1,000,000 gallons, was rather more than three gallons per inhabitant. There are also eighteen miles of main sewers and miles of private street sewers. **SEWERAGE SCHEME FOR LEEDS.**—It is stated Messrs. J. Mansorgh and Sons have made a report, at the invitation of the Corporation, upon a scheme for a new system of sewerage framed by the City Engineer in consultation with some leading specialists. Provision will be made to meet the requirements of an estimated population of some 300,000 persons, and it is recommended that extensive works for the treatment of sewage should be established at Gataforth; the estimated outlay upon the first portion of the project amounts to one million sterling.

MISCELLANEOUS.

CEMENT INDUSTRY IN AUSTRIA.—Mr. H. R. Archill, British Consul at Trieste, reports that the consumption of Portland cement during 1903 was somewhat greater than in 1902. A considerable quantity of cement is at present used for the construction of the new Tauri railway, and the manufacture of the Alpine regions of Austria will be for this reason sufficient work for several years. The prices of cement, compared with those of 1902, are not higher, and the trust Austrian Portland Cement Manufacturers do not, it is asserted, intend to increase prices. All the twenty manufacturing concerns are providing for the consumption of Austria belong to the trust; arrangements exist with fifteen manufacturing concerns of Austria within certain limits, standing in with the trust. The Austrian cement export to foreign countries was of small importance last year, only because many Austrian manufacturing concerns too far from the sea, but principally because there is an enormous over-production, many new manufacturing concerns have been set up in other countries. An establishment for the manufacture of Portland cement will be erected near Albora, in Istria, the proceeds of which is intended entirely for export. There are in the neighbourhood immense quantities of stone adapted for the manufacture of cement, and also a coal mine (Caro-Vines), all situated close to the port of Pula. A cement manufactory is also projected at Servola, near Trieste.

BIRMINGHAM MUNICIPAL SCHOOL OF ART.—An architectural class meets at the Central School throughout the session on Mondays, Wednesdays, Thursdays, and Fridays, from 7 p.m. to 9 p.m., and on Thursdays, also, from 5.45 p.m. to 7 p.m. The subjects taken are:—"Architecture (according to ornament syllabus)," by Mr. A. Freeman Smith; "Architectural Design," by Mr. F. Reynolds; "Architectural History," by Mr. W. H. Bidlake, M.A., I.R.A.; "Building Construction and Drawing (according to Government syllabus)," by Mr. Ralph Berrill, A.R.I.B.A.; and "Geometry—Practical Plane and Solid," by A. Freeman Smith. Mr. Alfred W. Smith, throughout the session, lecture "Taking Builders' Quantities," on Wednesday, from 5.30 p.m. to 6.55 p.m.

PICTURES IN POTTERY.—Messrs. Doulton and Co. send us a very artistically got-up small album on this subject, containing a number of illustrations on a small scale of tile-formed pictures which they have executed as mural decorations in hospitals and other buildings, decorated by a short account of various modes of faience and tile decoration, ancient and modern.

BOUND BOOKS IN LIBRARIES.—The cheapness of books has increased their vogue, but has lessened their interest. A book is not always the precious thing it once was. It was when a Bible cost 500 crowns, or a 2,000l. of our present money. No wonder it was chained in churches. The Black and Whites of Lincoln's Inn show that this practice has been abandoned there. There is an anecdote during the reign of King James I.:—at decent stools be provided, and that the desks be also made and chained for the books"; and a few years later the Inn books were valued at 20s. for twenty dozen of the same, and rings for the library, and there fresh order made that "all considerable books be chained." It appears that none of the existing books in the library retain chains or any part of them; but a considerable number—about forty—still have been added to the binding the ring or brass by which the chain was attached, and many more have the mark left by the ring now removed. "movable desk" and the "decent book" were essential appurtenances of a well-stocked library of any size. Even the zeal of medieval student was not equal to hold a chained folio. In the accounts of the

Middle Temple "chans for the books of the library" is a constantly recurring item; and a reader of Gray's Inn, in bequeathing his library, gives 40s. to the intent that he—the trustee—make by chains faster so many of them in the library at Gray's Inn as he shall think convenient." A chained library in all its quaint simplicity may still be seen at Winborne Minister, but the room is so small that the huge tomes can be deposited on a central table, to which the reader drags at each remove a lengthening chain.—*Law Journal.*

ASSOCIATED PORTLAND CEMENT MANUFACTURERS.—The fourth annual report of this Company states that, owing to the competition which the depression of trade has intensified, the selling price of cement has again fallen, while the higher price of coke has made fuel dearer for the year. The rotary kilns at Swanscombe and Arlesey have been working satisfactorily, and have produced an increased tonnage at a reduced cost. The largest of the Northfleet works has been equipped with a similar plant, and favourable results are anticipated for the current year from all these installations. The directors have appointed Mr. H. Osborne O'Hagan, who has rendered considerable and valued services to the Company during the last four years, to a seat on the Board, and to the offices of a Vice-Chairman of the Company, and a managing director. They will ask the shareholders to confirm their action.

THE WISHART PORT, DUNDEE.—We are glad to learn that the Town Council of Dundee have determined to preserve the old Wishart Port, the demolition of which was threatened. It is not a monument of architectural beauty, but it is a very interesting relic of the ancient history of the town; and there is such a disposition among municipal officials at present, under the idea of "improvement," to sweep away old buildings, that one is more pleased to find those of Dundee forming an exception.

PROPOSED MODEL LODGING-HOUSE, CONSETT, DURHAM.—On the 7th inst., at the monthly meeting of the Consett Urban District Council, the committee recommended the Council entering into a provisional agreement for the purchase of 1,115 sq. yds. of land in Steel-street, Consett, from the Consett Iron Company, for 227l. 8s., and that the Surveyor (Mr. W. S. Snell) be instructed to prepare plans and specifications of the probable cost of the building. It was suggested that the Surveyor first prepare the plans and specifications, and that the whole question, as well as the petition, be considered at the next meeting.

WAR MEMORIAL, SHEFFIELD.—A memorial is to be erected in the Sheffield Parish Churchyard to the officers and men of the York and Lancaster Regiment who fell in the Transvaal war. The monument will be 12 ft. from the ground, and will resemble a screen. The base will be of granite, and on each side will be an octagonal pillar, also in granite, about 9 ft. high and 14 in. in diameter. The space of 8 ft. between these pillars will be filled by bronze panels. The design is by Messrs. J. D. Webster and Son, architects, Sheffield, and the bronze work will be executed by Messrs. J. Starkie, Gardner, and Co., London. The cost will be about 450l.

CAPITAL AND LABOUR.

STATE OF TRADE IN SOUTHPORT.—The building trade in Southport is worse than it has been for the past thirty years, a large number of joiners being out of work. The depression is even more marked than it was last winter. Southport suffers more severely than other towns because the men have to depend on a residential population. There is already some distress evident. In the plumbing trade the outlook is very disappointing, and it is feared the winter will be a very severe one. The outlook is also extremely bad for the painters. There are 100 painters out of work in Southport at the present time, and as there are no large contracts to let things are assuming a serious aspect. One of the leading joinery firms is only working seven hours a day with half a dozen men, and this seems to be the rule adopted by others in the town.

BRICKLAYERS' DEBATE, TEES-SIDE.—A conference has taken place between the master builders of Tees-side and the Hartlepool and the operative bricklayers with regard to the dispute, and it was agreed that the wages should be 9d. per hour and the walking-time rule altered to one mile. The masters asked that there should be no limit with regard to apprentices, except legally binding, but the men asked that there should be specific terms with regard to apprenticeship, and that the number of apprentices should be governed by the number of bricklayers employed. The masters will meet to vote on this proposal.—*Yorkshire Herald.*

PATENTS OF THE WEEK.

APPLICATIONS PUBLISHED.*

20,358 of 1903.—**THE WORMALD PATENT LOCKS COMPANY, LTD., and A. H. WORMALD:** *Locks and Keys for the same.*

A means for safeguarding locks, which consists in forming or providing the key way of the lock with a projection or projections, and the key with a corresponding slot or slots, or vice versa, so as to guard the key way and prevent the entrance therein of "unauthorised" keys.

21,657 of 1903.—**D. A. PRUST:** *An Attachment for Tables, Desks, Cabinets, and the like.*

This consists in the attachment of weights, by means of cords passing over pulley wheels, to the movable inner tray of the table, desk, or cabinet, in such a manner that the weights form a counter-balance to the tray and its fittings, and so assist the said inner tray to be raised and lowered automatically, by the opening and closing of the two hinged flaps, which form the cover or top of the table, desk, or cabinet.

22,657 of 1903.—**J. E. YORKE:** *A Fastening for Hinged or Pivoted Articles.*

This relates to a fastening for hinged or pivoted articles, consisting of a pin or its equivalent fixed to one part, and a sliding plate secured to the other part, said sliding plate being formed with one or a pair of inclined striking faces, and a slot or recess to engage said pin.

22,741 of 1903.—**F. W. ADAMS:** *Door Springs.* A door spring, consisting in the combination with the pivot pin on which the door is hung, of an arm connected by a flexible member, such as a chain, to the end of a lever, and of a coiled spring acting upon the said lever through the medium of a ratchet and pawl device.

23,411 of 1903.—**J. J. HEALY:** *Barge Courses and Angular Barge Tiles for Roofs, Rendering Barges Wind and Weatherproof.*

An angular barge tile, having one or more slotted screw holes in the vertical wing, to admit of the tile being secured, by means of one or more screws to the barge board, or to the gable rafter.

23,535 of 1903.—**J. THOMAS and J. FOSTER:** *An Automatic Lubricator for the Eccentric Shafts of Stone Breakers.*

Instead of oiling the eccentric shaft by means of an oil-box cast on or bolted to the top of the pitman as hitherto, the oil-box is cast on or bolted to the front of the pitman, from this oil-box two holes are drilled which go to an inner oil-well in which a revolving brush is inserted, or a felt roller mounted on two small springs, these springs keeping the brush or felt roller on the eccentric shaft, and by the eccentric shaft being turned the brush turns round also with it, and thus cleanses the eccentric shaft and lubricates it at the same time.

11,513 of 1904.—**C. LEHMANN:** *Presses for Moulding Bricks of Beton, and the like.*

An apparatus for the manufacture of bricks of beton, and the like material, comprising, in combination, a support, a plate fixed on the top of said support, provided with a suitable opening, a mould placed over said opening, a movable plate at bottom of said mould, a toothed gearing for lifting said bottom plate, and a hand lever for operating said toothed gearing, a removable cross-partition wall for the mould provided with vertical slots, removable longitudinal partition walls in the mould guided in suitable slots of the front wall of the mould, a bar connecting the front ends of the removable partition walls, and a guide fixed on the table for guiding said removable partition walls.

12,257 of 1904.—**E. G. GONZALEZ:** *Combination Furniture for Clinical and other purposes.*

This consists in the combination with a stand for clinical and other purposes of a commode arranged between the uprights thereof, and connected therewith by parallel joints or like connexions, which will permit it to be readily drawn out for use and restored to place.

12,793 of 1904.—**R. MERKEL:** *Chimney Cowl.*

A chimney cowl, in the lower part of which are outlets running upwards, the distinguishing feature being that the upper part of the cowl is shaped like a mansard roof, its primary form being that of a rhombus or rhomboid, and is provided inside with a partition and on two opposite sides with openings so that the smoke escapes without hindrance, irrespective of the side on which the wind strikes against the top of the cowl or the partition.

15,569 of 1904.—**J. NOLTE:** *Fireproof, Waterproof, and Weatherproof Structures.*

Fireproof ceilings and walls, constructed with sheet-iron framing, characterised by the fact

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

that the principal beams or girders are formed of sheet or plate iron which is stiffened by laterally riveted transverse joists, the extremities being placed upon plates or angle pieces, whilst the joists are provided at their lower part, with teeth or projections which secure the layer of concrete with which the panels of the ceiling are filled.

16,022 of 1904.—A. J. BOULT (J. Haslam); Construction of Skylights.

A sash bar, consisting of a bulbous head at the superior end of the web of the bar, a wide base to the sash bar, a cap adapted to fit over the contour of the superior part of the sash bar, and a closing plate at the end of the bar, the same being adapted to prevent the cap from slipping or sliding off the bar.

16,027 of 1904.—J. W. CRAVEN: Pug-mills. This consists, in the combination with pug-mills, a bearing surface, race, or receiver, on the upper end of the pug-mill shaft and an inverted bearing surface, race, or receiver, rigidly supported above the said pug-mill shaft and bolts or rollers, carried between the said bearing surfaces, races, or receivers.

20,609 of 1903.—T. C. FAWLEY: Construction of the Ceilings of Rooms or Buildings.

A construction of ceiling for the rooms of buildings, characterised by a shallow tank or series of tanks of metal, or any suitable fire-resisting material for water, said tanks being supported by any suitable means, and means for supplying water to such tank or tanks.

23,069 of 1903.—J. STOTT: A Construction of Apparatus for Filtering, Humidifying, Cooling, or Disinfecting Air to be Supplied to Buildings.

An apparatus for filtering, humidifying, cooling, or disinfecting air to be supplied to buildings, and consisting in constructing a revolving drum with two or more concentric-arranged layers of filtering material with a space between each layer, so that all the air drawn or forced through the drum must pass through each layer of filtering material.

23,615 of 1903.—THE FIREPROOF PLATE WALL COMPANY, LTD., and C. H. SIDEBOTHAM: Construction of Ceilings, and other Structures.

A building plate or slab constructed with longitudinal flanges a short distance from either end to project between the joists, strengthened by webs running across between the flanges, and adapted to be held in position by nails, screws, or pegs driven through the flanges into the sides of the joists, and nails, screws, or pegs driven through the edges of the plate into the face of the joists and grouted solidly to the joists.

24,361 of 1903.—F. E. COOPER: A Paving Block.

A wood-paving block, consisting of a plurality of wood slabs, of the width and depth of the block, having a deep, narrow groove along each side, and a dog of tin, flat metal, with spikes or spike portions, the body of the dog lying within said grooves, and the spikes or spike portions being driven into the slabs.

6,919 of 1904.—C. E. TWYNHAM and H. DANIEL: Apparatus for Collecting and Removing Refuse from Wood Paving, and other Road Surfaces.

An apparatus for collecting and removing refuse from road surfaces, consisting in the combination of a sludge-removing implement or sucker, a tank or receptacle in connexion with said implement, and arranged upon a vehicle, said tank being arranged to have a vacuum created and maintained therein, a suction pump connected to said tank, and a rotary brush arranged to sweep the mud into the path of the said implement.

7,756 of 1904.—R. BAILEY: Hods.

This invention has reference to, and comprising improvements in and relating to hods such as are used by bricklayers, and has for its object to render them stronger and more durable. In carrying into practice the improvements of this invention the ordinary wooden brackets securing the sides of the box to the pole are dispensed with, and steel or iron brackets are used instead. These improved brackets are stamped or embossed out of sheet metal, preferably of mild steel. They are bent to the desired angle to fit the angle of the bod-box and pole, and are formed throughout their length of U or gutter shape, having a flange all round the edge. They are preferably secured to the bod-box and pole by screw nails passing through holes in the flange.

14,222 of 1904.—J. HARRIS: Method of Directing Daylight into Buildings, and the like.

For directing daylight by reflection with or without refraction, consisting in the employment of glass prisms or rows of prisms set in planes above, or successively above, the plane of prisms in closely adjacent rows.

MEETINGS.

INCORPORATED ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.—District Meeting at Withington, near Manchester.

PROVIDENT INSTITUTION OF BUILDERS' FOREMEN AND CLERKS OF WORKS.—Quarterly meeting of the Directors. 8 p.m.

ARCHITECTURAL ASSOCIATION.—Annual General Meeting: President's Address and Distribution of Prizes. 7.30 p.m.

INCORPORATED BRITISH INSTITUTE OF CERTIFIED CARPENTERS.—Monthly Meeting at Carpenter's Hall 6 p.m.

TERMS OF SUBSCRIPTION.

"THE BUILDER" (Published Weekly) is supplied DIRECT from the Office to residents in any part of the United Kingdom at the rate of 12s. per annum (52 numbers), cash in advance.

SUBSCRIBERS IN LONDON AND THE SUBURBS, by prepaying at the Publishing Office 12s. per annum (52 numbers) or 4s. 6d. per quarter (13 numbers), can ensure receiving "The Builder" by Friday Morning's Post.

 G—Outer Court.

find spacious rooms, some of them built with double walls, and wide corridors, so that the comfort of the chief officer was well looked after; and connected with this section by a corridor was a part of the building which seems to have been set aside as the "harem," or domestic quarters (C). The entrance to the fortress has not been discovered; but there is every chance that it will eventually be found near the north angle, where certain traces of burned brick may be found to represent a part of its foundations. Further excavations may serve also to throw light upon several points that are at present obscure. For instance we do not yet know what means of communication existed between the two courts; and the dimensions of the outer one cannot be ascertained until its walls are cleared of the *débris* that now encumber them. But the work already accomplished shows us that the Parthian builders were skilful in adapting the material they found at hand to suit their own purposes, and that they were no mean workmen.

The palace on the opposite (S.W.) bank of the Shatt en-Nil has been completely excavated, and, although it is a small place, it is full of interest. Its builders worked upon an unencumbered site, and were, therefore, able to lay the place out in accordance with a plan conceived as a harmonious whole instead of being compelled to incorporate any existing structures in their design. Moreover, being upon a smaller scale, the work was easier to set out with some degree of precision; and, consequently, we find its angles more true; while its detail shows an amount of refinement that is lacking in many other buildings at Nippur. But the points that chiefly differentiate it from all the other buildings of the site thus far unearthed are—(a) That columns were employed in it for decorative and structural purposes; and (b) that its architects sought to give

to certain portions of their work the appearance of stone, by a liberal use of stucco. The character of the building is utterly unlike that of any of the Babylonian structures, and, in many respects, bears such a strong likeness to Greek work that it seems almost certain its designer must have had considerable knowledge of the western architecture. The columns, indeed, are quite obviously imitations of the Doric, and, considering the method of their construction, remarkably good imitations too (see Fig. 8).

In the construction of the colonnade, parts of the porch, steps, and thresholds, for fireplaces, and for the floors of some of the best rooms, burned bricks were employed; but the walls were of crude bricks of a similar character to those used in the fortress, but slightly shallower ($7\frac{1}{2}$ in.). That the place was the scene of a conflagration we found ample evidence in the scorched walls and the abundance of ashes and charred timbers. Its exterior, too, had suffered seriously, from the detrition of the mound, but it appears to have been extremely simple; three of its sides were broken by shallow buttresses; but the fourth (the N.E.) was quite plain—a fact which suggests that other buildings abutted against it. The entrance to the building lay almost in the centre of the north-west façade, and was treated with some elaboration. Two steps led up from the street to the raised threshold, and on each side of the doorway was a pedestal, stuccoed with white plaster. Seen from the side these pedestals had a graceful outward curve, their tops projecting beyond their bases. They were about 4 ft. high, and were finished off with pediment formed mouldings in plaster on burnt brick. That they served to support fluted pilasters there is good reason to suppose, for we found traces of fluting in plaster above them; but, unfortunately, the upper portion of the work was lost,

and, owing to the perishable nature of the plaster, there is small hope that future excavations will bring to light sufficient evidence for a restoration of the doorway.

On plan the building was practically a square, each side being about 170 ft. Internally it was divided into two equal portions, one for the men's and public apartments, the other for the domestic portion of the household, the "harem." In regarding the character of the building one is strongly tempted to write "gynaecoon" for "harem," and, indeed, the whole subject bristles with such temptations to draw comparisons with a Greek house. But, for the whole, the palace presents decided characteristics of its own, and we therefore content ourselves by describing it as we found them, leaving the reader to draw his own inferences concerning them. The harem, then, was sub-divided into two sections, one for the use of the servants, stores, kitchen and so forth, and the other reserved for the ladies of the establishment, the quarters of their lord. The architects had planned the arrangement of these three sections very ingeniously, contriving to secure in a manner that ensured the utmost privacy to the women's quarters, and completely isolated the kitchen and its offices from the public portion of the palace. This will become apparent if we refer to the plan (Fig. 7). From the entrance (1) two doorways give access to the two halves of the palace. The one on the west led to the harem; that on the east to the men's quarters. Through an ante-room and loggia (2) access was reached the principal court of the building (5), the small room at the end of the loggia, numbered 4, was probably used as an armoury or gun room. The two columns, which were the antæ screened the loggia, should be noticed on account of their peculiar plan; and it will be observed that the loggia is not situated in the centre of the wall of the court. This court is the most ambitious feature of the palace. Its central portion was open to the sky, but around it was a covered colonnade with four circular columns on each side, and a square one at each angle. It was paved with crude bricks, and between the columns ran a curbing of two courses of burned brick, and the square foundations consisted of eleven courses of the same material. The columns themselves were built up of sector-shaped bricks set in mortar, and were stuccoed with lime plaster. Copies of the Doric, they had, of course, no bases; but for their capitals special moulded bricks were prepared. At the level of the pavement they had a diameter of 2 ft. 9 in., which remained constant for 4 ft. of their height, after which it tapered off to 2 ft. 1 in. at a height of 12 ft. 6 in. The roofing of the colonnade was probably of timber, which we naturally have perished when the palace was burned down. The rooms numbered 6 to 11 were apparently unimportant, while the passage 12, which could be closed by a door at either end, communicated with both sections of the harem through a lobby (20). The principal apartments of this part of the palace lay to the south of the court;

each side the colonnade widened out: broad step with a circular altar upon (5c) led up to the two chief rooms, and 14, between which stood three more steps. This part of the building lay beneath a part of the mound which had been washed almost away by the surface drainage of the mounds, and it suffered from injudicious excavating in the early days of the work; but the restoration shown on the plan is doubtless a correct one.

The other half of the palace could be reached either through the passage (12) from the main court or that (19) which led from the ante-room (18), already mentioned as lying on the west of the entrance lobby. Between 19 and 21, and at both ends of 12, were found door sockets, showing that the approaches to the private part of the palace were used by substantial doors; and it will be observed that the lobby (20), where a porter or eunuch could be conveniently stationed, completely controlled both passages. The servants' quarters call for little notice. In the kitchen (22) was found a fireplace, which bore a striking resemblance to that discovered at Pompeii in the house of Pansa, and was provided with a stone notched to receive a spit and hollowed for a wood

fire. Another door socket at the entrance to 24 seems to point to the small rooms at the west angle having been intended for storing such things as the cook wished to have under lock and key. All the rooms in this quarter were small, and must have been dark. Those in the harem proper, while still small, are more airy. The court (27) was about 28 ft. square, and south of it was a roomy portico, cut off by columns and ante of a like nature with those in the main court. In 34 and 36 were raised platforms of brickwork, which Dr. Hilprecht thinks were probably sleeping places; but the master's rooms seem to have been at 38 and 39. The small room (33) in the angle of the building, being provided with a door socket, may well have been a kind of strong-room, for the doorways of most of the rooms appear to have been closed only by hangings. The last room to be noticed, number 28, was particularly interesting, as it exhibited features which are still found in houses in that region. There could be no doubt that it was intended for a bath-room, for its floor of burned brick was waterproofed with bitumen and carefully laid to drain towards a small circular opening. It would be a puzzle to say where the water went to, but it probably was left

Fig. 8. Construction of Columns in Parthian Palace.

to soak into the soil. Around the room ran a skirting of burned brick, also coated with bitumen, which served to keep the crude brick walls from damage by water. At the present day many of the houses in Baghdad have bath-rooms constructed in the same way as this early example; and, although they are hardly luxurious places, they are admirably adapted for a good splashing, which is the best method of taking a bath in such a climate, as doubtless the Parthian builders of the palace knew.

CANTERBURY TOWER.

THE public announcement of the critical state of the central tower at Canterbury, made in a letter from the Dean published this week in the *Times*, will hardly surprise any architect who is well acquainted with the cathedral, and who has studied the appearance of the tower as it can be seen with a field glass (or even without one) from the ground. Mr. Carøe, the architect to the Ecclesiastical Commissioners, had warned the cathedral authorities, on the basis of such examination as could be made without scaffolding, that the tower was suffering from grievous external decay. The tower is now enclosed in a forest of scaffolding, and the detailed examination which Mr. Carøe has now been able to make shows that the state of things is worse than had been realised.

The tower is built of Caen stone, much of which is found to have been face-bedded. Up to the line of the roofs it was the work of Prior Chicheley, who used up a good deal of the stone of the Norman work which he had demolished. This portion, even when exposed to the weather, is in much better condition than the later work above; Norman builders appearing to have taken always remarkable pains to secure the best stone from whatever quarry they drew from, leaving the inferior beds for

their successors; hence the often-repeated experience of finding the Norman portions of a building in better preservation than the work of two or three centuries later; though of course the plain and massive nature of Norman mouldings and ornament, and the absence of undercutting, has something to do with its greater longevity. The portion above this level, which is now causing so much anxiety, was built under Cardinal Morton, nominally of the same stone, but evidently of much inferior quality.

Caen stone is a calcium carbonate, and in the present case much of this has been converted into calcium sulphate by the action of sulphuric acid in the air. Where this has taken place the result is that the particles of the stone have lost their cementing matrix, which has been washed out, and are consequently in a constant state of crumbling away. This action of the atmosphere does not penetrate very deep into the surface, and some of the stones which are crumbling on the surface are still sound at a depth of an inch or even half an inch below the present surface. But then the operation goes on from year to year, and when the surface first attacked has crumbled, there is a fresh surface open to attack. Thus some of the buttresses (of which we shall be able to show an illustration next week) are reduced in some places to little more than half their original thickness or projection. The tracery in some of the tower windows has split down vertically, the outer portion being almost ready to drop off. The general condition of the work is forcibly illustrated by the fact that when the tower was first examined from the scaffold there was a summer gale blowing, which in one day brought down on to the scaffold bits of stone to the amount of 90 lbs. weight.

The upper portion of the tower is lined with brick; the bricks, oddly enough, being of a progressively larger size in the upper portions. Besides the want of proper bedding there are various other little weaknesses in construction—want of bond, and pieces of carved work inserted in no connexion with the surrounding masonry. This is more especially the case in the turrets, the construction of which is in some respects more like that of joinery than mason's work. A curious point here is that the gablets round the turrets are capped with small bars of iron, as if intended as a preservative to the stone ridges of the gablets; the iron does not cap over the stone, but is merely a bar laid along the top edge where the two slopes meet. The tower is at present the abode of swarms of insect life, colonies of which have developed in the interstices left by decayed stone.

The south and west faces of the tower have suffered most, the west especially; this is what was to be expected, these being the wet aspects; the north and east faces are the blackest in appearance, but are in better preservation.

The problem now is, in the first place, to cut out stones which are decayed past preservation, and insert similar new ones. Doulting stone is to be used for this, as being more durable than Caen without presenting any very marked contrast to the eye. One may be sure that under Mr. Carcè's superintendence this will be done in the most conservative manner,

and that not a stone will be removed unnecessarily. The next and perhaps most important task is to treat the whole external surface of the masonry with something which will arrest the process of disintegration, and will supply to some of the stone the cementing material which it has lost, and prevent the rest from being disintegrated and washed out further. What this application is to be is a point on which the eminent chemical experts who have been consulted are not at present entirely in agreement; experiments are in progress which will probably afford ground for an ultimate decision; but we are not in a position at present to say anything further on this head.

We can hardly doubt that the country will rouse itself to provide the funds necessary for carrying out the work of repair. Though the tower is in a late and not very valuable style of Gothic, it is architecturally of the highest importance as the grand centre mass of the composition; and Canterbury Cathedral has a history so venerable and so important—it is so closely connected with our national history, that it must surely be felt by everyone that the preservation of its crowning feature is a work of national and not merely of local or diocesan interest.

NOTES.

British
Canal
Conference.

We have referred at various times to the desirability of rescuing English canals from the parlous condition into which they have fallen. That the same opinion is generally entertained by the trading community is evidenced by the action of many chambers of commerce, deputations to Government departments, and the introduction of Bills during the past two Parliamentary sessions. The conference held last week in Manchester still further emphasises the importance of this great national question. According to the latest returns the total length of canalised rivers and artificial canals in the United Kingdom is 3,856 miles, exclusive of ship canals, and of this mileage nearly one-third has been acquired by sixteen separate railway companies, with the sanction of Parliament, undoubtedly for the purpose of killing competition, the remainder of the canals belonging to some eighty independent companies. Apart from this divided ownership, the canals have been constructed so that through traffic can only be conducted under considerable disadvantage, owing to the absence of uniformity in the width of channels and locks, which was permitted by the inattention of Parliament when the various Bills were passed. Consequently, although the English canals run through valuable routes and are more or less inter-connected, they could not be regarded as forming a complete system capable of efficient competition with railways, even if amalgamated and placed under the administration of a single authority. At the present time it would be very difficult to effect a complete amalgamation without the intervention of Parliament. The railway-owned portions would have to be acquired compulsorily, and the whole of the waterways to be repaired and remodelled,

so as to constitute a complete national system open to barge owners and carrying companies at reasonable tolls. The cost of acquiring all existing canals would amount to nearly thirty-five millions, while the necessary improvements and the application of electric power for haulage would cost several millions more. Hence, only a really effective solution of the problem appears to be presented by a scheme for nationalisation of the canal system, and its administration in such a manner as to provide a cheap and convenient means of transport to the benefit of the public.

The
Building Trade
in 1903.

THE Report of the Board of Trade on wages for the year 1903 shows that the building trade—so far as concerns workmen—has been less flourishing than in previous years. The average percentage of employed was, for example, 4.9, as compared with 4.3 in 1902, 3.7 in 1901, and 2.5 per cent. in 1900. We, therefore, have a steadily increasing rate of unemployment. Again, in 1902 15,375 workmen had their wages changed, but in 1903 the number was only 4,638, which is the lowest figure since 1893. These changes are practically increases, since out of the number for 1903, 4,106 represent an increase—a diminution, therefore, if change means a diminution in the right direction. On the other hand, one must bear in mind that business will not bear a constant increase of wages, and we may fairly expect a decrease in change or increase of wages to some extent to the fact that the increase of wages cannot be further raised, present at any rate, without stopping employment. This is one of the points which artisans are inclined to forget. A consumer cannot stand more than a certain price, and if workmen go asking for increases the consumer fastens up his pocket, and work decreases. Increases of wages do not continue.

The
Premium
System.

ALL who have at heart the true interests of the British workman and of British industry must unite in regretting the perverse folly of the Engineers and Shipbuilding Trades Federation in reporting against the premium system. The autocratic rulers of trades unions, into whose hands workmen blindly commit their bodies and souls, object to everything that is calculated to benefit employers and men alike. Their faith seems to be as simple as it is mistaken. They regard the total amount of work obtainable as a quantity that cannot exceed a certain maximum value, although it may be below the limit. Starting with this false basis, they say in effect:—Let every man have his mathematical share of the work, let no man do more than his share, let capable fellows, and let all men avoid the snares devised by employers to ensnare the skilful and industrious men to earn more money than those who are incompetent and lazy. The unions wish the standard day's work to be measured by the minimum output of the most incapable among their members. On the other hand, employers know that by the exercise of enterprise the trade of the country can be increased with a corresponding increase of labour.

premium system is one method devised for encouraging men to do their best for themselves and the land of their birth. It allows all real workers can add to their wages by amounts proportionate to the skill and energy displayed, and, while affording immediate and direct benefit in this way, they are laying up for themselves future sources of wealth by helping to increase the trade of the country and consolidate markets for British products. Thousands of workmen recognise the correctness of the principles we have advocated, but their glib-tongued leaders, who prefer talk to honest work, do their best to burke every movement that seems likely to draw employers and men into the bonds of harmonious co-operation. Hence the adverse decision recently promulgated against the premium system.

The Dee Embankment. ON the day following the publication of our "Note" last week on this subject the sea broke entirely through the Dee embankment within a mile or two of Postyn Station, flooding the land as far as the railway. Some forty or fifty yards of the embankment, which we described as having been seriously damaged, were swept away, and subsequent action of the tide has further widened the gap. Thus it is evident that the action taken by the railway company for the protection of their works was only just in time to guard against the most serious consequences. Serious portions of the embankment on which the permanent way is laid have already been protected by clay, and opposite the gap large quarry-stones have been built into the slope. Stoning will probably be required along other parts of the line as the sea-wall succumbs to tidal action. It seems a pity that something cannot be done to save the land bordering the quay, but so far as we can judge the owners appear to think the loss of their property is a matter of smaller concern than the expense of repairing shore defences. The small value of land adjoining the sea is one cause of the indifference exhibited towards coast-protection works in many parts of the country.

The Paris Metropolitan Railway. RAPID progress continues to be made towards the final realisation of the extensive scheme of underground railways in Paris, and we now learn that the third line is already so far advanced that it will probably be opened for traffic before the end of the present month. During the whole of the summer the Place de l'Opera has been disfigured by hoardings surrounding the site of the railway station, but this obstruction has at last been removed, revealing a handsome boulevard around the open space leading to the underground station. This work is in complete harmony with the architectural character of its surroundings, and the entrance to the railway is free from the somewhat unartistic features characterising many of the underground stations in other parts of the city. The businesslike manner in which all the details of the great metropolitan system have been definitely settled in advance must be envied by Londoners, whose traffic

facilities have always been left more or less to chance or to undirected private enterprise. Some day, after the report of the Traffic Commission has been presented, we may have a public body capable of dealing authoritatively with the pressing question of rapid transit. In the meantime Paris continues to act, while we are obliged to wait for the formulation of foregone conclusions, and afterwards shall have to wait for the commencement of works that have been sadly needed for years past.

The Disfigurement of Clifton. We have more than once referred to the wretched vandalism by which one of the most beautiful and romantic spots in all England, the view over the Avon from the Clifton side, is being ruthlessly destroyed for the mere sake of quarrying a not very valuable stone, of which there is plenty more to be had elsewhere. The Clifton Improvement Association had the matter under consideration at a meeting held last week. Their secretary stated that the once beautiful wooded bank "would shortly become one series of quarries unless something were done." We fear that the beauty of the scene is already much spoiled; it ought never to have been touched; and the owners of these woods, in their desire for gain, do not seem to reflect that they are destroying the very attraction which draws visitors and residents to Clifton. As one speaker said, "if they carted away the scenery they would not get people to come to Clifton." The intended formation of jetties on the river for shipping the stone has been made a lever in opposing the work, as it is objected that the Avon is too narrow a river to have its traffic impeded by a number of jetties. That may be useful as a weapon of opposition, though it is beside the mark. The real point is that a scene of exceptional beauty is being deliberately and selfishly destroyed.

Traction Engines in Cities. WHILE ready to agree with the more extended employment of motor vehicles in cities and large towns, for sanitary, humanitarian, and other satisfactory reasons, the inhabitants of London and other large centres of population are united in objecting strongly to the unrestricted use of heavy road locomotives for the haulage of merchandise. Titanic engines of this type, followed by a train of lumbering waggons, bring a new terror into the daily—and, for that matter, the nightly—life of the resident in and near every large town. They threaten the foundations and damage the surfaces of streets and roads, shake houses from top to bottom, snort hot ashes upon the heads of the people by day, and make noise enough to wake the dead by night. The Commissioner of Metropolitan Police has no jurisdiction over the nuisance in the absence of any specific breach of the law, but county and borough councils have powers to make by-laws for the regulation, and even for the prohibition, of traction-engine traffic within their respective districts. We are pleased to find that the London County Council have now convened a conference of metropolitan borough councils

with the object of considering a new set of regulations for the adequate control of traction engines in general, and their exclusion from certain crowded highways in particular. For our own part, we doubt the necessity for the employment of such clumsy engines in urban districts, except in very special cases, and feel sure that all ordinary requirements could be met by the use of motor vans, which are comparatively unobjectionable, or, at any rate, not more objectionable than the ordinary two-horse waggon.

The Accident at Old Bailey Buildings. THE inquest held on the body of F. J. Housden, the unfortunate man who died last week from the effects of injuries caused by the fall of a block of stone that was being hoisted at the Old Bailey buildings, led to the usual recommendations from the jury to the effect that "more efficient provision should be made" for safety in hoisting stones, etc.; and by implication to the condemnation of the "lewis" as a means of hoisting heavy stones. If the coroner's jury had no clearer idea of the principle of the lewis than that conveyed by the reports in the daily papers, one of which described it as "a two-pronged piece of iron which was placed in a hole made in the stone, while a wedge was driven down between the prongs to tighten it up," it is no wonder that they thought it an inadequate way of securing a stone. The fact is that, except in the case of a soft and friable stone, the lewis is the safest way there is of temporarily attaching and raising a large block; if it is properly done, it is absolutely impossible for a lewis to give up its hold except by the breakage of the stone. In the case under notice we are informed that the hole had been cut a little large for the lewis, which accordingly had been packed up with a couple of thin slips of metal; and that Housden, for some inexplicable reason, took these out before the stone was sent up. That did not prevent the lewis holding, but it would give it some degree of play in the hole, and when the man jumped on to the stone (which was 4 tons weight), the shock sufficed to pull the lewis out, owing to it not being fitted tight. It was a case of bad workmanship. The public should understand that the very principle of the lewis is such that it is a fastening that cannot break away, provided that it is properly fixed in the first instance. It is much safer than slinging a stone in a chain, which we never see in a crowded street in London without some anxiety; for should the stone cant, there is considerable danger of it slipping. We understand, however, that at the Old Bailey work it has been decided in future to hole the larger blocks of stone for two lewises instead of one.

Flexure of Concrete-Steel Beams. BEARING in mind the different views entertained relative to the precise action of concrete-steel, and to the most suitable method of calculating the strength of beams composed of this new material, considerable interest attaches to the paper presented by Professor Talbot at a recent meeting of the Western Society of Engineers, Chicago. With the object of discovering the effect of certain

conditions, and of opening the field for further investigations, a series of tests was undertaken by Professor Talbot, in the Laboratory of Applied Mechanics of the University of Illinois, and a summary of the results is to be found in the communication to which we refer. In addition an analysis is presented, in the hope of placing calculations upon an improved basis. One important point which we are glad to see recognised is that the constants E_0 and λ_0 —the initial modulus of elasticity of concrete in compression, and the unit deformation in the most remote fibre of the concrete, respectively—require to be determined for a variety of concretes. It is undoubtedly the fact that much has still to be learned as to the internal condition of concrete when subject to stress. Study may also be made with advantage for the purpose of ascertaining whether the modulus of elasticity of steel encased in concrete is the same as that for steel not so enclosed. These and other points are commended by the author to the investigations about to be undertaken by the joint committee of the American Society of Civil Engineers, the American Society for Testing Materials of Construction, the American Railway Engineering and Maintenance of Way Association, and the Association of American Portland Cement Manufacturers. We very much regret that none of our own scientific institutions appear to take any interest in concrete-steel, being content to allow their members to obtain information second-hand through American and Continental sources.

In some property of about 37 acres of building land at Woodhall Spa and Tattershall, Lincs. Woodhall Spa, near Horn-castle, in the parts of Lindsey, which is placed in the market, is a ruined structure known as the "Tower on the Moor." It stands in the midst of the marshland traversed by the river Witham and the Foss Dyke navigation that extends to Kirkstead and Tattershall. Forming a conspicuous landmark, the isolated tower consists of a brick building, octangular on plan, having a winding brick staircase and rising to the height of about 60 ft. It appears that the tower was erected as a redoubt or conning-tower for the castle at Tattershall, on the river Bain, little more than four miles distant. It was constructed in the XVth century, and reputedly by Sir Ralph, fourth Baron Cromwell, whom Henry VI. made Lord High Treasurer of England in 1433. The red-brick masonry is very similar to that of the castle which Sir Ralph built at Tattershall—a once strong fortress greatly injured at the time of the Civil War. The rectangular keep, 89 ft. by 67 ft., having walls 16 ft. thick at their base, and battered, is 112 ft. high. At the four angles are octangular turrets, with their battlements machicolated. The ground floor is carried by massive groined arches; the stairs, of 181 steps, in the south-east turret, lead up to the fourth story, on which is a covered projecting platform or gallery, with a parapet pierced with embrasures and embattled. In the thickness of the east wall are curiously-arched galleries communicating from the stairs to the principal apartments. The sculpture about the open fireplace on the main

floor embodies the treasure-bags, coat-of-arms, and motto of Cromwell, as at Collyweston Hall, Northamptonshire, begun by him and finished by Margaret Countess of Richmond. The inner foss or moat has a facing of brickwork; in the outer moat stands the cruciform church of Holy Trinity, for which Sir Ralph founded a college of priests. The Cromwell monuments include the brasses of himself and his wife Margaret Dayncourt, 1454-5. Nearly all the fine glass in the choir was removed, 1754, to St. Martin's, Stamford Baron.

Recently Deceased Artists.

OUR Obituary column records this week the deaths of three artists of note—Mr. G. A. Lawson, sculptor; Mr. Colin Hunter, oil-painter; and Mr. Walter Severn, water-colour painter. Of these three, the decease of Mr. Colin Hunter occupies the mind of the public and the art critics in by far the largest proportion; he was a popular and always a well-placed exhibitor at the Royal Academy, and his pictures were such as appealed to the general eye; but in our view Mr. Lawson is artistically by far the most important loss of the three. Sculpture is a less popular art than painting, and Mr. Lawson was not a man to achieve popularity; he was of a very quiet, modest, and retiring character, wholly given up to his art, and not seeking any social or artistic advancement; but his best works in sculpture were of a very high class both in ideal and in execution; and his "Death of Cleopatra," which we believe never got further than clay and plaster, was a work of the greatest pathos and of monumental dignity of style. Its merit was recognised by the Academy in placing the plaster model as the central object in the octagon the year it was exhibited; and other works, especially his marble of the "Spartan Dancing Girl" (perhaps in point of style and execution his finest work) were repeatedly placed in prominent and honourable positions at Burlington House. Why, with these qualifications, he was never elected a member of the Royal Academy has always been a mystery to us. Mr. Colin Hunter we think a somewhat over-rated painter; he had mastered an effect of his own in sea and coast painting, but the style of his art was rather superficial, and his effects were rather categorically repeated. Mr. Severn, as appears from our obituary record, was something more in connexion with art than a painter in water-colours (in which capacity he was best known to the public); he had a considerable influence in developing a taste for better forms of applied art; and it was perhaps rather in reference to his general culture and influence than to his water-colour work that he was elected President of the Dudley Gallery Art Society. He began water-colour as an amateur, and the amateur element was rather obvious in his work throughout.

Royal Academy Lectures.

THE syllabus of lectures to students at the Royal Academy, for the Session 1904-5, announces a course of four lectures on painting by Professor Clausen, to be delivered on January 9,

12, 16, and 19. The subjects are "Style in Nature," "Style and the Ideal," "Invention and Imagination," "Taste." After the brilliant series of lectures (since published in book form) which Professor Clausen delivered in the last session, his ensuing course of lectures will be looked forward to with interest, both by the students and those of the general public who are desirous to obtain admission to them. The titles and subjects of lectures to be delivered on sculpture and architecture are not yet announced.

SUGGESTIONS FROM NEW ZEALAND THEATRE PLANNING.

THE following is an abstract of a paper by Mr. S. Hurst Seager, architect, of the Church, New Zealand, at the Australasian Science Congress held in January last at Dunedin. The abstract of the paper forwarded to us along with the accompanying diagrams. The paper had special reference to the provision of exits and escapes at the places of amusement. No more important problem presented itself to the architect, Mr. Seager, than this, yet there was none of the less successfully solved. The problem was not to design a building in such a way that an audience might leave it without discomfort under ordinary circumstances, but to design one which would be free from danger in the event of a panic, arising either from alarm of fire, earthquake, or other cause. It had to be borne in mind very clearly that the problem was to be solved by demanding on the part of the audience a certain course of action under unusual circumstances, for at that time they were incapable of thought and incapable of determining what action to take. The problem therefore was to plan a building which should be so arranged that without choice irresponsible people would be compelled to move in a certain direction, and that that direction should be absolutely free from all resistance. Where resistance there could be no pressure; where pressure there could be no danger. It was neglected of this fundamental principle which has been the cause of such sad loss of life in the past, and its continued neglect would be responsible

Fig. 1.

all that took place in the future. The first impulse of most of the audience at the time of imagined danger was to rush from their seats towards the entrance from which they approached (see Fig. 1). That at once made it perfectly clear that the usual entrance must in all cases be the exit, and safety did not depend at all upon any number of so-called special "escape doors." These were simple delusions, and should not be provided. There must be entrances, carefully calculated as to number and width, leading to different parts of the building, to be used both as entrance and exits for that part only, and the greatest care should be taken that each entrance should give uninterrupted communication between that portion of the building for which it was designed and the open street. It could not be too firmly insisted upon that there must never be any connexion whatever between one corridor of communication and another. Each entrance and exit should be perfectly independent of all others. To carry this principle into fully every building of entertainment should stand wholly detached with sufficient space round it to prevent any chance of blocking. Very many Continental theatres were so placed, and most decidedly no new building should be designed which had not a perfectly free, even space on at least three sides.

These spaces should be kept free during a performance. Carriages should always be drawn up sufficiently far away to allow of a free rush of people from the exits, for a very great danger existed in allowing carriages to stand at the edge of the pavement directly opposite the only means of egress. Gutters at opposite ends and steps outside entrances were so sources of danger which should certainly be got rid of. Special provision should always be made for those using conveyances, so that they could reach them without interfering with the flow of foot traffic or of being inconvenienced by it (Fig. 2). In order to avoid any resistance in passing from the seats to the corridor or roadway, provision should be made so that the streams of people approaching the doorway from different directions could be directed through it without conflict with the opposing streams. This could be effected by means of curved barriers, which he had designed (Figs. 3 and 4), arranged so that any pressure exerted by the people behind would force those in front out against other people, but only more quickly out of the building. The seats should always be placed, and the rows should be a sufficient distance apart to enable persons to walk easily between them. The corridors should be of even width throughout, perfectly smooth, and any change of direction should be made by curved surfaces. The sum of the widths of the openings

Fig. 2.

into any corridor should not be greater than the width of the corridor itself, and the stream of people entering it through any opening should be prevented by barriers from interfering with the progress of those entering it through other openings, for the greatest danger existed in allowing a stream of people to enter a corridor at right angles to the stream of people already pressing along it. Sliding doors into corridors should never be permitted, but all doors should be hinged to open in such a way that the progress of a stream of people pressing outwards will not be impeded. Staircases should be of even width, and designed with curved surfaces as corridors according to the London County Council rules. The steps should be of equal width throughout, and the flights should be easy, of equal length, and contain no

more than eight steps. His own experience led him to the conclusion that easy steps, built in a staircase of even curvature throughout, were much more safe (Fig. 5). Either form might be safely used, but irregular stairs of any kind should be strongly condemned. All stairs and corridors should be of fireproof material. For the walls, steps, floor, and ceilings, events had proved that it was much more essential to safety to scientifically design the entrances and exits than to insist on fire-proof construction throughout. The lecturer also drew attention to the danger of loose chairs for sitting accommodation, as they impede the traffic in leaving a public place of entertainment. In conclusion he moved:—"That this section of the Australasian Association for the Advancement of Science is of opinion that places of entertainment and

Fig. 3.

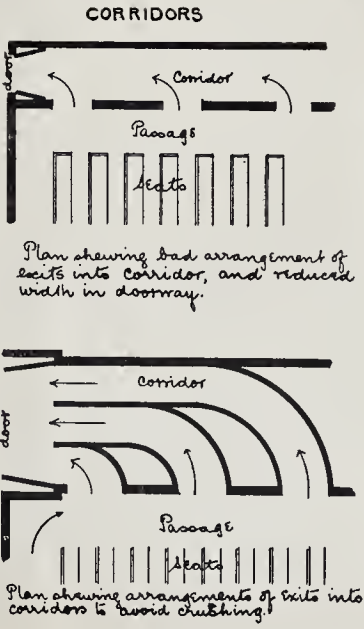

Fig. 4.

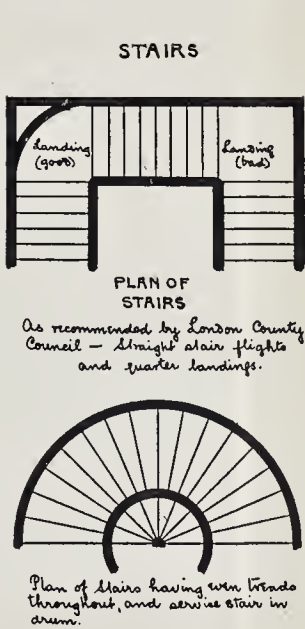

Fig. 5.

public assembly, in order to be considered safe against the dangers arising from panic, must be designed in accordance with the principles here set forth and shown in the accompanying diagram."

It was decided to refer this resolution and the following to the consideration of the General Council:—"That the Architectural and Engineering Section of the Australasian Association for the Advancement of Science, recognising the urgent necessity for the planning of all buildings used as places of entertainment and for public gatherings in such a manner that the safety of the public may be ensured, wishes to bring before municipalities the principles upon which such works should be designed, as embodied in the foregoing resolutions, and would urge that a licence be not granted to those buildings which do not fulfil the conditions stated, and that a copy of the above resolutions be forwarded to all Australasian municipalities."

THE ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

A LANCASHIRE and Cheshire district meeting of the Association of Municipal and County Engineers was held at Withington on Saturday, September 24. The district will soon form part of Greater Manchester, the amalgamation taking effect in November, and the meeting on Saturday gave evidence that the larger city will absorb a prosperous and progressive district. Mr. A. T. Davis, County Surveyor of Salop, President, was in the chair, and among those present were Messrs. J. P. Barber, Islington; A. D. Greatorex, West Bromwich; J. Corbett, Salford; H. Mountain, Withington; J. Cartwright, Bury; A. Burton, Stoke-upon-Trent; A. Dodgeon, Clayton-le-Moors; J. S. Sinclair, Widnes; G. Green, Wolverhampton; R. Simmons, Little Woolton; H. Shillington, Lurgan; C. Hall, Droylsden; C. Brownridge, Birkenhead; S. S. Platt, Rochdale; W. Holt, Sale; V. W. Lathwaite, Turton; G. M. Collins, Withington; A. J. Price, Lytham; T. W. A. Hayward, Battersea; S. S. Haywood, Brighouse; R. Pierce, Singapore; J. Swarbrick, Withington; A. M. Fowler, Manchester; and J. Johnson, Rawtenstall.

Mr. Turnbull, chairman of the Urban District Council, offered a most hearty and cordial welcome to the members of the Association. In a few weeks the district would be merged into one of the greatest cities of the kingdom, but he hoped they would come to the conclusion that the District Council had been progressive.

The President, in acknowledgment, congratulated the Council on the step they were about to take in joining Manchester. He then made announcement of the death of one of his predecessors in the Presidential chair, Mr. Escott, of Halifax. The Council at their meeting the previous week passed a resolution of condolence.

Mr. S. S. Platt proposed the re-election of Mr. Brownridge, of Birkenhead, as hon. sec. for the Lancashire and Cheshire district.

Mr. E. Spencer Yates, Waterloo, seconded, and it was carried unanimously.

Mr. Brownridge, in acknowledging his re-election, promised to do what he could to make the district one of the most active and energetic in the Association.

Municipal Works, Withington.

Mr. A. H. Mountain, Assoc. M.Inst.C.E., read a paper on the municipal works of Withington; with a description of the new sewerage system and sewage outfall works, on the double-contact bacterial system. He said the area of the Withington Urban District Council's district was 5,728 acres, and the population at the present time was estimated at 40,000. It was situated adjoining the southern boundary of the city of Manchester and the urban district of Moss Side, and might be considered to be the principal suburban residential district adjoining the city. The rateable value was 258,888 $\frac{1}{2}$. The district being mostly of a residential character, tar macadam had been much in favour during recent years, but the author from his experience had not found it altogether satisfactory, and considered that it should be used only in streets of light traffic. He had found the difficulty of repairing this class of road to be very great, since it could only be carried out in suitable dry weather, and had also found it to be expensive. Its advantages were, no doubt, great in a residential district such as Withington, where quietness might reasonably be considered to outweigh the dis-

advantages of its cost. Various specifications for tar macadam had been adopted from time to time, but the most satisfactory material consisted of limestone, granite not having sufficient affinity for the tar composition. The refuse destructor was erected in 1895 to the author's designs, and cost 7,105 $\frac{1}{2}$, including land (857 $\frac{1}{2}$), sewerage, and road making. It consisted of six cells in one range. As originally designed, a multitubular boiler, 11 ft. by 7 ft., was provided to drive a mortar mill and dynamo for lighting the works. The cells were worked by natural draught, the top of chimney being 150 ft. above ground level, and having an interior fire brick lining 4 ft. 6 in. diameter to a height of 80 ft. Amount of refuse consumed in each cell per day of 24 hours was 5 tons. Three stokers were employed on the day shift, and two at night. In November, 1897, owing to the high price of flags, and in order to make use of the clinkers from the destructor, the author recommended the Council to lay down a hydraulic plant for the purpose of making concrete flags. The scheme was adopted and the plant duly installed. The manufacture of flags commenced in September, 1898, since which time it had been continuously proceeded with. The hydraulic presses and plant were supplied and erected by Messrs. Fielding and Platt, of Gloucester, and had been very satisfactory in their working. The various main roads and highways, and also private streets, had been paved with these concrete flags, which were very satisfactory in colour and durability up to the present time. The cost of making them amounted to 1s. 11 $\frac{3}{4}$ d. per super yard. The proportion of materials used in the flags (by measure) were as follows: For the face of the flag ($\frac{3}{4}$ in. in thickness) 1 part granite chippings, 1 part of sand, 1 part of best quality Portland cement. The body of the flag consisted of 3 parts of ground clinkers (crushed in the mortar mill), 2 parts of clean sharp sand, and 1 part of Portland cement. The flags were all made 2 $\frac{1}{2}$ in. thick, and were allowed to mature for at least six months before being used. The total cost of the plant and buildings connected therewith amounted to 2,250 $\frac{1}{2}$. The new tramways were worked by electricity by the Manchester Corporation, the Council having entered into an agreement with the Corporation to lease them for a period of twenty-one years, commencing December 1, 1902, at a rental of 600 $\frac{1}{2}$ per mile of single tramway. In order to provide for the double line of electric tramways, it was found necessary to widen Palatine-road from 42 ft. to 54 ft. in width for a length of 1,100 yards, and reconstruct the roadway and paths throughout. This involved the purchase of portions of the gardens of various properties along the road on the west side, the setting back and rebuilding of the whole of the boundary walls, and the replanting of gardens and shrubberies, the total cost amounting to about 17,000 $\frac{1}{2}$. The permanent way consisted of girder rails weighing 102 lb. per lined yard, laid on Portland cement concrete, this being 18 in. wide and 9 in. deep under each rail. The paving was of Welsh granite setts 6 in. deep, the joints being raked with gravel, and grouted with pitch composition. The work was carried out by the Manchester Corporation Tramways Department, acting as contractors for the Withington Council. The cost per mile of single line was 5,620 $\frac{1}{2}$. The Council had obtained a Provisional Order, confirmed by Parliament, for the supply of electricity for public and private purposes within the district, and had transferred the same to the Manchester Corporation for a period of thirteen years, the Corporation undertaking to supply electricity to ordinary consumers on the same terms as it was supplied to ordinary consumers in the city. The gas supply for the greater portion of the district was obtained from the Manchester Corporation at a charge of 2s. 9d. per 1,000 cubic ft.; no meter rent was charged. The water supply was obtained from the Manchester Corporation. In June, 1899, a special meeting of the Main Drainage Committee adopted the scheme of the author (subject to the modifications suggested by Mr. Mansergh) for main sewerage outfall works, and he was instructed to prepare amended plans and estimates. In September, 1899, summonses were served on the Council, on the information of the Mersey and Irwell Joint Committee, for offences contrary to the provisions of section 3, Part II., of the Mersey and Irwell Joint Committee Act, 1892.

In the same month, the author submitted his

revised plans and estimates of cost of the sewers and sewage works, amounting to 86,455 $\frac{1}{2}$, and they were approved, application for the necessary loans ordered. The Local Government Board inquiry into proposed loans was held on November 18, 1899, by Mr. H. H. Law, M.Inst.C.E., later, interviews took place between the Government Board and the chairman of the Main Drainage Committee and the author and in consequence of the requirements of the Local Government Board, the estimates were again revised and increased to 133,615 $\frac{1}{2}$ June, 1900. Sanction to the loan was given July 14, 1900, and contracts were let to James Byrom, of Bury, for sections 1 A (outfall works), and to Messrs J. D. Newell Sons for contracts 3 and 4 (main outfall sewers). These contracts were all now completed, the works in operation. The author found it necessary, in order to carry out the scheme double contact bacterial beds, to raise sewage to 78-00 O.D. at the outfall works and in order to avoid pumping the water arranged the new outfall main sewers to gate the sewage of the upper zone of the district and the whole of the Levenshulme sewer leaving that from Didsbury and Chorlton-Hardy only to be pumped. The sewage from Chorlton-cum-Hardy was at the extreme western corner of the district, and was bound by the river Mersey on two sides, south-west, the Chorlton brook on the north, and an embankment on the east. The average level of the surface of the farm, as complete in 1884, was 71-75 above O.D.; this was practically level throughout, the variation 1 in 10 within 1 ft. either way from the above altitude. Moreover, the river Mersey rises at flood tide to about 81-00 above O.D., or to a height of 9-25 above the surface of the land. Difficulties attending the construction of sewage outfall works under these circumstances might be imagined. The alternative was to pump the whole of the sewage, a large portion of the storm-water, upon a suitable site; but, owing to the proximity of the population, and the fact that all available sites along the river had been already appropriated for the purposes of sewage treatment by other authorities, the author considered it impossible to suggest any other site than that already used by the Council as a sewage farm. The author estimated the population due to the works at the present time at 54,000 there being 40,000 in the Withington district and 14,500 in Levenshulme, and the present weather sewage flow at 3,000,000, or 4 gallons per head per day. Of this volume probably, 50 per cent. was sub-soil water which passed into the older defective sewers and drains. About half the above volume delivered by the high-level sewer at the outfall works at 78-0 above O.D., and the remainder from the low-level sewers, was delivered at 71-0 above O.D., into the pumping station at the sewage works, was lifted into a high-level channel adjoining the engine-house by centrifugal pumps. The steam-ran plant consisted of two Lancashire boilers. Each unit was capable of consuming 26 tons of asphalt refuse per twenty-four hours and of providing the steam for the whole of the works, and they were worked alternately. The pumping plant consisted of four A.E. engines and direct driven centrifugal pumps supplied by Messrs. Tangye, of Birmingham. The sewage on arrival at the outfall works was delivered into detritus tanks, of which there were two, each having a capacity of 48 gallons. In these tanks were deposited heavy grit and coarser particles held in suspension by the sewage. From these detritus tanks the sewage passed forward into sedimentation tanks, where further deposition of the finer solid matters took place. On way to these tanks the sewage passed through blocks of aluminiferous placed in the channel and the sedimentation was thereby materially assisted. The sedimentation tanks had capacities of 377,355 gallons and 408,650 gallons respectively. From the sedimentation tanks the sewage passed to the first contact bacterial beds along concrete channels 7 ft. wide. detritus and sedimentation tanks were provided with floating arms 12 in. diameter communicating with a conduit leading to a pumping sump, so that the top water might be taken off whenever it became necessary to convey the sludge from any one of the tanks. Each tank was also provided at its top and deepest part with a valve, communicating

an open channel leading to the sludge tank, which adjoined the western end of the buildings, since the sludge was lifted into the rams and seas. The sewage was held in contact about 24 hours, and was then passed by Ridgeway screened valves to the second contact beds. The author was pleased to say that the results of the treatment of the sewage since the works had been fully in operation was most satisfactory, the latest published results, on July 14, of analyses made by the official analyst of the Mersey and Irwell Committee showing the effluent first on the list of those from the Mersey and Irwell watershed.

Sewerage and Sewage Disposal Works.

Mr. J. Swarbrick, M.Inst.C.E., read a paper on sewerage and sewage disposal works. The paper was mainly a description of the schemes for sewerage and sewage disposal at Withington which preceded that recently executed. Dealing with the present scheme, he said that during 1895 it became imperative for the district council to proceed with works for the prevention of flooding in many parts of the district, as well as to satisfy the requirements of the Mersey and Irwell Joint Committee regarding the quality of the effluent. About that time the author was asked to accept the Chairmanship of the Main Drainage Committee. Forthwith Mr. Mountain was instructed to formulate a comprehensive scheme, and in September, 1897, his first scheme was submitted. Although only seven years ago, very little was then known of the practical application of bacterial treatment to the purification of water-carried sewage. That method of treatment had not then advanced beyond experimental stages. In his first report Mr. Mountain advised chemical precipitation and subsequent filtration through land, which was a method then favoured by the Local Government Board wherever sufficient land for filtration purposes could not be obtained. Those who had been studying the vexed question of sewage treatment were becoming conscious that they were upon the verge of a new era. The distinction between mechanical and bacterial sanitation had been discerned. The advocates of the biological treatment of sewage in artificially-constructed filters, now known as "bacteria beds," were showing marvellous experimental results. The discovery that local authorities unable to acquire sufficient suitable land for sewage purposes could, without the aid of treated precipitants of mediums for filtration, merely clarify, but, in fact, substantially purify water-carried sewage had, in the past years, completely revolutionised our ideas regarding sewage treatment. Personally, the author could not, in 1897, approve of any scheme of chemical treatment, plus land filtration, because there was no financially practicable method of chemical treatment known which could have been relied upon to produce an effluent free from liability to set up secondary decomposition. The proposal to improve the effluent by subsequent filtration through the land available was likewise not feasible, in consequence of the highly-polluted condition of the "sewage-sick" soil. The only conceivable way of proceeding would, if suitable land had been obtainable at a reasonable expenditure, have been to acquire a vastly increased area. That was believed also to be impossible. It was under those circumstances that the author insisted that attention be paid to the study of bacterial methods of treatment, and that the whole question should be referred to some independent eminent engineer having had municipal experience. The Council unanimously adopted the recommendation. Visits were made to most of the places where experimental plants had been laid down. Subsequently a small, simple, inexpensive, double-contact, experimental bacteria bed was constructed by Mr. Mountain at Chorlton Ees. It worked with most satisfactory results. The scheme was submitted to Mr. James Mansergh for consideration and report. He and Mr. R. Strachan, M.Inst.C.E., then associated with Mr. Mansergh, gave the question most careful consideration during a period of about twelve months. Ultimately Mr. Mansergh made important recommendations concerning sewerage and flood-prevention works, and finally he recommended the adoption of a scheme of sedimentation tanks and bacteria beds for the treatment of the dry-weather flow of sewage, as well as storm-water filters to treat the first discharge of storm-water. Mr. Mountain in the scheme executed had adopted the principles laid down by Mr. Mansergh. He had now completed the sewage purification

works in a most substantial manner. The effluent discharged fulfilled the requirements of the Mersey and Irwell Joint Committee.

Mr. A. M. Fowler (Manchester) said the scheme of sewage disposal was thoroughly up to date, and for a purely domestic sewage the bacteria system gave very good results. In the case of manufacturing towns the treatment of manufacturers' refuse involved additional expense for screening, to prevent the fibrous and other material going into the beds and choking them up. For this reason he cautioned municipal authorities against forming too hasty conclusions as to the system of sewage disposal to adopt. He challenged the profession to say that the bacteria system would treat any class of sewage.

Mr. J. P. Barber (Islington) proposed a vote of thanks to the authors of the papers. He knew some of the difficulties which the Urban District Council had had to contend with, and he was certain that the way in which they had surmounted those difficulties was a credit to the profession to which they belonged and had raised them to a very high standard among municipal engineers.

