It appeared that the plaintiff was the lessee of 5, Hanover-square, for a term of twenty-one years from September, 1899, and on those premises she carried on the business of a Court dressmaker. She asserted that she was entitled by prescriptive right to support from the adjoining house—viz., Hanover-buildings, the property of the defendant company. The

plaintiff's case was that defendants had deprived her premises of support by pulling down the old buildings and erecting in their place another building of increased height without properly supporting or securing plaintiff's walls, thus weakening them and cracking them. The wall separating her building from the defendants' had been fractured, and, in consequence of its settlement, the front wall, partitions, and ceilings, and papers were damaged on the second and third floors. The stonework in front of the house was also fractured. By an agreement the plaintiff entered into with the defendants in March, 1901, defendants agreed to indemnify the plaintiff against all damage in consequence of their building operations, and she sought damages accordingly. The plaintiff also alleged that the defendants had interfered with her trade, some soot and bricks falling down a chimney and damaging some valuable goods.

Defendants set up the defence that the damage was not due to any action of theirs, but to the age and other things connected with the plaintiff's building.

The expert witnesses called for the plaintiff were Mr. A. J. Hopkins, Mr. William Woodward, Mr. E. A. Lansdowne, and Mr. P. A. Hopkins.

For the defendants Messrs. Sawyer & T. H. Watson, architects, were called and gave evidence.

His lordship, in the result, in giving judgment, said that upon the evidence he found as a fact that the operations of the defendants had deprived the plaintiff's building of the support to which it was entitled. The result of the evidence showed that bricks were fractured in the party wall line. He found that there had been a subsidence and loss of support to the plaintiff's building. Defendants said that the injuries were due to old age. But he thought that the plaintiff was entitled to damages for the injuries done to her house by the building operations. He gave judgment for the plaintiff for 125 guineas damages and the costs of the action.

PATENTS OF THE WEEK.

APPLICATIONS PUBLISHED.*

23,786 of 1903.—T. GARE: *Solutions for Treating Wood and other Fibrous and Porous Materials or Compounds.*

A solution for treating wood and other fibrous or porous materials or compounds, consisting of vulcanised rubber or rubber composition in a powdered state, and resin or resin and boiled linseed oil or castor oil, acting as solvents for the said rubber or rubber composition, the said rubber or rubber composition being added to the said oil gradually in small quantities.

27,034 of 1903.—T. RAY: *False Grates or Fuel Economisers for Domestic and like Stoves and Fireplaces.*

According to this invention the front bars of the false grate or economiser project downwards for a suitable depth from a top bar, and are formed with horizontal portions of convenient length to constitute the bottom bars on which the fuel is supported and the ends of the bottom bars are merged into or connected to the usual back bar which is strengthened by a curved bar or plate of more or less "fish belly" shape, or the back bar itself may be "fish belly" shaped. Or again, the ends of the bottom bars may be extended downwards and merged into or connected to a "fish belly" bar or plate, and the usual back bar dispensed with.

28,515 of 1903.—J. R. WARTNABY: *Window Sashes and Frames.*

This invention relates to window sashes and frames, and has for its object certain improvements whereby the usual cords, weights, pulleys, pockets, and hinges are dispensed with, and certain advantages are gained over the ordinary window sash and frame. In this invention the sash style of the window is provided with a suitable number (say four) of projecting pins, pegs, or equivalents, which may project from the edge of the sash, and be held in a forward position by means of suitable springs against the action of which the projecting pins or pegs may be pressed inwards.

28,612 of 1903.—T. W. TWYFORD: *Water-closets and Urinals for Ships, Railway Carriages, and other uses.*

Folding water-closets and urinals, consisting in the arrangement, in combination with a main flushing tank, of a supplementary tank or chamber which is supplied from the main tank with a quantity of water adapted to be delivered into the folding pan or basin on the

latter being turned down for use, the passage of water from the main tank into the supplementary tank, and from the latter to the outlet pipe being controlled by a pair of valves operated mechanically from the folding pan of the apparatus.

28,683 of 1903.—G. A. CHADDOCK: *Window Doors, and similar Aperture-closing Devices.*

Windows, doors, and similar aperture-closing devices which consist in mounting one or more closing devices to swing on a horizontal axis and to slide bodily in a vertical plane either or both of which motions may be utilised to bring the parts into various positions.

28,733 of 1903.—C. H. THOMPSON: *Manufacture of Bricks, Tiles, Slabs, and the like.*

The manufacture of bricks, tiles, slabs, coverings, mouldings, and the like from waste glass, from a mixture of waste glass and other substances, moulded into any desired shape and size, and afterwards placed in a suitable furnace and heated to cause agglomeration and cohesion of the materials used.

109 of 1904.—A. TATE: *Window Sashes and Frames.*

According to this invention a double cord is connected with the upper and also the lower sashes, one end of each cord being attached to each side of the sash at its top end. The cords pass over pulleys situated at each end of the upper portion of the sash frame, down one side of the frame, and then on winding drums arranged preferably below the sill. A separate drum is provided for the double cords of each sash. Each drum is suitably mounted in a bracket, and has a toothed gear wheel rigidly secured thereto. Another toothed wheel, but of smaller diameter than the one mentioned, and carried by the said bracket gears with the first-named wheel. On turning a handle fixed to the spindle of this smaller wheel the cord is caused to be wound upon the drum, and raises the sash. Suitable notches may be formed in a plate with which the handle engages for temporarily holding it, so that the sash can be held at any height. A coil spring is attached at one end to the drum spindle, and the other to a suitable part of the bracket. The object of this spring is to prevent the cord unwinding too rapidly, and thus allow the sash to move gently when it being lowered.

633 of 1904.—M. J. ADAMS: *Lavatory Basins, and Similar Appliances.*

The discharge outlet of a lavatory basin hitherto been at the back or in the centre and has never been placed in the front which it is now desired to place it. The object two-fold. In the front it is practically noiseless and out of the way, and the front opening enables one to use a waste pipe or connexion which also serves to support or carry the basin by the thrust of this waste pipe or connexion against the wall. The special novelty of this invention is the placing of a waste outlet in front for the purpose described in a wide basin or sink. The outlet may be placed at the front, but to one side so that the waste pipe forms one of two more supports.

2,200 of 1904.—J. MUTR: *Window Sashes and Frames.*

In window sash frames the combination comprising sliding bars, grooves, and plates said bars, and opening out sash frames fit with short projecting kneed plates to fit grooves and plates in the sliding bars.

17,662 of 1904.—J. A. SCHNEPPE: *A Comb Door Stop and Burglar Alarm.*

A wedge-shaped door chock provided with contacts for electric light and bell device said chock adapted to be fixed to the floor, a suitable position for preventing the door from being opened, so far as to permit one while at the same time the electric light and bell devices are automatically put into action.

19,628 of 1904.—A. PAILLET: *Pivots for Swing Doors.*

A bearing for swing doors, consisting in a disc fixed to the pivot of the door, an annular ball race provided with swells attached to said disc, a second similar ball race fixed to the bearing of the pivot, balls running in said races, and annular discs for keeping the balls in position.

20,140 of 1904.—E. JOHNSON: *Windows, and the like.*

A sash cord holder for windows, and the like, having either a flat or curved surface, or a one or a series of projections or teeth adapted to fit on the sash stile of such windows, and to hold the sash cord in the position required.

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

20,668 of 1904.—R. AMES: Joints for Earthenware and Similar Pipes.

An earthenware or similar pipe provided with spigot and socket ends, the spigot end having a ring at the extreme end thereof and a collar at a distance from the end of the spigot greater than the depth of the socket, and jointing holes being formed in the collar.

21,323 of 1904.—W. P. THOMPSON (S. W. Funk): Casements and Hinged or Pivoted Sashes or Doors.

A window casing, consisting of a window sash pivoted therein by pivots located at one side of the sash and near one edge thereof, and weather strip means secured to the window casing in a plane to one side of the pivots of the sash in a position to engage with the edges of the sash when the latter is closed.

23,316 of 1903.—T. WARBURTON: Reflecting Apparatus for Incandescent Gas Lamps in Domestic and Shop Use.

This consists in attaching mirror reflectors integral with or detachable from a ring which fits on the shoulder or the upper edge of the chimney or globe, or attaches by means of groove pieces or the like to the wire holder in anti-vibration devices, or to a smut catcher.

25,595 of 1903.—R. S. FOSTER: Rotary Fans for Use in Connection with Dust Collection, Ventilation, and other purposes.

This invention applies chiefly to rotary fans for use in connexion with dust collectors for use with high-speed machinery ventilators, but is also applicable to other purposes. The apparatus is cylindrical in form, and connected to a cast-iron base, and provided with one or more inlets and outlets, the inlet being connected with the main dust shaft outside, and to a spiral incline inside the cylindrical case which is connected to the outlet of the chimney or globe, or attaches by means of groove pieces or the like to the wire holder in anti-vibration devices, or to a smut catcher.

27,697 of 1903.—W. BOYES, SEN., and W. BOYES, JUN.: Apparatus for Heating Buildings and other places.

This invention refers to improvements in, and relating to, apparatus for heating buildings, and consists in disposing in what is known as a self-contained stove, heated by burning a fuel, a metallic pipe through which water is passed from the bottom end to the top outer leading to heated pipes located in the building or place to be heated. If desired the metallic pipe may be duplicated as often as desired or required according to the size of the self-contained stove, and for the purpose of increasing the efficiency of the same.

20,455 of 1904.—H. STANTON and A. W. STANTON: Fire-resisting Floors.

This relates to an improvement in fire-resisting floors by means of specially-shaped plates or slabs of cement, concrete, earthenware, or other suitable material arranged so as to cover the lower flanges of metal or bottom of wooden joists resting on or fitted to same.

20,466 of 1904.—E. A. BAKER: Means for Escaping from Burning Buildings, and for other purposes.

Means for escaping from burning buildings, and other purposes, consisting of a rod or bar provided with a bar or other receptacle, and guide wheels or rollers, capable of adjustment and operating in conjunction with a cable wire or cord fixed to said bar, and for connecting same to a rod or bar loosely fixed to a joint of a building.

21,053 of 1904.—A. MORGAN: A Method and Process of Disinfecting.

A method and process of disinfecting, consisting in forming an intimate mixture of about one part of paraformaldehyde, six parts of carbon, and sufficient gum tragacanth or other gum to form a stiff paste, thoroughly pulverising and intimately mixing the ingredients, and forming the mixture by pressure into blocks of any size and shape, and drying the blocks, which are ignited when required, the vapour of formaldehyde being gradually and uniformly disseminated.

1,139 of 1904.—A. MÜLLER: Frame Buildings.

A frame building having masonry or brickwork bases or sills which are erected sets of one or more uprights according to their position on the building, said uprights or certain of them being brought into erect position on said bases by turning them round horizontal bolts arranged at their lower ends, said bolts being carried in stationary angle-irons secured to said bases, and the uprights being then lowered on to the bases and fixed to the angle-irons.

21,140 of 1904.—A. MÜLLER: Frame Buildings.

A construction of frame buildings, consisting in the connection of the central uprights with the ridge beam and the upper ends of the rafters in such a manner that the two ends of the rafters abut above said ridge beam fixed to the head of the upright, and are clamped between broad angle-irons by means of two traversing bolts.

TO CORRESPONDENTS.

NOTE.—The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples, sent to or left at this office, unless he has specially asked for them.

Letters or communications (beyond mere news items) which have been duplicated for other journals are NOT DESIRED.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

We are compelled to decline pointing out books and giving addresses.

Any commission to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

MEETINGS.

FRIDAY, DECEMBER 2.
Institution of Civil Engineers (Students' Meeting).—Mr. R. T. McCallum, M.Inst.C.E., on "Midland Railway, West Riding Lines: The Construction of Contract No. 1." 8 p.m.

SATURDAY, DECEMBER 3.
Incorporated British Institute of Certified Carpenters.—Annual General Meeting. 6 p.m. (Carpenter's Hall, E.C.7.)

MONDAY, DECEMBER 5.
Royal Institute of British Architects.—(1) Business Meeting; (2) Adjourned Discussion on Papers read at the last meeting on "Ferro-Concrete." 8 p.m.
Liverpool Architectural Society.—Paper by Mr. Maurice B. Adams, entitled "More About Modern Libraries," illustrated by plans and examples. 6 p.m.
Society of Engineers.—Mr. W. E. Storey on "Condensing Machinery." 7.30 p.m.

TUESDAY, DECEMBER 6.
Northern Architectural Association.—The Rev. H. C. Windley, M.A., on "English Church Architecture in its Relation to English History." 7.30 p.m.
Institution of Civil Engineers.—(1) Paper to be further discussed, "Distribution of Electrical Energy," by Mr. J. E. Clewton Snell, C.E. (2) Time permitting, Paper "On the Construction of a Concrete Railway Viaduct," by Messrs. A. Wood-Hill and E. Davy Palm, B.A. 8 p.m.

WEDNESDAY, DECEMBER 7.
Royal Archaeological Institute.—(1) Mr. J. Hilton, F.S.A., on "The Hildrathen and Saalburg in Germany"; (2) Mr. Philip M. Johnston on "Mural Paintings Recently Discovered in Trotton Church, Sussex," etc. 4 p.m.

The Buildings of Elementary Schools.

In a recent issue, we briefly referred in a Note to the circular of the Anglesea County Council to the managers of non-provided elementary schools in regard to structural repairs and alterations.* The subject has already become more important, and it is desirable to refer to it at greater length than was possible within the compass of a Note:

Two facts should be referred to. The first is the action of the Education Committee of the London County Council and of the Council itself in this matter. Under the London Education Act 1903 the County Council is placed—as regards London—in much the same position as a country county council towards its district. By section 7 (d) of the Education Act 1902 the local authority, that is, the county or town council, shall in the case of what were called “voluntary” as opposed to Board schools, and are now called “non-provided” schools, require the managers “to make such alterations and improvements in the buildings as may be reasonably required.” If a dispute on this point arises, then the difference between the local authority and the managers is to be decided by the Board of Education in London. As an example of the increasing importance of this enactment, it may be mentioned

that a meeting was held last week at Durham to raise a sum of 25,000*l.*, part of a sum of 35,000*l.* which is required in order to put the non-provided or Church schools in the state demanded by the County Council of Durham. Still more important is the fact that the Education Committee of the London County Council has reported that twenty-nine non-provided schools are structurally deficient. The number of the non-provided schools in London is 508, and the Council has referred back the report in regard to the twenty-nine schools till the report as to the whole number is complete. The survey which was ordered by the Council was to be as to (1) lighting, (2) ventilation, (3) heating, (4) cloak accommodation, (5) lavatory accommodation, (6) teachers' rooms, (7) staircase accommodation and emergency exits, and (8) areas of playground.

It is unquestionable that reports in all these particulars should be made by skilled persons on behalf of every local authority. It is equally certain that the ratepayers will insist sooner or later on this being done. There is yet another point. We have in these columns over and over again insisted that the system of reports to the Education Department on the structure and sanitation of elementary schools by an inspector, whose main business is to examine the scholars, was useless and absurd. The report of the architect of the London County Council and that of the technical adviser of the Durham County Council, upon which—as we have already said—a demand for a large expenditure is based, clearly show

that the Board of Education has been lax in its duty. The duty of that department was, among other things, to take care that the buildings of elementary schools, kept up in a large measure by Government grants, were reasonably perfect. No one would require that school buildings should be elaborately equipped and magnificently built, but they should reach a good and proper structural and sanitary standard. The Education Department has already sanctioned the demands of the Durham County Council, thereby showing that that body only requires reasonable alterations and improvements, such as unquestionably should have been completed long before the Act of 1902 was passed.

It is certain that the health of the community will be largely increased by the sanitary improvement of elementary schools, so that from a non-educational point of view the present trend of affairs is welcome. But an improvement in the buildings of elementary schools may, we hope, tend to greater educational efficiency, and it should lead to an improvement in the buildings of secondary schools. One of the points for report by the architect of the London County Council was in regard to lighting. It would be interesting to see the result of a survey by this official of many of our private and public schools, for we feel pretty sure they would come in for a good deal of censure. It will be an absurd anomaly if the buildings of our elementary schools are brought up to a reasonable standard of efficiency whilst those of so-called higher schools are left in a less satisfactory state:

* See our issue for November 12.

But it will be no loss to the community if some of the private schools in which the children of the lower middle class are now educated come to an end in consequence not only of the provision of a reasonably perfect system of education in elementary schools, but of the provision of reasonably perfect elementary school buildings.

On the immediate question as to the policy of the London County Council in postponing action as to the twenty-nine schools until the report on the whole number is completed, so that the ratepayers of London may be impressed with the shortcomings of the managers of Church schools and appreciate the expenditure which will be required in order to find places for children for which the schools are now pronounced inadequate, it is only necessary to speak briefly. From a business and from an educational point of view, the moment a school building is reported unfit, then the improvements and alterations should be commenced as soon as possible. Every day's delay is the continuance of a state of things condemned by competent persons, and no excuse such as that put forward by the Council is of any value from an impartial point of view. Immense sums of money, it is clear, will have to be spent on school buildings all over England, and the sooner the work is put in hand the better.

THE CARE OF ANCIENT MONUMENTS.

By PROFESSOR BALDWIN BROWN:

I.

THE ancient monument is at present the centre of a considerable amount of activity, of which it is itself so sublimely unconscious. One wonders what the Great Pyramid or the trilithons of Stonehenge have thought of the various people who for different ends have been busy about them through the ages! They have been adored and then shamefully used, have been ransacked for treasure and exploited as quarries; have been measured and theorised over, and now again find themselves the objects of a new sort of cult not exactly religious, but of a pious and at times sentimental order. In our own land ancient monuments for the most part take care of themselves, or depend on the irregular assistance proffered from time to time by their private friends. Only in the case of a very few in Great Britain is the protection of the Ancient Monument Acts of 1882 and 1900 available, though in Ireland, as is usual with that much-persecuted country, the national monuments are far better treated. On the Continent every country, practically speaking, is supplied with official machinery for the protection of its monuments. These are made everywhere the object of the attentive scrutiny of inspectors and the deliberations of State-appointed Commissions, while in several countries there are formal Monument Acts, the number of which has been considerably augmented within the last few years.

It is the purpose of what follows to give in the briefest possible form an indication of what has recently been essayed in

monument administration both in our own and in foreign countries.

Monument administration, in the sense in which it is understood in Germany, Italy, or France is a somewhat extensive and complicated affair. The word monument means, of course, far more than is commonly understood by the term when applied, say, to the Nelson monument in Trafalgar-square or the Wellington monument in St. Paul's. It covers, roughly speaking, all old structures, and all the objects which we gather into museums like those at Bloomsbury or South Kensington. Quite recently the term has been somewhat arbitrarily extended to embrace natural scenes and objects, the preservation of which is of importance in the interest of the community. The draft of a Monument Law for the Grand Duchy of Baden in 1883 explains the term as including "all immovable and movable objects which have been handed down from a bygone period of civilisation, and as characteristic productions of their time have a special significance for the comprehension of art and art industry and their development, for the knowledge of antiquity and for historical investigation in general, as well as for keeping alive the remembrance of events of outstanding interest," while the Monument Law of the Grand Duchy of Hesse, which was passed in 1902, includes under the expression "Natural Monuments" "phenomena of the earth's surface, such as watercourses, rocks, trees, and the like, the maintenance of which is a matter of public interest on grounds of history or of natural history, or from considerations of the beauty or special character of a landscape."

All these objects, natural and artistic, through their interest, their beauty, or their associations, possess a value for the present to which testimony is given by the efforts made in so many quarters for their preservation: There is no space here to attempt to appraise this value or to discuss the reasons which make for protection. As a matter of general theory almost everyone will admit this value. Most people like the country, and are open to the impressions of beauty and sublimity from natural scenery, while few will deny that they are interested in a historic memorial or are sensible to the charm of a picturesque mediæval building. Unfortunately this vague general feeling is seldom effective for the defence of an ancient monument or a lovely site when attacked in the name of some modern improvement. It requires continual effort on the part of those fully alive to the value of this portion of the national assets to secure a proper balancing of the claims of the new with those of the old. If the importance of the preservation of the remaining specimens of our older town architecture were once firmly implanted in the public mind it would be found possible in very many cases to devise a way of meeting modern requirements, while yet preserving what is old. The two well-known churches in the Strand were repeatedly warned off that thoroughfare on the ground that they were hopelessly in the way, but the friends of monuments managed to save them from the spoiler, and we now behold them not only not in the way but the *foci* of a great architectural scheme,

and elements of the utmost value for the future effect of the whole neighbourhood.