Mr. S. S. Platt (Rochdale), who seconded, said he understood they had adopted contact beds because of the difficulty of the levels. Recently sprinkler beds had come into favour, and there was a tendency to abandon contact beds and go in for sprinklers. He had experience of both types of beds, and could say that the sprinkler beds had come to stay.

Dr. Fowler (Manchester) claimed that they could get equally good results from both contact and sprinkler beds. If they had a sufficient area of land he thought it was economical to go in for contact beds. On the other hand, if they were shut in a corner, he thought they would find it best to go in for continuous filters. In each case they must deal with the question as best fitted local conditions.

Mr. Corbett (Salford) was of opinion that a deep drain running through the entire district would be a benefit to the community. He asked if the difficulty in the way was an engineering one, or whether it was that of getting the various authorities to unite together.

The vote of thanks having been passed, Mr. Swarbrick said that thirty years ago all kinds of attempts were made to carry out the deep drain, but it was impossible, because they were not part of Greater Manchester and Salford. Probably, when they got the two united with all the suburbs, they might carry out many deep drainage schemes to the benefit of the district.

Mr. A. H. Mountain also briefly replied.

Cremation.

Mr. J. Harvey Simpson, Secretary of the Manchester Crematorium, read a paper on "Cremation in Manchester and Elsewhere." He said a more rational method of the disposal of human remains had been forced upon the community at large mainly for two reasons:—(1) The increase of towns and populous places; (2) The dangers to the public health to which places of interment give rise. Modern cremation was first brought before the British public in an article written by the late Sir Henry Thompson and published in the *Contemporary Review* of January, 1874. The publication of this article resulted in the formation of the Cremation Society of England in 1875. The two most prominent objections to cremation were the religious and the medico-legal difficulty. The following were the requirements under the Act for a cremation:—(1) The usual registrar's order for burial; (2) an application for cremation by the nearest relative or executor of the deceased, to be signed before a solicitor or justice of the peace; (3) two medical certificates, one to be signed by the ordinary medical attendant of the deceased. These forms were placed before the medical referee of the crematorium, whose duty it was to carefully examine the same, and, if satisfied, to give a written authority to cremate. The above requirements proved therefore that no cremation could take place except under satisfactory conditions. Having considered the two popular objections to cremation, they now turned to the arguments in favour of cremation. In regard to a dead body they had a duty to perform (a) to the deceased, (b) to themselves and to their descendants. In relation to the deceased, they must see that the dead body was dealt with kindly, decently, and in a spirit of reverence to his memory. In relation to themselves and to their descendants, they must see that in their

manner of dealing with the dead body they left no legacy of disease and pestilence from which they and their descendants might suffer from their disregard of proper sanitary precautions. The dangers to the public health to which places of interment gave rise were of two kinds:—(a) The contamination of air by the gaseous and volatile, and (b) of drinking water by the liquid and soluble products of decomposition. The following were the present crematoria in England and Scotland:—Birmingham, Darlington, Glasgow, Hull, Leicester, Liverpool, London (Woking), London (Golder's Green), London (Ilford), and Manchester. The crematoria at Hull and Leicester were erected from municipal funds by special Acts of Parliament; but now, under the powers contained in the Cremation Act, 1902, any municipality could vote funds for the erection and maintenance of crematoria. The crematorium at Ilford was erected for the City of London under such powers. The other crematoria were erected by private subscription, and would, it is anticipated, be eventually taken over by their respective municipal authorities. The main architecture of a crematorium was a detail entirely to the taste of the architect. The architecture of the Manchester crematorium was similar to churches to be found to-day in Lombardy and Venice. As regarded the furnace portion of the architecture, the form used at the Ilford crematorium, which was an improvement upon that of the Manchester crematorium, was the best one at present suggested.

On the proposition of Mr. A. D. Greatorex, (West Bromwich), seconded by Mr. Jones (Colwyn Bay), a vote of thanks was accorded to Mr. Harvey Simpson for his paper.

The members were then entertained to luncheon at the Public Hall, and the afternoon was devoted to visits to the crematorium, the refuse-destroyer, and the sewage-disposal works.

THE CONSTRUCTION OF PIANO-FORTES.

LAST week the President and members of the Society of Engineers paid a visit to the pianoforte factory of Messrs. Broadwood and Sons, at Stour-road, Old Ford, where they witnessed the manufacture of pianofortes of various types at every stage from start to finish. The first grand pianoforte was made by John Broadwood in 1770. In 1803 iron bars were first used by the Broadwoods in order to withstand the increased tension of the strings in their large grands. In 1821 they introduced the fixed string plate, and, six years later, James Broadwood patented a combination of resistance bars and string plate. In 1847 the firm brought out their first iron grand piano, an invention by which the instrument became practically independent of the wooden bracing below the sounding-board, and was thus enabled to sustain far thicker strings than formerly, the methods of pianoforte construction being thus entirely revolutionised. Chopin's piano, made for him by the firm in 1843, contained no fewer than five heavy parallel bars of iron. In 1850 the firm substituted a diagonal bar abutting on the string plate for the old straight resistance bars. Then followed the complete iron frame cast in one piece, and the steel barless grand piano, in which an elastic but very strong steel frame takes the place of the old-fashioned cast-iron frame. It will thus be seen that, even in its framework, a pianoforte involves a series of important technical considerations and mechanical details.

Messrs. Broadwood's new works cover a plot of ground 1½ acres in extent, within a boundary formed by Stour-road, Smeed-road, and Beachy-road, near Old Ford Station and Victoria Park, and they are connected by a private tramway with another plot on the Hackney Canal, which forms the timber yard of the firm. Every approved modern machine, tool, or appliance tending to rapidity and improvement in the product has been adopted. It is electrically lighted throughout by about a thousand incandescent lamps, and electric power transmission is largely used in the combination system adopted of driving the varied kinds of machinery partly by light high-speed shafting and partly in groups or singly by electric motors. Electric power lifts and an electric tramway are also employed.

The various processes carried out begin with the working of the rough materials at one end of the factory and end with the finished pianoforte in the store at the other. The rough sawmill is served by a line of tramway from the adjoining timber yard, and in it the timber is cut to various dimensions for the final artificial drying. This mill is

driven by two electric motors, one of 26 h.p. and the other of 20 h.p. As it leaves the machines the wood is stacked on special trucks, and these are placed on a traverser truck at one end of the adjoining air-drying house. From the traverser truck the special trucks with the wood are run into five drying chambers, where it remains for a few weeks to two months, according to requirement. An air propeller delivers about 17,000 cubic ft. of air per minute into the drying chambers. In the metal shop is a small vertical engine by Marshall and Co., which is used for continuously running the drying-room if required, and the exhaust from it is then used for heating the air for timber-drying. When the wood is completely seasoned the trucks are run into a second traverser truck at the other end of the drying chambers, and by it delivered to an electric lift, which raises it to one or other of two floors above the drying chambers for storage.

From these upper floors the wood, as required, is taken to the next building, in which is a large collection of modern wood-working machinery. Most of this is of British make, but there are some special American machines, while in other parts of the factory are some German and some French machines, besides other special machines made on the premises. The machinery in this shop includes numerous planing, thickening, and surfacing machines. There are also machines for planing four sides at one operation, tenoning machines, mortising machines, circular and hand saws, moulding machines for moulding from $\frac{1}{4}$ in. up to a cut 3 in. deep, with a width of 8 in., for shaping the falls of keyboard covers, large and small sand-papering machines, vertical spindle moulding machines, vertical spindle sand-papering machines, and other special machines. The whole of the chips, shavings, and sawdust from the machines in both this mill and the rough sawmill are carried off by a system of pneumatic conveyors to cyclones over a sawdust chamber in the boiler-house, where they are burned in the specially-arranged furnace of a Babcock and Wilcox boiler.

Parallel with the mill is a large metal-working shop, where the steel and iron frames of the grand and upright pianofortes are prepared. This shop contains a large number of special drilling machines, planing machines, radial and other drills, and tapping machines, lathes, and hinge-making machines. The shop is provided with overhead travelling carriers, which command all the drilling machines and the tramway, reducing the cost of lifting and carrying to a minimum. The products of the metal shop pass on to the japanning and gilding shops, and thence to a large four-story building in which are the case-making and finishing shops. Tram rails are laid throughout the ground floor.

Like the products of other shops, those of the wood-working departments also pass on a continuous process path to the various departments in the main building. Here, again, is a large quantity of machinery driven by electric motors, so distributed as to avoid the loss of time which occurs where ample appliances are not provided for a continuous process system. Three of these floors are provided with tramways and with overhead travellers and appliances for the economical handling of the work, and which lead to and from four 14-ton lifts, worked by 10-h.p. and 12-h.p. electric motors, and serving every floor.

In this building some 500 hands are employed, and a great quantity of sawdust and shavings is produced every day. To facilitate the removal of this, every floor is provided with communication to a large shoot, from which the waste is carried away by another system of pneumatic conveyors to the boiler-house. Some notion of the extent of this system may be gathered from the fact that the fans providing the air-exhaust and blast deliver over 1,000,000 cubic ft. of air per hour, and require about 36 h.p. to drive them.

A double system of heating is necessary, one portion for heating the workshops, and another for the glueing work, of which there is a very large quantity. At every point throughout the main buildings hot plates, heating chambers, and batteries of glue pots are necessary, and these are supplied with heat by the exhaust steam from an engine of 100 h.p. In winter this is supplemented by a hot-water heating system, comprising a battery of four large boilers, several miles of pipes, and a large number of American radiators.

At the north-eastern end of the works are the engine, boiler, and dynamo houses. The boiler-house contains four boilers, three being of the locomotive type, by Davey, Paxman, and Co., producing steam for about 320 h.p., whilst the fourth is a Babcock and Wilcox boiler, giving about 100 h.p. All the boilers work at a pressure of 120 lb. per sq. in. The feed-water is heated by a large Dohy-Chevalet detartriser, and there is a complete system of

feed pumps with duplicates connecting up with all the boilers, feed heater, separator, and elevated feed-water tank.

In the engine-house are four engines; one is a compound horizontal engine, by Davey, Paxman, and Co., of 100 i.h.p., for driving the large mill and the metal-working shop. Then there are two sets of combined Crompton-Paxman compound-wound dynamos, with Peache high-speed engines for nominally 40 kilowatts, but capable of large overload, each engine being of 80 i.h.p. Arranged for working in parallel with both or either of these 40 kilowatt sets is an 80 Kilowatt Crompton-Belliss compound-wound machine, capable of heavy overload, the engine being of 120 h.p.

These electric generators supply the whole of the incandescent lamp and the power circuits, the latter alone aggregating 160 h.p. effective, so that in the winter months the large set and one small set are always required. The switchboard is by Crompton and Co. Every work-bench has one lamp, and many of them have two, mostly of 32 candle-power. The cubic contents of the four floors of the main building is about 1,000,000 cubic ft., exclusive of the mills and metal shops, which are chiefly of one floor only, and make a total of about 1,250,000 cubic ft. of space in shops to be lighted, the floor area being over 100,000 sq. ft. This gives some idea of the task of arranging the lamps and circuits to the best advantage. By generating their own electricity, Messrs. Broadwood effect a great saving as against other methods of obtaining their lighting current, or lighting by gas; great convenience also results from having the electric power transmission facilities entirely under their own control. The pneumatic dust and shavings conveyor plant was supplied by the Sturtevant Company, under the specifications and superintendence of Mr. W. Worby Beaumont, and consulting engineer to Messrs. Broadwood, and under whom the whole of the engineering work has been carried out. The machinery throughout the factory has been erected by the Company's own staff, under their chief engineer, Mr. Collen. The electrical work has been carried out to the joint specification of Mr. Worby Beaumont and Mr. R. W. Weekes. The electric wiring and cable work was put in by Messrs. Ward Brothers. The buildings were erected by Messrs. Grover and Sons, Mr. Eugène Beaumont, being the architect.

A system of electric clocks, installed by the Synchronome Company, insures uniform time throughout the factory. There are twenty of these clocks, driven by electric impulses sent over the circuits from a master-clock. The four Day time recorders in the works entrance are also electrically driven from the same circuit. The works are provided with complete telephone communications between the various departments. The local exchange is placed in the general office and twenty-five telephones are connected to it. In the manager's office plug boards enable rapid connexion to be made to any department without the delay caused by going through switching operations at the exchange board.

COMPETITIONS.

BAPTIST CHURCH, BREARWOOD GREEN.—The designs submitted by Messrs. George Baines and R. Palmer Baines, 5, Clement's-inn, Strand, for this church have been selected. The building will accommodate about 400 persons in a mixed congregation, and the cost will be slightly over £1,500.

OPEN SPACE, WELSHPOOL.—The following is the result of the competition for laying out an open space in the town of Welshpool, *i.e.*, first premiated design, Mr. Frank H. Shaylor, architect, Welshpool; second, Mr. Leonard Moore, architect, Maidenhead; third, Mr. J. W. Rowell, architect, 21, Titchborne-street, Edgware-road, London, W.

STAMFORD FREE LIBRARY.—Mr. H. T. Hare, the assessor, has made his award in the competition for Stamford Free Library, and the successful competitors are as follows: First, "Portico A," Messrs. Hall and Phillips, of 6, Great James-street, Bedford-row, London, W.C.; second, "Burghley," Messrs. Buckland and Farmer, of 25A, Paradise-street, Birmingham; third, "Erming," Mr. Thomas William Colman, of Northgate-street, Ipswich.

NEW WESLEYAN CHURCH, HECKINGTON, LINCOLN.—The foundation-stones of a new Wesleyan church at Heckington, near Sleaford, were laid on the 22nd ult. The total cost of the building will be 2,250. The architect is Mr. A. E. Lambert, of Nottingham, and the erection of the building has been entrusted to Messrs. T. Barlow and Company, of the same town.

Books.

Storia degli Scavi di Roma. (Vol. II.) RODOLFO LANCIANI. Loescher and Rome, 1903.

Das Forum Romanum, seine Geschichte, seine Denkmäler. By CHRISTIAN HÜLS Loescher and Co., Rome, 1904.

To those who are at all familiar with literature of Roman topography the author of these two works need no introduction. They are without question the two greatest living authorities upon this most difficult and fascinating subject, and have already done incalculable service to students of it. They have watched and discussed the discoveries which of recent years have thrown more light upon the edifice of the ancient city than centuries of pollen on paper, and may be said to have made exceptional use of exceptional opportunities.

The two books, however, are of a somewhat different character. The *Storia degli Scavi di Roma*, of which this is the second volume (as its title implies) a history of the excavations which have been made within the city, and in its neighbourhood, from the 11th century onwards. The first volume, which appeared in 1902, extends as far as the year 1530 (though the period previous to 1400 occupies of the first forty-one pages), while the present volume does not profess to go beyond the year 1549. This statement is, however, to a certain extent misleading. In the first volume the chronological order was strictly adhered to; but in the second, in order to avoid the inconvenience of "perpetual change" from one subject to another and of the consequent dispersion all over the volume of information regarding any given building, the system has been modified, special buildings, groups of buildings occupying each a separate section. The history of these frequently does not stop abruptly at the year 1549, but is carried on to a considerably later date (e.g. the history of the Farnese collections is extended to the removal of its last remnants in 1834, and the excavations of the Baths of Trajan described down to 1897).

The present arrangement is certainly more convenient than that adopted in the first volume, but the statement in the preface, that "the second volume embraces a period of hardly eighteen years," requires some qualification. The book itself is a mine of valuable information, taken from unpublished documents, preserved in various archives, from the great store of notes and drawings of Rome remains made by archaeologists and architects of the Renaissance, which are to be found in the various libraries of Europe, and from the extensive printed literature of the subject. It is not, and is not intended to be, a book to be read through—differing thus in character from the handsomely illustrated volumes which have made Professor Lanciani's name well known to English readers. But as a work of reference it is of great importance, and many interesting items are added to our knowledge. That it is complete and exhaustive would not be claimed for it by the writer himself.

The history of the Capitoline collection from 1537 onwards is one of the best sections in the book. We find that the exportation of antiquities from Rome is no new thing, and that the municipal authorities, when (as often happened) the state of their finances did not permit them to enter into competition with private buyers, did their best to secure the retention in the city, though it was, as a rule, difficult to persuade the Pope of the day to take action. Nor did they view with indifference the destruction of the remains of ancient Rome in order to supply materials for the edifices of the modern city; and their protests, though often unheard, were frequent and emphatic. The praise which Professor Lanciani gives them (p. 96) is a well-merited tribute. Other sections trace in detail the history of other collections (notice especially that devoted to the Palazzo Farnese), though the greater part of the book deals with ancient buildings. The chapter which describes the destruction of the remains of the Forum Romanum is of interest (though its story has in part been told before in the writer's other works), and shows us how much better a state of preservation they were before the search for building materials for St. Peter's commenced in 1539. Indeed, if it had not been for those few years (for the process of destruction ended, temporarily at

ate in 1554) the whole of the Forum would come down to us in the condition in which atrium Vestæ and the fountain of Juturna recently been brought to light.

ll, from so much destruction some good ill, as Professor Lanciani points out (36), we owe to Paul III., the very Pope who lioned the devastation of the Forum, y of the changes by which Rome was trasns from a mediæval to a modern city in ource of the XVIII century. New build- were erected, new streets made, and old widened and improved. Sixtus V., later the century, no doubt did more, but he not the sole author of the new Rome.

Should be noted that some misprints (most men fairly obvious) might have been corded; and it may fairly be objected that to general reader it is of no service to be told number a print (with an unpublished ing the case is somewhat different) bears professor Lanciani's collection. It is also venient to have an article from a periodical y the pages and title of a reprint, without name of the periodical or the date being a (e.g., the reference to Geoffroy's *Album Pierre Jacques*—an article which appeared *Études de l'École Française*, 1890, p. 156 sq), o on the same page a reference to Vol. VIII. e Tarin MS. of Ligorio would have been ore used had the exact folio been cited.

he other book is of a very different nature. es not profess to be more than a hand-book visitors to the excavations of the Forum animum, the renewal and extension of which, r the charge of Comm. Boni, have excited uch interest in recent years; but it has erit of being written by an acknowledged er of the subject, and it has two advan- over Mrs. Barton-Brown's useful little ce, which was reviewed in the columns of *Builder* earlier in the year; first, that it is ided with an excellent historical intro- ; and, second, that it is not merely a iption of the work of the last six years, but des the whole of the buildings within the of the Forum, and the researches that been made there from the first. The new stigations thus are shown in their true ective, as coming at the close of a long e of previous "campaigns," and take their place within the picture of the whole; we are reminded that, though they are uly the most important that have yet undertaken, and though their director is y of the highest praise, yet—

Vixerunt fortes ante Agamemnona.

he illustrations, too, are well chosen, ranging views of the Forum taken in the XVth and th centuries to the latest photographs. plans, too, are good, though it is a pity neither on pl. II. nor pl. III. is the north d indicated.

he various problems connected with the m are only lightly touched upon; those desire to find a fuller discussion of them seek it in Dr. Hülsen's article in the *tische Mitteilungen* (1902, pp. 1—97). is not, therefore, the occasion to deal with subject in detail, nor to attempt to sustain claims of rival theories, which the author ationally does not mention in a professedly controversial volume, though a bibli- by at the end will be useful to those who to study the subject further. No better e for those who desire to acquire more e a merely superficial knowledge of the m, and who understand German, could ound.

Modern Carpenter, Joiner, and Cabinet-ker. Vol. VIII. London: Gresham Pub- ing Co. 1904.

most important section in the eighth me of this work is that on joinery, which it, we should have thought, to have pced the section on cabinet-making. It is once evident that the section is written an architect rather than a practical crafts- , for the first chapter plunges at once into geometrical methods of describing, enlarg- and diminishing the classical mouldings— ools probably of which the men who sub- ted and cut those mouldings were sub- ly ignorant. Since one section of this e is devoted entirely to architecture, we der that the chapter on mouldings did find a place in that section. Modern ry has been so hopelessly vulgarised by constant application of machine-run ed mouldings that the best policy, as our ger architects are beginning to realise,

is never to use a moulding in woodwork if it can possibly be avoided.

The bad arrangement of this work, and that absence of cross-references which we have already complained of, are further exemplified when, as frequently happens, the same operation is insufficiently described two or three times over in as many of the various sections. Take the instance of dovetailing. The three kinds of dovetails—common, lapped, and mitred—are described in less than half a page of text in the section on joinery, and at about the same length in that on cabinet-making; and in neither section is the student told, for instance, whether he should cut pins or dovetails first; or how, when either are cut, the others may best be set out so as to ensure a fit. A single good description of this important operation in one section, with a reference to it in the other, would have answered the practical purpose much better with the same economy of space.

Worse than this, as an example of the insufficient treatment of important operations and principles, we may take the following:—"Wide panels should be formed of narrow pieces glued together, with the grain reversed alternately" (page 314). What a reader unfamiliar with the process referred to would make of those last five mysterious words it is difficult to imagine. Yet in all these eight volumes upon the subject of wood-working these five words contain the only hint of that property of wood which it most concerns the joiner and cabinet-maker to know, and of which he is too frequently quite unconscious—the fact, namely, that a plank of wood in drying tends always to go round (convex) on that face which is nearest the heart of the tree, and hollow on the side remote, and that this tendency increases with the distance of the plank from the heart of the tree. It is for this reason that in jointing up a wide panel the heart-sides of its component parts should be kept alternately on the face and back-sides of the resultant panel. This principle is involved—it cannot be said to be hinted at—still more obscurely in a statement in the section on cabinet-making to the effect that a wide panel is more likely to stand if jointed up of narrow pieces than if cut from a single wide plank—a statement which is only true if the pieces are all cut nearly parallel to the medullary rays, or else jointed up in the way we have just described. In the section on timber, which goes into a great many less essential details, this important property is not so much as mentioned. These and similar deficiencies of these imposing volumes are the more culpable because on a casual inspection of the work, such as one might take at a bookseller's before purchasing, it would seem to be replete with every conceivable detail.

This volume contains also sections on shop management, estimating, and building law, and concludes with a good glossary.

The literary quality of the work all through leaves much to be desired. How comes it, for instance, that an author who seems to be a scholar rather than a practical craftsman should talk about "joining angles formed by the meeting of two boards," instead of joining the boards by which the angle is formed?

The Beginner's Guide to Carpentry. By HENRY JARVIS. (Marshall's Practical Manuals.) London: Percival Marshall and Co. 1904.

This may best be described as a book for the "very amateur," and it shows no great superiority to the numerous other cheap text-books on the same subject which are already on the market. The author makes a praiseworthy effort to do the first steps thoroughly; he shows how the most necessary tools may be bought or made, used, sharpened, and kept in good working order, and describes the construction of bench, sawing-trestles, mitre-box, wooden cramps, etc. There is a chapter on timber, in which, however, its curious and important physical properties are not described, and another on glue. With all this the student does not learn how to joint two pieces of wood together edgewise until the fourteenth out of fifteen chapters, and then he is given none of the most essential practical hints—he is not told, for instance, how to use his plane so as to correct an edge which is not perfectly square, and unless he is told this he will certainly try to do it in the wrong way.

At the end of this chapter nothing has been said about the elementary operation of plain

dovetailing, and very little of others equally important; yet the next and last chapter opens with the following sentence:—"In order to give a finished appearance to work it is often necessary to add an ornamentation of some kind, and we propose, by way of conclusion, to describe a few easy methods of doing this." How characteristic is it of modern ideals in wood-working and other arts that easy methods of ornamentation should be asked for and described, when some of the first principles of construction have not been—nor will be—so much as touched upon! It is true that occasional references are made to the *Wood-worker* journal, and to another text-book on "Woodwork Joints," not apparently of the same series; but if a "Beginner's Guide to Carpentry" cannot cover the most elementary operations involved, why should it be concerned with "easy methods of ornamentation"?

Ferric and Heliographic Processes: a Handbook for Photographers, Draftsmen, and Sun Printers. By GEORGE E. BROWN, F.I.C. Second edition. London: Dawbarn and Ward.

In the first eight chapters of this little work the reader will find a considerable amount of information relative to the theory of various processes for the production of prints from tracings and drawings, and numerous formulae for the preparation of sensitising, developing, toning, and other solutions. These chapters are of comparatively little interest to architects and engineers, who usually purchase sensitised papers ready-made, and unfortunately the author does not state in every case whether the prints produced by the several processes are of the "positive" or the "negative" variety. A further undesirable feature is the insertion of plates which are more appropriate as advertisements for certain manufacturers than as illustrations of the letterpress. In fact, one of them has no apparent connexion with the process described, another is entirely misplaced, and none of them are numbered or mentioned in the text. Chapter IX. contains a useful summary and comparison of heliographic processes, by which negative and positive prints may be made in the drawing office; and Chapters XI. and XII. dealing with the preparation of tracings for sun-copying and the necessary outfit for printing purposes, are distinctly worthy of perusal. In the three succeeding chapters will be found detailed instructions for printing by the four processes in general use—the ferro-prussiate, giving white lines on blue ground; the pellet, blue lines on white ground; the ferro-gallic, black lines on white ground; and the brown, white lines on brown ground. In the second of these chapters there is another plate baving no reference whatever to the text, but careful study of Chapter XIII., on "Minor Heliographic Processes," will lead to the discovery of five lines mentioning a "secret process" by which the misplaced plate was evidently printed. As the method in question is not available to the public, it is difficult to understand why the author should take the trouble to give an example of its work, but if he really thought the illustration of importance he might just as well have put it in the proper position. With the exception of some hints on oiling drawings on paper for printing, the removal of stains, and the mounting and varnishing of prints, the remainder of the book is devoted to matters of more interest to those who require guidance in the preparation of papers than to the architect or engineer. Although the arrangement of the matter leaves much to be desired, the author of this work evidently understands his subject, and has given in compact form a useful collection of notes, which may be studied with profit by all desiring information as to the theory and practice of the processes described.

British Standard Sections issued by the Engineering Standards Committee; Properties of British Standard Sections. LESLIE S. ROBERTSON, M.Inst.C.E., Secretary. London: Crosby Lockwood and Son. 1904.

THIS, the latest publication of the Engineering Standards Committee, contains particulars of the standard sections for angles, tees, channels, beams, and Z-bars, the dimensions and other measurements having been published some months ago in the form of a pamphlet which was reviewed in our columns at the time. That pamphlet gave the size, thickness, weight per

foot, and sectional area of each section settled, and the same information is repeated in the present book, but with the addition of the centre of gravity, moments of inertia, radii of gyration, and moments of resistance for each section. The latter measurements are obviously of the greatest value to architects and engineers who require to calculate the proportions of the members used in structural work, and their preparation must have involved a vast amount of labour and much expense. Doubtless everyone into whose hands the book may come would be quite willing to accept the names of the eminent experts constituting the three committees by which the lists were drawn up as sufficient authority for the accuracy of all the figures. It is not necessary, however, that these should be accepted blindfold, for in the preface are given details of the methods adopted for arriving at the mathematical measurements to which we refer. This preface, written by Mr. Max am Ende, is extremely concise and contains all requisite explanations, together with the formulae used by the staff of the Committee for the purpose of calculation. The present volume has long been awaited by architects and constructional engineers, by whom we feel sure it will be heartily welcomed.

Journal of the Sanitary Institute; Vol. XXV., Parts I. and II. London: The Sanitary Institute and Edward Stanford. 1904.

PART I. contains *inter alia* two or three papers of especial interest to architects. That on "The Ventilation of Buildings," by Mr. E. T. Hall, F.R.I.B.A., is a sane and useful contribution, and the discussion on the paper is also worth reading. The discussion on "Municipal Rehousing," opened by Mr. W. E. Riley, F.R.I.B.A., gains in value by the plans with which the report is illustrated. The paper on "Disinfecting Stations," by Dr. H. R. Kenwood and Dr. P. J. Wilkinson, is full of useful information and includes plans and views of buildings and illustrations of disinfecting and washing apparatus; for disinfecting textile articles the authors are in favour of saturated (not superheated) steam at a pressure of about 10 lb.

Part II. is of more general interest, and is almost exclusively confined to the Sectional Addresses delivered at the Congress in Glasgow in July. By far the longest paper is that by Prof. J. Glaister on "Smallpox Infection from Hospitals"; after a long review of the evidence, he comes to the conclusion that the doctrine of aerial convection has not been proved. The address delivered by Prof. Frank Clowes deals principally with the purification of sewage, special reference being made to his work for the London County Council. Sir Richard Douglas Powell in his address on "The Prevention of Consumption" lays stress on the necessity for "general hygiene" in combating the disease, and thinks that "our measures for sanatorium treatment are on right lines." "School hygiene" forms the subject of a paper by Dr. E. Walford and of an address by Prof. John Elgar.

The Purification of Sewage. By SIDNEY BARWISE, M.D., B.Sc., etc. Second Edition, revised and enlarged. London: Crosby Lockwood and Son. 1904.

THE first edition of this work was published in 1898, and was followed in 1901 by a smaller book entitled "The Bacterial Purification of Sewage," which was intended as a supplement to the former. Although the fact is not stated in the preface, the new edition contains much of the matter which appeared in the supplementary volume, and is really therefore a revised and enlarged edition of the two earlier works. Dr. Barwise, like so many recent writers on the subject, states that percolating filters give better results than contact-beds, and adds that they are also in many cases less costly. One of the principal objections to the system has been the difficulty of distributing the sewage uniformly over the surface of the bed, and Dr. Barwise devotes nearly the whole of Chapter X. to descriptions and illustrations of various kinds of apparatus designed for this purpose. The analysis of sewage and sewage-effluents is described in detail in an appendix of twenty-five pages. The book can be recommended as an excellent handbook on a difficult subject, and will prove useful to the engineer as well as to the medical officer and the councillor.

Illustrations.

COMPETITION DESIGN FOR LIVERPOOL CATHEDRAL: INTERIOR VIEW.

THIS is an interior perspective view, made (if we mistake not) since the competition, showing the interior effect of the design submitted by Mr. W. J. Tapper.

In our review of the second competition (*Builder*, May 30, 1903), we drew attention to the many fine and effective characteristics of this design, which we regarded as the finest of the five, and the one which we should have wished to see carried out. We may draw attention to one more point which is brought out in this interior view, viz.: the effect of space given to the immense nave by the contraction and the comparatively narrow proportions of the choir. This was an intentional and considered contrast, without which the scale of the nave would hardly have been realised.

The plan was published in our issue of June 13, 1903.

FOREIGN FLOWER MARKET, COVENT GARDEN.

This building has been erected by the Duke of Bedford, in place of a structure of a more temporary character, to meet the demands of the increasing foreign flower trade.

The site upon which the building stands was cleared some years ago to reduce the congestion of streets in the neighbourhood by accommodating waggons and other vehicles laden with market produce. The retention of as much of this wheel area as possible necessitated wide spans and few points of support, and resulted in a departure from the regular planing of market buildings in the construction of the market upstairs.

The first floor is approached from the east end by two exceptionally wide staircases, each entered by two doorways in the north-east and south-east angle pavilions, and by an additional staircase situate at the north-west corner; it provides sixteen small offices for the use of salesmen against the north and south walls, each with its own stands and counter for the display of flowers. In the centre of the hall thirty-four more stands and counters are provided, with ample space for the public between the rows of counters. Additional offices on the first and second floors, over the north-east and south-east staircase entrances,

are provided for salesmen and for the flower market staff.

To facilitate the delivery of goods two electric lifts, running from the basement to first floor, are provided at the south-west with motor-room over. The basement, which is lofty, is mainly used for storage purposes, and is approached by three staircases. Loading flaps are also provided through the wheel floor at convenient intervals, with mezzanine staging under extending over a considerable portion of each cellar.

The materials used in the exterior are sand-faced bricks and Portland stone, with light buff-coloured Candy's facings have been used for the staircases and internal walls of market on the first floor. The building has been designed so as fairly to be in harmony with the other more recent market buildings and to express externally the arrangement of plan and the purpose for which the building is intended.

In view of the necessity for the pier and other supports being as few as possible, special attention was given in the designing of angle pavilions to avoid the appearance of building standing on stilts. The probability of future extension westward has also borne in mind.

The glazing of the roof lights is on Mello principle; the lifts are by Messrs. East Messrs. Merryweather supplied the fire hydrant artificial lighting, which is of special importance (the bulk of the business being done in the early morning hours), is effected by high pressure incandescent gas, installed by Messrs. Keith, Blackman, and Co.; Mr. Henry McCaskey was the carver, and the builders were Messrs. Cubitt and Messrs. Howard and Co.

The architects are Messrs. Lander, Bedford and Crompton.

HOUSE NEAR LEICESTER.

This dwelling-house has been recently erected in the parish of Oadby, near Leicester, by Mr. M. H. Pearson.

The materials used are Woodville's bricks for the wall facing; Ketton stone, sills, copings, and other dressings; old Swalesland slates for roofing; these are thick, varied in colour, and laid in diminishing courses.

The ridges and hips are covered with lead, the eaves, gutter, and downspouts in the same material, but with some slight modelled enrichments.

The garden adjoining the house has 1

ent in a formal manner from the architects' contractors for the work were Messrs. W. Chambers; and the architects Messrs. Ward and Pick, all of Leicester.

HOUSE AT ROGOJENY, RUSSIA.

This drawing was exhibited at the last Academy, under the title "Design for a house in South Russia." Referring to the absence from England of the architect, Mr. H. Inigo Triggs, we are unable to furnish any further information in regard to it.

HILDEBURG'S CHURCH, HOYLAKE.

This church has been erected on the north-boundaries of the celebrated golf links. The site was given by the late Lord Stanley of Ely, who also was a contributor in many ways to the building. Through the donations of some members of the congregation and friends of the church the interior has been much embellished; for instance, the chancel has been paved with tiles of different patterns by Messrs. Partner and Brindley. It has been furnished with oak stalls, and placed by the chancel arch with an oak pulpit with a canopied sounding-board, all carved elaborately. The oak work executed by Mr. Hunstone, of Tideswell. The largest Lord Stanley's gifts may be seen in the filling of a great number of windows with stained glass made by Messrs. J. and Sons, of Whitefriars. Mr. Wm. Ward, of Wigan, was the builder, and Edmund Kirby, of Liverpool, the architect.

MARK'S CHURCH, PLUMSTEAD.

MARK'S, Plumstead, was designed for the Rev. A. V. Baillie, now Rector of Rugby, but by the Vicar of Plumstead. It occupies a high and prominent position overlooking the Tidal Common. The main feature of the design is that the church is planned to be on the first floor, and reached by wide outside flights of stone leading to a large open landing. A feature of this landing is that it contains a projecting pulpit, to be used for open-air preaching. At the present, however, only the lower part, which is finished in brick, has been built, the roof of which is formed of Homan and Rodgers' fire-construction and asphalted. This will be the floor of the church when built. The architect is Mr. Richard J. Lovell; the contractors being Messrs. L. H. and R. Roberts. The plan, as will be seen, constitutes in its features a revival of the ancient Basilica and represents a somewhat unusual precedent in modern English church architecture.

TRADE CATALOGUES.

Messrs. HERBERT MORRIS and BASTERT, of Birmingham, send us their catalogue No. 41, the object of which is to recommend their "M. B." pulley block. This appliance is provided with double-pitched worm gear, and worm and wheel being machine-cut, and so timed that the form of gear, the workmanship and accuracy of fitting, are such that the one would suffice to reverse the motion. The pulley block can be fitted with a self-automatic brake, allowing free rotation, and creating sufficient resistance in order to balance the load. Those who have ordinary self-sustaining pulley blocks that, apart from other disadvantages, are liable to the power exerted is considerably in excess of that usefully employed in raising the load. It is certainly wise to avoid blocks of this kind, and the catalogue here recommended is quite worthy of study by builders and contractors generally. Acetylene Corporation of Great Britain send us a copy of the fifth edition of its catalogue of acetylene generating plant and accessories. Although acetylene is not so common in London and other large British towns as it was four or five years ago, it is still from the work which has been, and is being accomplished by this and a few other firms at the acetylene industry has at length established upon a sound and substantial basis the successful adaptation of acetylene luminant for country houses. Installed and operated by this corporation several years

ago in various country churches, schools, and mansions are certified by their owners to be still giving satisfaction. The present catalogue contains many illustrations of lanterns, pendants, and brackets specially designed for use with acetylene, and also contains much useful information concerning acetylene and calcium carbide. The assumption that calcium carbide "contains 5 cubic ft. of gas in every pound thereof" is, however, entirely erroneous. Calcium carbide does not contain any acetylene.

Messrs. J. and H. McLaren, of Leeds, send us a pamphlet, written by Mr. John McLaren, M.Inst.C.E., descriptive of the traction engines made by them, and of the various uses to which these machines have been applied in various parts of the world. After an introduction, occupied chiefly with the works equipment of the firm, the author directs attention to the salient features of "thrashing" engines, and next deals with the heavier types of road locomotives employed for haulage purposes. Illustrations are given of military traction engines and cranes of the types largely used during the South African campaign, in which they were proved to be of the greatest value. Perhaps the most interesting series of illustrations is to be found in the last chapter of this pamphlet, descriptive of "Pioneer Work in the Colonies." The photographs here reproduced give an excellent idea of the immense assistance afforded by mechanical haulage, and of the trying situations in which traction engines often find themselves in new countries. Mr. McLaren has not attempted to follow the bad example of those who profess to write scientific treatises while their real object is to force advertisements on unsuspecting readers, but gives a straightforward account of the general serviceability of the types of locomotive, with the development of which he has been honourably associated for many years past.

NOTES ON PORTLAND CEMENT. CHAPTER IX. (Continued).

THE exposure to weather and the effect of temperature on concrete does not appear to be taken into account by users generally. Very often a cement is condemned because the concrete will not set quickly enough. In cold, wet weather concrete cannot be expected to set as quickly as in hot, dry weather.

Mr. A. E. Carey, an engineer of wide experience in concrete work, in a paper on "Concrete in Relation to Marine Work," read before the Engineering Conference of the Institution of Civil Engineers, says:—

"The effect of a low sea temperature is a subject which has not hitherto received the notice its importance merits. The author had seven winters' experience at Newhaven, that of 1889-81 being unusually severe; but, in carrying on the harbour work now in progress at Hastings (only about twenty-five miles distant), the experience of last winter raised novel issues in this particular. The breakwaters at Hastings are being wholly constructed in mass concrete, and, commencing in October last, the setting became so extremely slow that work on the foundation reef was liable to be ploughed up by a sea sometimes days after deposit. The specification is a severe one, and the greatest care was taken in testing.

"Up to this time nothing of the kind had occurred, and the season was open and normal. Cubes of concrete were then made with, and immersed in, sea-water in the open, the cement being taken from five of the best makers. All gave pretty much the same results, the

cement failing to set for days. The retardation of the setting was ultimately clearly traced to the extremely low temperature of the sea, due, doubtless, to the predominance of cold currents flowing down from the North Sea. The sea temperature varied in January last from 37° to 38° Fahr.; February, 37.5° to 40°; March, 31.5° to 43°; and in April, 43° to 49°. At Newhaven probably the warmer currents from the Atlantic set up a different set of winter conditions. Observations of the sea temperatures, as long continued as possible, and some elasticity in the specification are two important matters where extreme seasonal variations may obtain. A very heavily-burned cement is unsuited to winter work under rigorous conditions of temperature."

With certain necessary precautions, cement work can be done in freezing, as well as hot, dry weather. In freezing weather the work should be protected by covering with thick paper, tarpaulin, sawdust, or sand. Some contractors use salt in the gauging water. There are, however, objections to its use, and it can be dispensed with. In the publication of the German Association of Cement Manufacturers on "Portland Cement and its Applications" we find the following:—"In cement work to be executed in freezing weather the addition of salt to the mortar has been recommended and used; such an addition, however, is not only superfluous, but even injurious, as it causes unsightly efflorescence on the work. If compelled to do cement work in very cold weather, it is preferable to heat the water and sand, and use little water in order to accelerate the setting of the mortar. If one is careful not to allow any free water to separate out, or to absorb this water with dry stone, there is scarcely anything to be feared from the action of heavy frost, and the use of salt may be dispensed with."

Paving or plastering work which has been frozen appears spotted, blistered, scales off, and sometimes crumbles.

Similar work exposed to very hot weather resembles glazed clay, and shows small cracks like those in dried mud. In hot weather the great secret is to keep the moisture in the work, and it should be kept wet for some days after setting, as it helps in the hardening and bleaches the surface, thus obtaining a better colour.

One authority on concrete work says:—"It should not be overlooked that in the laying of dry concrete it is absolutely necessary in warm weather that the surface be kept constantly wet with water, and for the best results it should also be covered, the best method of accomplishing this being probably the use of large pieces of canvas."

Badly-mixed concrete gives poor work. In work which has to be faced it is the cause of irregular finish, sandy surfaces, and, in paving, it wears badly and unevenly. Concrete should be mixed so thoroughly that all the materials are covered with a thin coating of cement. Sand, gravel, or stone should be slightly damp, so that the cement will adhere to the particles when mixed in the dry state. The cement and aggregate should be thoroughly dry-mixed before adding water.

Work on poor foundations causes the concrete to crack. Where the ground does not drain naturally, about 6 in. to 12 in. of broken stone should be put in before the concrete and well tamped.

Insufficient tamping makes work porous and weak. In work which is faced, the top coat should be laid before the lower one has set, or top and bottom courses will not unite. The hollow sound in paving is often from this cause. Some contractors say that by damping the bottom course and sprinkling with neat cement in sufficient quantity to unite the two courses and tamping will give good results. If the concrete contains dirt or clay, this will rise to the top and prevent surface coat adhering.

In finished work, over-trowelling brings too much cement to the surface. When this top skin wears off, the under work will be powdery and rough. Over-trowelling also causes hair cracks.

Insufficient trowelling will cause rough, pimply surfaces, the latter due to the air not being worked out.

It should be remembered that trowelling is only done to obtain a smooth surface.

In paving and such like work some operators dust neat cement over the surface. This practice cannot be recommended; it causes hair cracks, and has the same effect as over-trowelling.

If necessary, never dust with neat cement, but with a mixture of cement and fine sand.

Hair cracks in finished work are caused by the following:—Too much water used in gauging, over-trowelling, allowing the top to dry out quickly, too much cement brought to the surface, and dusting with neat cement.

Large cracks are caused by poor mixing of concrete, bad foundations, and expansion of foundations through wet.

Crumbling may be caused by not using enough cement, poor mixing, dirty materials, and cement drying out before being set.

In years to come this will undoubtedly be called the "concrete age." Rapid advancement is being made in the application of cement concrete to the various forms of construction. Concrete is admirably suited to building. It is fireproof, is not affected by dampness, and becomes harder with age.

The building block industry has made very rapid progress in the last two years, and many residences have been erected in concrete blocks in almost every city. Especially in America is this form of construction coming into very extensive use.

COURT OF COMMON COUNCIL.

The first Court after the vacation was held at the Cullihall on Thursday last week.

A communication from the chapter clerk of St. Paul's Cathedral, suggesting that some permanent representative of the City should be appointed as trustee of the Fabric Fund of the Cathedral, in the place of the Lord Mayor, was referred to the General Purposes Committee for consideration and report.

Street Improvements.—The Improvements and Finance Committee submitted a lengthy report relative to a number of proposed street improvements in the City. The following improvements were sanctioned:—Removal of the buildings over the entrances at either end of Duke Head-passage, cost 500*l.*; widening of the public way in front of 71, Fleet-street, contribution 2,214*l.*; widening of Old Broad-street in front of Winchester House, at the corner of that thoroughfare and Loudon-wall, 3,000*l.* for acquiring the necessary land.

Public Service Works.—A communication was received from the Board of Trade approving and allowing the by-laws made by the Court under the provisions of the City of London (Various Powers) Act, 1900, with respect to public service works authorised to be constructed in the City.

The Unemployed.—A letter from the Metropolitan Borough of Islington asking the Court to appoint three representatives to attend the conference to discuss the question of the unemployed, which conference will be held in the Town Hall, Islington, on October 10, was referred to the Streets Committee for consideration.

OBITUARY.

MR. LAWSON.—We regret to announce the death of Mr. George Anderson Lawson, R.S.A., the eminent sculptor. Of Mr. Lawson's principal works the following have been illustrated in the *Builder*:—"Ave Caesar, Imperator, Moriuri Te Salutant," the figure of a *retirius* (June 21, 1884); "Summer," a lad resting after bathing (May 29, 1886); "Spartan Dancing Girl Reposing" (May 30, 1888); "Cassandra," a statuette (June 9, 1888); "Motherless," a father and child; and "Bequeathed by Bleeding Sire to Son," a youth bearing his father's shield (May 13, 1889). These were exhibited in the Royal Academy rooms in the years we cite. We have also illustrated Mr. Lawson's statue of Burns, at Ayr (September 10, 1892), a replica of which he was commissioned about twenty months ago to execute for the Caledonian Society of Melbourne; "Death of Cleopatra" (October 23, 1886), shown in the Royal Academy, and subsequently at the Edinburgh Exhibition; and the sculptured friezes, forming one continuous band, for the municipal buildings and technical schools at Bath (July 11, 1896); and, on April 9, 1898, the eight statues of Roman emperors and generals set up on the pedestals of the balustrade above the colonnade around the Roman bath at Bath, for which he also executed the ideal bust of "Roma," at the south-west angle. Mr. Lawson was the sculptor of the statue of Burns for the Belfast Free Library, 1893; of the Royal Arms, supported by figures of Britannia and India, carved in full relief, immediately above the central niche which contains Signor Lucchese's statue of Queen Victoria in the Bridge-street front of the Victoria Art Gallery and Reference Library at Bath; the Wellington monument at Liverpool; and the statues of James Arthur at Glasgow and Joseph Pease at

Darlington. He carried out many commissions from both private and public sources in this country as well as abroad.

MR. COLIN HUNTER.—Mr. Colin Hunter, A.R.A., died on the morning of last Saturday at his residence, No. 14, Melbury-road, Kensington, aged sixty-three years. The house was designed, and we have heard, for him by Mr. J. J. Stevenson. He was a son of Mr. John Hunter, of Helensburgh, N.B., and was a native of Glasgow, where he was educated. After having been employed during four years in business, he, when twenty years of age, resolved to follow his real vocation and became a painter. In 1864 he was elected an associate member of the Royal Academy; he was a member, too, of the Royal Scottish Water-colour Society. When thirty-two years of age Mr. Colin Hunter sent to the Royal Academy exhibition his "Trawlers Waiting for Darkness." Several of his most important pictures exhibited there in the years we mention were secured for public collections, amongst them being "Their Only Harvest"—1878, purchased by the Chantry Bequest trustees; "Waiting for the Hopeward Bound"—1882, now at Adelaide; "Herring Market at Sea"—1884, acquired by the Corporation of Manchester; and "Salmon Stake-Nets"—1874, the property of the Government of Sydney. Of his other principal works we should instance, adopting the chronological order of their exhibition in the Royal Academy galleries, "Cree Way"—1875; "Digging Bait"—1876; "Silver of the Sea"—1897; "Mussel Gatherers" and "In the Cloaming"—1880; "A Pebbled Shore," and "Lobster Fishers"—1885; "The Rapids of Niagara"—1885; "The Woman's Part"—1886; "Their Share of the Toil"—1887; and "Fishers of the North Sea"—1888. He contributed, moreover, "Ireland," in 1885; "Winty Weather and the Clearing of the Herring Harvest," in 1884; "The Hills of Morven," in 1880; and "Baileys" in 1889. In 1881 Mr. Colin Hunter exhibited "The Island Harvest" in the Fine Art Society's rooms. His more recent pictures comprise "Good Night to Skye"; "Tanning the Herring-Nets"; and "Salmon Fishing on the Dee," 1895. During the past ten years or so he exhibited in the Royal Academy rooms about twenty paintings of scenes of wild life. Mr. Colin Hunter married thirty years ago a daughter of Mr. John H. Young, of Glasgow.

MR. SEVERN.—We have to announce the death on September 22, at his residence, No. 9, Earl's Court-square, S.W., in his seventy-fifth year, of Mr. Walter Severn, President of the Dudley Gallery Art Society. Born at Rome, he was the son of Joseph Severn and his wife, Elizabeth, daughter of Archibald, Lord Montgomerie, Major-General, who, in 1820 had, at no small personal sacrifice, accompanied Keats to Italy. Mr. Severn had his education at Westminster School; entering the home Civil Service, he was appointed an examiner in the Education Department of the Privy Council Office, but subsequently became known as a painter in water-colours. Amongst his works exhibited by Messrs. Agnew in 1874 was "Our Boys," rendered familiar by the highly popular engraving. Mr. Severn illustrated many of his own literary works, as well as editions of certain books—including the *Morning and Evening Services*—and Lord Houghton's "Good Night and Good Morning." He devoted most of his efforts to the cultivation of the applied arts. In an early period of his career Mr. Severn contributed largely to a revival in England of the art and practice of skilled embroidery and needlework. Nearly fifty years ago he, in collaboration with his quondam school-fellow, Charles Locke Eastlake, directed himself to the improvement of the design of textile fabrics, wall-papers, and furniture. Mr. Severn married in 1866 Mary, a daughter of the late Sir Charles Dalrymple Fergusson, Bart., who survives him.

MR. WALKER.—The death is announced of Mr. Francis Blennerhasset Walker, M.I.C.E., of Castlemaine, co. Kerry, Ireland, who died at his residence in Cheltenham on September 14, in the sixty-seventh year of his age. Mr. Walker was formerly Consulting Engineer to the Government of Madras.

PROPOSED RECONSTRUCTION OF THE MUNICIPAL BUILDINGS, ABERDEEN.—At the meeting of the Finance Committee of the Aberdeen Town Council, held on the 21st ult., the remit from the Council regarding the proposed reconstruction of the town-house buildings came under consideration, and it was decided to proceed with the modified scheme of reconstruction involving a cost of 3,000*l.*, of 4,000*l.* Mr. Rust, the City Architect, will prepare the plans for the work.

GENERAL BUILDING NEWS.

ADDITIONS TO ST. MATTHEW'S CHURCH, NEWCASTLE.—The Bishop of Newcastle recently dedicated the new portions of the aisles & porches of St. Matthew's Parish Church, Newcastle. The building work has been carried out by Mr. Thomas Weatheritt; the heat by Messrs. Dinning and Cook; the electric lighting by Messrs. Robson and Gledhill; the architects are Messrs. Hicks and Chalmers, who, as far as was practicable, have carried out the designs of the first architect, Mr. R. J. Johnson. The cost of the additions amounts to 3,900*l.*

NEW CHURCH, SOUTHPORT.—The memorial stone was recently laid of the new Holy Trinity Church, Southport. At present it is only intended to rebuild the nave and aisle at a cost of 10,000*l.* or 12,000*l.*, the building the tower, west end morning chapel, chancel and transept being deferred. The estimated cost of the complete scheme is 30,000*l.* The style of architecture is decorated Gothic. The internal arcades will rise to a height of 40*ft.*, whilst the apex of the barrel vault, which covers the nave, will be 62*ft.* above the floor level. The aisles are to be carried to a height of 32*ft.*, divided from the nave by octagonal shafts supporting moulded arches. Seven traceried windows of four lights each of different design, will illuminate the aisle and nave. Over the aisle windows will be flying arches springing from buttress to buttress, the buttresses rising above the parapet being finished with panelled and weathered gables. The transept, which has still to be built, will consist of a double bay, pierced by two traceried and shafted windows, and the roof will be vaulted and divided by moulded groin ribs. The architects are Messrs. Huon, Matear, and Simon, Liverpool.

NEW WESLEYAN CHURCH, HULL.—The foundation-stones were recently laid of the Wesleyan Church in Prince's-avenue, Hull. The building, which is from the plans of Messrs. Gelder and Kitchen, architects, is to be built in the Gothic style, with Rucon stone, slaters, and stone dressings. The elevation of Prince's-avenue will be flanked by a tower and spire. The interior will be formed with colonnade and half-open roof, with transept and organ recess, and will be fitted up with pitch-pine, providing seating accommodation for about 900 people. The contractors for the work are:—Mr. C. Houghton, bricklayer; Mr. J. Houghton, joiner; Messrs. Bower and Sons, masons; Messrs. Williamson and Sons, slaters; Mr. W. G. Padgett, plumber; and Mr. Codner, painter. The total cost of the edifice, including the site, will be 11,000*l.*

NEW PRESBYTERIAN CHURCH, BLUNDELSANDS, LIVERPOOL.—The foundation-stone of the Presbyterian church at Blundellsands was laid on the 14th inst. The buildings occupy a site at the corner of the Serpentine and Victoria-road. The main axis of the church is north and south. The principal entrance under the tower at the north-east corner. The nave is 32*ft.* wide by 5*ft.* 6 in. long, and has a centre aisle. The side aisles and transepts are separated from the nave by a series of red sandstone piers, and pointed arches. An organ chamber is provided in the south-west angle of the church, with staircases opening into it from the choir and a transept. At the north end of the building and situated over the entrance vestibule, is a gallery. The minister's vestry and choir vestry are at the south-east angle of the church, and will form a connecting link between the church and schools when the latter are built. The style adopted for the church is a late period of Gothic, with traceried windows. Externally the building will be faced with Rucon stone throughout, the roof covered with green Westmorland slates. The windows will be glazed with leaded light. Internally the arches and doorways will be of Rucon stone, and the walls will be plastered. The roof will be finished with pitch-pine boarding, relieved by ornamental moulded ribs. The church will be lighted by electricity, and an electric fan in the ventilating turret will be used for extracting vitiated air. The heating throughout will be by means of hot-water pipes and radiators on the low-pressure system. The building, which is to cost about 8,000*l.*, will accommodate 200 persons. The architects are Mr. Art Thornely, and Mr. Gilbert Fraser, of Liverpool; and the contractor Mr. Samuel Lees, Bootle.

PRIMITIVE METHODIST CHURCH, CRONSIDE, YORKSHIRE.—The memorial-stone was laid short time ago of a new Primitive Methodist church at Croaside. The new building, the design of Mr. J. P. Earle, architect, Sheffield. It is being constructed of Greenstone, with concrete dressings, and is estimated to provide seating accommodation for 200 persons. Only a chapel is now being built, but there is room in the rear for

on of vestries, etc., in future. The total will be about 9000, including the purchase of the freehold of the site.

WESLEYAN METHODIST CHAPEL, COLWYN
The foundation-stones were laid recently of a new chapel which is being erected by the Wesleyan Methodists at Colwyn Bay. The building will comprise a chapel seating 300, a Sunday school for 300 scholars, and a parlour for the connexion meetings, 1 as vestries for the minister and choir. The structure is to be in the late decorated style of architecture, the materials used being pressed bricks, with terra-cotta facades. It will be lighted by electricity.

ARTHUR BROCKLEHURST, of Manchester, is architect, and Messrs. J. Tucker and Sons, Colwyn Bay, the contractors. The work cost, including the land, etc., 7,000.

SCHOOL, GLASGOW.—A new school has been erected in Walter-street, Glasgow. The plan is that of a central hall and reading classrooms. The material is a red sandstone. The south elevation in the street has an unbroken frontage, but is relieved by pilasters and a small pedimented centre. The ground floor gives accommodation for 480 infants and juniors in six rooms, the first and second floors being in design and accommodation. The roof of the central hall is laid with wood on concrete, and the dados of the stairs and staircases, etc., are lined with pine and the finishings generally are of pine. Fresh air is admitted by air brackets fixed in the classrooms fitted with filters and regulators. The heating is by low-pressure hot-water system, and the hall and staircases are heated by radiators connected by branches to the heaters. Electric light is fitted throughout. The organ loft has been erected at the end of the school buildings. The architect of the school were Messrs. A. Lindsay and Son (Glasgow). Excluding the site, the total cost of the school was about 20,000.

The principal part of the work was under the supervision of Mr. William Arnott, consulting engineer. The various contractors were: masonry work, James Parker; carpenter work, James Brown; slater work, Hamilton and Easton; iron work, Messrs. D. King and Steel; steel work, P. and W. McLellan, Ltd.; plaster work, James Raeside; plaster work, James Raeside; cement pavior work, Messrs. J. J. McKenzie; glazier work, James Raeside; wood block flooring, The Acme Flooring; smith work, Bryden and Co.; patent roof glazing, The Heron Combination System; ironmongery, J. L. M'Indoe and Co.; tile work, W. Forbes and Co.; heating, James and Son; ventilating, Messrs. R. and Son; stair work, Jas. Laing; and T. C. Watson.

CHOICE EXTENSION, LEEDS.—The foundation-stone of the new receiving wards, which have been erected in connexion with the proposed extensions and improvements at the Leeds Union Workhouse, was laid recently. The buildings are of brick, with cast-iron columns, and will be in harmony with the existing blocks. They will be divided into sections, the block on the right of the entrance being set apart for men, and the block on the left for women. There is also to be separate day-room and dormitory accommodation for the children in each block, and every accommodation for the cases which the medical officer may consider advisable to admit to the hospital. All the upper floors will be fireproof, and there will be every accommodation for thirty patients. The principal contractors for the new buildings are Messrs. Thompson and Sons, with Mr. Fred Moore as clerk of works. The total cost of the building, which is being erected from the plans of Messrs. Winn and Sons, is about 7,000.

ELEVATING AND STORAGE PLANT, DALTON
WORKS.—The Dalton Main Collieries Company, Rotherham, are erecting a coal elevating and storage plant on a large scale. The plant includes a storage bunker, 800 tons capacity, with suitable outlet doors; a bucket elevator to carry the coal from the ground to the top of the storage bunker; and a conveying system of the push-plate type, with a bunker, with the roofing and necessary structural work for supporting the elevators and principals. The bunker is to be built up of mild steel plates, riveted to an iron framing, tied together by flat-bar bolts, and the side plates stiffened by diagonal channels on each side running the length, with tee-iron vertical stiffeners. The channels rolled steel joists, 20 ft. apart, to support the sloping end of the bunker. Thirty-four sliding outlet doors of mild steel plates, and supplied with wrought-iron handles and hand levers for operating them, are fitted to the bottom of the bunker.

The elevator, running from the ground-level to the top of the bunker, is to be of the case-in-type, and 82 ft. between centres. The driving and trailing shafts are to be provided with cast-iron spoked wheels. For delivering the coal from the elevator to the conveyor, a discharge shoot, built up of 4-in. thick mild steel plates, riveted to 2-in. angle-iron framing, and firmly secured to the elevator head, will be furnished. The conveyor for distributing the coal over the bunker is a 24-in. push-plate, 71 ft. between centres. The framework for this conveyor will be of channel irons riveted to bottom plates, which constitute the trough, angle-iron stand-offs and top runners to be used for the return chain. Eight standard sliding outlet doors, with the necessary wrought-iron levers and brackets for operating them, are to be provided for the conveyor. The work is being carried out by Messrs. Graham, Morton, and Co., of Leeds.

HALL AND SCHOOLS, OXFORD.—The Wesleyan Hall and schools, which have been erected at the corner of Junee-street, Oxford, were opened recently. The hall is in the Renaissance style, built of Hambrough stone, with Bath stone dressing. The entire site is surrounded by a dwarf stone wall, surmounted by an iron palisading. The principal entrance is from the south-east angle, a flagged pathway leading to the entrance porch, which opens into two lobbies, the gallery being approached by a staircase under a tower in the right-hand corner. The gallery, supported on columns, runs round the school of the interior and behind the rostrum is the organ loft, with choir vestries on either side. The building has a hammer-beam roof, filled in with panels, and with moulded purlins. The organ loft is approached by a back staircase, and also by a staircase from the rostrum, leading through the choir seats. The furnishing throughout is of pitch-pine open seats, varnished in two tints, seating accommodation being provided for 750 persons. The chapel is lighted by electricity, the work having been carried out by Messrs. Hill, Upton, and Co. It is heated by the low-pressure hot-water system, the work of Messrs. Ison, Kidman, and Watts. The means of ventilation are both from patent tubes in the walls, the windows, and a patent extracting pump in the centre of the roof. The carving is by Mr. W. H. Feldon. The schools are built entirely of brick, and are detached from the hall. The body of the structure forms a central school, 44 ft. by 40 ft., open up to the roof, with a balcony on either side at the first-floor level. On the ground floor are also the juniors' school, infants' school, classroom, and two entrance lobbies. On the first floor is the guild-room, which is 24 ft. by 44 ft., on the south, and at the north end are two classrooms. The school affords accommodation for about 500 children. Like the chapel, it is electrically lighted and heated by hot water. The architect was Mr. Stephen Salter, Oxford, and the contractors Messrs. T. H. King-gerlee and Sons, also of Oxford.

CO-OPERATIVE BUILDINGS, IPSWICH.—A new branch of the Ipswich Industrial Co-operative Society has been opened in Bramford-lane and Surbiton-road, Ipswich. The building is in red brick, comprising in the front a grocery and butcher's shop. There are underground cellars and a cold storage in white glazed brick. A warehouse accommodation is provided, and there are two living-rooms, a kitchen, and three bedrooms for the manager, this portion being approached by a private entrance. Mr. S. Skerritt was the builder, and Messrs. Eades and Johns the architects. The contract price was nearly 1,7000, and the price of the land 2100.

NEW LAUNDRY FOR THE WOOLWICH UNION INFIRMARY.—Plans have been prepared by Mr. C. W. Brooks, architect, for a new laundry which is about to be erected at the infirmary of the Woolwich Union.

WORKHOUSE EXTENSION, SOUTH SHIELDS.—The extension of the Harton Workhouse, South Shields, by the provision of a nurses' home, with accommodation for twenty-four nurses and servants, has been completed. On the ground floor of the new buildings there are probationer nurses' sitting-room and dining-room, with a folding partition, so that the rooms may be used for the purpose of lectures and recreation. There are also superintendant nurses' sitting-room, and charge nurses' sitting-room, with ample kitchen and scullery accommodation, at the rear. Twenty-four bedrooms are provided on the first and second floors. The contracting work has been executed by Mr. J. J. Moore, of South Shields, and Mr. J. H. Morton, also of South Shields, was the architect.

PREMISES, WOOD-STREET, LONDON.—The new offices which are being erected in Wood-street, City, are now nearing completion. The structure is of stone and has a Mansard roof and dormer windows. The lighting areas are

faced with white glazed bricks. A hydraulic passenger and goods lift is provided to all the upper floors, of which there are five, and in addition there are two staircases. The main supports of the building are of solid steel, protected by fireproof materials; the window sashes are also of steel, and wire glazing is used in skylights. The architect is Mr. George Vickery, and the builders are Messrs. Kilby and Cayford.

CHARLES GARRETT MEMORIAL HALL, LIVERPOOL.—The laying of the foundation-stones of the new central hall of the Liverpool Wesleyan Mission, which is to be erected as a memorial to the Rev. Charles Garrett, took place recently. The site of the building is at the corner of Renshaw-street and Upper Newington. The principal hall will seat 2,500 persons, and the smaller one 750, both being accessible from the street level. There will also be reception and crush halls, vestries for Sunday School work, clubrooms for social work, drill hall, and convenient administration offices. Shops with showrooms and offices will be placed in the main portion of the Renshaw-street and Upper Newington frontages. The total cost, with furnishings and organ, is estimated at 37,2500. The architects are Messrs. Bradshaw and Cass, of Bolton.

TEMPERANCE HALL, YEADON, LEEDS.—Memorial-stones were laid recently in connexion with a new hall which is being erected for the Yeadon Temperance Society, at Yeadon. The building, the designs for which have been prepared by Mr. Harold Chippindale, architect, of Guiseley, will occupy a position on the Green. The cost will be about 2,0000, and besides a number of smaller rooms, caretaker's residence, and one or two shops to the front, there will be an assembly-room capable of accommodating from 700 to 800 persons. The mason's work is being executed by Messrs. W. Flesher and Sons, of Yeadon.