The means that are taken to impress the value of ancient monuments on the general sense of the community are threefold. There is first the agency of private societies which stimulate and guide public opinion, and of individuals who write to the papers, interview local authorities, and ask questions in the House in defence of some threatened possession. There are next official agencies in the form of State-appointed Commissions served by a staff of inspectors and custodians, who bring Government influence to bear on monument problems though they may not be armed with direct legal authority; and, lastly, there is definite legislation, either in the form of State Monument Acts or in that of local by-laws affecting building in special towns or districts. Among ourselves private societies flourish, and by their influence on public opinion are the most potent agencies we possess for effecting the end in view. On the other hand, our Monument Act or Acts are very slight and ineffective, while we are absolutely without the elaborate official organisation of Monument Commissions in which continental countries are so rich. Abroad all three agencies are in active operation and their organisation and manner of working will now be briefly sketched.

The following European countries possess formal Monument Acts, that are here arranged in order of date: Greece 1834; Hungary, 1881; Great Britain and Ireland, 1882; Turkey, 1884; France 1887; Bulgaria, 1884; Roumania, 1892; Cantou de Vaud, 1898; Italy, the Grand Duchy of Hesse, Cantons of Bern and Neuchâtel, 1902. To this it should be added that other countries also, and these some of the most important in Europe have State Monument Acts at this moment under discussion. This is the case in Prussia, in the Austrian Empire in Bavaria, and also in Spain, while the Grand Duchy of Baden in 1883 and Greece in 1893 had drafts of new or amending Acts before their Parliaments.

This list of Monument Acts does not exhaust the efforts of Legislatures and Governments for the care of monuments for there exists in almost all European countries a mass of Royal and Ministerial decrees and circulars, and of resolutions of deliberative bodies which have the practical effects of law, and the majority of which establish official Commissions and Conservators for the care of monuments throughout the regions where the rescripts run. In fact, it conveys a false impression when it is said that one country possesses and another is without a Monument Law, with the implication that monuments are safer in the one country than in the other. Prussia has no Monument Act, though she has been talking of one for the past eighty years, yet there exists in the Prussian provinces a very full provision for the survey and upkeep of monuments, and there are no fewer than fourteen provincial and district Conservators in charge of the work with a General Conservator, under the Minister of Religion, Education, etc., at their head.

The Austrian Empire, again, has no monument legislation, but for the last fifty years the "Royal and Imperial

Central Commission for the Investigation and Maintenance of Artistic and Historical Monuments" has been at work. France had her "Commission des Monuments Historiques" for half a century previous to her Monument Act of 1887, and at this day Italy probably does more for the upkeep of her monuments through her provincial commissions, the "Uffici Regionali per la Conservazione dei Monumenti," than through the direct agency of her State Monument Act of 1902. Spain, Belgium, Holland, and Switzerland have their officially-appointed Monument Commissions, though they are without formal laws; Denmark and the other northern kingdoms attach the care of monuments to the administration of their great museums of the national antiquities.

The best sign of a healthy public feeling on this question in foreign countries is the existence of a large number of active private societies vowed to a holy war in the defence of the monumental legacy of the past against modern vandalism. These private societies have always flourished greatly in our own country, and we have, indeed, set the fashion in them to our neighbours over the sea. The Society for the Protection of Ancient Buildings, for example, which has about it for the foreigner the glamour of the name of William Morris, has a reputation abroad which it hardly enjoys in certain architectural circles at home. This last fact, it needs hardly to be said, is not wholly to its discredit. The example we have set is now being followed abroad by the foundation of new protective societies, on which a word will be said later on. Over and above these more or less polemical associations there are, of course, both at home and abroad, the established antiquarian and architectural societies, the members of which may be trusted to make their influence felt in favour of monument preservation. France is particularly rich in local societies of the kind, some of the most important of which owe their inception to the energy of Arceise de Caumont. Germany has a general association of local antiquarian societies, and these constituent bodies number no fewer than 161.

It is sometimes imagined that in matters like the care of our monumental legacy from the past the foreigner places his trust in official machinery, while in our own country we depend rather upon the free action of public opinion. This may have been the case to some extent in the past, though de Caumont, who in the thirties did so much to create the modern intelligent interest in mediæval art, was not in the official ring; but in the present day, in all the more progressive European countries, there is great personal activity shown in the founding of societies with a national or a local scope, and in outspoken criticism of official "restorers" and of bureaucratic methods of monument administration in general. Special organs of this movement exist in the foreign Press. Thus in 1887, the year of the passing of the French Monument Act, M. Charles Normand, an indefatigable champion of monuments, founded a "Comité des Monuments Français" with its organ, the periodical entitled *L'Ami des Monuments*, which announces itself as "founded

with the aim of watching over the monuments of art of France and the general appearance of her towns, and of defending the picturesque and the beautiful." A German periodical founded more recently in the same interests is of greater general value as giving a wider outlook on the whole field of monument administration in every civilised land. The periodical in question is called *Die Denkmalpflege*—"The Care of Monuments," and was started in 1899*, as the organ of a movement for the defence of the older monuments of the Fatherland which sprang up about that time. A league called "Heimatschütz"—"The Defence of Home," recently founded, carries out the propaganda to which the periodical gives literary expression. In Belgium a national society of somewhat similar aim was established in 1894 under the name "L'Œuvre Nationale Belge," or "L'Œuvre Nationale de l'Art Appliqué à la Rue," the main object of which was to improve the artistic character of new work, both in buildings, and in details such as electric light standards, shop signs, or the like; but its influence extends also to the preservation of excellent work handed down from the past. There is also a "Société Nationale pour la Protection des Sites et des Monuments en Belgique," which breaks a lance sometimes with the official "Commission Royale des Monuments."

These societies of national aims correspond to our own useful "National Trust for Places of Historic Interest and Natural Beauty." Their activities are supplemented by provincial and urban societies of narrower scope but of effective energy. Vienna has her "Association for the Protection and Maintenance of the Artistic Monuments of Vienna and Lower Austria." In France in 1897 there was formed in the Prefecture of the Seine a "Commission du Vieux-Paris," the object of which is "to search out the vestiges of the older city, to record their present condition, and, as far as practicable, to supervise their maintenance." A "Commission Municipale du Vieux-Lyon" was formed in 1898 on the lines of that of Paris, and in 1903 there was published at Lyons an illustrated *Inventaire Général du Vieux-Lyon*, which contains a list of existing houses possessing a value from the point of view of Lyonnaise history and art.† There is also at Rouen a "Société des Amis des Monuments Rouennais." In Belgium an energetic local "Société pour la Protection des Sites et des Monuments de la Province de Namur" has lately sprung into existence, and will probably lead to the foundation of other associations of the same kind. In Italy there is the same awakening of personal interest in the protection of the national heirlooms, which is the best and healthiest form which the movement for the care of monuments can take. In various towns of the Peninsula societies are formed by "Amici dei Monumenti," the object of which is to watch carefully the official proceedings of the Government authorities who deal with monuments, and to

* As an offshoot from the *Centralblatt der Bauverwaltung*. It is published by Ernst und Sohn, Berlin, and only costs \$8 per annum.

† It is worth notice, as an encouraging sign of the times in our own country, that a proposal is now under consideration by the municipal authorities of Edinburgh for making an inventory of the older domestic buildings of that city, as a preliminary to possible measures of protection.

keep the public interested in the subject through the medium of the Press. The "Riunione Artistica," of Perugia, recently formed a special committee of its members for this purpose. In Rome the "Associazione Artistica fra i Cultori di Architettura," now presided over by Signor M. E. Cannizzaro, has been doing good work in a city that needs intelligent treatment more than perhaps any other.

It is in Germany, however, that the personal movement for the care of monuments, as distinct from State and official agencies, is most apparent. Up till a few years ago Germany was in this respect somewhat in the background. There was plenty of official machinery for the protection of monuments, but the public in general had not taken up the subject. It has been the custom in Germany for a General Congress of Historical and Artistic Societies to be held yearly. The Congress of 1899, which met at Strassburg, took up the monument question, and passed certain resolutions, signed by representatives of 124 societies, in which the interest already shown by governments in these memorials of the past greatness of the people was acknowledged, but a demand was made for increased attention to what was termed "a question of life and death for the historical sciences and for the maintenance of the national consciousness." From that date a yearly congress, exclusively for the discussion of monument questions, has been held in different parts of Germany, and the various aspects of these questions have received the systematic treatment for which our neighbours across the North Sea are famous. The Ministers of the German States have sent delegates to these congresses, and some of the leading architects and antiquaries of the country have taken part in the proceedings. The verbatim reports of these, which have been published under Government subsidies, make the most interesting body of reading available on monument administration generally.

No principle is more insisted on in these discussions than the need for basing the movement for the care of monuments on the public will. Laws and commissions, it is pointed out, can only be really effective if they represent the genuine wishes of the community. The idea is to work from below upwards, and to build up a solid conviction of the real value of this part of the national assets by influences brought to bear on the public in general and especially on the young. This view has been well expressed by a Prussian jurist, Dr. Bredt, in a small brochure that is one of the best things written on the care of monuments in our own time.* He warns his readers against reliance on laws and regulations, and especially on the weapon of compulsory purchase or expropriation, which can, however, be held in reserve against the obdurate proprietor who insists on maltreating a monument of public value that happens to be on private land. The true method of monument protection, he points out, is the instruction of the public. Popular articles in the daily journals, free public lectures, lessons to the children in the schools, and visits with them to

* *Die Denkmalpflege und ihre Gestaltung in Preussen*. Berlin, 1904.

interesting buildings and to museums, are all means to this end; and a suggestion is made that a small illustrated home-guide should be prepared in every ancient city for distribution in schools. In this way, he argues, will the interest in the preservation of monuments, now confined to a limited circle, pass into the flesh and blood of the rising generation.

NOTES.

Architects' Drawings. WE are glad to be able to announce that the Council of the Institute of Architects have resolved to devote a sum of not more than 100*l.* from their funds towards upholding the appeal in the case of *Gibbon v. Pease*. But we must press on the Council the consideration that the many architects in this country whose subscriptions form the bulk of the income of the Institute, and whose interests the Institute is supposed to represent, will not be satisfied with the mere pecuniary support of a case in which the interests and the honour of the whole profession are concerned. They will expect that the Institute, through its newly elected body the "Board of Defence," should take an active part in supporting the just claims of the architects, and in representing what is the true function of architectural drawings, which the law has hitherto misunderstood, through not having it clearly and logically stated. What we have to show is that the existing law (as now construed) is an injustice based upon a mistake, and subscribers to the Institute have a right to expect that the Institute should do all in its power to bring this properly before whatever tribunal is ultimately appealed to. If it fails in this, the question will naturally be asked—what is the use of a "Board of Defence" which does not defend?

Technical Education. ALL who are interested in this important subject will do well to notice the comments made by Sir William White at the recent prize distribution of the Sir John Cass Institute. Although admitting that our friends in the United States and Canada had a good deal to teach us, the speaker expressed the comforting opinion that our best systems of instruction were fully equal to the best in America and on the Continent. This favourable condition, he thought, was less generally evidenced lower down in the scale; but, as a set-off, our system of evening classes was described as being far in advance of anything attempted elsewhere. It is very satisfactory to observe this eulogium of the valuable work done by polytechnics and kindred institutions, which undoubtedly confer inestimable benefits upon the working classes and others who have no time for study during the day.

"Owners" under the London Building Act. THE case of *Ori v. Payton* (*Times*, December 3) refers to the London Building Act, 1894, and although the actual decision turned upon the question of costs, an important point seems incidentally to have been decided. The plaintiff and defendant at an auction had become lessees from the County Council of two adjoining lots held under building conditions, upon the terms that leases should

be granted and that until the granting of the said leases the lessees should be deemed to be tenants at will, and the conditions also gave the lessees power to excavate for the purpose of the building. The plaintiff had erected a party wall on the line of junction between the two plots, having served the defendant with notice under the London Building Act, 1894. The action was brought by the plaintiff claiming that the defendant had trespassed upon the party wall, and was utilising it for his own purposes. During the pendency of the action an arbitration had been held, and the arbitrator had awarded the plaintiff a sum as the defendant's share of erecting the wall, which sum had been paid by the defendant, but on a motion as to who should pay the costs of the proceedings, the rights of the parties had to be considered. It was contended that the plaintiff was an "owner" within the meaning of section 5, sub-section 29 of the London Building Act, 1894, "a person in possession or receipt either of the whole or any part of the rents and profits of any land or tenement or in the occupation of any land or tenement otherwise than as a tenant from year to year or any less term, or as a tenant at will." It was argued that the plaintiff was not a tenant at will, owing to his rights under the conditions which enabled him to take away sand and gravel and commit legal "waste," but the Court dismissed these inferences, and held that the plaintiff had specifically agreed to be a tenant at will, and that therefore he had no rights as "owner" under the London Building Act, and he was condemned in costs. It will be remembered that it has already been decided in the case in *re Stone v. Hastie* (see our note "Rights over Party Walls," the *Builder*, October 31, 1903), that the provisions of the London Building Act charging an adjoining owner with a proportion of expenses in respect of extra user of a party wall only apply to the owner of the premises.

Sea Erosion in North Wales.

THE storms which caused so much injury to the Dee embankment, between Holywell and Mostyn, were also responsible for serious damage in the neighbourhood of Rhyll, about ten miles further along the coast. It appears that a portion of the promenade extension has been undermined by the action of the sea, but fortunately this can be made good at a comparatively small cost. A more serious condition is evidenced at the eastern end of the town, and it seems not improbable that a few more storms might render the lower parts of Rhyll liable to inundation. In the direction of Prestatyn—a village about four miles to the east of Rhyll—the sea has encroached for a distance of quite 140 yds. within the last thirty-three years, the rate since 1898 having been between 6 and 7 yds. per annum. Unless effective measures are taken without delay it is morally certain that the town will suffer considerably. However, as elsewhere, the local authorities appear to think the question is too large for individual action, and in the present juncture the only decision made is that the London and North-Western Railway Company shall be invited to join with the Urban District Council in the construction of defensive works. On this particular part of the

coast the railway line is in far less danger than the town of Rhyll, and it is scarcely reasonable to expect the company—which was established more for the earning of dividends than as a quasi-statutory department of public works—to expend capital in protecting the property of the ratepayers. Unless the Urban District Council want to see a portion of the town swamped, or perhaps washed away, they had better face the situation in a self-reliant spirit, and begin protective work before more damage is done.

The Embankment Roadway.

FOR years past the wretched condition of the roadway of the Victoria Embankment has been a reproach to London. Although comparatively little used, the macadam surface has to be re-made every year at great cost to the ratepayers, and very soon regains its normal character, one of the worst roadways in London. Being in a central position, this thoroughfare necessarily attracts more attention than other highways of similar construction in outlying districts. It serves, however, to point the moral that the modern perversion of Macadam's system is quite unsuitable for urban traffic. The essential feature of the true macadam roadway is that the small angular fragments of stone used become compacted, without other material, into a mass nearly impenetrable by water and wearing evenly throughout. In the present day the size of 1-in. cubical stone fragments recommended by Macadam has been increased up to 2½ in. or more, with the result that a so-called binding material is necessary for filling up the interstices. This "binding material" is really embryonic mud or dust, while the friction of the large stones or gravel against another furnishes the material for further supplies of mud or dust. Moreover, the effect of unnecessarily large stones in some parts of a roadway is to cause bumping, which leads to general disorganisation of the surface. Unless the road authorities of the London County Council are prepared to conform with the essential requirement of Macadam's system, it would be far better to pave the Victoria Embankment with wood or asphalt, and thus to get rid of standing reflection upon their capacity.

The Pennsylvania Railroad and New York.

AN engineering project of New York of far greater magnitude than the Rapid Transit Subway is now being executed by the Pennsylvania Railroad Company. At present the terminus of this railway is the premier line of the United States in New Jersey, and passengers can only reach New York by means of ferry boats crossing the Hudson River. The inconvenience of this method of access has been felt for a long time, and thirty years ago an abortive attempt was made to connect the two shores of New York Harbour by means of a tunnel. In March last the previously abandoned works were completed by the Pennsylvania Railroad Company, and a second tunnel is now in course of construction to provide adequate accommodation for traffic. The method of tunnelling adopted is to form a hydraulic shield through the silt forming the bed of the river, and so great is the power applied that the soft material can be pushed aside without involv-

its entrance to, and removal from, the interior of the tube. When the Hudson River tunnels have been finished, the railway company will be in a position to establish a great terminus in the centre of New York City. This station, with an area of 27 acres, will be situated about 50 ft. below the street level, and a part of the site above it will be occupied by the new United States Post Office buildings. A second pair of tunnels will be carried below the East River on the opposite side of Manhattan Island, coming to the surface at Long Island City. By the completion of this undertaking connexion will be afforded between the Pennsylvania and the New York, New Haven, and Hartford Railways, thus making direct communication possible between New England and the West or South, and effecting a most marked improvement in the traffic conditions of New York itself. Moreover, it is suggested that a further result may be the establishment of a harbour for Transatlantic steamers on the Long Island shore, thereby rendering unnecessary the present tedious navigation of the channel past Sandy Hook and up New York Bay. Thus some place near Long Island city may ultimately become to New York what Tilbury is to London.

Magnetic Testing. An important paper on magnetic testing was read to the Institution of Electrical Engineers this week by Mr. G. F. C. Searle, lecturer in physics to Cambridge University. This paper will be a great help to all who have to test the magnetic qualities of iron. Many of the difficulties which are met with in practical work have been cleared up. It was well known, for example, that the results of magnetic tests depended to a considerable extent on the previous magnetic history of the iron. So far as we know, however, Mr. Searle is the first to publish detailed tests showing exactly how the magnetic properties of the iron depend on the previous magnetising forces to which it has been subjected. Mr. Albert Campbell, of the National Physical Laboratory, had anticipated some of Mr. Searle's discoveries, and it is very satisfactory to find in an appendix to the paper that their results are in such close agreement. It is only with virgin iron that very anomalous results are obtained. If the iron be magnetised and demagnetised about fifty times, then perfectly consistent results are obtained, and these results are those which are required in practice. The author found that any mechanical operation considerably affected the magnetic qualities of the iron. He also found that strips cut from the same sheet of transformer iron differed considerably amongst themselves. In order to avoid the very considerable labour involved in winding coils of insulated wire on the samples of iron which have to be tested, the author has devised a magnetic testing square which ought to prove of great use to electricians. We were particularly struck by the method of applying corrections for the demagnetising effects produced by the magnetic lines which leak from the samples under test. Such a correction could only have been applied by a physicist who was also in the

front rank of mathematicians. The paper is practically non-mathematical, and so can be easily understood by any electrician. The Institution of Electrical Engineers is to be congratulated on its new departure of welcoming papers by non-members, and Mr. Searle's paper will considerably add to the value of this year's *Journal*.

The Leicester Gallery. At the Leicester Gallery is a collection of beautiful water-colour drawings by Mr. W. L. Wyllie, under the title "The Highway of many nations," signifying (as may he supposed) the Thames, long a favourite subject with Mr. Wyllie. In such a set of drawings the opportunity is given for combining landscape effect with the learned and satisfactory treatment of shipping in which Mr. Wyllie has no rival except Mr. Somerscales. One or two of the drawings, notably "The Warspite and Arethusa Training ships" (29), are admirable studies of old men-of-war. In most of the drawings, however, the ships are only an addition to a general landscape effect. How well Mr. Wyllie paints water, river or sea, we all know; but in this exhibition we were also attracted by another point of excellence, viz., the great beauty, variety, and truthfulness of the sky treatment in the various drawings, which is quite as worth note as any other quality in the drawings, and has perhaps been rather overlooked on account of the artist's special reputation as a marine painter. Among the works exhibited we may specially mention "Limehouse, a bit of vanishing London" (10), showing the curious tumble-down buildings along the wharf; "Rotherhithe" (15); "Greenhithe—brisk east wind" (32), a capital sea; "A Tide Rip in the Lower Hope" (47); "Barge Race on the Thames" (52); "St. Mary's Marsh" (62), with a group of barges in the foreground; and "Sea Reach" (68). The exhibition includes also two large architectural subjects, "The Houses of Parliament" (belonging to Sir J. Wolfe Barry) and "St. Paul's from Blackfriars Bridge" (40). The columns under the dome are a little too thin in proportion, but in general this is one of the best representations of St. Paul's from a painter that we have seen—well-balanced, in true perspective, and the character and outline of the western towers well preserved. In another room at the same gallery is a collection of XVIIIth century "Humorous Mezzotints," mostly of a very coarse species of humour and of little artistic value, though they are of interest as showing what sort of thing served to amuse English people one hundred and fifty years ago.

Sketches at Home and Abroad. UNDER this title Mrs. Mary F. Raphael exhibits at Mr. Maclean's gallery a pleasing collection of small oil-paintings of scenery, chiefly at Montreuil and the adjoining country. In a broad and sketchy style these show a great deal of talent and fine landscape effect. "From the Bastions, Montreuil-sur-mer," with its masses of white cumulus clouds on the horizon, is particularly effective; and there are a number of other small

landscape studies from the same district which have much merit. A larger and more finished work, "A Church-yard Idyll," also claims attention.

TRAMWAY RUNNING POWERS.

IN a paper read last week before the Tramways and Light Railways Association Mr. Sellon presented some interesting facts relative to running powers over tramway systems. It should be borne in mind that "running powers" differ from "facilities," in the respect that the former provide for the cars of one authority to run over the lines of another authority, while the latter merely amount to an arrangement for the issue of through tickets with a change from one car to another at the point of junction. The principles regulating running powers are fairly established in connexion with railway legislation, and, although numerous examples can be quoted of tramway running powers in London as well as in various provincial urban districts, there is still a very strong prejudice against facilities which are so obviously to the advantage of the travelling public. As claimed by Mr. Sellon, the elementary principles of English highway law apply to tramway politics in the respect that a tramway is an improvement of the highway on which it is laid, increasing its capacity, cheapening its use, and saving the expenditure of time and strength by the traveller. Consequently, those to whom Parliament entrusts tramway powers hold substantially the same position towards the public as highway authorities, so far as their powers extend, and they are equally obliged to afford all travellers the maximum facilities within their capacity. The public and local advantages of a tramway should not be limited by unreasonable conduct due to sentimental, selfish, or capricious motives. An example of the unreasonable objections frequently entertained is to be found in the petition seriously presented to Parliament in the session of 1904 against the request of the Tyneside Company for running powers over the tramways of the Newcastle Corporation. The chief plea then put forward was, that the proposals in the company's Bill were objectionable, retrograde, and against the public interest by reason, among other things, of their interference with the principles of municipal self-government. Fortunately the Tyneside-Newcastle running powers were obtained, and the result has been a large increase of tramway traffic. To illustrate the disastrous effect of an interrupted service the Edinburgh and Leith tramway systems may be instanced. The break between these occurred at Pilrig when the Edinburgh section of the line was converted to cable traction, and the consequent loss has been estimated at fully 6,000*l.* per annum, equivalent in this case to 4,000*l.* per mile per annum. The foregoing are two instances quoted by Mr. Sellon, whose paper ought to have the useful effect of convincing tramway authorities that it is most desirable to co-operate one with another with the object of connecting important districts by through services free from irritating and unnecessary obstructions.

LETTER FROM PARIS.

DURING the Christmas and New Year's festivities at Paris the streets always become a kind of public fair, the Boulevards from the Madeleine to the Bastille especially, and the dealers vend their wares in temporary shops which form a great disfigurement to the streets. It was to provide for something better this year that the competition, already referred to in our pages, has been organised in one of the rooms of the offices of *Le Bâtimeur*, where designs are assembled which are intended to suggest a better and more artistic type of temporary structure for these occasions. The "Société du Nouveau Paris," which originated the idea, has in preparation a plan also for the transformation of the Palais Royal, which the inhabitants of the quarter have so long called for. The scheme includes the opening up of the Palace, if not on its four faces, at all events on its north and south sides. The gardens, which are nearly as they were a century ago, it is proposed to replant. In the quarter thus transformed it is thought that sites might be found for public institutions, etc., on the ground left vacant by the gradual and continuous emigration of business establishments from

this quarter. It may even afford an opportunity for relieving the Pavillon de Flore at the Tuileries of the offices of the Colonial Office, the presence of which in that place is a danger to the treasures of the Louvre.

A conflict has arisen between the Société Centrale des Architectes and the Municipality of Paris on the subject of the ancient Hôtel de Ville. It has been proposed to put a tablet commemorating the old building, and the Société Centrale prepared one in which, following the conclusions of M. Marius Vachon, they worded the inscription to the effect that the Hôtel de Ville of Boccador was demolished and replaced by that of Pierre Chambiges. The experts of the "Comité des Inscriptions Parisiennes" maintain, on the contrary, that Chambiges merely continued the work of Boccador, finished in 1628 by Guillaum. The question is rather futile, since in the conflagration of the building under the Commune all evidence that could be gathered from the work itself was destroyed. M. Ballu and Deperthes reproduced faithfully the old façade, which was at all events a charming piece of Renaissance architecture; and that is really all that can be said with certainty.

This same Committee of inscriptions has just affixed a tablet to the last city residence of Bossuet, a house now No. 46, Rue Ste. Anne.

At the Petit Palais last week was inaugurated the collection of works by the sculptor and ceramic artist Carriès, offered to the city of Paris by M. Haenschel. It consists of more than 300 works of great interest; among them are portrait busts of a large and powerful style, and a monumental gateway commissioned for her château, by the Princess de Montéaliard, and ornamented with quaint sculptures; there are also some curious experiments in ceramic work with metallic incrustations, etc. It is a remarkable collection of works to have been left by an artist who was cut off prematurely in the height of his career.

The Socialists of the Municipal Council, who are an even stronger and more intolerant body than are to be found in the State departments, are scandalised at the prominence of the great church on the hill of Montmartre, and have been actually demanding either that it should be demolished or that it should be turned to a secular use. It is not likely, however, that the necessary alteration in the law will be made; and failing that, they demand that there should be erected opposite to the church the statue of the Chevalier de la Barre, condemned and executed as a heretic under Louis XV. If the Government authorise this public homage, it is probable that they will unearth from the Magasins de Beaux-Arts at Auteuil a very poor statue of this victim of religious intolerance, by Emile Hébert, a sculptor of some talent, but whose work hardly merits this kind of prominence.

It does not appear that M. Besnard has any chance of the election to the post of Director of the Villa Medici; and that is all that one can be certain of at present. MM. Saint-Saëns and Barrias having both withdrawn their candidature, a new list has been presented, in which the name of M. Daumet, the eminent architect, occupies a prominent position. Whoever is ultimately appointed, it is understood that the new appointment is to be the occasion of a good many reforms in the administration of the Académie de France at Rome.

A committee has purchased Rodin's rather over-rated statue "Le Penseur," with the intention of presenting it to the City of Paris, the authorities of which, however, are by no means anxious for it and were not prepared with any site for it. However, it appears that the gift has now been accepted and the Place du Panthéon fixed upon as the site; the statue to be raised on a pedestal so as to cause it to stand out against the great bronze door of the Panthéon as a background. It is needless to add that there is little harmony of style between the statue and Soufflot's building, but that is a matter of little consequence to the Rodin-worshippers, who are still lamenting that the too-celebrated statue (?) of Balzac is not decorating some public place in Paris.

The lovers of Impressionism, which is now called "Art Moderne," will be gratified by the fact that the Government has authorised the exhibition at the Luxembourg of a collection of the works of Toulouse-Lautrec, to whose eccentric and disconcerting work attention has been drawn by the recently exhibited examples at Salon d'Automne.

The death is announced of the sculptor

Maurice Ferrary, a Professor at the Ecole des Beaux-Arts. This talented artist was a pupil of Cavellier. In 1875 he exhibited a statue of Narcissus at the Salon. In 1882 he obtained the Prix de Rome; he had medals at the Salons of 1879, 1886, and 1889, and a gold medal in the 1900 exhibition. At this year's Salon he exhibited a bronze statuette, *à étre perdue*, of St. Michael.

The death is also announced, at the age of 88, of Mr. C. Augustin Salleron, a member of the Société Centrale des Architectes, an architect of a good many buildings in Paris, of which the most important is the Mairie of the Twentieth arrondissement, in the Place Gambetta.

NOTES AND SKETCHES IN SOUTHERN ITALY.—V.

BARÌ.

BARÌ is an ancient city which has continued prosperous in modern times, and is the capital of a province and the most important commercial town in Apulia. Its 60,000 inhabitants live partly in the old town, which has narrow, tortuous streets and is very thickly populated, and partly in the new town, which is laid out in uninteresting quadrangles, in which the one object of interest is the Museum, housed in the Ateneo. It was a Greek colony, called by Strabo "Bapiov," by Pliny "Barium." Under Nero it was a Roman municipium. There is a tradition that the name comes from a pirate—Barione—who took the city at a very early date and destroyed it to build it larger. When excavations were being made for the later walls an ancient tumulus was found, which contained gigantic bones and military trappings with bronze medals bearing the ancient crest of the city—a Cupid shooting—which was thought to be Barione's tomb. It formed part of the Gothic kingdom, and was retaken by the Byzantines with the rest of the peninsula. It changed hands frequently, Saracens and Lombards disputing possession of it during the early mediæval period. In 690 it was taken by

Romuald Duke of Beneventum with Brindisi and Taranto, but in 726 Gregory II's mediation obtained its restoration. In 802 it was again taken by the Prince of Beneventum Sicard; and twenty-eight years later the Saracens relieved him of its government. St. Michael III. regained it for the Byzantine and its possession was contended for between Lombard and Greek and Greek and Saracen till the Norman grasped it with tenacious hand, though the Venetians held it for a short time after 1002, when they wrested it from the Saracens. In 1046 Count Humfred negotiated for it, and Robert Guiscard did the same in 1064, but negotiation proving fruitless, besieged it by land and water for three years, taking it in April, 1071. He was succeeded by his son Boemund, and it then became the uncle Roger's. Robert the Angevin gave it to his favourite, Amelio del Balzo, of the Provençal house of Les Baux, in 1324, and it remained a dukedom in the hands of his descendants till the middle of the XVth century. The Sforzas then had it, but soon gave it away, and in 1558 it was united with the kingdom of Naples.

The greatest misfortune which Bari has suffered was its destruction by William the Bastard in 1156 as a penalty for revolt, when it is recorded that the only building left standing was the Church of St. Nicholas. It then lay waste for eleven years. Earthquakes damaged the city seriously in 1254, 1267, and 1727. The earliest notice of a Bishop of Bari occurs in the VIIth century. It was, however, of sufficient importance for Urban II. to hold council or synod there in 1098; the Antipope Anacletus held one also in 1131, and other met under the presidency of the Archbishop Antonio Pulco (in 1564) and Ascanio Gesuald Patriarch of Constantinople (in 1628).

The site of the ancient walls towards the land is now occupied by tree-planted piazzas, at the angle of which stands the Prefecture. Opposite is the Teatro Piccini, and towards the sea is a garden in which is a statue of the compose

Fig. 1. East Window, Cathedral, Bari.

Fig. 2. Crypt of S. Nicola, Bari.

the rival of Gluck, who was a native of the city.

The strongest influence in the development of the various forms of art in Apulia was monastic. The Basilian monks, of whom there were as many as 1,000 in this part of Italy in 933, of course spread Byzantine feeling; and the Benedictines, who came a little later, continued the connexion with Constantinople as far as the art tradition went, though in other matters representing Latin influence, while also employing workmen from the north of Italy. The church at Bari was indeed tightly bound to Constantinople, the Catapan's residence there strengthening the political bonds. At Conversano there was a monastery in the VIIIth century, as also at Monopoli and Trani. The Benedictines were certainly established in Bari in 978, but there are no remains of so early a date. They cultivated good relations with the Greek governors, and prospered exceedingly. Mr. Carabellse says justly:—"They were agriculturists and artisans, artists, writers, politicians, and thinkers, like a new republic within the circle of which rich and poor, noble and plebeian entered without class distinction, bringing a precious dowry of power and activity into every relation of life and re-establishing civilisation and cosmopolitan thought. The land in which their house rose became a centre of action, extending itself to those surrounding with a wider circumference every day." They attached themselves to the Normans when they gained power, and thus became still more rich and powerful. When the body of S. Nicholas of Myra was brought to Bari in 1087, the relics were delivered over to the custody of the Benedictine Abbot Elias. The Order already possessed two churches dedicated to the saint, one in Bari and the other on the town of the port of Monopoli, rebuilt about 1054 by a Barese craftsman—Mele di Martino.

In documents of about this period other names of craftsmen appear:—"Lupo, magister, f. Ermeffid; Grisante, f. Guisoni; Mel, ferrario, f. Natali; Mel, patitaro, f. Forzalis"; and that of "proto magistro Melo di Simeone da Bari," who in 1073 built the church of S. Nicola da Monte. He also superintended the work which was going on at the cathedral which was commenced by Archbishop Bisanzio in 1027. From a Greek document of 1032, we know that it was originally dedicated to the Virgin Deipara of Mettizza, and that it had the baptistery separate from the church—a Byzantine detail, though common also to Romanesque churches. The crypt was commenced in 1034. The same workmen were employed (Byzantines) who had built the churches of S. Saviour and S. Prisco in Bari, neither of which exist now. Bisanzio was succeeded two years later by Nicola (1035-61), a true artist, who belonged to the most powerful family in the city; he was elected by the vote of the people, and continued the work at the cathedral, but the eastern façade is due to Archbishops Angelo and Rainaldo, the latter of whom built one of the flanking towers, the other being of the period of Archbishop Giovanni, who held office between the two. The apse is round, but the screen wall between the two flanking towers hides its shape. In this wall is the fine window illustrated, Fig. 1, an arrangement frequently met with in the neighbourhood. Over the crossing is a beautiful octagonal cupola, with a finely-carved frieze crowning an arcade on corbels which are mostly heads of men and animals. This was built in 1178 with the transepts, one of which has a splendid rose window; the carving is like the east window, and makes its date certain. The roof was originally flat, which is proved by the disregard of the slope of the present one for the little columns round the cupola, which take the place of

corbels at the angles, and at the second arch on each side. Some of the XIIIth century roof timbers have been preserved, still bearing their coloured decoration. The building was not completed in 1245. In that year Angelo da Cicoria was superintendent. There is a central nave and aisles with triforium, and the western façade is divided by two plaster strips answering to the nave and aisles in the Lombard fashion. There is a fine cornice to the façade, and a richly-carved hood mould follows the curve of the round window, and has figures of animals at the ends. The transepts and towers have double arcades, two smaller arches beneath a larger one, and the aisles are also arcaded, but with single arches. The nave has clearstory windows. The pilasters and arches beneath the matroneum or triforium simply butt against the transept walls, a proof that they are later; and the cornice also shows the original width of the façade. The arches were filled up about 1300 to make side chapels. None of this upper church can be older than 1156, the date of the destruction of the city by William the Bad. The sacristy is on the foundations of the ancient baptistery, and a wall has been found 9 ft. from the front wall of the transepts of similar construction to buildings in Steilly, with marble fragments carved with geometric interlacings and Arabic letters, which suggests the existence of a mosque here during the domination of the Saracens in the IXth century, who have left other relics, such as the tomb of a Sultan, preserved in the Museum. The floor of the cathedral is inlaid, and the central feature reproduces the design of the rose window of the principal façade. It is XIIIth century work, in which serpentine, porphyry, antique green, and red marbles are made use of. Of the ancient altars which were made by Romuald, archbishop in 1292, only one remains. The high altar was consecrated February 6, 1233, by Bernardo

Costa, Archbishop of Palermo, formerly of Bari. Frederick II. was probably present, as he was certainly at Bari eleven days before. It was made by Anseramo of Trani, but only fragments of it remain worked up by Alfano of Termoli in the XVth century. The ciborium is of the usual type, like that of S. Lorenzo fuori at Rome. It was consecrated in 1428 by Archbishop Francesco de Ajello. Some of the caps and the eagle from the ambo are preserved in the Museum. In 1745 great alterations were made, most evident in the interior and the western facade. At this time the lions from the west door were removed to the rocco courtyard of the archbishop's palace, where two stand upright by the stable door; two others crouch holding prey in their claws. The lower church or crypt has three rows of eight columns to support the vaulting and two at the arch of the apse. It was finished about 1178, and contains the relics of Angelarius, Bishop of Canosa, 845-68, in a marble sarcophagus, which were placed there in 1092. Those of S. Sabinus are also here, brought from Canosa in 1092 by Archbishop Elias. In the treasury is a very early Exultet roll (of the IXth century). Over the altar of S. Rocco is a picture by Tintoret, and opposite to it one by Paolo Veronese.

The church of S. Nicola, with its appurtenances, occupies the site of the dwelling of the Catapan, the imperial pretorian palace. There was a small Greek church dedicated to the saint at the beginning of the XIth century, which was almost attached to the palace, and had, in common with it, the great courtyard where the judges and imperial counts rendered justice and received public oaths. It is named in a document of 1048. When the relics of S. Nicholas were brought to Bari in 1087 Roger, son of Robert Guiscard, ceded the palace area to the Baresi, so that the sanctuary was free from episcopal jurisdiction, and the Benedictines immediately commenced to build a great church for them of which Abbot Elias was probably the architect. A large part of the material is Byzantine and Roman. In two years it was sufficiently finished for Urban II. to consecrate

it. He was holding a synod at Melfi, and, on his way to Brindisi to consecrate the new cathedral there, stopped at Bari and on September 30, 1089, installed the abbot in the new dignity. The next day the bones of S. Nicholas were laid in the crypt, which must be the part which had been completed. According to the anonymous chronicler of Bari, the synod of October, 1098, was held in the upper church, and the bishop's throne, now preserved in the treasury, was made by Abbot Elias for Pope Urban II. to occupy on that occasion; but it was not consecrated till 1197, when Conrad of Hildeheim, imperial chancellor to Henry VI., officiated. Some say that it was finished by King Roger in 1139, who was crowned here in 1131 with an iron crown by the Antipope Anacletus II., according to an inscription of the XVIIth century at the entrance, which, however, makes mistakes about two other coronations named in it. The principal door of the facade was made by Ansaldo and Taddeo, "maestri comacini," and the equally fine north door, called "of the lions," by a Greek or Apulian named Basilio in 1105. Another door recalls the design of the inner portion of that of S. Maria in Piazza, Ancona, with twisted sections and bosses between. The master mason's name was Angelo da Fiumarello. An inscription gives the name of another mason "Magister Blasius." Abbot Elias is buried in a XIIIth century sarcophagus near the southern flight of steps to the crypt. The upper church is mainly the work of his successor, Eustasius (1105-23). The crypt (Fig. 2) has three rows of eight columns each and two in the apse; twenty-two pilasters in the walls receive the arches of the vaulting which they support. There is a legend that one of the columns threatened to fall during the construction, and that S. Nicholas appeared and kept it upright. It is now marked by an iron cage for the veneration of the faithful and to protect it from relic-hunters. The columns are most of them antique, as are many of the caps, above which are enormous abaci, but there are no bases. The altar is of silver. One was made in the XIVth century for the Servian king Urosius by Ruggiero dall'

Invidia and Roberto da Barletta, but melted down in the XVIIth century by two Neapolitan silversmiths to afford material for the present one. From the tomb a fluid exudes known as "Manna di Bari" and thought to be miraculous.