NEW FIRE STATION, BRADFORD.—The memorial-stone of the new district fire station, which is in course of erection at Odsal Top, Bradford, was laid a short time ago. The building stands on a site at the junction of the Cleckheaton and Huddersfield roads, and advantage has been taken of the opportunity afforded by the works to make a street improvement. The plans for the work have been prepared by the City Architect, Mr. F. E. P. Edwards. In the centre of the structure will be the engine-house, with stabling for four horses immediately in the rear. Opening out of the engine-room on the one side will be a watch-room for the officer in charge, and beyond this a recreation-room for the men who are off duty. On the other side of the engine-room is a workshop for repairs, and a room for the Camewell fire-alarm apparatus and the telephones. Behind the stables is an open yard, and beyond are houses for five men. Dwelling-houses for the station officer and for the driver of the engine are provided on an upper story over the engine-house. The total cost of the land and building will be 5,0000.

ISLINGTON WORKHOUSE ADDITIONS.—The Islington Board of Guardians received an order from the Local Government Board on Wednesday authorising the carrying out of alterations and additions to the Cornwallis-road workhouse, at an estimated cost of 5,5000.

EXTENSION OF FACTORY, LIVERPOOL.—The Lord Mayor of London (Sir James T. Ritchie, Bart.) laid the foundation-stone, on the 23rd inst., of new buildings which form an extension of the Phoenix Safe Works in Smithdown-lane, Liverpool. The building, when completed, will extend 300 ft. along Aigburth-street and 127 ft. along Smithdown-lane, covering an area of about 3 acres. The premises are to be constructed of brick, with Whitehaven stone dressings. They will be divided into three bays, and each will be fitted with a powerful electric travelling crane for lifting and transferring work in progress from one section to another. Galleries are to be erected on three sides of the new building, and these will be used for the lighter manufactures of the Company, the main building being reserved for the manufacture of safes, bankers' armour-plated strong-rooms, and strong-room fittings. The architect of the building is Mr. F. H. Oldham, of Manchester, and the contractors are Messrs. W. Brown and Son, of Salford.

STAINED GLASS AND DECORATION.

REVERED, ST. MUTHEW'S CHURCH, IPSWICH.
A new reredos, designed by Mr. J. Shewell Corder, architect, of Ipswich and executed by Messrs. Percy Bacon and Brothers, of London, has been inaugurated at this church. It is constructed of oak, and extends across the entire width of the chancel. The centre portion is divided into five panels, three of which are carved in high relief and coloured

beneath cusped and carved traceried canopies, surmounted by a carved cornice and cresting, the whole relieved and enriched by gilding. The centre panel exhibits the Nativity, the panel on its right showing the Shepherds, and the panel on its left the Magi. Flanking these panels, and divided from them by pinnacles, are two painted panels on the flat, representing the Annunciation, the one on the left depicting the Angel Gabriel, and the one on the right the Virgin. The centre portion of the reredos is divided from the wings by two more pinnacles of greater size, rising higher and containing niches, in one of which is placed the figure of St. Matthew, and in the other the figure of St. John. The wings extend on either side with cusped and traceried panels, divided by bands of carving, and surmounted by a carved cornice of angels with cresting over. The extremities of the reredos are terminated by carved and traceried pillars, each surmounted by an angel in a devotional attitude.

MURAL PAINTING FOR A PLYMOUTH CHURCH.—Mr. E. A. Fellows Fryne has on view a mural decoration, "The Church Triumphant," designed as a memorial painting to fill the space over the chancel arch of St. Peter's, Plymouth. It is a decorative and symbolical treatment of the attitude of Christ and the angels—and saints departed—to the saints on earth. In the centre over the crown of the arch is the figure of Our Lord robed in priestly garb, and around the vesica glori are seven cherub angels and a rainbow, and grouped at the feet of Christ are the Holy Innocents. On the right are the Virgin and St. Joseph, and on the left are St. John the Baptist and Mary Magdalene. Seated on clouds and grouped in segmental sweeps on either side of the central figures are the Apostles, Evangelists, Saints, and Martyrs, figures representing the arts, with higher sweeping tiers of a multitude of angels and spirits. Three flying angels fill the fore space on either side of the vesica, symbolic of Incense, Prayer, Passion, Sacrifice, Harps, and Praise. In the lower part of the picture are figures of the four Latin fathers, representing Theology. Adam and Eve on the extreme right and left represent the human race, and on the right are the patriarchs, balanced on the left by figures of Sarah and Ruth; on either side are the rulers of Israel. Lower down is a semicircular row of the prophets seated on clouds. In the spandrels are the Magi and figures of a slave and cripples; the lower portions of the spandrels are filled with the two Archangels Gabriel and Michael. It is altogether a fine conception, handled in a scholarly way. The composition leads in sweeping segmental tiers of grouping to the central figure of Our Lord, which stands dominant over all, and behind which the multitude of angels and spirits recede in delightful mystery. It is impossible to judge of the colour effect of such a painting before it has been fixed in position, and one hopes that the delicacy which is so charming in the studio may not be lost in the comparative gloom of its ultimate surroundings. The two windows above and on the same plane as the picture occur somewhat unapplyingly. Mr. Fryne has in hand the completion of the scheme of decoration in the friezes under the clearstory windows, the subject of which is the life of St. Peter. The church was designed by Mr. Fellows Fryne, brother of the artist.

FOREIGN.

FRANCE.—It is announced that the old building of the Faculté de Médecine (Rue de la Bûcherie), the Hôtel de Lauzun, the Church of L'Assomption, the Dupuytren Museum, and the church of the Abbey of Port Royal, are to be classed as Monuments Historiques. —The Société Nationale des Architectes Français has given, as the programme of its next competition, "Un établissement des Bains et d'Hydrothérapie dans le Faubourg d'une Grande Ville."—The Department of Assistance Publique at Paris is undertaking some important architectural works, among them the erection of a new hospital at Aubervilliers.—M. Constantin Mounier has been commissioned to execute a monument to Zola, the model for which he will submit shortly for acceptance.—A monument to André Chénier, the poet, is to be erected in the Carrefour de la Muette.—The Municipality of Vichy are about to erect new post-office buildings, at an estimated cost of 450,000 francs.—The General Council of La Charente has decided on the erection, at Angoulême, of a departmental hospital for aged men who are infirm or incurable.—A new departmental lunatic asylum has been opened at La Charité-sur-Loire.

GERMANY.—A new theatre is to be built at Charlottenburg from the designs of Messrs. Heilmann and Littmann, of Munich.

SWITZERLAND.—Important alterations and extensions are to be undertaken at Lausanne, which the "Commission d'Art Public," consisting of five architects, has under consideration.

INDIA.—A large station is in course of erection at Santragachi, on the Bengal-Nagpur Railway.—Electrical lighting is being considerably developed in Madras, and the National Bank there has just been fitted with electric light and electrically-driven punkahs.—At Bombay University the subject for the Sir G. Legrand Jacob prize for next year is "The advantage derived from the development of irrigation during the last fifty years in the Bombay Presidency, and the directions in which further development is possible." Competitors must be graduates or undergraduates of the University of Bombay.—The question of the drainage of Rangoon is occupying a good deal of attention. The drainage system was laid out by Messrs. Shope and Ault, but is said to be getting into an unsatisfactory state owing to want of sufficient and intelligent supervision. Mr. Ault has accepted an invitation to visit Rangoon and make recommendations for the improvement of the drainage.

—A length of road in Calcutta is to be laid with Val de Travers asphalt, as an experiment in regard to its suitability for the climate. If successful, it is expected that its use on roads in India will be extended.

PUBLIC WORKS IN NATAL.—Bills have passed the Natal Parliament authorising the Municipality of Pietermaritzburg to contract a loan of 200,000*l.* for the completion of the scheme of water supply for the town, and authorising the Municipality of Durban to contract a loan of 900,000*l.* to be expended on various public works, including 200,000*l.* for the construction of municipal offices, library, museum, etc., 150,000*l.* for drainage and sewage, 150,000*l.* for an electric department, 150,000*l.* for waterworks, and 50,000*l.* for tramway extensions.

SANITARY AND ENGINEERING NEWS.

BRIDGE OVER THE RIVER REDE, NORTH-UMBERLAND.—The new bridge erected over the river Rede at Reedsmouth, near Bellingham, was opened a short time ago. The structure is built on two stone piers, and has three spans of 42 ft. each. The framework consists of steel girders embedded in concrete. The roadway is constructed of cross-girders with expanded metal and ties embedded in 2 ft. of concrete. The expanded metal is carried round the girders and into projecting mouldings, binding the whole together. The work has been carried out by Messrs. John Rule, of Sunderland and Newcastle, to the order of the Bellingham Rural District Council, the general work being under the supervision of their Surveyor, Mr. R. E. Riddle.

MISCELLANEOUS.

LOCAL IMPROVEMENTS AT BRENTFORD.—Plans and designs for the new market have been prepared by Mr. Nowell Parr, C.E., Engineer and Surveyor to the Brentford Urban District Council, who is architect of the proposed manual training and cookery centre at the Ealing-road Council School, with two additional classrooms for 120 children. Brentford Market claims to have been established 600 years ago; it has lately fallen into disrepute, yielding very little profit. The new buildings will extend over an area of 155 ft. by 350 ft., and consist of three covered avenues, with numerous shops and stalls, spaces being reserved for the holding of sales. The tender for the new market works by Messrs. Dorey and Co., of Brentford, amounts to 45,302*l.*

A BUILDERS' EXCHANGE, BIRMINGHAM.—We learn that the leading men engaged in the building and cognate trades at Birmingham are taking measures for the establishment of a Builders' Exchange in that city. The exchange is intended to furnish means for the exhibition of samples of builders' materials, with exemplars of machinery and appliances used in constructional works. The hall will be opened to subscribers and exhibitors for the purpose of meeting and consulting their fellow-traders and customers, and for affording a business resort for architects, manufacturers, builders, and builders' merchants. The project extends to the starting of an authorised intermediary periodical and the opening of a department for inventions.

THE TAPESTRY WORKS, OLD WINDSOR.—A few days ago Mr. Ricardo, of the Friary, Old Windsor, purchased for 2,400*l.* at auction the picturesque group of buildings known as the "Tapestry Cottages" at Old Windsor. The twelve houses and a large central hall stand in about three acres of ground, and

are held under a lease from the Crown for a term of ninety-nine years from October 1881, at a ground rent of 46*l.* per annum granted to the late Prince Leopold, Duke of Albany. The buildings were erected, at a cost of some 9,000*l.*, in furtherance of a project, warmly espoused by the Duke, for the revival of the tapestry-weaving industry in England. Instructions were brought over from France, and of the many beautiful specimens of the handicraft which were woven, designs made by the best artists some were purchased by Queen Victoria for Windsor Castle and by members of the Royal Family. Latterly, however, the industry dwindled for lack of sufficient encouragement, and the party is managed by Sir Robert Collins, Controller of the Household to the Duke of Albany, who has let the cottages originally built for the weavers—at rents amounting to the aggregate to 235*l.* 4*s.* per annum, the being rented by Mr. Francis Ricardo of half of the inhabitants of the village.

FAWCETT'S IMPROVED FLOOR SYSTEM.—In ordinary form of the Fawcett system for construction of floors, ceilings, and the essential feature is the employment of tubular lintels fitting between ordinary steel joists, the lintels having profiles which protect the lower flanges of the joists and ribs which afford a key for the concrete filling and for the plaster ceiling. Concomitant with the section of a floor panel so built may be said that the area below the panel possesses little or no tensile strength, being more deficient in this respect than some part of a floor formed of concrete slabs while the area above the neutral axis, being largely composed of concrete, is capable of resisting compressive stress to some extent. Consequently, the upper flanges of the joists are relieved in a measure of compression and the resistance of the structure to deflection is somewhat greater than that which is usually necessary. The result is that part of the metal in the upper flanges of the joists represents waste of material, and it may be remarked that the same condition obtains in the case of all floors consisting of corrugated steel joists.

In the latest form of the Fawcett floor recognition is made of the compressive strength of the concrete employed above the hollow lintels, as well as of the small proportion possessed by the upper portions of the lintels themselves. Accordingly the patent granted this year to Mr. Fawcett, iron or steel joists are employed above upper flanges of which are of smaller sectioned area than the lower flanges. It is claimed that in this way metal can be economised in the joists, and that, at the same time, strength and fire-resisting properties be increased, as the larger lower flanges afford more resistance to tensile stresses and do not longer become heated. The first result appears to be as good as the second and third are bad. Metal will certainly be saved, taking into account the compressive resistance of the concrete. But if the amount so saved is applied to the purpose of giving strength to the lower flanges, the money saving is at once lost. It is true, however, that a floor can be built on the new system on one of the old system and without increased expenditure. Again, it scarcely wise to recommend larger masses of metal for the purpose of resisting deflection. Every increase in the surface of metal employed means increased danger and involves greater outlay in protective material. These criticisms merely refer to the claims made in the patent, and do not imply want of appreciation of the improvement itself, which, representing an approach towards the principle underlying true concrete-steel construction, is distinctly worthy of adoption. We understand that the patentees have taken considerable trouble to ascertain by actual experiments the correct proportions of the new joists, which will not be applied exclusively in connexion with the Fawcett system, but can be obtained for general use with any forms of concrete floor construction.

PRIZES FOR COTTAGES, GARDENS, &c.—Charles Birchall, who owns a property known as the Cottages, Wheatland-lane, Seacombe, Cheshire, has, for some time, encouraged his tenants to beautify their gardens by awarding annually prizes for best-kept gardens, window boxes, and flower boxes in connexion with these cottages. Last summer's awards were distributed last week in the Wesleyan Mission Room, Oldisle, in the presence of a large gathering of the tenants and their friends. Mr. Birchall said the object of awarding those prizes was to note, as well as he could, their own well-being. He would like to see them taking a deep interest in home life, to make their surroundings comfortable and attractive, and he would be pleased to help them in that direction. He did not limit the competi-

men, but gave encouragement to their by offering prizes for the best-kept w boxes. They could do it, and it did st much either financially or in labour. er speaker, noticing that there were a or of children present, said it would be ouragement to them if there was a priz for the best gathered bunch of wild s. The following tenants were awarded:—1st, Mr. F. Hughes, 29, Wheatland- 2nd, Miss Surrell, 31, Wheatland-lane. Ir. Morris, 1, Sefton-cottages; 2nd, Mr. ts, 2, Cavendish-cottages; 2nd, Mr. 5, Russell-cottages. 1st, Mr. Rogers, ftesbury-cottages.

RAISING HOUSES BY THE "RÜCKGAUER" M.—At Goppingen, in Württemberg, a has been raised under the supervision architect from Stuttgart, Mr. Rück- the object of raising the building being use the available space for shops. The was first supported by a strong timbe ing composed of baulks of suitable ec- esicidistis platform the walls were strutt- ed timber struts, especially at the angles, is stage there was inserted a form of with threads of low pitch, thus allow- ing building to be raised to a very small : these jacks constitute the patent on the system is based. They are capable staining a load of 50 tons. On these nos rest strong piers, and on these again ouse to be raised. Operations began ugust 15 at 6 a.m. By half-past nine e been raised 5 ft., and by half-past one eached the required height. During the ions, which were carried out with com- ease and without shocks, the house od inhabited, and inside there was not ash crack to be seen. A crowd assembled the site especially builders, engineers, thers connected with the building trade, tch the proceedings. We may say that inventor of the system, Mr. Rückgauer, thortly commence similar operations on a at Ulm.

ENT NOTES.—It is stated by Mr. Sev- Bell, British Commercial Agent in the d States, that during the fiscal year the imports of cement received at the of San Francisco, New York, Galveston, Baltimore were of the aggregate value 1,993,303, the countries of origin in approximate order of importance as re- value being Germany, Belgium, and United Kingdom. The Acting British l at Lourenço Marques, in his report for et year, remarks:—"Germany has gain- ed most of the cement used locally, and appears to be able to put it in the t, at a slightly lower price than is d for the British article. The total t imported (about 7,700 tons) is no comparatively small, but in view of arbour and other public works which are undertaken, the demand is bound to so, and it might be worth the while of manufacturers to look into the on."

CHAIR, MARYLEBONE.—The Mary- lebone Council Chamber has recently been refurbished by Messrs. Oetzmann and under the supervision of Mr. Herbert nsky, the furniture expert to the Metro- n Asylums Board. The preparation of a e scheme was one of some difficulty, was desirable to preserve the character old building, which has many historical ations. Part of the town hall is the fatch House, of early XVIIIth century. The general style selected is of the French Renaissance period, the wood- being throughout of oak, fumigated to a golden brown. The seats, in the form of boxes, each with a dual desk in front, upholstered in a specially-prepared e cowhide, in colour very nearly match- ing the oak. The table in front of the ros- ter for the chairman of committees is a example of cabinet work, the top, 18 ft. t, 6 in., is 2 in. thick, and flush-panelled t panels with the grain of the wood g diagonally; it is supported on seven d fluted columns with underframing. The rostrum front is panelled, and eze carved, with columns and carved ls on the corners. The panelling at the of massive oak, with fluted and moulded ers. The mayoral chair is also in oak, dered in cowhide to match the settees, the arms of Saint Marylebone carved a pediment. The whole scheme, in the ed light of the council chamber, pro- a rich golden effect.

WHITEWASHING AND SPRAYING MACHINE.—accompanying cuts show the outer rance and the working section of Messrs. ell's type K spraying machine for paint itewash. In constructing the spraying atus according to this invention, a con- A is provided, somewhat conical in order to provide a larger base to in- the stability of the apparatus, and

- T—Spray Nozzle.
- S—Cock in Spray Rod for Starting and Turning off the Spray.
- R—Spray Pipe.
- A—Container for Whitewash, Limewashing, etc.
- N—Rocking Lever Handle.
- P—Pivot on which the Handle Works.
- K—The Lid of Container.
- H—Connexion between Pump and Hose. (This can be made long or short, as may be desired.)
- D—Pump Barrel.
- C—Pigtail.
- G—Mechanical Agitator attached to Rocking Lever Handle.

Exterior View.

Wallach's Spraying Machine (Type K).

according to its dimensions, although not shown in the drawing, the apparatus may be provided with runners or wheels for transporting it from place to place. Secured in a vertical position to the interior of the container A is the pump and pressure chamber device, consisting of a pump barrel D, containing a valved pump bucket carried by a pump rod, and co-operating with a back pressure valve at the base of the pump barrel. The lower suction passage of the pump barrel is fitted with a straining nozzle at a short distance from the base of the container. Connected to the upper end of the pump barrel is a cylinder, from the base of which there extends a nozzle pipe, to which is connected a strong flexible tube through which the liquid is delivered to a spraying nozzle. The upper end of the pressure cylinder is closed by a cover provided with a packed gland, through which the pump rod passes. The upper end of the pump rod is forked, and receives a pivot which connects it to a hand-operated lever. Upon the liquid to be sprayed, such as white-wash, being placed into the container and the operating handle worked, the pump bucket will be reciprocated in the pump barrel and the liquid drawn through the strainer into the barrel below the bucket; upon the descent of the pump bucket, the liquid will pass above the latter, and then upon the next movement will be forced upwards into the pressure chamber; and as the pressure increases in the chamber the liquid will be driven through the flexible pipe and out by the spraying nozzle for application to the surfaces which it is desired to treat with the liquid so forced. At the same time that this operation is proceeding, the agitating lever will be rocked backwards and forwards through the liquid in the container and prevent settlement.

BRITISH WHITE LEAD AND VARNISH.—In a lengthy report on the trade of Odessa, Mr. Bosanquet, acting British Consul, remarks that the best white lead is still supplied by the United Kingdom, and, indeed, the secret of its undoubted superiority over any quality of the substance which can be produced in Russia has up to the present time been carefully kept. Inferior qualities are manufactured locally, but cannot at present rival the British-made product. An increase in the duty is anticipated, which, if enforced, will probably reduce the quantity of import, though it will continue to be imported for those purposes where the very best kind is essential. Verdgris is mainly imported, but ultramarine is produced locally, and has, he understands, no foreign rival of sufficient merit to compete with it successfully. The best varnish still comes from the United Kingdom, but varnish of a good quality reaches Odessa from Moscow, where it is manufactured.

WAR MEMORIAL, YORK.—A memorial to the officers, non-commissioned officers, and men of the Duke of Wellington's West Riding Regiment who lost their lives during the South African war was recently unveiled in York Minster. The monument has been designed by Mr. G. F. Bodley, R.A., and occupies a position on the west wall of the south transept, close to other memorials of the regiment. It is of white marble, with a central

tablet of brass containing the names of the fallen, flanked on each side with a bronze figure of a khaki-clad warrior. Above the names on the brasswork is a decorative representation of the white roses of York, and on the wall above the memorial are representations in brass and black enamel of the two badges of the regiment.

NATIONAL ASSOCIATION OF MASTER HOUSE-PAINTERS AND DECORATORS.—This Association held their annual dinner last week at the Midland Hotel, Manchester. Councillor J. Higson (President) was in the chair. The Lord Mayor of Manchester, in reply to the toast of "The Municipalities of Manchester and Salford," congratulated the Association on the excellent exhibition, and spoke highly of the work of the students. The decorative art had, he said, made a considerable advance since his young days. Mr. J. D. Grace, President of the Institute of British Decorators, proposed "Architecture and the Arts," and Mr. J. W. Beaumont responded. The latter gentleman said that the Municipality of Manchester was doing a great work with regard to architecture by establishing a school of architecture. He suggested, if the City Council decided to build a City Art Gallery, that the formation of an architectural museum would be an excellent addition. Mr. John Sibthorpe, proposed the toast of the Master House-Painters Association, and the President, responding, spoke of the efforts being made to establish a board of arbitration. They wanted local arbitration boards in every centre in England and Wales, and if they disagreed on any question submitted to them the services of a national board should be requisitioned. Failing the latter a referee would be called in to give a decision on any disputed points between masters and men.

THE HOUSING QUESTION IN SOUTH WALES.—A conference of representatives of the mining and other industries in South Wales was held in the Town Hall, Merthyr, on the 24th ult. Mr. Keir Hardie, M.P., presided, and in his opening remarks said that the importance of the housing question could hardly be exaggerated. He did not think that local authorities ought to begin by providing houses for the poorest of the working classes. He rather suggested that they should build for the better class of artisans, and thus make more room for the poorer workers, and to that extent avoid the danger of raising rents. He advocated the taxing of all land, particularly of unoccupied land. During the last ten years there had been a slight decrease in overcrowding. Local authorities should have the power to lay out the plans of new building areas and to schedule adjacent land. Colliery villages should be prohibited, and central towns built for the miners; but this, of course, was still in the future. Mr. R. Williams (London), in the course of a paper which was read, argued that the decrease in overcrowding shown in the census returns was illusory, and he advocated the compulsory requirement in all houses of at least as much cubic space of air as is required for prisoners, policemen, and soldiers. Resolutions in support of the objects of the conference were carried unanimously.

BELGIAN CEMENT.—The cement industry in Belgium, according to the report of Mr. Consul-General Hertslet, made good progress, as far as the export trade was concerned, in 1903, the figures being 599,091 tons, with a value of 623,040*l.*, increases of 10 per cent. on the volume and 2.5 per cent. on the value over 1902. The countries to which large quantities of this material were exported were the United Kingdom (208,159 tons, valued at 215,484*l.*), Canada (23,717 tons), Cape Colony (22,906 tons), the United States (90,137 tons), and the Netherlands (51,308 tons).

CAPITAL AND LABOUR.

STATE OF THE BUILDING TRADE IN AUGUST.—According to returns supplied by seventy-three employers' associations, whose members are estimated to employ about 84,000 building operatives of all classes, and by trade unions, with an aggregate membership of about 185,000, employment in the building trades continued dull during August, and on the whole showed little change as compared with July. It is, however, rather worse than a year ago. With bricklayers employment is dull, but improving, and somewhat better than last month, and about the same as a year ago. It is moderate with masons; not so good as a month ago in England, but rather better in Scotland. With carpenters and joiners employment is bad: worse than a month ago in England, but much the same in Scotland. The percentage of unemployed trade union carpenters and joiners was 5.9 at the end of August, compared with 5.7 in July and 2.9 a year ago. Employment with painters generally is bad, and worse than a month ago and a year ago. With plasterers it is much the same as a month ago and worse than a year ago. With plumbers employment is reported as rather better than a month ago. The percentage of unemployed trade union plumbers was 2.9 at the end of August, compared with 10.4 at the end of July and 7.1 a year ago. With slaters and tilers in England and Ireland employment is bad, slightly better than a month ago, but worse than a year ago; in Scotland it is quiet.—*Labour Gazette.*

SETTLEMENT OF THE MIDDLESBROUGH PLASTERERS' AND BRICKLAYERS' DISPUTES.—After a six months' strike against a reduction of wages, the bricklayers and plasterers of Middlesbrough, Stockton, Thornaby-on-Tees, and West Hartlepool resumed work on the 26th ult. The operatives a fortnight ago consented to a reduction of a halfpenny per hour together with certain alterations of working rules against a penny originally asked by the Teesside master builders, but the labourers held out until Saturday, when they agreed to a somewhat similar reduction.

Legal.

AN ARCHITECT'S FEES.

At the City of London Court on the 21st ult. before His Honour Judge Rentoul, K.C. Mr. T. M. Garrod, architect, Birkbeck Bank Chambers, sued Mr. Charles Butcher, Ewell-road, Surbiton, for ten guineas for preparing plans. The plaintiff's case was that he acted as the architect of some houses which were being built at Surbiton. The defendant was the builder. An arrangement was made by which the plaintiff was to be paid his fees of 3*l.* guineas per cent. on the advances made by the freeholders to the defendant. The plaintiff was instructed to let the adjoining land. He agreed to let it on a building lease to the defendant. The latter gave instructions to the plaintiff to prepare the drawings, and agreed to pay the same fees as before. The plans were prepared, but the defendant decided to dispense with the plaintiff's services. He (the plaintiff) now sued for ten guineas for preparing the drawings. Of course, if the matter had gone through the plaintiff would have received 3*l.* guineas per cent. on the advances. As there were seven houses, on which 150*l.* was to be advanced, his remuneration would then have been much larger. The defendant's case was that he never employed the plaintiff to prepare the drawings. He decided not to appoint him as the architect because his fees were too high. As a fact the buildings were erected from plans supplied by a Mr. Mason, whose fees were 2*l.* guineas per cent. on the amount advanced. The plaintiff alleged that his drawings were used, and pointed out that, where his drawings and Mr. Mason's varied, the latter's had not been followed. The Judge said he was in favour of the plaintiff, but, at the same time, he was in a difficulty and scarcely knew what to do. He would take a timid way of getting out of the difficulty by giving judgment for the plaintiff for five guineas.—*City Press.*

PATENTS OF THE WEEK.

APPLICATIONS PUBLISHED.*

20,775 of 1903.—R. F. POCHLIN and H. S. POCHLIN: *Breaking, Crushing, and Grinding Machinery.*

A method of ensuring an evenly distributed and regular supply of material to stone-breaking or analogous machines, which consists in directing said material to an adjustable outlet of a hopper, and thence over one or more revolving feed rollers.

22,109 of 1903.—E. S. LOCIER: *A Combination of a Fire Shield and Cinder Screen for use in Kitchen Ranges and other Grates.*

A device for improving the combination or attachment together of ashpans and fire-front shields for grates and ranges by means of stout framing of sheet iron, or other suitable material, formed to fit into the ashpan fender and to cover the open front of the fire grate, having the front shield and cinder screen attached thereto.

22,619 of 1903.—J. W. FRYAR: *Lifting Tackle.* This invention relates more particularly to the supporting tackle of colliery cages, the object being to distribute the weight of the cage equally between the four chains by which it is carried, but it may be applied to other lifting tackle in which chains or ropes are used. The invention is carried out as follows when applied to a cage carried by four chains; for example, the end of the winding rope is attached in any suitable manner to a swing plate, which is preferably of a triangular form, the lower corners of which are pivotally secured two links, each carrying a similar triangular swing plate provided with links or like connexions to which the chains are secured, and this combination automatically adjusts the strain of the weight upon each chain equally.

23,196 of 1903.—H. J. HOSKINS: *Method of Protecting Earthenware Chimney Pots and other Fragile Goods in Transit in Railway Waggons and other Vehicles.*

An apparatus for protecting chimney pots and other pottery goods in transit in railway and other waggons, comprising frames composed of horizontal and vertical members, being rails and posts, set at suitable distances apart by means of readily detachable struts or distance pieces, to form with such pieces skeleton cells or sections of fencing for guarding the goods, such fencing being adapted to be readily unshipped and piled flatwise for return transit.

4,056 of 1904.—J. H. WILKINSON: *Heating Appliances Applicable to Fire Grates, Stoves, and the like.*

A radiating or auxiliary heating appliance for use in connexion with domestic fire grates, stoves, and the like, comprising a cylindrical or other radiator, means by which the same may be suspended or supported in front of the fire, and means for adjusting the position of the appliance.

12,687 of 1904.—R. C. MATHEWSON: *Apparatus for Saving, Dressing, and Polishing Stone, and the like.*

The sawing of stone, and the like, consisting in the combination of blocks of carborundum, corundum, or emery with saw blades, such blocks being carried in serrations with V-edges in the periphery of the blades, and held in position by a pin or pins.

14,027 of 1904.—C. G. WOODS: *Window Screens.*

A window screen, consisting of rigid clamping-plates extending inwardly from the sides of the window casing, a spring roller mounted at the upper end of the window, a guide roller, a screen attached to the spring roller and extending over the guide roller and downwardly in front of the rigid clamping-plates, movable clamping-plates in front of the screen and having cam slots, studs extending from the window casing through the cam slots, and bell-crank levers pivotally connected to the window casing and to the movable clamping-plates to move the movable clamping-plates to and from the screen.

15,016 of 1904.—J. WILMSHURST: *Door and Gate Closing Apparatus.*

A self-closing door apparatus, consisting of a central rod hinged to the door post, a central bracket fixed to the door, coil springs on each side thereof, adjustable collars upon the rod, and telescopic encasing tubes on each side of the central bracket.

15,402 of 1904.—J. A. FERGUSON and F. E. KIDDER: *Building Blocks and Walls.*

A wall composed of a plurality of blocks, said blocks having each a headless projection and the blocks arranged with the projections

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

alternately oppositely disposed, said blocks arranged in juxtaposition to form a pl. of air spaces intermediate the inner outer faces of the wall.

16,669 of 1904.—G. HARRIS: *Fastening Windows, and the like.*

Fastenings for window frames, and the like, consisting in the combination of a thumb bolt provided with a handle and nose, with a threaded sleeve attached to a plate and a plain or other surface plate.

19,676 of 1903.—J. H. MAGENS: *Treatment of Concrete, and the like, whereby the same after Mixture may be Arrested.*

A method of preparing and storing mixed cement, concrete, cement, concrete mortar, and the like without its setting or binding power, which consists in cooling the constituent parts, they are mixed together, below the air temperature prevailing at the time being, maintaining the mixture in such cooled until it is used.

22,245 of 1903.—J. DUCKETT and SON, and W. C. LAWTON: *Street Gullies.*

A trap or seal movably fitted inside a gully, and having its trapping extremity extending downwards into the trapping chamber and its mouth arranged to fit into the edge of gully.

3,556 of 1904.—L. G. MUTTHER: *Process Means for Imparting a Velocity Appear to the Walls of Rooms, Doors, Fences, and the like.*

A process for the direct flock-papering, velveting of walls or partitions of rooms, doors, furniture, and the like, characterised by the fact that the woolen or equi particles producing the velvety coating are applied by means of a coarse-fibred web cloth to the surface to be covered, which face has previously been covered with coating of viscous material.

3,795 of 1904.—H. HERZIG: *Sluice Gates.*

A sluice gate, consisting of four or more separate gates which are linked at the bottom end to the beton foundation, and iron at the upper edge of the outer face of each sluice gate, three struts for each part of the sluice gate abutting with their upper ends against said angle iron, shoe the struts, each consisting of an angle fixed to the beton foundation at a suitable distance from the sluice gate, a draw movably arranged on the beton foundation in guide brackets fixed to the same, irons corresponding in number to the struts fixed to the upper surface of the draw and suitable means for moving the draw to and fro from the footpath.

14,036 of 1904.—H. N. COVELL: *Horizontal Engines, and the like.*

This consists in the combination with a driving engine, a swinger gear, consisting of a hand-operated shaft, a swinger drum, and a therefor, a duplex clutch mechanism disposed between said shafts, a clutch mechanism whereby said clutch mechanism shaft is driven from the hoisting engine, a connexion whereby such clutch mechanism controlled from said hand-operated shaft.

16,445 of 1904.—M. HOFHEIMER: *Street Signs.*

This consists in the combination with a having an overhanging light, a sign-mounted on said post and having a plurality of separate signs, and means for reflecting light from the rear through the sign or facing in the direction of the light, the main sign or signs being in unobstructed path of the light rays, which pass directly through them.

 from the Office to residents in any part of the United Kingdom
 at the rate of 10s. per annum (12 numbers) FREE (A.D.). To all
 parts of Europe, America, Australia, New Zealand, India, China,
 Ceylon, &c., 20s. per annum. Remittances (payable to J.
 MORGAN) should be addressed to the Publisher of "THE
 BUILDER," Catherine-street, W.C.

SUBSCRIBERS IN LONDON and the SUBURBS, by
 prepaying at the Publishing Office 19s. per annum (52
 numbers) or 4s. 9d. per quarter (13 numbers), can ensure
 receiving "The Builder" by Friday Morning's Post.

PRICES CURRENT OF MATERIALS.
 * Our aim in this list is to give, as far as possible, the
 average prices of materials, not necessarily the lowest.
 Quality and quantity obviously affect prices—a fact
 which should be remembered by those who make use of this
 information.

TO CORRESPONDENTS.
 THE.—The responsibility of signed articles, letters,
 papers read at meetings rests, of course, with the
 author. The Editor cannot be responsible for
 communications that cannot be returned to the
 sender, and the Editor cannot be responsible for
 drawings, manuscripts, or other documents, sent to or
 at this office, unless he has specially asked for
 them. Communications (beyond mere news items)
 that have been duplicated for other journals are NOT
 returned.
 Communications must be authenticated by the
 name and address of the sender, whether for publica-
 tion or not. No notice can be taken of anonymous
 communications.
 Contributors are compelled to decline pointing out books and
 articles.
 The Editor is not prepared to receive a
 commission to a contributor to write an article,
 to execute or lend a drawing for publication, is given
 subject to the approval of the article or drawing, when
 sent, by the Editor, who retains the right to reject
 any communication that is unsatisfactory.
 The receipt by the author of a
 notice of an article in type does not necessarily imply its
 acceptance.
 Communications regarding literary and artistic
 matters should be addressed to THE EDITOR; those
 relating to advertisements and other exclusively busi-
 ness matters should be addressed to THE PUBLISHER,
 11, Abchurch Lane, London, E.C. 4.

COMPETITIONS, CONTRACTS, AND PUBLIC APPOINTMENTS.

(For some Contracts, &c., still open, but not included in this List, see previous issues.)

COMPETITIONS.

The Church of Greenstead.

ABOUT a mile to the west of Chipping Ongar, reached by a beautiful walk through meadows flanked on each side by a wide avenue of elm-trees, lies the little church of St. Andrew, Greenstead, which serves for a small parish of less than a hundred inhabitants. Hidden among trees, and at first sight of no particular moment, this diminutive village church may yet fairly lay claim to be in one respects the most interesting in England.

It is upwards of a century and a half since attention was drawn to the singular construction of the nave. Among the MSS. of the British Museum are a collection of original letters on anti-arian subjects, written by Mr. Smart Vieullier, of Aldersbrook, Essex, to Lyttleton, the then president of the Society of Antiquaries. The following is an exact transcript of a letter read from Aldersbrook on January 21, 1712 (Stowe MSS. 752, f. 49):—
In obedience to your command I give you the best account I can collect concerning our very singular parish church at Greensted, juxta Ongar, in this county.

What is now the body of the church is the whole of the original fabric. It is 29 ft. 9 in. long and 14 ft. wide. The sides from the present ground

without, only 5 ft. 6 in. high, on which the primitive roof depended, but whether of that or of other materials, we have nothing to determine by. This structure is entirely composed of the bodies of oak-trees split and roughly hewn on both sides. They were sett upright close to one another and lett into a sill at bottom and a plate at top, where they are fasten'd with wooden pins all in a very rough manner at first, and now much corroded and worn with age.

"There appears one little contrivance of art in ye building, viz., that the edge of one tree is made to slip a little within its neighbour, doubtless to prevent the wind from blowing thro, but upon the whole I think an ax, a chizel, a mallet, and an augre were tools sufficient to compleat the fabrick.
"It was no small pleasure to me to meet with a passage quoted from an ancient MS., which in some measure I think determines the time and occasion of erecting this uncommon fabrick.

"Leland and the compilers of the Monasticon have extracted a passage from a register once belonging to the Abbey of St. Edmunds Bury in Suffolk, wherein it is recorded that the body of St. Edmund the King and Martyr, heing on its way from London to Bury, was lodg'd one night at Stapleford in Essex, when the Ld of the manor was by its presence miraculously cured of an infirmity he had long labour'd under; and then says the register—*Idem apud Aungre hospitabatur ubi in ejus memoria lignea capella permanet hodie.* 'Tis no wonder that the monk who drew up this register

should mistake Aungre for Greensted in his placing this chapel, since they are hardly a mile asunder; but it is evident that the present road thro Ongar is a much later one, since it cuts thro the outward fortifications of the castle, which was built there in Henry ye 2nd's time. And we have both tradition and visible remains that the antient road from London into Suffolk ran thro Oldford, Abridge, Stapleford, Greensted (perhaps Green Street), Dunmowe, and Clare upon the borders of the two counties.

"The forementioned Translation of the body of St. Edmund appears to have been in the year 1013. For the Danish fleet under Turkill, having committed great ravages in most parts of England, Ailwinus bishop of Elmham in ye year 1010, the 30th of King Ethelred, caused the holy body to be transported to London for safety against those ravagers, and peace heing soon after bought, the body was three years after recarried to Bury.

"From all which I think we may reasonably conjecture that this wooden fabrick was at that time erected on purpose to receive the holy body, and having been once so honour'd was preserved with veneration and converted into a parish church with the addition of a small chancel in much later ages.

"Perhaps here is better authority for the history of this piece of antiquity than we have for any other of so remote an age, and of no more considerable import in its original; I look upon it as a thing done in haste for a particular

Greenstead Church: before Restoration of 1845-9. (From an old drawing.)

occasion, and not as any model for the style of the age it was erected in. I fear I have been tedious, but as you seem to esteem it a curious piece of antiquity I was willing to set it in as clear a light as I was able."

Mr. Letheuillier forwarded some drawings of the church to Dr. Lyttleton with his letter, and the Society of Antiquaries considered them to be of sufficient importance to be figured in *Vetusta Monumenta* (vol. ii., pl. 7). On that plate is given a general south view of the church drawn in 1748, of the timber wall of the north side, and of the timbers of the west end of the church. A single dormer window, of four lights, is shown in the roof of the nave on the south side. There is a clumsily-made plain wooden porch on the same side. The priests' door, of moulded brick, with a window each side, appears in the chancel. A vacant space between the logs for a north doorway to the nave is also shown, though apparently plastered up. But the most interesting feature of these drawings is that of "the west end of the church." It is an exterior view of the west gable, formed of seventeen split logs with their rounded surfaces outwards, rising in the centre to a considerable height. The date and construction of this gable is evidently coeval with the side walls. A very small doorway is shown as roughly cut through parts of the two centre logs. This drawing could not have been an invention, and is clearly intended to show the condition of the west end before the tower was added, and which must then have remained with the tower simply built up against it. This very small doorway seems at that time to have been the only entrance into the tower. The west end remained, we suppose, in this primitive condition until the restoration of 1848-9.

From two drawings of this church of a later date, but prior to the restoration, we know that there were also two dormer windows to the nave on the north side.

There is a much-condensed abstract of the just cited letter of Mr. Letheuillier on the plate in the *Vetusta Monumenta*. His discovery of the interest pertaining to this fabric and his account and

drawings of the building are of much value. There is not the least reason to doubt the correctness of his assumption that this is the very building that gave shelter to the body of St. Edmund on its return from London to Bury St. Edmund's in 1013, and that the old primitive building was subsequently retained unaltered in consequence of the honour that had been thus done to it. But where Mr. Letheuillier, followed by other antiquaries, is almost certainly wrong is in the suggestion that this wooden shelter was run up hastily for the mere purpose of affording a night's lodging for the much-venerated body of the saint. Against such a surmise there are several strong arguments. In the first instance, the words cited from the old register do not bear out this idea; the natural translation of the terms used implies that the wooden chapel remained or was preserved because of the use to which it had been put, and that there was a wooden consecrated chapel on the site when the body arrived. The notice of the approach of the body could have been but very brief, and the timber building with south and north doorways shows no sign whatever of hasty erection. Had the building been subsequently consecrated because of sheltering the body, surely it would have been dedicated to St. Edmund, and not (as is the case) to St. Andrew. Moreover, the old part of the fabric is not the least what might be expected in the XIth century, but rather pertains to a period earlier by one or two centuries. By the beginning of the XIth century churches of stone were certainly the rule and not the exception. Bede tells us that when Finan first erected his celebrated missionary church at Lindisfarne in 652 the bishop was content with one which was not built of stone, but, after the Scottish fashion, composed of cleft oak thatched with reeds (*More Scottorum de robore secto totum composuit atque harundine texit*). The term "cleft oak" is singularly appropriate to the nave of Greenstead church.

It has recently been shown in the columns of the *Builder* that the closely-adjacent market-town of Chipping Ongar

bad almost certainly its church of stone at the date of St. Edmund's translation. Why then, it may be asked, was not the venerated body lodged for the night within the consecrated stone walls of a more dignified sanctuary? The answer is a fairly obvious and interesting one: because parts of the country were still in an unsettled state. Those making this solemn journey would naturally be somewhat nervous as to being entrusted with their precious charge, and would therefore prefer the shelter of a retired forest-screene, old wooden chapel to that of the church so prominently situated in the midst of a little town.

In the "Memorials of Essex," by R. A. Suckling, published in 1845, a careful account is given of this church, accompanied by a lithographed plate of the north side, and by another plate bearing a ground plan (inaccurate), a portion of the timbers on the south side, and other details. Shortly after this volume was issued the chancel was restored, and that was soon followed by the restoration of the oldest part of the fabric. Beneath the tower, against the north wall, is a board incised with the following inscription:—

"The chancel of this church was restored 1845, the nave 1848-9.

PHILIP W. RAY, Rector.
WM. SMITH, } Churchwardens.
JOSEPH KENSLEY, }
T. H. WYATT, Architect.
J. BARLOW, Builder."

Whilst the latter work was in progress the matter was more than once referred to in our columns; and on its completion a south view of the restored church appeared in this paper, which was afterwards reproduced in the *Gentleman's Magazine* for June, 1849.

At the time of the restoration of the nave poorly-selected deal was unfortunately used for the new roof. About forty years after its erection the roof showed such obvious signs of decay that its reconstruction soon became a necessity. An oak roof on an improper plan was substituted in 1894, under the superintendence of Mr. F. Chancel. At the same time a brick buttress was wisely removed from the north side of the nave, exposing the sound timber behind it.

After the restoration of 1848-9 the rector (Rev. P. W. Ray) published a booklet on this church, which ran through three editions. It was illustrated with two poor plates of the south side before and after restoration, and by a useful plate giving a transverse section of the logs with the uniting tongue of wood, and also a side view of one of the logs showing the groove for the tongue.

In a good article on the timber of Essex churches which appeared in the *Essex Archaeological Journal* for 1891 (vol. iv., old series) a north view of the church is given.

Before entering on the brief consideration of the present condition of the church and of the timber walls of the nave it will be best to give further particulars of its vigorous restoration in 1848-9. The *Builder* of those days commented on the severity of the treatment, and brought a letter from Mr. Barlow Ongar, the builder, which appeared on January 27, 1849. He there states that the principal cause of the walls being

ken down was that "the oak sills, having been laid on the earth with merely some rough flint put under them at intervals, had become so rotten to let the upright timbers drop through, and, had not the ends of the wall-plates rested on the brickwork of the chancel, the great part of the nave must have fallen." He added that it was the wish of the restorator and architect that every possible part of the old timbers should be preserved; that the only parts lost were about 1 in. cut from the lower ends; and that the timbers had been fresh tenoned and inserted in oak sills laid on brickwork 1 in. from the ground. He further stated that the planks when cut were found to be "so hard as almost to defy the saw." The scheme also involved the taking off the plaster from the interior, so that the inner sides of the somewhat roughly-hewn logs were left exposed. Other facts in connection with the restoration are made clear by further notice in the *Builder* and by the restorator's little book. The cleft logs, or trunks, forming the walls, numbered twenty-five on the north side and twenty-five on the south. The rounded side of the trunks was placed outwards. Those on the north side were the least decayed, requiring only about an inch of rotten wood to be removed, whilst those on the south had about 5 in. taken away. The uprights were tenoned into the sills and wall-plates in grooves about 1½ in. deep, and fastened with wooden pins. The uprights were found to be tongued together at the junction with oak strips, which had proved to be a most effectual preservative against wet; for, although the interior was plastered, there was no evidence anywhere of moisture having found its way through the junction of the uprights. In the reconstruction of these walls the old plan was faithfully adhered to, the only alteration being that the red inner walls show narrow strips

of oak fastened on at the joinings of the uprights.

The curved outsides of the trunks were left exactly as they were found when the restoration began, save that one or two were wholly renewed and one was patched. At first sight, these outsides, then as now, present the appearance of having retained their bark; but a closer examination shows that the ten or twelve centuries of exposure to the weather has furrowed them, to the depth of from half an inch to an inch, into long, irregular ridges, through the decay of the softer parts of the surface wood.

There seems little doubt that the reconstruction of the old timber side walls was absolutely imperative at the time when it was undertaken, and that the work was on the whole executed on sound and careful lines. But one unhappy blunder was made. There was apparently no necessity for taking down the gabled west end, made (like the sides) of split trunks; even if it was so, it should have been re-erected on the old lines. Instead of this, the greater part of the centre lofty timbers were cleared away so as to leave a great doorway or quasi-arch into the western tower. We suppose this was done to make the base of the tower easily available as a vestry, which could scarcely have been the case when it was only entered by the very small doorway cut out of two of the logs, as has been already mentioned; but the destruction of so much of the most characteristic part of this ancient and unique fabric was a heavy price to pay for a few feet of vestry room.

A new open timber work porch was provided on the south side; its predecessor was pronounced "modern." The south doorway, of just the same dimensions as before, is 4 ft. 7 in. wide, including the jamb-posts. Nearly opposite, but

a little nearer the west, is the north doorway, which is only 2 ft. 5 in. wide. It had been plastered up, but the opening was then filled with three new logs. It may here be mentioned that singularly bad choice was made of the few new logs or trunks required in 1848-9. If the three that fill up the north doorway are examined, they will be found to be already peppered with wormholes, and the grubs have obviously strayed from the softer new wood to the much harder adjacent old timber. Again, upright number five from the west end, on the north side, has been mended with a small new piece rather clumsily nailed on, and this piece is simply freckled over with wormholes, and is a dangerous source of infection to the rest. The whole of the logs, inside and out, most urgently require attention to check further worm ravages. They can be checked effectually with a comparatively small expenditure of money and care: The application of equal parts of benzene and linseed oil is usually successful. This work ought to be promptly undertaken. Having paid visits to this church in the autumn of 1903 and again in June and September, 1904, and having made diagrams of the number of wormholes in certain places on the north side, we are able to state that the progress of decay is now rapid.

The uprights vary much in size; the largest on the north side has a width of 16 in. and the narrowest only 7 in.; on the south side the widest is 17 in. and the narrowest 8½ in. The exterior measurement on the south side is 29 ft. 10 in. and on the north side 29 ft. 7 in. The interior width is 14 ft. 6 in. In one of the uprights just west of the north doorway a small pointed niche has been hollowed out, 11 in. high by 7 in. in width; this has doubtless served to hold a small holy-water stoup in the old days.

Greenstead Church: from South-east.

Greenstead Church: North Side.

The foolish idea, at one time so commonly held, and now again repeated in guide-books and directories of the present day, that this old timber work is chestnut and not oak, had, perhaps, better be once for all combated. Mr. Lethuillier, Mr. Suckling, Professor Boulger (of the Essex Field Club), a deputation of the Linnean Society (who specially visited the church during restoration), and many other experts pronounce the timber to be certainly oak. This notion of a certain class of old oak being chestnut had at one time a strong hold upon the popular imagination, and though always exploded on investigation, seems as difficult to uproot as "leper" lowside windows or crusading cross-legged effigies. About a score of old buildings in England have shared with Greenstead in this fond imagining; the most noted cases being the roofs of Westminster Hall and of the refectory of Westminster Abbey. With regard to this belief that the roof beams and other timber of certain ancient buildings were of sweet chestnut wood, it must suffice here to cite some of the exact words of Selby in his "British Forest Trees":—

"The examination and the repeated experiments that of late years have been made upon this wood have satisfactorily proved that, in all such instances, the timber of the oak, and chiefly of the sessile-fruited kind, have been mistaken for chestnut. The fact is, as Buffon first observed, the wood of the oak, more particularly of the sessile-fruited variety, assumes, in course of time, a near resemblance in colour to that of the chestnut in its best condition or when young and untainted at heart; and, as few chestnuts could have acquired the scantling frequently observed in the timber of these ancient buildings at the age of decay almost invariably commences, this, in itself, furnishes a strong argument against the use of chestnut timbers and beams by our ancestors, inasmuch as the trees must have become unfit for the purpose long before they had attained the necessary dimensions."

When originally erected, this cleverly-built kind of a log-hut was complete in itself, and probably received a mere modicum of light from a window or windows in the east end; but the east end has long ago disappeared. It is usually stated that the chancel dates from the time of Henry VII., but a careful examination shows that there was a chancel built out at the east end

of the wooden church at a far earlier date. There are patches of untrimmed flint work in the south wall of the chancel for about 2 ft. above the ground; a little of the same rough material shows at the east end; whilst on the north side there are fully 3 ft. of the same composition. The style of this kind of rubble work, with an abundance of mortar, particularly if compared with various other examples in Essex churches, points clearly to Norman days. As this district revived soon after the Norman conquest, there would come about a desire, even in this small place, for greater accommodation, and especially for greater altar space. Hence the throwing out of a chancel at the east end of a church, which the feeling of reverence for St. Edmund among the older and Saxon inhabitants would not permit to be otherwise molested. This Norman chancel sufficed up to the latter part of the XVth century, when it was rebuilt on the old foundations in the brickwork that was then beginning to be popularised as a material for church extension and improvement in various parts of Essex. The priests' doorway on the south side, of moulded brick, is a good example of about Henry VII.'s time, and the recessed window on the west of this doorway is of the same date. In 1845 this chancel was restored and a great deal of new brickwork introduced. It is quite easy to distinguish the bricks of the XVth century from those of the XIXth, which are here mingled together in the same walls. The older bricks measure $8\frac{1}{2}$ in. long by 2 in. broad, whilst the modern ones are 9 in. long by $2\frac{1}{2}$ in. broad. When the chancel was restored it must have been done somewhat heedlessly; an interesting and unusual shaft piscina, described and figured by Mr. Suckling, which used to stand in the south-east angle, disappeared.

The tower and spire at the west end are sometimes spoken of as if they were almost entirely modern, but this is a complete mistake. A study of the older timbers shows that it is a plain example of XVth century date. It is rather singular that the tower was not applied to the centre of the old log-hut gable

end. It is about 12 ft. and a few inches square, and was placed nearly flush with the south wall, so that there is no space to the north of it where part of the old rebuilt gable end, with six gradual logs, still remains. The octagon broach spire is covered with shingles. In the tower there used to swing two bells, when it was visited by Edward IV. commissioners for the seizing of church goods on September 27 in the sixth year of his reign, they found "ij great bells weight cccli. and di." They took with them a variety of vestments, ornaments, and other church goods, but left for the use of the minister a silver chalice, a surplice, and a black satin cope.

In the north-east angle of the tower stands a good panelled oak pulpit of hexagonal shape. On the centre panel facing west is the date 1698 and the monogram "I.H.S." let in in dark coloured wood; the base is new.

The chancel is entered by a new Tudor archway. Against the north wall is a mural tablet of alabaster in a well-designed border. The inscription is—

"Here lieth Jane, sister to Thomas Smit Mont, Knight, second wife of Alan Wood Snodland in Kent, Gent, who livinge vertuous 66 yeeres died godly the xx of August 1585."

"Feare thou God and doe
As thou wouldest be done unto."

On the same side of the chancel is a tablet to William Hamilton Warren, thirty-one years rector, who died in 1845.

Against the opposite wall of the chancel is another mural tablet, to the memory of Richard Hewyt, a native of Essex, another rector of Greenstead, who died in 1724. The inscription, as given by Suckling, is of exceptional interest, and refers to his father's faithfulness to Charles II. when in exile. The inscription is now almost wholly illegible; it would be a pious work to revive it.

In the churchyard, on the south side close to the nave wall, is a large, fine stone coffin-cover or sepulchral slab with a slightly-raised line running down the centre. It is 6 ft. 3 in. long and tapers from 26 in. to 15 in.; it is probably of XIIIth century date. We believe it was moved here from out of the chancel at the time of its restoration in 1845.

The four windows of the chancel are filled with stained glass to the memory of William Smith, twenty-five years churchwarden of this parish; he died in 1871. The small north window has an effigy of St. Edmund, with the incident of his being shot to death pictured below. The border is filled with crowned E's.

Beneath the tower, affixed to the north wall, is a well-painted wooden panel of St. Edmund pierced with arrows. It measures, without the frame, 24 in. by 10½ in. The costume of the bowman in the background shows that it is of late XVth or early XVIth century date; it seems to be of Flemish design. The panel was for some time kept at the rectory; it is well worthy of a better position in the church than against the dark wall under the tower.

In the British Museum is a private printed book called "Yearly Records of Pyrigo Park, Haveringe-atte-Bower, Essex from 946 to 1888. Extracted and compiled by Montagu Browne." Amongst the notes on churches of this part of Essex

urs the following note (p. 152) as to
instead:—

The rood-screen is well-preserved XVth
ary work, and contains a representation of
Edmund's martyrdom."

Possibly this entry may be a careless
take, for the rest of the church notes
this book have several blunders.
There ever was a rood-screen in this
rch in comparatively modern times,
must have disappeared before Mr.
king's account of "Greenstead was
ned in the "forties." There is this
be said in favour of Mr. Montagu
wne's statement, namely, that the
ited panel is about the size and shape
ne that might well have formed part
he lower panels of a screen for a small
rch. If such a screen had been
troyed in some "churchwarden
utifying," this particular panel might
have been saved from destruction
some pious parishioner.

It may interest some to know that the
sters of this parish, from 1561 to 1812,
et privately printed by Mr. F. A.
p in 1892; a copy can be seen at
British Museum. They contain, how-
ever, no entry in any way relating to the
ic of the church.

NOTES.

A SUGGESTION recently made
by Professor Forbes is that
the construction of a dam at
third cataract would entirely obviate
necessity for raising the Assuan dam,
would thereby save the temples of
e from further submersion. The
is an attractive one, but even
ming its practicability, we have
l reasons for thinking it will not
mend itself to Lord Cromer and Sir
iam Garstin, upon whom now vir-
tly devolves the responsibility of
ding the details of the forthcoming
ation programme. In the first place,
may point out that it was long ago
led by the Public Works Department
imperative reasons exist for the
olishment of a single reservoir of
le capacity at the threshold of Egypt
er, and the hastily-formed opinion
of so distinguished an engineer as
essor Forbes will scarcely suffice to
ge the deliberate policy of engineers
have made Egyptian irrigation the
ect of special study for many years.
Just not be forgotten that the third
ract is some 420 miles south of
an, a distance involving considerable
oration of precious summer water,
requiring about twenty-three days
the passage of water to the point
e it is first required. Therefore the
ion of storage in reservoirs so widely
rated would be undesirable, and
d not secure for Egypt the condition
ved to be absolutely necessary—that
to have near at hand, at the point
e the Nile enters Egypt, a reserve
ter to meet any contingencies which
t arise." Moreover, the loss by
oration in the two reservoirs would
early double that in the deepened
voir at Assuan, owing to duplica-
ion of the exposed surface. Finally,
ave the financial side of the question.
cost of a new dam would probably
ed 2,500,000*l.*, whereas the Assuan
can be raised for about 500,000*l.*

a difference of at least 2,000,000*l.*,
to say nothing of the heavy annual
charges entailed by the necessity for a
second staff of officials at the new dam,
which the Egyptian Government could
not be expected to authorise for the realisa-
tion of a project that is not in accordance
with the views of its expert advisers.

The
Simplon
Tunnel.

At various times during the
construction of the Simplon
Tunnel work has been re-
tarded by the influx of water from under-
ground springs. In the autumn of 1901
a stream of water burst into the Italian
workings, and, attaining a discharge
of nearly 8,000 gallons per minute,
speedily converted the two headings into
canals. Several months elapsed before
the flow could be overcome, and no
sooner had this been effected than a
tremendous fall of rock took place.
Timber struts and shores, of 20 in.
diameter, were repeatedly broken like
tinder, and the boring machinery had
to be dismantled on three successive
occasions. Finally the unstable rock
was held up by means of heavy steel
frames placed at intervals of from 1 to
3 ft. apart. The experience of the
Italians has been unfortunate through-
out, for they have had to deal with
floodings, rock slips, high temperatures,
and exceedingly hard strata. It now
appears that the turn of the Swiss
engineers has come, as only last week
a spring of boiling water was tapped, with
a discharge estimated at 18,000 gallons
per minute. This new influx has resulted,
unhappily, in serious loss of life, and, in
the opinion of a Swiss engineer who
has investigated the condition of the
workings, it is open to question whether
the tunnel will ever be completed. At
the present time we cannot accept this
report as final, but it is undoubtedly
most difficult to deal with a formidable
spring of hot water in space so confined
as that offered by the headings of the
tunnel. As about 10 miles, out of the
total length of 12 miles 458 yards, have
already been driven, it would be singu-
larly unfortunate if the final abandon-
ment of the work were to become neces-
sary. We still hope that the indomitable
energy and great resources of the
engineers, which have served to over-
come so many difficulties in the past,
may once more triumph over adverse cir-
cumstances.

The Third-
Rail System
of Traction.

THE fatal accident to a
soldier who endeavoured to
cross the line of the Liver-
pool and Southport Electric Railway last
week, taken in conjunction with the
recent fatalities on the Lancashire and
Yorkshire and the North-Eastern Rail-
ways, raises the question of whether
the third-rail system of electric traction
is the proper one to adopt on railways.
An unguarded third rail must always
be a source of danger not only to tres-
passers, but also to guards and porters.
The anxiety caused by fear of coming
in contact with the rail will make them
less careful in looking out for approach-
ing trains, and so may also cause
accidents indirectly. Where electric
traction is adopted the trains are gener-
ally reduced in weight and run much
more frequently, and thus the permanent-

way men will have to keep a sharper
lookout for trains, and at the same
time be careful never to touch the rail.
In some lines in America the third rail
is protected by having pine planks
fixed over it, and this not only protects
the officials, but also is of great use in
snowy weather. In this country, how-
ever, the permanent-way men apparently
prefer working on the line with the third
rail entirely unguarded, as they can
make the necessary repairs much more
quickly in this case. It seems to us that
the third-rail method of traction has
this inherent objection—that if you leave
the third rail unguarded the line is
dangerous to porters, etc.; and if you
guard it effectively, then the permanent-
way men are in danger owing to the
limited time at their disposal in order
to make necessary repairs. In our
opinion, the best method will be one in
which the trains get their current from
a trolley wire supported at the side of
the line, so that repairs can be made to
the electric part of the system without
interrupting the traffic and without
undue haste. The permanent-way men
in this case have only to look out for
approaching trains, and there need be
no fear of the traffic being interrupted
by one of them dropping a spanner
or a pick on a "live" rail. With this
system, which is widely used on the
Continent, very high alternating pres-
sures can be safely used. It may be
used also in conjunction with a 600-volt
direct-current third-rail system, such as
will be used by the Underground Electric
Railways Company of London. The
British Thomson-Houston and the
British Westinghouse Company are both
prepared to supply "series" motors
which will operate equally well either
with low-pressure direct current or high-
pressure alternating. The overhead wires
required for this kind of railway will
be quite different from those used with
trams.

Processional-
road
and the Mall.

A REFERENCE to the plan
and two views published in
our number of November 2,
1901, will show how Mr. Aston Webb's
approved designs provide for a rearrange-
ment of the railings and their gate-
entrances which enclose the fore-court
of Buckingham Palace. The designs
embrace the abolition of the middle gates
and the substitution of two gateways,
one on either side of the Queen Victoria
Memorial. The two side gateways will
give access from the Palace to the new
"Queen's-garden" and to the Pro-
cessional-road beyond, as well as to the
two new roads from the "Queen's
garden" which communicate with Green
and St. James's Parks, Constitution
Hill, Birdcage Walk, and Buckingham
Palace-road. The alteration involves a
removal, which is now nearly completed,
of the stone piers and railings and their
reconstruction a short distance north-
eastwards into alignment with the south-
west side of the Memorial. Thus will
disappear what has hitherto been known
as the Sovereign's-gate, whilst the
two new gateways will be fitted with
the gates from the Secretaries'-gateway
and a copy which is being made of them.
When, in 1847, Blore enclosed with a
fourth block the quadrangle of the Palace

as completed by Nash in July, 1837, the fore-court was enlarged on that side and enclosed with piers and railings designed by Decimus Burton, the sculpture being by John Thomas. Three years subsequently Nash's Marble Arch, erected in 1825-7 on the ground now converted as Queen's-garden, was removed to Cumberland-gate, Hyde Park.

**The Bridge,
Kingston-on-
Thames.**

It appears that the bridge is to be rebuilt, or at any rate reconstructed, in connexion with a project for running tramway-cars from Hampton Wick to Kingston market-place, and thence by the Surbiton-road to Ewell and Epsom. A wooden bridge at Kingston is cited in a close Roll of 7th Henry III., and, London Bridge excepted, it was the most ancient across the Thames. In 1607 a severe frost broke the wooden bridge, which Aubrey says had a length of 168 yds. Old charters and other records testify that from Queen Elizabeth's time, at least, until 1828 the bridge was toll-free. An Act having been obtained in 1825, the first stone of the existing structure was laid by Lord Liverpool on November 7 of that year, and on July 17, 1828, the bridge was opened by the Duchess of Clarence, afterwards Queen Adelaide. The Exchequer Bill Loan Commissioners, to whom the trustees applied for a loan of 45,000*l.*, referred the plans, specifications, etc., prepared by Edward Lapidge, County Surveyor, to Telford, their Engineer, who made a favourable report; but, since the Act limited to 40,000*l.* the sum to be raised, Lapidge modified his plans accordingly. About that sum was expended upon the entire works, with the approaches, the bridge itself costing 26,800*l.* Constructed chiefly of brick, with ashlar of Portland stone, it consists of five elliptical arches; the middle arch has a span of 60 ft., with a versed sine of 19 ft.; the two arches on either side have spans of 56 ft. and 52 ft. and rise 18 ft. 3 in. and 16 ft. 6 in. respectively. The foundations were laid upon the substratum of blue clay which lies under all the river-bed at that spot. The bridge is 382 ft. long between the extremes of the abutments, and is 25 ft. wide between the balustrades. The gradient-rate of either incline is 1 in 40; the ratio of the piers to the span of the arches is about 1 to 6. The abutments are terminated with low towers or bastions; a cornice and balustrade, with the recesses or refuge-places that project over the piers, give bold relief to the general elevation. The lowest summer level of the stream falls to about 6 ft. below the springing line of the arches. Official reports made some years ago show that the control of the fabric was vested in a trust whose estate comprises various gifts connected with the revenues of the Corporation of Kingston; and the trustees, as lords of the manor, own the river's banks in the town, some of the aits, two-thirds of the bridge-wharf revenues, and gifts made for repair of the bridge, the rental of about 2,500*l.* being managed by two bridge-wardens. The average annual payment on account of the original loan has been between 700*l.* and 800*l.*; the bridge is now free from tolls. Lapidge

exhibited a view of the bridge at the Royal Academy rooms in 1828. The Act we mention above is 6 Geo. IV., c. 125; the heavy cost of the shore works for the bridge was due to the taking of a fresh site a short distance up-stream from that of the old bridge.