The upper church (Fig. 3) has a nave and aisles, with a flat ceiling over the nave, carved, painted, and gilded, made by gifts of the Baresi, and vaulted aisles, above which is the matroneum. The nave arcade has double columns as at Trani in the three western bays, but the inner one seems an afterthought connected with the cross arches which were added by Francesco Sforza to strengthen the structure against earthquake. His arms are on the first one. The choir screen is original as far as its construction goes, but in the XVIIth century details of that period were added. The capitals resemble those at Cefalù. On one side of the entrance to the choir is a seat for the king, as at Monreale and Cefalù. The high altar was erected by Abbot Eustasius, as an inscription on the step says. The ciborium above it has the colonnettes above the architrave and the octagonal top which are seen at the cathedral. If this is contemporary with the altar (as is believed), it is the earliest example of the kind, that at S. Lorenzo fuori, Rome, being dated 1148. On the front of the architrave is a metal plate representing King Roger crowned by S. Nicholas, which is said by some to be niello in various colours (as in the bronze doors of the period) and by others to be enamel. M. Bertaux claims it as Limoges work of the middle of the XIIth century. The costume of the king is much like that of the mosaic at La Martorana, Palermo, but I was not able to examine it closely owing to the numbers of tapers placed all round the upper part of the ciborium in preparation for Easter. Behind it is the tomb of Bona Sforza, Queen of Sigismund I. of Poland and last Duchess of Bari, who died in 1558, and a small portion of the mosaic pavement remains. In a chapel to the right, the chapel of S. Martin, is a Madonna with saints by Bartolomeo Vivarini (1476), a lunette is above with Christ and SS. Nicholas and Francis. The north aisle contains the tomb-

Fig. 3. Upper Church, S. Nicola, Bari.

stone of Robert, Count of Bari, protonotary of Charles of Anjou, who conducted the judicial murder of Conradin, the last of the Hohenstaufen, and was therefore slain on the spot by an indignant noble. The capitals of the columns of the matroneum (which resembles that at Trani) are many of them finely carved. Some columns have bases, some are without them, and some have been lengthened by the addition of small sections. At the end on the south a little two-light window looks into the transept. The base of the central colonnette is formed of an Early Byzantine cap turned upside down. The façade is divided by pilaster strips in the Lombard manner, but resting on columns at the bottom, and the walls have the usual arcades supported on corbels. The central door is flanked by columns, which support a frieze; above it is another arch with a figure of the patron saint in the tympanum and a pedimental termination. The arcading springs from this and the pilaster strips. Above the side doors is a similar arch, with two smaller beneath springing from a corbel above the centre of the door. The central gable has a moulded circular sinking at the top, and below that are three two-light windows, one above and two below, and the aisle walls were also pierced by smaller similar windows, now built up, which hug the pilaster strips in a curious manner. Encausted in the walls are tombstones of noble families of Bari and of Byzantine pilgrims who died here. The treasury contains an illuminated breviary of Charles II. of Anjou and his sceptre, and an iron crown said to have been made at Bari in 1131 for King Roger; also many pieces of goldsmiths' work, and Abbot Elias' marble seat, which bears on its sides the following inscription:—

"Inclitus atque bonus sedet hac in sede patrouus
Presul Barinus helias et Cansinus."

The seat is supported on two crouching figures. The central one has a pointed cap, and supports the seat with his shoulder and keeps himself up with a club. At the back it rests on octagonal pillars and on a lion which holds a man's head in his claws. The footstool has two crouching lions. The ornament of the side has suffered a good deal, the panels are pierced. On the front are different animals in crouching figures set diagonally. The crouching figures occur continually in architectural sculpture of the period; this is, perhaps, the earliest example. The entrances to the courtyard have pointed arches and are mediæval. The principal one has a figure of S. Nicholas above, with shields of Angevin arms at each side. Below are those of Raimondello Orsini (a rose and three bars), who died in 1405, and a blank shield. It was probably built under Giovanni I. of Anjou.

Close by is the little church of S. Gregorio, said to be the oldest church in the city. The façade has a central door, then three round-headed windows, each surrounded by a band of ornament and with pierced tympana; above them is a large pointed arch, within which is a square-headed opening; below this opening is a little arcade of four arches on colonnettes in couples with pierced tympana, and an ornamented band which returns down a gap in the middle. Four bracket corbels project on each side, and six more in pyramidal form round the arch, three on one side and two on the other with one at the summit; they are carved with heads and beasts. The whole is enclosed between two pilaster strips with square, moulded tops and a gable. At each side is one little window, and then similar pilaster strips to the height of the roof slope of the aisles. The nave arcade has stilted, round arches, two groups of three on two columns, with a pier between and half columns at the end of each group. There are three shallow apses, of which the centre one is larger, and a clearstory of three little windows on each side at unequal intervals. The pierced slabs of the windows (like those in the cathedral transepts) and the general conception show Oriental influence, though several of the characteristic Apulian details appear here thus early. The church of S. Marco was founded by the Venetians in the XIIIth century.

King Roger built a castle at Bari in 1131, employing Mussulman workmen. It was on the site of an older work, and one tower which still exists was raised on an earlier wall. The north-east angle is the oldest part, and is probably Romano-Greek, Sig. Avena says. It is built of large local stones without cement, and was restored by Frederick II. between 1233 and 1240. The archivolt of the west door and some caps show excellent carving. The eagle on it shows that it is of Frederick's time. Just

beyond this door is a portico, on one of the abaci of which the name of Mele da Stigliano appears, while another is signed by Finarro da Canosa. Three large two-light windows on the north are Angevin work. The fortifications were strengthened by Isabel of Aragon and her daughter Bona, and bastions were added by the Bourbons. It is now a prison and caserne.

In the Piazza Mercantile is a much-worn lion on a kind of seat pedestal with the inscription "Custos justitiæ" on its collar. It was the heraldic cognisance of Bari. In S. Scolastica is a Romanesque fountain inscribed "Ursus laborator hujus fontis." In the narrow and winding streets one every now and then comes across a balcony of wrought iron, late in style, but effective, or a delicate two-light window with slender shaft, and the little shops are generally delightfully picturesque, niched into queer corners, or with much of their wares displayed outside in the street. The Museum contains a large collection of South Italian vases, a beautiful silver dish with heads in high relief, found at Taranto, architectural fragments of various dates, and photographs of interesting buildings in the surrounding country, the "Terra di Bari," which may be of assistance to the traveller who has not planned his tour completely as indicating places desirable to visit.

F. H. J.

[In No. 2 of this series it was mentioned that the cope stolen from Ascoli had been discovered in the collection of Mr. J. Pierpont Morgan. It is with great pleasure that I observe that Mr. Pierpont Morgan, with a graceful generosity, has presented it to the Italian Government.]

THE INTERNATIONAL GAS EXHIBITION.

II.—HEAT AND POWER.

Industrial Uses of Gas.—The most novel exhibit in the exhibition at Earl's Court is a naked gas flame burning continuously while completely submerged in water. The air required for combustion is mixed with the gas before the gas passes to the burner, and the products of combustion rise through the water with a bubbling noise. Explosion, or "back-firing," of the inflammable mixture of gas and air is prevented by keeping the mixture under a sufficiently high pressure (1 lb. to the sq. inch), and by using a specially constructed burner. The fact that an unprotected gas flame can be maintained under water was announced some years ago by a foreign experimentalist, we forget by whom, but this is the first occasion upon which we have seen the discovery put to industrial use. The exhibit is made by the Smethurst Furnace and Ore Treatment Syndicate, Limited, who have applied it for evaporation and other purposes. The same exhibitors also have on view a furnace heated to an intensely high temperature by a mixture of gas and air under high pressure.

As manufacturers of gas-consuming workshop and general industrial appliances the firm of Fletcher, Russell, & Company stand alone, and the exhibit of the firm in this class of goods easily surpasses that of any other exhibitor. Here may be seen crucible furnaces, muffle furnaces, ladle furnaces, soldering-iron heaters, blow-pipes, glue-pots, smoothing irons, coffee-roasters, and a number of other utensils dependent upon gas as a source of heat. The ease with which high and low temperatures may be attained, and maintained without variation for any length of time, renders gas an ideal fuel for the heating of drying ovens and for many other industrial purposes.

Water Heaters.—All the principal manufacturers of gas water-heaters have exhibits, and they appear to have almost attained perfection in the art of rapidly transmitting heat from a gas flame to water without undue waste of heat. Boilers and water-heaters of many forms may be seen, but bath water-heaters are the most prominent of the exhibits of this class. There is now no difficulty in obtaining a bath water-heater which will heat water rapidly, at small cost, and without emitting an obnoxious odour. The best exhibits bear so close a resemblance to one another that it would be useless to attempt to discriminate between them so far as their general utility is concerned. Gas water-heaters of good make may be safely used in bath-rooms if the products of combustion are led into a flue which has a constant up-draught even when the water-heater is not in use, and if they do not emit an offensive odour

when in use. Emission of a stink is a danger signal. In selecting a water-beater care should be taken to choose one in which the flame does not remain in contact with a mass of cold metal, for such contact reduces the temperature of the gas flame, and results in the generation of the poisonous products of imperfect combustion.

A novelty in the form of a tubular boiler fitted on top of a gas cooker, and connected with an overhead water tank, is shown by J. Nutting. The boiler is in the form of a grid constructed of V-shaped tubes. Other boilers are placed at the bottom of the cooker. The object of these boilers is to utilise the heat which is usually lost when the cooker is at work, the water from the boilers being employed for washing crockery, etc. It is stated that these boilers are being fitted to the cookers employed on the Great Western corridor trains.

Excellent forms of water-heaters are shown by Ewart & Son, Ltd.; Maughan's Patent Geyser Co., Ltd.; Fenlon & Son; Richmond Gas Stove and Meter Co., Ltd.; and Fletcher, Russell, & Co., Ltd. A foreign exhibitor of water-heaters is Carl Flüge, of Hamburg.

Cookers.—From the smallest of grid burners to the mammoth cookers in which a tall man may stand upright, gas cooking appliances of all sizes and designs may be seen at the exhibition, but there are few striking novelties. The latest invention in cookers is probably the "Harris" grill, exhibited by A. E. Harris. This is a little oven which instead of having one row of small flames along each side of the bottom of the oven, has along its sides, from top to bottom, tier upon tier of small gas jets. The result is that food can be cooked in this grill much more rapidly than in an ordinary cooker. One would naturally expect that meat cooked in this way would be burnt on the outer surface and nearly raw in the centre. Impartial judges have, however, tasted food cooked in the Harris griller and declared it to be satisfactorily cooked throughout. J. Nutting exhibits a cooker in which the waste heat is utilised to heat water, but reference to this has been made under the head of water-heaters. Among the exhibitors of cookers are Cannon Iron Foundries, Ltd.; Carron Co.; the Davis Gas Stove Co., Ltd.; Fletcher, Russell, & Co., Ltd.; Imperial Stove Co.; R. & A. Main, Ltd.; Planet Foundry Co., Ltd.; Richmond Gas Stove and Meter Co., Ltd.; Wm. Sugg & Co., Ltd.; Wilsons & Mathiesons, Ltd.; and the Wright & Butler Lamp Manufacturing Co., Ltd.

Gas Fires and Stoves.—Although a great variety of these are exhibited they are too familiar to the general public to require description. A general improvement has of late years taken place in the design of many of these appliances, and in the form and composition of the ball "fuel" used. In our opinion the fires in which ball fuel is used are decidedly preferable to those provided with asbestos in strips or in bundles of short fibres. In selecting an "atmospheric" gas fire it is well to remember that the air-holes gradually get clogged with dust, and a fire so constructed that the burners can be readily handled and cleaned is more serviceable than one so constructed that it is difficult to get at the burners for cleaning. S. Clark & Co. exhibit several forms of their well-known "syphon" condensing stoves, and a number of firms show reflecting stoves of various designs. All the firms mentioned as exhibitors of cookers also exhibit gas fires and stoves.

Radiators.—Radiators in which circulating steam or hot water may be produced with the aid of gas are shown on several stands. Other gas-heated radiators are simply hot-air radiators. These radiators are very simple in construction, and are very compact. Among the exhibitors of radiators are Fenlon & Son; Cannon Iron Foundries, Ltd.; Ewart & Son, Ltd.; and the Davis Gas Stove Co., Ltd.

Gas Engines.—Gas engines are well represented. On entering the exhibition the "Stockport" engine, manufactured by J. E. H. Andrew & Co., and exhibited by Bilbie, Hobson, & Co., the London agents, is first encountered. Engines of 40 B.H.P., 25 B.H.P., and 1½ B.H.P. are shown. The National Gas Engine Co., Ltd., Crossley Brothers, Ltd., and W. Grice & Son, Ltd., also have engines erected in the Prince's Hall. Crossley Brothers, Ltd., exhibit a high speed 27½ B.H.P. engine for electric lighting, and this engine has been utilised for driving the dynamo which supplies current for the incandescent electric lamps with which the firm's stand is illuminated. In the Queen's Palace

annexe, P. Simon & Co. exhibit a "Capel" gas engine driving a dynamo which is providing current for a number of electric arc lamps. At first sight this array of electric arc lamps appears a strange exhibit for a gas exhibition, but the object of the exhibit is to show that a gas engine is the best agent for driving a dynamo. Gas engines are also exhibited by J. Firth Blakeley & Co., and Geo. Waller & Son.

Miscellaneous Exhibits.—Gas meters of all descriptions are exhibited by the principal meter manufacturers. A discount or check meter exhibited by the "Rotary" Meter Syndicate, Ltd., is a novelty. Scientific apparatus is shown by several firms. Wm. Sugg & Co., Ltd., exhibit photometers and apparatus used for testing the heating power and purity of gas. Townson & Mercer exhibit chemical apparatus. Siemens Brothers & Co., Ltd., exhibit a water pyrometer and an electrical resistance pyrometer. In the loan collection is a photometer for high-power lights lent by Mr. C. C. Carpenter. A device for lighting burners from a distance is shown by the Pneumatic Gas Lighting Co., and a clockwork arrangement for automatically lighting and extinguishing a gas burner at any desired hours of the day or night is shown by the Automatic Light Controlling Co., Ltd. Mechanical conveyors for coal or coke, machines for charging retorts, and appliances for purifying gas are shown by a number of engineering firms.

It has been impossible to list the exhibits now on view at Earl's Court, but from such notes as we have been able to publish it will be seen that many of the exhibits are of interest to all who are concerned with the lighting or heating of buildings, or with the lighting of open spaces.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE third general meeting (business and ordinary) of the present session of the Royal Institute of British Architects was held at No. 9, Conduit-street, Regent-street, on Monday, Mr. T. E. Collcutt, Vice-President, in the chair.

The minutes of the last meeting having been taken as read, the decease of the following members was announced, i.e., Mr. C. J. Ferguson, F.S.A., Associate, of Carlisle, and Mr. Francis W. Bedford, a Fellow and Ashpitel prizeman and Owen Jones student.

Elections.

The following gentlemen were then elected as members, i.e., as *Fellows*—Messrs. W. A. Aickman, Gresham-street, E.C.; S. N. Chandabhojy, Bombay; J. B. Chubb, Foundling Hospital, W.C.; B. J. Dicksee, New Kent-road, S.E.; W. Dunn, Lincoln's Inn Fields, W.C.; F. Emley, Johannesburg; A. C. Forrester, Old Queen-street, S.W.; A. L. Guy, Gray's Inn, W.C.; W. Leck, Johannesburg; E. C. P. Monson, Acton Vale, W.; H. A. Pelly, Old Broad-street, E.C.; E. Thornton, Calcutta; W. F. Young, Norfolk-street, Strand, W.C.; R. Watson, Lincoln's Inn Fields, W.C. As *Associates*—R. J. Allison, H.M. Office of Works, Westminster; E. G. Allen, Croydon; W. H. Bagot, Adelaide, South Australia; W. J. Ball, Creve; E. Bates, East Croydon; C. Batley, Kettering; W. E. A. Brown, Regent-street, S.W.; A. N. Campbell, Bloomsbury-square, W.C.; W. A. T. Carter, Wimbledon, S.W.; C. M. Childs, H.M. Office of Works; B. C. Chilwell, Wednesbury; C. B. Cleveland, Whitehall-place; N. Colley, Huddersfield; S. C. Curtis, Holborn, W.C.; W. T. Curtis, West Dulwich; W. J. Davies, Sidecup; A. H. Gloyne, Richmond; H. P. Gordon, Blomfield-street, E.C.; P. W. Hawkins, Westminster, S.W.; B. B. Hooper, Dunedin, New Zealand; V. Hooper, Redhill; P. C. Pilling, Bolton; K. D. S. Robinson, Westminster; G. A. Ross, Montreal, Canada; T. T. Sawday, Leicester; A. Scott, jun., Dennistoun, Glasgow; N. O. Searle, Paternoster House, E.C.; R. E. Stewardson, Pall Mall East, S.W.; F. E. Stratton, Theobald's-road, W.C.; P. J. Westwood, 130, Jernyn-street, S.W.; G. H. Widdows, Derby; F. Wilson, Sheffield. As *Honorary Associates*—Count Plunkett, B.L., F.S.A., M.R.I.A., Dublin.

It was announced that the following are the gentlemen who passed in the November examinations. One hundred and ninety-five candidates were admitted, and of these fifty-eight were exempted from sitting. The remaining 136 were examined, with the following results:—

The Preliminary Examination.

A. J. T. Abel, Fulham, S.W.; J. E. Adamson, Manningham, Bradford; A. G. W. Allen,

Roundhay, nr. Leeds; J. C. Anderson, Lee, S.E.; F. Bacon, jun., Battersea Park, S.W.; F. A. Baldwin, East Acton, W.; E. H. Ball, Dinnington Colliery, Dudley, R.S.O., Northumberland; C. D. Barber, Romford, Essex; T. C. Barker, Scarborough; V. S. Barnes, Carmarthen; H. Battiscombe, St. Mary Cray, Kent; W. Beswick, Chester; B. W. Billings, Farnham, Surrey; A. G. Blackford, Ealing, W.; C. V. H. Blackwell, Hulland-road, Derby; B. J. Boothroyd, Brockley, S.E.; J. E. Bowness, London; H. Bradley, Blackpool; H. E. Bunce, Clapton, N.E.; W. H. Burgum, Edgbaston, Birmingham; F. M. Burr, Hornsey Rise, N.; E. G. Catelapole, Ipswich; R. A. Chadwick, Blackpool; R. T. Chapman, Bolton; P. J. Clarke, Heswall, Cheshire; O. Coghlan, Cheltenham; E. S. Coldwell, Kensington, W.; F. W. Commin, Exeter; C. Cooke, Southend-on-Sea; G. V. Cooke, Eastbourne; C. J. M. Cowdell, Leicester; J. Crabtree, Blackpool; J. D. Crawford, Bishop Auckland, co. Durham; C. E. S. Davies, Hafody-Coed, Llanfairfechan, N. Wales; C. R. Davy, Maidenhead; A. H. L. Daw, Cardiff; H. A. Diekmann, Sherwood, Nottingham; G. Duncan, Rochdale; S. Edwards, Barnstaple; W. H. Elsdon, Dalston, N.E.; W. S. A. Emden, Hampstead, N.W.; C. G. Evans, Neath; F. Fernyhough, Didsbury, nr. Manchester; D. H. Fish, Chigwell School, Essex; H. S. Fleming, Moorlands, Bingley; G. H. Foggett, Ash Field, Yealton, nr. Leeds; O. Gaunt, Camden Town, N.W.; B. S. W. Gilbertson, W. Hartlepool; K. Glover, Wylam, R.S.O., Northumberland; W. Goodchild, Ipswich; G. D. G. Hake, London; H. W. Hallas, Huddersfield; J. C. Hardy, Nottingham; S. Harrison, Linthorpe, Middlesbrough; A. P. Hartnell, Bristol; J. S. Harvey, Clapham Common, S.W.; W. H. Hatchard-Smith, Epsom; C. D. Hawley, Ipswich; H. C. Haworth, Chorley; J. A. S. Haworth, Huddersfield; I. Henderson, South Shields; L. K. Hett, Rugby; A. Hewetson, Leeds; H. R. Holland, Southampton; P. E. Holland, Exley, Kent; J. H. Hood, London; P. Howard, Waterloo, Ashton-under-Lyne; T. C. Hughes, Cloughton, Birkenhead; G. B. Jackson, Newcastle-under-Lyne; R. Jaques, Knaresborough; J. McN. Jeffrey, Pimlico, S.W.; J. R. Johnstone, Ayr, N.B.; G. B. Kaufmann, Sutton; S. V. Kendall, South Croydon; P. K. Kipps, Lewisham, S.E.; S. M. Kirkman, Croydon; F. Lambriek, Burton-on-Trent; T. S. Linton, London; F. A. Llewellyn, Richmond; H. S. Lockhead, Stroud Green, N.; H. J. Luck, Leighton Buzzard; C. B. Lync, Cheltenham; G. N. Lynn, Newark-on-Trent; R. J. Macdonald, Inverness; A. J. McLean, Brighton; C. S. Madeley, Perry Barr, Birmingham; T. C. Mannooch, London; G. P. Marshall, Leek; C. J. F. Martindale, Wetheral, Carlisle; H. E. Matthews, Yeovil; S. W. Milburn, Sunderland; W. Melbourne, Bishop Auckland; C. J. Mole, Plymouth; W. Moor, Morecambe; E. J. E. Moore, Newport; C. O. Moreton, Edgbaston, Birmingham; W. E. Müllerhausen, Forest Gate, E.; W. W. Neat, Brynmawr; D. E. Oram, Croydon; W. A. Orton, Harehills, Leeds, N.; W. Park, London; G. E. Pearce, Johannesburg; A. T. Phillips, Rickmansworth, Herts; H. G. Phillips, Richmond; A. D. Philpott, Dover; B. Pierce, Llanfair, P.G., Anglesey; D. J. G. Plumley, Clifton, Bristol; R. S. Ponting, Kingsdown, Bristol; W. W. Price, Liverpool, S.; C. E. F. Prynce, Bedford; S. G. Rellly, Bayswater, W.; W. G. Relp, Carlisle; L. A. Reynolds, Newington Hall; J. B. Richardson, Sholely Bridge, co. Durham; P. Richardson, Thornton Heath, S.E.; S. R. Riches, Balham, S.W.; F. A. Roberts, Ty Birt, Mold; S. Robertson, Dumbarton; F. J. Robinson, Brixton, S.W.; H. E. Rolley, Fulwell, Nottingham; J. A. Ross, Wainburgh; G. C. Rubie, Dover; H. J. Ruddie, Watford, Herts; A. Rylatt, Hull; W. H. Sagar, Blackpool; G. S. Seales, Westcliff-on-Sea, Essex; G. D. Scammell, Redland, Bristol; S. M. P. Sheppard, Camberley, Surrey; A. S. Slater, Besham, Gateshead; T. Spencer, Putney; G. R. Stanislaus, Bayswater, W.; W. C. Steljes, South Tottenham, N.; G. J. T. Stemp, Newport; J. J. Stout, Stockton-on-Tees; R. V. Sturgeon, Whalley Range, Manchester; F. Suddards, Bradford; M. C. Sunter, Chorlton-cum-Hardy, nr. Manchester; T. S. Tait, Paisley; J. H. Taylore, Whitley Bay, R.S.O., Northumberland; F. D. Thomson, Dundee; A. I. Turner, Forest Gate, E.; A. Walsley, Haslingden, Lancashire; R. A. Walter, Harringay, N.; S. K. Watkins, Rotherham; R. A. Welch, Crofton Park, S.E.; W. B.

Wheatley, Hull; W. G. Whincop, Stoke Newington, N.; A. E. M. Whitehouse, Heaton Moor, Stockport; H. Whittaker, Accrington; H. S. Whittingham, St. John's, S.E.; H. G. Wicks, Bournville, nr. Birmingham; J. P. Williams, Llangollen, North Wales; F. C. Wilson, Edgbaston, Birmingham; N. F. S. Winter, Blackpool; L. S. Wood, London; W. E. Woodin, Ankerley, S.E.; J. Woollatt, Nottingham; C. H. Wright, Aylesbury.

The Intermediate Examination.

G. Nott, Leicester; W. Harvey, Kennington, Ashford, Kent; P. M. Fraser, Streatham-hill, S.W.; H. L. Samson, Balham, S.W.; S. J. Webber, Maidenhead; S. S. Waghorn, St. John's Park, N.; L. S. Wood, London; P. Dalton, Birkdale, near Southport; E. L. Wren, Leicester; H. A. Beeston, Dover; J. S. Cable, Brixton, S.W.; A. G. Lynham, Exeter; C. H. Potter, Matlock Bridge; F. G. Oliver, Tweed-month, Berwick-on-Tweed; A. D. Aitken, Airdrie; R. H. Blackburn, Manningham, Bradford; H. Blackadder, Broughty Ferry, W. Scotland; W. P. Schofield, Leeds; A. E. Beswick, Swindon; G. H. Parry, Upper Warrington, Surrey; W. L. Mellor, Halifax; D. W. Ditchburn, Leytonstone, Essex; R. G. Roberts, Stafford; L. S. Fifoot, Penarth; F. N. Bamford, Bloomsbury, W.C.; T. S. Attle, Putney, S.W.; F. L. Atwell, Plumstead, S.E.; F. H. Bulmer, Balham, S.W.; T. H. O. Collings, Hove; W. F. Dickinson, London; J. P. Firth, Walton, nr. Wakefield; B. W. Fitch-Jones, Bexhill; H. French, Hull; E. H. Gandy, Canonbury, N.; J. H. Gask, Stamford-hill, N.; J. H. Goodchild, Finchley; G. H. B. Gould, Ipswich; J. H. Hargreaves, Fulham, S.W.; A. J. Healey, London; F. B. Hooper, C.-on-M., Manchester; W. Jackson, Hitchin; W. Kerr, Putney, S.W.; H. G. Lay, Wellingborough; A. S. W. Mackay, Barking, Essex; M. R. Martin, Chiswick; A. M. Millwood, Barnes, S.W.; G. E. H. Newbold, Gainsborough; G. W. Page, Bolton; J. A. Pirie, Highbury, N.; H. A. Porter, Gravesend; A. Rigby, Manchester; H. E. Secombe, Clapham Common, S.W.; A. F. Slaughter, Reading; J. C. Smythe, Mutley, Plymouth; B. H. Sutton, Basildon, near Reading; W. I. Travers, Kensington; G. M. Trench, Honor Oak, S.E.; R. J. Tyndall, Meida Vale, W.; F. A. Walker, Hampstead, N.W.; J. B. Wills, Clifton, Bristol; W. B. Wylie, London; S. A. S. Yeo, Exeter.

The Final and Special Examinations.

T. F. Amery, Chelsea, S.W.; D. Anderson, Hampstead, N.W.; E. G. G. Bax, Catford, S.E.; W. S. Beaumont, Manchester; M. S. Briggs, Otley, Yorks; J. S. Brocklesby, St. James's S.W.; J. T. W. Brooke, Bowden, Cheshire; C. F. Callow, St. Leonards-on-Sea; C. P. Carter, Mansfield; G. R. Ellis, Longsight, Manchester; J. A. Fletcher, Leicester; H. C. Fread, East Molesey; W. J. Freeman, Halifax; C. L. Gill, Regent's Park, H.W.; H. H. Golding, Woolwich; P. A. Hinchcliffe, Barnsley; P. A. Horrocks, London; A. B. Hubbaek, Kuala Lumpur, Selangor, Federated Malay States; D. B. Jonkinson, Kimberworth, Rotherham; G. A. Johnson, Croydon; J. Miller, London; C. Nicholas, Tooting, S.W.; H. L. North, Llanfairfechan, N. Wales; C. T. Palmer, Stamford-hill, N.; C. Paterson, Bowdon, Cheshire; A. R. Powys, Denton, Grantham; E. Quiggin, Blundellsands, Liverpool; G. S. Salomons, Manchester; H. R. Smallman, Wimbledon Common, S.W.; N. C. Smith, Moffat, N.B.; E. G. W. Souster, Northampton; C. J. Thompson, Wandsworth, S.W.; J. N. R. Vining, Sydenham, S.E.

The following shows the number of failures in each subject of the Final:—

I. Design	23
II. Mouldings, etc.	34
III. Materials	13
IV. Sanitation	14
V. Specifications	11
VI. Construction: Foundations, Walls, etc.	15
VII. Construction: Iron and Steel, etc.	27

The Ashpitel Prize.

On the recommendation of the Board of Examiners the Council have decided to award this prize to Mr. Charles Lovett Gill, he being the candidate who has most highly distinguished himself in the Final Examinations held during the current year.

The Chairman moved "that the Registration Committee appointed by the general body be allowed to co-opt additional members," and this was agreed to.

Mr. G. A. T. Middleton moved "that it be referred to the Council to consider the

advisability of appointing an official assessor of architectural competitions." The Chairman accepted the motion on behalf of the Council.

Reinforced Concrete.

A discussion then took place on the papers on Reinforced Concrete, read on the 21st ult. by Messrs. W. Dunn and M. L. G. Mouchel.*

Mr. De Vesian read a communication from M. L. G. Mouchel in which he referred at some length to the question of formulae and methods of calculation with regard to ferro concrete. He said that there were concrete specialists who were wasting their time in formulae, for often if they followed them they would arrive at absurd results. In regard to his work every case was considered separately and was gone into as a fresh problem. Although he had not great faith in the hydraulic test, he had made such tests. In 1901 the Mersey Docks and Harbour Board tested a pillar at 245 tons per sq. ft. As a matter of fact, however, he had had a good many pillars in actual use under varying conditions for many years, and these pillars had been subjected to eccentric tests of a severe character and stood the trials, and he claimed that such facts as these were worth tons of theory. Mr. De Vesian afterwards exhibited a large number of lantern slides showing how ferro concrete had been used, and was being used, in the construction of warehouses, mills, factories, bridges, piers, etc.

Mr. Watson expressed the great regret that Mr. Dunn felt at being again unable through illness to be present, and said that Mr. Dunn had asked him to read some replies to questions which had been sent to him by letter. The first question was as to the effect of temperature on the rate of setting of cement, and this had been fully investigated by Professor Tetmajer in the laboratory of the University of Zurich. These reports were not easily got in this country, but extracts showing the effect of temperature on the rate of setting of cement would be found in Johnson's "Materials of Construction," which should be found in the library of the Institute. Investigations were made as to the ways in which the time of setting for tensile strength are influenced, and they might be expressed by means of graphical representations. For these researches cement was used, the normal time of setting of which was one and a half hours, and the normal tensile strength of which was 23 kilos in 28 tons. In the experiments, both the cement and water were brought to a temperature, and it was shown that a cement which had the normal temperature of 16° centigrade and had a setting time of one and a half hours at 7° centigrade, which was winter temperature, it did not set in five hours; while in 30° centigrade it set in twenty-six minutes. If temperature were left out of consideration, a medium-setting cement might be found either slow or quick-setting, and many complaints which had been made were thereby explained. The results of the experiments were these:—At 7° centigrade the time of setting was five hours; at 10° centigrade, three hours; at 16° centigrade, one hour thirty minutes; at 23° centigrade, fifty minutes; at 30° centigrade, twenty-six minutes. When cement and mortar set at a temperature below freezing-point, the water it contained was likely to freeze and the mortar could not properly harden and became disintegrated, and so it was customary in frosty weather to use some salt in the water for mixing mortar to prevent the freezing. Another question was asked as to the amounts of materials for concrete. When the aggregate was mixed and rammed, the finished concrete occupied much less space than the various constituents did separately. The results of actual measurement showed that 580 lb. of cement was required for each cubic yard of rammed concrete. The other question asked was as to a diagram figure for Marsh's formula. This was not mentioned in the paper, but was given on page 288 of Marsh's "Reinforced Concrete."

The Chairman, in calling on Mr. Marsh to speak, explained that that gentleman was the author of two volumes concerning reinforced concrete, which were in the library. Mr. Marsh said there were only two things he would like to refer to in Mr. Dunn's paper. In the first place, Mr. Dunn stated that cement with no free lime could be manufactured, but he thought that this was seldom the case. Even with the rotary kilns, when the clinker came out they saw small uncalcined bits. It was practically impossible to pick these out, and they went through the grinding mills with the rest

of the clinker. He believed there were some firms who introduced a jet of steam in the tube mills, which had practically the same effect as air slacking, but he did not think this was a general practice. Another remark of Mr. Dunn was that no formula had been devised for columns which took into account initial stress. He felt that any such formula would be very unreliable. The stress induced in concrete varied so very much according to the dampness of the atmosphere. When concrete with reinforcement in it set in dry air, there were tensile stresses induced, but if it set under water the stresses are compressive. Consequently, if they had a formula which took into consideration initial tensions, and the air happened to be damp when the column was setting, they might have initial compression, whereas what they had taken into consideration was tension. Hence, any formula which did not take into consideration the exact conditions existing when the column was being made would be unreliable. M. Mouchel's paper was an excellent statement from the practical view of reinforced concrete, but it would have been better had he treated the subject more generally. M. Mouchel simply dealt with the Hennebique system. It was an excellent system, but it was only one of many systems, each of which had good points, many being just as good as M. Hennebique's. Of course, one could not be surprised that M. Mouchel should only speak of his own system, and they could not blame him for it. The Hennebique system was, he believed, the first to be commercially introduced into this country, but he was not sure that the Expanded Metal Company was not really the first. Besides the Hennebique system, there were others represented in England, amongst which were the Ways and Freitag, an offshoot of the firm which exploited the old Morrie patents and was a very old firm. This firm was represented by Mr. Werner of the Armoured Concrete Construction Company. M. Cottancin had also constructed several buildings and water tanks in this country, and several other systems had representatives in London. As reinforced concrete became more generally understood and known in this country, he hoped that there would be other systems brought forward. American systems in particular would be introduced, and he believed it would be a good thing for all of them when they were. The stirrups which M. Mouchel mentioned were specially useful for tying together the layers of the concrete. The layers had to be put in in small thicknesses and very often after considerable lapse of time, and, consequently, it was very beneficial to have these stirrups to tie them together. Many other constructors use this form of reinforcement. Some of them attach them to the longitudinal bars, which is an excellent thing, as it tended to resist the shearing along the main reinforcements. The bent-up rods which M. Mouchel mentioned as being used to resist the tension over the supports were also extremely useful in resisting the shearing. With respect to columns, Mr. Dunn had very clearly shown the nature of failure. The horizontal bindings usually employed in columns are not sufficiently close together to resist the swelling and shearing of the concrete. There was no doubt that the hooped column introduced by M. Considère was the most efficient form of construction. He was surprised that M. Mouchel should have spoken of M. Considère as being unpractical, for he considered him one of the greatest authorities on reinforced concrete. It might interest them to know that M. Considère's patents had been taken up by the Armoured Concrete Construction Company. M. Mouchel had said that no system could compare with M. Hennebique's in simplicity, but Ransome's system in America was almost identical with Hennebique's, and many others were quite as simple. American architects and engineers were now taking up the design and construction of their own buildings in reinforced concrete, and they always applied the reinforcement in a simple and scientific manner. M. Hennebique was certainly one of the first to introduce the reinforced concrete beam, but Ransome in America, Cottancin and Coignet in France, and Möller in Germany, introduced it about the same time, and there seemed to be some doubt as to who was the first. Every honour was due to the pioneers of this material, and there was no doubt that M. Hennebique ranked very high amongst them. With reference to the formula used in ordinary reinforced concrete structures there was not the slightest doubt that it was right to take into consideration the elasticity of the

two materials, and he would just explain the nature of the effects on concrete under pressure, which would show the reason why elasticity should be taken into account. When concrete was first put under pressure it contracted very considerably, and on the load being removed there was a very considerable permanent set. If the same load was applied again there was still a distinct shortening, and still a permanent set. If they applied and removed the load several times they would go on having a shortening and a permanent set, but these became less and less as they kept on applying and removing the loads until at last there was no permanent set at all, and the shortening was very considerably less than the shortening under the first loading. They would see what effect that had when reinforcement was introduced. Under the first load or test the concrete contracted considerably. Consequently the reinforcement which took up the same contraction as the concrete could take a very considerable amount of stress. After the concrete had taken its permanent set it contracted considerably less, and consequently after the structure had been loaded several times the stress taken by the reinforcement was very much less than under the first load. That of course applied not only to columns but also to beams. Many constructors now used a formula based on elastic resistance. The American systems generally used formulae which took into account the elasticity of the two materials. The comparatively great elongation of reinforced concrete as compared with plain concrete was due to the presence of the reinforcing metal. The reinforcing metal takes up the stress and distributes them over the whole length of concrete, and if there are any weak sections the reinforcing metal carries it over the weak section and takes it to the stronger section. Also when a crack did occur the reinforcement acted exactly in the same way. M. Mouchel implied in his paper that laboratorial experiments on reinforced concrete were unreliable and were not conducted on pieces of practical dimensions, but most of the experiments on this material during the past few years had been conducted on pieces of practical dimensions, and the mixtures of concrete and other necessary details had been carefully noted. It was to be hoped that such experiments when properly interpreted would lead to the establishment of true formulae. Of course even the best formulae at the present time were not absolutely correct, but when they thoroughly understood the nature of the properties of this material which they were rapidly learning by these excellent experiments, there was no doubt that absolutely true formulae would be found which would be generally employed. With reference to the acceptance tests of floors he thought that the load ought to be applied across the whole width of the floor. If it was only applied over one beam or bay they did not get a true result, because the whole of the floor acted together, and the beams at the side helped to carry the load. Thus if they applied the test load over only one beam or two beams it was not sufficient, and the load should be applied across the whole width of the floor. One of the most valuable properties of reinforced concrete was its monolithic nature. Each part acted with the other, in resisting the stress, and the way in which a reinforced structure resisted being knocked about and generally damaged had been very well shown by M. Mouchel in the photographs he had shown of the tramway car shed and the coal silos where there had been accidents. There was also a very good demonstration of this in the destruction of the San Moreno Pavilion constructed by M. Cottancin for the Paris Exhibition in 1900. That pavilion measured 35 ft. by 30 ft., and was about 39 ft. high; the top 24 ft. of the height was only supported at each corner. After being subjected to very severe fire tests the three supports at one corner were broken away one after the other, and the building only collapsed after the three supports were knocked completely away. The reinforced concrete pile was of the greatest use, and its introduction was entirely due to M. Hennebique. Its excellent qualities were too obvious to need any further comment; nor did M. Mouchel's excellent demonstration of the several advantageous qualities of reinforced concrete require enlargement excepting that he might point out that other systems possessed the same

* See our issue for November 26.

qualities. He cordially agreed with M. Mouchel in the main in what he said as to the by-laws governing reinforced concrete construction, but he disagreed with him on the subject of formulae. It was very necessary indeed that formulae should be inserted. Some of the restrictions as to design which had been instituted by various authorities up to the present were too severe, and that of the Prussian authorities for columns was ridiculous, but this latter was due to the very low working stress allowed on the concrete which was only one-tenth the ultimate resistance. It must be remembered that the constructors did not take the eventual responsibility for the structures, and as the responsibility fell on the authorities it was perfectly right that they should institute methods of calculation to guard themselves in every way. He hoped if any by-laws were framed they would institute no such absurd requirements as line D in figure 9 B, but at the same time some formulae should be insisted upon which would meet the general requirements, although they might not come up to the ideals of some constructors.

Mr. H. Anderson, as a manufacturer of Portland cement, said he was glad to be able to listen to such papers. This material was one into which cement largely entered, and naturally he had followed its development with interest. Mr. Dunn had alluded to the fact that if the cement was bad when the concrete was made cracks formed. It would not be safe to assume that this was due to the quality of the cement. It was equally necessary that the materials forming the aggregate should be of the first quality, and that great care should be shown in mixing the cement with the aggregate. He must say that a combination of the high tensile strain of steel with the great crushing resistance of concrete formed an ideal amalgamation, and it was a matter for regret that in this country ferro-concrete had made such slow progress compared with the rapid strides made both on the Continent and in the United States of America. This leisurely movement in England he put down to two causes, and the first of these was the antedelinian restrictions of the building by-laws. Secondly, it was due to the little attention given to this science, as he called it, by the technical Press of the country. He hoped that the papers which had been given before what he understood was a record attendance in that building would do something towards giving a stimulus to the interest shown in the material, and would encourage the technical Press to give more attention to the subject, and thus remove the necessity of those who wished to know something of the latest developments having to go to American and Continental journals.