**Progress of
the Steam
Turbine.**

A FEW years ago the turbine, which in principle is the oldest form of the steam engine, was looked upon as a type of prime mover that could never come into general use, owing to its excessive steam consumption. Thanks to the indefatigable labours of Mr. Parsons, and of those who have followed in his footsteps, the efficiency of the turbine has been made to surpass that of the reciprocating engine, and in almost every department of engineering the new type of motor now finds extensive application. In marine engineering, as our readers already know, the turbine has been adopted with most satisfactory results, and it may be noted that the new turbine steamer *Manxman*, built by Messrs. Vickers, Sons, and Maxim for the Midland Railway Company, has established a record for turbine-driven merchant vessels during her recent official trials, as regards both speed and fuel consumption. Electrical engineers throughout the world are busily occupied in the construction of turbines for the equipment of generating stations, and mechanical engineers are devoting increased attention to the design and perfection of new varieties of the engine itself. A striking instance of the importance attached to the new branch of industry thus created is to be found in the announcement made this week by a firm specially identified with reciprocating engines that in consequence of unprofitable business the directors have decided to open up new branches of trade, one of the most noteworthy being the manufacture of steam turbines. That this company, holding the premier position in connexion with a certain form of steam engine, should thus be driven to the manufacture of a rival motor is indeed a triumph for the turbine.

**Electricity in
Building
Operations.**

ACCORDING to the *Electrician* of last week, the erection of the new Home Office buildings in Westminster furnishes us with an object lesson of the relative advantages of steam and electric driving in building operations. We are told that steam and electric mortar pans are both being employed in doing practically identical work. Taking a week of fifty hours as a basis of comparison, it is said that the cost of the steam-driven pan is 2*l.* for coal and 2*l.* for labour, while the total costs of the electrically-driven pan does not exceed 25*s.* under the worst conditions. The large difference in the cost of the coal and the cost of the electricity must be mainly due to the fact that the electric motor is always ready to work. With steam, on the other hand, a large amount of coal has to be expended in raising it to the required pressure before operations can begin. A steam engine requires the constant attention of a driver, whilst a good electric motor can be operated by anyone by simply moving a switch. It is calculated that the

adoption of electricity in working cranes, etc., used in erecting this build has resulted in a saving of about 100*l.* week. In our opinion, when electric energy can be had from public mains the neighbourhood of the building at a moderate rate, then electric driving is more economical than steam driving. Incidentally, electric driving has an advantage in the matter of cleanliness and the operation of lowering heavy weights very slowly can be done with greater nicety. It has to be remembered, however, that electric motors should be put up by a competent electrician in the first place, as great care has to be taken even with the so-called "enclosed motor" to protect them from dust.

**The
Motor
Omnibus.**

LAST week the "trial" of a new motor omnibus heralded throughout the daily Press with a degree of innocent enthusiasm almost equal to that which might appropriately be excited by the practical consummation of some great and novel invention. What the public were expected to believe was "an interesting experiment to test the capability of motor omnibuses" was merely a demonstration in our backward metropolis of a fact thoroughly recognised in large provincial cities like Birmingham, where the advantage and practicability of the motor omnibus are perfectly familiar to all who use the public streets. The "trial" was no trial, and the "experiment" no experiment. Foreigners who visit our capital with sluggish conservatism in many respects must convey a very unflattering picture of national enterprise, while to provincials the same characteristic is a perfect laughing-stock. But in addition to the plethora of London, regarded as an entity, we fear there is some feeling of superiority, perhaps due to the enormous dimensions of the place, given rise to the idea that things successful in little towns, like Glasgow, Liverpool, Manchester, and Birmingham, might break down under the responsibility and excitement attending their introduction to so important a city as the capital of the British Empire. However this may be, we are glad to learn that the antiquated horse-drawn omnibus is at last approaching its inevitable end.

**Sanitary
Condition of
Whitehaven.**

In July, 1902, Dr. B. Strode reported to the Local Government Board upon an outbreak of enteric fever in the Borough of Whitehaven, and upon the sanitary administration of the Town Council. Dr. Farrar has now been instructed to report on the progress since Dr. B. Strode's inspection. In respect to the water supply, he reports that the Council have now a lake works inspector who resides at the lake side, and submits the Borough Engineer and Surveyor's weekly report upon the height of water in the lake, the condition of the gauging the rainfall, and other matters. He also inspects and reports any nuisance which may occasionally arise in the vicinity of the lake. In regard to hot drainage, it is admitted that in many cases drains pass under the houses, and the local committee maintain that in

ld-constructed town like Whitehaven is impossible to avoid this. Whenever defect arises in a house, the Council cause any drain which passes under it to be embedded in concrete and properly ventilated. There still remain, however, a large number of dwellings in which the water-closets are in altogether improper situations (e.g., unventilated closets in cellars, opening directly into living rooms), and Dr. Farrar found several cases of tenements, the occupants of which could only reach their water-closet by going out into the street and round two corners into an adjoining court. The Town Council have, however, displayed considerable activity in remedying some of the more gross sanitary defects in courts and alleys by additional water-closets and improved ventilation and lighting; but, as many of the court houses consist of back-to-back tenements utterly devoid of thorough ventilation, the problem of ventilation cannot be considered to have been solved. Several courts have been provided with electric light, but far too many are still left in darkness. Dr. Farrar estimates that there are at least from 120 to 200 houses, mostly in back-to-back blocks, and in every case without thorough ventilation or proper lighting, which ought to be demolished, not only as insanitary in themselves but as obstructive dwellings.

A CORRESPONDENT draws our attention to the terms of an advertisement by the Borough Council of Paddington which is appeared in our column, in which the Council ask for applications for an appointment as draughtsman in their surveyor's office. The candidate is required not only to be a "neat draughtsman," but to be "experienced in sewerage and drainage works, the examination plans, designs of works of construction including those of iron and steel," and not to employ himself (even out of his spare time apparently) in any other work whatsoever without the express permission in each case by a resolution of the Council. The terms of the requirements would almost imply that it was a surveyor that the Council wished to engage, rather than a draughtsman; and to a person with these various and very important acquirements they offer the salary of 120*l.* a year! Whether the condition of supply and demand in the surveyor's profession is such that there are men with these requirements who would be tempted by such a salary we do not know; but the contrast between the requirements and the salary offered is, at all events, not very creditable to the perceptions of the Paddington Council. They have only 120*l.* to spare for an assistant in their Surveyor's office, they might at least have confined their demands to something more in keeping with the salary offered.

Changes at Finsbury-square. An imposing mass of buildings is in course of being erected at the west corner of the north side of the square, with an extended return front along the City-road. The premises are being built by Messrs. E. Lawrence and Sons, contractors, after Mr. Belcher's plan and designs, for the

life assurance offices of the Royal London Friendly Society, and, we are informed, constitute the first portion of a scheme for rebuilding most of that side of the square as the leasehold interests in the adjoining property gradually expire. A similar change will also be carried out along the south side of the square, where No. 50, at the corner of Finsbury-pavement, has been rebuilt by Messrs. J. Greenwood and Co., contractors, after designs by Messrs. Gilbert and Constanduros, as the head offices of the London and Manchester Industrial Assurance Company, who removed thither two or three months ago. The new premises are part of a large block for which the plans and designs have been approved by the Ecclesiastical Commissioners, who own the freehold of the land. Finsbury-square was laid out in 1787-8, the houses being built by George Dance, the younger. Those on the west side have an ornamented and continuous façade. A branch of a well-known banking company occupies the house at the corner of that side, by Chiswell-street, which, we understand, was at first built for Caslon, the type-founder; the premises were subsequently taken by Lackington, Allen, and Co. for their famous print shop, the "Temple of the Muses," depicted in T. Tegg's large aquatint drawing of 1789. At the south-east corner Dr. George Birkbeck practised as a physician. He was the founder, with Lord Brougham, Bentham, Wilkie, and Cobbett, of the London Mechanics' Institution, and its first president from 1824 until his death on December 1, 1841.

Our Cathedrals. MR. G. F. BODLEY's short paper at the Church Congress, on "Cathedrals: their History and Use," is a very eloquent summary of the place which the Cathedrals occupy in relation to the history of the nation, and their effect on the mind of to-day. He suggests the idea that the Cathedrals were really built "by the will of the people," by united gifts of labour and money. In the case of York Minster, for instance, "the stone for the building was chiefly a free gift of the Vavasour family, while the Ladye Chapel was partly constructed by Archbishop Thoresby with the stone of an old palace at Sherburn, near Leeds. Thus we see how clerics and lay-people alike had their share in the erection of the Cathedral." Speaking of the educational effect of the Cathedrals to the modern mind, Mr. Bodley says:—

"We may be sure that our Cathedrals call out and foster the imagination of the young. I remember when a child being at York, and suddenly and unexpectedly coming into sight of the Minster. It was the first Cathedral I had seen, and I shall never forget the impression and the awe that the mighty fabric gave me. It seemed like a great cliff, wrought over with beauty and stamped with dignity. Such was a first impression.

"And age does not stale the effects that these great works produce on the mind. For there is a mystery and a well-nigh inexhaustible mine of interest about them. They bring us to our knees, and they elevate our souls. Their founders and their builders have long passed, but their works potent and remains—remains to teach, to add beauty to a beautiful world, and to lift our hearts, with their lofty dignity, to a calm, a quiet atmosphere—with 'less of earth and more of heaven.'"

Indeed, it is difficult to realise what a difference there would be in our feelings and our associations to-day, if our great

Cathedrals had never existed, or had been swept away before our time. They are one of the most important elements of national poetry.

MESSRS. Brown and Phillips have on view at the Leicester Galleries a very interesting miscellaneous collection of water-colours by living and deceased artists of the English school. They are mostly small works, but include some sketches by De Wint and Collier which are very characteristic examples of the slighter and more rapid work of these two masters of true water-colour art. Then we have two or three examples of Prout at his best, especially the fine and powerful drawing of the temple of Vesta; an "Old Manor House" by Girtin; a "River Scene" by Cox, remarkable in its contrast between the tender and delicate treatment of the sky and the minute finish (very unusual with Cox) of the boat and figures in the foreground; a drawing of "Fishing Boats at Sea" by Cotman, which is curiously like a Turner sea-piece; Turner's own little drawing of "Nemi"; Varley's interesting drawing of the "Vauxhall" of his day, with old Vauxhall Bridge seen under the trees; and Collier's large and grand drawing of "Arundel," an old friend which we remember many years ago in one of the standard water-colour exhibitions. Among the works by living artists is Sir J. Linton's admirable scene of Gil Blas at the tavern, another old acquaintance—a work quite exceptional in the humour and character of the figures as well as in its thoroughness of execution. In contrast with this collection illustrating so much of the beauty of art, we are invited in the adjoining room to admire the ugliness and eccentricity of art in various works by Mr. Conder and Mr. W. Rothenstein. Mr. Conder's designs for fans and drawings of interiors show a remarkable feeling, no doubt, for colour, but there it ends; the rest is badly drawn nudes (drawing the figure being apparently of no consequence now) and not a little vulgarity of subject and suggestion; while Mr. Rothenstein's, though escaping this latter reproach, have not even beauty of colour. Yet we are invited in the elaborate preface to the catalogue to regard these as important developments of "the serious art which makes the delight of the world." If so, it is surely the worse either for the world, or for art, or for both.

THE death of M. Bartholdi, the late M. Bartholdi, the sculptor, has naturally attracted a good deal of public attention, for the author of the colossal statue of Liberty at the entrance to New York harbour has in that immense and conspicuous work, the largest cast statue in existence, a continual memorial of world-wide fame. Yet we could hardly call him a sculptor of genius. He was a very clever artist, with evidently a great deal of energy and strength of will; but his fame is rather that of a producer of large than of great works; and there are many French sculptors who have modelled no colossi, whose death would leave a much more serious gap in the artistic world. Sculpture is not to be valued or estimated by acreage of surface.

LETTER FROM PARIS.

It appears that two Salons at Paris are in a state of war; the "New" Salon (now fourteen years old) and the Salon d'Automne, only a year old and already the subject of angry discussion. The first, which opens in spring, wishes to forbid its members to exhibit in the second, which opens in October. Having been a failure last year at the Petit Palais, the Salon d'Automne now aspires to the Grand Palais, where its success is very doubtful. Several members of the New Salon, among them such important artists as M. Besnard and M. Carrière, in spite of its formal regulation forbidding its members to exhibit elsewhere, wish to take part in the Salon d'Automne; and the new Salon (the Société Nationale), which is rather afraid of a rival, insists on the observance of its restrictions. The subject is exciting passionate interest among the Paris public; but it really resolves itself into a "querelle de boutique." The two traditional Salons do not suffice for the ever-increasing number of exhibitors, nor content all the different artistic groups. Hence the succession of minor exhibitions which call themselves salons, attract a little of the attention of amateurs, and then disappear. The true and leading French artists of the day have nothing to do with these rivalries, and merely leave them alone.

The public are now able to see for themselves how much superior is the new Metropolitan station of the Place de l'Opéra to the fantastic designs—"style Guimard"—of the existing entrances to the underground stations. The Place de l'Opéra station is designed by M. Cassien Bernard, the architect of the Alexandre III. bridge, who has treated the exterior of the station in a very simple manner and with a low elevation. Instead of a dingy iron-work design there is a stone balustrade in Louis Quinze style, on a curved plan, where a series of colonnettes alternate with blocks of polished marble. The whole is surrounded by a pavement of polished granite, of which the steps are also formed. The new station, which will soon be open to the public, has exit galleries so planned as all to lead into a large open staircase onto the Place de l'Opéra; and thus all the traffic of the three supposed lines can be worked with a single outer entrance, which is 9 mètres in width of opening.

Some years ago, when the Municipality of Paris was rather uncertain in its ideas as to the future use of the Petit Palais, an artist who was a specialist in sporting pictures wished to organise there a permanent exhibition of carriages, harness, and liveries of all dates. This was refused; but now, with the influential support of M. Detaille, the scheme seems likely to be revived at Versailles, where it is proposed to form, at the old "Écuries Royales," a collection of this kind, of which the elements exist already at Clugny and the Grand Trianon, where are preserved the State carriages which have been used by Louis XV., Napoléon, Charles X., Louis Philippe, and Napoléon III. There are private collectors of relics of this kind who it is believed will be willing to add to the proposed museum, either by the gift or the loan of objects of interest; and there is to be a section reserved for automobiles. If properly carried out and the objects correctly dated, such a museum will be of no little interest.

The demolition of the buildings annexed to the Bourse, and which so much disfigure its façade towards the Rue Notre Dame des Victoires, has at last commenced, and it is hoped that the opening out of the Bourse will also be accompanied by the setting in order of the Rue du 4 Septembre, which has been in a state of chaos, for some years, in consequence of the works connected with the Metropolitan railway.

M. Henri Toussaint has been commissioned to engrave a "frontispiece" for the diplomas given by the Société Centrale des Architectes, on which will appear the portraits of the founders of various prizes, Paul Scille, Destors, Souffache, and others. The commission has come from the united body of those who have received Société Centrale diplomas, who wish thus to honour the memory of the founders.

A new legacy for the assistance of young sculptors has been left by the late anatomical sculptor Jacques Talrich (whose death we mentioned some little time since). This gives the Académie des Beaux-Arts a permanent fund from which to assist, at their exit from the Ecole, those who have tried for but have not obtained the Prix de Rome, and who often find themselves in a very difficult position. Sculpture

is a costly and ill-paid art which stands in need of the continual support of the State or the municipalities, and young sculptors without any private means (which is the case with the majority) have a hard struggle before them.

The death is announced, at Nancy, of the eminent artist Emile Gallé, at the age of fifty-two. His works count among the best productions of French art of the XIXth Century. Gallé, who devoted himself specially to works in glass, terra-cotta, and wood, equalled the greatest names among the decorative artists of the past. His contributions to the great Exhibitions of 1878, 1889, and 1900 were of a remarkable character, as well as his exhibits at the Union Centrale des Arts Decoratifs and the Salons of the Société Nationale. His career has been prematurely cut short at a time when, in spite of illness, he was engaged in preparing a series of works for the coming exhibition at Nancy.

The death is also announced, at the age of sixty-three, of M. G. Allar, architect, of Marseilles. He was a pupil of Esperandieu, and Inspector of Works at the Cathedral of Marseilles and at the Ecole des Beaux-Arts of the same city. He was architect of many private buildings, and had much success in various public competitions. In 1881 the Société Centrale awarded him their medal for domestic architecture.

The Société Nationale des Architectes has just awarded the prizes in its thirteenth annual competition, the subject being "A Hydro-pneumatic Establishment in the Suburbs of a Large Town." The jury awarded the first prize to MM. Eugène Chauvat and Marcel Oudin; the second to M. Alfred Schneider; the third to M. Jules Pin; and the fourth to M. Emmanuel Sélonier.

[The death of M. Bartholdi, the well-known sculptor, occurred since the foregoing letter was sent off.]

THE ARCHITECTURAL ASSOCIATION.

The opening meeting of the new session of the Architectural Association was held on Friday, last week, in the meeting-room of the Association, at the new premises, No. 18, Tufton-street, Westminster, S.W. Mr. E. Guy Dawber, President, occupied the chair, and there was a very large gathering of students and members.

The minutes and nominations having been read, the following gentlemen were elected members of the Association:—Messrs. C. H. Yeoman, M. Botting, L. Furniss, G. L. Alexander, and C. Whitley. It was announced that the following gentlemen had rejoined the Association, *i.e.*, Messrs. J. A. Smith, L. Dennis, and C. R. H. Tyndall, and Mr. E. Prioleau Warren was elected a member by acclamation.

The President announced the following donations to the New Premises fund in addition to the amounts already published in the *Architectural Association Notes*, *i.e.*, Mr. C. W. Stephenson, 26*l.* 5*s.*, and Mr. E. Thornton, 5*l.* 5*s.*

Mr. Lewis Ambler, Hon. Sec., announced that the Camera and Cycling Club will hold a meeting on October 11, at 8 p.m., when papers by Messrs. S. B. Bolas and D. M. Mackenzie will be read on "Westminster Abbey."

Mr. Ambler also announced that the conversazioni will take place on October 27 at No. 18, Tufton-street, Westminster. Invitations have been sent out with the recently-issued *Brown Book*.

Distribution of Prizes, &c.

The President then distributed the prizes, &c., gained by students last session, as follows:—Mr. Maurice E. Webb, Advanced Class of Design, first prize, value 5*l.* 5*s.*, Bronze Medal, and pass for Modelling Class; Mr. G. Drysdale, A. A. Travelling Studentship, value 25*l.*; Mr. A. Horsnell, A. A. Travelling Studentship, second prize, value 5*l.*; Mr. C. E. Piusent, Class of Design, second prize, and pass for Modelling; Mr. J. A. Hallam, A. A. Silver Medal and prize value 10*l.* 10*s.*; Mr. D. G. Round, Elementary Class of Design, first prize, value 3*l.* 2*s.*; Mr. F. J. Watson, Barr, Banister, first prize, value 2*l.* 2*s.*; Mr. F. J. Hodgess, Andrew Oliver Prize, value 3*l.* 3*s.*; Mr. F. T. Bush, Andrew Oliver Prize, value 2*l.* 2*s.*, and Studio Prize, Volume A. A. *Sketch Book*; Mr. C. R. Davy, Studio Prize, 2 Volumes A. A. *Sketch Book*; Mr. J. H. Markham, Studio Greek and Roman Class; Mr. J. H. Markham, Studio Travelling Studentship, value 15*l.*, and Studio Prize, Volume A. A. *Sketch Book*; Mr. T. Braddock, Studio Prize, Volume A. A. *Sketch Book*; Mr. H. M. Whiddington, Studio Prize, Volume A. A. *Sketch Book*; Mr. M. R. Martin, Elementary Construction Prize; Mr. H. L. Sanson, English Architecture Prize; Mr. H. H. Christie, Medieval and Renaissance Prize; Mr. A. T. Groves, Elementary Physics prize, and Professional Practice

prize; Mr. T. W. Watkins, Materials and Ventilation Prize; Mr. L. T. Sifton, Construction Prize; Mr. Crawley, Drainage Prize; Mr. S. H. J. Murch, Surveying Prize; Mr. A. Welford, Day School Travelling Studentship, value 15*l.*; Mr. A. N. Peckham, Day School Prize, Volume A. A. *Sketch Book*; Mr. R. C. Cook, Day School Prize, Volume A. A. *Sketch Book*; T. F. W. Grant, Day School Prize, Volume A. A. *Sketch Book*.

President's Address.

The President then delivered the following address:—

Gentlemen—The present occasion marks an epoch in the annals of the Architectural Association.

It is the first time that an address has been made from this chair in a building devoted exclusively to the uses of the Association, we may well feel proud that our effort to attain this result have been crowned with signal success. I do not wish to weary you with an account of how this has come about, all that is ancient history and was fully set forth in the address of your President last year. It is my great privilege to declare the summation of our desires has come to an end, after more than half a century's wait the Architectural Association has at last found a home of its own.

For many years past, our growing needs and requirements, and the increasing number of members, rendered the removal from our cramped premises in Great Marlborough-street a necessity—a change was bound to come sooner or later; so that when the Royal Architectural Museum premises were offered together with the leases, the Association gladly took the requisite steps to avail itself of the offer, and undertook to manage the museum and to keep it open to the public as before, and I would like to take this opportunity of thanking Mr. W. H. Jamieson, our hon. solicitor, for the infinite pains he took in connexion with the transfer of property. To meet our needs, the building required considerable alteration, but the Committee felt that this was the opportunity to obtain studios and lecture rooms that the work of the Association could be carried on properly without being hampered by lack of space. It was therefore decided to have the heavy outlay connected with the work and for all, and have thoroughly useful well-equipped premises. This most important work—the re-arrangement of the building—entrusted to Mr. Leonard Stokes, and I feel we can congratulate both him and ourselves upon the successful issue of his labours.

In addition to premises of our own we have also an admirable collection of casts and models which originally formed the Royal Architectural Museum, and there is not the least doubt that will prove of great value to students and form a very fitting adjunct to a society such as ours. It will be a matter of great labour to arrange for the display of these casts in some chronological sequence, but a start has been made, under the able direction of Mr. W. G. Lewis, and we hope in time not only to see the work completed, but a revised catalogue compiled, so that both the public and the profession may be aided in their researches, and take intelligent interest in what is a most unique collection. This work, however, has not been accomplished without incurring heavy responsibility, and the indebtedness of the Association has reached a total of about ten thousand pounds. Of this amount over five thousand pounds have been subscribed, of which the R.I.B.A. kindly contributed 500*l.*, and a generous donor has offered a further sum of a thousand pounds conditionally upon the balance being raised before the end of this session. We need, therefore, about four thousand pounds, and I feel sure all members of the Association and professional will respond most generously to appeal for help to clear off this debt. If members would bring the matter before any of the who are interested in the education of architects and the advancement of architecture, we might soon expect to be free from the liabilities of this nature. Apart from this Association as a body is in a thoroughly prosperous condition. Our membership continues to grow year by year, during the past sessions at the rate of over one hundred annually.

It is especially gratifying to find old and new members of the profession wishful to enter themselves in our ranks. Great and varied our work is, the enthusiasm of all is well maintained. I feel sure a great deal of this is attributable in no small degree to the able guidance

retiring President, Mr. Henry T. Hare, whose illing energy, tact, and ability, have done much during the past two years to forward very far the interests of the Association. I do not too much to say that the Architectural Association, as a body, owes much of its growth and vitality to the admirable way in which, in the past, it has been served by its Presidents. Officers, who have spared neither time nor effort on its behalf, and in taking up the reins of office for the coming year, I feel a great responsibility devolves on me to maintain this tradition.

Education and the Association.

The Day School, under the mastership of Mr. P. G. Maule, is now firmly established in new quarters, and the comfort and convenience of the spacious studios is greatly appreciated by both students and instructors—and it would be impossible to find in London more complete set of rooms adapted to the needs of the school. It is now commencing its 11th session, and has proved an unqualified success, which must be a source of great satisfaction to our past President, Mr. W. H. Smith, to whose initiative the Day School largely owes its origin. It was a difficult task to fill the post of headmaster, but Mr. Arthur Bolton so well occupied, which he relinquished after two years of arduous work. His was a labour of considerable difficulty in organising and inaugurating a definite curriculum. The selection of his successor, Mr. Maule, entirely justifies my high opinion your Committee had of his fitness for the position, and the Association every reason to be well satisfied with the manner in which he is carrying on this onerous and responsible work. The main idea of the Day School is that pupillage should be preceded by a special elementary training, preparatory to entering an office. Many consider it desirable that a student should be grounded systematically and thoroughly in the rudiments of his work, before he may begin to study the history of architecture and its development in various countries, and obtain some insight into the principles of design and construction at the outset of his architectural career.

At the expiration of either one or two years in the school, a student entering an architect's office will have gained a sufficient elementary knowledge to be able not only to take an intelligent interest in his work, but to utilise to the best extent the results of his preliminary training. The advantages to a student who is equipped beforehand in this way must be obvious to all, and I am convinced that in a time to come the school will be recognised as rendering great service to the profession at large. We have also this session established an evening Continuation School, under the mastership of Mr. T. Frank Green, to enable students who have passed through the Day School to carry on the work in a systematic way, concurrently with their articles in an architect's office.

I do not intend to deal in detail with the details of the various evening classes, but I do intend to draw the attention of members to the Classes of Design—both Elementary and Advanced—which are visited by many of the eminent architects in London, who generously give their time to the service of the Association. It is a great advantage for a student to be able to work out a series of designs, to have them examined and criticised in open class, and to see how his work compares with that of his fellows. This not only promotes a healthy rivalry, but enables him to see the progress of his own making and what his capabilities are, and to be in the counting session that many more join these and the other classes. Students should make a point as much as possible of doing this, and in some way or other to take advantage of the training the Association offers. The fees for these various classes represent a capital well invested, and, if only from a commercial point of view, assistants can always find a larger salary if properly equipped. The Register of the Association shows only too clearly that this is so, as there are always twenty per cent. more non-members wanting berths than members.

The Architectural Association represents the most educational body dealing exclusively with the training of architects in the United Kingdom, and is, I think, the only Society in which teaching has been carried on systematically from its foundation in 1847. There are no less than six Schools of Architecture at the Royal Academy,

the Royal College of Art, and the Universities of London and King's College, and also Liverpool, Manchester, Glasgow, and Edinburgh, at some of which a regular course of study is pursued. Though there are no less than eighteen other architectural societies scattered throughout the provinces, it is only the Architectural Associations of Birmingham and Ireland that hold Classes of Construction, Design, and History. The Devon and Exeter Architectural Society, founded in 1890, have, however, established classes for the teaching of Design, and it has been arranged for some of our members to visit periodically and criticise the work—our valued past-president, Mr. G. H. Prynne, undertaking it for the ensuing session. It is much to be desired that other societies would follow this example, for, although in many of the places where they exist there are technical colleges, schools of art, and institutes, yet these do not and cannot train architects in the systematic and thorough way which is felt nowadays to be a necessity.

The question of education occupies the attention of most thinking men, and, as a profession, we can no longer afford to allow our students to be trained in the haphazard methods of the past. It is much to be hoped that the report of the Board of Education Committee appointed by the late Council of the R.I.B.A., comprising, as it does, many of the soundest educational experts of the day, will result in the establishment of some definite scheme of training which can be accepted as a basis by the various teaching bodies throughout the Kingdom. I feel sure the Architectural Association would welcome any suggestions that would tend to bring its work into line with this new movement, and thereby further enlarge and extend its sphere of usefulness.

I regret to announce that eleven members have died during the past session, amongst them, only a few weeks ago, being Mr. C. K. Toe, one of the most promising of our day school students.

This year has been memorable, in that one of our members, a young and most talented one, has seen the inauguration of his design for Liverpool Cathedral take place. We must heartily congratulate Mr. George Gilbert Scott on his brilliant success, and the Association, as indeed the whole profession, will watch, with keen interest, the development of his great work.

The Laying-out of Streets and Diversity of Design.

We are living in a wonderful age of building, when houses, streets, great towns indeed, spring into being almost in the space of days. In London, large schemes are in hand, such as no previous generation has ever known, and which are changing the character of whole districts. The most conspicuous feature in this new architecture is its entire absence of uniformity or consideration of surroundings. Architects, with varying success, have given rein to their imaginations without allowing themselves to be controlled or influenced in any way by neighbouring buildings; so that our streets present a want of character and scale which is singularly unsuitable in a city such as this. That this should be the case where many of the buildings individually are most admirable, is lamentable, and I cannot help thinking that it is a matter for regret that in this country we have no Ministry of Fine Arts, or some consultative committee on art who could advise when sites come into the market, or buildings are pulled down, as to the form the rebuilding should take, or what improvements or modifications in the design would conduce to the future dignity and beauty of the City.

It is, perhaps, too much to hope that the London County Council will control the capricious talents of architects and builders in Aldwych and Kingsway, but the greatest opportunity of recent years will be lost if such sites are allowed to be covered with individual erections—the creations of commercial syndicates, too varied in style and material to give any dignity or character to their environment. The recent changes in the Strand have proved that a great deal of the beauty of Saint Mary's came from the fact that the church was so well fitted in style and size to the position in which it was built, and to the height of the houses around it. I venture to think this essential principle is not sufficiently regarded in most of the new buildings we see on all sides. This feeling of inequality and lack of proportion is

more noticeable in our street architecture than in anything else—there is no settled tradition in building; no definite aim or standard in view, and all treat different things in different ways, and the "loudest" and most garish edifice attracts the most attention. This, again, is emphasised in the treatment of our shops, where massive buildings, many stories high, rest with no visible means of support upon huge sheets of glass, whilst the façades of many others are covered and disfigured by enormous letters and advertisements. It is indeed strange that we should, as a nation with some claims to taste and refinement, tolerate these shams and eyesores that mar and spoil the finest streets of all our large cities and towns.

I cannot help thinking we have lost a good deal in the beauty and consistency of our street architecture since the days when such men as the brothers Adam, Chambers, Nash, and the Woods of Bath gave us their quiet façades and street fronts, all based on some definite idea and planned on a big scale, and though perhaps slightly uninteresting to us to-day, yet possessing dignity, scale, and symmetry. In street architecture the mass should be the main idea and the individual building should be subsidiary to the general design, but exactly the opposite seems to be the prevalent idea to-day, and one cannot help looking forward with some degree of misgiving to the result of such experiments as we see in Regent-street, which break the simple lines and grouping of what, however much its monotony may be abused, possesses some claims to design on a monumental scale.

Without doubt, all this variety, this diversity of idea and design which we see everywhere throughout the country, is attributable to our lack of architectural education in the past—we have not learned in any school, nor on any method, and hence our architecture, like our training, is individual and haphazard, everyone building what best suits his taste, just as our students study or pick up their ideas in a haphazard manner. On the other hand, in essentially domestic architecture, this country stands pre-eminent. Our country houses possess a character and quality of which we may well be proud, and in this branch of our art a commonsense and legitimate use of material is producing a style that stamps the building of to-day. In municipal architecture we have also vastly improved during the past decade, and many of our modern buildings are well worthy of comparison with the works of masters of bygone years.

But as a nation we have quite failed to recognise the importance to the community of well-thought-out schemes of building and their environment on a large scale. We lack in England that spirit of civic pride which is so pronounced abroad—a pride in the beautifying of our cities and towns that makes one vie with the other in a display of noble buildings, dignified squares, and that co-operation of architect, sculptor, and painter, which alone can produce great and noble works of art. The least observant cannot fail to be struck by the feebleness of conception shown in dealing with the various sites that come into the market. It is deplorable that they should be regarded merely as commercial speculations, to be covered with buildings with neither character or individuality, and without the least regard for their surroundings, and perhaps more than anywhere else this is seen in the development of our suburbs. On the Continent this problem is dealt with in a systematic way, and the various municipal authorities prepare the layout of the general scheme, the lines along which the extension is to take place and the proportion of the whole site which may be covered by buildings. It is a great pity that our English town councils do not study the admirable work of town extension now being done in Germany, and do not obtain Parliamentary powers to do similar work here; our towns might then be developed and improved on broad and dignified lines instead of the haphazard way we now deal with a question that is worth far more consideration than is given to it.

In this country the interests and rights of the individual are so jealously guarded that it is almost impossible to effect improvements, so that it is utopian to hope for the wide avenues, open spaces, gardens, and fountains, such as we see and admire in foreign cities. A longing for light and air, though unexpressed on the part of the public, is evident from the desire shown to live away from the over-crowded centres of our towns

—to spend some few hours in the outskirts, where sufficient air space can be given to the houses, and where streets can be wide and open spaces provided. But unfortunately the country surroundings of our towns and cities are so rapidly becoming alike, so levelled down to one dull cosmopolitan stamp, that the people who live there forget, or never realise, that there are towns and cities which can boast of long antiquity and a noble history, and contain ancient and venerable buildings. They form as they grow up their impressions of architecture from that they live amongst and see on all sides, and if their surroundings are commonplace and mean, can it be wondered that by them architecture is regarded with indifference, and that beautiful buildings arouse no feelings of reverence and appreciation?

It was estimated in the *Times* recently that London suburbs were spreading and filling so fast that as many as nine hundred thousand people settled in them, in new houses, in ten years; and that to Greater London every year is added a city the size of Norwich! It is difficult to realise such a fact when we contemplate it seriously and think of the old cities of mediæval days, crowded with beautiful buildings which cost long years, even centuries of toil and thought to create, when building was for all time and architecture a living force. To-day, when these communities grow like mushrooms, I feel that this is almost a national question, and, unless some steps are taken to plan our new towns and their surroundings on better and more artistic lines, that architecture, as an art, will very greatly suffer.

Experiments have been made in recent years in this country, of building and laying out towns and villages on some artistic basis, and with very satisfactory results. The paper that was read last session on the Bournville settlement, showed that these buildings could be erected to pay a fair return of interest for the outlay, and entirely disposed of the fallacy that to build artistically is more expensive than otherwise. There can be no doubt that the influence of communities such as these must eventually have a great effect on the taste of the public. But unless this question of the extension of London suburbs is dealt with on some such lines, we shall be surrounded by a belt of appalling monotony and ugliness, as every suburban extension makes the existing suburbs less desirable.

Building By-Laws.

I have up to now dealt with towns and cities, but there is another thing that affects our present-day architecture, especially in country districts, and that is the building restrictions enforced in nearly every part of the kingdom. I make no apology for introducing the subject before such a society as this, as its effect on the work of the country is wide and far-reaching—to architects these by-laws are only too well known, but the public do not realise in the least the baneful and cramping effect they are producing. Buildings in cities and populous towns must of necessity be under conditions, but in country districts these restrictions should be relaxed, as the circumstances are entirely different. That the same rules framed originally for dealing with buildings in crowded cities should be applied indiscriminately all over the kingdom, and that only certain materials should be used in particular ways, not only tends to make our architecture lifeless and uninteresting, but causes the neglect and discouragement of many of the old crafts and methods of building that made our country districts so picturesque and interesting. It is now frequently only on large private estates that building can be carried on without interference, for, owing to the extended powers granted to the Urban and District Councils, and the wide areas they cover, properties miles away from the nearest town or village, and in many cases entirely isolated, are now compelled to conform to these vexatious restrictions. Surely the time has come when some broad and sensible regulations should be made, and these unnecessary and mechanical by-laws modified, which are of little use in preventing jerry building, but which harass all good designers, besides adding largely to the cost.

These by-laws, again, are killing the last lingering country crafts still in use, just as the so-called "improvements" have changed the surroundings of the poorest peasant. He now has no distinction of dress; his antique smock has been discarded for the cheap tweed suit, his wooden clogs for ready-made boots. In his

work he no longer uses the scythe, the sickle, and the flail, but has become a mechanic, and does most things by machinery. His cottage, too, is changed, and is built now in depressing rows, after the ugly model laid down by the Local Government Board; the open hearth has given place to the stove, the red-tiled floor to linoleum, and the old-fashioned lattice casements to sash windows and coloured glass—all things that doubtless conduce to his material advantage, but certainly to the great loss of picturesque effect.

Of course it is idle to wish for those old days to return; circumstances are altered, and as architects it is imperative for us to keep abreast of the times, but I would urge you to remember that there is an architecture for the country as for the town, and to bring the one into the peace and quiet of the other is altogether out of place. Each building should be treated with due regard to its position, aspect, and environment as a separate problem, and also with reference to the local materials of the district. It is the employment of so many and varied materials, out of all harmony with their surroundings, that has done so much to destroy the local styles and characteristics that once made all country building in England so beautiful. Many are inclined to reproach the public for their apathy and lack of sympathy with the architecture of to-day, but does not a large amount of the fault lie with architects themselves? The public judge architecture by what they see around on all sides, and when we look on the vast amount of building throughout the country erected thoughtlessly, hastily, and with an entire absence of taste, much of it, indeed, done by men who do not claim to be architects at all, it is not to be wondered that the estimation of such work should be low, and that the press of this country should treat it so indifferently.

Architectural Design.

Gentlemen, all these are broad questions not unworthy of your careful consideration, and though they may appear to our younger members as dry and uninteresting, it is essential that they should be conversant with such matters, which in after years will force themselves on their attention. But do not believe that architecture has vanished as the pessimists say, for at least we are not satisfied with its substitute, and though houses and costumes perhaps fall short of mediæval grace and colour, yet both are tending to become more seemly and convenient than those our forefathers knew. Slowly, but surely, we are striving for, and I think arriving at, that combination of beauty and utility wherein lies the truest, perhaps the only true art, and we have to-day an ever-increasing body of able and thoughtful men, who are doing work that is worthy of our highest admiration, and which is awakening the interest of the public in an art which for years past has been regarded with comparative indifference. In architecture, decoration, and the plastic arts, there is a strong and virile movement permeating the country, not only to treat material sensibly, but with freedom from the fetters of bygone schools of design. It lies in your power to forward this movement, to train your hand and eye, to study and labour in the profession you have chosen, remembering always that as the coming generation of architects with you rests a great responsibility. I would have you think of architecture from a national standpoint as a great power, and make up your mind from the day you enter the profession to devote yourselves to the uplifting of the noblest of all the arts. Your work will be your greatest recompense, and if you throw your heart into it you will find it a never-ending pleasure and engrossing pursuit to the end.

Look at things largely and try to think in the mass, and do not design your buildings as separate elevations, but picture them in the round, as imaginary buildings, that you can feel and handle, and plan out the surroundings, and the environment, so that the whole is complete in every way. If you accustom yourselves to this habit of thinking of your designs as a whole, you will be surprised at the grasp of idea it will give you and the increased pleasure you will get out of your work. Study the work of our best living men whenever you have the opportunity, as well as of those long since dead, and do not neglect the prosaic present for the picturesque past.

Whenever you see a beautiful building or work of art, either one just completed or an old one coloured by the mellowing hand of time,

one that instinctively impresses you by a sense of proportion and fitness, try and analyse it and find out what it is in its conception or construction that produces this effect. Cultivation of this habit of analysing everything you see, of dealing with actual existent facts will help you to design and plan far more studiously hooks and illustrations.

The reason we admire old work so much, I think, partly sentiment and partly because it is, as a rule, thoughtful and honest—the feeling of reposefulness, of satisfaction, of charm that so much modern work lacks, and it is this spirit, this intangible something that one feels but cannot express in words that you should strive to attain and which give character and beauty to your work. The spirit and the thought behind the design that makes a beautiful building, and the thought you put into your work the better nobler will it be.

Sketching and Measuring.

So much is being done nowadays to encourage practical training and technical education that many are apt to neglect the more artistic side of their work. The recent Exhibition of holiday sketches and drawings, at the Royal Institute of British Architects was quite a revelation, and showed that architects in our practice can yet produce most clever artistic drawings and sketches. By some of our younger men, sketching and measuring understood, is not nowadays in favour, and tends to keep alive that interest in the traditions of the past which many consider harmful cramping. But, in my opinion, there is no better training for an architect than the study and analysis of buildings, both old and new; it helps you to cultivate a sense of proportion to appreciate the beautiful in art, and, more than anything else, the means by which their results were attained.

Apart from anything else it teaches you to draw in perspective, to see your building in the round, a point I have already urged, and an invaluable aid in designing to be able to draw your schemes clearly and rapidly, as you know, designs which look well in elevation, often look very different in perspective. Cultivate a good style of draughtsmanship, remember that the object of all architect drawing is clearly to explain your designs to those who will carry them out, so that the tricks and mannerisms should be avoided which do not convey any practical meaning.

In these days, when travelling is so easy you should take every opportunity of study and comparing in each country you go to different ways in which similar problems are treated, and the materials and workmanship with which they are carried out; this will broaden and enlarge your mind, and you gain many valuable lessons in design and construction. But do not sketch or measure for the object of copying old forms and features for mere servile imitation is a sure sign of decadence and lack of creative force. At the same time avoid going to the other extreme and in your efforts after so-called originality becoming "banal" and grotesque. Guard against being carried away by the love of the pretty and picturesque, the passing fashion of the hour, and recollect that eccentricity is synonymous with genius. Do not worry over trifling details, trivial mouldings, and such things; the greatest and noblest buildings are those that impress us with their breadth and dignity, as a rule, are very simply treated. You know that ornament must follow construction, and that this again must be based on the proper use of material, and, though the tendency of the day is to try to be original, produce something fresh and striking, yet venture to think, and indeed hope, that instead of what we see around us is only ephemeral and will not hold its place in years to come, as representative of our architecture to-day.

Beauty in architecture does not result from richness of material and profusion of ornament, but from elegance of form and proportion, harmony of colour, and perfection of execution, and in a large measure from the intelligent application of material to its proper purpose. Many do not sufficiently remember this, and forget that all materials have their limitations and uses; so consider well the suitability of your designs to the materials you would build them in. Details and features that are right in one are wrong and out of place in another. It is unnecessary to

again to err on the side of simplicity and restraint in your work. Everyone can add his design with meaningless ornaments in detail, but few have the power of being able to know exactly what to use and what to omit. This can only be gained by careful study, by thought and experience, and though sometimes you may get discouraged and feel that your work is at a standstill and you are not improving, yet this very dissatisfaction may be the means of benefiting your work in the future.

It will encourage and help you, if you will devote some of your leisure to reading the lives and biographies of our great architects and artists. You will find that they had the same troubles and difficulties to overcome that you are bound to meet with in your career, and that they learnt in the hard school of experience, just as you will do.

You should lose no opportunity of visiting buildings in progress, and of going to see workshops and acquainting yourselves to actual materials and how they are used. The spring and summer terms arranged by the Association to buildings admirable, and should be better patronised than they are. If students could get a few months, or even longer, on a building in progress, advantages would be inestimable, for there is nothing that is so useful as practical knowledge gained first hand. This, again, bears on a very debatable question of craftsmanship, which several papers have been lately read.

The Function of an Architect.

It is a common feeling that if a man means to be an architect all his time and thought should be concentrated on his work and in that action alone, and to attempt to make himself master of any of the subsidiary crafts, to work in his own hands on buildings of his own is a mistake. I have never been able to ascertain if any of the greatest architects of the past were craftsmen in the sense that we use the word to-day, and I do not think that any workman of any of their known buildings can be pointed out as actually executed by them. The function of an architect should be to design and have the control of the entire building, to be the master builder in fact, and to be conversant with all work being done. He should, as far as possible, have a knowledge of the technique of the various trades and crafts, and be able to direct and control them all, in more than this seems unnecessary. To learn himself personally with matters of detail craftsmanship must be to the detriment of his buildings, because an architect cannot carry out the multifarious duties required to-day and find time to do these things as well; though of course if an architect wishes to work with his own hands, and has a tendency that way, will doubtless produce excellent results, but the idea in buildings of any magnitude or importance seems out of the question. Do not get astray with theories such as these, but and gather round you artists and craftsmen in the allied arts, who understand and sympathise with your aims and who will work with you. That is what all our great architects have done and what we should try and do.

In conclusion, cultivate that spirit of comradeship with your fellow students which has always been one of the chief aims of the Association, and if you possibly can, take some part, however small, in the good work it is doing. The aim of the Association has always been to be of service to its members, and this is the spirit that has enabled it to maintain its almost unique position. May you be your lot to stand by the wayside and help others pass you in the race of life, for its prizes are only for the few; but do not be disgraced, for if you do the work, however small, which comes to your hand to the best of your ability and power, it will not only bring its own reward, but will help and encourage those around you to follow your example.

Mr. Aston Webb, R.A., said he felt proud that he had fallen to his lot to propose, on his own behalf and on behalf of that large gathering, a hearty vote of thanks to the President for his most admirable address, on what, without exaggeration, might be called, so far as the occasion was concerned, an historic occasion. He had all dreamt for years of a home for the Association, and that night they woke up from their dreams to find it a reality. He spoke a little sadly, because he felt that the day had come when he ought to cease to play that rôle, and on their opening night,

therefore, he was afraid this would be his first and last appearance on the Tufton-street stage. He did not think there was a single word in the President's address with which he did not entirely agree. It was only to be expected that the President should refer to the architect to whom they were indebted for the conversion to their uses of that building, and he thought they could all congratulate Mr. Stokes on the happy issue of his labours on their behalf. He hoped they would long occupy the premises, and in that connexion there was a little story he might tell. A judge had been doing a great deal of work to his house, and a friend said to him, "I suppose you have a long lease of the house?" The judge replied, "Lease! A lease is no use to me. I have got the freehold, and I mean to see it out!" The Association, if carried on with the vigour with which it is to-day, would certainly see its lease out, whatever length that lease was. There was the little doleful point the heavy financial deficit to refer to, but the Association had never yet been beaten, and he did not for a moment suppose it would be beaten in this matter. A magnificent offer (there were not many architects in London or elsewhere who could make it) had been made by an anonymous gentleman, and he (the speaker) would, on the same conditions, be glad to make a modest addition of 50% to his donation. The President had made one alarming statement, i.e., that the membership of the Association was increasing at the rate of 100 a year! It really was a serious matter for architects generally that there should be this increase. To another gentleman the President had mentioned, Mr. W. H. Seth-Smith, a great deal was due for starting the Day School of the Association. Mr. Seth-Smith's scheme when it was first proposed did not, perhaps, receive that support it might have had, but by persistence and perseverance Mr. Seth-Smith carried it through, and the Day School marked a very important departure in the education of architects and would be one of the most beneficial things that had ever been done for the education of young architects. It had already proved a success, and as time went on it would be found to be indispensable, and it would be a matter of wonder how architects ever got on without preliminary training before entering an architect's office. The address referred to a matter that greatly interested him, i.e., the subject the Board of Education was now considering—a general scheme for the education of architects. That Board consisted of many who had been known for a long time to take a great interest in the subject, and he believed and hoped that the deliberations of the Board would be of some use; but it could not be of use unless the educational bodies of the country assisted the Board, and it would be a great encouragement to think that the Association would be ready to consider suggestions which might be made. If the Board had the co-operation of the Association, as he believed it had, in the one object, i.e., the improvement of architecture, a great deal of good would come of it. Architects had been going on for some time on a certain system, and it seemed to him and others that the time had come when they might take stock of what they had done and also see if some improvement in the architectural curriculum could be made. His own feeling was that the system on which they had been working had tended rather to the exercise of memory on the part of students than to the exercise of thought and judgment in the design itself—that they had tended rather to the study of details and had omitted the great problems which presented themselves to all architects, whether on a great or small scale. In his student days, when they entered a church they looked at the door, took a sketch of the jamb and the arch moulds in order to send a little drawing to the Architectural Association Sketch-book; when they went inside, if there was a screen they took a sketch of the carving and perhaps one or two of the mullions, and generally looked out little bits which would form an easy and useful little sketch. Very often they missed perhaps the whole interest that the church may have possessed, as he was thinking the other day when he was in a west-country church. He noticed, what was to be seen in many west-country churches, that the nave and chancel were of the same height; but, what was not so often the case, the transepts were also the same height, which gave the architect the opportunity of putting a barrel ceiling over the nave and chancel, and also over

the transepts, so getting a groin at the intersection over the nave; the arcade was continued straight through to the chancel arch, but the wall was not carried up to the roof, so that one saw the roofs of the transepts over the arcade, giving a delightful and unusual perspective effect. What they wanted to teach students to see and understand was the scheme of the whole thing; the detail was a matter as to which the individual feeling and character of the man who designed the church should be left, to a great extent, unrestrained. Students would learn more from the general design and scheme of the architect of buildings visited rather than in looking at small details—mouldings, carving, and such like. The President had touched on another subject in which he (the speaker) had taken much interest, i.e., the desirability of some control, or some advice, in the laying out of towns and cities—both new and where great alterations are in hand. The subject had been sympathetically received by the present First Commissioner of Works, and it was quite possible that, if the profession supported the idea, that in time something of the kind might be obtained. They all regretted the stage in which the matter of the great new street of the London County Council stood. There was the competition for the selection of a design, the design was selected, but then no further action had been taken upon that. That was a matter of great regret; and, although they all knew that the London County Council were anxious to do the best, he should like to see some expression of opinion amongst architects that more decisive steps should be taken before it was too late to prevent that great street being built on in the style described in the President's address. During the last two years an important Commission had been sitting in reference to streets and traffic, and, as far as he knew, only one architect had been called to give evidence, and, as far as he could gather, the evidence of that one witness gave more suggestions than nearly all the others put together on the general layout of a city. It might be an ideal scheme, but it had the germ of an idea, i.e., radiating roads from London to the suburbs which would, to a great extent, redeem London from that monotony and dullness which the President had so properly objected to. He had always thought that it is a most unfortunate thing that the municipal bodies of the cities and towns of England had dispensed more or less with architects as their advisers, and had engaged surveyors instead—absolutely necessary gentlemen in certain work; but, after all, in the formation of new streets, etc., there was something more required than the convenience of traffic and excellence of drainage; there was the question of æsthetic appearance, and the man who could give the best advice on that was the man who had been trained in such matters, and he was, generally speaking, the architect. That brought them to the final duty of the architect, which was to beautify—the final aim of the architect was not only to make a building convenient—that was essential, but it was not architecture. The final goal of the architect was not only to build well—the builder could do that—and that too was absolutely essential, but it was not the highest point. It was not that he should conclude his work at exactly the estimated cost—of course, that was what they all did. No, the highest aim of the architect should be what they often found so difficult and what they were always striving for, i.e., that there should be beauty in the buildings they put up, and that was what people had a right to expect from architects. The opening meeting of a new session of the Association would not be complete without quoting their motto, i.e., "Design in beauty and build in truth." The two things were synonymous; the poet had said: "Beauty is Truth; Truth, Beauty." "That is all we know upon this earth, and all we need to know."

Mr. H. L. Florence, in seconding the vote of thanks, congratulated the President in occupying the chair at the commencement of a new phase of life of the Association—a phase which he hoped would be crowned with success for a long period. As to the President, they had not only been encouraged by his precepts that evening, but they knew the admirable buildings he had carried out in which they could see the reposeful charm the President had referred to and the happy English character he had given to all his works. A considerable portion of the address had been taken up in the consideration of big problems; for instance, the development of large towns. All towns after a time needed

reconstruction and redevelopment, as could be seen to a far greater extent in some foreign capitals than in London. There were many opportunities in which a more united effort and a more supreme control would doubtless be a advantageous, but at the same time this was not always the case. He had just been reading that in New York there was a municipal Art Committee and other well-known and powerful art committees which were hopelessly at loggerheads on the subject of a new bridge. One committee had chosen one design and another committee another design, and the erection of the bridge might be indefinitely postponed. So that the committee proposed by the President might not be an unmixt blessing. What might happen they saw to some extent every year in London. We had an annual exhibition of Art—painting, sculpture, and architecture—the works constituting which were judged solely by artists distinguished over all others in their separate spheres; but he thought he was right in saying that this did not result in an unqualified success. In many instances far superior works to those accepted and put in prominent places were rejected. Again, the practice of leaving matters of art and taste to the decision of assessors did not meet with unqualified approval, and it did not follow that those who were supposed to be, and indeed were, eminent in art and quite capable of giving individual opinions on such matters were those most qualified to determine important competitions or great public improvements. A union of qualities was required for the purpose which was rarely met with in those who devoted their attention to one particular kind of art. The circumstances in which architects of the past built were so different from the circumstances of to-day that there were few neighbourhoods in which schemes on old lines could be successfully carried out now. The tendency now is to build to far greater heights, and while streets were much the same in width, it was obvious that the treatment of the lower stories of buildings must be modified in order to get that light which was essential to making buildings suitable for their purposes. That would account for some of the deficiencies in some modern buildings in London. As to broadening thoroughfares, that invariably led to the displacement of a great many inhabitants, who were accommodated in the immediate suburbs of large towns, where the result was generally interminable and unlovely lines of streets. It seemed to him that some more determined effort should be made to preserve the old houses and grounds in London and such cities—that was to say, the old houses and the many acres of ground attached to them in such neighbourhoods as Clapham, Denmark Hill, Peckham, and Dulwich. If these houses and grounds had been preserved and kept as open spaces, a work would have been done which would have been of lasting benefit, and London would have been surrounded by agreeable neighbourhoods; there would have been better sanitation and health, and Londoners would have had more joy in living than they have now.

Mr. H. T. Hare said he should like to congratulate the President on the position he held that night, and to say how proud the Association was to have him in the chair. This was an historical day for the Association; it marked a distinct step in advance—a very serious step, which had been taken after due consideration, and there could be no doubt that the position of President involved a very great deal of responsibility and a very large amount of hard work and application, but they felt sure that the destinies of the Association would be safe in the hands of their President. As to the deficit on the building, the very generous offer which had been made would, he hoped, lead to other generous offers, and that the whole of the amount required would be wiped off by this time next year. As to the development of cities, that was a question which concerned architects very nearly. The President had referred to the desirability of buildings in streets having some uniformity, and with that a great many of them would agree to the fullest extent; but unfortunately there was a great diversity of opinion in the matter, and he frequently heard architects and people who were interested in the arts express the opinion that London is the most beautiful of cities and that its beauty is largely owing to the fact that there is no uniformity—that you never know what you are going to meet as you go along the streets. In his opinion that view was entirely wrong for a large city, but while this diversity exists amongst people who

ought to know better we could not wonder that the authorities did not take a strong line in directing the progress of building operations in that direction, and this want of taste on the part of a certain number of people was almost entirely due to the fact that up to now we have had no systematic course of education for architects—no standard of taste for architects. Almost all other countries have a definite course of education for their architects, and that tended to the formation of definite views and standards, and that was what the establishment of the Association school might ultimately lead to. Of course, before that could be accomplished the Association must become a much more important institution than it is at present, and he had no doubt that it would grow until it became one of the leading influences in the education of architects. As to the cramping by-laws which exist in London and the country—more particularly in the country—that was largely due to the want of education—to the fact that the people who drew up these by-laws were not advised by anyone except the surveyor who had not had an education as an architect and who looked at matters from a building scheme point of view only—or his own point of view, which was not the point of view of an architect or an artist, whose ideas were ignored in drawing up the by-laws. That could not be altered until the officials of corporations and other bodies were educated in some way to see the artistic standpoint. As to the formation of a Ministry of Fine Art, that was an ideal which they would all like to see taken up; if it was to be adopted, pressure in that direction would have to come from the profession. These reforms would never be initiated from inside; architects must keep on using pressure until their views were to some extent agreed to and adopted. With regard to the curriculum they had established in the Day School, he believed it to be a most excellent one, but no doubt as time went on it would be found susceptible of improvement; but as to the craze or wish to establish some sort of school of craftsmanship, he was not altogether in sympathy with that. It was a hopeless thing, and useless to endeavour to make an architect a craftsman, and it was a waste of time, for he would never become a good craftsman, and he need never know much more than the theoretical principles which govern craftsmanship in any particular trade.

Mr. Webb then put the vote of thanks to the meeting, and it was very heartily agreed to. The President briefly replied. His great ambition was to see the Association at the end of their term of office free of debt, so that, under their then new President they might start with a clean sheet. The President finally announced that there will be a special visit to Charing Cross Hospital on Saturday, October 15, at 2.30 p.m., by permission of the architect, Mr. Saxon Snell; and that the next meeting of the Association would take place on October 24, when Mr. E. Dockree would read a paper on "Photography as Applied to Architecture," illustrated by lantern views.

THE ARCHITECTURAL ASSOCIATION SCHOOL OF DESIGN:

OPENING MEETING OF SESSION.

THE opening meeting of the Architectural Association School of Design was held on Tuesday in the new premises of the Association, 18, Tufton-street, Westminster, S.W.

The President of the Association, Mr. E. Guy Dawber, who presided, said that they were to have the privilege of hearing that evening short addresses from Mr. Halsey Ricardo and Mr. G. H. Fellowes-Prynce. He would ask Mr. Ricardo to address the meeting first.

Mr. Ricardo said he meant to make the occasion an excuse for stringing together some well-worn platitudes, which, having stood the test of time, had almost earned a right to repetition. Like a nail in a fence, each man does a kindness who gives it a blow and helps to drive it home. In addressing a group of architectural students, it sounded a rather belated question to ask, "What do you mean by architecture?" and they would, with one accord, reply, "It is the result of building well and beautifully"; and that they had come here to be taught how to do this. The art of architecture was indeed the outcome of good building; and, as he believed, no building was ever erected that was thoroughly well built but what had a beauty proportionate to the purpose and to the

sincerity of the building. He held that beauty was the bloom and consecration of honest passionate endeavour, and that it was to be acquired that way and that way only. That, if they were to learn about beauty, it must be taught it through the paths of construction, of morals, and enthusiasm; or rather since it cannot really be taught, but evoked, strengthened, and developed, they must prepare themselves for this efflorescence, by discerned knowledge. At first blush it would seem that any knowledge was all to the good; that, as long as one was acquiring no matter what knowledge, the time was being well spent. But it was not so. One could not, to be sure, with, know everything, and, besides that, it was such a thing as intellectual indigestion from which we all suffer, in varying degrees. Knowledge, to be of any good to us, was only to be absorbed—it had to be assimilated, and the thing most generally interesting about a young man was not so much the quantity of knowledge that he possessed, but the quality of what he sheds of it. That he should devour voraciously and take more than he could incorporate was the sign of young, healthy, vigorous appetite, and no one could determine the capacity of his own digestion except by trial. But, for all that, as at the table food might be classed as digestible and indigestible with intermediate degrees of either in between, so knowledge might be classed, with a view to a student's digestion, as that which could be taught and that which you teach your son. Now it was the habit with food for the indigestible to be the most alluring—and with knowledge the parallel held good—for the most alluring subjects—such as beauty and proportion—were those they could not teach.

It may, and you must, cultivate your sense of beauty and proportion; but such education can only point out to you what has been done in past times under past conditions and attempt to explain why it has been accepted as beautiful ever since; it can't tell you what to do when your occasion comes. Each for yourself—you must build up your powers of appreciation, your faculty of discerning the spirit of a building and recognising the devotion and the passion there may be in it; each for yourselves must evolve your own canons of beauty; the more you know what has been done before, the more guidance you will get towards your own problem. But it is easy to dwell too long and too anxiously over the aesthetic side of your work—the man who is always considering what he may eat and what will agree with him is a valetudinarian, the strong man knows his powers and his limits, and doesn't think about them. Beauty is the unconscious bloom of thoughtful work, it is rightfully done—be it prose or verse, it is a matter of the moment, catch the surges of fashion and popular approval, and when day is past it has to suffer an added scorn from those who deem themselves its cajoled votaries. But if the fair form of your profession is to be taught, there is not the same restriction about the bones and muscles of it. That can most certainly be taught, and, moreover, they cannot be too well-known. They are your modes of expression. Art is the message from man to man. It matters not so much as art is concerned, what that mode of utterance may be. The painter flings his story on canvas; the sculptor dashes and wrings his life of the stone; the musician pours out his life in melody and rich texture of sound; the writer in prose, the poet in verse; it is a matter of the individual, not of art, in what guise the gospel shows itself. And as a musician uses sounds, so an architect uses bricks and stones as his methods of expressing the message in his hand. And, like the composer of a symphony, he has—to give outward form to his inspiration—to depend upon the co-operation of many hands for its realisation. The composer must be so much master of his craft that he knows what each of his performances will do, and writes passages for them, that when they contribute to build up the one harmonious whole, they still each may have the power—the opportunity to express their own individuality and emotion. And what is true of an orchestra is true, in a greater degree, of scaffolding. An architect must know how to design the parts of the whole, that each workman may see the sense of them and delight in his opportunity of collaboration. But, to this means knowing your work to the roots of it—your construction, your material, your men. You have to enlist their sympathy

you want to get the best out of them, and to this they must believe in you as one who only knows what he wants, but knows also one should go about to effect this. On his rest in the work he is doing for you depends fine flower of its effect. Your walls may be alive or dead-tired—it depends on you the way you have caused them to be dead. If they are alive and exhibiting every-where a personal touch and the evidence of mason's or bricklayer's fancy as well as plain, as regards features, as a barrack; but, your walling has been built in a mechanical, less way, the workman content with doing day's work, earning his day's wage and no care, careless of what his result may look like as it passes the standard of the foreman that building will look dull and bored, no matter what amount of enrichment (on the terms) you put upon it. Its weariness communicates itself to the spectator; not conscious of the reasons why, he feels that in an oppressive mass of labour there is no joy to tell, that nothing interesting has been done that it is only one more structure added to the tedious heap that already cumber the land. Architecture is so sensitive—it reflects fine shades and gleams of character, it is you the spirit in which the edifice was built, the temper of its occupant, of the moment it has suffered at previous hands, and its elements and time have been working in hand to co-ordinate and harmonise ravages. Interest in architecture is not a human—it is human. A fine design bespeaks a human spirit, and yet, until human passion played in and about the building, there is something wanting. Until it has been lived and shows the marks of kindly human hands, it is imperfect. Often the hands are hardly we can call respectful; additions are made later date, the symmetry is broken into mutilated, the scale and characters of features, doors, and windows are altered, yet the charm of the building remains. Very fact that the innovations—so regarded of the modulus of the existing building—so frankly and sincerely made, accepting altered conditions of life and its requirements, counts as a good mark; it forms a page in the book of history: the alterations not a sequel, they are actual human growth, they carry with them, and all over them, colour of the epoch in which they sprouted, the 'beauty,' as conceived by the original designer, is gone in a parous way, and, as for the proportion, that is a lost thing. But, granting the innovations are honestly, not wantonly, and that the same sincerity of purpose and thoroughness of workmanship is in them as in original building, most people will be apt say that the world is a gainer by this division of the aesthetic character of the building. The architecture of to-day is a living art all give evidence of its life by development. cannot stand still, it responds to the great of life, and, as these are incessant growths, must art be continually modifying itself, since the feelings of the time. New methods, facilities crowd upon us; new aims, new necessities appear with each fresh generation; we are here to embody these in permanent forms. Our personal equipment must be made knowledge of our materials—so that by of wise application we may make them grow and do more than they as yet have done and intimate knowledge of construction—so we may avail ourselves of all the forces of late have sprung up around us, and also enabled to recognise and wrest to our purpose capabilities of yet newer ones when they appear. It is want of this training that puts present in an inferior position (in the eyes of the public, and very rightly so) to the past; he at least has had the sense to learn he could about bricks, steel, and concrete, the mighty spans of his railway arches, flights of his bridges across the rivers, the docks and sea-walls are the real important manifestations of living architecture in the 19th century. He has advanced the possibility of building by force of hard sense, experiment, and mathematics. Brunelleschi his dome at Florence, Sir Christopher Wren his dome in London on these terms, and New Yorkers are erecting their sky-scrapers on these terms. Neither Brunelleschi nor Wren had what we should call an architect's feeling; neither of them set much value on it, or cared to be bothered with it, but their intuitive sense in the great problems they

had to grapple carried them] securely through the smaller questions of detail; they knew enough to inspire their coadjutors to play up to them. I will only, at this time, point out to you, for your own reflection, the general statement that good detail goes with good construction, and where you detect bad detail you will discover heartless or ignorant construction. And how little excuse there is for this ignorance. The problems of construction are the fascinations of architecture as much as the problems of planning. Both are the arts of contrivance; and the art of architecture was of all the Arts (with a capital A) the last to appear amongst her sisters, since she was the outcome of so many balanced forces and so many cultivated virtues—compared to her simpler-natured sisters. We are the votaries of this goddess; in imitation of the delicately-poised equilibrium that constitutes her cognisance we rear our buildings, and in our hearts we pray that she may look down upon our efforts and irradiate them with the smile of her approval."

Mr. Fellowes-Pryne then addressed the meeting. He said he sometimes wondered how far the words that are spoken on such an occasion as this influence or help those to whom they are spoken; or whether, like many sermons that are preached, their effect ceases on leaving the door of the place in which they are spoken. Yet he would fain hope that the many words of advice—words that are often the outcome of matured experience and well-seasoned thought—that had been spoken before the Association and at the Institute year after year, had not always been cast aside by the student hearers as mere platitudes or pleasant words strung together to tickle the ears of the audience for a little while. No; he was sure this was not the case with the more serious student who had the welfare of his studies really at heart. The seed had not always been cast on waste ground. Nay, more, such delightful addresses to students as were given at the Institute by Mr. Aston Webb he was sure could be read and re-read with advantage and encouragement, not only by the younger students, but by those in later life. Indeed, with all such addresses it was often the case that the thoughts and suggestions they contained would not be fully realised or appreciated at the time they were heard, but reading after having heard them spoken was much more likely to leave an indelible impression as to the more important points. In again addressing the A.A. Class of Design, one felt like addressing old friends, for although the faces were different—and those to whom he had previously spoken were now well launched on their professional career—the enthusiasm and *esprit de corps*, he trusted, remained the same as ever, and would always continue while the A.A. exists; for was it not enthusiasm that was the very life-blood of the Association? What, in its earlier days, would the A.A. have done without the warm enthusiasm of its members? How would this very Class of Design have fared if it had not been for the enthusiastic support of those who were seeking for knowledge? "You who now have such well-served feasts of architectural education and other opportunities of study can little realise the difficulties which beset the student of thirty or even twenty-five years ago. Those were days in which one's studies were the outcome of real self-help. Yes, I'll be bound to say that no greater enthusiasm exists now than then. But the great question is, with all these advantages and opportunities, what are you going to make of them? Are we in the future, as in the past, to see our streets burdened and disfigured with such designs as your President rightly complained of in his very interesting address last week?" The result of the great and well-organised Architectural School that has arisen in our midst should, in a very few years, make itself felt, not only in Great Britain, but in every part of the Empire. Those of you who have been members of this class of design, or who have passed through the day-school, must, to some extent, realise the difficulties, as well as the capabilities and the pleasures of such a profession as ours; they must also know by this time that it is no easy-going profession that they have chosen, but one that demands, if it is to be successful in the highest sense, continuous study and hard work. But to those who have that priceless gift of enthusiasm and real love for our great

Art, the study and hard work will become a real pleasure. Remember Sir Joshua Reynolds's words:—"If you have great talent, industry will improve them. If you have but moderate abilities, industry will supply their deficiencies. Nothing is denied to well-directed labour, nothing is to be obtained without it."

From much of the work that was done during the last session one could not but see the great improvement that was taking place under the systematic training and the able guidance of the day-school masters. Of course, the one for in systematic and academic training was that they might be inclined to get into a somewhat narrow groove of study and be perhaps led to think that only such and such a style of work—i.e., the style that may for the time be in fashion or favoured by this or that master—was correct, and all else was unworthy of study. Now, nothing to his mind could be more degrading and disastrous to the highest and noblest view of their great art; and, from the very commencement of their studies, he did most strongly advise them to be as catholic and wide in their views as possible. "Do try and look at architecture—as indeed all art—in the broadest sense possible. Avoid, as far as possible, thinking in styles. I don't mean for a moment that you should not study your orders and the gradual development of styles in all periods, and gain all the knowledge you can as to the reasons and causes of such development. This, of course, is all a part of the essential knowledge of an educated architect. But, in your study of old and new buildings, try and find out the why and wherefore of things—first in the plan, next in the effect that the plan has upon the elevations, or *vice versa*. Ask yourself:—1st. Why you admire this or that building? 2nd. What are the leading lines or details that make it beautiful? 3rd. And, perhaps, above all, what is it that makes the proportions good? 4th. How does the detail at different stages and heights affect that proportion? These and similar questions are those the answering of which, wholly independent of style, will help more than any other in the intellectual study of any good building. When once you have satisfied your own mind as to the reasons that go to make up a thing of beauty, if possible, note them down at once in your sketch-book, and, as far as you can, measure and figure the details that seem to help most in giving beauty and proportion to the design you admire. This kind of analytical study you will find of immense use in design. The notes in your sketch-book may not be very pictorial or interesting to others, but will gradually form a regular storehouse of information to yourself. And, while speaking of sketching, let me advise you to always have a small sketch-book with you for making notes and small sketches in: I don't mean only when you go out intending to sketch, but always—on your walks, your bicycle rides, in fact in your every-day work—for, if you keep your eyes open, it is wonderful what one sees that is worth recording, either by notes or sketches. There are some things and sayings that stick to one's mind throughout life, and the advice of the first architect I worked with was, 'Whatever you do, don't go through the world with your eyes shut, as more than half the people in the world do.'

There was another point on which he should like to say a few words, and that was the practical side of their work. The fascination of sketching, and thinking, and setting out schemes of design on a drawing-board was great; but, as a preliminary part of their education, it was equally, if not more, important that they should thoroughly grasp the practical side of their work. Now, he was sorry to say so, but over and over again he had found men and pupils who fought shy of often visiting the actual works while in progress. As one said to him a short time ago, "I don't care for mixing up with a lot of workmen." And another, "I don't see the good of watching a whole lot of concrete put in."

"My dear young friends, for goodness' sake don't let such nonsense enter your heads, or if there is one here who thinks thus and adheres to such thoughts, let him give up the profession; he evidently doesn't think it worthy of him, and he is certainly not worthy of the profession. Some practical experience is essential, and the sooner you get it, the better for yourselves and your future work and clients. Put off your kid gloves—aye, and your coat if necessary—and take every opportunity of

getting on any works you can while in progress; watch each stage of the work carefully and intelligently; get on friendly terms with the foreman and the men, and don't be ashamed to ask for information. The men like to have interest taken in their work, and you will gain invaluable information by carefully watching the work on bench or hanker. Most of the men I have come across will be only too glad to tell you all you want to know. Personally, I believe that it would do most of us all the good in the world to be put under the care of a good clerk of works on a large job for a year. It would knock some of the pride and nonsense out of us, and make us realise that architecture does not consist solely in making pretty drawings of sometimes impossible buildings. I have nearly always found the greatest kindness and civility from workmen in all trades, and I sometimes feel I ought to pay a premium for the amount of practical knowledge they have given me on various occasions. There are lessons to be learnt on a building in progress that no amount of book-work or diagrams will teach you. Again, the enormous advantage in practical experience to an architect is at once seen in his drawings and designs. It is this want of practical knowledge that so often makes the progress of otherwise capable pupils and draughtsmen so disappointing. To give you one personal example of how I have found some experience in carpentry useful:—The opening of a certain church was to take place on the following day, and the first service was at eight o'clock in the morning. Things were much behind, and, when I arrived, I found that some unpleasantness had arisen with the joiners, who had been drinking with the foreman, and they lounged about, refusing to work after six o'clock. I tried to persuade, but only obtained the help of one good man. It was of the utmost importance that some of the east-end woodwork should be properly fitted in position. At seven o'clock I took off my coat and, to the astonishment of the men present, set to work with horrowed tools. The moral effect was excellent. At nine o'clock some of the better men came back to work, and by two o'clock in the morning I had the satisfaction of seeing the work completed. I can assure you the much-abused British workman respects the man who not only orders the work to be done, but can tell him how to do it.

Now, in conclusion, having treated with the practical side, let us for a moment look on another and, perhaps, more pleasurable side of our art. There is that happy social side which has made its mark on the lives and work of so many members of the A.A. in past years. Do all you can to keep up that social aspect of the work. Encourage, as far as possible, that friendly intercourse with your fellow-students—friendly criticism of each other's designs will be of the greatest possible value, and friendships made now, and kept up and cemented in after-life, will in future years be cherished as an added pleasure to your professional work. Last, but not least, throughout your work let your aims be high. Think of the greatness of the art which you have chosen for your profession. An art that is at once noble and ennobling to those who view it rightly. It is an art that more than any other marks the character and history of nations. Surely, the advancement of such an art is worth living and working for. Let my last words be those of George Herchert:—

'Pitch thy behaviour low, thy projects high;
So shall thou humble and magnanimous be.
Sink not in spirit; who smeth at the sky
Shoots higher much than he who means a tree.'

The President said they had had two delightful addresses, and there was much in them that one would be glad to read when they were printed. In Mr. Ricardo's beautifully-expressed paper one thing was emphasised, and that was that there could be no good architecture without a sound, practical knowledge, and he (the speaker) hoped they would, as students, impress that on their minds. They might be walking in the country where they might see an old wayside cottage which was built of brick or stone, which would impress them far more, perhaps, than the modern, garish villa next door covered with ornament. They might ask themselves why that was. He thought the reason was that the people who built the old cottage understood the capabilities of the materials they were using, and he should like students to remember that without practical knowledge it was impossible to make a good

building. As Mr. Prynne had said, they should use every opportunity of getting on to buildings in progress, and into shops, in order to learn everyday practical things. For instance, if they visited a stone quarry, they should go right down inside it, and see how the stone was got out, how it was worked, the tools used, how it was cut, and whether it was fine or coarse grained—before they could properly design in that material, and so with others. As Mr. Prynne said, if they could get on a good building with a clerk of works, and accustom themselves to seeing the work through from beginning to end, it would be of inestimable advantage to them. They could never design until they knew how a building was put together and constructed. Good construction helped good design. Then as to what Mr. Ricardo said about mouldings and details, he (the speaker) thought with him that students would do well to leave such trivialities alone—they were the mere trimmings of a building—and study mass and dignity in design. The design without detail would speak for itself, and would be good or bad architecture without detail. It was very good of Messrs. Ricardo and Prynne to have come among them that evening, and he was glad to see such a good audience.

On the motion of the Chairman a very hearty vote of thanks was then accorded to Messrs. Halsey Ricardo, and Fellowes-Prynne for their remarks.

Mr. H. Tanner, jun., announced that there were two classes the Association would be glad if some students could find time to attend, *i.e.*, classes in ornamental leadwork and stonework at the L.C.C. Technical Institute in Vincent-square, Westminster. They were poorly attended, and the L.C.C. thought of discontinuing them unless about fifteen or eighteen students could be found to attend them. It would be a great pity to let such useful classes drop.

The meeting then terminated.

UNIVERSITY EXTENSION GUILD.

The annual reunion of the University Extension Guild was held at the University of London, South Kensington, on Tuesday evening, under the chairmanship of Sir Arthur Rücker, F.R.S. (Principal of the University), when addresses were given by Dr. Emil Reich and Mr. Hillaire Belloc, B.A., descriptive of their lectures to be delivered in the Michaelmas term.

The Chairman, in opening the meeting, congratulated those who had worked so hard for the Guild on the success which had attended their efforts. It was an answer to those who doubted at the commencement that they could get such an attendance at a course of lectures which were not merely ordinary popular lectures, but were a system of lectures extending over three years. This was the second year's lectures of the three years' course. Last year the history of antiquity was dealt with; this year they were to hear a great deal of the time between the decline of the Roman Empire and the Reformation, and next year the subject of more modern history would be dealt with. It would be thus possible for those who could attend to hear a continuous course of history extending over almost the whole range of time known to man.

Medieval History.

Dr. Emil Reich delivered an address introductory to his course of lectures on "Medieval History," and said that he intended to give an account of the Carolingian Empire, the Byzantine Empire, and of the great Popes of the Middle Ages; of the foundation of the great orders and the Crusades, and to devote three lectures to mediæval thought or scholastics, mediæval art, Gothic architecture, and mediæval life, both home and public. The Middle Ages, he held, had been suffering from a variety of causes, misleading public judgment. In the first place the public generally identified the Middle Ages with everything dark, unprogressive and benighted. The average man thought that they were full of tortures, witch trials, religious persecutions and the like, but as a matter of fact all these evils were infinitely more frequent in the XVth and XVIIth century than in the Middle Ages. They owed an enormous debt to the Middle Ages, which gave them a most magnificent specimen of a novel art—Gothic architecture. In the XVIIIth century they laughed at

Gothic architecture, and called it crude, rude, but they had long learned to think differently, and no modern man could see exquisite mediæval churches without that the Middle Ages for that art. It might be said these people had no literature and science, but their souls went into beautiful buildings.

Mr. Hillaire Belloc, who will deliver lectures during the term on "The History of Mediæval Town," said his was but one of the subject which Dr. Reich had put before them, but it was a subject which attracted him from his boyhood, and he tried to show why it still continued to attract. A matter which would soon be debated whether certain physical things or great philosophies had had more effect on the history of civilisation, but when it was debated no conclusion would be arrived at because they did not compare the two things. When that decision was entered into people would rush in and that religion was more important than anything else. Although for many years they had held that the Middle Ages were ourselves, and it was their interest. When a man said Greece or Rome was nearer to him than the Middle Ages—he meant a man who knew the Middle Ages—then he would say, "You saying something up in the air." Give a man a slave and he would not know why he with him, but a Greek or a Roman would know where to sell him and how to treat him. In the Middle Ages there were capitalists and prisoners of war, but there was no slavery; the men of the Middle Ages were ours. When the Roman Empire fell the barbarians did not come to destroy, and the great city of Paris remained for 130 years. If they had they would find that there was no great change after the first invasion. They gradually declined. Then came the invasion of the Saracens, but Western Europe was not that with difficulty. At the beginning of the Xth century Europe was like a man who had almost lost his memory, and wondered how he had survived. At the end of the XIth century, by a process no one could understand, but which was more wonderful than the Renaissance, there came an awakening of Europe. There came Gregory VII., the Crusades, and that extraordinary phenomenon the Normans. Just as they made steel by adding a small percentage of carbon to iron, so a small percentage of Scandinavian blood added to the blood of the Roman people made the Norman. Like all things eccentric could not last—he doubted if it lasted 130 years, but while it was there it organised and schooled Europe. It actually made a land measure, and the Normans put into the air vague institutions of which came a true feudal system, was the awakening of Europe. There appeared with the beginning of the XIIth century an ideal which lasted 300 years, and that ideal was made by men like ourselves. There had been no change in our race; there had been no influx into our blood since there had not been even an admixture of blood since then. We were the same people we were ourselves in the Middle Ages. Architecture was not copied from elsewhere and our social system was organised on a system which had evolved and copied from now. And then came the great tragedy of history. He was sorry that Greek art declined and was heartbroken to hear that the Stoic last became Mystics; but much more sad to him to read how this great dream of the Xth century went down. Some attributed it to black death, and others to the Catholic Church, but they might discuss it again and still be no nearer the truth. It was true, was supposed during the term to tell them it fell, but in truth he did not know, and would only be able to sketch out the approximate causes of its failure. He could only tell them that terrible failure came, but not why it came. But, with regard to that delightful time, they had not only the documents of the architecture, but many stories which illustrated the life of that period. And in dealing with this period he continually asked himself as if he was living in it. In that time in Western Europe there were two principal forms of social units—the manor or village and the town. In the course of the lectures he was to deliver was going to show how the mediæval town arose from Rome, and should try to describe

interior organisation and how it became a centre of great activity. He should deal with such towns as London, Paris, Rheims, Lisbury, Chester, and others, as examples, and then he would come in the last lecture to discuss why the ideal fell, but that could not be answered.

THE THAMES AND RIVER-SIDE HOUSES.

FROM A CORRESPONDENT. THE August number of the Strand Magazine contains the answers of many great artists to a question, "What is the finest view in the kingdom?"

One replies that his favourite view used to be that of the Thames at Stratley, now ruined by the modern buildings there. Now, why could that be so unfortunately true? No one could assert that a building—even a large building—need spoil a landscape. Windsor Castle, for example, is the chief charm of the view from the river near it. To take the other extreme, a rustic cottage is the artist's delight. Why should that which lies between these two, a gentleman's villa, be so often a blot on the landscape? Is it not because suitability to a place has not been considered? A dweller in Kensington or Fitzjohn's Avenue wishes for a country house in one nook which has captivated him by its tranquil beauty, and he orders in the style of his town house, so spoiling the very charm that has attracted him.

Wordsworth, who gave so much thought as well as time to laying out Lady Beaumont's grounds for her, says that the fundamental principle is that "the house should belong to the country, and not the country be an appendage to the house."

It would be a real public benefit if those who are going to build Thames-side houses would take them on the further side of their land, from the river, and this in most cases would be an improvement to the house. Not only will the higher ground be drier, but also the view of a stream between its banks is generally more attractive than a view which contains the flat but the opposite bank, with a floor of water.

This suitability, which is an essential part of any garden, should extend of course to the grounds well as the house. In towns, where a garden is surrounded with buildings, many people mire geometrical beds with blooms that imitate mosaic, but a glance shows how little they fit in to a country landscape. Long, straight lines that seem to flow into the stream—these are not Nature suggest them by her statelike beds and bamboo-like grasses? Yet many parian gardeners, instead of cultivating this rampant growth, use the sickle and mowing-machine to destroy it, and then place painted boards in a row on the bare, hard edge. If they could view their riverside gardens from a boat, at a little distance, and consider them as part of a landscape, they would soon decide that a different treatment was wanted.

THE LONDON COUNTY COUNCIL.

THE first meeting of the London County Council after the summer recess was held on Tuesday in the County Hall, Spring-gardens, W., Mr. J. Williams Benn, M.P., presiding.

Loans.—On the recommendation of the Finance Committee, it was agreed to lend Battersea Borough Council 1,054*l.* and 1,581*l.* for the purchase of land; Bermondsey Borough Council 10,000*l.* for the erection of working-class dwellings; Camberwell Borough Council, 5,500*l.* for the purchase of leasehold interests in depôts; Poplar Borough Council, 1,472*l.* for purchase of dust-vans; St. Marylebone Guardians, 4,000*l.* for drainage works at the primary; Shoreditch Board of Guardians, 100*l.* for water-supply purposes at the work-house; Southwark Borough Council, 14,000*l.* for purchase of Greenmore Wharf, Bankside, to be used as a depôt; Woolwich Borough Council, 500*l.* for contribution towards the cost of acquiring Eltham Park. Sanction was also given to the borrowing by Hackney Borough Council of 5,339*l.* for paving works; and to Eppingdon Borough Council, of 2,587*l.* for paving works.

Improvements: Central-street.—The following recommendation of the Improvements Committee was agreed to:—

That the estimate of 5,875*l.*, submitted by the Finance Committee, be approved; that to enable the Council to complete satisfactorily the widening of

Central-street now being undertaken under the powers conferred by the London County Council (General Powers) Act, 1901, and in accordance with the application of the Council of the Metropolitan Borough of Finsbury, a contribution be made on the usual conditions of half the net cost of the widening of existing and the formation of new streets on the eastern side of Central-street, proposed to be carried out by the Borough Council by arrangement with the Ironmongers' Company, in accordance with the plan presented to the Improvements Committee on July 13, 1904; provided, however, (a) that if the total net cost exceed 11,750*l.*, the Council's contribution shall be limited to 5,875*l.*; (b) that in the carrying out of the improvement no departure whatever be made from the approved plan, except with the previous sanction of the Council; and (c) that the Ironmongers' Company agree to provide other land for the purposes of the L.C.C. school in place of that taken for the improvement, and to bear the cost of the necessary re-arrangement of the boundary walls, out-buildings, etc., and also carry out the proposed arrangement with the Borough Council for the sale of land for the provision thereon of re-housing accommodation for the persons of the labouring class to be displaced by the execution of the company's scheme."

Health Asylum, Bexley.—The following recommendation of the Asylums Committee was agreed to:—

"That, subject to the approval of the necessary plans by the Home Secretary, the estimate (No. 4,248) of 16,250*l.*, submitted by the Finance Committee, for the erection and equipment of a hospital villa on the male side of the Health Asylum, Bexley, be approved; and that the expenditure for the purpose of a sum not exceeding that amount be sanctioned."

Tramway Works.—On the recommendation of the Highways Committee it was agreed:—

"That the estimate of 1,000*l.* submitted by the Finance Committee, be approved; and that expenditure, on capital account, not exceeding that amount, be authorised in connexion with the purchase by the Council of the freehold interests in a portion of the Queen's-road, Battersea, tramways depot, for the erection thereon of a sub-station for the electrical working of a portion of the London County Council Tramways.

"That the freehold interests of the trustees of the Stockwell Orphanage in the proportion of the Council's tramways depot in Queen's-road, Battersea, referred to in the foregoing resolution, be acquired for the sum of 825*l.*

"That Messrs. H. Lovatt, Limited, be allowed to sub-let to Messrs. Beaven and Sons, London (or to such other firm as may be approved by the architect), the work of plumbing, painting, and glazing included in several contracts being carried out by Messrs. Lovatt for the Council, in connexion with the Greenwich electricity generating station and sub-station.

"That the seal of the Council be affixed to any necessary documents in connexion with the acquisition by the Council of the freehold and leasehold interests in the property known as No. 32, Rivington-street, Old-street, which has been acquired as a site for the erection of a sub-station for the electrical working of portions of the Council's (Northern) Tramways."

Housing.—The Housing of the Working-classes Committee submitted the following statement of new dwellings completed during the summer recess, and opened for occupation:—

Table with 5 columns: Name of Estate and Buildings, One Room, Two Rooms, Three Rooms, Four Rooms, and [Number of persons provided for. Rows include Hughes-fields, Deptford; Drake-buildings; Ropemaker's-fields, Wapping; Brightonsea-buildings; Preston's-road, Poplar; Hudson-buildings; Quebec-buildings; Winnipeg-buildings; Leroy-street, Bermondsey; Barnaby-buildings (part); and Total.

Drake-buildings have been erected on a plot of surplus land acquired under the Hughes-fields scheme, 1885, and are intended to provide accommodation for re-housing 214 persons of the working-class to be displaced by the erection of an electricity generating-station at Greenwich in connexion with the Council's tramways. Brightonsea-buildings have been built in part satisfaction of the obligation resting upon the Council for re-housing the persons to be displaced on the north side of the river Thames by the construction of Rotherhithe tunnel. The erection of Hindson, Quebec, and Winnipeg-buildings completes the provision of the accommodation required on the Preston's-road and Norfolk-street sites for persons to be displaced by the clearance of the areas included in the Burford's-court, etc., improvement scheme, 1899, and, also, by arrangement with the late School Board for London, for satisfying the obligation which rested upon that authority for providing accommodation in lieu of that destroyed by

it in various parts of the county over a number of years. Barnaby-buildings are provided for the purpose of re-housing persons to be displaced by the carrying out of the Long-lane and Tabard-street improvement.

Boswell's London House.—Upon the recommendation of the Local Government, Records and Museums Committee, it was agreed that a memorial tablet should be affixed at No. 56, Great Queen-street, to commemorate the residence there of James Boswell.

Theatres, etc.—The Theatres and Music Halls Committee reported that plans for the following, showing alterations, etc., to licensed premises, had been dealt with during the recess:—

- Beelstein Hall, Wigmore-street—Showing the provision of a private room for the box-office keeper. National Skating Palace, Argyl-street—Proposal to meet one of the Council's suggestions for the improvement of the premises. All Saints' Institute, Priory-road, Lambeth—Showing seating arrangements. Daly's Theatre—Proposals to meet certain requirements of the Council. Excelsior Baths, Bethnal Green—Showing alterations to the seating and flooring. Bus of Court Mission, Drury-lane—Proposal to substitute fire-proof plaster doors for the existing iron doors. Lectures Hall, Greenwich—Provision of ante-room. London Exhibitions, Earl's-court—Formation of a cinematograph enclosure in the Panorama-buildings, Western gardens. Lyric Theatre—Re-arrangement of pit seating. Royal Court Theatre—Provision of a new transformer chamber. Bermondsey Town Hall—Bazaar from November 1 to 5, 1904.

Plans relating to certain work at the following buildings were, on the recommendation of the same Committee, passed on conditions:—

- Clarendon Hotel, Hammersmith-broadway. Forest Hill Baths. Fulfords, Limited, Nos. 207 and 209, Regent-street. Headquarters of the South Middlesex Volunteer Rifles, Fulham. King's Assembly-rooms, Cottage-grove, Bow-road. La Graciera, Nos. 29 and 30, High Holborn. London Coliseum. London Exhibitions. Long's Hotel, New Bond-street. Prince's Restaurant, Piccadilly. Sportsbank Hall, Catford. "Ye Plough," Clapham Junction.

Motor Omnibuses.—Mr. Baker, in reply to several questions, said that the working of motor-omnibuses as tried in several provincial towns, did not lead him to believe that if they were introduced in the London streets they would form any formidable rival to the Council's electric tramways. In the event, however, of such motor omnibuses being put on the Council's based tramway routes, steps would be taken to see whether motors could not be

used on the horse-trams so as to compete with the opposition.

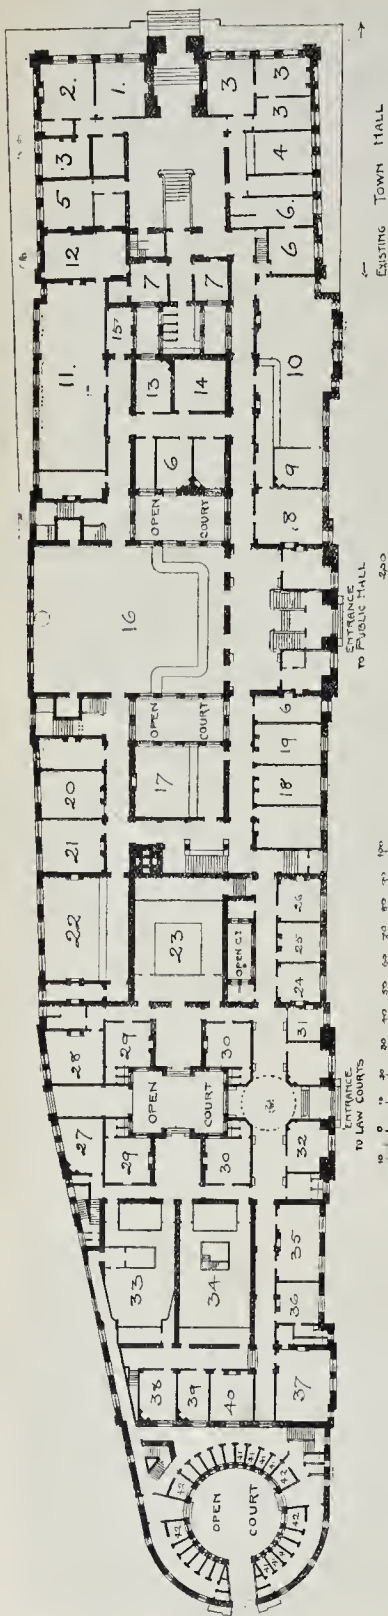

Traction Engines.—On the report of the Public Control Committee, Mr. Beachcroft asked the Chairman when the conference on the subject of the use of traction engines in London thoroughfares was likely to be held.

Mr. Harben replied that the conference had been fixed for Friday, November 18.

Mr. Beachcroft asked whether in that case, assuming that the conference came to the conclusion that legislation was required, it would not be too late to initiate any action in the coming Parliamentary session.

Mr. Harben: Undoubtedly it will be too late for this session, but it will be quite impracticable to call the conference at an earlier date.

Inspection of Theatres.—On the motion of Mr. Dolman, the Theatres and Music Halls Committee were instructed to present a half-yearly return as to the inspection of places of entertainment by the Council's officers, showing the number and nature of the offences reported.

Bethlem Hospital.—Mr. Gilbert moves that, in order to provide South London with a necessary open space, it be referred to the Parks and Open Spaces Committee to consider and report as to the acquisition of the Bethlem Hospital and grounds for a park open space, and whether, as it is the property of the Bridge House Estates of the City Corporation, it can be acquired by means of exchange of other land, in or outside the Corporation, or by any other suitable method.

This was agreed to without discussion. *Westminster Bridge Trams.*—On the motion of Mr. Gilbert, it was also agreed that, in order to facilitate the traffic requirements of South London and the general requirements of the High Committee he instructed to consider and report to the Council with reference to the proposal in the next session of Parliament of a scheme for joining the two tramway termini at Blackfriars-bridge and Westminster-bridge by means of a tramway constructed across the bridges and along the Victoria-embankment in order to provide a continuous circular route which the blocks in Blackfriars-road, Westminster-bridge-road might be obviated. The Council then adjourned.

Illustrations.

A DESIGN FOR STAINED GLASS

THIS is a design made by Mr. A. H. Wooller, a student of the Royal College of Art. The four panels intended for the windows on staircase of a country house, and the subjects chosen are meant to illustrate in some measure the joys of a life in the country. The right-hand upper panel on the sheet, and the left-hand lower one, should more properly come side by side, as they belong to the same subject, and illustrate Keats's line—

"Happy in beauty, life, and love, and everything suggesting the playful and lighthearted side of life away from towns. The first and last panels illustrating poetry and music, suggest deeper and more emotional side.

These two last-named figures have been subjects of some interesting experiments in silver stain and its application in the production of white and coloured glasses.

DESIGN FOR THE EXTENSION OF HULL TOWN HALL.

This design, by Mr. John Murray, was submitted in the recent competition, the conditions of which stipulated, among other things, that the old building was to be retained, there was to be no building over the prison cells, and the total cost was to be 100,000.

The leading ideas in this scheme were to retain, with slight alteration, the existing building; to keep the new principal entrance facing Alfred Gelder-street on two lofty floors carried along level with the old offices; and to carry through lineable the principal zonal architectural features.

The law courts were placed upon the ground floor, with the prison cells at the western end of the site for the convenience of transferring prisoners from the gaol, which is nearly opposite thereto.

In order to provide the requisite accommodation, an additional story was arranged facing Anne-street.

The elevation facing Alfred Gelder-street was treated with two main pavilions, under which were placed the entrances to the law courts and to the public hall, rates office, etc.

The architectural treatment was intended to harmonise with the old building and to do so with a degree of restrained monumental dignity and solidity, as the architect conceived the best adapted for this problem; and to satisfy modern public ideas of civic splendour.

NEW OFFICES FOR THE BRISTOL GAS COMPANY.

THE business of the Bristol Gas Company having outgrown the accommodation in its existing offices, which are in an inconvenient situation and difficult of access by the public, has been determined to erect new buildings in a conspicuous position on a site adjoining Colston Hall and in the principal business centre of the city.

The accommodation provided comprises the basement floor, storage for gas stoves

the kindness of Mr. Caröe, the architect
 charge of the repairs to the centre tower of
 Canterbury Cathedral, we are enabled to give
 illustrations of portions of the tower,
 photographs recently taken, which show
 present state of some of the work.
 s, 1, 3, and 8 show the condition of some
 e mullions in the tower windows, Nos. 5
 e extent to which some of the buttresses
 orn away. No. 2, which shows one of
 urret tops in which the gables (as men-
 ll last week) are capped at the apex by
 ars, is on too small a scale, unfortunately,
 ow all that it was intended to show; the
 work, as Mr. Caröe informs us, is put
 her much more like joinery than
 work. No. 7 is a view taken looking
 d through the scaffolding up one of the
 e of the tower. This illustrates one of the
 ns that is in best preservation.

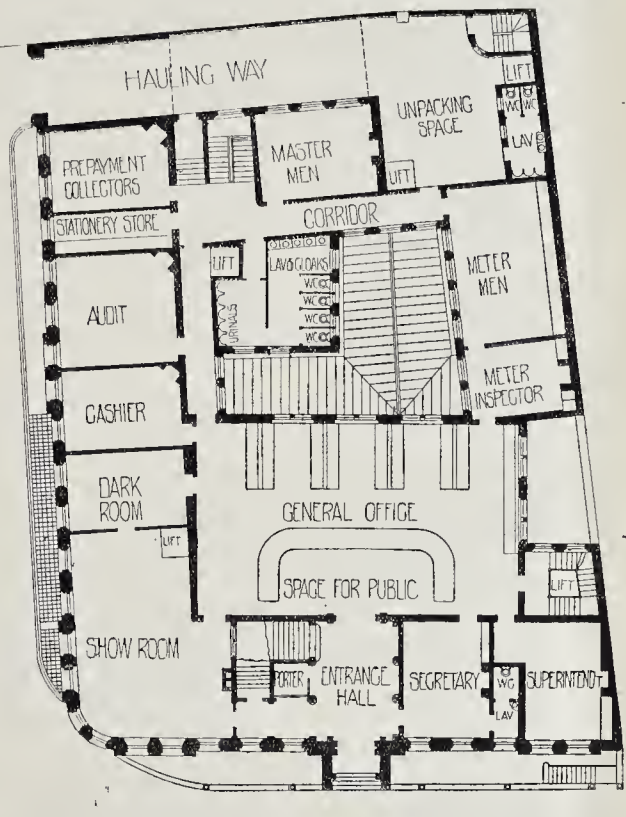

LUNATIC ASYLUMS.

Commissioners in Lunacy, in their fifty-
 report to the Lord Chancellor for the
 1903, devote many pages to an explana-
 of their views on the subject of large
 ns and of their objections to the use of
 rary buildings. Subjoined are the chief
 and arguments adduced:—
 e are unable to view without grave con-
 the modern tendency to undue increase in
 e of asylums for the insane poor, and we
 that the time has arrived when we should
 our protest against it. Its advocates
 it principally on the ground of con-
 ce and economy, and if this were proved,
 here were no weighty counterbalancing
 e should have no adequate grounds for the
 sion of adverse views. This is however, in
 opinion, far from being the case. We have
 failed to recognise the serious financial
 n which the continually increasing accumu-
 of the insane poor is imposing upon the
 unity, or to sympathise with every legiti-
 and practicable effort to lessen its onerous
 ter. As we have pointed out in previous
 es, we think that this might be done to an
 sible extent by the building of asylums
 pler forms of construction, in which the
 nd harmless class of patients who are now
 ed in increasing numbers from their homes
 on the wards of workhouses into asylums
 have been built and are fitted for acute
 might be accommodated and maintained
 somewhat cheaper rate. While such asylums
 have indicated could never be made abso-
 cheap, for the helpless and sick poor
 ate and would need all the appliances for

suitable nursing, we think that they could be
 built and furnished less expensively than at
 present and be conducted at a lower rate. The
 mixed asylums, as now built and organised,
 provide for all patients, in whatever mental
 and physical condition they may be, practically
 the same kind of accommodation and treatment,
 which for some is necessary but for others super-
 fluous. As long, however, as these asylums
 remain of moderate size they accomplish their
 objects, if in a somewhat expensive at least in an
 efficient manner; and the medical superintendent
 of each, who has presumably and generally been
 selected by the committee for his skill and
 experience in the treatment of mental disease, is
 able to apply those qualities to the treatment of
 all his patients and to be in close medical relation-
 ship to them. The moment that his asylum
 increases beyond a reasonable size this ceases to
 be possible. He loses touch with his patients, and
 has to delegate his medical functions to others
 who are, if not less able, usually less experienced
 than himself. When an asylum contains 2,000
 to 2,500 patients, as some of them now do, this
 delegation must necessarily apply to the great
 bulk of the patients, and the special qualifications
 of the medical superintendent become of com-
 paratively small value in the matter of medical
 treatment. The aggregation of large numbers
 of persons, moreover, within buildings upon a
 limited area gives rise to the origination or
 development of diseases of a serious and fatal type,
 such as that which has come to be known as
asylum dysentery. The evils of undue aggregation
 in consumption have already been widely recog-
 nised by the public, who have long since realised
 the extreme difficulty, if not impossibility, of
 maintaining in health even animals of the lower
 species which are kept in confinement under such
 conditions. As the population of asylums
 assumes proportions beyond certain limits their
 administration becomes increasingly difficult. It
 certainly does not conduce to greater efficiency,
 and it obviously cannot, therefore, be supported
 on the ground of economy. Of the sixty-two
 county asylums the weekly cost per head in
 maintenance in 1902 was, in thirty-six, which con-
 tained less than 1,000 patients each, 9s. 8½d.,
 whereas in twenty-six, each of them containing
 from 1,000 to 2,672 patients, the average weekly
 cost per head was 10s. 3½d., showing an excess of
 6½d. per head per week. As has been well pointed

out elsewhere, there would seem to be an unit of
 economical supervision and management which
 cannot be overpassed without waste and loss of
 efficiency. In the case of the Rowton Houses,
 this is said to have been found to be about 800
 beds. For these and other reasons of a similar
 nature we regard the present tendency unduly
 to enlarge county asylums as distinctly retro-
 gressive and opposed to the best interests both of
 the insane poor and of the public, upon whom
 falls the burden of their maintenance.

Temporary Buildings.—The Commissioners
 go on to state that immediately after the occur-
 rence of the deplorable and disastrous fire at
 Colney Hatch Asylum in the early part of 1903,
 resulting in the death of fifty-one patients and
 the entire destruction of the temporary
 buildings in which those patients were then
 lodged, they (the Commissioners) made a careful
 investigation with respect to the temporary
 buildings which had been erected at other
 asylums. They possessed themselves of full
 particulars upon all points which concerned
 their liability to danger from fire, and took such
 further steps as were within their power to limit
 that danger as far as possible and to insure the
 escape of the inmates in case of necessity. They
 made certain recommendations, and in some
 cases the course subsequently adopted in several
 of the institutions concerned had received their
 approval, but in others their strongly expressed
 opinions had been entirely disregarded. At
 Banstead Asylum the temporary buildings,
 first sanctioned in 1895, are still, the Com-
 missioners regret to report, in use, and in their
 opinion continue to menace the safety of not
 only the inmates of the temporary annexe but
 also the main building itself. It is the very
 strong opinion of the Commissioners that these
 buildings ought to be disused at the earliest
 possible moment, as they are constructed of
 highly-inflammable materials very similar to
 those with which the late temporary annexe at
 Colney Hatch Asylum was built. Pending the
 abolition of the temporary buildings the Home
 Secretary has approved certain alterations
 recommended by the Commissioners with a

New Offices for the Bristol Gas Company. Plan.

view to minimising the danger in case of an outbreak of fire. These alterations, which, in the judgment of the Commissioners, cannot safely be regarded as more than a temporary expedient, are as follows:—

- "1. The blocks of single rooms and the sides of connecting corridors have been removed.
- "2. The subways beneath the corridors have been partitioned by cross walls.
- "3. Concrete flooring has been laid at the entrance of the wards and also between the day-rooms and dormitories.
- "4. The work of staining and dry-rubbing the floors has been discontinued; and
- "5. Additional exits, opening outwards from all the rooms, have been provided."

With regard to the decision to erect at Banstead Asylum a new permanent block in lieu of the existing temporary buildings, the Commissioners express their strong objection to the course proposed on the ground that, as at Colney Hatch, there are special reasons militating against the proposals, inasmuch as both asylums are built upon estates too small to justify the enlargement of their buildings, the estate at Banstead being less than half the size which is regarded by the Commissioners as necessary for the purposes of an asylum in respect to the matters of exercise, recreation, useful occupation, and some forms of food supply.

The Commissioners also review at some length the proceedings in connexion with temporary buildings at the Denbigh, Durham, Essex, Glamorgan, Monmouth, Northumberland, Notts, Rainhill, and Brighton Asylums.

APPLICATIONS UNDER THE LONDON BUILDING ACT, 1894.

The London County Council at their meeting on Tuesday dealt with the following applications under the London Building Act, 1894. The names of applicants are given between parentheses:—

Clapham.—One-story shops in front of Nos. 20 to 48 (even numbers) inclusive, Battersea-rise, Battersea (Mr. W. N. Dunn for Mr. W. Williams).—Consent.

Kennington, South.—Buildings on a site on the south side of Kennington-road, Kennington, to abut also upon Palace gate (Messrs. Millard and Pryce for the Royal Exchange Assurance Company).—Consent.

Strand.—A projecting clock in front of Nos. 27 and 28, Haymarket (Mr. F. T. Verity for the Civil Service Co-operative Society, Ltd.).—Consent.

Hackney, North.—Retention at No. 45, Eastbank, Stamford-hill, Hackney, of an oak and tile porch at the front entrance, and of an oak and tile pent over the side entrance abutting upon Dunsmore-road (Mr. W. J. Ellis for Mr. T. Saxton).—Consent.

Hampstead.—Verandahs at Nos. 10, 12, 14, and 16, Crediton-road, Hampstead (Messrs. Boucher and Gibbs for Mr. E. Walker).—Consent.

Holborn.—A projecting clock at No. 125, High Holborn (Messrs. Jones and Ham for the Waltham Watch Company).—Consent.

Kensington, North.—An iron and glass shelter in front of No. 20, Pembroke-square, Kensington (Messrs. Towers, Ellis, and Co. for Mr. K. H. James).—Consent.

Kensington, South.—An additional story on the addition at the side of No. 42, Onslow-square, Kensington, abutting on Summer-terrace (Mr. E. H. Payne for Mrs. G. Hargreaves).—Consent.

St. George, Hanover-square.—A projecting sign in front of No. 157, New Bond-street, St. George, Hanover-square (Mr. I. C. Goodison for Messrs. Speaight, Ltd.).—Consent.

Chelsea.—Retention of a gas-meter house at the Ashburnham school, Lots-road, Chelsea (Mr. I. J. Bailey for the Education Committee of the Council).—Consent.

Clapham.—The completion of four houses, with porches and bay windows, on a site abutting upon the east side of St. James'-road and south side of Balham-park-road, Wandsworth-common (Messrs. White and Co.).—Consent.

Hammersmith.—Bay windows to twenty-two semi-detached houses in Flanchford-road, Hammersmith (Mr. A. Dawkins for Mr. W. G. Chapman).—Consent.

Hammersmith.—Re-erection of the "Wallington" public-house on the site of Nos. 102, 104, and 106, Uxbridge-road, Hammersmith (Mr. J. H. Richardson for Messrs. Watney, Combe, Reid, and Co.).—Consent.

Hampstead.—A bay window and porch to "Wayneffe," Eton-avenue, Hampstead (Mr. A. F. Faulkner for Mr. Willott).—Consent.

Hampstead.—A wooden porch in front of No. 30, Belsize-avenue, Hampstead (Messrs. M. H. Judge and Sons for Mr. F. Weintraud).—Consent.

Kennington.—One-story shops at No. 355, Wandsworth-road, Kennington (Mr. H. Bigrod for Mr. O. Camburn).—Consent.

Kennington, South.—Buildings on the south side of Hollis-street, Kennington (Messrs. Chesterton and Sons for Messrs. C. A. Daw and Son).—Consent.

Lewisham.—Twelve houses with bay windows on the northern side of Rutland-road, Perry-hill, Catford (Mr. W. C. Poole for Mr. J. Johnson).—Consent.

Lewisham.—That the application of Messrs. W. D. Church and Son on behalf of the Rev. F. A. Trick for an extension of the periods within which the erection of a porch in front of a proposed church on the south-eastern side of Torridon-road, Lewisham, was required to be commenced and completed be granted.—Consent.

Paddington, South.—A porch and balustrade in front of No. 36, Gloucester-gardens, Bishop-road, Paddington (Messrs. M. H. Judge and Sons for Mr. A. Dowie).—Consent.

Pekham.—Buildings on the site of Nos. 295 and 297, Commercial-road, Peckham (Mr. A. Budds for Mr. A. L. Horlock).—Consent.

Wandsworth.—The erection of sixteen houses with bay windows on the southern side of Mayford-road, Wandsworth-common, eastward of Ravenslea-road (Mr. W. C. Poole for Mr. W. E. Kerven).—Consent.

Lewisham.—One-story shops in front of Nos. 120 and 122, Sydenham-road, Lewisham (Mr. H. E. Davey for Mr. W. Cooper).—Refused.

Paddington, South.—A building upon the site of Nos. 127 and 129, Edgware-road, Paddington, to abut also upon Burwood-place (Messrs. Bouchier, Burmester, and Galsworthy for the London and Provincial Bank, Ltd.).—Refused.

Strand.—That the Council do not accede to the request of Messrs. Wilkinson, Howlett, and Wilkinson on behalf of Mr. P. Curzon for permission to retain a projecting wood and canvas sign in front of the Strand Theatre, Strand.—Refused.

Hackney, South.—The retention of a wood, glass, and iron porch at the Workhouse, Sidney-road, Hornerton (Mr. F. R. Coles for the Guardians of the Hackney Union).—Refused.

Hammersmith.—The retention of a sign-board in front of Nos. 36 and 38, Uxbridge-road, Hammersmith (Mr. A. Sykes for Messrs. Lilley and Skinner).—Refused.

Kensington, South.—A conservatory building on the south side of Cromwell-road, Kensington, westward of Collingham-road (Mr. J. D. Hunter for Mr. J. Russell).—Refused.

Kensington, South.—Stone entrance steps and a glazed canopy at No. 31, Holland-park, Kensington, to abut upon Holland-park-avenue (Messrs. Rawlings Brothers, Ltd., for Mr. R. Bradford).—Refused.

Norwood.—Houses with shops on the west side of Brixton-hill between Acre-lane and Hayter-road, Norwood (Messrs. Gush, Phillips, Walters and Williams for Mr. R. A. Johnston and Miss C. S. T. Johnston).—Refused.

Wandsworth.—A dwelling-house, No. 10, Mount Ephraim-road, to abut upon Blakemore-road, Wandsworth (Mr. W. N. Dunn).—Refused.

Westminster.—A one-story shop in front of No. 276, Vauxhall-bridge-road (Mr. H. Branch for Mr. R. W. Essex).—Refused.

Width of Way.

Hackney, Central.—The retention of a one-story building on the west side of Roseberry-place, Dalston (Mr. E. C. Trench for the North London Railway Company).—Consent.

Finsbury, East.—A building on a site abutting on Great Arthur-street and Little Arthur-street, Finsbury (Mr. J. Groom for Mr. C. Clifford).—Consent.

Battersea.—A building on the south side of Cabul-road, Battersea (Mr. E. Cannell for Mr. F. Priddis).—Consent.

Bethnal Green, South-west.—The retention of a building, consisting of a range of water-closets, on the western side of Paradise-row, Bethnal Green, with external walls and a boundary fence (Sir Joseph Causton and Sons, Ltd.).—Consent.

Greenwich.—A building on the west side of a street leading out of the south side of Greenwich-road, Greenwich, westward of the Royal Kent Dispensary (Messrs. Young and Hall for the Committee of the Miller Hospital and Royal Kent Dispensary).—Consent.

Southwark, West.—Buildings on the site of No. 54, Lant-street, Borough (Messrs. A. C. Potter and Co.).—Consent.

Hackney, Central.—The erection of houses on the west side of Woodland-street, Dalston, northward of Holy Trinity Church (Mr. D. P. Hayworth).—Consent.

Rotherhithe.—An addition at the rear of No. 42, Lower road, Rotherhithe (Mr. E. F. Thompson for Messrs. A. J. White and F. S. Neame).—Consent.

Wandsworth.—A church on a site abutting upon the east side of South-street and west side of Iron Mill-place, Wandsworth (Mr. W. Mountford).—Consent.

Brixton.—Two cottages in an alley in the south-cottages, Warham-street, Kennington (Mr. G. Trotman for Mr. J. Skinner).—Consent.

Width of Way and Line of Front.
Finsbury, East.—Buildings upon a site abutting upon the south side of City-road, east side of Nelson-street, and east side of City-road, Finsbury (Messrs. Yotis, Sturdy, Usher for Messrs. T. Wallis and Co., Ltd.).—Consent.

Kensington, South.—Two two-story buildings to a building on the east side of City-street, abutting upon the south side of Mall, Kensington (Mr. W. M. Weir for Mr. H. and T. Harris).—Consent.

Battersea.—The retention of a bay window in front of the Battersea Liberal Club, Colney-lane, Battersea (Mr. F. Banister for the Battersea Liberal Club).—Consent.

Lines of Frontage and Construction.

Islington, East.—An iron and glass canopy way at the first floor level in front of Nos. 302 and 304, Essex-road, Islington (Mr. J. Lovegrove for Mr. J. King).—Consent.

Rotherhithe.—The retention of a grain access Rotherhithe-street and of an iron bridge across Princes-stairs, Rotherhithe (Mr. G. Gillman and Spencer (1902), Ltd.).—Consent.

City of London.—The retention of an iron and glass covered way over London-yard, City, connecting Nos. 79 and 81, Paul's-churchyard (Messrs. J. Spence and Co., Ltd.).—Consent.

Southwark, West.—A deviation from plan approved for the erection of an iron and concrete gangway to connect the fourth floor of "Clink Wharf," Clink Wharf, Southwark, with the roof level of "The Works" on the south side of the street, as relates to the substitution of three 7 in. by 33 in. H steel joists for two 9 in. by 33 in. H steel main supporting beams, and chequered iron plate for the concrete floor of such gangway (Mr. R. H. Kerr for Mr. Noel and Sons, Ltd.).—Consent.

Rotherhithe.—The retention of two cases in front of No. 244, Southwark-road, Rotherhithe (Mr. S. J. H. Stua for Mr. Neave).—Consent.

Stepney.—The retention of a wood and building at the rear, and of a show-case the forecourt, of No. 274, Commercial Street.—Refused.

Formation of Streets.

Lewisham.—That an order be issued by C. J. Bentley sanctioning the formation of a new street for carriage traffic to lead out of the south-eastern side of stone-road, Lewisham.—Consent.

Whitechapel.—That the application of Messrs. R. Plumbo and Harvey for a revision of the period within which the widening and adaptation as a street for carriage traffic of the northern portion of Rose-street, Mile-end Old Town, was required, clearly defined by posts and markers, or otherwise as the Council might please, and thrown open to the public as a byway be granted.—Consent.

Greenwich.—That an order be issued by C. Reilly, refusing to sanction the formation or laying out of new streets for carriage traffic, out of the west side of Victoria-charlton (for the President and Governors of Queen Elizabeth's College, Greenwich).—Consent.

Hampstead.—That an order be issued by Messrs. Farebrother, Ellis, and Co. refusing to sanction the formation or laying out of new street for carriage traffic, to lead from Redington-road to Bracknell-gardens, Istead (for Sir Spencer P. M. Marryon-V. Bart.).—Refused.

St. George-in-the-East.—That an order be issued by Mr. A. Davis refusing to sanction street for foot traffic formed at the rear of houses in Morgan-street, Stepney.—Refused.

Cubical Extent.

Hoxton.—A modification of the consent upon which consent was given under sections 207 and 76 of the Act, to the erection of the Guttapercha Company's premises, V-road, Hoxton, of a building with two divisions, each exceeding in extent 250,000 cubic ft., so far as relates to the omission of fire-resisting plaster, 2 in. to five columns, on which columns cranes, in the testing-tank room in the basement (Mr. P. E. Pilditch for the Guttapercha Company).—Consent.

Clapham.—The erection at the Brick Nine-alms-lane, Nine-elms, of a building exceeding in extent 250,000 cubic ft., and used as a bottling store (Messrs. Lee and Co. for Messrs. Thorne).—Refused.

Space at Rear.

Windsor.—A modification of the provisions of section 41 of the Act with regard to open spaces about buildings, so far as respects to the proposed erection of a building on the south-west side of Totterdown-street, being, with an irregular open space about a building (Mr. W. Bartholomew).—Consent.

Wolwich.—A modification of the provisions of section 41 of the Act with regard to open spaces about buildings, so far as respects to the proposed erection of an addition to Northam-road, Plumstead, with an irregular open space at the rear (Mr. J. H. Sutcliffe Mrs. S. H. Smith).—Consent.

of Frontage, Width of Way, and Widening of Street.

Pancras, North.—A building upon the site of Nos. 9, 11, 13, 15 and 17, Highgate-st. Pancras, to abut also upon Green-place, and in connexion with the erection of a building the widening of a portion of Green-wood-place (Mr. G. H. Greatbaird for W. A. Curnock).—Refused.

Buildings for the Supply of Electricity.

City of London.—A deviation from the plans approved for the construction of a five-story building on the site of Nos. 32, 33, and 34, Church-street, City, so far as relates to certain alterations of the positions of the main partitions and the addition of an staircase between the ground and first floor; (2) the placing of all the lavatories on the fourth floor instead of distributing them on the various floors; (3) the addition of lavatories in the rooms thus cleared of lavatories; (4) the placing of a lantern light over the fourth floor lavatories; (5) the omission of skylight, which was formerly over the lavatories on the ground floor (Mr. W. E. Brown for the Charing-cross and Strand Electric Supply Corporation, Ltd.).—Consent.

Means of Escape at Top of High Buildings.
Waterloo.—Means of escape in case of fire, to be provided in pursuance of section 53 of the Act, on the sixth (top) story of the Waterloo Hotel, Jermyn-street, St. James' upper surface of the floor of which story rose 60 ft. from the street level for the persons dwelling or employed therein (Mr. D. Martin for the Waterloo Syndicate).—Consent.

Means of escape in case of fire.—Means of escape in case of fire, to be provided in pursuance of section 53 of the Act, on the seventh (top), sixth, and fifth stories of the Savoy Hotel offices (block), Strand, for the persons dwelling or employed therein (Messrs. Colclutt and Co.).—Refused.

Recommendations marked + are contrary to the views of the local authority.

ENGINEERING SOCIETIES.

ROYAL UNITED SERVICE INSTITUTION, Whitechapel.—At a meeting held on the 3rd inst., Mr. D. B. Butler, President in the chair, a paper was read on "Deep erosion and foreshore protection," by Mr. E. Allanson-Winn, M.Inst.C.E.I., and of the following is an abstract:—The speaker first pointed out that, in consideration of the erosion in the majority of cases given to the visible shore and the agencies of destruction, whilst the physical conditions and changes going on in the depths of the sea were overlooked. The theory advanced by him was that, in all places where the encroachment of the sea was steady and continuous and the soil was of a soft and easily eroded nature, considerable depth below low-water level, protective devices erected on the visible shore in high and low water marks would not only arrest the encroachment of the sea, but they might afford temporary protection by collecting and retaining material for short periods. It would not be denied that the sea had been changing in many places, and the author said he would not lay claim to any fresh discovery in this direction, but he claimed to be the first to bring to the public attention a new point of view, and to suggest that very often the encroachment of the sea was due more to the presence of material below low-water level than to the erosion of the visible shore. It was this new aspect of the problem which appeared to be deserving of the attention, and the author observed that investigations should be made with the view of ascertaining to what extent the unseen forces might be causing the encroachments in any particular place, how far the theory applied to any particular case, and what measures should be taken to mitigate the evil. Instances were cited

of places on the east coasts of both England and Ireland where, in the opinion of the author, that class of erosion was especially marked. An account of the inland march of the sea at Glenbeigh during the past fifty years was given to show how persistently deep water had advanced, whilst additional evidence was produced to prove a similar state of affairs all along the Holderness coast of Yorkshire, where might now be pointed out situations, in the neighbourhood of the present five-fathom line, where formerly towns and villages stood on the dry cliffs. The author held that additional absolute proof of deep-sea erosion was to be found in the carrying up of sand, shells, and large stones attached to the *laminaria digitata* and various deep-sea weeds. Those materials could only come from depths below low-water level, and it was certain that on their removal the vacancy caused must have been, in the first instance, filled up by sea-water, and that therefore the depth of water at that particular spot must have been greater than it was prior to the removal. In other words, the erosion had caused an advance of deeper water shorewards. Allusion was made to the possibility of the sinking or subsidence of certain coast lines and the rising of others. The author stated that he had heard that the south of Ireland was subsiding and the north rising, and that in Norway the inhabitants showed certain marks on the rocks which were formerly washed by the waves, but which were now far beyond the reach of even the highest tides. He stated, however, that he had had no opportunity of investigating those alleged alterations of levels, and, of course, any comparison of shore levels with adjacent bench marks would only be misleading, as the bench marks themselves would probably have sunk as well as the neighbouring country. The author suggested that a clearer view might be arrived at if we regarded as "sea bed" all surfaces actually beneath the sea at highest spring tides. If that view were accepted, we could more easily eliminate from our minds the popular fallacy that all our troubles began and ended in the changes observed on the little strip of visible shore between high and low water marks. He observed that it had been so long customary to speak of "beach," "shore," or "foreshore," as quite distinct from "sea bed" or "sea bottom," that we might get into the habit of regarding them as not being continuations of the same surface. We had, for example, been in the habit of regarding the shore as a natural bank with a very flat gradient, the toe of which extended to low-water mark. It would be more correct to look upon the junction of the glacial drift or other erodible material with the chalk, rock, or other hard material as the toe of the bank under consideration, quite irrespective of whether the junction was above or below low-water level. Alluding to protective devices, the author described a form of slanting and curved groyne which he thought might be applied to many shores with advantage. He claimed that that form of groyne combined many of the advantages of the high slanting groynes and the low groynes. In conclusion, the author mentioned that he believed he had discovered an entirely new method of groyning, and that, as soon as he had given his discovery a practical test, he would bring the subject before the Society.

COMPETITIONS.

STAMFORD FREE LIBRARY.—Messrs. Buckland and Farmer, who were given as the winners of the second premium in this competition, write to say that the name of Mr. G. H. Vernon Cale should have been given, as their partner in the preparation of the design. The mistake is not ours; we gave the list as officially communicated.

THE PROPOSED CONCERT HALL AND PAVILION, AYR.—The Town Council at a special meeting on the 29th ult. considered a report by Mr. James A. Morris, F.R.I.B.A., Ayr, who had been appointed assessor on the twenty-nine competitive plans for the proposed concert hall and pavilion on the Low Green. Mr. Morris placed first the plans sent in by Mr. J. K. Hunter, Ayr, and bracketed equal the designs submitted by Mr. Henry Higgins, jun., 248, West George-street, Glasgow, and by Mr. Eric A. Sutherland, 90, Renfield-street, Glasgow, and Messrs. Magnall and Littlewoods, 42, Spring Gardens, Manchester, jointly. In accordance with the assessor's decision Mr. Hunter was awarded the 50*l.* premium, and it was agreed to give 25*l.* to each of the next two.

SCHOOL, ACCRINGTON.—The Accrington Town Council in committee on the 3rd inst. rejected a recommendation from the Education Committee that plans for a new day school at Woodnook be prepared by the Borough Surveyor, and that the latter should be paid an honorarium of 200*l.* This work is to be thrown open to competition, and 400*l.* awarded to the successful architect. —*Yorkshire Post.*

Books.

The Cathedrals of Northern France. By FRANCIS MILTOUN. London: T. Werner Laurie. 1904.

THIS is an octavo volume of nearly four hundred pages—perhaps a small space into which to compress an adequate description of so large a subject. The author appears to have devoted much time and labour to this work, and to have personally visited the buildings. He has no doubt endeavoured, as suggested in the introduction, to produce something that has little resemblance to a guide-book, and the letterpress is chiefly a record of personal impressions and criticisms interwoven with a certain amount of technical detail and historical facts. Whether so large a subject can be dealt with satisfactorily in this way is doubtful, and, although there is a certain charm in portions of the work, the whole fails to impress, and at the same time suggests the desirability of conciseness in arrangement. No less than ten appendices are at the end of the book, much of the information in which might well have been incorporated in the descriptions. A glossary of architectural terms—which seems an almost inevitable adjunct to this kind of book—is included.

The illustrations and plans are of the poorest possible description. It is inconceivable that, in these days of improved book illustrations, such drawings of Notre Dame, Beauvais, Chartres, and Amiens—to mention but a few—should find a place in the book at all. It would have been far better had they been omitted. And when at the beginning of the book we find the book dedicated to "the genius of the race which made possible the existence of these architectural glories of France," it seems quite unaccountable that more care was not taken to make the illustrations worthy of the subject. In Appendix No. 6, which has a series of plans to a very small scale, plans of portions of the city are in three instances introduced instead of the plan of the church. There is no plan of Chartres and several of the lesser buildings given in the list.

With adequate illustrations and plans the book would be vastly improved; and it would be well if the somewhat ghostly representations of four cathedrals on the cover were omitted.

Hints on the Planning of Poor-Law Buildings and Mortuaries. By ALBERT C. FREEMAN, architect. London: St. Bride's Press.

THE paper, type, and binding of this book are so admirable that the reviewer brings to the reading of it a mind prepossessed in its favour. His pleasant anticipations, however, are soon shocked by the slipshod English in which it is written. The second paragraph of the first chapter (page 11) is an early example, but many others occur throughout the book. On page 22 there are two, which we quote as specimens:—"The building, if planned with two wings or projecting blocks at the rear of the building, the male and female accommodation can be satisfactorily arranged in the respective wings or blocks"; "Apartments are necessary in a large infirmary for an assistant medical officer in addition to the medical officer, and he situated as to afford complete privacy." On page 39 the author is unconsciously humorous—"Wards provided for epileptic patients should be placed on the ground floor level, this class of patient being subject to fits." The italics are ours.

We hasten to add that the author's general treatment of his subject is better than his grammar. He discusses in turn the various rooms and buildings which go to the making of a complete workhouse, including the buildings for casuals and vagrants, the administration buildings, receiving-wards, buildings for the able-bodied, aged and infirm, isolation and maternity wards, mortuaries, laundries, etc. The subject of "Cottage Homes for Children" is also fully treated. Many excellent hints are given,

and the requirements of the Local Government Board are clearly stated. The illustrations are a valuable feature, and include many examples of buildings or parts of buildings designed by well-known architects. With one exception, the north points are not marked on the plans; this is a serious omission, and is not rectified in the text. Precise hints on the best aspect for the various rooms, and particularly for the wards, ought certainly to have been given.

Model Answers to Questions Set by the Sanitary Institute. London: The Sanitary Publishing Co. 1904.