Mr. H. K. G. Bamber, Managing Director of the Associated Portland Cement Manufacturers, Limited, said he would like to refer to the question of specifications and tests which Mr. Dunn proposed. Mr. Dunn said it would be very beneficial to the profession and the trade generally if some sort of standard specification could be adopted. He quite sympathized with Mr. Dunn when he said that engineers and architects were in great difficulties as regards their specifications, he had no doubt that it was so. There was no doubt that every engineer or architect there liked to frame his specifications in accordance with his own views, and it would be a great advantage if they would compare these and see the immense variation there was between one and the other. As they knew, a Standardising Committee had been sitting, and had now completed its deliberations. That Committee was composed of representatives of the engineering and architectural professions, contractors, and Portland cement manufacturers. They had heard a good deal of the English manufacturer not being up-to-date, but in this particular case in framing a specification, which was perhaps the most stringent yet put into force, the representatives of the cement trade were the prime movers in working up that specification to the highest possible standard. He believed that specification would shortly be made public, and he hoped those members of the profession who were about to alter their specifications would await its arrival before embarking on new conditions. They could imagine that an architect who framed his own specification found it difficult, and they could imagine also the difficulty of the cement manufacturer who had all these various specifications put before him. He would welcome the time when the architectural profession and the engineering profession

generally adopted some standard specification, and relieved the cement manufacturer from the difficulty of trying to comply section by section with the specifications he had given him day by day. Mr. Dunn had referred to the fineness of grinding, and he would point out that of late years cement was ground much finer than in the past. The profession probably did not realise what an immense difference that made to the properties of cement. It made the cement much quicker setting for the reason that a large proportion of the material which formerly constituted cement had absolutely no cementitious value, whereas now, by much finer grinding, it was brought into use, and the avidity with which the cement took up water and the chemical action resulting was much greater than in the past. It was much more quick-setting, and methods had been adopted to regulate the setting time. The custom in Germany, and also in England had been to add a small percentage of gypsum, which had the effect of retarding the setting time. Many engineers, however, had a great objection to the addition of such material, and in order to get over that difficulty, and regulate the setting time in accordance with the requirements of various specifications, a method which Mr. Marsh referred to had been invented by himself and largely employed. By this means they were able to make cement of the highest quality and regulate the setting time without the aid of gypsum at all. The effect of the hydrating process was partly a chemical one, and much improved the soundness of the cement. Mr. Marsh referred to the question of free lime and rotary kilns. He had perhaps the largest installation of rotary kilns in the United Kingdom under his control, and although Mr. Marsh said there did appear at times to be very small particles of free lime passing through; the percentage of half burned obtained by that process as compared with cement manufactured by the older processes was infinitesimal, in fact, the percentage could hardly be measured.

Mr. Hammen, jun., of W. Cubitt & Co., who are licensees under the Hennebique patents, said a few words on ferro-concrete from the contractor's point of view. He might say at once that, so far as the scientific part of the business went, he knew nothing about it. Mr. Dunn some years ago asked him to look into the question as to whether they were getting the best cement that could be made. He went into the question carefully with Mr. Dunn, and the result was that they had now a specification which he thought was more stringent than any in England. The cement manufacturers, however, had so come up to the standard that they gave him a better cement than he asked for. There were two points of interest he had noticed. One of these was that in the old days it was always thought when putting in concrete floors an allowance should be made at the edge of the floor for expansion. On account of the improvement in modern cement that necessity was entirely done away with, and now, when they constructed a ferro-concrete floor, they rammed it tight home to the walls on both sides, and in all the floors they had ever constructed of ferro-concrete there had never been the least sign of expansion; as a matter of fact, the concrete shrank and did not expand when setting in air. His second point was that, owing to the extremely fine grinding, the cement deteriorated when kept any length of time. They had noticed in particular where they had had to deal with piles and work of that description, where the punishment was enormous, that piles made of cement two months old were not so good as piles made of cement ten days old. He gave that experience for what it was worth. In numerous buildings they had carried out, they had made tests of the floors and the columns, and at one of these tests at Tottenham, for which Mr. Arthur Dixon was the architect, their chairman that night was present. The result from those tests of fire-proof floors were extraordinary. The deflection was so slight with the enormous loads they were made to carry. Quite recently they put 40 tons on to a 9'9" ferro-concrete column in a building designed by Mr. Pearson, and got a deflection in the beams bearing on the column of 3 millimetres. As he had said, he knew nothing about the scientific part of the matter, but what did occur to him was, how were architects going to design in this material, when the time occupied and the expense came to be considered. The work of designing, drawing, and taking out quantities was enormous; it would mean engaging the services of several

trained engineers to work out the complicated figures; all this meant time and money. Consequently, it looked to him as if they would always have to leave the matter in the hands of the specialists. There had been a discussion that night on the question of formulae. He believed that Mr. Hennebique had never published any formulae at all, although other persons had published them for him. It was obvious that one formulae for floors and beams would not get over all the difficulties that arose in general construction. When they came to deal with a building it was not all floors and beams. There might be exceptional difficulties crop up which would require special reinforcement at certain points, and then they would find the ordinary formulae did not touch it and they would have to go in for experienced specialists. "Experience doct" should be the motto of all. As he was coming into the room a gentleman raised a question as to whether it was as easy to alter these buildings of ferro-concrete after they were built. It surely was easier to cut steel rods than it was to cut steel girders. The special difficulty of altering ferro-concrete was the hardness of the concrete, but that was only because the concrete in this form of construction was particularly good.

Mr. A. T. Walmisley said the importance of the proper construction of ferro-concrete was great, and he felt they could not be too thankful for the opportunity given them to discuss the two practical papers which had been read. M. Mouchel had brought a complete description of Hennebique's system, and they knew that wherever it had been used it had been most successful. But, of course, there were other systems that architects had to deal with, and amongst these Mr. Marsh had mentioned the Expanded Metal system, which was used in works of construction. The Expanded Metal system could be placed in sheets up to 16 ft. in width, and it had simply to be laid down at a proper level and position and needed no further supervision; whereas, if he had to make a concrete floor with Hennebique's system he would want to see that the rods and saddle pieces and so on were all properly placed, and so there would be a great deal more supervision needed. Although he agreed with the speakers that they could not rely too much upon formulae, yet they could gain some benefit by the consideration of formulae applied by the result of experience. It would be a very injudicious thing to place the reinforcement upon the neutral axis of the slab; they wanted to place it where it would take the tension properly. Although they could not rely upon formulae in their entirety, yet it was well to formulate their experience. If they took a retaining wall or a concrete footpath made of pure concrete they found it would show cracks. He had watched various retaining walls, and had found, as a rule, these cracks would average about 11 ft. apart; so that, if they made a straight joint in a retaining wall of 11 ft. and introduced reinforcement into the concrete, they would have no cracks at all. Then, with regard to piles, for which Hennebique's system was largely employed, it had been found at Southampton that, if they took a rod covered in good concrete and embedded that concrete to the length of eleven diameters of the rod, they could break the rod, when the concrete had set, before they pulled it out of the concrete. There was one thing which must be remembered above everything, which was that in reinforced concrete it was absolutely essential to have the best material, both of the aggregate and the cement. He had no fear of corrosion if he eliminated sea-sand and sea-water. They had heard that the action of the iron and concrete were about the same, and that there was no occasion to provide for one expanding and the other contracting. He felt that the subject had elucidated very profitable discussion, and no doubt these papers were simply the prelude to other papers which must come before the Institute later on, when they had further experience upon the subject.

Mr. E. Robins remarked that he had had a long experience of concrete work, and in 1869 he took out the first patent for armoured concrete, which the Americans called skeleton construction. In 1877 he took out a patent for employing it by casting the whole of a house from the middle floor window, and giving the decoration and reverse forms of that decoration which would form different features in each room. That was before anything of the kind was done from concrete in America, and therefore it was an English invention, and he claimed

to be the pioneer of the system. His experience was that Portland cement was not reliable so far as adhesion was concerned, and he had adopted the plan of preparing materials to make it more adhesive. Where he used no heat, he added to the Portland cement about 10 per cent. of whitening and gum dextering. Where heat was employed, he used silicate of soda, and that became petrified by the heat, and it was a hard matter to chip it off. By these means he could use it in the best form for any kind of construction.

Mr. Hilson Nash did not think that M. Mouchel had made the best of his case, for he had not told them the great cost which would be saved by putting up buildings of this construction. Some four years ago a large warehouse was put up partly under his supervision, and in the building, costing 10,000*l.*, he was able to inform his client that by using ferro-concrete he could save 1,000*l.*, and that he felt was a very important item. Another thing they saved in warehouses by the use of the material were ceilings and floors. They had a homogeneous floor of concrete, and when it was finished they had simply to whitewash the under side of the floor. There were drawbacks to the system where they had machinery, because it necessitated providing for the situation of the machinery before the floors were made, so that the holes could be left for the machines. He had very great faith in Mr. Hennebique's system, although he thought that some other systems were equally good. He believed that any one using the system would find it most useful and economical.

Mr. E. W. Hudson asked if there was any possibility of adjourning the discussion. As a member of the R.I.B.A. he was wondering where architects came in at all in the discussion.

Mr. T. L. Banks said he held that all novelty in architecture arose from two causes—either new requirements or the use of materials which the ancients did not use. Lately they had had two new materials—first iron and now concrete. He could not say that the introduction of iron had improved architecture at all, and he rather thought it was the reverse. In the last few years he had given considerable attention to fire-proofing, and his idea with regard to protecting iron was to separate the protecting shield from the metal. Any covering, such as concrete or terra-cotta, in contact with the metal is necessarily thrown off where the metal expands under heat. What he rose for, however, was to call attention to a material which perhaps cement manufacturers might not like. He read in the paper that the best cement was the slowest setting cement, but, unfortunately, they lived in a "hustling" age, and could not do with slow-setting cement. The strongest cement he knew of, and which he had used for thirty years, was slag from the hematite blast furnaces, not the slag from the lower ores. He had brought with him a portion of a brick made thirty years ago, and he did not think any cement manufacturer could produce anything so hard as that. He built a house which cost 30,000*l.* with nothing but that slag, and it was used very much in the North of England. It would stand fire better than any material he knew, but its drawback was that it set so slowly that he was afraid many men would not have the patience to wait for the setting. It hardly set in a fortnight. He would like to know what effect fire had on the rods in the beams, for they knew the effect it had on girders; secondly, was there any danger of the cracking in large areas of cement roofs and floors simply by the contraction of the cement? and, thirdly, when did cement cease to contract? He had observed that cement for twenty years and found it still contracting, and he did not know when it did stop. Fourthly, he would like to know what effect weather had on ferro-concrete-constructed buildings.

Mr. S. Perkins Pick said that he would not have risen had not the question of slag been introduced, but his firm had had very lamentable experiences of the use of slag as an aggregate for concrete. We had some time ago to construct a covered reservoir of over 200 ft. in diameter, and when the cement concrete was made the aggregate was formed of slag from Northamptonshire iron furnaces. It appeared to be quite as hard as an aggregate could reasonably be expected to be, and apparently made excellent concrete, but after the reservoir was filled with water attention was called to certain serious leakages, and upon inspecting the reservoir they found there was a very horrible smell from the outlet which received the under

drainage from the reservoir, and which the chemist informed them was sulphuretted hydrogen. The cracks seriously developed, and they tried at first to combat the leakage by putting an enormous iron band round the structure. The effect of that was that the whole of the vaulting sprang upwards, and cracked along the lines of least resistance. They had to take the top off, and then they found that the concrete, which when made appeared to be so good, could be taken in the hand and squeezed through the fingers. The chemist informed them that this was due to chemical action. It was altogether a bad experience for them. With regard to ferro-concrete generally he had had very small experience of it, and had only used it for floors and roofs, and his experience of its use had been quite different from what had been stated. He found without exception that they expanded. He had had cases under his own supervision where walls had been forced out one, two, and three inches, where they had had iron as a tie in the concrete. As an architect, he rather feared a system like that coming into general use, for it appeared to him that the hanging out of great oriel windows, angle turrets, balconies, and so on, without, architecturally speaking, any reasonable support, was destruction to good architecture. Engineers might perhaps be interested in such freaks, but he felt that, as architects, they were going on wrong lines. Of course he spoke absolutely as an architect from the artistic point of view when he said he feared the ferro-concrete coming into general use.

Mr. L. Solomon said they had been shown buildings where the upper walls were $4\frac{1}{2}$ in. or 5 in. thick. He would like to know how they kept the cold out in cold weather and the heat out in hot weather.

The Chairman said he did not know that they could continue the discussion with any further benefit, but they were much obliged to the gentlemen who had come there that night and joined in such an interesting discussion. Unfortunately, he did not hear the papers read, and he was afraid if he had he would have been quite as foggy as Mr. Hannen said he was with regard to the technical part of it.

The discussion then closed.

The Chairman announced that the next meeting would be held on December 19, when papers on "Architecture and Building Acts" would be read by Messrs. Lacy W. Ridge and J. S. Gibson.

THE INSTITUTE OF SANITARY ENGINEERS.

THE annual dinner of the Institute of Sanitary Engineers, Limited, was held on Wednesday at the Holborn Restaurant, W.C. Mr. W. J. Dibdin, F.I.C., presiding, in the unavoidable absence of the President, Mr. W. H. Maxwell, A.M., Inst. C.E. There were also present—Mr. C. Tuff, M.P., Mr. W. Whitaker, B.A., Chairman of the Royal Sanitary Institute, Surgeon-Colonel W. R. Smith, M.D., and Messrs. J. A. Crowther, President-elect, W. Fairley, C.E., J. T. Griffin, Chairman of Council, A. J. Martin, J. C. T. Murray, Dr. Thresh, —Thompson, A. E. Ashby, Secretary, and others.

The loyal toast having been honoured,

Mr. W. Fairley proposed the "Imperial Forces," coupled with the name of Surgeon-Colonel W. R. Smith, M.D., V.D., who suitably responded.

The Chairman then proposed the toast of "the Houses of Parliament," coupled with the name of Mr. C. Tuff, M.P.

Mr. Tuff, in reply, said there was room for very great improvement in the ventilation of the House of Commons. If some engineer would contrive some apparatus that would remove the impure air that the members had to breathe over and over again, and could bring in a pure and fresh supply that would not have that sporadic effect on some members that the present air had, it would be a very great advantage.

Mr. A. J. Martin then proposed the toast of the evening, the "Institute of Sanitary Engineers." Every one who knew the Institute and the sterling work which it was doing would agree with him that it is an Institute which abundantly deserved to prosper, and he was glad to see signs that it was on the way to prosperity. He saw an earnest of this in the hard-working and capable committee and

secretary. An intelligent interest in sanitary matters was by no means widely diffused amongst the public at large. Let them contrast for a moment the absolute apathy with which sanitary questions were regarded, and the interest with which our countrymen were watching the course of the war in the Far East; and yet he doubted whether that campaign was of such importance to the people of this country as the questions with which the Institute had to deal. The sanitary engineer was, in company with others, a soldier who waged a stern and unceasing warfare with disease and dirt. His mission was not to take life but to preserve it, and how well he did his duty would be gathered by a comparison of the death-rate of to-day with the death-rate which prevailed fifty years ago. There was an enemy greater than disease and death which the sanitary engineer had to encounter, and that was ignorance, and in fighting that there was but one weapon to rely on, and that was education. The work of the sanitary engineer and those associated with him was in great measure a work of education. The sanitary engineer had to teach the public and those members of public bodies with whom he came in contact. They had to be taught many things, especially that, of all the duties entrusted to them, there was none so sacred as the care of the public health. They had to be taught also that systems and methods which were the best of their kind thirty years ago were not necessarily the best of their kind now. Most important of all, they had to be taught that in sanitary matters the best was usually the cheapest in the end. But true education began at home, and before the sanitary engineer could educate others he had to educate himself, and that brought him to what he conceived to be the chief function of this Institute. It was pre-eminently an educational body, and he must not forget those kindred institutions which were engaged in similar work. Mr. Martin then referred to the lectures and classes of the Institute, to the meetings for the interchange of opinion, and to the excursions which it makes to interesting and important works, and to the distinguished men who had served the Institute in the past. With the toast he coupled the names of the Chairman and Mr. J. T. Griffin, Chairman of Council.

The Chairman, in responding, referred to the excellent work of their secretary, Mr. Ashby, on behalf of the Institute. During the year 53 new members had been elected to the Institute, namely, 8 Fellows, 43 Associates, and 2 Students. The examinations had been extended by the holding of provincial ones; these also had proved a great success. In connection with the examinations, and in conjunction with them, a Students' Grade Examination is now being held for those who are between the ages of 18 and 21. This examination is held for students to graduate for the higher examination when they attain the age of entry, namely, 21 years. The students' lectures were again being given during the winter months in practical sanitary science, in preparation for the spring examinations of this and other kindred institutes. The lectures were given by eminent gentlemen in the profession, and the students who attend them showed by the interest they took, and the homework they did, that the lectures prove a beneficial success to them. The technical colleges were now teaching their classes in practical sanitary science on lines similar to the examination syllabus of the Institute, which tended to show that the Institute is doing good work, besides being recognised as one of the leading institutes in sanitary science. At Altrincham the technical college sent nine of their students to the examination of the Institute, held in September at Manchester. District centres have been formed in Exeter and Cardiff this year, and, with the one in Manchester, were doing good work. For the members in the aforesaid districts papers had been read and discussed, and visits to local works of interest had been taken. The local secretaries were to be congratulated on their success. Other district centres would be formed as was found requisite. The Saturday visits that had again been held from the Institute had proved that such visits were required, and that members took an interest in them, for at all the visits that had been held the members had attended in great numbers, and showed that the knowledge to be gained by these visits was worth all the time, and perhaps a little trouble, that had to be given. Very interesting papers had been read to the members on the sessional meeting

evenings, and these had proved successful and interesting by the discussions that followed.

Mr. Griffin, who responded, said that at the last annual dinner a monthly journal, to be issued by the Institute, was talked about, and that matter, he might say, had not by any means been forgotten.

The Chairman then proposed the toast of "The Visitors," coupled with the names of Mr. G. A. Crowther and Mr. W. Whitaker, B.A.

Mr. Crowther, in the course of his reply, referred to the value to those engaged in sanitary works of visits to works and places of interest. He wished he could get members of his Council to visit places where work was going on, for that would help him in his work very materially.

Mr. Whitaker spoke to the same effect as to visits to works, and said that there was only a friendly rivalry between the Institute and the Royal Sanitary Institute. If the Institute of Sanitary Engineers increased and prospered, as he hoped it would, they would do no one any harm.

Dr. Thresh then gave the toast of "The Press," and in doing so said he was not at all certain that the Institute would be well advised in producing a journal as was proposed.

With the toast the names of Mr. C. Ady and Mr. Thompson were coupled, and these gentlemen having responded, the proceedings terminated.

The half-yearly meeting of the Institute was held in the afternoon, in the offices, Bloomsbury-square, W.C., Mr. J. T. Griffin, Chairman of Council, in the chair. The half-yearly report was presented, which showed a membership of 540—a large increase over the preceding year. The report also showed the great help which had been given to those who were desirous of becoming sanitary engineers by the help of the examinations which had been held in the provinces. Mr. J. A. Crowther, engineer, Southampton, was elected President for the ensuing year, and other officers were elected.

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring Gardens, S.W., Mr. J. Williams Benn, Chairman, presiding.

Loans.—On the recommendation of the Finance Committee, it was agreed to lend Bermondsey Borough Council 16,457*l.* for paving works; and Lewisham Borough Council 8,828*l.* for a similar purpose. Sanction was also given to the following: Hackney Borough Council, sanction to borrow 8,900*l.* for sewer works; Lambeth Borough Council sanction to borrow 3,411*l.* for paving works; Shorelditch Borough Council sanction to borrow 1,255*l.* for street lighting purposes, and Westminster City Council 1,966*l.* for contribution to cost of street improvement.