It is not an easy matter to answer examination questions tersely and accurately, and we fear that some of the answers given by the anonymous author of this volume would fail to obtain the full number of marks. In his "Advice to Candidates" he says wisely, "before answering a question, it should be read, and read again, until it is thoroughly understood," but he does not always practise what he advises. The answer to Question 23 ignores the first part of the question and does not adequately consider the subordinate clause in the second part. Question 108 asks, "What are the contents in cubic feet" of a certain room? The author cuts off 3 ft. from the side of the room, "on account of the lowness of the sloping part of the ceiling"—it is 7 ft. high at the lowest part—and gives the cubical contents of the remaining portion. This is not a correct answer to the definite question. "Why is a valve-closet inserted for use as a slop-sink?" is not answered by giving objections to such use. In the next answer the author omits to mention pail-closets, although the question specifies them, and also ignores the "economic" merits and demerits of the different types of closet. He appears, also, to forget that the Sanitary Institute hold an examination in "Practical Sanitary Science," which is attended by many who are not sanitary inspectors; and he makes the mistake of introducing a great deal of irrelevant matter as to the powers of sanitary inspectors into his answers to questions of a purely practical nature. Question 141 asks plainly, "What points should be specially considered in testing drains and soil-pipes?" The answer contains about 160 words entirely irrelevant to the question, and devotes only sixty words to an answer in which soil-pipes are not mentioned. A still worse example is the answer to Question 145—"How would you inspect the concrete and brickwork in a house in course of erection?" The answer contains 400 words, of which 350 are superfluous and the remaining fifty are a sanitary inspector's evasion of the direct question. These are not the only answers which appear to us to be defective or erroneous, but it is unnecessary to give other examples. The book is evidently written for sanitary inspectors, and many of the answers are quite accurate and to the point. May we suggest another scrap of "Advice to Candidates"? "Never say anything about matters not directly included in the question; if you do, you exasperate the examiner, and also increase the possibilities of error."

Heating and Ventilation of Houses. By C. F. TOWNSEND, F.C.S. London: Dawbarn and Ward. 1904.

This is one of a series of "Rural Handbooks." It is a little book of thirty-six pages, and, as about one-fourth of the space is occupied by illustrations, it is obvious that the subject is not treated in an exhaustive manner. The author is in favour of admitting air to a house by means of a downcast shaft, the top of which is 20 ft. or 30 ft. above the ground, but this is not such an easy matter as the author appears to think; the shaft can be built, but whether the air will always flow down it is another matter. In the part on heating, we look in vain for some of the most modern types of fire-grate. The author writes lucidly and to the point, and the book is clearly printed on good paper.

Old West Surrey. By GERTRUDE JEKILL. London: Longmans, Green, and Co. 1904.

This book is a record of the old buildings, furniture, industries, and habits of the people of West Surrey, and, though pretending to no literary style, is yet a most pleasant book to read. There are more than three hundred

illustrations from photographs, taken by the author. The cottages are familiar to many who do not know Surrey, for they are the same that Mrs. Allingham so often gives us in her pictures. There are two photographs of new cottages on an old pattern, which are very charming. There are also some delightful specimens of furniture, especially the oak linen-hutch on page 51 and the chairs on page 60.

One chapter deals with the people themselves and their old sayings and doings, another with their clothes, and one, perhaps the most interesting of all, treats of "churchyards then and now." In connexion with this subject the author has some excellent remarks on the difference between ancient and modern churchyard monuments:—

"In the older days, monuments in country churchyards erected to the memory of people of means and of some importance of standing were specially designed by a competent architect. Often they took the form of fine altar-tombs—monuments of much dignity, excellent in proportion, with sufficient and well-placed ornament and well-drawn mouldings. . . . The monuments, if any, to members of the labouring class or people who could not well afford stone were the dignified but unpretentious grave-boards. Each district had a traditional pattern of funeral at the heads of the posts and of ornamental outline of the lower edge of the board. The latest I know in this district bears the date 1861. It is much to be regretted that this simple form of monument should have passed out of use. The cast-iron crosses from the ironmonger's pattern-book are but a sorry substitute for the honest piece of carpenter's work made in the dead man's own village, perhaps by a younger man of his own blood; in any case by one who was known to him."

"It is this invasion of the pattern-book and love of meretricious display that is so regretably spoiling our churchyards. It was a sad day for the most hallowed spots of English ground when traders introduced from the Continent and pushed into public notice those artificial wreaths under half round glasses that debase and disfigure so many of these sacred places. . . . I have seen as a monument over a grave (in France) an iron erection exactly like a hat-stand, with pegs for the holding of bead-work wreaths. Is this honouring the dead? Let us jealously guard and treasure the quiet beauty and dignity of our country churchyards and, above all, keep them from the desecration of anything ill-designed, mean, or tawdry."

Minchew, Porlock, and Dunster. By C. E. LARTER. Second Edition. London: The Homeland Association. 1904.

NOTHING but praise can be said of this excellent guide—one of the Homeland Series—with its interesting and brightly-written letterpress and capital illustrations—chiefly from photographs, but including some from drawings by Mr. Gordon Home. The district of Exmoor and that which lies immediately to the east, on the Somerset side, is full of most picturesque villages. Minchew itself has in recent years become a flourishing watering-place, without losing, however, the picturesque quality of the old port and village; and there are numberless points of interest and attraction in the villages between it and the Quantocks, including Dunster, and the Cistercian Abbey at Cleve. West of Minchew is Porlock. All are well illustrated and described, and four chapters are added on the stag-hunting, fishing, and geology of the neighbourhood.

BOOKS RECEIVED.

STUDIES IN ASTRONOMY. By J. Ellard Gore, F.R.A.S. (Chatto and Windus. 6s.)

THIRTY-THIRD ANNUAL REPORT OF THE LOCAL GOVERNMENT BOARD. (Eyre and Spottiswoode. 4s. 11d.)

A HANDBOOK TO AGRA AND THE TAJ. By E. E. Havell. (Longmans, Green, and Co. 5s.)

SUNDIALS: PAST AND PRESENT. By T. Harrison Myres, F.R.I.B.A.

PRACTICAL SURVEYING. By G. W. USH, A.M.Inst.C.E. Eighth edition, revised and enlarged by A. Beazeley, M.Inst.C.E. (Crosby Lockwood and S. n. 7s. 6d.)

A DOULTON PANEL FOR RUSSIA.—Messrs. Doulton have on view a large ikon, 15 ft. 10 in. by 11 ft. 9 in., executed to the order of Mr. Robert Meltzer, Court Architect, for the Orthopedic Hospital now being built in St. Petersburg. It is to be built into the outside front wall, and is in a hard-fired material to resist the extreme cold.

TRADE CATALOGUES.

MR. J. S. HENRY sends us five little but wooden electric fittings. The illustration either hanging or standard lamps. Wood material that has not been much used in connexion, and it has distinct possibilities of artistic treatment. The designs shown in the catalogue are almost entirely new ones with few exceptions, are of considerable value. One advantage of the use of wood in metal is the saving of expense. We remember to have seen before fittings at a reasonable price.

Messrs. Orenstein and Koppel send us catalogue No. 620, chiefly occupied with illustrations of requisites for portable railway contractors' trucks, and wagons of various incline and overhead railways, tank locomotives and of the concrete mixer made by them. Very little descriptive matter is given in the mere names of the different objects, but the pamphlet will be found useful to contractors and others using plant of the kind illustrated.

We have received from the General Electric Co., of Queen Victoria-street, a new edition of their catalogue of main switches and circuit breakers. The class of switch described seems admirably adapted for its purpose, the break being long and being made very rapidly. "Adelphi" switches, which are contained in iron case, are very substantial, and should be the requirements of those who use motors running at high pressures. We are glad to see the cut-outs are made with a sufficiently large break, and that a large clearance is left between the conducting metal parts and the The "hobbin" and "arch" types of which are made of porcelain are well known and are very suitable for main switchboards.

The Student's Column

NOTES ON PORTLAND CEMENT.

CHAPTER X.—THE ACTION OF SEA-WATER.

THE failure of cement concrete at Aberdeen Harbour in 1887 was a considerable amount of attention amongst engineers who were engaged in the construction of sea-water works. Reports of Mr. Smith, the Harbour Engineer, in conjunction with Professor Brazier, Aberdeen University, went to show that the action of sea-water had a decomposing effect on cement. In this opinion they were supported by the late Mr. Messent, an engineer of considerable experience in sea work. After a considerable amount of chemical and physical research these gentlemen, the conclusion drawn was that the sea-water had a dissolving action on the cement, as shown by the amount of magnesia in the concrete taken from the dock. Professor Brazier attributed the presence of this magnesia to the sea-water dissolving lime out of the cement and the solid lime precipitating the magnesia from the water. To corroborate his views, he dissolved cement in a powdered state with sea-water with constant stirring to prevent it from setting, and found that a certain amount of lime dissolved out and a quantity of magnesia deposited.

Professor Brazier, however, lost sight of the fact that, by preventing the cement from setting, the free or loosely-combined lime in all Portland cements was not allowed to combine with the compounds which would resist the action of the sea-water. It does not follow because cement in the powdered state is acted on by the salts in sea-water, that the same cement will be decomposed after setting, as its chemical constitution is quite altered in the process of setting.

It was afterwards conclusively shown that the Aberdeen failure was due to poor quality cement, excess of sand, and the porous nature of the concrete.

Candlot investigated the action of sea-water on mortars, his experiments extending over a period of forty years. The mortars were of Portland cement, natural cements, puzzolanas mixed with sand, trass, etc. The Portland cement blocks remained in good condition, while all the others completely lost their cohesion in different periods. Neat cement was found to more rapidly acted on than cement and mortar, and the mortars offering the greatest resistance were those consisting of 1 part cement to 1 or 2 parts sand, or a proportion

ent sufficient to fill the voids between
ins of sand, this making the least porous

Chatelier has shown that compounds of
um are the constituents of cement
subject to attack by sea-water. The
osition arises from the action of calcium
e on the aluminates of lime, and the
sulphate is itself produced by a reaction
in the lime in the cement and the sulphate
nesia in the sea-water. The disintegration
the greater the larger the percentage
ina in the cement; thus, with cement
ing 1 to 2 per cent. it is very slight,
with 7 or 8 per cent. the swelling in sea-
water is marked.

In the view of producing a mortar more
in sea-water, Le Chatelier investigated
ct of replacing alumina by other oxides
acting with sulphate of lime. The
ments tried were oxides of iron, cobalt,
manganese. The cements thus
d were found to be more stable in the
e of sulphate of lime than those con-
much alumina, the best results being
d with Fe₂O₃.

Chatelier also observed that cements
small percentages of lime are less
than those with more lime and an
percentage of alumina, and that addition
olana does much to mitigate the chemical
of sea-water.

Chatelier has supplied some valuable
on the action of sea-water on
d cement. He maintains that Portland
from a chemical point of view, is too
lime. Cement containing 61.04 per
lime would leave after setting 13.79 per
O unhydrated. In a cement of average
tion with 1 part silicate to 2 parts
5 per cent. CaO or 33 per cent. Ca(HO)₂
be segregated. A body containing a
ee of such strong chemical affinity as
se cannot be regarded as stable. The
ne will continue to react till it forms
ed compounds.

In the mortar hardens in air or water
ing CO₂, the lime is converted into
ite but in sea-water it is chiefly the
es which act on the lime.

The formation of the sulphate of lime with
bivalents of water causes a considerable
of volume, and may destroy the
a of the mass.

The formation of sulphate of lime, the
ion of lime-alumino sulphate goes
hand, and causes an enormous increase
ne and a total destruction of the cohesion,
e double compound crystallises with
t, thirdly, probably sixty, equivalents
r, and, in doing so, converts the strongest
into a mud, the only parts of which
g any cohesion being those protected
formation of carbonate. Even if cement
be exposed to air till a protective skin of
ite is formed, such a skin cannot attain
siderable thickness, and the chemical
to which the destruction of the cohesion
attributed will eventually take place.

In order to ascertain the action of carbonic
d sea-water on the strength of concrete,
e of experiments were carried out by
is.

sets of briquettes were made up accord-
e German standard rules, one composed
rt by weight of cement to 3 parts by
of sand, and the other 1 part of cement
arts of sand. These briquettes were
to harden twenty-four hours in air,
ected from CO₂, then placed in
distilled water for fifty-six days, the
h which they were kept being hermeti-
cally sealed. Half of the briquettes were
eated with moist CO₂ for thirty-five
hand were finally returned to the
vessel, in which they were kept nine
days longer. When tested, the
riquettes were, therefore, 120 days
e 1 to 3 mortar protected from CO₂
tensile strain of 148 lb. per sq. in.;
e briquettes treated gave 156.7 lb.
n. The crushing strength was 1,699.5 lb.
59 lb. respectively. The 1 to 5 mortar
sile strain of 77 lb. and 92.4 lb. per sq. in.
ushing strength of 616 lb. and 759 lb.
1 to 3 briquettes only 13.3 per cent.
the 1 to 5 briquettes 24.8 per cent.
d lime was converted into carbonate.

ersed in sea-water or a 0.2 per cent.
of magnesium sulphate, the briquettes
ad been protected from the action of
n disintegrated, and even those which

had been carbonated were strongly attacked
in seven weeks, especially the 1 to 5 mortar.

In fresh-water the conditions are more
favourable, for only the free lime can be dis-
solved or converted into carbonate.

The more lime is dissolved out, the more
insoluble are the residual silicates and alumi-
nates. The magnesia which is deposited during
the action of sea-water upon cement mortar
is a preservative agent which tends to close
the pores of the mass. It would be more
correct to speak of the injurious action of the
sulphates in sea-water than to attribute such
action to the magnesium salts, although it is
true that magnesium sulphate is the special
salt which acts in sea-water. The sulphates of
lime or the alkalies, in fact any soluble sulphate,
have the same destructive action, but do not
act with the same degree of energy.

Micheli's finds that those cements which are
richest in lime offer least resistance to sea-
water. A mortar containing free caustic lime
is as unstable from a physical as from a chemical
point of view, as by reactions already explained
great internal strains are produced and expansion
and cracking continues sometimes for
years.

All these defects may be avoided by offering
to the lime, which remains or becomes free
during the hardening process, hydraulic silica
or alumina, with which it can form more stable
compounds. The addition of trass or of an
efficient puzzolana to hydraulic cements
containing an excess of lime, such as Portland
cement, can increase the strength of mortar
very considerably and render them stable in
sea-water. Hydraulic cements which contain
more lime than is required to form stable
hydrosilicates and hydroaluminates should
not be used for marine work unless improved
by the addition of substances, such as those
named.

Sea-water, no doubt, attacks unset cement,
for, if a pat of cement be placed in it im-
mediately after gassing, in a short time magnesia
will be found to be deposited, and the surface
of the pat will be soft, while the inside will
be perfectly hard.

This would point to the advisability of using
a quick-setting cement for sea work, so as to
allow of as little action as possible. It has
been sufficiently proved that sea-water, when
allowed to pass through concrete, has a destruc-
tive action; but it has also been conclusively
proved that, if the concrete is made dense so
as to present as little surface as possible to
the action of the sea-water, there is not much
to fear from the action of the latter.

As set and dense concrete is but little acted
on by sea-water, the block method of con-
struction appears to be the best. The sack
method adopted by Mr. Carey at Newhaven,
is no doubt good, as it keeps the concrete in a
dense mass till set, but, as Mr. Carey himself
remarks, in the use of large masses by this
system a great deal depends upon the rapid
mixing of the concrete so that the sack may be
placed in its allotted position before setting
commences, otherwise not only will it not
settle down in its place properly, but the
strength and homogeneity of the mass will
be impaired.

LAGOS MAHOGANY.

In the annual Blue Book for the Colony
of Lagos for the year 1903, it is remarked
that the timber industry may be said to have
had its inception in 1897, when 275 logs,
valued at 1,722*l.*, were exported. This in-
dustry, which has now become an important
one, is subject to very considerable fluctua-
tions, as may be seen from the following
figures, which represent the exports of timber
for the last five years:—1899, 7,680 logs, value
34,738*l.*, or an average of 4*l.* 10*s.* 5*d.*; 1900,
15,250 logs, value 58,574*l.*, or an average of
4*l.* 8*s.* 1*d.*; 1901, 4,540 logs, value 12,216*l.*,
or an average of 2*l.* 13*s.* 10*d.*; 1902, 12,049
logs, value 33,292*l.*, or an average of
2*l.* 15*s.* 3*d.*; 1903, 15,785 logs, value 56,167*l.*,
or an average of 3*l.* 11*s.* 2*d.* The market
value, as shown by these figures, varied
largely, and there can be no doubt that the
high prices obtained in 1899 and 1900 stimu-
lated this trade to such a degree that a great
many immature trees were brought into the
market, and hundreds or thousands of logs
that were found to be unsaleable were left to
decay and rot in the forests and rivers of the
territory. The destination of the timber ex-
ported during the two last years has been:—
1902, to Germany, 1,261 logs, value 3,939*l.*;
to Great Britain, 10,652 logs, value 28,846*l.*;
to New York, 136 logs, value 507*l.* In 1903,

to Germany, 1,323 logs, value 3,600*l.*; to Great
Britain, 14,170 logs, value 51,850*l.*; to New
York, 287 logs, value 517*l.* Many immature
trees are still being cut down and wasted, to
no present profit, but to the great prejudice
of the future. All the forests are native pro-
perty, and practically all are at present
beyond the direct jurisdiction of the Colonial
Government. Efforts that were made to
regulate the industry so as to protect the
forests from the waste and mismanagement
that still go on were, to a large extent, frus-
trated, and the forest law that was passed by
the Legislature is, in the form in which it
had to be promulgated, quite inadequate to
preserve the forests. The only really valuable
remedial measure that has been applied, is
the setting apart of considerable forest
reserves, which have been put by the native
owners into the charge of the Colonial
Government for a period of fifty years. This
will at least preserve a sufficient number of
hardwood trees to supply seed for future
planting. Unless the forests are brought
under the control of the Government in a
way that is not the case at present, it would
be futile to look upon the timber industry as
a permanent one of important dimensions. It
is but too manifest that the forest area is
being steadily reduced by the inroads of the
farmer. This is more particularly noticeable
in the central districts. The forest soil is
richer and more fertile than land that has
been recently cultivated, and there is thus
a strong temptation to constantly clear and
plant new fields at the expense of the forest.
At the same time the natives have a great
love for trees, and one of their very best
instincts is the planting and preserving of
numerous beautiful shade trees in their towns.
But they have not yet learned generally the
importance and the great value of the forests
in retaining moisture and providing perma-
nent articles of export, if prudently managed.
In fact, the idea of forest management is
new to them, and much time and patience is
required to bring this home to the native
mind. In many parts of the country only the
hardwood tree has been left standing to indi-
cate to the observant traveller that at no
very remote date a much greater area than
at present was covered by forest, all of which
has been cleared away and destroyed, except
the great and beautiful "Iroko" tree, which
has been spared through the fact that some-
wise and thoughtful priest dedicated that
tree to a sylvan deity, whose abode it is, and
whose living temple has thus escaped the
hand of the destroyer until now, when it is
being cut down in the interest of trade.
What is most required at present is a stringent
general law to prevent the cutting down of
immature hardwood trees.

METROPOLITAN ASYLUMS BOARD.

The usual fortnightly meeting of the
Managers of the Metropolitan Asylum Dis-
trict was held on Saturday last week at the
offices of the Board, Victoria Embankment.

Among a large correspondence received from
the Local Government Board were letters
sanctioning the following, among smaller
works:—Enlargement of workshops at the
Western Hospital, 285*l.*; additional male staff
mess-room and store accommodation at the
Western Hospital, 595*l.*; works in connexion
with the laundry at Leavesden Asylum, 1,800*l.*;
alterations and additions at Belmont Asylum,
1,750*l.*; fire exits at the South-Western and
Eastern Hospitals, 169*l.*; cottages for married
attendants at Leavesden Asylum, 350*l.*; addi-
tional infirmary accommodation for imbeciles
at Leavesden and Caterham Asylum, 1,825*l.*;
and additional storeroom accommodation at
White Oak School, 275*l.*

Southern Hospital.—The Works Committee
reported that they had authorised the issue on
the contractors, Messrs. Johnson and Co., of
orders for sundry extra works amounting in
value to 185*l.* 16*s.*

Tooting Bee Asylum.—On the recommenda-
tion of the Committee, Messrs. Fowler and
Hugman were appointed to take out the
quantities of the proposed additional build-
ings at Tooting Bee Asylum.

North-Western Hospital.—The Board ap-
proved and adopted a plan, prepared by the
Engineer-in-Chief, of a cottage for the resident
engineer at this hospital. The estimated cost
of the building is 500*l.*

Leavesden Asylum.—The Asylums Com-
mittee submitted a report by the Engineer-
in-Chief on the working of the water-
sterilising and softening apparatus which has
been installed at Leavesden Asylum. The
conditions of the contract had been complied
with in all particulars except that of the
softening of the water. The contract re-
quired that the hardness of the water should
be reduced to 7 deg., but, as yet, the apparatus
had reduced it to only 9½ deg. The

contractors, however, considered that the softening of the water would improve, and had agreed that the plant should be put into ordinary working practice for three months. This agreement was accepted.

OBITUARY.

MR. HUNT.—The death is announced of Mr. Henry Arthur Hunt, of the firm of Messrs. Hunt and Steward, of No. 45, Parliament-street, Westminster, surveyors, and of No. 19, Warwick-square, Piccadilly. Mr. Hunt died at Ponza on September 26, aged sixty-eight. He was a son of the late Sir Henry Arthur Hunt, C.B., who, during a long period, was Consulting Surveyor to H.M.'s Office of Works. On leaving Westminster School Mr. Hunt adopted the profession of surveyor, and having received some practical training in Thomas Cubitt's workshops, and in the offices of Philip Hardwick, the architect, he entered his father's office. He was the honorary architect of the new junior school at Clapham Junction for the Royal Masonic Institution for Girls, 1902-3; his firm were, we believe, architects of the buildings on the Thames Embankment for the Thames Conservancy, and in Regency-street, Westminster, for the Canteen and Mess Co-operative Society. Mr. Hunt was a Fellow of the Surveyors' Institution, and held the appointments of surveyor to the Royal Commissioners for the Exhibition of 1851, the Paddington Estate Trustees, the Dean and Chapter of Westminster, the Corporation of the Sons of the Clergy, and the Chelsea property of Lord Cadogan. He took an active part in the management of several of the Westminster eleemosynary and educational charities, and was a Governor of the Emanuel, Greycoat, and United Westminster Schools. He served on the House Committee of the Royal Masonic Institution for Girls, and in recognition of his services to the craft was, in 1891, raised by his present Majesty, then Grand Master, to the rank of Past Grand Superintendent of Works.

GENERAL BUILDING NEWS.

NEW BOARD-ROOM FOR THE SOUTH SHIELDS UNION.—The extensions and improvements which have been carried out at the South Shields Union offices in Barrington-street have now been completed, and the new board-room for the Guardians has been opened. The new buildings comprise, on the basement floor, an applicants' waiting-room at the rear, with offices for relieving officers adjoining. The entrance to the ground floor is by a hall, approached from Barrington-street, on the left of which is the old board-room, which has been converted into rate collectors' and overseers' offices, registrars' office, and waiting-room. Rooms are also provided on the ground floor for the vaccination officer, superintendent relieving officer, etc. On the first floor are the clerk's, general, and private offices, committee-room, etc., and at the rear is the new board-room, 36 ft. by 28 ft. It has a barrel vaulted roof, the ceiling decorated in white and gold, and a dado panelling of oak. The main staircase is constructed of concrete, with ornamental metal balustrading, and is lighted from the roof. There are rooms for the caretaker, and store-rooms on the second floor. Two fire-proof rooms are provided for the storing of books and documents. The work has been carried out by Mr. J. C. Nichol, contractor, South Shields, from designs prepared by Mr. J. H. Morton, architect, South Shields.

PUBLIC LIBRARY AND HALL, HATTON, N.B.—The foundation-stone of the new Hatton Public Library and Hall was laid a short time ago. The building is to have a frontage of 50 ft. On the ground floor will be a lending library and reading-room, each 28 ft. long by 20 ft. broad, also ladies' and gentlemen's waiting-rooms, cloak-rooms, etc., with a vestibule. Above is to be the hall, 51 ft. long and 23 ft. wide, exclusive of a gallery, and which will accommodate 350 people. In addition, there is to be a sunk floor, in which there will be a kitchen and heating chamber, the lending library, reading-room, and hall being heated by hot-water pipes. Ordinary fire-places will be provided in the waiting-rooms. The building is to be erected of rubble blocks, while the front is to be of sneaked ashlar; and the inside is to have pitchpine flooring, lining, and finishings. The contractors for the work are—Mason work, Mr. Edgar Gall, Aberdeen; carpenter work, Davidson and Son, Hatton; slater work, James Greig, Peterhead; plaster work, Alexander Kelman, Peterhead; plumber work, John Davidson, Peterhead. The architect is Mr. William Davidson, of Ellon.

RENOVATION OF PARK CHAPEL, CROUCH END.—The work in connexion with the renovation of the interior of this church has now been finished, and the building was recently reopened after having been closed for several

months. The work has consisted of re-colouring the woodwork with a lighter tint. The walls are light green in the upper parts, with a dado of dark green near the ground, and a border of salmon hue round the windows. The ceiling is cream colour, and the wooden beams are two shades of light oak. Messrs. J. Grover and Sons, of Islington, were the general contractors. New heating apparatus has been installed by Messrs. Rosser and Russell. The method of heating is by hot water at low pressure and in three circuits. Ordinary gas lighting has been replaced by the electric light, by Messrs. Duncan, Watson, and Co. The ventilation has been attended to, and electrically-driven fans have been inserted in the roof. The plans for the improvements were prepared by Mr. Alfred Conder, architect, and the cost has been 1,200l.

FEVER HOSPITAL, SEACROFT, LEEDS.—A new fever hospital near Seacroft has just been erected for the Leeds Corporation. The foundations of the present buildings were laid in 1900, and now there are some forty blocks ready for immediate use. The hospital buildings cover 42 acres, and are built on the one-storied-pavilion principle, and connected by means of covered ways. There are more than twenty of these pavilions, each containing thirty beds. Eight pavilions are set apart for scarlet fever cases, four for diphtheria, and four for enteric, whilst others are to be used as observation and convalescent wards. The pavilions are raised on arches 5 ft. above the ground. A total of 452 cases can be treated at one time, these being made up of 240 scarlet fever cases, sixty diphtheria, 104 enteric, and forty-eight isolated cases. In the administrative and residential blocks accommodation will be provided for 100 nurses and seventy female servants. The male staff will number over thirty, and there will be sixteen cottages for married servants. The main contract was obtained by Messrs. H. Arnold and Sons, of Doncaster, for 198,000l. Mr. E. T. Hall, of London, has been the architect, with Mr. A. Turner, of the Corporation, clerk of the works.

SCHOOL, ABERAVON.—The new Aberavon infants' school was opened recently by Dr. Morris, the Chairman of the Glamorganshire Education Committee. The school is situated facing the Causeway, and is built of red pressed bricks, with Bath stone dressing. It has two entrances—one in the Causeway and one in Charles-street. The building consists of entrance-hall, cloak-room with lavatory, mistress's room, corridor, and four classrooms, which have accommodation for 204 children. The playground consists of two levels, in all about 1,000 yds. square. The entire cost of the building was 3,000l. The architect for the schools was Mr. J. A. James, Port Talbot, to whose plans the work was carried out by Mr. E. G. Groom, contractor, Aberavon, the clerk of the works being Mr. J. Williams, Taibach.

CHURCH, MIDDLESBROUGH.—On the 28th ult. the Archbishop of York (Dr. MacLagan) dedicated the new district Church of St. Michael's and All Angels, which has just been erected in Waterloo-road, Middlesbrough. The new building has been erected at an approximate cost of 6,000l. On the ground floor is a parochial hall, 57 ft. by 44 ft. The vestries and committee-rooms are on the same floor, and have a staircase leading to the church, which is on the second story. Lavatories and cloak-rooms are provided in connexion with the hall. The church proper is 96 ft. by 44 ft., and is approached by a wide open staircase. The seating throughout is of pitch-pine. The building is of common brick, with ornamental brick and stone dressings, and has been erected by Messrs. Easton Brothers, contractors, of Middlesbrough. Mr. William Duncan, of Middlesbrough, is the architect.

ISOLATION HOSPITAL, NEAR HEREFORD.—The Hereford Rural District Council, with which the neighbouring authority of Weobley has combined for isolation purposes, have erected a new hospital on land at the extreme end of Stretton Sugwas parish, bordered by outlying portions of Burghill, Credenhill, and Tillington. The principal building is the isolation hospital and wards for the reception of infected patients; and the male and female wards are placed on either side of the main entrance. These are 25 ft. by 25 ft., and 13 ft. high. The walls and ceilings are coated with granite silicon plaster. Attached to each ward are annexes with necessary slop sinks, and closet arrangements. The floors of the hospital are of cement concrete, and the wards are warmed by grates having slatted tiles. Between the two wards is the nurses' duty-room, having fixed inspection windows overlooking both wards. Attached to the nurses' room are a scullery and larder and office. A bath is provided in the main hall, and also a linen stores. In close proximity to the isolation hospital is situated the residence for the nurses and caretaker.

The discharge block consists of an inward, a bath-room for medicated bath discharging patients, and a disinfectant. The range of outbuildings comprise a house, disinfecting chamber, coal-house, and mortuary. The whole of the building throughout have been erected with red bricks, relieved with buff brick string courses and arches; the roofs are all boarded and covered with best Broseley and the walls are cavity walls. Each of four buildings has tanks in the roofs supplied with the pure water from a well. Rain-water tanks underground are provided for the respective buildings. The buildings have been carried out under the direction and superintendence of the architect, Mr. G. Davies, the builder being Mr. C. Cooke. The total amount of the contract was 2,050l.

COMPLETION OF EDINBURGH NEW COURTS BUILDINGS.—The new County Buildings, Edinburgh, which have been erected by the Edinburgh Corporation, Parliament-square and Melbourne-place, have now been completed, and will be opened in the autumn. The buildings are in the style of the English Renaissance, and the total cost has been 40,000l. The architect is Mr. McIntyre Henry, Edinburgh, and the contractor was executed by Mr. W. Birnie & Co., Glasgow.

WESLEYAN CHURCH, FROCKTON-ON-THE-HILL, N. WESLEYAN CHURCH AND SCHOOLS, OF BRADFORD.—The new Wesleyan church and schools, of Bradford, are the architects, was opened recently. The building is situated in Yarrow-street, is of stone, with tower and spire, and tracery windows filled with leaded lights. Accommodation provided is for 660 pupils, 33 on the ground floor and 230 in the galleries, which occupy three sides of the church. The interior woodwork of pews and roof is pitch-pine, the rostrum and communion furniture being of walnut. The building is heated by low-pressure hot water, and is lighted throughout with electricity. The schools in the rear of the premises comprise a large assembly hall with a stage, a gallery, an infants' room, a ladies' parlour, and thirteen classrooms. The cost of the buildings is about 7,800l.

WESLEYAN CHURCH, LUTTERWORTH.—The memorial-stones have just been laid of the new Wesleyan church at Lutterworth. Mr. J. Lambert, Nottingham, is the architect, and the contractors are Messrs. T. Barlow and Sons, of Nottingham, and Mr. J. Hewins, of Lutterworth, clerk of works. The building, which is expected to cost about 3,500l., will be seating accommodated in the chapel proper for about 250 people. There will be transepts on either side of the minister's vestry, a schoolroom to accommodate 200 scholars, a large classroom, which will be divided into two, and a classroom adjoining the schoolroom, also kitchen and necessary buildings. The bricks used in the building are of the best, and the site is expected to cost about 3,500l. There will be seating accommodated in the chapel proper for about 250 people. There will be transepts on either side of the minister's vestry, a schoolroom to accommodate 200 scholars, a large classroom, which will be divided into two, and a classroom adjoining the schoolroom, also kitchen and necessary buildings. The bricks used in the building are of the best, and the site is expected to cost about 3,500l. There will be seating accommodated in the chapel proper for about 250 people. There will be transepts on either side of the minister's vestry, a schoolroom to accommodate 200 scholars, a large classroom, which will be divided into two, and a classroom adjoining the schoolroom, also kitchen and necessary buildings. The bricks used in the building are of the best, and the site is expected to cost about 3,500l.

SUNDAY SCHOOL, NEAR WHITBY.—The memorial-stones and memorial-bricks were laid recently for the new Sunday school in connexion with the Sleights and Briggs (near Whitby) Wesleyan Methodist Church. The school and vestry, etc., are being erected at the back of the site upon which the church is to be erected, and it will be of brick, relieved with stone dressings, covered with tiles. The internal dimensions of the school are as follows:—Length, 19 ft. 6 in. The projected church, which is to be erected on the site of the old chapel, will be built of stone covered with slates. In the interior the floor is divided by a centre aisle. The woodwork will be of pitch-pine, and the whole of the tracery windows will be filled with leaded lights. The church is estimated to seat 200 people. The total estimated cost of the school and church is 1,175l. Mr. A. E. Y. of Whitby, is the architect, and Mr. J. J. son, of the same place, is the contractor.

MEMORIAL HALL, LIVERPOOL.—The foundation-stone of the new central hall of the pool Wesleyan Mission, erected as a memorial to the Rev. Charles Garrett, was laid on the 28th ult. The new building has been designed by Messrs. Bradshaw and Gass, architects, Bolton, and will contain two halls, to accommodate 2,500 people in full view of a platform, and the other to seat about 100. The latter will be arranged with tiered seats at the back, and will be adapted

school work. There will also be reading and chess halls, classrooms, rooms for social work amongst both sexes, a drill and administration offices. The main hall is to be through a wide vestibule to the central tower, and the two others the Corporation gardens to be laid out on the site of the Unitarian Burial Ground in pleasant, and from Upper Newington. Provision is made in the main hall for an organ. Shops with show-rooms for offices will be placed in the main part of the Renshaw-street and Upper Newington frontages. The total cost, with fittings and organ, is estimated at 37,250*l.*

WESLEYAN METHODIST CHURCH, STOCKTON.—The 29th ult. a new Wesleyan Methodist church was opened in Yarm-road, Stockton. The new church, which is built in the Gothic style will cost nearly 10,000*l.* The architect is Mr. H. Mozley, of Bradford.

CHURCH, BRADFORD.—On the 29th ult. the foundation-stone was laid of the new Church of the Holy Trinity, which is in course of erection in the district of the city of Bradford. The architect of the new building is Mr. Temple Moore, of London. Seating accommodation will be provided for 620 persons. The work is being carried out by Messrs. Thompson and Co., of Bradford.

WESLEYAN CHURCH, BRIGHTON, SHREVEPORT.—The memorial-stone was laid recently of a new Wesleyan church which is being erected at Brighton. It is estimated that the building will cost about 2,300*l.* The architect is Mr. W. C. Jackson, and the contractors are Messrs. Lund and Swann, of Ekeington.

COLLEGE, LEITH.—The foundation-stone of the new College of St. Barnabas at Leith was laid a short time ago by the Bishop of Raphoe. The building will be in the Gothic style, and amongst the prominent features are four round towers projecting from the exterior angles of the quadrangular plan, and the inner courtyard, surrounded by an open cloister and corridor, with stone columns and circular-headed tracery. The elevations are broken by stone gables and irregular embattlements along the eaves, with running mouldings, and at intervals by projecting Celtic carvings and sculptures. The contract for the work has been entrusted to Messrs. Lavery and Son, Belfast, and the architect is Mr. Thomas F. McNamara, of Belfast.

METHODIST CHURCH, EAST FINCHLEY.—The foundation-stones of the new Wesleyan Methodist church, which is now built in High-road, East Finchley, were recently laid. The design of the building is by Mr. J. H. St. John, and the front elevation having Bath stone and a traceried mullioned window in the end, while a porch and vestibule, projecting from the main wall, occupy the lower part of the design. The interior has an intricate roof, plastered walls, and an ornamental rostrum of bronze-green colour finished, which fills up a semi-octagonal space at the end of the building, while lavatories, and scullery are also provided. Accommodation will be afforded for 400 persons. The architects were Messrs. Mence, and Houchin, the builders being Messrs. T. D. Steed and Sons.

LIBRARIES FOR LEWISHAM.—The Local Government Committee of Lewisham Borough Council reported on Tuesday that, upon the recommendation of the committee, the purchase of the site for the new branch library, they invited designs from local architects for the erection of the building at a cost not to exceed a total of 4,500*l.* One of the fifteen selected architects sent in a plan, and that which was numbered nine was the one which was chosen. The sum of 4,500*l.* was subject to a *bona-fide* tender being submitted within the specified limit from a suitable contractor. The 4,500*l.* is to include fittings, and architect's and quantity surveyor's fees. With regard to the proposed site of a public library at Hither Green, the Local Government Committee has decided to apply to the Lewisham County Council to convey their land in Mountfield so that the building may be adapted for a library. If that can be done the site could be used for library as soon as funds are available.

CHRIST CHURCH, WORCESTER.—The foundation-stone of the new Christ Church, Broadheath, was recently laid by the Bishop of Worcester. The new church is situated near the junction of the canal and the schools, near the road. It comprises chancel, nave, and porch, with arches between it and the school, and a tower of future extension by a north aisle, porch, and a tower upon the nave level, choir, and organ case in a gallery, which is approached by a staircase from the porch. Above the gallery are the clock and bell chambers, reached

by turret stairs from the south-east corner of the tower. The church is built throughout of red stone from Lord Dudley's quarries at Holt. The font and cover were carved by Mr. Haughton, sculptor, of Worcester, and, together with the other furniture, were designed by the architect; the gallery front and altar rails by Messrs. Collins and Godfrey, Tewkesbury; and the remainder of the oak furniture by Messrs. Braithwaite, of Worcester. The builders were Messrs. Collins and Godfrey, Tewkesbury; the foreman of works was Mr. E. B. Smith, Bedford. Mr. C. E. Ford Whitecombe, of Winchester House, E.C., and of Newbury, Broadheath, was the architect.

TEMPORARY STRUCTURE, LUTON.—The building which was erected at Luton for the purpose of providing accommodation for the recent political meeting held there was designed by Messrs. Martin and Martin, architects, of Birmingham. The total interior area was 200 ft. by 135 ft., and the roof was constructed by Messrs. McTear and Co., Belfast.

A YEAR'S BUILDING IN GLASGOW.—Lord Inverclyde, at Glasgow Dean of Guild Court, made, on the 29th ult., the annual statement as to building operations in Glasgow. The total valuations of the linings granted during the year, he said, amounted to 2,119,800*l.*, or not very far below the valuations of the previous year, which was the second highest on record. When the figures came to be analysed, however, it was found that there was really a considerable decrease in building operations in Glasgow, and that exceptional causes had kept up the total valuations. In regard to houses there had been a very marked falling off in the applications for linings throughout the city, both in regard to houses with a small number of apartments and houses with six or more apartments and upwards, showing that the supply of the last few years had more than met the demand for increased dwelling accommodation. The decreased valuation in this respect compared with the previous year was no less than nearly 800,000*l.* This falling off, however, had been met in the increase in valuations of linings applied for in connexion with public buildings, warehouses, workshops, and alterations and additions to existing buildings, while a few special linings for works of large value had made up for the decrease in other directions. The linings granted for new streets were just half of what they were in the previous year. In view of the apparent lull in the building operations within the City of Glasgow at the present time, it seemed a suitable occasion to look back at the valuations of the linings granted by the Court during the last quarter of a century. For the purpose of this retrospect he would go back twenty-five years, to 1879-1880, and dividing them into five quinquennial periods down to the present time, he found that the linings granted for each five years amounted as follows:—1879-84, 2,535,708*l.*; 1884-9, 2,244,252*l.*; 1889-94, 4,542,625*l.*; 1894-9, 8,747,580*l.*; 1899-1904, 10,338,933*l.* In considering these figures, however, two points must be borne in mind. In the first place, in the middle quinquennial period the city boundaries were extended—in 1891-2. In the second place, allowance must be made for the valuation of old buildings removed to be replaced by new ones. In the year 1879, to which he had gone back, the population of Glasgow was 500,000, while to-day it was over 780,000.

In the second place, allowance must be made for the valuation of old buildings removed to be replaced by new ones. In the year 1879, to which he had gone back, the population of Glasgow was 500,000, while to-day it was over 780,000.

AGRICULTURAL AND FISHERIES BOARD.—The Agricultural and Fisheries Board, represented the Board of Trade. Mr. B. Francis-Williams, K.C. (instructed by the town clerk), appeared to support the Corporation scheme, which is for an outlet at Brynmill. Mr. B. Francis-Williams said there were at present five outfall sewers, and the projected one would serve a population of about 7,000 at Brynmill. The Local Government Board in 1890 sanctioned the scheme, but pointed out that the consent of the Board of Trade would have to be obtained, and this consent was subsequently refused, owing to the apprehended pollution of the oyster beds at the Mumbles. It would be shown that the danger was an imaginary one, for the sewage matter would be dealt with in septic tanks, and would be discharged only when the tide was going seaward. Mr. Wyrill, Borough Engineer, said the Council, after full consideration of various schemes, were firmly of opinion that the Brynmill scheme, combined with the septic tank accommodation for 212,000 gallons of sewage matter, was the best scheme.—There is considerable opposition to the scheme, and Mr. Wyrill was cross-examined at length.

FOREIGN.

GERMANY.—The town of Bremen has opened an international competition for the most artistic architectural designs for a block of houses to be erected in the Kaiser Wilhelmsplatz, facing the town hall. Prizes of 5,000 marks (about 250*l.*), 3,000 marks (about 150*l.*), and 2,000 marks (about 100*l.*) are offered for the best designs.—The United States Consul at Mainz reports that a Hamburg firm have patented a process for manufacturing an artificial building stone from infusorial earth, which they call "Guhrolit." This stone is very light, is fireproof, withstands the influence of most chemicals, and can be easily sawed, nailed, and bored.

MISCELLANEOUS.

LINCOLN BUILDING BY-LAWS.—A meeting of the Lincoln City Council was held on the 4th inst., when Mr. Bainbridge called attention to the passing by the Building Committee of plans with outer walls of only 4½ in. Mr. Mills maintained that, being in a passage, the walls in question were not outer walls. A long discussion ensued, the labour members of the Council favouring the 4½-in. walls on the ground that it would mean more rent for the working men if 9-in. walls were insisted on. The Mayor said the building by-laws of the City were very antique, and very much easier than any new by-laws could possibly be. He could not help expressing the opinion that it would be a great mistake to make them easier. For working men to believe their good interests were served by putting up buildings which could not stand as long as they ought to stand, seemed to him very much like encouraging the erection of buildings of the class which they were trying to abolish, and which he hoped would soon be swept away. Alderman E. Pratt moved that the plans in question be referred back to the Committee, and this was carried by fourteen votes to seven.—Yorkshire Post.

FINLAND TIMBER.—It appears from official statistics that in the year 1903 there were exported from the Grand Duchy of Finland deals to the value of 780,840*l.*, battens to the value of 1,334,600*l.*, and boards to the value of 1,665,820*l.* It has long been known that the "Enare Lapmark" possesses great wealth in its immense forests. They have stood untouched for centuries up to the present without any careful supervision, but, at the same time, free from the wood-cutter's axe. In this district there was only one forest inspector and a few foresters, whose duty it was merely to prevent the illegal felling of trees, and to protect them against fire, and up to the present it has been almost a necessity to leave these valuable forests untouched, on account of their remoteness and want of suitable rivers to float the timber southwards. It has now been decided to commence a rational exploitation of these vast forests, containing about 10,000,000 of large trees. On account of the slow growth in this northerly region, an average age for full-grown trees has been calculated at 250 years, with an average height of about 55 English ft. About 100,000 trees are now to be sold by public auction as a trial, and the timber will have to be floated through the Patsjoki Lake, on the Finnish Frontier, to Varanger Fjord in Norway. It can also be floated through several Finnish lakes and rivers to the Murmur coast, on Russian territory. This experiment by the Finnish Government to open the forests in the "High North" will certainly be of great interest to saw-mill owners. Swedish and Norwegian companies

SANITARY AND ENGINEERING NEWS

THE DRAINAGE OF SWANSEA.—A Board of Trade inquiry was held at the Town Hall, Swansea, recently, respecting the proposed sewerage outlet for the western district of Swansea. Mr. William Matthews, C.M.G., M.Inst.C.E., assisted by Mr. Fryer (of the

are already making inquiries with regard to the time of sale, yet it is improbable that Finnish speculators will avail themselves of this fact, as no Finnish firm at present carries on any timber export from the Arctic Sea, though Swedish, Norwegian and Russian exporters have great experience in floating and exporting timber from that northerly region. At a meeting of saw-mill owners, the chairman said he had received accounts from eighty-six mills, with a production of over 300,000 standards. The quantity remaining unshipped, although sold, was 90,579 standards, against 91,331 standards in 1902. An agreement has been arrived at amongst the producers that next winter there shall be a further reduction of 10 per cent. in the number of trees to be felled.

APPOINTMENT.—The question of appointing an architect for carrying out the Leeds Workhouse Extension scheme was discussed by the Leeds Guardians on the 21st ult. Mr. Richardson had given notice of a motion on the subject, but the Chairman (Mr. Arthur Willey) raised a direct issue by proposing the appointment of Mr. Thomas Winn. The resolution having been seconded, Mr. Richardson moved a direct negative to the Chairman's proposition, but afterwards varied his amendment to one adjourning the appointment for a month. This was seconded by the Rev. Father Corr, but it was defeated by nineteen votes to thirteen. On the substantive proposition Mr. Winn be appointed, the voting was evenly divided—sixteen for and sixteen against—and the Chairman gave his casting vote for the motion. Mr. Winn was therefore appointed.

SELF-WINDING ELECTRICAL CLOCK. We had an opportunity last week of inspecting a self-winding clock, which is being put on the market by The Self-Winding Clock Syndicate, of Audrey House, Ely-place, London. A self-winding clock, to be of any real use, must be a very accurate time-keeper, otherwise there is practically nothing gained, as constant attention will be required for the purpose of regulating the hands. The accuracy of such a clock must be of a far higher order than those in everyday use. An inspection, however, of the clocks of this type which we were shown has convinced us that they can be made so that they keep time much more accurately than ordinary clocks. The winding is done electrically every five or six minutes, the necessary power being obtained from two small dry cells. The main spring is of the helical type, and is distinctly novel. Its elasticity will alter much more gradually than the elasticity of the ordinary flat spiral spring. Its extension is very slight compared with its length, and thus the "elastic fatigue" will be infinitesimal. The rate of the clock can be adjusted very accurately by simply turning a screw. We see no reason why the primary batteries should not be able to keep it going for several years. The novel points in the design of this clock should make it popular, especially if it prove to be an accurate time-keeper.

DOUGLAS'S PATENT SIPHON CISTERN.—The illustration shows the section of a siphon cistern patented by Mr. J. P. Douglas (Workington, Cumberland). The water is admitted by a ball-tap arrangement in the usual manner, and, in filling, the cistern imprisons and compresses to a certain extent the air in the air bell D. The imprisoned air prevents the water from rising to the level of the siphon inlet contained in the air bell. To empty the cistern the air escape valve or push is pressed. This releases the air from the air chamber, and the atmospheric pressure on the water in

the cistern forces the water up to the level of the siphon inlet enclosed in the air bell. The water rushes down the outlet pipe, and the suction so caused brings the main siphon B into play. A double siphonic action is thus secured, and the consequent increased pressure, it is claimed, gives a powerful and complete flush. The further advantages claimed for the cistern are:—(1) It cannot overflow; (2) the absence of the chain pull wear and tear, reduces the cost of the maintenance and repairs to a minimum; (3) the parts, being stationary, can all be made of non-corrosive metal; (4) the cistern is noiseless in action; (5) the air escape pipe, being of small diameter, can be let into the wall or encased in wood. We may add that we are not responsible for the mis-spelling, "siphon," in the references, which form part of the block furnished to us by the patentee.

OPEN SPACES.—A body, consisting of nine conservators, has been appointed to frame a code of by-laws for the preservation of the Oxshott woods and common, in the parish of Stoke D'Abernon, Surrey, which are being gradually despoiled of their natural beauties at the hands of "trippers," holiday-makers, and others. The land, which formerly belonged to Waverley Abbey, appertains to the manor of Clarendon, and the Duchess of Albany will be represented upon the new board by her Controllor, Sir Robert Collins, K.C.B., whilst Mr. John H. Clutton will act in a similar capacity on behalf of the Woods and Forest Commissioners. The Lambeth Borough Council have expressed their willingness to contribute 2,000*l.* towards the purchase of the 6 acres of meadow land in Trinity-road, by the south side of Brockwell Park, when the remaining sum of 10,000*l.* shall have been raised. The proposed addition would, so far as is now possible, preserve all the land which forms a natural boundary of the park and prevent that side of it from being blocked in with rows of small houses; the owner, it is stated, received an offer of 15,000*l.* for the land for building purposes, but is willing to meet the promoters' object by taking 12,000*l.* In response to the appeal of Miss Octavia Hill and Canon Rawnsley for the acquisition, at a price of 12,000*l.*, of 700 acres on the shore of Ullswater Lake, with Gowbarrow Park and Fell, and the Aira Force, or cascade, a sum of 100*l.* is offered by "Stroller," provided that nineteen similar donations are forthcoming. Of the nineteen individual donations fifteen are already promised, amongst other contributors are Mrs. Charles Buxton (100*l.*), and Mr. Alfred Waterhouse, R.A. (20*l.*). The property is offered to the National Trust by Mr. Henry Howard, of Greystoke Castle.

THE LABOUR MARKET IN THE COLONIES.—The October circulars of the Emigrants' Information Office state that in *Canada* the supply of mechanics and general labourers is quite sufficient, and the emigration of such persons is not recommended, especially as the winter season is coming on. In *Australia* there is a demand for experienced farm labourers in Western Australia, Queensland, and parts of Victoria, but there is little demand anywhere for more miners, mechanics, or general labourers. Late reports from New South Wales state that, owing to the severity of the late drought, and the numbers of the unemployed, no one without capital should emigrate to New South Wales at the present time. In *New Zealand* employment has been good, and skilled mechanics should be able to obtain work without waiting long. In *Cape Colony* there is now no opening for

mechanics in the building or other trades, all persons (especially general labourers) wanted amongst going at the present time unless they go out to situations engaged by them, or have means of their own sufficient to keep them for some months. But in Cape there is no opening for indifferent men. The building trade in *Natal* has fairly busy, but labour is plentiful, and numbers of unskilled workers and indolent workmen are unable to obtain employment. Emigrants, therefore, other than those going nominated passages, are warned against going to Natal at the present time on a chance of work. No one can enter *Transvaal* without a permit, and persons warned against going there at the present time in search of work. There is no import in trade. In the *Orange River Colony* there is very little demand for mechanics, and none at all for second-hand or general labourers. It is officially notified that, in view of the large number of candidates already registered, no further applications for appointments under Government of the Orange River Colony be entertained.

SCHOOL OF ART WOODCARVING.—The School of Art Woodcarving, South Kensington, which now occupies rooms on the floor of the new building of the London School of Art, near work in Exhibition-road, has been reopened after the summer vacation, and we are requested to state that some of the free student maintenance by means of funds granted to school by the London County Council is vacant. The day classes of the school held from 10 to 1 and 2 to 5 on five of the week, and from 10 to 1 on Saturday. The evening class meets on three evenings a week, and on Saturday afternoons. For application for the free studentships any further particulars relating to the school may be obtained from the manager.

ENGLISH CRAFTS AT THE ST. LOUIS EXHIBITION.—We have received a catalogue a pamphlet of photographs of work done by "Craft School" (an Evening Art and Technical School) in Globe-road, Bethnal Green, which has been contributed to the St. Louis Exhibition. Judging from the photographs the work done, especially in woodwork and repoussé metal, appears to be very good and a credit to the school. The prospectus of the school states that the object of teaching is educational; to develop creative faculty of the pupil and his power of appreciation. The crafts are taught, not separate trades, but as various modes of expression; and the same boy always designs and carves it out in the appropriate material. All this seems very factory.

ARCHAEOLOGICAL DISCOVERIES.—During various by Corporation workmen at Newbury-under-Lyme, the foundation of part of a castle built about 1180 was discovered. The corner wall of plinth courses has been bare to the extent of 10 ft. or 12 ft., each and to a depth of 3 ft. The wall is of red sandstone. The excavations are continued and the walls traced.

Legal.

AN ARCHITECT'S CLAIM FOR PROFESSIONAL SERVICES.

At the Clerkenwell County Court on 29th ult., Mr. E. A. Agutter, architect, Messrs. Levy and Co. for 25*l.* due in respect of professional services. Mr. Walter Stewart appeared for the plaintiff, Mr. Green for the defendants. The case was heard before a jury.

The plaintiff's claim was for services rendered in connexion with repairs at the defendants' premises, 2, Pitfield-street, Hoxton, which a builder's estimate of 150*l.* was given. Subsequently further work was required, amounting to an expenditure of 550*l.* The work was then abandoned, and on plaintiff applying for his fees he received a law letter in which the defendants denied him any instructions for the plans. In the course of the evidence plaintiff stated that he could never get written instructions from the defendants, who said that was not their way of doing business.

Mr. Lovegrove, District Surveyor, gave evidence in support of the plaintiff's claim in accordance with professional custom.

The solicitor for the defendants was called and produced a letter written to him by the defendants in reference to rebuilding the premises. In this they said they had instructed plaintiff to prepare plans.

Mr. Stewart: Then I need ask you not else.

Mr. Green consulted with his clients, the result that twenty guineas and costs were offered and accepted, and the jury withdrew.

PATENTS OF THE WEEK.

APPLICATIONS PUBLISHED.*
 5 of 1903.—A. TIXIER and L. RAMBAUD: *Process for the Manufacture of Varnishes the Direct Solution of Gums without previous Fusion.*

Process of manufacture of a solvent of, consisting in causing an acid to act on spirit of turpentine, on agitation, so as to cause terpeneol directly, or to produce terpeneol which is afterwards transferred into terpeneol by the action of dilute sulfuric acid, spirit or turpentine, benzene, or of a similar substance being afterwards added to the terpeneol obtained in one case or the other.

of 1903.—W. FAIRWEATHER (G. 3. 3): *Mixing Machines for Concrete and other Materials.*

Concrete mixing machine, comprising a vertical drum having a lateral feed and a large opening therein, means for revolving said drum, and means for performing mixing, said means comprising a central shaft, arms on said shaft, and mixing blades on said arms adapted to scrape the material from the sides of said drum and discharge it at the centre thereof.

of 1903.—C. J. HART and W. FINCH: *Swinging Apparatus for Swinging and other uses.*

Invention has reference to closing apparatus for swinging and other doors, the door being to cause such doors to come always when swung to a definite central closed position without shock or jar. A door box is formed, preferably circular and of suitable depth, and to the inside bottom of said box is fixed a circular plate, or an inclined piece, with a race for balls, rollers, or the like, the same being kept in the race by a pivot, or other suitable means. The pivot or other which fits the bottom of the door, upon which the same turns, passes through the cover of the case or box, and is held in an inclined circular piece, the cam turning in two or more of the balls at a time, so that when the door is being turned from an open or closed position for opening, the door is moved along by the cam turning on the pivot, the end of which turns in the inclined circular piece.

of 1903.—T. W. LOVATT and C. PURSER: *Working Wood-working Mechanism.*

Working mechanism, which comprises a frame or suspended arms adapted to carry any at its lower end a tool or tools which the frame or arm is moved upon its axis of rotation, may be utilised in cutting into the surface of a piece of wood resting in a stationary position below the tool or arm.

of 1903.—P. P. ORUM: *Fastenings for Windows, Doors, Boxes, and other Articles.*
 A lock for windows, doors, boxes, and the like, comprising a locking arm engaging a bolt and capable of turning around two perpendicular to each other, said arm being hinged to a pivot rotatively attached to the window leaves and having a plate having a U-shaped cavity that fits on its bottom, the bottom of the lock being adapted to engage said groove turned round at 180 deg.

of 1903.—A. ROBERTS: *A Construction of a Portable Folding Table, or the like.*
 A folding table, or the like, consisting of a cover of some soft material which can be clipped or folded up of cross pieces or the like capable of being folded up or taken down, and of legs which can be disconnected and folded up or taken to pieces so that the table can be packed in a small compass.

of 1903.—E. SUMMERFIELD: *A Wedge Adapted for Fixing Doors and Windows, and other similar purposes.*

Invention relates to a wedge fitting being adapted, when in use, for preventing opening of a door or window, and for fixing a door or window in a more or less open position. A short, narrow piece of metal is taken—say, for example, 4 in. in length by 1 in. in breadth, or of larger or of smaller relative dimensions—one end of same being cut to a fine edge, and the other end being turned down, the turned-down part being one-fourth of the entire length of the wedge, thus, when the fitting so formed is pushed so that it takes its bearings on the door and the turned-down end it will have the appearance and be of the form of a wedge.

These applications are in the stage in which they are entitled to the grant of Patents upon them can be seen.

24,043 of 1903.—A. J. SMITH and J. HUMPHREY: *Means for Securing the Doors of Lift Wells.*

This consists in the combination with a cam on the lift of means for moving the cam horizontally, latches projecting up through the floors to hold the doors of the well, and means operated by the cam to withdraw the latches.

25,335 of 1903.—E. CROWE: *Roller Bearing Drawers for Cabinets.*

A drawer fitted with extension slides and comprising a combination of anti-friction rollers and rails or channels, such rails or channels having closed ends, forming a closed roller path for the double purpose of preventing displacement of the rollers and forming a stop to the drawer.

11,258 of 1904.—E. STOFFER: *Fire-proof Quartz Bricks or Blocks.*

The manufacture of fire-proof quartz bricks by steaming, and subsequently burning the moulded bricks, consisting in the employment of magnesia as a binding material.

16,531 of 1904.—D. J. MCKENZIE: *Fire Arches for Furnaces.*

A fire arch for furnaces, consisting in the combination of a cross beam arranged transversely across the furnace, a plurality of inwardly-extending brackets secured thereto, and extending inwardly therefrom, a plurality of longitudinally-disposed bars detachably secured one to each of said inwardly-extending brackets, and fire-brick tiles detachably secured to each of such longitudinal beams.

16,808 of 1904.—R. NICHOLSON: *A Window Furniture Bracket.*

A combined roller blind and curtain pole support, comprising a lower projecting part for receiving the blind roller end or spindle, a fastening lug adjacent to said part, and the curtain pole carrying part, projecting up above the lower projecting part and beyond same, and having the carrying part at its extremity.

16,948 of 1904.—J. E. GAGNON: *Window Scaffolds.*

A device, comprising a seat, hook arms upon said seat adapted to engage the inner portion of a window sill to support the front of said seat, and means for supporting the rear of said seat, said means comprising a pair of adjustably-connected members adjustably secured upon said side of said seat and adapted to engage the rear portion of said window sill.

17,105 of 1904.—N. BARRETT: *Machine for Dovetailing Window Sashes.*

A sash dovetailing machine, consisting of a vertical adjustable circular saw revolving in a horizontal plane, in combination with a vertically adjustable table, coiled pressure springs, a vertical horizontal adjustable face carrying a metal protecting plate, a tapering liner, and a movable angle plate.

19,447 of 1903.—J. S. OWENS: *Apparatus for Mixing Concrete and the like.*

Apparatus for making concrete and the like, consisting in the application of a series of equi-distant bars or straps which pass down the middle of the shoot so as to form sinuous or zigzag-wise disposed surfaces, and are so fixed or attached as to be able to feather or vibrate, in combination with sloping baffles plates applied alternately to opposite sides of the shoot.

23,747 of 1903.—R. H. REEVES: *Sewer Manholes or Shafts.*

This relates to sewer manholes or shafts, and consists in constructing a shield or contracting appliance from segments and placing a ring on the top of such segments to keep them together, the whole being situated on corbels or projections in the manhole or shaft.

16,987 of 1904.—E. RYSER: *A Building Stone.*

A building stone, characterised by a main piece having the form of a four-sided prism, one face of which has a headpiece also having the form of a four-sided prism, and is so disposed that it projects with at least two lateral surfaces beyond the corresponding lateral surfaces of the main piece whilst it stands back one lateral surface in relation to the corresponding lateral surface of the main piece.

16,999 of 1904.—A. WOODHOUSE: *Gullies.*

A gully, consisting in the arrangement wherein the grating is held upon an internal shoulder in the frame, and is locked in position by a taper tongue upon the grating, which engages an undercut recess in the frame, and a gravity catch.

17,045 of 1904.—A. HENDEL: *Ventilating Apparatus.*

A ventilating apparatus or device characterised by this—namely, that the water serving for flushing the closet before entering

the flushing tank rises in one or more tubes, so that, by an atomising nozzle or nozzles, opening into a ventilating conduit, suction is produced, and, if two valve-fitted tubes be used, such suction may be produced in one or the other direction at will, while, at the same time, the atomised water passes from the lowest point of the ventilating conduit into the flushing tank.

17,066 of 1904.—G. B. GODSON: *A Composition for Effecting the Adherence of Tiles and the like to Walls.*

A composition for attaching opal glass tiles and the like to walls, consisting of about 40 per cent. of dextrine, 40 per cent. of powdered alum, and 20 per cent. of adamant cement, to which is added a sufficient quantity of gum dissolved in water, the composition being spread upon the back of opal glass tiles, and small pebbles, grit, fragments of coke breeze, or granite chips, being scattered upon its surface.

CONTRACTS.—Continued.

Table with 4 columns: Nature of Work or Materials, By whom Advertised, Forms of Works, etc., supplied by, and Timers to be delivered. Lists various construction contracts and their details.

PUBLIC APPOINTMENTS.

Table with 4 columns: Nature of Appointment, By whom Advertised, Salary, and Applications to be in. Lists public appointments and their terms.

Those marked with an asterisk (*) are advertised in this Number. Competitions, iv. Contracts, iv. vi. viii. x. Public Appointments, xvii.

TENDERS.—Continued from page 377.

Table of tenders for restoration, alteration, and maintenance of the Market Hall and Assembly Rooms, Urban District Council.

Table of tenders for South-West Bethnal Green, Daniel-street, and North-East Bethnal Green, Globe-terrace.

Table of tenders for East St. Pancras, "Brecknock" School (Redividing Rooms C, D, and E in the Bay's Department into Four Rooms by Moving certain Partitions, and Providing a New Partition, etc.).

EDUCATION COMMITTEE TENDERS.

Table of tenders for partitions, etc., in Chelsea, Kilburn Lane, and E. Islington, "Forster".

FOR ERECTING PLAYSHEDS AT VARIOUS SCHOOLS.

Table showing tenders for erecting playsheds at various schools, including Millbank, Rolls-road, Canterbury-road, and Ponton-road.

LONDON.—For the docking and repair of the a.s. *Barron*, for the London County Council:—
 Thames Ironworks Shipbuilding & Engineering Co., Ltd. £1,771 11 0
 W. C. Reader & Co. 1,434 2 5
 Mills & Knight 1,493 18 6
 London Graving Dock Co., Ltd. 1,463 0 0
 Brown's Dry Dock & Engineering Co., Ltd. 1,399 0 0
 Fletcher, Son, & Farnall, Ltd., Millwall* 1,300 0 0

MANSFIELD.—For erecting mixed and infants' schools, Newgate-lane, for 700 children, for the Education Committee. Messrs. Vallance & Westwick, architects, Mansfield:—
 T. Cutbbert, Hyson Green, Nottingham* .. £7,550

MOSS SIDE (Lanes).—For erecting public baths, Middleton-street, for the Moss Side Urban District Council. Mr. H. B. Longley, Engineer and Surveyor, Council Offices, Moss Side. Quantities by Mr. J. B. Langley, Manchester:—
 G. Macfarlane & Son, Manchester* £10,725
 [The lowest of ten tenders received.]

NORTHAMPTON.—For new school and cookery centre, Kingsthorpe-grove, and formation of road, for the Education Committee. Messrs. Law and Harris, architects and surveyors, Northampton. Quantities by the architects:—
 E. Archer £16,174
 E. D. Sharman & Son 16,150
 W. Beardsmore 16,081
 R. Casford 15,850
 W. Heap 15,773
 G. W. Souster 15,724
 G. F. Sharman 15,670
 H. Green £15,612
 E. Green 15,382
 G. J. Fisher 15,330
 W. Higgins 15,262
 A. P. Hawtin 15,259
 A. A. Clarke 15,225
 A. J. Chown 14,815
 † Withdrawn.

PONTARDAWE (Wales).—For constructing a stone bridge, approaches, etc., over the Nantmilw, for the Rural District Council:—
 P. Rogers, Glais Clydach £174 10

PORTISHEAD (Bristol).—For road works at Portishead, for the Urban District Council. Mr. Frederick H. Smith, surveyor, Fairmount, Portishead. Quantities by surveyor:—

Woodhill-road.	
M. Lovell .. £2,490 16 7	Lloyd & Son £1,757 0 7
J. Marshall .. 2,194 0 0	T. Free & Co. £1,776 5 1
W. A. Green .. 2,112 10 1	J. & T. Binns, Knowle, Bristol, & Croydon* .. 1,638 15 2
W. & J. Bennett .. 2,018 0 0	J. Coles & Son .. 1,567 2 11
R. W. Hunter & Co. 1,989 17 2	
Bench-road.	
M. Lovell .. £1,594 18 11	T. Free & Co. £1,289 11 4
J. Marshall .. 1,477 0 0	Lloyd & Son .. 1,225 5 6
W. A. Green .. 1,468 10 0	J. Coles & Son .. 1,140 2 7
R. W. Hunter & Co. 1,466 3 2	J. & T. Binns, Knowle, Bristol, & Croydon* .. 1,142 15 3
W. & J. Bennett .. 1,430 0 0	

STEVENAGE.—For tar-paving and resetting kerb and channel of Albert-street and part of High-street, for the Urban District Council. Mr. John Gillespie, Council's Surveyor, Stevenage:—
 S. Deley & Co. £371 12 6
 P. Smith 352 9 2
 La Brea Asphalte Co., Ltd. 330 10 0
 Asphaltes United 290 5 0
 Public Works Co. 230 5 0

B. NOWELL & Co.,
 Stone Merchants & Contractors.
 Chief Office.—*Warwick Road, KENSINGTON.*
 Norway, Guernsey, and Leicestershire Granite, Kerb, Pitching, and Yorkshire Stone.
ESTIMATES GIVEN FOR EVERY DESCRIPTION OF ROAD MAKING.

SWANLEY (Kent).—For erecting iron fencing at the White Oak School, for the Metropolitan Asylums Board. Mr. W. T. Hatch, Engineer-in-chief:—
 F. Fox £380 15 0
 W. Lucy & Co., Ltd. 259 10 0
 Lockerbie & Wilkinson, Ltd. 297 2 0
 Hefford & Shuttlewood, Ltd. 197 10 0
 W. Hayward & Sons, Ltd. 195 0 0
 Messers Bros., Ltd. 193 10 0
 Salway Bros. 182 14 6
 G. B. Smith & Co. £185 15 0
 S. W. Gibson 163 7 6
 E. J. Raybould & Co., Ltd. 151 0 0
 Bayliss Jones & Bayliss, Ltd. 149 15 0
 M. McVeay 147 15 9
 J. Priest & Son, Hill & Smith, Brerley Hill Ironworks, Staffs.* 130 0 0

TOOTING.—For constructing an overground convenience at Cemetery, Blackshaw-road, Tooting, S.W., for the Lambeth Borough Council. Mr. H. Edwards, Borough Engineer, 348, Kennington-road, S.E.:—
 T. Laphorne & Co. £346 0 0
 J. N. Leonard 298 15 0
 G. Cruss & Co. 277 0 0
 J. Shelbourne & Co., 70, Fen-church-st., E.C.* 276 0 0

TROWBRIDGE.—For additions and alterations to schools, for the Managers of the Newtown British Schools. Messrs. T. B. Silcock & S. S. Reay, architects, 47, Milson-street, Bath:—
 H. A. Forse & Sons £2,235
 A. J. Colborne £1,738
 Erwood & Morris 1,694
 W. Webb 1,695
 J. Long & Sons, A. Wills & Co. 1,798
 Bath* 1,593

WARLEY.—For constructing detritus and screening chambers, storage tanks and pump well, and erecting pumping station, office and store, for the Oldbury Urban District Council. Mr. J. T. Eays, engineer, 39, Corporation-street, Birmingham:—
 J. Wortley, Oldbury* £1,431 7 11

WARRINGTON.—For widening Warrington Bridge, for the Corporation. Mr. J. J. Webster, engineer, 39, Victoria-street, Westminster, S.W.:—
 H. Fairclough, Warrington* £3,263

WIMBLEDON.—For making-up roads, for the Urban District Council. Mr. C. H. Cooper, Engineer and Surveyor, Council Offices, Wimbledon:—
 Asebury-road.
 E. Hes, jun., Wimbledon* £865 0 0
 Strathearn-road.
 E. Hes, jun., Wimbledon* 480 0 0
 Worplesden-avenue.
 T. Adams, Wood Green, N.* 424 0 0

San Lorenzo, Verona.

N the north side of the Corso Cavour at Verona, between the street and the Adige, and facing the piazza of the ancient church SS. Apostoli, a glimpse may be had of a little known and remarkable church, seldom visited—S. Lorenzo. Baedeker misses it in a line; Hare fails to notice it at all; nor is it mentioned in De Castelein's monumental book on Lombardic architecture. Verona is full of ancient arches—from S. Stefano, parts of which date back to the IXth century, to the choir of S. Zeno, the Durham peyper of Italy, built probably in the eleventh century. Milan, Pavia, and Verona are the incunabula of Italian Romanesque. Among these Lombardic churches, S. Lorenzo presents many points of interest in plan, elevation, and detail: It consists of an aisled nave, with piers, or, rather, quasi-transpts, for a pier arcade runs uninterruptedly across the transepts as it did in Ernulph's choir at Canterbury, a choir with three parallel eastern apses, and an eastern aisle to each transept. The façade has four round towers, as at Aix-la-Chapelle, and there is a square tower south of the choir. The pier-arcade consists of four and a half coupled bays—one in the choir, one in the transept, two and a half in the nave. As at Durham, the westernmost bay is a half bay: The aisles are groined,

and, as at Jumièges, are surmounted by a groined gallery, which returns round the transept ends, as in St. George's de Boscherville and Winchester Cathedral. This gallery was also originally carried round the west end of the nave, for the base of the midway column has been found; the western gallery has now been rebuilt, as shown in the photograph. The approximate dimensions of the church are:—Length, 110 ft.; transept, 72 ft.; breadth of nave, 21 ft., and of nave and aisles, 38 ft.; height, 42 ft.

The whole of the interior was masked by a veneer of Renaissance work; this was swept away at the restoration of 1889, and it has been attempted to restore the interior to the form which it presented at the period when it was built. But what that period was has yet to be determined. The authorities of the church, as is natural, carry back the date to very early days—even to the very beginnings of State Christianity, when Constantine, c. 330 A.D., is said to have handed over to the Christians of Verona a temple of Venus, on the site of the present church: Again, a church of S. Lorenzo is mentioned in the time of King Pepin (800-808), a son of Charlemagne, whose subterranean tomb and sarcophagus are still to be seen in the churchyard of the neighbouring church of S. Zeno; so that the present church may belong to the earliest years of the IXth century. If so, it will be older than anything at Pavia; older even than the apses of S. Ambrogio and S. Eustorgio at Milan: Again, in 1185, Pope Lucius III. granted to it certain privileges as

to mass: As far as documentary evidence goes, therefore, the church may be of the IVth century, IXth century, or XIIth century. Nor is this all. The internal elevation of the choir differs from that of the nave—the latter is shown in the photograph from the south-east. In the choir the pier-arches are wider and semicircular, not stilted; and the gallery is very small and set very high, leaving a large space of blank wall between the pier-arcade and the gallery. Again, the south wall of the nave, half way up, is of alternate courses of stone, brick, and river-pebbles, some of the latter being set in herringbone fashion: The upper part of the wall is built of much larger stones or of brick, and is of much better masonry: It follows that the choir and apses may be earlier than the western part of the church and that the upper part of the nave may be later than the lower part, the galleries being a later addition, as they probably are in the basilicas of S. Lorenzo and S. Agnese, Rome. It is just possible that these earlier parts may be of the IXth century; the rest must be much later. Now turn to the plan. The triple eastern apse is found at Rome, at S. Pietro In Vinculis (VIIIth century), and S. Maria In Cosmedin and S. Maria In Domnica (IXth century), and in S. Ambrogio, Milan (824-859). Again, the return aisles of the transepts and the west end are decidedly a mark of late date; they occur in the middle of the XIth century in the Caen churches, but are very exceptional in the north of Italy. Outside are the foundations of an exo-narthex, which may have formed

Plan of San Lorenzo, Verona. (From Hubsch's "Architecture Chrétienne.")

part of an atrium. At S. Ambrogio, Milan, an atrium was added in the XIIIth century. The pair of western towers, also, are found in S. Ambrogio; in the Verona church they are in a line with the aisles; in S. Ambrogio they are flanking towers.

As for the materials, the interior is built partly in brick, partly in alternate courses of brick and stone—a common fashion in Verona. As in S. Ambrogio, Milan, and S. Michele, Pavia, the aisles are in two stories, both covered with groined vaults, and, as in S. Ambrogio, there is no clearstory. The piers, too, are arranged in Lombard fashion. Was it with a view to covering the nave in great squares with an intersecting ribbed vault? That seems hardly probable; the slenderness of the supports seems against the possibility of a Lombard vault, which was usually very heavy, sometimes as much as 20 in. thick. Rather one would judge that the heavy vaulting shaft of each principal pier was intended to carry a broad transverse arch crossing the nave, with its spandrels filled up with walling carrying the purlins. Thus the wooden roof would be divided by four party-walls into five compartments, and a fire in any one compartment could not spread into the neighbouring compartment. A similar roof occurs in S. Miniato, Florence (XIIIth century), and in Modena Cathedral, and formerly in St. George's de Boscherville, Normandy, and in the aisles of St. Peter, Northampton.

As for the plan with alternating piers and coupled bays, this in itself forbids a IXth century date. This Lombard plan of church occurs indeed in S. Eustorgio, Milan, and in SS. Felix and Fortunatus, outside the walls of Vicenza, both Xth century churches; but in both the piers are less advanced in type than at S. Lorenzo. The columns are a curious melange of different marbles; some are monoliths, others are pieced together; capitals and bases, too, are a miscellaneous assortment, reminding one of the diversity of S. Maria in ara celi, Rome, which may be c. 900. But an equally mixed set of capitals, shafts, and bases may be seen in the XIIth century crypt of S. Zeno, Verona. In both the Verona examples some of these capitals, bases, and shafts come, no doubt, from earlier churches on the same site. Others are of different origin, for some of the capitals are too small, others too large for their shafts. Some

of the columns have the Attic base, some have none, some have large bases hacked down to fit. It will be noticed that, owing to the thickness of the wall and the slenderness of the columns and their capitals, both in the pier-arcade and in the upper aisle, the Byzantine dossier or cymaise occurs instead of an abacus; this is common in Lombardic work. The principal piers have a cushion capital similar to those of S. Zeno, Verona, but less developed. Cushion capitals occur in S. Miniato, Florence, and S. Abbondio, Como, in the XIth century. All the capitals of S. Theodore, Pavia (1190), are of the cushion form. The pier-arches are more simple in type than those of S. Ambrogio, Milan, and S. Michele, Pavia, not being recessed in orders. On the other hand, the gallery-arches of the choir are in two orders, and the windows have square orders. Of the string beneath the gallery, many fragments were found at the restoration, one or two *in situ*. It is very classical in character, and seems too elaborate to have been executed before the XIIIth century. Externally, there are brick buttresses—pointed oblongs on plan—which occur in other XIIIth century churches—at Verona and Milan; where, also, a similar semicircular corbel-table is common, appearing first perhaps in the IXth century, in the choir of S. Ambrogio. The two western towers are very remarkable; both are circular, both contain newel staircases leading to the spacious galleries, which, as in the Byzantine churches, may have been appropriated to the female members of the congregation. Still more remarkable are the bases of the towers. One tower stands on a big quadrangular sculptured block, which may quite conceivably have been an altar belonging to the Temple of Venus, which the IVth century church superseded. The other stands on the base of some vast column, such a base as one sees still here and there, for the engaged columns of piers in the halls of the Roman thermae.

And now to sum up. The church presents many features to be found in the very earliest Romanesque churches, and even in the early Christian basilicas of Rome and Ravenna, and the domical churches of the Eastern Roman Empire. On the other hand, there is not a single one of these features which cannot be paralleled in undoubted Romanesque work of the XIth or XIIth century.

Further, there are other features which occur nowhere before the XIth or XIIth century. The conclusion seems incontestable—that we must dismiss as a figment any ascription of the church to the IVth century and come to the conclusion that, if any part of the church belongs to the IXth century, it can only be the eastern apse, the lower part of the walls and fragments of east-work re-used. The church, as it appears now, cannot be earlier than the latter years of the XIth or the early years of the XIIth century. Some help to date may be got from the great church of S. Zeno. It resembles S. Zeno in many respects, but in a humbler and less ambitious fashion. Now, S. Zeno was built not earlier than 1138, which would give us for S. Lorenzo a date earlier than the first quarter of the XIIth century. Its position relative to S. Ambrogio, Milan, and S. Michele, Pavia, is still more uncertain; the date assigned to these churches by De Darstein is quite impossible, and has any other date been satisfactorily established. A probable sequence is: (1) S. Ambrogio, Milan, except the apse and choir, which are IXth century; (2) S. Michele, Pavia; (3) S. Lorenzo, Verona; (4) S. Pietro in ciel d'oro, Pavia, consecrated in 1136; (5) S. Zeno, Verona after 1138.

THE REPORT ON WORKMEN'S COMPENSATION.

IN our former issues we have referred to the general observations of the Report of the Departmental Committee on Workmen's Compensation, and we purpose now to make one or two observations on the recommendations contained in the Report, although we do so in no cavilling spirit, since the Report has been framed only with great attention to detail, and the suggested amendments have been conceived in an impartial spirit, with reference to the various interests represented before the Committee.

In making these observations we propose not to follow the text of the Report, but to take the Act and, as far as possible, follow the order of its provisions.

As regards the word "accident," the Committee recommend that no attention should be made to define it, but that the Courts must be left to determine whether an injury is or is not accidental. The Committee do, however, say that they are not prepared to advise an extension of the Act to include diseases incidental to a man's occupation. Although we agree with this view of the Committee, their recommendation appears hardly strong enough to attain the end in favour. As the law now stands the anti-cases, *Turvey v. Brinton*, and *Higgin v. Campbell and Harrison*, are binding precedents, and they are compelled to decide diseases incidental to occupation as accidents within the Act. These cases are an appeal to the House of Lords, and if they are reversed there will be no difficulty in giving effect to the recommendation of the Committee; but should the House of Lords affirm these decisions, it is obvious that a change in the law will be necessary to carry out the vi-

expressed in the Report, and a definition would have to be given of the word "accident."

The Committee recommends (paragraph 111) that the limitation of locality involved in the words "on, in, or about," should be modified, and that the workman shall be entitled to the benefits of the Act, wherever the accident happens, whilst he is actually engaged on the duties of his employment; but this recommendation must be read with the important limitation contained in paragraph 153, that it is not to apply when an "undertaker" is liable to the workman if his sub-contractor, in which case the liability is still to be limited to an accident which happens, on, in, or about the undertaker's own works, or the place where he is exercising control in carrying out the work. As to the word "undertaker," which, when read in conjunction with the word "employer," as used in the Act, has caused some difficulty, specially with reference to indemnities under section 4, the recommendations of the Committee are not so clearly expressed, and it will be for Parliament to consider the form to be given to their recommendation. The intention is clear that wherever an employer has had to pay compensation to a sub-contractor's workman, there is to be an indemnity. It appears that the word "undertaker" might well be dispensed with throughout the Act in favour of the word "employer," although this would necessitate re-drafting the defining section, where undertakers are referred to with reference to the various employments within the Act.

Some of the definitions suggested in the Report would require careful consideration. Thus it is proposed to define "wharf" as "a place for landing or unloading goods or passengers contiguous to water." This definition seems to have been suggested to adopt the view expressed by the majority of the Court of Appeal in *Haddock v. Humphrey*, but would it include the decision in *Ellis v. William Cory and Co.*? The intention of the Committee appears to be to express the law as laid down in both these cases, but would discharging goods upon a floating structure in mid-water unconnected with the shore be deemed to be "landing" them? Moreover, the definition appears too wide, since it would include piers and wharves, and a pleasure steamer taking up passengers from a pier would be using a wharf. As regards warehouses the Committee propose sweeping away the distinction between wholesale and retail premises now laid down in the Courts in *Green v. Britten and Gilson*, limiting the employment to "storage for sale or safe custody by way of trade, or for purposes of gain."

A definition of "engineering work" is also suggested, extending the operations to road-making, well-sinking, construction and maintenance of telegraphs, telephones, "and other electric appliances," but the latter words appear far too vague, and would encourage much litigation.

The Committee have recommended an extension of the Act to quarries less than 20 ft. deep, but in this connexion a matter which causes much hardship

in the case of mines and quarries seems not to have been brought to the attention of the Committee. The definition of undertakers in the case of such undertakings includes the "occupier," but, owing to a lack of definition of the word "occupier," the persons temporarily working quarries may escape liability, and the occupiers also may become liable to pay sub-contractor's workmen, and yet have no right of indemnity from the sub-contractor. We should suggest a simple remedy for this by defining the word "occupier" in this connexion as it is defined in the case of docks, wharves, quays, etc., including persons having the actual use and occupation of such premises. As regards building operations, the Committee have recommended the drastic course of abolishing all restrictions, and including all building operations. The restrictions in the present Act were inserted to exclude small builders, and the Committee, in relation to other occupations, seem fully alive to the objections of including small traders, unless and until a system of compulsory insurance can be enforced, and consequently we are drawn to the conclusion that, in the case of building operations, their only reason for including all building operations was the difficulty of suggesting satisfactory limitations, and the litigation that has attended those contained in the present Act. We venture to suggest that a limit, based on the cost of the work to be done, may possibly offer a satisfactory solution of this question, since a low limit on contract prices would exclude the use of real scaffolding or machinery. The suggestion that the word "dependants" should include brothers and sisters is a departure from the Fatal Accidents Act which does not meet with our approval, and which the Committee fails to support with any strong reasons. The burden placed on industries should, in our opinion, not be so increased.

The recommendations of the Committee as to the assessment of compensation in the case of labour casually employed do not seem to offer any satisfactory solution of a question which hears heavily on both employer and workman. The recommendation practically comes to this—that the standard prescribed by the Employers' Liability Act, 1880, may be applied, and the earnings he estimated by reference to the earnings of persons in the same grade of employment in the district—the principle adopted by the County Court Judge in *Bartlett v. Tutton and Sons*. This recommendation involves the proposition that the employer of a casual hand, he the employment only for an hour or two, must incur the liability of having to pay him compensation out of all proportion to his service, and practically on the same scale as the workman regularly employed, who is probably a higher class workman. Under the Employers' Liability Act the principle is reasonable, since negligence on the part of the employer or his servants is involved in the injury to the workman; but when accidents are unconnected with negligence, as under the Workmen's Compensation Act, this principle is inequitable. The question is an extremely difficult one, but we hoped that the

Committee might have devised a more satisfactory solution, and a different scale have been applied in the case of really casual hands, a principle adopted by the Committee in reference to the aged and infirm. The recommendations of the Committee dealing with the election of remedies, taken in conjunction with the proposed limit to be placed on the redemption of weekly payments, will tend to do away with some cases of hardship. In the *Law Times*, March 7, 1903, an example was given of a case of considerable injustice to employers. In this case a man claimed under the Employers' Liability Act 250*l.*, and, having failed in his action, obtained an award under section 2 sub-section 4, and the employers who were compelled to defend themselves against the charges of negligence, and who had succeeded in their action, found themselves saddled with a liability to pay some 750*l.*, in place of the 250*l.* claimed in the action. We do not, however, agree with the suggestion made by the Committee that in actions at common law or under the Employers' Liability Act, a plea may be set up that the workman has an adequate remedy under the Workmen's Compensation Act; such a plea would raise questions of great difficulty and considerable uncertainty.

Before leaving the subject of compensation, we desire to draw attention to a point which seems not to have been brought prominently before the Committee. At a recent meeting of the Oddfellows, complaint was made of the pernicious influence the Workmen's Compensation Act was having upon the funds of benefit societies. These societies hesitate to pronounce a man fit for work as long as he is in receipt of compensation, yet since compensation is received without any of the restrictions attending sick pay, the men are not so anxious to return to work, and it is obviously not their interest to do so until they are at least so far recovered as to be able to earn wages considerably in excess of the half-pay they may be receiving as compensation. The restrictions placed upon a man in receipt of sick pay are a direct check on malingering. He is subject to surveillance, he may not be out after certain hours, or walk more than a certain distance from his home, and the consequence is that his *otium* is enjoyed with a certain loss of *dignitas*. Now, seeing that these benefit societies are famed for their excellent management, and that their rules are framed by the men for the men in their own interests, it would appear that the Legislature might well take a leaf out of the men's book, and that some system might be devised by which a man in receipt of compensation might be given a similar incentive to go back to work. As it is, the benefit societies and the Act often work to their mutual disadvantage. The two are independent, yet the benefit society often is guided by the payment of compensation as a test of capacity; whilst, on the other hand, when an arbitrator is trying to compel a man to return to some work by reducing compensation, his object is frustrated by the man's being in receipt of sick pay.

The Report contains some very

practical suggestions as to the time for commencement of proceedings, but since it states that the "notice of claim" shall not be a step in the action, and as "proceedings" cannot be taken without special leave after the expiration of three months, it will be well in the Act to define what step is to be deemed the commencement of proceedings, to avoid questions such as that raised in *Parry v. Clements*. The recommendations as to the functions of medical referees are very important, and tend to substitute a medical tribunal for the present quasi-judicial tribunal which, in many cases, would be more effective. In paragraph 231, however, a clerical error seems to have crept into the Report. Where a workman is in receipt of weekly payments, and a dispute as to his capacity is referred to the medical referee, the Report states that the opinion of the referee is to be conclusive of the condition of the workman "at the time of his injury." It is obvious that this reference might be made weeks or even years after the accident, and the question to be determined is the workman's condition at the time of the reference, and earlier in the paragraph this is so stated. Before the Report takes shape in legislation, these and other minor points will no doubt receive full consideration, but attention cannot be too soon drawn to any suggested amendments, if a satisfactory measure is to be obtained at the hands of the Legislature.

NOTES.

Coast Protection. As we have before observed, a circumstance militating against the adoption of protective works in many parts of the Eastern and Southern coast-line is the small value of agricultural land. When the value of such property becomes increased by the extension of watering places, or by the development of new building estates, a solution for the problem is at once afforded. We believe that in numerous places the local authorities might do much for the protection of England from encroachment, by road construction parallel with but at a safe distance from the shore. At present it is by no means uncommon to find towns, villages, and hamlets on the coast entirely without direct means of inter-communication. An example of the kind is furnished by the towns of Worthing, Goring, Littlehampton, Bognor, and intermediate villages. Access between these places can only be obtained by circuitous inland routes, and we are certain that the construction of a continuous road along the coast would be of immense convenience, as well as serving to augment the value of land bordering the new highway. If the local authorities were to acquire the property on either side of the road at the present nominal value, the investment would be highly remunerative in the long run. The cost of the road and protective works would be repaid, further incursions of the sea would be prevented, and the popularity of the various places would be greatly increased. We have here considered merely a representative case, but very

similar conditions obtain along many other parts of the coast-line.

In an article which recently appeared in the *Times* on the growth of electric tramways, it was stated that some of the municipalities were contemplating the inauguration of parcels and goods traffic, and that one municipality was even considering the question of carrying coal. This appears only to be rumour at present, but it draws attention to a matter which might become a most serious abuse. As it is, our roads, both in towns and suburbs, are being used for nearly every purpose except that for which they were created. They form a convenient trough in which to lay all pipes and wires, and are generally kept open for this purpose. Tramways rush at high speeds down the portion of the highway which is not opened up, and motor-cars and cycles dash at higher speeds past the tramways. The normal vehicular traffic, and the pedestrians, are already much in the position of those who engage in an obstacle race. If goods and coal traffic is to be added to the use and abuse of the roads, a serious condition of things will be created, and it is, therefore, of importance that Parliament should see that Tramway Bills contain clauses restricting the municipalities from engaging in goods traffic. When the increase is considered in the number of tramway passengers, they having only amounted to 759,466,000 in 1896, whereas last year the number carried was 1,681,949,000, some idea can be obtained of what parcels and goods traffic on the roads might grow to.

Lightning Arresters.

THE extensive use of electricity in America to transmit power over long distances by overhead wires supported on wooden poles or iron standards has brought into prominence the importance of studying the effects of the electricity in the atmosphere. One of the greatest difficulties which the pioneers of this method of transmitting power had to overcome was the constantly recurring breakdown of the system due to short circuits caused by miniature lightning flashes from the wires to the nearest conductor in contact with the earth. It is now about forty years ago since Lord Kelvin showed, by means of his water-dropping electrometer, how rapidly the electric pressure in the air varied with the height above the surface of the ground even on days when the sky is clear. This rapid and erratic variation of pressure with height makes the working of transmission lines, especially those which vary greatly in altitude during their course, very difficult. Even when the line is not working the electrical surges set up in the wires by the atmospheric electricity have sometimes been great enough to do serious personal injury to the officials and to pierce the insulation of the generators and transformers on the line. To get over this difficulty "lightning arresters" are always used. In a recent paper in the *Electrical Review* of New York Mr. A. D. Adams gives a most interesting discussion of the theoretical principles on which these appliances are supposed to act. The form

of arrester which has come into general use with transmission lines in America consists of a porcelain slab with a row of small brass cylinders placed parallel to one another on it at distances of about $\frac{1}{8}$ in. apart. The top cylinder is connected with the transmission wire, and the bottom cylinder is connected with an earth plate exactly similar to the one used with lightning conductors. When an electric wave generated by atmospheric electricity comes along the wire it goes to earth by sparking over the brass cylinders which are sufficiently numerous and sufficiently distant apart to prevent the working pressure of the line from establishing an arc. Mr. Adams states that it is quite an ordinary sight to see the "lightning arresters" at a station connected with a long transmission line flash "scores of times" during a thunder storm, often with loud reports, and the flashing to be continuous for several minutes at a time. The very elaborate arrangements of these safety devices that are put up in connexion with transmission lines show that electricians are now fully alive to the dangers of the surges due to atmospheric electricity.

Paints for Structural Work.

SOME interesting results of an investigation into the durability of paints for the protection of structural ironwork were found in a paper recently read before the Franklin Institute by Mr. Robert J. chemist to the Philadelphia and Reading Railroad. Three types of paint had been used for several years on this line, and after various trials, it was found that ironwork covered with one variety remained in perfect condition after some four years service, while parts of the same structure coated with another quality of paint became very badly corroded. The general results suggested an investigation to determine the causes of the variation and to assist in the establishment of a specification for paint of satisfactory durability. Chemical analysis threw very little light on the subject, and resort was had to microscopic examination. Marked differences were then observed in the sizes of the particles of pigment, the three qualities of paint. Full particulars of the investigation are given in the *Journal* of the Franklin Institute, which our readers are referred to; but we may state that the point made by the author of the paper is that fineness of pigment is a very important element in the durability of the paint. Naturally the finer the pigment, the slower will be the drying process, and there is a degree of fineness beyond which drying would be inconveniently slow. At present, ordinary inorganic pigments are ground to a fineness which is far below the point at which a question that considerable improvement may be made without causing any risk of slow drying.

Indiarubber Paving.

OWING to its high cost the use of indiarubber as paving material can never become general; but in limited areas where the prevention of noise is of great importance, it has been employed with considerable satisfaction and ultimate economy. Perhaps the most familiar example of such paving is that on the carriage-ways passing beneath the Eust

tel. Laid nearly a quarter of a century ago, at a cost of about 5*l.* 8*s.* 6*d.* sq. yd., the rubber covering set until May, 1902, when the original thickness of 2 in. had been reduced in the middle of the roadway to about 1 in., and to $\frac{5}{8}$ in. at the places where horses step upon it from the macadam road. In consequence of the increased price of rubber the cost of covering the carriage-ways with the same quality of material as before was estimated at 2*s.* 6*d.* per sq. yd., and a cheaper quality was substituted at very little more than the original price. The material adopted is vulcanised rubber similar to that laid down in 1895 at Wellington Court, Knightsbridge, where it has worn well. In the courtyard of the Grosvenor Hotel the rubber paving, 2 in. thick, was laid at a cost of about 8*l.* 8*s.* sq. yd. In all the above cases the amounts mentioned are exclusive of concrete foundation work. During the life of the paving at Euston the average cost of maintenance has been less than 3*d.* per sq. yd. per annum. From these notes it becomes clear that rubber paving is by no means an extravagant luxury.

LIVERPOOL has wisely taken up the question of theatre safety with due regard to modern requirements and the lessons learnt from the Chicago fire some nine months back. It would be well if all the other larger provincial cities were to adopt rules of similar tenor. Birmingham and Manchester, we believe, have recently revised their regulations, those of Birmingham being essentially of a modern character. But where revised rules are really more required than in the large provincial centres is in the medium-sized provincial towns that perhaps have one or two theatres at the best, and perhaps an additional variety theatre. It is in towns of medium size that there is so much neglect at the present moment. We may take the opportunity of observing, however, that there ought to be some "model" regulations for adoption in all centres, so that the theatre manager, and more particularly the touring manager, does not find himself met with a curious variety of requirements in the various places in which he wishes to do business. As London is, one provincial centre requires blinkers; another does not require blinkers, but will not allow any scenery to the theatre that is not "flame-proof." One centre requires a certain class of electrical safeguards; another requires a different variety. Surely the time has arrived to standardise the requirements as to theatres, and there could be no great difficulty in doing this if the theatres be classified according to their size and their position in relation to public thoroughfares. Of course it is well known that the regulations of the London County Council frequently serve as a model in the provinces, but these regulations are not necessarily applicable everywhere to provincial requirements; in fact, very much the reverse, as the disadvantages as to site in many provincial theatres require special treatment, if even an ordinary amount of safety is to be attained.

Architects and Elementary Schools. AN important discussion took place last week at the meeting of the Education Committee of the Herts County Council as to the employment of an architect to prepare plans for and carry out the erection of a new "provided" school at Watford. It appears from the report in the *Watford Observer* that one party proposed that the work should be done by an architect, another that it should be done by the County Surveyor. Fortunately it was decided that an architect should be employed; but it was decided, as regards the erection of a "provided" school at Bushey, adjoining Watford, that the County Surveyor should do the work. The business of the county surveyor is mainly concerned with main roads, and this work alone, if it is to be done properly, is quite enough for one official. But for the satisfactory erection of a school an architect should be employed, one who has studied the subject, and not a surveyor who is an engineer by profession, and who is an amateur as an architect. The question is one of more than local importance, and we think the Institute should consider the matter, because the proper course for a county council is to appoint an architect to do their architectural work, either permanently or for each building as required.

A Cape Building Case. WE have received a report, published in the *Cape Times*, of September 6, of a case of *Skippon v. De Witt*, which contains the judgment of Chief Justice Sir J. H. de Villiers, in the First Division of the Supreme Court. It is interesting as showing how the same questions of building law are cropping up the world over. The action was brought by a builder against an architect to recover damages for incorrect quantities supplied by the defendant, who had acted both as architect and quantity surveyor for the building owner. This question has more than once come before the English Court, as many of our readers are aware, and it has been decided over and over again that when there has been no fraud on the part of the quantity surveyor, the builder cannot recover if the quantities are incorrect. This was also the judgment of Chief Justice de Villiers, who appears, however, not to have relied on any of the English decisions, but rather to have treated the case as a novel one. Possibly it may be so in the Cape Court, and, therefore, it may be regarded as a decision of some importance for practitioners in South Africa.

Croyland Abbey. For the past seventeen years, through the energy of the Rector, what remains of the grand Abbey Church of Croyland, in the Lincolnshire Fens, has been gradually repaired, the work having been carried out by Messrs. John Thompson and Co., of Peterborough. The lead roof covering the north aisle of the nave—now used as a parish church—was pronounced by the late Mr. Pearson to be in a very bad state, its thrust also endangering the side walls. This it is estimated will require a sum of 537*l.* to properly repair, and an additional sum of 240*l.* is wanted for two new windows on the south side.

For these sums, of which the first is the more important, an urgent appeal is now made, and considering the great interest of the building as a national monument, and the care which has been taken to preserve it to us in recent years, it is earnestly to be hoped that the required sum may be forthcoming. The sum is a comparatively small one, and should be easily raised if the needs of the building are made widely known. All sums should be sent to Rev. T. H. de Bœuf, the Rector of Croyland.

The Belle Vue at Brussels. THE Hotel Belle Vue, which stands at the north-east corner of the Place Royal at Brussels, has been purchased by the State, so that the house and garden may be added to the grounds of the Palace which adjoins it, in accordance with the plan for the enlargement of the royal dwelling and grounds. The demolition of the building will take something away from the symmetry of the Place Royal, since the Belle Vue is a kind of wing corresponding with a similar building on the north-west side. With the Belle Vue will also disappear what may be considered a historical hotel, for in 1776 Maria Theresa, Empress of Austria, granted to Philip de Profit the portion of the grounds of the ancient ducal palace, on condition that he should build on it in prescribed style a large hotel for travellers. In 1779 Charles de Loraine granted a piece of ground adjoining the hotel for the purpose of a terrace. So that the Belle Vue has been an hotel for more than a century, and during its existence has been the resting-place for all sorts of travellers, royal and otherwise. With it will disappear one of the most agreeable kind of old-fashioned hotels—spacious, quiet, comfortable—containing the comfort of the modern caravanserai, without its size, noise, and railway-station atmosphere.

Rushton Hall, Northants. WE read that an American gentleman has purchased Rushton Hall, near Kettering, of late years the property of Mr. W. C. Clarke-Thornhill. Rushton Hall, one of our finest examples of domestic architecture, was originally built in the XVth century by an ancestor of the great building squire, Sir Thomas Tresham; to that period belong the great hall with its circular bay, and portions of the lower two stories. In 1594-5 Sir Thomas Tresham enlarged the house, and inserted his device of the trefoil, the "*Johis languentibus herba*" of his kinsman's epitaph, with the figures "1595" in the straight gables. The dates "1610," "1618," and "1626" in other gables of somewhat similar detail commemorate the completion of the house, and after the then prevalent style, by the Cockaynes, of whom Sir William Cockayne, Knight, elected Lord Mayor in 1619, had bought the property, about 360 acres in extent, after its confiscation in 1605 from Sir Thomas Tresham's son, Francis, for his complicity in the "Gunpowder Plot." The Cockaynes possessed the estate until the close of the XVIIIth century, when it passed to Sir William's descendant, Lord Cullen. An illustration in our columns of November 3, 1888, shows the main elevation of Rushton Hall,

with the galleried screen which connects the two wings and so encloses the quadrangle. Rushton had belonged to the elder branch of the Treshams in the time of King Henry VI.; after the decapitation of Sir Thomas Tresham after the battle of Tewkesbury, it was seized by the Crown, but was restored by King Henry VII. to John Tresham. In a distant corner of the park, at the end of a long avenue of box and yew trees, whence the "straining eye" may see the Field of Naseby, is the singular building known as the Triangular Lodge, erected by Sir Thomas Tresham in 1593-5, and illustrated in the *Builder* of July 21, 1883, after measured drawings by Mr. J. Alfred Gotch. There is a tradition that Dryden wrote parts of "The Hind and the Panther" at Rushton.

DURING recent excavations of the Castle, whereof it was believed all vestiges had been quite destroyed. The remains consist of about 12 ft. of walling, having a return of the same length, built with off-sets, and constructed of the local red sand-stone. The Castle, first erected in the last decade of the 13th century, was exchanged by King Stephen to Ranulph de Gernons, Earl of Chester, for the old Castle, commonly known as John o' Gaunt's, at Chesterton, about two miles distant. The fabric was repaired and enlarged *temp.* John, who in 1206 visited the fortress, which on the Borough seal appears as a many-gabled building, largely constructed of timber. Leland mentions the survival of one great tower in 1530. The Castle was pulled down after the Civil War; of late years a part of the site, known as Castle-hill, has been occupied by some foundry works.

At the Fine Art Society there is on view a collection of water-colour drawings by Mr. Wimbush illustrating the Channel Islands. Without perhaps rising to what may be called the poetry of water-colour art, these are very charming drawings illustrating many beautiful and picturesque scenes, and the artist treats all classes of subjects with success—old streets, views of hill and bay, and garden scenes with masses of flowers in the foreground; the exception perhaps is in the one or two which are purely sea-pieces—rough weather pictures, not very powerful as sea-painting. Many of the quieter scenes, in which the blue Channel sea forms a framework to lovely coast nooks surrounded by hills, are most attractive, and the view of "The Town Church, St. Peter Port, Guernsey" (36) shows how well Mr. Wimbush can paint architecture. The assemblage of greenhouses which make Guernsey a kind of conservatory have been judiciously ignored. One result of the exhibition may be to lead some more holiday-makers to turn their thoughts towards the Channel Islands, here portrayed in so attractive a form.

REOPENING OF ST. CHAD'S CATHEDRAL, BIRMINGHAM.—St. Chad's Cathedral has been closed for a few weeks while the interior has been renovated. The builders' work has been done by Messrs. J. Barnsley and Son, of Birmingham, under the direction of Mr. Keogh, architect, of London.

BROCKLEY BRANCH LIBRARY COMPETITION.

The drawings comprising the designs, thirteen in number, submitted in limited competition for the proposed library to be erected upon a site adjoining Crofton Park station, have been exhibited to the public at Catford Town Hall during the present week. The competition has been instituted by the Public Libraries Committee for the Borough of Lewisham, and although the Committee is intrusted with the expenditure of public funds, it does not appear to have considered itself under any obligation to secure technical advice in the matter; the Committee has organised the conduct of the competition, and has adjudicated upon the designs submitted. No premiums were offered, and the statement of the Committee's requirements, which, together with a plan of the site, were supplied to invited competitors, are so brief that they may be here quoted in full:—

"The Committee invite designs for the erection of a new branch lending library, including reading and news rooms, also separate reading-room for juvenile readers (but without a reference library), also with caretaker's rooms, on an acquired site at Brockley (see ground plan enclosed). The buildings to be planned with a view to the best utilisation of the site and possible future extra accommodation; the cost, including fixtures, fittings, architect's and quantity surveyor's fees, is not to exceed £5,000."

The site does not lend itself readily to successful planning. It is a right-angle corner site with a building frontage of about 30 ft. only, on Brockley main road, and of about 104 ft. on Darfield-road, which we understand to be an unimportant bye street. At that end of Darfield-road frontage which is remote from Brockley-road, the site is some 82 ft. deep, so that the building lines show a triangle with a truncated apex on the chief roadway. The competitors have had to decide whether they should contrive their main entrance in the 30 ft. frontage upon the important Brockley-road, or consider this sentiment immaterial when opposed to the greater economy and convenience of plan afforded by arranging the main entrance opposite the heart of the site in Darfield-street. On this point competitors have proved themselves divided in opinion, and it may further be said that the limit of cost mentioned in the "Memoranda of Instructions" has been to a very large extent ignored by them. Very few indeed of the designs could be carried out for a sum approximating to the limit fixed by the Committee.

The design which has been numbered 9—the work of Mr. Albert L. Guy, of Gray's Inn—has been selected by the Committee, and we understand that the appointment of Mr. Guy as architect has been confirmed by the Council. We are inclined to think, on considering the drawings submitted by Mr. Guy, that the Committee have been guided in their choice by the fact that Mr. Guy's design is the least objectionable of those few designs in which are found combined a main entrance into Brockley-road and a character and dimensions which hold out some hope that the work may be executed at the stipulated price. These advantages Mr. Guy's design offers; but we find it hard to congratulate the Committee on the result of the competition. The selected design entirely lacks character and style in its architecture, and shows few conveniences in plan. A lobby immediately inside the entrance gives direct access to a wide corridor in continuation of it, which affords access to reading and magazine rooms on the left, and forms a space for borrowers using the lending library, whose counter limits this space, upon the right. This counter is 36 ft. long, and the lending library is 16 ft. 9 in. wide. The reading-room for juveniles is at the end of this space, opposite the entrance lobby, and has a separate entrance from Darfield-street. All reading-rooms are well placed for thorough supervision from the lending counter, but there is no librarian's room or office, work-room, binding, or other room or store on the ground floor. A staircase opening into the staff entrance lobby leads to an ill-lighted basement apartment allocated to "staff," with lavatory accommodation convenient thereto. The requirements of the elevations, rather than the needs of the caretaker, surely have endowed that official with a suit occupying an upper floor placed over the salient portions of the building, consisting in scullery, kitchen, offices, living-room, and two bedrooms. The style of the building shows Elizabethan proclivities, with a Dutch gable, and is rendered in red brick and in what would suggest itself to be Bath stone, but which we

understand to be intended as Portland stone. The design lacks distinction or scholarship. The requirements as to future extension seem to have been disregarded.

We will do no more than refer to a design numbered 8, which shows a school elevation in Portland stone of a two-storey building—an impracticable quality in a library of this size and character; or to the design numbered 5, also in Portland stone, an elaborate design of merit, which soars beyond proper matters of cost (though not disdaining to present a conspicuous but really well-devised tower, a gas meter and the caretaker's stairs); or to the drawings numbered 3, wherein are sharply delineated elevations, simple and monumental, in brick with economical Portland stone dressings, but with plans which are fatuous and impossible.

The designs in which competitors have arranged their main entrance in Darfield-street are for the most part too elaborate and costly, of dimensions which place them outside consideration, but we think it would have been well if the committee had disabused its mind of obvious prejudice against the entrance from Darfield-street. When all is said, the 30 ft. frontage of a building will not predominate 100-ft. frontage because its entrance is placed there. It is also obvious that the absence of an entrance on the Brockley-road frontage gives just that importance to the Darfield frontage which may detach the building from its surroundings. If the committee had seen the matter from this point of view, they might have fixed their choice on the design numbered 4, and thereby have obtained an economical building with an eminently convenient, not elaborated plan, and an elevation which would have a sufficiently monumental character without any suggestion of extravagance. The author of this design has placed his entrance in Darfield-street, somewhat remote from Brockley-road. A compact lobby gives entrance on the right hand to news and reading-room and on the left to the junior readers'-room, and leads direct into the space allotted to borrowers, counter and the lending library are on the right hand, and upon the left hand is space designed to be occupied by a future reference library, other extension of the buildings. There is a small librarian's office convenient to the counter, a work-room and lavatory access from the lending library. A separate entrance and apartments for the caretaker are arranged on the first floor, affording a gable over the entrance bay. The roofs are finished by a reasonable economy ignored by all, or almost all, other competitors.

We are afraid the committee has missed the chance of securing for Brockley a well-designed, economical, and convenient library, and will be accountable for the erection of a building which lacks character and practical convenience in plan.

MAGAZINES AND REVIEWS.

THE Art Journal devotes some space to illustrations of electric light standards and fittings by different firms, under the general title "Electric Light and the metal crafts." The writing, however, is little more than an appendage to the illustrations. Some of the designs are good; but there is nothing of first class inventive artistic character about them, and this is hardly surprising when we consider that they are only the productions of firms and that no artist's name is given in connection with any one of them. The most distinctive characteristic things are the wood fittings noticed by Mr. Henry, some of which we have already noticed with approval. "Northumberland's some Artists"; "The National Gallery, Scotland" (especially in regard to its French paintings); and "George Morland," are subjects of three other articles. The connection between France and Scotland in the XVIIth and XVIIIth centuries would have one to expect an even larger representation of French art of that period, in Scotland, actually exists; but the Scottish gallery includes some very fine and celebrated works of Watt, notably his "Fête Champêtre," with its curious and dramatic contrast between the stately and brocaded living persons and the stone nymph on the terrace wall. Was it intentional satire on Watteau's part, or was his nymph merely decorative? We do not know whether Mr. Cundall, who writes the article on Morland, does not give a reason

aggregated estimate of his genius—that is, what might have been possible to him had he avoided dissipation and low company. The fact that he had those preferences seems rather an indication that his genius was not of the highest, or it would have held him above that level of life.

The *Burlington Magazine* includes an article by Mr. Binyon on "Drawings of the Norwich School at the British Museum," with illustrations of two fine and interesting drawings by G. C. Brown and Cromie respectively. Mr. Clouston's "Minor English Furniture Makers" (III.) deals with the work of Ince and Mayhew, and, judging from the illustrations given, may be said to have represented the faults of the period (which were very serious ones) about his merits. The style of these is about as bad as can be, and it is time that the fashion of admiring this kind of work was given up. J. H. writes an article on the Ionides Collection, an article containing some good technical suggestions. While we agree with him that Rousseau is very unequal, we should regret that the same might be said of Diaz, instead of merely dismissing him as an over-rated painter. Diaz at his best is so remarkable a scape-painter, with a style so intellectual as to especially his own, that it is difficult to over-rate him; but it is not very often that we find him at his best. What the writer means by calling that *farceur* Monticelli a follower of Diaz, and suggesting that Diaz will ultimately place below him, we cannot imagine, except that art-critics seem in the present day to be merely going off their heads in the perversity of seeing beauty in what is crude and ugly. An article on the lace collection of Mr. Blackstone is accompanied by illustrations of some of the most curious figured lace (Venetian point) illustrating the Story of Judith, and also the use of unsuitability of figures to lace-work. The illustrations also of some perfectly exquisite lace of purely decorative work in the same class of lace.

The most interesting illustrations in the *Miner Architekturwelt* are those of the restoration, by Professor Otzen, of the ancient brick masonry chapel of Heiligengrabe; a fine piece of work with a lofty stepped gable at the end, and a heavy brick vaulted interior the lower portion, which has been repaired, painted, and decorated. Among the modern buildings illustrated, a very pleasing one is a school and master's house in the Christianstrasse, Berlin, by Herr Hoffmann. Here at least there are none of those architectural details which so often disfigure modern German buildings; it is a lofty T-shaped façade, feetly plain except in the three gables which form the centre and wings, where a specially rich treatment contrasts effectively with the expanse of plain wall below. Two illustrations of sculpture from the Berlin art-exhibition of this year are very good; a bull in bas-relief by Herr Spieth, and a "Kugelspieler," a nude youth balancing a ball on his arm; but these have a classic purity and dignity of line which is essentially sculptural. There is some really good furniture from the St. Louis Exhibition, designed by a Berlin architect, Herr Nachtlicht, and something new and effective in the way of a fence and wing in front of a street house, designed by E. Bernitt and Lange. Those who are concerned in providing decorative house-ings should look at this; it contains a good deal of suggestion.

In *Technics*, Mr. H. F. Parshall and Mr. H. M. Bart commence a serial article upon "The Dynamics of Heavy Electric Traction," dealing chiefly with train resistances at various uniform speeds. Several diagrams are given containing views based upon results afforded by the high-speed line at Zossen, the Central London Railway, the City and South London Railway, the New York Central and Hudson River Railway, and other lines. These diagrams show that there is now a fairly general agreement among engineers as to the total tractive resistance on well-built modern railways and their normal conditions. This series will be followed with interest, in view of the rapidly increasing employment of electric traction. A short contribution by Mr. Percy Longmuir deals with the "Influence of Casting Temperature on the Properties of Metals," and may be regarded as the continuation of a paper read by the writer in 1903 before the Iron and Steel Institute. Since that year the investigations have been continued to the examination of various commercially pure metals, and the

results now stated represent matter that has not been published heretofore. The value of the present records is indicated by the fact that, in the case of a fragile metal like zinc, a fall in casting temperature of only 37 deg. C. was accompanied by a decrease in maximum stress equivalent to 956 lb. per square inch. Variations in the case of aluminium appear to be chiefly shown on the extensibility of the metal, while the highest maximum stress in copper is coincident with the lowest casting temperature adopted by the writer. "Dampness in Houses" is the title of an illustrated article by Mr. Rufus E. Marsden, who presents a series of notes on the prevention and cure of dampness. The suggestions made are familiar to all practising architects, but should be of service to students. Mr. E. Flander Etchells continues his series on the "Theory of Structural Design," devoting attention to "Pillar Formulae." The object of the chapter is to compare Gordon's formula with a rule given in a previous instalment, and to elucidate the application of Mr. Shaler-Smith's sliding factor of safety formula to Gordon's rule. This is essentially a chapter that must be read in conjunction with those preceding and, probably, succeeding it. There are several other articles of considerable interest in the same issue, especially "Electric Lamps," by Mr. James Swinburn, wherein the Nernst lamp is fully described; "The Chemical Analysis of High Speed Steels and Alloys," by Mr. Fred Ibbotson, a subject of much importance to mechanical engineers; "Electric Waves," being Part III. of a series, by Professor J. A. Fleming; and "Starting Resistances for Shunt Motors," by Mr. George W. Howe, a short contribution giving rules for the design of such apparatus.

Public Works contains an admirable article on "The Public Baths of Ancient Rome," by Mr. Thos. Asby, jun., of the newly-established British school at Rome, who has been several times a contributor to our own columns on subjects of Roman archaeology. The electrification of steam railways is the subject of a long article by Mr. F. F. Bennett, containing a large number of statistics as to comparative cost of steam and electric working, and other questions incident to the subject. Mr. Bennett thinks that an accelerated and more frequent service could be obtained on the electrical system, which would result in a much higher percentage of passenger load in relation to the means employed to convey them. It does seem, as he says, rather absurd to employ a conveyance of 200 tons weight to convey 2½ tons of people about, and that is what he maintains that the present train system, on the average, amounts to. But we do not see that electrically worked railways could do so much to modify this condition of things. The composition of trains should be a little more elastic. Except on long distance journeys, there are certain times of the day when trains are always full, and others when they are generally nearly empty. It may be, however, that the extra work and time entailed in altering the composition of trains would more than compensate for the saving in haulage. Towards the close of the article the author threatens us with the bogey of State ownership of railways, which is every now and then put forth by railway economy theorists; and against which we protest. The public would not be nearly so well served by the State as it is by most (though certainly not all) of the great railway companies. Mr. A. T. Walmisley, the engineer to the Dover Harbour Works, contributes a long and amply illustrated article on the subject of groynes for the preservation and regulation of sea-beaches, which is attracting so much attention at present.

In the *Independent Review* Mr. T. C. Horsfall writes a very good article under the title "Housing: Lessons from Germany." The Lesson from Germany is put definitely in the form of the plan for suburban improvements of the town of Kassel, in which the plan is coloured to show "existing buildings," "buildings to be removed," "close building," and "open building." The point is that in Germany the town authorities put forth a carefully considered plan, on a comprehensive scheme, for the improvement of a town, and that such a plan includes the reservation of certain streets and areas from close building in long rows of houses. Commenting on their example, Mr. Horsfall says:—

"It will not suffice to ensure that in new districts the dwellings shall be free from structural defects and faults, shall be adequately lighted, ventilated, and supplied with wholesome water and with sanitary

arrangements. Far more than this must be done. The new districts must be so wholesome and pleasant, that few or none of their inhabitants shall be tempted to get drunk, for the purpose of escaping as quickly as possible from the influence of their environment. The building of long unbroken terraces of small houses must be stopped. All dwellings must have within easy reach a broad, tree-planted street, and a pleasant open space, where parents and children may get air and exercise, and feel glad that they are alive. One of the problems which must be solved, if the new parts of towns are to be made and kept wholesome, is that of ensuring that the dwellings of people of different social classes shall be intermingled. The experience of all large English manufacturing towns shows that a high degree of civilisation cannot exist in a large district which contains only the dwellings of working people. In such districts, grave evils are caused by the lack of knowledge on the part of each family of kinds of life fuller than that which it lives. And, as where each house is small, the streets are necessarily narrow, and little or no planted open space can be supplied, ignorance of nature as well as of full human life necessarily prevails."

Further on, in reference to the same point, after speaking of the necessity for having comprehensive "extension plans" of towns, Mr. Horsfall says:—

"I know that at present in Manchester, and doubtless the same kind of feeling is found in other towns, a considerable number of persons who desire to take part in the work of providing wholesome dwellings, are prevented from building by the conviction that, if they provided a number of well-built, well-arranged dwellings, these could not long be wholesome and pleasant homes, because before long they would be ruined by the miserable surroundings and the foul air which our municipal authorities at present allow to invade all new districts. If professional builders and well-to-do persons of public spirit did not provide a sufficient supply of dwellings, it would be easy for the central and the municipal authorities, by encouraging the formation of such building societies of public utility as are now doing much good work in Germany, and by enabling them to obtain loans at low rates of interest, to give a great stimulus to the supply. And in the new, well-arranged districts Town Councils could safely build a large number of dwellings."

In the *Nineteenth Century* Mr. Wilfrid Blunt writes an amusing and sarcastic article on "By-law Tyranny and Rural Depopulation," based on his own experiences as a landlord. Whether he is right in considering that the want of adequate habitations has had an influence on depopulation is a very large question. What is of more direct interest is that he found that he could build healthy and comfortable cottages of iron at 130l. each, and has had to relinquish it at the bidding of the District Council. One may shudder (aesthetically) at the idea of iron cottages in a country district; Mr. Blunt says he had them painted green and that in general treatment they were not ugly; "the cottage occupants were delighted with their new dwellings, and all the neighbours envied them their luck." Mr. Blunt was vaguely cautioned by the authorities, who, however, said "there appears to be no objection to your proposals."

"Yet this is what has happened. During my absence last Christmas in Egypt, my builder, having nearly completed his task, was summoned to the Council's instance and fined 5l. at East Grinstead for the offence of building otherwise than with bricks and mortar, and on my return a further action was brought against me on the same charge, which resulted in a continuing penalty of two shillings a day being imposed on me so as to oblige me to pull the building down. The grotesque result was therefore reached that on the strength of a public health Act, designed to secure the better housing of the poor, a building against which no charge that it was insanitary could be brought—indeed the charge had been expressly repudiated—was condemned, not because it was not good enough, but merely because it was too good. The sole evidence brought by the prosecution was that of the district surveyor, who deposed that he had measured the building and found it was larger in area and contained more cubic feet of air—that is to say, that it was a better and, according to all modern sanitary views, a healthier building—than the Council's curious by-laws allowed to a single-storied cottage not of brick or stone."

Mr. Wilfrid Blunt's cheap cottage experiences come up again in an article in *The World's Work*, which seems to have been suggested by this special case. A photograph is given of the half-demolished cottage, and a rough plan and section of it as intended. The plan certainly betrays the amateur architect, for the rooms are simply placed in a row, and one bedroom can only be reached through an outside door or through the other bedroom. We fear the plan leads us to think that there may have been more justification for the official condemnation than Mr. Blunt quite recognises; but this does not affect the main argument. There is very little doubt that the application of cut-and-dried building by-laws in country places will have to be reconsidered before long; too strong a case has been made out against them. What is wanted, however, is not the abrogation of any by-laws, which would be a dangerous experiment, but a greater elasticity given to their requirements, and a power to the surveyor of exercising special judgment in special cases. The same number contains an article on the Jungfrau electric railway, with illustrations.

In the *Century* Miss Edith Wharton concludes her series of articles on Italian villas by one on "Venetian and Genoese Villas," with pictures by Mr. Maxfield Parrish, along with other illustrations. The illustrations, with their combination of water, balustraded terraces, heavy masses of trees, and dignified bits of half-crumbled Renaissance alcoves, are most fascinating. The same number contains an article by Mrs. Pennell on Mont St. Michel (under the title "In the Peril of the Sea"), with black and white illustrations by Mr. Pennell which are of the first order—masterpieces of pen line drawing.

Scribner publishes an interesting article on the foundation and development of the Royal Academy, from the competent pen of its Secretary. Under "The Field of Art" Mr. Frank Fowler contributes a short article on G. F. Watts which is one of the best we have seen on the subject; a sympathetic criticism, and not a mere piece of idol worship.

Harper publishes what is called "a critical comment on 'Othello,'" but as it is by Mr. Swinburne, the reader is not surprised to find that there is more of enthusiasm than of criticism in the usual sense of the word, though there are some fine suggestions in regard to Shakespeare's treatment of the original legend, and his probable or possible reasons for altering it. However, our special concern with the article is that it is accompanied by illustrations by Mr. Abbey. As in some other instances, we do not think Mr. Abbey is very successful in the portrayal of Shakespeare's heroes; his Desdemona is disappointing; but on the other hand he gives a very fine and remarkable study of Iago, which forms a plate by itself.

The *Fortnightly* contains a short but remarkable article by M. Mactierlinck (translated) on "Rome." We cannot give a *resumé* of an article in which almost every sentence embodies an original thought; but we recommend it to thoughtful readers, it will give them some new suggestions about Rome, both in the antique and the Renaissance phase of her wonderful history. The same number contains an article by Mr. E. V. Heward on "The Belted Giant of the Solar System," summing up in a non-technical manner the present position of our knowledge as to Jupiter. One circumstance is mentioned which many readers, even interested in astronomy, may not be aware of—viz., that the occultation of a star by Jupiter is not instantaneous, the star being more or less visible for about ten seconds after the limb of the planet has covered it; a convincing proof of the vaporous condition of all events a great depth from the surface.

The subject of Rome comes up again in *Longman's Magazine*, where "F. R. C. S." writes a most eloquent and picturesque article under the title "The First Sight of Rome," which should be read by any who have this "first sight" in immediate expectation. As the writer says, the first sight of Rome is a tremendous event in any man's life, "and he would be a fool who should go to Rome offhand, without forethought, without reverence, without study." We fear there are many such fools. "F. R. C. S." suggests that the passengers, like the baggage, should be examined at the frontier, and the stupid ones, who have no business to see Rome, sent back, for further study, to Basle; "it would be difficult to find a worse punishment"; but the reason for this special animus against Basle does not appear. The examination suggested would at all events have stopped out such visitors as the English lady who observed—"Rome is very nice now; you can get everywhere by trams."

In the *Contemporary Review* we read with a certain refreshment an article by Mr. E. Wako Cook on "Progress or Decadence in Art," in which he has said the plain truth in regard to the present absurd craze on the part of art critics and some artists who mistake decadence for progress, and imagine that ugliness, crudeness of colour, and bad drawing, are signs of a regeneration of art. The article is forcibly written, and expresses what probably a good many people really think, only they do not like to be out of the fashion. Mr. Cook's characterisation of Whistler, though perhaps a little exaggerated, is we think not very far from the truth. He thinks Lowell's description of Edgar Poe would fit Whistler very well—

"Two-fifths of him genius, and three-fifths sheer fudge."

The *Antiquary* contains an article, which we hail with delight, on "Miss Marie Corelli as an Antiquary." As the writer says, "there is no particular sin in not understanding mediæval

church architecture and its various accessories, but to write at length on topics of which you have not even an elementary knowledge is a downright evil, particularly if you have succeeded in gaining the ear of the less educated and less refined of the novel-reading classes." Some of the instances given are delightful. An article on "The Early History of Panoramas," by Mr. G. L. Apperson, deals with a curious and rather novel subject. The name of de Louthembourg is connected with one of the most successful of these shows, the "Eidophusikon," which appears to have attracted both Reynolds and Gainsborough, the former recommending any of his lady friends whose daughters cultivated drawing to take the girls there, as "the best school to witness the powerful effects of nature"; though why nature herself would not have done as well one does not understand. However, de Louthembourg was a landscape artist of some power, and probably was able to give to his panorama something more of real art than was commonly found in such displays.

The *Pall Mall Magazine* contains a picturesquely written article by Mr. W. Hyde on "The Thames at Night," accompanied by some fine and effective illustrations drawn by the author.

To the *Gentleman's Magazine* Mr. McInnes contributes a historical or biographical sketch of "The Duke of Bridgewater and his canal."

LIVERPOOL ARCHITECTURAL SOCIETY.

THE opening meeting of the session was held on Monday, the 10th inst., when the President for the session, Mr. P. C. Thicknesse, delivered an address. After commenting briefly on some local subjects of interest, Mr. Thicknesse continued:—

"I take it that no one in this room will deny his interest in architecture itself, and it follows that none can do other than admit his interest in the way we all, young and old, do our part in carrying on the work of architecture. To say to us that all our enthusiasm and energy ought to be devoted to our mistress would only be to repeat a platitude. I speak to everyone here, because some of our young members need perhaps teaching or reassuring of this, and our elder members will not mind being reminded that we can do no good for so great a mistress, if we are not wholly and entirely devoted to her. However long we may have been working for her and for her interest, we can never be so perfect in knowing her thousand sides and thousand interests that we can be sure of having mastered all the departments into which her service leads us.

"Our enthusiasm should, in my opinion, be great enough to make us put aside the mercenary idea that we shall make a fortune out of her, and make us well content if we make a livelihood. I am sure anyone entering our profession who does not believe this, but comes among us to make money, would be far better breaking stones—at least, so far as architecture is concerned. The most successful architect is the man who designs most the beautiful, comfortable, and well-arranged buildings, not the man who makes most money out of it or 'lays the heaviest burden on the earth.' Some few, very few, have made a fortune out of architecture; but, when we look back and think of the work which lives, and which we all admire, is it not the work of men who have worked, not for the money they made, but for architecture—men who loved their work and worked for it entirely? There is too much of this mercenary enemy to blaspheme against us—the enemy who will think, whatever we may say or do, that we make a building more expensive in order to make another shilling for every extra pound we make our clients spend on the building. This is, of course, a most absurd idea, but it is said and, I think, believed by many. However untrue this may be, I think it is true that we some of us think of a job as bringing us so much money, when we should be thinking how best we may serve our employers and architecture.

"The real difficulty of our work, as indeed all knowledgeable men must recognise, is the difficulty of knowing sufficiently about the numberless trades and materials we are dealing with in every building we work on, as well as knowing the particular uses to which the building we are constructing is to be put. To find out these latter really well is often almost impossible, for we should know—and know it more than superficially—how every room is to be used, and what each man in it has to

do and how he does it, and, therefore, to be able to imagine the story of his life in the room.

"I understand that this is felt so greatly by some of the men we most look up to for the beauty of their work, that, in order to minimise the number of the subjects they must understand, they have given up looking into many practical parts of building and leave to other anything which does not strictly belong to the design part of their work. Kitchen ranges, sanitary fittings, and the like are too dull, perhaps, for an 'artist' to know about; still, as they are a part, and a most important part, of a building—for who wants to live in the most lovely of houses and have a kitchen range that sends your mutton up either raw or baked hard?—I cannot see myself how a building is to be designed unless these things are made into our thoughts as the beauty and utility of a room, the drawing-room chimney-piece, or the strength of the foundation. The whole an every corner of a building must be thought out and arranged for by the architect, or the building will be a failure—a failure artistically as well as practically, because it cannot be really artistically good unless it is fitted for its purpose in each and every detail, however small that detail may be.

"I have heard of an architect (then may be many) who had a committee, sent to speak of all trades, with him as chairman, to carry out the work. This plan, no doubt, is an excellent one in theory, but I fear that in practice it would be found to waste time and lead to difficulties in extras and other matters. Of course, there can be no doubt that the most ideal of all arrangements for a building would be that an architect should have only one building at a time, that he should live on the job, and think and do nothing else until he has finished it—become, in fact, a glorified clerk of works. But we must live, and I fear we should have but little butter and no jam on our bread out of our 5 per cent. if we carried out that plan. However, if this could be done, then our friend's committee would be excellent; but, until we get to so high a state of perfection as that, I am afraid that we must work as we are and know as much of every man's work—as trades and all materials—as possible.

"Of 'ghosts' I will not speak for since Pecksniff we have been made sick with the talk of ghosts. We all know that delightful conceited chap who thinks he does all the work of the office and says so. We don't believe him, and in most cases find, when he leaves, that his master does the same work—often excellent—whilst he did before.