Lines of Frontage and Projections.—The Building Act Committee recommended that the Council, in the exercise of its powers under section 22 of the London Building Act, 1894, but in no way otherwise than under such section, do consent to the erection of a one-story lavatory addition in front of No. 62, Portland-place, St. Marylebone, to abut upon Weymouth-street, to the line shown on the plan, dated October 1, 1904, submitted with the application of Mr. H. Laks, on behalf of Mr. W. Tebb.

Mr. Lewis moved, and Mr. Spokes seconded, that all words after "that" in the first line should be omitted, and that the following words be added: "Considering it undesirable that an addition should be made to an existing projection beyond the building line, the Council, under the exercise of its powers, do not consent to the erection of any addition."

Messrs. E. White, J. Burns, Howell Williams, and Strans spoke in support of the amendment, which was subsequently carried.

Proposed New Westminster Fire Station.—The Fire Brigade Committee recommended, and it was agreed, that the estimate of 14,360*l.*, submitted by the Finance Committee, in respect of the erection of the new Westminster fire-station be approved, and that expenditure not exceeding that amount be authorised; that of this amount the sum of 13,250*l.* be authorised for the work of erecting the station; that the work be executed by the Council without the intervention of a contractor; and that the drawings, specification, quantities, and the architect's revised estimate be referred to the Works Committee for that purpose.

Standardisation of Rolling Stock, etc.—The

Highways Committee recommended, and it was agreed, that the special maintenance estimate of 350*l.*, submitted by the Finance Committee, be approved; that expenditure not exceeding that amount be sanctioned in connection with the standardisation of the rolling stock used for the London County Council Tramways.

Map of London.—On the recommendation of the General Purposes Committee, it was resolved to allocate a sum of 200*l.* for the purpose of preparing a pocket map of London, showing the property under the control of the Council, such as the schools, working-class dwellings, and other buildings.

Vauxhall Bridge.—Mr. Straus, the Chairman of the Bridges Committee, in reply to a question, admitted that the progress of the work on the new Vauxhall Bridge was very slow, but the quality of the work was of the most satisfactory character.

Motor Fire Engines.—The Fire Brigade Committee recommended that tenders be invited for the supply of a motor steam fire engine.

Sir McVill Beachcroft asked the Chairman of the Committee if he considered that motor-traction was satisfactorily adaptable to fire engines.

Mr. E. Smith said that the motor-engine in the possession of the brigade had been fairly satisfactory, but there were things about them which rendered them less reliable than engines drawn by horses. The committee were watching every invention in that form of traction and its adaptability to fire brigade purposes, and they hoped to make a fuller report in due course. At present, however, they could not entirely rely on motor fire engines.

The recommendation was adopted.

Proposed Legislation.—The Council approved of the form of the London County Council (General Powers) Bill, the Tramways Bill, and the London Port and Docks Commission Bill, which are to be promoted in the ensuing session. In reference to the General Powers Bill the following recommendations were agreed to:—

(a) That the resolution of 21st June, 1904, directing that application be made in the next session of Parliament for powers enabling sanitary authorities to require owners to make reasonable provision for the supply of water to the tenants of each floor in tenement houses, be rescinded.

(b) That the resolution of 21st June, 1904, directing that application be made in the next session of Parliament for powers enabling sanitary authorities to undertake, if they think fit, the collection and removal of offensive trade refuse; and empowering them to require payment of a reasonable sum by the owner or occupier of any premises from which such refuse is removed, be rescinded.

(c) That the London County Council (General Powers) Bill be approved; that the seal of the Council be affixed to a petition for leave to bring in the Bill; and that the Bill and petition be deposited pursuant to the standing orders of Parliament, and with such necessary alterations (if any) in the Bill as the Parliamentary Committee may consider desirable.

Proposed County Hall.—Mr. John Piggott, in accordance with notice, moved that, having regard to the fact that the Council's present rental in respect of the inadequate and disconnected chief offices, comprising over twenty-five separate blocks of buildings, amounts to over 34,000*l.*, and also having regard to the increasing extra expense, loss of time, and inconvenience caused by the departments of the Council's service being so far removed from each other, and to the pressing need for adequate office accommodation for the staff, it be referred to the Establishment Committee to consider and report, as quickly as possible, upon sites available for a county hall and offices, and that the Committee do submit a definite recommendation for the acquisition of the site which, in their opinion, is most suitable for the Council's purposes.

Mr. Edward White seconded the motion, which was carried without any discussion, and the Council adjourned.

PANAMA ARMS AND FLAG.—It is reported in the *Bulletin Commercial*, of Brussels, that the Government of Panama have opened an international competition for designs suitable for the arms, also for the flag, of the Republic. Details of colour and designs are left to the discretion of the competitors. A prize of 200 gold piastres (about 40*l.*) will be awarded for each of the designs adopted. Competing designs will be received at the office of the Secretary for Public Works, Panama, until the first meeting of the National Assembly in 1905.

Illustrations.

THE BOURSE, PARIS: AS RECENT ADDED TO.

THE Paris Bourse, commenced in 1808 from the design of Brogniart and completed in 1827 by Labarre, had been long insufficient for its modern uses. Its enlargement, decided on in 1900, commenced, under the superintendence of M. Cavel, in February 1901 and completed in December 1903, when the new buildings were formally opened. Two months therefore sufficed to carry out the important work, without any interruption of the daily business of the Bourse.

The original building had no basement cellarage, but was merely erected on the surface of the ground. A large subterranean story, now been carried out, including galleys for the passage of vehicles, and for the service of lighting, heating, ventilation, electric lifts, etc., a kitchen to furnish the lunch room, a printing-press, and various other accessory departments.

In regard to the architectural aspect M. Cavel rightly judged that in adding to a piece of purely symmetrical columnar architecture, the only course was to continue the order of columns and the whole architectural ordonnance round the new wings, so as to link up as little as possible the homogeneous character of the design; and in this he has been very successful.

In a building of this classic style, with a central area, the lighting of the new basement was of course a considerable difficulty, which has been solved by the employment of filigree partitions formed of the Luxfer Plate Company's prismatic glazing, which allows floors that transmit light without being practically transparent. The two interior views show the ground floor of one of the new wings entirely floored with Luxfer prismatic glass, lighting the basement below. The interior shows a portion of the basement with the corridors, all lighted by this means.

The estimated cost of the new building was 4 million francs, but it actually amounted to 6 millions. However, it is a thoroughly good piece of work, architecturally and structurally.

SHIPTON COURT, OXON.

The drawings represent some of the interior in an early XVIIIth century house, originally known as "Shipton-under-Wychwood," as modelled from the designs and under the superintendence of Messrs. Perkin & Bulmer-Leads.

The drawing was exhibited at the last Royal Academy.

CHURCH OF ST. CHRISTOPHER, HASLEMERE.

THE new church of St. Christopher, at Haslemere, is a chapel of ease to the parish church. It is designed to seat 200 worshippers, exclusive of the choir and clergy, and with a view to possible enlargement in the future by the addition of an aisle on the north side. There is a room over the vestries for various parocesan uses.

The church is built of Bargate stone (the local rag stone), with dressings of Weldon stone, and is seated with chairs. The font is made of Ancaster weather bed, and the pulpit of oak on a stone base.

The lectern, of wrought-iron and leather, by Mr. W. Bainbridge-Reynolds, and so is the whole of the wrought-iron work in strap hinges and handles and the tower cross; the latter gilded.

The figure of St. Christopher in the niche the west door is in cast lead, and is the work of Mrs. M. D. Spooner.

The church was built by the Haslemere Builders, Limited. Messrs. Spooner & Coburn are the architects.

MEMORIAL CHURCH, MALVERN L.L.

THE church here illustrated, which was erected as a memorial to Archdeacon Livington, and is dedicated in honour of the Saviour's Ascension, consists of a nave and choir. There are no aisles, and the vestries are below the choir, advantage being taken of the natural fall of the ground. At the west end is the baptistery, and above that organ is placed. The nave is spanned

Memorial Church, Malvern Link.

transverse stone groins, between which is a plaster barrel vault. The choir, three bays in length, is vaulted with stone transverse and diagonal ribs, with plaster filling. An arched clearstory runs the entire length of the church. Coupled lancet windows light the nave, the choir having single lancets. At the entrance to the choir is placed a wrought-iron hammered screen, partially gilt, and above this, at the springing of the choir arch, is the roof, of oak, stained and gilded. At the east end of the choir is a triplet lancet window, containing the subject of the Ascension, the treatment being that of single figures on grisaille work. Below is a painted triptych in red and gold, the centre panel of which contains a picture of the Virgin and Child, with attendant Saints in the surrounding panels. The triptych stands on a stone base, bearing the inscription, "O oriens splendor lucis aeterna veni et illumina," and a carved rose and rays in the centre, brought out by means of gold and colour. The festal frontal is of silk damask, with panels of the three archangels, Gabriel, Raphael, and Uriel, worked in silk on a gold ground, alternating with panels of gold arabesque. The font is of Irish grey marble, eight-sided, with detached shafts. A metal cover hangs from the vaulted ceiling, of copper, parcel gilt. Over the baptismal arch stands the figure of S. Michael. At the western face of the tower, externally, is a carved representation of the Ascension, with the inscription, "Ascendisti in altum cepisti captivitatem." The choir stalls, pulpit, lectern, and other fittings are of oak. The floors of the choir and baptismal are of black and white marble. The walls externally are plastered with a fair quantity of Guiting stone used for the dressings. Internally the latter are of Farleigh Down. The roofs are covered with stone slates. Adjacent to the church at its eastern end is the parish room.

Mr. W. J. Tapper, of London, was the architect, and the builders were Messrs. Stephens, Bastow, & Co., of Bristol.

APPLICATIONS UNDER THE 1894 BUILDING ACT.

THE London County Council at their meeting on Tuesday dealt with the following applications under the London Building Act, 1894. The names of applicants are given between parentheses:—

Norwood.—(a) That the resolution of September 1, consenting to the erection of buildings on a piece of land on the east side of Poplar-walk and the south side of Feridene-road, Herne Hill, be rescinded; (b) that the Council do not consent to the erection of buildings on a piece of land on the east side of Poplar-walk and the south side of Feridene-road, Herne Hill, to abut also upon proposed new streets (Messrs. R. Ellis & Son for Mr. R. A. Sanders).—Agreed.

Lines of Frontage and Projections.

Hackney, South.—Additions to a building at No. 17, Sutton-place, Hackney, to abut upon Urswick-road (Mr. J. Hamilton for Mr. T. C. Wootton and Messrs. Barlow & Son).—Consent.

Haggerston.—That the application of Mr. G. H. Lovegrove for an extension of the periods within which the erection of a building upon the site of Nos. 225 and 227, Hackney-road, Haggerston, was required to be commenced and completed be granted.—Consent.

Kennington.—That the application of Mr. F. Hingston for an extension of the period within which the erection of bay-windows and a porch to No. 52, Priory-road, South Lambeth, was required to be commenced be granted.—Consent.

Norwood.—Six houses on a site abutting

upon the southern side of Park-road and western side of Clive-road, Norwood (Mr. P. Stock for Mr. G. E. Freeman).—Consent.

St. George, Hanover-square.—A projecting porch at No. 6, Upper Brook-street, Grosvenor-square, St. George, Hanover-square (Mr. R. Armstrong for Mrs. Seymour).—Consent.

Battersea.—That the application of Mr. M. Fitzmaurice for an extension of the periods within which the erection of a pumping station on a site abutting upon the east side of York-road and the north side of Creek-street, Battersea, was required to be commenced and completed be granted.—Consent.

Wandswoth.—A one-story building upon part of the forecourt of the premises of Messrs. Pickfords, Ltd., on the southern side of Grove-road, Balham (Mr. J. E. Beaumont for Messrs. Pickfords, Ltd.).—Refused.

Width of Way.

Bow and Bromley.—Buildings upon a site abutting upon the eastern side of High-street and southern side of Ammiel-terrace, Bromley, with external walls at less than the prescribed distance from the centre of the roadway of Ammiel-terrace (Mr. H. Heckford for the Council of the Metropolitan Borough of Poplar).—Consent.

Lewisham.—School buildings on the eastern side of Kelvin-grove, Sydenham Hill-road, Lewisham, with a forecourt fence at less than the prescribed distance from the centre of the roadway of the street (Mr. T. J. Bailey for the Education Committee of the Council).—Consent.

Formation of Streets, etc.

Lewisham.—That the application of Mr. H. Porter for an extension of the period within which the roadway of a new street to lead from Woolstone-road to Cranston-road, Lewisham, was required to be clearly defined throughout by posts and rails or so otherwise as the Council might permit and thrown open to the public as a highway, be granted.—Consent.

Hackney, Central.—That an order be issued to Mr. C. Winkley refusing to sanction the formation or laying out of a street for foot traffic only to lead out of the western side of Priory-place, Well-street, Hackney, the widening of a portion of Priory-place and the erection of buildings.—Agreed.

Space at Rear.

Lewisham.—A modification of the provisions of section 41 with regard to open spaces about buildings, so far as relates to the proposed erection of a building on the south side of Dunoon-road, Forest Hill, with an irregular open space at the rear (Mr. H. L. Upham for Mr. C. Walker).—Consent.

Lines of Frontage, Projections, and Deviation from Certified Plans.

Strand.—A building upon the site of Nos. 36 and 36a, St. James'-street, and No. 64, Jermyn-street, St. James', Westminster (Mr. W. Woodward for Mr. L. Thomas).—Consent.

The recommendations marked + are contrary to the views of the local authority.

APPOINTMENT.—The Shoreditch Borough Council, at their meeting on Tuesday last, appointed Mr. A. G. Cross, F.S.I., and member of the Quantity Surveyors' Association, of Old Queen-street, Westminster, their quantity surveyor in connexion with the rebuilding of the town hall, a portion of which was destroyed by fire in August last.

TASMANIAN WAR MEMORIAL.—A bronze statue representing a soldier in the field has just been shipped to Hobart for erection in the public park in memory of the colonists who served in the South African war. The statue is the work of Mr. Benjamin Sheppard, of Chelsea.

ARCHITECTURAL SOCIETIES.

THE LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.—At the rooms of this Society, on Thursday the 1st inst., Mr. Alexander McGibbon, of Glasgow, read a paper on "Byzantine Architecture." The justification for this subject, he said, was found in the current popularity of the style, notably in the new Westminster Cathedral and some of the paper designs for the Liverpool Cathedral, and a large number of students' competitions, and as a suggested counteraction to *L'Art Nouveau*, whose vogue can only be explained as a protest against the restraints of orthodox architecture. Designing architecture in "styles," as commonly understood, was defended by the lecturer. Byzantine architecture was described as Romanesque, modified in its principal features, and it has been defined as mediæval Greek. Whatever the first intention, in effect the style was one of interiors principally; for, as with many of the Italian Romanesque Churches, the exteriors were bald, but the idea seems to have been marble veneer. Rustication was not employed, but the traditional Romanesque use of tiles brought about the first appearance of polychromatic architecture. The constructive methods were ingenious, but not perhaps, for modern builders, very instructive. An interesting point was that truth in architecture was much more in evidence then than with Gothic or Renaissance builders, for semi-circular vaults were not sheltered under a wooden roof, and there was no false dome. When height was wanted, the later usage was to elevate the dome on a drum, but still the form that was seen internally was that of the exterior. The absence of mouldings was noticeable, but suggestive to present-day designers. Of their mosaic little need be said, and they were of glass rather than marble or encaustic tesserae. The carvings in capitals were very characteristic, largely influenced by drill work, and the decorative effect realised in flat surface treatment was more like painting or inlay than carving of the bossy sort we are accustomed to. The ornament was taken from metal work, but the transference to another material was not allowed to influence the form. A number of lantern slides, illustrating the various points of the lecture, were shown on the screen.

ARCHITECTURAL SECTION OF THE GLASGOW PHILOSOPHICAL SOCIETY.—At a meeting of the Architectural Section of the Royal Philosophical Society of Glasgow, held on the 28th ult., Mr. Neil McWhannell, the President, in the chair, Mr. Samuel Smith, clerk of works at the new Technical College Buildings, read a paper on the "Decay of Stone in Buildings." After introducing the subject, Mr. Smith said that decay in buildings, in a great many cases, might be attributed to the cementing materials of the stones being of clay, on which the action of frost has a disintegrating effect. The stones, which showed no signs of decay on examination, would be found to be covered with a hard skin which protected them from atmospheric action. In every stone when it was newly quarried there was a certain amount of moisture or natural sap. In many cases, where the binding material had been of a felspathic nature, this moisture had in solution a quantity of one of the alkaline silicates. As the sap dried out the soluble silicate came to the surface of the stone, when by the action of the carbonic acid in the atmosphere it was decomposed, and a coating of insoluble silica was deposited on the surface of the stone. This coating protected the stone from atmospheric action, thereby preventing decay. It did not always follow that a stone which showed good weathering qualities when built in the district in which it had been quarried would possess the same good qualities in every district. Cleopatra's Needle stood the Egyptian atmosphere for 2,000 years, but commenced to decay immediately after its erection in London, and there were similar results with stone built in Glasgow. In the author's opinion, the chief cause of decay in Glasgow was the amount of sulphur acids in the atmosphere. These acids attacked very readily stones of which the binding material was the carbonate of lime or magnesia. A practical proof of this was to be seen, until the erection of a verandah a few days ago, at the exit from the Central Low Level Station, on the west side of Hope-street, the masonry above the doorway all showing signs of decaying very badly; while on the other parts of the building there was very little if any decay. Passing on to discuss the question

as to what stones were the most suitable to use for buildings in Glasgow, he said that in a sulphur-laden atmosphere the stone with the smallest percentage of carbonates had been found to be the least liable to decay, provided that the physical properties of the stone used were in proper order. These conditions were best met by the red sandstone from that part of Dumfriesshire which lies between Thornhill on the north and Dumfries on the south, and includes Catelowbridge, Closeburn, Corncockle, and Locharbriggs Quarries. On some of the older buildings in Glasgow the signs of decay were not so marked as in new buildings. At the time these buildings were erected the city of Glasgow covered a very small area, compared with what it did now, and the sulphur acids would be very quickly diffused among the purr air of the surrounding country districts. The stone with which some of the older houses were built was taken from local quarries, and on analysis had been found to contain less carbonates than the majority of the white stones in use at the present time. The paper was brought to a close by some remarks on the nature and application of various preservatives.

Mr. James Stark said that Mr. Smith had brought forward many reasons unsettling his belief that carbonic acid, dissolving the carbonates, especially of lime, was the cause of the decay of buildings in Glasgow. He would not like, however, to offer a decided opinion on the subject. Mr. David Chalmers said that they were all agreed that both the old red sandstone and the carboniferous rocks readily decayed, especially those of the quarries round Glasgow. But the question was where were they to find a substitute? He did not think it was in the red rocks of Dumfriesshire, as some of the buildings erected with stones from these quarries already showed considerable signs of decay. Dr. R. M. Buchanan did not agree with the theory propounded. In the first place, he said there was difficulty in realising how these sandstone rocks were originally disintegrated without a change of a bio-chemical character. This raised a doubt in his mind as to the feasibility of the view that free carbonic acid was the agent in the disintegration of stone in buildings in Glasgow. If sulphuric acid was the agent, why was not the whole surface not washed by rain decayed? The localisation of the decay suggested that they had to deal with a process not purely owing to atmospheric conditions, but to a process under the control of vital agencies. His view was that decay was primarily due to living organisms in the stone. These living organisms broke down the stone, liberating sulphates, which readily combined with the sulphuric acid in the atmosphere, and which were then built up again. He admitted, however, that without carbonate in excess the process of decay would not go on.