"I am so little afraid of being said to keep a ghost, that I am going to lay myself open to the charge of saying that many go too far in the opposite direction and make assistants and pupils into hands instead of helpers, and thus make our offices too 'officey,' not enough like ateliers. I heard of a man the other day who made one of his assistants into a drainage man, to do nothing else but drains. And certainly men often come into our offices who have never seen any building they have been working on in course of construction, and know no more of it than the drawing they have made. The effect of this way of working is to stifle all interest in and enthusiasm for architecture and their work, and to make them machines who care only for the drawing and not for the building, and whose duty it is to be in a certain place at, say, nine o'clock, have an hour for luncheon, and leave at 5.30, unless their chief is out, when they run away, or play cricket in the office as soon as they are sure he won't be back or find out.

"Now, that this state of things happens even in a few offices may be partly because the younger members of our profession are not conscientious enough; but I am sure it is more the fault of the system under which some try to work; this system which makes the assistant and pupil drudges, and instead of encouraging interest in our work, stifles it and makes architecture appear as a grind as hard and uninteresting as continuous tracing. It is a system which is bad because it is to the disadvantage of everyone concerned and of the work itself. The master architect gets his work done by men whose real interest in life is outside his work (and no man can do good work, however conscientiously he may try without interest in it), and hence the mechanical, often wonderful, drawings, made more or less like the architect's sketch or small scale drawing. No, I say it without fear of contradiction, there is only one way to interest a man

architecture, and that is by interesting him in the building and not in the dull paper representation of it only. Can there be anything more futile (and it is the outcome of this system) than the design of what I call a paper architect, who only makes drawings, plans, elevations, and sections, which might as well, as far as he is concerned, be carried out in brick, stone, or terra-cotta, wood, or even Wilsden paper? Let us see the work of such architects every day. The man has not even thought of it in perspective, and never as a building, only as a series of drawings.

"We are all students—or should be: heaven help us, if we are not. Then let us treat our pupils and assistants as junior students, and try to teach them while they are doing our work; not only teach them by getting them copy our drawings or correcting theirs, but also by letting them know the why and wherefore of all the work. Let them help us through every part of it. Let them have a change of one or more jobs, and stick to them from beginning to end. Let them see the estimates, know how we have to reduce them, know the prices of the work and each part of it. Encourage them to know everything connected with the buildings, and, above all, to see the building they are working on, in office hours, as it proceeds, and find out how things are done, both in the office and on the building. We shall then have men interested in their work and our work. They will feel their responsibility to the work. They will be working for themselves and us at the same time. I don't say I shall put old heads on young shoulders—I could be the last to wish to see it done—but there is plenty of room both for cricket and football, or more serious things outside our profession, as well as for architecture and the kindred things belonging or allied to her. I can say for myself that, when an assistant here in Liverpool in Mr. Doyle's offices, I had these advantages, and, although I was an enthusiast before, the system under which I worked there published my interest and my feeling of responsibility for my work, and I feel grateful for it."

"You may say this involves more trouble; quite agree. But I say it is worth it—a thousand times worth it—because it interests the younger members of our profession, and thereby helps the cause of architecture, and that should be even a greater thing to us than the little bit that we are doing. I would even go further, and encourage assistants and pupils to design parts of the work. The whole conception the architect himself must do, but let the assistant pupil do parts under the architect's correction. That will make him feel still more as the work were his own. My whole object is to make more interest for every man connected with us in his work."

"This is only the beginning of what would wish to see done. I would interest contractor, clerk of works, mechanics, and even labourers in the work. These mechanics, for instance, work in an exaggerated way in the same way in which many, I fear, our assistants and pupils work. So many bricks must be laid in such a way, and they do no more than the bricks themselves at it is to come after; they have no interest in their work; it is dull drudgery. Many of us complain that our workmen are not like the men of old. Why? Because they have no interest in their work. They make mistakes, and we call them fools; they do bad work, and we call them other names. It may not be our fault, but it is not theirs, and we shall never make it any better till somehow interest is brought into their work."

"To the assistants and pupils I say this, as well as to the master architects, because we must all work together—the whole of it is unity, the work being the work of collection of men under one head, who is responsible to the world and his employer for it. If the younger members won't help, it is most impossible to carry on work in the way I describe; for, if every man does not feel his interest and responsibility, and that he is on all honour to play fair with his chief, then he can't work unless under compulsion."

"The very nature of beginners' work is necessarily dull and boring, and though much has been done to interest beginners by that most excellent plan which Professor Simpson instituted and carried out so successfully at the University, interesting men in architecture and teaching the rudiments of the most congenial parts of our work in a way not possible in an office, yet even now it must be an ugly drop to come from making designs and details for themselves

of pleasant parts of a building to the often rather sordid little details of out-of-the-way corners of a building, or tracing sheets of full-size details which they have hardly time to study. But I would say, feel the work as your own, and the interest comes at once. If it is only a coal-cellar door, it has its own story; it must, for instance, open out, or it won't shut; there is a reason for each part of it and a story belonging to the whole, and it will help your imagination to rise to do more interesting things well if you will find out that story. It is imagination to throw yourself into every man's use for the thing you are designing, which is the greatest thing you can teach yourself. If the work is interesting, you will find your office hours too short, and you will not spend your time in wondering when five o'clock will strike."

"Many of us complain of the small amount of old work there is to be found up here. Surely there are heaps of things, new and old, good and bad, to study and criticise, if we will only look out for them. I would say, also, go to the contractor, clerk of works, or foreman on a building, and he can, and I have always found will, gladly show us many things which will help us to learn building."

"For be sure of this at least—that building without architecture may be a poor thing, but architecture without building is nothing. You can't make a thing really beautiful if it won't stand, nor if it is not beautifully fitted for its work."

"My subjects have been interest, enthusiasm, and a greater sense of unity in each office, and a little more feeling of fellowship between the younger and elder members of the profession; may I say, also, that I would like to see rather more fellowship and friendliness among all our members, young or old. I feel this as an important, the most important, part of the use and work of our society; for, if we met more, and knew each other more, we should like each other, I am sure, and be more united, and help each other more to work heartily to the great aim of our existence—the improvement and development of architecture."

THE PRINTING-HOUSE, CAMBRIDGE UNIVERSITY; AND THE "PITT" PRESS BUILDINGS, 1804-1904.

WITH the close of the current year will terminate the existing partnership in the printing and publishing businesses of the University Press between Mr. John Clay and Mr. C. F. Clay and the University of Cambridge. Some changes will be made in both businesses, and a new building is to be erected on the south side of Silver-street. The business of the University Press has been conducted in its present locality during the past 250 years, and on the existing site between Silver-street and Mill-lane since 1762. In that year the White Lion inn, on the south side of the former street was purchased, and the erection of the existing buildings was begun just one hundred years ago. The press has its origin from a grant made by King Henry VIII. in 1534 to the University of the right and privilege to appoint three printers or "stationers." Until the middle of the XVIIIth century the University printers did the work in their own homes. John Siberch, the first to be so appointed, lived in the Royal Arms, since incorporated in Gonville and Caius College, opposite St. Michael's Church in Trinity-street. Another, Thomas Buck, worked in what had been the refectory of St. Augustine's Priory, situated between Luthburne, since Free School, lane, and Slaughter-lane, now Corn Exchange-street. The Friars' refectory—afterwards the site of the Museums and Natural Science Lecture Rooms—is plotted in Hammond's map of 1592. In 1655 the President and Fellows of Queens' College leased to the University a parcel of their garden-ground on the north side of Silver-street, shutting also on the east side of Queens' lane, whereon John Field, appointed as printer in 1654, built his workshops, around the old almshouses in Silver-street, which Carter, writing in 1753, describes as being "now in use." Some forty years afterwards Field's shops were extended on the north-west side by the erection of workshops along the east side of Queens-lane, opposite Queens' College; in 1716 those later shops were made over for use of the Professors of Chemistry and Anatomy. James Gibbs's plans of 1715 for a senate house, library, schools, etc., comprised a new printing-house to occupy the south wing on the King's-

parade site, but that portion of his scheme was not carried out. In 1762 the University authorities purchased the White Lion inn, on the south side of Silver-street opposite Field's shops, for the building of new printing works. In 1821 the Syndics acquired for 5,060l. the adjacent site of the Cardinal's Hat, or Cap, inn, which had a frontage to Trumpington-street, eastwards, and extended to a considerable depth westwards, between Silver-street and Mill-lane on its north and south sides respectively. On that ground James Walter, architect, erected in 1826-7 the buildings which stand on the west side of the quadrangle—the courtyard has been roofed-in since—and a house in Mill-lane for the master-printer's residence. In the meanwhile the Senate and a committee of subscribers to the William Pitt Memorial Fund had agreed to devote the surplus, after payment of 7,000l. for Chantry's statue, set up in Hanover-square in 1831, to an enlargement of the Press to be called by his name (see Willis and Clark's "Architectural History of the University of Cambridge," 1886). Seven architects were invited to submit designs. In 1829, E. Blore's were chosen, and, a sum of nearly 12,000l. having been expended in buying more ground, the new Pitt Press was opened by the Marquis of Camden, Chancellor of the University, on April 28, 1833. Blore's building, facing Trumpington-street, was erected at a cost of 10,711l. 8s. 9d. The main façade, constructed of stone, is after the Late Perpendicular style; the block contains three floors, and has a lofty central tower. Further extensions were made at the rear on the site of Black Lion-yard in 1863 for the type-foundry, and nine years afterwards for a machine-room and warehouse on the site of Diamond-court, both on the Silver-street side. Then in 1877-8 was erected the large building in the south-west-corner of the quadrangle, after Mr. W. M. Fawcett's plans and designs, and some alterations and additions were carried out eleven years ago by Mr. Henry Dawson, architect, on the contract of Mr. W. Tindall, of Cambridge, for 6,184l.

VERIFICATION OF STANDARD MEASURES.

We have received the following circular from the Standards Office of the Board of Trade:—

"The following measures of length can be tested by the Standards Department:—

"Metal measures in the form of 'ribbands' or 'tapes':—100 links or 66 ft.; 50 links or 33 ft.; 100 ft.; 50 ft.; 25 ft.; 20 metres; 10 metres.

"The whole or total length only of each of the above measures will be tested, except in the case of a standard measure required for survey purposes, when the corrected values of each part or interval of the measure will be given—e.g., every 5 metres on 20 metres, every 10 ft. on 100 ft.

"Unless otherwise required, each measure will be tested under the following condition as to normal tension, 'pull,' or stretching-weight when the measure under test is supported throughout its whole length on a plane and even base:—

	Metal Measures.
100 link ribband	} 10 lb. avoird.
100 ft. to 50 ft.	
20 metres	} 5 kilograms.
10 metres	

"Linked chains, or round-wire chains composed of links and rings, and tapes made of linen or other fabric are only verified for certain official purposes.

"All results are reduced to 62° F. for links and feet; and to 0° C. for metres.

"The coefficient of linear expansion of a metal measure is taken to be as follows, unless otherwise stated:—

	For 1° F.	For 1° C.
Steel	0.00000689	0.00001240
Nickel-steel (35.7 nickel, 64.3 steel)	0.00000487	0.00000877

"Metal measures should have a brass disc ($\frac{1}{2}$ in. diameter) affixed upon which to place the official stamp.

"In certain cases Treasury fees are required, particulars of which can be obtained at the Standards Office. Fees are not payable on measures for Government Departments or for Local Authorities.

"A certificate of verification is given with each measure, in which its error or difference from standard is stated, and also, in some instances, the modulus of elasticity and 'sag' of a chain.

"On standard steel tapes for the use of local inspectors of weights and measures, an error on manufacture of 0.1 in. is allowed in excess or

deficiency. On other steel standards 0.25 in. is allowed; and on linen tapes 0.5 in. is permitted.

"Metric measures should be accurate to about 5 millimetres in 20 metres or to one four-thousandth of the whole length. The verification of measures can be carried out to nearly one-fourth-hundred-thousandth part of the whole length."

THE ARCHITECTURAL ASSOCIATION CAMERA AND CYCLING CLUB.

On Tuesday last Mr. D. M. Mackenzie read a paper on Westminster Abbey, illustrated by slides by Mr. S. B. Bolas. After explaining the plan, which showed the dates at which the various portions of the building were erected, Mr. Mackenzie described the interior of the building, including many of the multitudinous tombs and memorials, and the manner in which the building had been altered from time to time. Many of the slides, all of which were of splendid technical quality, possessed fine pictorial effects, notably those taken looking towards the transepts. Details of the triforium and of the tombs—especially that of Henry VII.—were shown, and were exactly the kind of photograph the architect always wishes, and usually fails, to procure.

A tour round the outside of the building followed, in which many fine slides of the buttresses were shown: Mr. Mackenzie remarking that the western towers were never completed, and that Wren had little to do with the final design, which was due to Hawksmoor, Wren wishing to complete them in the Gothic manner.

The meeting terminated with the announcement that in the recent photographic competition, inaugurated by the club to stimulate the study of architecture by photography, Mr. Alan Potter had been awarded the prize of three guineas for his set of photographs illustrating the treatment of apses in Italy.

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring Gardens, Mr. J. Williams Benn, Chairman, presiding.

Loans.—On the recommendation of the Finance Committee it was agreed to lend Bethnal Green Borough Council 30,000*l.* for pipe sewer reconstruction works; Hackney Guardians, 5,800*l.* for erection of casual wards; Kensington Borough Council, 12,050*l.* for street improvement; Lambeth Borough Council, 7,786*l.* for jarrah wood paving works; Poplar Borough Council, 2,400*l.* for the purchase of a site for a depot; Stepney Borough Council, 23,900*l.* for electric light installation and meters; Stoke Newington Borough Council, 2,350*l.* for paving works; and Wandsworth Borough Council, 36,000*l.* for contributions to street improvements. Sanction to the borrowing by the Westminster City Council of 2,146*l.* for brick and pipe sewer works, and Kensington Borough Council of 7,600*l.* for street improvement, was given.

Chairman's Address.—The Chairman then delivered the annual address to the Council. Speaking of the Main Drainage Committee, he said:—

"First, then, the health of the citizen depends largely upon the magnificent system of main drainage, which has made Greater London's death rate one of the lowest, for large cities, in the Kingdom. It fell from 18.5 per 1,000 in 1899 to 14.5 in 1903. This may be some compensation for the rise in another rate of which we occasionally hear.

"During the year 1903, under the chairmanship of Mr. Goodman, nearly a hundred thousand million gallons of sewage were treated at the two outfall works, and this output exceeded that of 1902 by nearly ten thousand million gallons; so it is that new sewers are constantly needed and being constructed. Two such, costing three-quarters of a million, are in progress between Barking and Old Ford, and from Crossness to Deptford and Catford.

"So anxious was the Council to provide additional relief sewers and pumping-stations to carry away storm water that, in February last, it approved a scheme involving the expenditure of three-quarters of a million pounds for that purpose. The main drainage extension scheme and these flood relief works should do much to obviate these serious inundations. During the year the alarming suggestion was made that shell fish in the Thames estuary were contaminated by London sewage. It goes without saying that the Council would be most loth to damage either a great industry or a nourishing and popular food. But the special report of the Committee to the Council of February last shows that the suggestion was groundless. This conclusion, arrived at by bacterial examination, is fortified by the opinion of the Royal Commission on Sewage Disposal, which conducted an independent investigation."

In reference to some other Committees, the Chairman remarked that:—

"The Building Act Committee, presided over by

Captain Hemphill, are concerned under the Factory Act in preventing our factories becoming death traps in case of fire. In the course of the survey some 782 cases. In administering the Building Act they dealt with 2,251 applications, 2,000 complaints, and 3,638 danger structure cases. The Act however requires amendment, and suggestions have been received from the Metropolitan Borough Councils, from the various bodies, and from various Committees of the Council. Although the work is one of considerable magnitude and difficulty, the Committee hope to be in a position to submit amending proposals in the form of a Bill to be introduced into Parliament in the session of 1905.

"There are municipal heirlooms beside landed property, and I regard with much interest the work of the Historical Records, etc. Committee, presided over by Dolman was chairman. I venture to think we devote too little attention to the æsthetic side of London life, and too readily allow ancient landmarks and memories to be obliterated. Suitable tablets now indicate those houses in London which have been inhabited by distinguished Englishmen, and some historical buildings, of great interest to our city, have been saved from destruction. London, to its credit, was the first of the municipal authorities to obtain power to render this small service to future generations. The Horniman Museum is being made a most valuable educational institution—the first of a series of several museums which will awaken interest and impart information in a manner beyond the power of book-study.

"Not only is the citizen worker protected and catered for in the various ways which have passed under review, but some attempt has been made to improve the wages conditions of his fellow-workers. As an object lesson, showing what can be done under the best conditions extant, and for its protection and convenience, the Council still successfully keeps up the Works Department.

The Works Committee, presided over by Mr. Torrance, present figures which speak for themselves. The result of works completed during the year was reported to the Council shows, in the case of estimated works, a balance of cost below final certificate of 31,814*l.* 7*s.* 11*d.*, or 9.61 per cent., and in the case of jobbing works a balance of cost below schedule value of 547*l.* 10*s.* 11*d.* or 7.11 per cent. The Works Committee during the year executed work to the value of 416,295*l.* 16*s.* 6*d.* But apart from these satisfactory figures there is no doubt that this useful department has saved a considerable sum by the prevention of those prohibitive prices met with in our earlier years for that huge mass of work which still goes to contractors.

"With regard to the amount of work to be done, it must be remembered that we ourselves observe such regulations as we impose on contractors.

"Throughout the Council's service an endeavour has been made, without prejudicing the men, to give that thoughtful and sympathetic consideration to such questions as hours, wages, sick pay, holidays and uniforms, which binds together employer and employed. We cannot, of course, do all that is asked, but we have done much to make tolerable the position of these municipal servants."

The address was ordered to be printed.

Mr. T. J. Bailey, architect (Education).—The General Purposes Committee reported as follows, the recommendation being agreed to:—

"The Council, on July 26, 1904, resolved that Mr. T. J. Bailey should be continued as head of the architectural department (education), under the title of architect (education), and referred it to us to report as to the position which Mr. Bailey should hold in the Council's service. We have carefully considered the matter, and we think that, in view of the fact that the Council has decided to keep the architectural department (education) separate from the department under the superintending architect, it is desirable for the present that the chief officer of this department should rank as the head of a department. The circumstances are unusual, and we think it should be clearly understood that this decision relates only to the present holder of the office, and does not in any way prejudice any action which the Council may take in the future with reference to this position. We recommend that Mr. T. J. Bailey, during his term of service under the Council as architect (education), do rank as head of a department."

Long-grove Asylum.—The Asylums Committee reported as follows in regard to this building:—

"On March 24, 1903, the Council in accordance with section 239 of the Lunacy Act, 1890, authorised the Asylums Committee to proceed with the erection of a new asylum for 2,000 patients on the Horton estate, and on March 31, 1903, voted the sum of 97,210*l.* towards the cost of the provision of such asylum (the Long-grove asylum), viz., for the foundations, roads, the architects' and quantity surveyors' fees, additions to the central station for the supply of electric current and well sinking. On January 28, 1904, a further sum of 6,550*l.* was voted for the fencing of the estate, clerks' salaries and contingencies, making a total sum of 103,760*l.* The contract for putting in the foundations was let to Mr. Charles Wall, of Chelsea, on September 11, 1903, and the work has since proceeded with all dispatch. The foundations of the main building are now practically completed, and the contractor is putting in the foundations of certain of the detached buildings.

"The Council has no doubt, however, it is proposed to build a replica of the Heath and Horton asylums with such modifications as have by experience been found desirable. We have found the detached buildings for patients to be advantageous that we have increased the number to nine, against six at Horton. The designs of these villas have been most carefully considered, entailing visits to other asylums, and those we have decided on will, in our opinion, be an improvement on those at Horton asylum. The accommodation for patients in the main building has been correspondingly reduced. We have also decided to adopt the principle

of open corridors wherever possible. This we think, be safer in case of fire and ensure better ventilation, besides reducing the cost of the building. All the above have been approved by the Home Secretary.

"In accordance with the wishes of the Finance Committee we agreed that, before asking the Council to vote any further sum for the erection of the main building, an estimate should be submitted to them of the cost of erecting the superstructure upon a quantitative survey, and on June 28 the Council approved our proposals—viz., that we should have the estimate prepared by tenders for the work of the superstructure from selected contractors—the contract should be an omnibus contract and include the remaining building works, roads, etc., and a provision for the equipment of the farm and garden buildings and that the engineering works (electric lighting, laundry machinery, kitchen and bakery plants) should be the subject of later contracts. The Council further agreed that the contract should provide for a period of non-completion within the contract time, which will extend at two and a half years, and a bonus for early completion; also that a clause should be inserted in the contract giving facilities to the contractor to put a railway to the site, he to negotiate for any such wayleaves.

"We accordingly invited tenders from thirteen, but two of these firms returned the form of tender sent them, one objecting to the conditions of contract, the other stating that the work was more than could undertake at the present time. The remaining firms sent in tenders as follows:—

	AMOUNT
Foster and Dicksee (Rugby)	£359,091
C. Wall, Ltd. (London)	368,093
J. Carnichael (London)	371,111
Holloway Brothers (London) Ltd. (London)	371,200
(Subject to modification of form of contract)	
Holland and Hannen (London)	373,331
Holliday and Greenwood, Ltd. (London)	374,900
Patman and Fotheringham, Ltd. (London)	375,331
Leslie and Co., Ltd. (London)	379,093
H. J. Lovatt, Ltd. (Wolverhampton)	385,811
Mowlem and Co., Ltd. (London)	397,411
F. and H. F. Higgs (London)	401,000

"The priced bills of the lowest tenderers (J. Foster and Dicksee) have been examined by the quantity surveyors engaged by us, with the result that, with exception of clerical errors showing a sum of 600*l.* to be deducted from the amount of the tender, they are in order. We have therefore decided to recommend the Council to accept the tender of Messrs. Foster and Dicksee for the work. The amount of the quantity surveyors' estimate based upon a quantitative survey has been communicated to the Finance Committee, to whom we have submitted our revised estimate.

"It will be observed that the figure included in the estimate for 'foundations' has been reduced to 10,000*l.* This is the sum estimated by the architect as necessary to be deducted from the original estimate following the putting in of the foundations of the detached buildings (the sites of which had already been assigned) having to be transferred to the superstructure contract. This course has been rendered necessary in consequence of the local authority having decided to agree to the diversion of certain footpaths and roads, and under conditions we could not recommend the Council to accept. The amount of 10,000*l.* therefore now merged in the figure for the superstructure. We recommend (a) That the estimate (No. 423) of 408,353*l.*, submitted by the Finance Committee in completion of the erection of the superstructure of Long-grove asylum, Epsom, be approved; and the Asylums Committee be authorised to incur expenses exceeding that amount for this purpose, at the tender of Messrs. Foster and Dicksee, amounting to 359,892*l.* 10*s.*, for the erection of the superstructure of the Long-grove asylum including the putting in of the foundations of certain of the detached buildings, thereat be accepted, and that the solicitor do give and obtain the execution of a contract to give to the tenderer."

Mr. Dew moved, and Mr. Gosling seconded, an amendment that as the lowest tendered 21,953*l.* above the architect's estimate recommendation be referred back to the committee with a view to the work being carried out by the Works Committee without the intervention of a contractor.

Mr. Howell J. Williams said he thought the matter ought to be referred back for his consideration.

Mr. Torrance, Chairman of the Works Committee, said he was not in favour of the amendment.

Mr. E. White deprecated the commencing this large contract to a provincial firm when the building trade in London was in a state, more carpenters and joiners being out of work than there had been for years. The wages of skilled mechanics in Rugby was 8*d.* an hour, whereas in London it was from 10*d.* to 11*d.* If they were to contract out on that basis they would find that the difference in wages alone would account for the difference in the amount of the lowest tender.

Mr. Crooks, M.P., said there could be no doubt that if the contract was given to a Rugby firm the joinery work would be done better, and that was manifestly unfair to the London people. He supported the amendment that the matter should go back to the committee for further consideration, because he was convinced that by finding employment in London workmen they would be doing a good, and at the same time save money to the end.

After further discussion the Council divided:—
 For the amendment 40
 Against 68
 Majority against —28

The amendment was accordingly defeated, and the recommendation of the committee to the contract to Messrs. Foster and Co. was adopted.

Motor-Cars in Public Parks.—Mr. Sanders gave a reference to the Parks and Open Spaces Committee to consider and report as to amending the by-laws so as to prohibit the entrance of motor-cars under the Council's control of motor-cars which emit offensive odours.

Mr. Waterlow thought that the Council could hardly seriously consider the matter, as its practical working was almost impossible.

The motion was rejected, and the Council adjourned.

APPLICATIONS UNDER THE LONDON BUILDING ACT, 1894.

THE London County Council at their meeting on Tuesday dealt with the following applications under the London Building Act, 1894. The names of applicants are given between parentheses:—

Line of Frontage and Projections.

Hampstead.—An iron and glass shelter at Belle Vue. (Mr. H. M. de Meza).—Consent.

Wandsworth.—Bringing forward of the site of "Garwood," "Wardleville," "Vroham," and "St. Leonard's," Rosendale, Horne-hill (Mr. P. C. Davies for Mr. Parry).—Consent.

Strand.—The retention of three wood and six showcases in front of No. 1, Piccadilly, St. James', Westminster (Mr. A. Olden).—Consent.

Wandsworth.—Buildings upon the site of Nos. 207, 209, and 215, Balham-high-road, Wandsworth (Mr. E. Schneider for Messrs. Wallis and F. J. Pettit).—Refused.

Hammersmith.—An addition in front of the Primitive Methodist Church and Schools, Hammersmith-road, Hammersmith (Messrs. David and Phillipson for the trustees of the church).—Refused.

Kensington, South.—One-story shops upon the site of the forecourts (Nos. 54 and 56, Church-street, Kensington (Mr. W. G. G. for Mr. C. Sale).—Refused.

Kensington, South.—One-story shops upon the site of the forecourts (Nos. 50 and 52, Church-street, Kensington (Mr. W. C. Hunt for Mr. F. Norton and Messrs. Weeden and Simpson).—Refused.

Width of Way.

Kensington, South.—A motor-car house at the site of No. 25, Brompton-square, Kensington, with external walls at less than the prescribed distance from the centre of the roadway of a street leading out of Cottage-place (Messrs. A. E. Curtis for Mr. J. Oswald).—Consent.

Hammersmith.—Two houses on the north side of Hammersmith-terrace, Hammersmith, with external walls and boundary fence at less than the prescribed distance from the centre of the roadway of Terrace-court (Mr. Marsh).—Consent.

St. George-in-the-East.—A playshed on the site of Globe-street, High-street, Wapping (Mr. T. J. Bailey for the Education Committee of the Council).—Consent.

Woolwich.—An iron and glass shelter at a ding on a site situated between Nos. 194 and 220, Plumstead-common-road, Plumstead (Mr. F. Bethell for the Royal Arsenal Corporation Society, Ltd.).—Consent.

Limehouse.—A warehouse upon the south side of Narrow-street, Limehouse (Mr. J. M. Wright for Mr. Hough).—Refused.

Width of Way and Line of Frontage.

Hammersmith.—An addition to St. Vincent's church, Queen-street, Hammersmith (Messrs. F. Tasker and Slater for Madame M. Bois).—Consent.

Width of Way and Construction.

Windsor, Central.—A wood and iron mission house on the south-eastern side of Exmouth-street, Clerkenwell (Messrs. Humphreys, Ltd., and the Rev. H. C. Frith).—Consent.

Space at Rear.

Marylebone, East.—A modification of the provisions of section 41 of the Act with regard to open spaces about buildings, so far as respects the erection of an addition to No. 1, Weymouth-street, St. Marylebone (Mr. W. Ridgway for Col. Matthey, C.B.).—Consent.

Formation of Streets.

Wandsworth.—That an order be issued to

Mr. J. S. Gabriel, sanctioning the formation or laying out of new streets for carriage traffic on the Fisher estate, between Leigham-court-road and Velely-road, Streatham.—Consent.

The recommendations marked † are contrary to the views of the local authority.

ARCHITECTURAL SOCIETIES.

NORTHERN ARCHITECTURAL ASSOCIATION.—The members of the Northern Architectural Association visited the new council schools, North Heaton, and St. Gabriel's Church, Heaton-road recently. The new school cost about 11l. per head. Mr. S. D. Robins, the architect, conducted the party over the building, and was cordially thanked, on the motion of Mr. Clark (Darlington), seconded by Mr. Brown (Sunderland). At St. Gabriel's Church the members were received by the vicar (Rev. Robert Trotter) and the contractor (Mr. Baston). Hitherto the church has consisted of the nave and south aisle. There is at present being added a north aisle and transept, part of a tower, with an organ chamber, and the chancel. This extension will, it is expected, be completed by the middle of next year, leaving only the south transept, vestries, morning chapel, and baptistry to complete the building. Lord Armstrong is building the tower, or a portion of it. When completed the tower will be 116 ft. high. The seating accommodation up to the present has been 500. The present scheme of extension will provide for 300 additional worshippers, and when the church is fully completed the accommodation will be furnished for 1,000. The architect of the church is Mr. F. W. Rich.

Correspondence.

THE LIABILITY OF COUNCILS FOR SANITARY INSPECTORS' ERRORS.

SIR,—The decision of Judge Addison, K.C., in the case of Johnson v. Bermoidsey Borough Council, if legally sound, seems illogical and unfair. A principal should surely be bound by the act of a recognised agent, where loss is caused to another.

The Council gave the plaintiff notice to open ground and reconstruct a drain under a house. Examination showed there was no drain there, but one existed next door. The mistake arose through renumbering of the houses. Plaintiff sought to recover the cost of examination.

The judge held that sanitary inspectors were, by law, the judge of whether drains required relaying or repairing, and if they, by reason of a defective nose or any other cause, made a *bona-fide* mistake, the Borough Council could not be held liable, and gave judgment for the defendant Council, without costs.

In this case it was not a question of judgment as to the need of repair as no drain existed. The order involved the owner unfairly in certain expenses, and its service in error constituted a depreciation of the property in the eyes of a prospective buyer, and, in fact, was more detrimental than a statement by an individual that the drainage of the house was defective, which would be tantamount to a libel, and actionable.

I should like to see the matter carried further, and to know if there is any precedent for the judgment.

E. W. HUDSON, F.S.I.

TECHNICIANS' ENGLISH.

SIR,—In the current issue of the *Builder* a reviewer of a book takes very proper exception to the composition of the author. My object in writing is not to defend that gentleman's English, but to point out that such dictation is not at all uncommon among technicians. In the course of my business, I have had to prepare a great number of papers for publication, and I find that many people who consider themselves capable of writing them have a very vague idea of the structure of sentences. The result is a most involved production. The process of making it clear is something like this:—I get a leaf of foolscap covered with words. I start at the top with a sentence, and possibly go down two-thirds of the leaf before I come to a full stop. What it all means it is impossible to say. The first thing to be done is to try to get at the subject, and then at the predicate, marking off interposed clauses by commas or parenthesis. The result is generally the production of three or four short sentences for the original rignarole which was not understandable. When the author sees his paper in print, he thinks what a clever fellow he

is, or what wonderful people composers and "readers" are to express so well what he intended! But "*palum qui meruit ferat.*"

A SUB-EDITOR.

[*] We fear our experience is that many architects, as well as technicians, have most vague ideas as to the structure of sentences or the use of punctuation; and if we had made a list of all the wrongly-spelt words we have met with in communications from architects, it would be a formidable and distressing one. By the same post that brought the above letter we received a communication from an architect asking us to take a certain course "in the interests of the profession." It may be said that such mistakes are of little practical consequence, but they imply a regrettable deficiency in general culture.—ED.]

ERRORS IN QUANTITIES.

SIR,—Being the surveyor who prepared the case for the plaintiffs in the case of Patman and Fotheringham v. Pilditch, I trust you will pardon me for troubling you with the following remarks, as I believe a wrong impression exists as to the complete decision in this case. In your issue of July 16, p. 72, you report Patman and Fotheringham v. Pilditch; you say "The point decided is one of importance to building owners and contractors; we think it well to put on record the judgment of Mr. Justice Channell, which was as follows." The report of the judgment you then give is correct as far as it goes; but, unfortunately, you do not seem to have been in possession of the whole of Mr. Justice Channell's judgment, the concluding portion of which is very important, as it implies that the "total omission" of an item from the bills of quantities is "not an error," and would not have to be paid for as such (the case which he quotes being of that nature). You will note, also, that Mr. Justice Channell's words are:—"But I should have to deal specially with cases of things that everybody must understand are to be done, but which happen to be omitted in the quantities."

I enclose a copy of the concluding portion of the official transcript of the shorthand notes required to complete your report.

This modification of the judgment is worthy of note by contractors, and has a most important bearing on Clause 12A of the Schedule of Conditions of Building Contract sanctioned by the Institute of Architects in agreement with the Institute of Builders and the National Federation of Master Builders, since, to make this clause effectual, it should now read:—"Should any error appear in, or omission be made from, the bills of quantities," etc.

WALTER LAWRENCE.

COMPETITIONS.

CHURCH, NEW SOMERBY, GRANTHAM.—Mr. G. H. Fellowes Prynn has been appointed the assessor in this competition. One hundred and three sets of plans have been sent in.

VILLAS FOR THE COEDSAESON BUILDING CLUB.—We are asked to state that the result of the competition for these will not be known till November 2.

COWEN MEMORIAL, NEWCASTLE.—In connexion with the competition held recently for the purpose of obtaining designs for a monument to be erected in memory of Joseph Cowen, the model of Mr. John Tweed, of London, has been placed first. Mr. T. Eyre Macklin, Newcastle, has been awarded the second premium of 50l., and the third of 30l. has gone to Mr. Kellock Brown, of Glasgow.

NEW LEWISHAM LIBRARY.—The plans selected by the Lewisham Borough Council for the new library to be erected at Brockley at a cost of 4,500l. are those of Mr. A. L. Guy, A.R.I.B.A., of Lewisham Park.

A MEMORIAL TO HALLEY.—A marble bust of Edmund Halley, the astronomer, executed by Mr. Henry Pegram, A.R.A., has been placed in the Borough of Shoreditch Library at Haggerston. Halley was born at Haggerston on October 26, 1656; his father, a member of an old Derbyshire family, was a wealthy trader having a soap manufactory in Winchester-street, in the City of London.

CHEAP COTTAGES FOR LABOURERS.—The Chertsey Rural District Council on the 11th inst. discussed a recommendation of their medical officer that the building by-laws should be so altered as to permit of the erection of cottages, in the rural district, of wood and corrugated iron, for letting to labourers at cheap rents. The recent action of Mr. Justice Grantam was eulogised, and the Council unanimously appointed a committee of farmers to consider the by-laws with a view to their early alteration.

Illustrations.

SAN LORENZO, VERONA.

 THE view of the interior of this church is given in connexion with, and in illustration of, the first article in the present issue, to which the reader is referred.

NEW HÔTEL DE VILLE, SENS.

THE illustration of the new Hôtel de Ville at Sens is reproduced from the architects' elevation drawing.

The building was formally opened in April last. It is the result of a competition held in January 1901, in which the present design, by MM. Dupont and Poivert, was selected.

Owing to the practice prevailing in France of not drawing a scale on the paper, but only giving a note of it, the memorandum "Echelle 0.02" in the corner of the illustration is of course incorrect now that the drawing (a very large one) is reduced to the size of our page; but there are a good many figured measurements which will to some extent supply the place of a scale. The height of the campanile is 190 ft.

The exterior sculpture is executed by

members of the Société des Sculpteurs; the interior sculpture is by MM. Dufeu, Jacquier, and Bersin. The decorative paintings on the ceilings were executed by M. Cavallé-Col, the mural panels by M. Maugonot, and a historical painting by M. Scherrer.

The building is founded on concrete piles 23 ft. deep. The plinth is of Roche de Comblanchien stone; the main portion of the façade of Charentenay stone; the balustrades of Larrys stone. The campanile is of iron as far as the balcony, and of timber above that point. The roofs are of timber, and the floors of steel. The decoration of the main staircase is in stucco. The steps are of Comblanchien stone on steel framing.

We give also a sheet showing the decorative treatment of two of the ceilings, also reproduced from the architects' drawing.

We fear we cannot expect English architects, as a rule, to admire this work, which is in a style very contrary to the taste and feeling prevailing in this country at present. But it is of interest as illustrating an important new French building, and as showing the type of work which is in favour in France at present, since it obtained the first place in a competition.

The plan, traced from the architects' drawing, is a very good one, and perhaps for a good deal in the selection. The plan of the circular "Salon d'Honneur," adjoining the vestibule both to the Salle des Fêtes, and the Salle des Mariages, and placed at the angle of the building, is a good point.

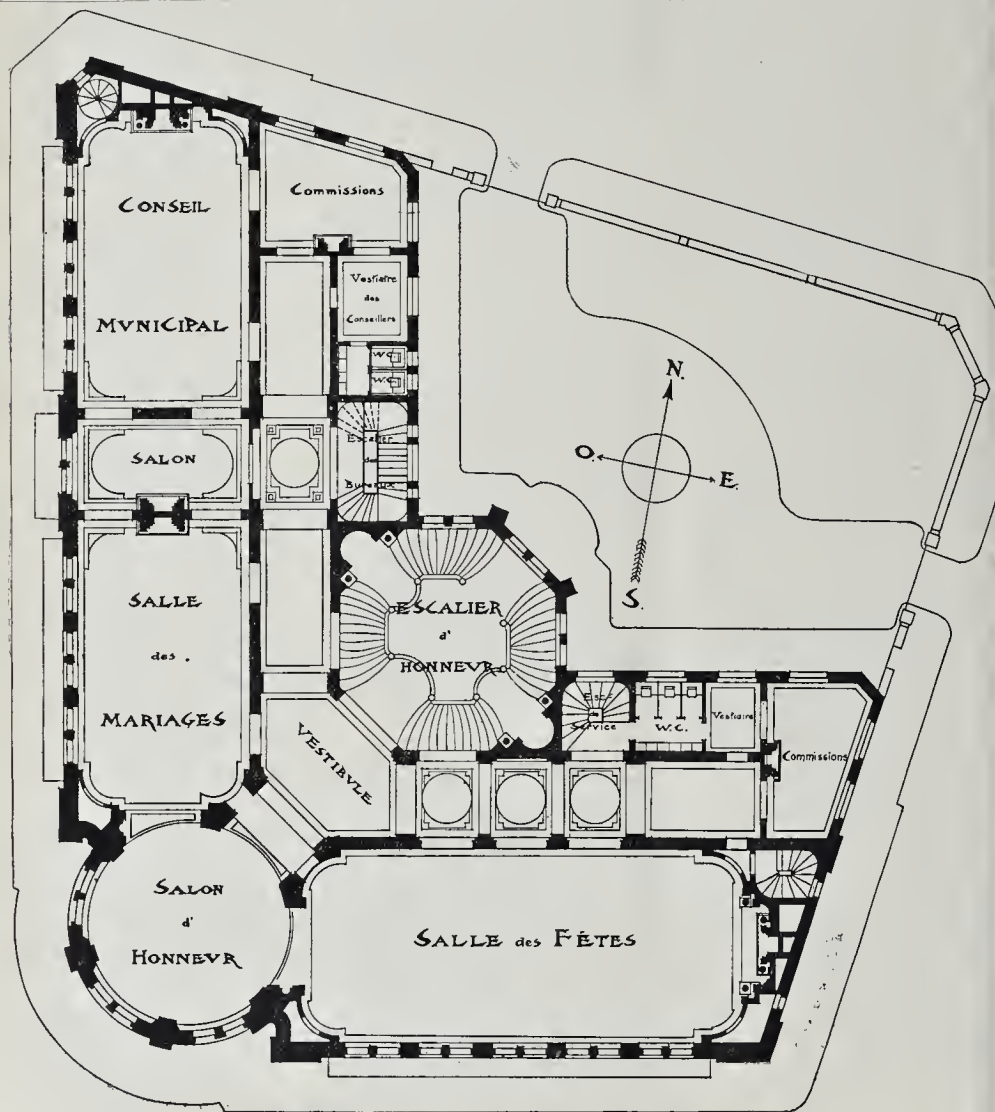

We are much indebted to MM. Dupont and Poivert for their kindness in lending their drawings. As a general rule it is exceedingly difficult to induce architects on the Continent to send drawings to England; so their courtesy in this case is all the more appreciated.

THE WHITE HOUSE, HELENSBURGH.

THE illustrations represent the exterior and interior of a house on the Clyde.

The exterior is finished with white cast, the window mullions being of grey, and the roof of red tiles. In the hall the work is in pine stained a dark bronze, with a red-brick arch to the fireplace, and a copper hood. The upper part of the hall is decorated, the prevailing colours being green, and grey.

Mr. M. H. Baillie Scott is the architect.

NOTES ON PORTLAND CEMENT.
 CHAPTER XI.—SPECIFICATIONS.

VERY common error made by the writer of a specification is to pick out the most important clauses in other specifications and incorporate them in his own. This particularly is the case in Portland cement, the properties of which so little understood by users generally. The specification thus drawn up is often impossible to work to. Some users of cement still hold to the old idea that a heavy weight per bushel denotes a good, well-burned cement. At the same time they recognise the fact that the finer a cement is ground the greater cementitious value; so they specify a weight about 112 lb. per bushel, together with grinding, being ignorant of the fact that the finer a cement is ground the less will its weight be, the weight decreasing in direct ratio to the fineness.

It is common to find that a cement leaving residue on a 50 by 50 mesh sieve is specified, while as much as 12 per cent. residue is allowed a 76 by 76 mesh sieve.

With the present methods of grinding cement, to obtain a product which will pass through a 50 by 50 mesh sieve, the residue on the 76 by 76 would require to be about 3 per cent.

This, of course, means that the manufacturer desires to grind the cement much finer than is specified, a costly operation for which the consumer does not care to pay, although the value of the cement is greatly increased. Omission usually made in specifying fineness is that no particular size of wire for the sieve is given. This is more the want of uniform methods of testing, England having adopted no standard methods for cement-testing as other countries have done. It would insure the user supplied with better ground cement if specified the fineness on some of the finer sieves, such as 100 by 100 mesh.

It is frequently specified that a certain amount of water shall be used for gauging test pieces, and the quantity required varies with almost every sample. A manufacturer might supply a cement much finer ground than asked for in a specification (an advantage to the consumer) which could not be gauged with the amount of water specified, but which, if ground to the fineness specified, could easily be gauged with this amount of water. A writer of a specification, who must have read that cement requires about 12 per cent. of water to form necessary compounds of hydration, inserted a quantity in his specification. It would be quite impossible to gauge any "neat" cement with this amount of water, as a considerable excess is always required over the quantity actually absorbed in the hydration of the cement compounds.

Another great mistake made in specifications, is one which causes considerable friction between the manufacturer and user, is specifying laboratory tests and carrying them out under practical working conditions,

For instance, a high tensile strength may be asked for which can only be obtained by careful manipulation, but the user expects to get this strength by mixing the cement as he would do in practical working and putting the paste in the moulds with no particular care, often introducing internal strains in the mass which will cause the briquettes to break with a very light load. In the majority of complaints investigated by the author it has been his experience to find that the laboratory tests specified have been done by a labourer or unskilled operator who knows absolutely nothing of the properties of the material which he is testing.

As showing the necessity for care in drawing up cement specifications and testing, reference might be made to the German standard rules, than which there is none better, as drawn up by the Association of Cement Manufacturers.

Time of Set.—In order to ascertain the time of set, take a sample of "neat" cement and mix for three minutes with water to a stiff paste; for quick-setting cements only one minute is required. The mixture is then spread on a glass plate at a single operation, in the form of a pat 1.5 c.m. thick and tapering towards the edges. The consistency of the gauged cement should be such that a few taps on the glass plate will cause the mass, which was placed thereon by a spatula, to flow outwards towards the edges. From 27 to 30 per cent. of water is generally sufficient for this purpose. When the pats become hard enough to withstand a slight pressure with the finger nail, the cement may be considered as set.

To ascertain accurately the exact time of set, and to determine the commencement of setting (the initial set), which is of the greatest importance with quick-setting cement, as it must not be worked after it begins to set, a standard needle of 300 grammes weight is used with a diameter of 1 millimetre and a flat point. A metal mould 4 c.m. in height and 8 c.m. inside diameter is placed upon a glass plate and filled with gauged cement of the above consistency, and tested at intervals with the needle. The moment when the needle fails to penetrate the entire depth of the mass is considered as the commencement of setting. The time which elapses between the gauging and the moment at which the needle leaves no visible impression on the surface of the pat is the time taken to set. In order to obtain uniform results in determining the setting of cement, it is of importance to carry out the test at a mean temperature of both air and water of 15° to 18° C., as the setting is influenced by the temperature of the air and of the water used in gauging, a high temperature quickens the setting, a low temperature, on the other hand, retards it.

Slow-setting cements should not materially increase in temperature during setting, whereas with quick-setting cements a marked increase is permissible. Cement is rendered slower setting by long storage, and its tensile strength is increased if kept in a dry place free from draughts of moist air. The opinion frequently prevailing that cement deteriorates by long warehousing is, therefore, an erroneous one, and contract clauses which specify the use of fresh cement only should be discarded.

Soundness.—Portland cement should be constant in volume. The decisive test of this property should be that a pat of "neat" cement made on a glass plate and kept in a damp atmosphere for twenty-four hours, and afterwards immersed in water, must not show any signs of warping or cracking at the edges, even after the lapse of a considerable period.

In carrying out this test the pat prepared for determining the time of set should be placed under water at the end of twenty-four hours in the case of slow-setting cements, but in any case only after it has become set. This may be done much sooner in the case of quick-setting cements. The pats, especially of slow-setting cements, must be well protected from draughts and the direct rays of the sun until after they have become set. The best method is to place them in a closed box, or cover them with damp cloths. Hair-cracks which are caused by shrinkage due to rapid drying will thus be avoided. These generally appear in the centre of the pat, and are often mistaken by the uninitiated for cracks caused by "blowing." If the cement shows any crumbling, or cracks are visible during the process of hardening while under water, this is a certain indication of the "blowing" of the cement. That is to say, the cement becomes cracked in consequence of an increase of volume, and a

gradual disruption of the particles previously connected takes place, which may ultimately lead to the total destruction of the mass. These symptoms of expansion usually appear within three days, but an observation extending over twenty-eight days is always sufficient.

Fineness of Grinding.—Portland cement must be ground so fine that not more than 10 per cent. of residue is left after a sample has been passed through a wire sieve of 900 meshes to the sq. c.m. The thickness of the wire of the sieve should be equal to half the width of the opening of the mesh.

To carry out the test, 100 grammes of the cement must be used for each determination.

The fineness of grinding of cement is of paramount importance, because as sand is nearly always used with it, and sometimes in large proportions, the cohesive strength of the mortar is greater in proportion to the fineness of the cement, inasmuch as under those conditions more particles of the cement come into action. It would, therefore, seem advisable that the fineness of the powder should be uniformly tested by the use of a fine sieve of above-mentioned description. It would, however, be erroneous to judge of the quality of the cement by its fineness only, as inferior underburned cements are more frequently found to be finely ground than good hard-burned ones. The latter kind, though coarser, will generally show a higher cementitious value than the former. When cement is used mixed with lime it is advisable to employ hard-burned and extremely finely-ground cement; the cost of production is higher, but will be counterbalanced by a materially improved quality of mortar.

Tests for Strength.—The cementitious value of Portland cement should be determined by testing a mixture of cement and sand.

The testing shall be carried out in a uniform manner, both as to its tensile strength and resistance to crushing. The test blocks shall be of uniform shape and section, and the same apparatus used in every case. It is advisable at the same time to ascertain the strength of the neat cement. The tests for tensile strength should be carried out by briquettes having a sectional area of 5 sq. c.m. at the point of fracture. In the crushing test cubes should be used having sides of 50 sq. c.m. in area. Slow-setting cement, when tested with three parts by weight of standard sand to one part by weight of cement, must attain after twenty-eight days (that is to say, one day in air and twenty-seven days in water) a tensile strength of at least 16 kilos. per sq. c.m. The crushing strength must be at least 160 kilos. per sq. c.m.

With quick-setting cements, the tensile strength at twenty-eight days is generally less than that above mentioned. The time of set should therefore be stated when specifying the strength required.

It is absolutely necessary to use a large proportion of sand in testing, especially when comparing several cements, as the power of cementing sand together varies with different cements, and in practice this is the most important feature. The most suitable proportion for this purpose is held to be three parts by weight of sand to one part of cement, since with that proportion the cementitious value of various kinds of cement becomes sufficiently developed.

Cement showing a greater relative tensile strength than crushing strength often admits of the addition of a larger proportion of sand, and in consideration of this property, as well as for its greater strength with the usual amount of sand, should command a higher price.

The standard test of strength, is the crushing test at twenty-eight days, it being impossible to accurately determine the cementing power when comparing different kinds of cement in a shorter period of time. Thus, for instance, the strength of various samples of cement may be alike after twenty-eight days, whereas there may be a material difference between them after only seven days.

The tensile test at twenty-eight days serves as a controlling test of cement delivered. If, however, a decision is to be arrived at after seven days it may be made with a given sample, after the ratio of tensile strength between the seven days and twenty-eight days has been determined.

This preliminary test may also be carried out with "neat" cement after having ascertained the relation between the strength of the "neat" cement at twenty-eight days and that mixed with three parts of sand.

It would be of special value in cases where

circumstances will admit, to further extend the hardening period of the test blocks, in order to ascertain the behaviour of different kinds of cements at long dates.

To arrive at consistent results, sand of the same size of grain and of the same kind should always be used. This normal sand is obtained by washing pure quartz sand as clean as possible, drying it and passing it through a sieve of 60 holes per sq. c.m. in order to remove the coarser particles; the sand thus obtained is again passed through a sieve of 120 holes per sq. c.m. to free it from the finer particles. The thickness of the wire of the sieves should be 0.38 and 0.32 c.m. respectively. Since all quartz sands do not always give the same results when similarly treated it should be ascertained whether the normal sand employed will give results consistent with the normal sand supplied for testing purposes under the direction of the Committee of the Association of Cement Manufacturers, and which is used at the Royal Testing Station of Charlottenburg.

As in testing the same cement, a great deal depends on consistent results being obtained at different places, the subjoined rules should be strictly adhered to. In order to secure accurate results at least ten tests should be made at each date.

Tensile Tests.—The briquettes can be made either by hand or by machine.

Hand Made.

On a metal or thick glass plate, forming a base for the briquettes, place five small sheets of filter paper dipped in water, and on each sheet a mould dipped in water. Weigh off 250 grammes cement and 750 grammes dry normal sand, mixing both well together in a vessel. Add 100 ccs. of pure fresh water, working the whole mass well together for five minutes. With the mortar thus produced fill the moulds at one operation and heaped up in the centre; by means of an iron spatula, having a surface of 8 c.m. by 5 c.m. and 35 c.m. long, and weighing about 250 grammes, beat down the projecting mortar, first gently on the sides, then harder and harder till it becomes plastic and water appears on the surface. A continued beating of about one minute per mould is absolutely necessary to attain this object. Adding mortar to that already in the mould is not advisable, as briquettes of the same cement made at different testing stations should be of equal density throughout. Scrape off with a knife any mortar projecting above the top of the mould, smoothing the face with the same instrument; loose the mould carefully from the briquette and place the latter in a covered box lined with zinc, to avoid unequal drying owing to variations of temperature. Twenty-four hours after making the briquettes they should be placed under water, in which they must remain quite submerged during the whole period of hardening.

Machine Made.

After the mould, fitted with the filling-box, has been screwed on to the bedplate by two adjusting screws, 180 grammes of the mortar, made as just explained, are placed into the mould for each briquette and the iron core put in; 150 strokes are then given to the core by Böhme's hammer apparatus, with the hammer weighing 2 kilos.

By strictly observing the above instruction hand and machine tests give fairly uniform results. In disputed cases, however, machine-made blocks are considered the standard.

"Neat" Tests.—Rub the inside of the moulds with a little oil, placing them on a metallic or glass plate (without filter paper), then weigh off 1,000 grammes cement, add 200 ccs. water, and work the mass for five minutes (a pestle is recommended). Fill the moulds, heaping full, and proceed as explained for sand briquettes. The moulds, however, must not be removed till the cement is sufficiently hardened.

As in beating in "neat" cement, briquettes of equal density are required, a very fine or very quick-setting cement will require a correspondingly larger quantity of water. The amount of water used should always be mentioned in giving the results of such tests.

Treatment of Specimens in Testing.—All test pieces must be tested immediately after being taken out of water. Since the speed at which the strain is applied has an influence on the results, in testing for tensile strength the increase of weight shall be at the rate of 100 grammes per second.

In testing for crushing strength, in order to get uniform results, the pressure should always be applied on the flat surfaces of the cube and not on the bottom or trowelled surfaces.

COURT OF COMMON COUNCIL.

The usual fortnightly Court of Common Council was held on Thursday last week at the Guildhall, E.C., the Lord Mayor presiding.

Women Sanitary Inspectors.—On the recommendation of the Sanitary Committee it was agreed to appoint another woman sanitary inspector (second-class) at a commencing salary of 100l. per annum. The Committee were authorised to advertise for candidates.

The Salaries of the Medical Officer of Health and the Sanitary Inspectors.—Some discussion took place on a recommendation by the Sanitary Committee that no action be taken in the matter referred to the Committee for consideration of applying to the London County Council for payment of half the salaries of the Medical Officer of Health and the Sanitary Inspectors.

Mr. John Harris moved as an amendment that the report be not adopted, but that it be referred to the Committee to make application to the London County Council as at first suggested. This was carried.

International Congress of Drainage and House Sanitation.—It was agreed to appoint representatives to attend the first Congress of Drainage and House Sanitation to be held in Paris, from November 1 to 8 next.

Crematorium, City of London Cemetery.—The Sanitary Committee submitted a certificate from the engineer that the crematorium at Little Ilford had been built in accordance with the plans approved by the Secretary of State for the Home Department in October, 1902. It was reported that the Medical Officer of Health, Dr. Collingridge, and the Police Surgeon, Dr. Gordon Brown, had offered to act as Medical Referee and Deputy Medical Referee in hon. capacities. The appointments were agreed to, and the Committee were authorised to make the necessary arrangements for the opening of the crematorium.

Streets Committee.—A lengthy report was submitted by the Streets Committee recommending the Court to consent to a large number of minor building operations and additions to buildings in the City. Among those to which consent was given was an application by the London Hydraulic Power Company to extend their mains in Tower-hill, Cooper-row, Lloyd's-avenue, and portions of Crutched-friars and John-street.

The Spread of Disease by Vagrants.—A letter from the London County Council asking the Corporation to appoint a member, together with the Medical Officer of Health, to attend the forthcoming conference on this question, was referred to the Sanitary Committee.

The Resignation of the City Surveyor.—The Officers and Clerks Committee submitted a report, in which they dealt with the letter from Mr. Andrew Murray, the City Surveyor, with reference to his retirement. The letter had been referred to the Committee with instructions to consider and report upon the nature, duties, and emoluments of the office, and also as to whether there should be any rearrangement of the duties at present discharged by the Engineer.

The Committee submitted a "List of Duties of City Surveyor," with proposed additions italicised. Paragraph 16 of this was as follows:—

16. To prepare designs, with preliminary sketches or drawings, plans, specifications, estimates, and working drawings as may be required (subject to Clause 19), to instruct the Quantity Surveyor who may be appointed to take out quantities, and to take all necessary steps to enable tenders to be obtained from contractors; to examine the materials intended to be used in all buildings to be erected or in any way altered or added to by the Corporation, and to permit the use of such only as are the best of their respective kinds; to superintend and direct the execution of all such works; to see that they are done in a workmanlike manner, and in conformity with the respective contracts and the Acts of Parliament and by-laws of local authorities for the regulating of buildings; to take the extras and omissions upon all contracts (no extras or additions being allowed, for which there is no previous order in writing from the City Surveyor), and make all necessary certificates thereunder; and generally to report thereon from time to time upon the progress of the works and upon proposed variations or otherwise.

The Clause 19 referred to read:—
19. These duties do not refer to or embrace the designing and execution of any work or works of an architectural character.

The Committee recommended:—

- That the office of the City Surveyor and Engineer should not be amalgamated.
- That a City Surveyor be appointed.
- That the salary of the office be 1,000l. per annum, rising, at the discretion of the Court, to a maximum of 1,500l. per annum.

iv. That the age of candidates shall exceed fifty years on the day of election.

v. That the position be advertised.

vi. That it be referred back to this Committee to receive applications and select candidates for final election by the Court.

Mr. Deputy Douglas Matthews moved the report be referred back for further consideration; particularly with regard to practicability of eliminating so many of the duties of the Surveyor as appertained to valuation and letting of land, and matters which were generally dealt with by auctioneer, and also the appointment of officers for these duties. This amendment was lost on a show of hands.

Mr. Algen remarked that with a salary so low a figure the best men would not forward. He would move as an amendment that the salary should commence at 1,500l. annum, as nothing under that sum should be offered by the City.

The Town Clerk pointed out that examination would involve the suspension of the standing orders, and ultimately matter was adjourned. Mr. Cooper gave notice of motion that the age limit should be placed at forty-five years.

OBITUARY.

A. BARTHOLDI.—Auguste Bartholdi, sculptor, to whose death reference was made last week in our columns, was born at Colmar in 1834. He began life as an architect, subsequently came to Paris to study painting in the atelier of Ary Scheffer; but turned his attention to sculpture, and became a pupil of Soitoux. In 1855 he exhibited the Salon a group entitled "Le Bon Samaritain"; and, two years afterwards, a statue of General Rapp. He subsequently executed a fountain for Bordeaux, and a statue of Martin Schongauer for the cloister of the museum at Colmar. We owe to him the figure of "Douleur" which adorns the tomb of Neftzer, and the statue of Coppion for the Collège de France. Better known dates from the time when he executed the colossal statue of "Liberté Eclairée" which stands at the entrance of New York harbour. We should mention among his works the commemorative monument of Basle; the group of Lafayette and Washington erected in the Place des Invalides; the monument to Gambetta at St. Etienne; the monumental fountain at Lyons; the monument to Sergeant Hoff which is to be placed in Père Lachaise; and the models for monuments to the aeronauts of the Sieges of Paris and for that commemorating the sieges of Belfort. It will be remembered that Bartholdi brought an action against the Corporation of Marseilles for not having carried out his design for the Palace of Longchamps, and given the preference to the work of Esperaudieu. This hard-working artist attained a good many honours at the Salons, exhibitions, and was promoted successively the grades of Chevalier, Officer, and Commander in the Legion of Honour.

Mr. TAIT.—We have to announce the death in his seventy-third year, of Mr. William Tait, of Glasgow, who practised engineering a long period as an architect in that city. He served his articles in the office of Messrs. A. and A. Heiton, of Perth. Messrs. A. and Mitchell, of Glasgow, made the plans for his designs six years ago for the Institute in West High-street, Forfar, founded by Mr. Meffan for purposes of a lecture hall, library, and museum.

Mr. RIDLEY.—Mr. Matthew Ridley, Superintendent of the Government Horticultural Gardens at Lucknow, died at Lucknow, on September 17, aged fifty-six years. He had about to retire from that position, which he had occupied during some thirty years. Mr. Ridley received his earlier training in Kew; his service in India as a landscape gardener has been marked by the great improvements which he carried out in the public gardens and parks around the Taj Mahal, as well as at Lucknow, more especially in the vicinity of the Residency and other places of historical interest in that city which are associated with the story of the Mutiny. Mr. Ridley traced his descent from the Bishop of London who was burned at the stake in 1555.

Mr. J. LEWIS THOMAS.—We regret to record the sudden death of Mr. James Lewis Thomas, F.S.A., F.R.G.S., late Chief Surveyor to the War Office, which took place at his residence, 26, Gloucester-street, Warwick-square, on the 4th inst., in his seventy-year. Mr. Thomas was educated at Christ Church, Brecon, and studied under Charles Barry. He had a long association with the War Office, serving abroad in

days. In 1855, he was appointed Surveyor to the War Department, and promoted to be Chief Surveyor, which he held till 1880, when he retired. The citation of hon. A.R.I.B.A. was conferred on him soon afterwards. He designed the Herbert Hospital, Woolwich, and other notable buildings of which he is the architect is the Royal Victoria Hospital at Netley, the drawing of which he made to Queen Victoria on the occasion of Majesty laying the foundation-stone in being at the same time presented to Her Majesty; he also designed the Herbert Convent Home at Bournemouth, erected to the memory of the late Lord Herbert of Lea. Thomas was a fellow of several learned societies, also a distinguished freemason; he was Vice-Treasurer of the Most Hon. and Ancient Society of Ancient Britons, which supports the Welsh girls' school at Ashford, and a brother of the eminent Breconshire poet, the late Mr. J. Evan Thomas, J.P. He was interred in Brompton Cemetery in the 3th inst.

GENERAL BUILDING NEWS.

CHURCH, CHANDLER'S FORD, HANTS.—The Rev. of Winchester dedicated a few days ago the new Church of St. Boniface, which has been erected at Chandler's Ford. The church is of red brick, with Bath stone dressings. At present only a portion of the work has been carried out. This consists of the nave and a small portion of the chancel, forming a temporary sanctuary. On the east side of the north transept a temporary altar has been erected, constructed from a roof of the nave is timbered and surmounted by a bell turret. The ceiling is of oak, and divided into panels, with a carved boss at each intersection. The walls are plastered inside, and the windows are all with leaded lights, filled with Cathedral glass. The floor of the nave is of wood blocks under the seats. The roof of the temporary sanctuary is raised 6 in. above that of the nave, and is composed of black and white marble. The building is heated by a hot-air system carried out by Messrs. Haden and Son, of Trowbridge. The seats are of oak, fumigated and polished. The vestry will eventually be of pitch-pine, but meantime seats from the old church will be used. The font, pulpit, lectern, and organ have been brought from the existing church. The remainder of the scheme consists of the completion of a parsonage, the ground for which has been reserved on the south side, the north and south transepts, but this only to be carried out when funds permit. The work of erecting the church has been entrusted to Messrs. Parnell and Sons, of Winchester. The architect was Mr. G. F. Bodley, of London, and Mr. C. Woodley acted as clerk of the works and foreman.

ST. ANNE'S CHURCH, WIMBORNE.—The laying of the first stone of the new Roman Catholic church, which is to stand at the corner of Merton and Latimer roads, and is to be dedicated to St. Winefride, a Holywell, took place recently. The plan comprises a wide nave with narrow aisles on either side, a sanctuary on a separate step above the nave level, and on one side by a side chapel, and on the other by priests' and boys' sacristies, a vestry on the north side, with a porch opening, giving access to that portion of the church, and a baptistry at the north-west end. The main entrance will be by a recessed arched doorway at the west end, and there will be also another entrance at the south-west corner. The total cost will be 112 1/2 £, and the width of the church will be 53 ft. Accommodation will be provided for between 600 and 700 persons, and the cost for 6,375 £. The architect is Mr. F. A. Smith and Sons, of Westminister, and Messrs. Smith and Sons, of Norwood, are the clerks of the works, and Mr. Bailey, of London, is the architect.

ST. ANNE'S, BRISTOL.—The foundation of the new Church of St. Anne's, laid by the Bishop of Bath and Wells on the 11th inst. The church will consist of a north and south aisles, north and south transepts, chancel, and morning chapel, and accommodation will be for 795. The whole building will not be proceeded with at present it is intended to construct the nave, and transepts, which will provide accommodation for about 700 people, and a temporary chancel will be erected at the east end of the church, and a temporary vestry at the east. The estimated cost of the whole is 5,800 £, and of the portions that have been first built about 3,000 £. The structure