SHEFFIELD SOCIETY OF ARCHITECTS.—A meeting of this Society was held recently in the Society's room, Leopold-street, when Mr. J. R. Wigfull lectured on "The Lanct Period of English Architecture." He urged the necessity of studying the history of a country side by side with its architecture. In illustration of this he pointed out that in the middle of the XIIIth century what is now France was divided up into a number of separate provinces, about half of which were under the government or indirect control of the King of England. To say, therefore, that Gothic architecture was the invention of the French was misleading if one regarded France in its modern aspect of one country and one people. By the help of plans of various cathedrals the lecturer showed that, although starting from one point, the architects of England and France worked on more or less independent lines, and by the commencement of the XIIIth century each evolved a distinct type, as shown in the contemporary cathedrals of Amiens and Salisbury. He pointed out that the plans of our English cathedrals were largely influenced by the monastic desire for a large presbytery, while the great cathedrals of Central France, intended more for general worship, were quite different in arrangement. The lecturer then dealt with the introduction of the pointed arch, showing that the difficulty of vaulting oblong and irregular spaces with the round arch led to the use of the pointed form, one which, while more readily adapted to varying spans, had the advantage of being better constructionally. The general design of various features of the buildings of the period was described and illustrated by slides from photographs and measured drawings made by the lecturer, who laid stress on the desirability

of studying a portion of a building, such as a bay or the end of a nave, choir, or transept, as a whole, and not merely a small feature separated from its surroundings in the way common amongst many students. On the motion of Mr. C. Pawsou, seconded by Mr. F. H. Wrench, and supported by Messrs. H. L. Paterson, E. M. Gibbs, and W. G. Buck, a hearty vote of thanks was accorded to Mr. Wigfull for his lecture, which was illustrated by lantern slides, exhibited by Mr. J. Atkinson, of University College.

ENGINEERING SOCIETIES.

THE JUNIOR INSTITUTION OF ENGINEERS.—There was an exceptionally large attendance at the meeting of this Institution held at the Westminster Palace Hotel on the 3rd inst., the Chairman, Mr. Samuel Cutler, jun., presiding, when a paper entitled "Some Points of Interest on Torpedo Boat Construction" was read by Mr. H. E. Yarrow, Stud. Inst. C.E., of Poplar. Commencing with considerations with respect to the hull, the author showed the importance of realising in the design the maximum strength with the minimum weight, uniform elasticity throughout its length being essential. Any sudden change of section in these lightly constructed vessels formed a source of great danger, and it was quite possible, by adding material, to reduce the actual strength. It was of great importance to minimise vibration as much as possible, and the author illustrated by means of lantern slides the effect of a properly balanced engine on the stability of the boat itself. With the use of high pressure steam the paper showed how imperative it was to specially consider the best practice relating to steam pipes, those of small diameter being recommended for various reasons, amongst them being superheating of the steam and ensuring that each boiler was developing approximately its proper proportion of the power required. Referring to steam turbines, the author held that, although they possessed many advantages over reciprocating engines, they could not be regarded as economical for varying speeds as in torpedo boats. He alluded favourably to the explosive type of engine, which was developing so rapidly at the present time.

COMPETITIONS.

Y.M.C.A. PREMISES, PAISLEY.—The Building Committee of the Paisley Young Men's Christian Association have now accepted the plans for the new buildings to be erected by them at High-street and New-street. In connexion with the buildings, several local architects had sent in competitive plans, which were submitted to Mr. H. E. Clifford, architect, Glasgow, as adjudicator. Mr. Clifford awarded first position to the plans of Mr. T. G. Abercrombie, architect, Paisley, whose designs the Building Committee have now adopted. Mr. Abercrombie's plans show a four-story building in High-street, consisting of shops, offices, and rooms, with main entrance to the institute, and there is also a building to the rear with frontage in New-street. In the latter building there is to be a hall capable of accommodating 500, and the classrooms, clubrooms, janitor's house, etc., will also be in the rear premises. The buildings, including site, are estimated to cost between 10,000l. and 12,000l.

BOOKS RECEIVED.

PAPERS OF THE BRITISH SCHOOL AT ROME, Vol. II. By T. Ashby, jun., F.S.A. (Macmillan & Co., 30s.)

ENGLISH METAL WORK: Ninety-three drawings. By W. Twopeny (1797-1873), with a preface by Laurence Binyon (Archibald Constable & Co., 15s.)

THE TABERNACLE: ITS HISTORY AND STRUCTURE. By the Rev. W. Shaw Caldercott (The Religious Tract Society, 5s.)

ARBITRATIONS. By Banis'er Fletcher, F.R.I.B.A. Third edition. (B. T. Batsford, 5s. 6d.)

THE CONDUCT OF BUILDING WORK. By J. Leaning, F.S.I. Second edition. (B. T. Batsford, 2s. 6d.)

THEATRE, CARDIFF.—A new theatre is to be erected in Park-place, Cardiff, from plans prepared by Messrs. Ernest Runtz & Ford, London. The new theatre will be constructed of red brick, with terra-cotta mouldings. The auditorium will accommodate about 2,000 persons. The stage will be 70 ft. wide by 45 ft. deep, and there will be twenty dressing-rooms.

Correspondence.

THE JOINERY TRADE.

SIR.—Your correspondent, "A London Builder," complains that he cannot produce doors, sashes, frames, etc., at prices that will compete with those of foreign manufacturers. A great deal depends on the quantity he puts in hand. Of course, he could not make two or three of each at prices anything like what he could buy foreign. But if he can not produce joinery in quantities of, say, 20 or 300 at a cost considerably less, and of much better quality than anything that comes from abroad, there must be something wrong with his management. A short time ago we required a quantity of 2-in. doors of a certain size. Being rather slack, we decided to make them, and the result was that we were able to produce for 18s. 2d. what would have cost us 22s. 6d. had we bought foreign. I could name several large works in London where joinery such as he mentions is made to such profit that the proprietors are laying down special plant for this purpose. I agree with him that the local rates and the requirements of the Factory Act form a severe handicap to the London manufacturer, but to fall to see how the tax he proposes would help him, most of the imported joinery being made cheaply at the large converting mills in timber-producing countries. The manufacturer who sends the joinery your correspondent complains of likewise sends the timber which constitutes our raw stuff, so if we put a tax on manufacturing goods, it simply follows that the manufacturer will raise the price of his raw stuff against us which would mean a raising of prices all round to benefit nobody. The organisation of business which allows of no waste either of time or material, and the cutting of all unnecessary expenses are the principal factors in getting work out cheaply.

A SHOP FOREMAN.

FIRE-RESISTING FLOORS.

SIR.—Adverting to Mr. E. O. Sachs' letter in your issue of the 3rd inst., the words he used when writing on the lessons of the Baltic more fire were:—"The necessity of prohibiting the use of terra-cotta hollow floors with thin webs in such classes of buildings, unless the superimposed concrete filling is self-supporting, and the terra-cotta tiles used merely to take the place of centering."

Mr. Fawcett anticipated all this nearly seventeen years ago by his patent of February 25, 1838, and we have made this form of floor ever since. We do not see why we should not call attention to the fact by advertisement, if we think proper to do so.

BRETT A. ELPHECIE
(for Mark Fawcett & Co.)

PROPOSED NEW POLICE AND FIRE STATIONS, BRISTOL.

SIR.—As most of your readers are aware, in this competition no professional assessor is to be appointed, and both the Institute Committee and Competition Reform Society have issued notices to their respective members that, for that and other reasons, the conditions are unsatisfactory.

I should like to supplement this by stating that the Council of the Bristol Society of Architects, has, through the President and Hon. Secretary, addressed a circular letter to each member of the Watch Committee pointing out (1) that in the very large majority of architectural competitions promoted by public bodies, such a professional assessor is engaged, and consequently, the confidence of intending competitors is secured; (2) that a very large proportion of architects have, for a considerable time past, engaged to abstain from all public competitions in which no assessor is appointed, and that numbered amongst their ranks are nearly all the well-known architects of eminence in various branches of their profession; it is evident, therefore, that the designs submitted will not be likely to be of a high order if the majority of the best men are excluded; (3) in the recent competition for the Bristol Central Library a professional assessor was appointed, and that we believed that the principle of appointing an assessor had been adopted by the Bristol Corporation for all succeeding competitions, and it is a source of much disappointment to us that, in this instance, the principle for which the architectural profession contends so strongly has been departed from.

It was also added that architects outside the district should have confidence that no local bias has in any way affected the decision, and that this confidence was obtained by the appointment of an independent professional assessor.

An examination of the site plan issued with

show that no details of the existing police courts are given; these were recently added to by a local architect, and there would have been no difficulty in obtaining information so essential to competitors, the absence of which must place them at a great disadvantage.

We think, sir, that these facts will be sufficient to show that all self-respecting architects will be wise loyally to conform to the request of the R.I.B.A. not to enter a competition of so unsatisfactory a character.

GEORGE H. OATLEY, President.
H. DARE BRYAN, Hon. Sec.
Bristol Society of Architects,
Fine Arts Academy, Bristol.

A MYSTERIOUS COMPETITION.

SIR.—It would be interesting to know if any of your readers have news of a mysterious competition, the drawings for which were sent in nearly six months ago. It was for alterations to the Shire Hall, Bury St. Edmunds, and the County Surveyor, Mr. Ainsworth Hunt, was to be the assessor. One guinea was paid for the particulars. No information is forthcoming as to what has been done except that Mr. Hunt has been ill. If this illness has lasted six months, is it not about time that the Council appointed another assessor? Such proceedings are hardly courteous to the competitors.

I would suggest that the competitors should take some strong and joint action in this matter. I enclose my card. MYSTERIFIED.

The Student's Column.

ASPHALT: ITS COMPOSITION AND PROPERTIES.—I.

THE use of asphaltic materials for a variety of architectural and engineering purposes is increasing year by year, and it is to give some account of the origin, preparation, composition, and characteristic properties of the various forms that this short series of articles is written. The mode of application of asphalt to roadways, and of bitumen for securing watertight qualities, has received attention in engineering circles and been recorded in the technical press, and this aspect will therefore not be dealt with except so far as is necessary to explain the distinctive properties of the several substances. It will, however, be seen, as the subject unfolds, that the lessons of practical work are, of the first importance, and that, valuable as is the information furnished by mechanical or other tests, they must be associated with experience of the same material under working conditions. As, however, the sources of supply of asphaltic materials are continually enlarging, and include not only new specimens of natural products, but also of artificial imitations, it becomes necessary to have aids in discriminating their worth.

To be able to do this, it is necessary to describe the behaviour of materials of proved value for the purpose in question, to describe the various adulterants or inferior substances that are likely to be met with, and give, as far as present-day information will allow, the means of separation and estimation of the desirable constituents.

The two distinctive qualities of asphaltic materials are (a) elasticity and (b) imperviousness to moisture, and they are in direct antithesis to the qualities of concrete. The two materials are correlative; they have their separate functions, which when applied each in its proper place may combine to produce the most useful effect.

The difference in elasticity is made use of in the construction of foundations to steam hammers, engines, heavy machinery, etc., where vibration has to be absorbed. This may be accomplished by building (a) layers of good concrete, alternating with sheets of bitumen, (b) building in bituminous concrete, (c) filling into a steel framework compressed asphalt rock powder. On the other hand, the elastic nature of asphalt, which keeps it from cracking even under considerable changes of temperature, requires that it shall be supported by an unyielding foundation such as is secured by good Portland cement concrete; and it is upon this fact that success in asphalt pavements and in watertight layers largely depends. Wherever a pressure of water has to be resisted, that must be opposed by concrete or other equivalent, the accommodation to changes of shape and the prevention of percolation being supplied by the asphalt.

The "accommodation" of asphalt is the reason of its long life under heavy street traffic, it having been found that compressed asphalt is always more dense in the upper layers than the lower, even when the thickness has been reduced by wear to only $\frac{1}{2}$ in. thick. The surface which receives the shock of the vehicular traffic, therefore, always rests on a cushion, and is elastic to the tread of animals.

Asphalt paving was first introduced in Paris in 1838, and its use has now become so extended as to require annually 600,000 tons of the natural rock, in addition to the substitutes made in Europe and America. The experience gained in the early years of the industry have been set forth in the volume published in 1886 by M. Leon Malo, and in the papers read by Mr. W. H. Delano before the Institution of Civil Engineers (see vols. 43, 60, and 152 of their Proceedings), and this information forms the groundwork of our knowledge of the utility of the natural materials.

As applied to roadways and footpaths, these materials fall into two classes:—(a) Compressed asphalt powder, (b) asphalt mastic.

The first is the natural asphalt rock ground to fine powder, and must be of such composition as will agglutinate its particles under the pressure and heat of the hot iron tools used for ramming. It is essentially a base of pure limestone impregnated with a minimum of 10 per cent. of bitumen.

The second is the same material as the first, but to which a quantity of bitumen has been added to make it liquefy at a moderate temperature, and enable it to be floated and worked under trowels.

It is convenient in studying natural rock asphalt clearly to comprehend that it is dependent upon two leading factors, the first of which is occasionally sandstone but generally limestone in a pure and finely divided state, and the second of which is "bitumen," a term used to express those organic substances which give it the distinctive properties of agglutination, elasticity, etc., and which are found to be soluble in bisulphide of carbon. Ideal asphalt for a compressed roadway is composed of pure limestone uniformly impregnated with 9 to 10 per cent. of bitumen, non-evaporative at a temperature of 428° Fahr. Bitumen, as shown by Boussingault, is composed of carbon 85 parts, hydrogen 12 parts, and oxygen 3 parts by weight, corresponding approximately and empirically to the formula $C_{85}H_{12}O_3$. It is found almost pure in various places, as will subsequently be described, but "pure bitumen" is not the constituent which is exclusively desired in the mixture known as natural asphalt.

What is required is a mixture of substances of the bitumen class such as shall give a suitable melting point, with an absence of brittleness, and shall do this without deterioration under the changes of atmospheric temperature and exposure that will come upon it.

These bitumen-like constituents extend on the one hand towards the nature of petroleum and on the other towards pure bitumen, which has its natural prototypes in the manjak of Barbados and in the veins of New Brunswick and Benheim in Hanover. The oil-like components tend to decrease the melting point, but if present in excess cause creeping under changes of atmosphere and abrasion of wheel traffic, whilst the "pure bitumen" tends to brittleness and to a considerable increase in the melting point. It is upon the respective proportions of the intermediate components, and their total percentage in the asphalt rock, that its behaviour depends. These facts have been slowly evolved by repeated investigations by chemists in Europe and America, made for the purpose of learning the synthesis of the natural material and how it might be artificially reproduced; but the first researches were made by a means which stated the result as bitumen without any fractionation—viz., by extraction with carbon bisulphide. For the manufacture of asphalt mastic, bitumen must be added to the natural rock after grinding, and for this purpose "Trinidad Lake asphalt" is found to be the best, because of its composition, which corresponds more or less completely with the mixture of bitumens in the European rock asphalt.

There are, however, on the Island of Trinidad every shade and variety of asphalt, from petroleum to manjak, and it is that found in La Brea (the Spanish term for Pitch Lake) that is found to be the most satisfactory for blending. How far this is a pure mixture of bitumen will be seen from the analyses to be given later.

WESTMINSTER CITY COUNCIL.

The usual fortnightly meeting of this Council was held at the City Hall, Charing Cross-road, on Thursday last week.

Workmen's Hours of Labour.—The General Purposes Committee, having again considered this question, recommended that the existing hours of labour of employees in both the Works and Highways Departments be not altered, and that the City of Westminster Municipal Labour Union (who petitioned the Council for a revision) should be informed accordingly. This was agreed to.

Haymarket Electric Railway Station.—The Works Committee reported that they understood from the plans of the proposed alterations in the lifts at this station that passengers would alight from the four exit lifts only 6 ft. from the old street line in Jermyn-street. The footways of that thoroughfare were narrow, and as it appeared to the Committee that there was a likelihood of serious inconvenience being caused to pedestrians, they had drawn the attention of the London County Council to the matter.

Metropolitan Paving Committee.—On the recommendation of the Committee Alderman Emden was reappointed the Council's representative on this Committee for the ensuing year.

Piccadilly Widening.—After a long discussion on a further report of the Improvements Committee on this matter it was agreed to inform the London County Council that the City Council was prepared to contribute an amount equal to one-seventh of the total cost, the recommendation of the Committee that no increase should be made in the contribution being lost.

District Surveyors and Plans of Drainage Work.—The Public Health Committee reported having received a letter from the London County Council, dated November 18, in reply to the City Council's letter of July 15 last, suggesting that district surveyors, in all cases in which plans of new buildings submitted to them include proposed work which is subject to the supervision of the sanitary authority, should call the attention of the persons submitting such plans to the fact. The County Council stated that in March, 1899, copies of a notice drawing the attention of builders and others to the fact that the district surveyors had no control over matters relating to the sanitary arrangement of buildings, in respect of which the approval of the local authority was necessary, were sent by the County Council to district surveyors for exhibition in their district offices; that they did not feel that they could require district surveyors to undertake the duty of specially examining plans with a view to ascertaining whether or not notice was required to be given to the sanitary authority; but that, with a view, however, to meeting as far as possible, the wishes of the City Council, they had given instructions for further copies of the notice above referred to to be sent to each district surveyor.

OFFICIAL ENGINEERS AND SURVEYORS AND ARCHITECTURAL WORKS.

The Royal Institute of British Architects have sent the following memorial to various public bodies:—

"That whereas the employment by county or municipal authorities of their officials to execute works of architectural importance is a matter involving grave interests of an artistic, practical, and financial nature, it is for the general welfare of the community that such employment should be regulated by certain conditions.

The Royal Institute of British Architects and the Allied Architectural Societies respectfully beg leave to point out:

- (1) That when the official is an engineer or surveyor, the artistic aspect of buildings designed by him is apt to be overlooked or misunderstood by reason of his not having received the artistic training of an architect.
- (2) That the engineer or surveyor in planning and arranging buildings is fettered by the lack of expert knowledge possessed by architects.
- (3) That greater expense is incurred by employing an engineer or surveyor than by employing an architect. Non-expert planning entails unscientific distribution, and consequent expense in construction, often leading to subsequent alterations which involve waste of public money, the amount of which is impossible to be ascertained owing to the complicated nature of official departments. The saving of an architect's fees is undoubtedly false economy. It is the function of an architect to obtain for his client the best value for money expended, which special experience, not possessed by an engineer or surveyor,

alone enables him to do; further, his independent position compels him to exercise a closer control over expenditure than the salaried official, whose purely personal interests are not intimately involved.

(4) That the time of a county or municipal official is so greatly occupied with administrative work that it is impossible for him, when entrusted with any building scheme of first-class importance, to devote the requisite attention to the essential considerations of artistic design, expert planning, and economic building. Such work is inevitably referred to irresponsible assistants, and an unsatisfactory and expensive building is the result.

The Royal Institute of British Architects and the Allied Architectural Societies therefore respectfully and earnestly urge upon county and municipal authorities:—

(1) That architectural work be not placed in the hands of engineers or surveyors.

(2) That where it is deemed desirable for architectural work to be carried out by a county or municipal official, such official shall be required to have passed the qualifying examinations of the Royal Institute of British Architects.

(3) That the work of an official architect be restricted to structures of secondary importance, and that all buildings of a monumental character be entrusted to independent architects to be selected in such a way as may seem best to the local authority.*

COURT OF COMMON COUNCIL.

THE Lord Mayor presided over a meeting of the Court of Common Council at the Guildhall, on Thursday last week.

The Proposed Embankment Tramways.—Alderman Sir Charles Bell presented a petition from the president and court of governors of Sion College against the proposal for a tramway along the Victoria Embankment. The petition was referred to the Streets Committee.

Memorial from the R.I.B.A.—A memorial from the Royal Institute of British Architects and the allied architectural societies in favour of the employment by county and municipal authorities of architects in the planning and arranging of buildings was referred to the General Purposes Committee.

The City Engineer.—On the recommendation of the Officers' and Clerks' Committee it was agreed that Mr. D. J. Ross, the Engineer to the Public Health Department, should retire (on account of ill-health), and that a retiring allowance of £500 per annum should be made to him during the pleasure of the Court. A lengthy discussion on the duties of the engineer and surveyor ensued, the Committee having come to the conclusion that these should be separate offices. Ultimately the matter was referred to the Streets and the Improvements and Finance Committee.

OBITUARY.

MR. FERGUSON.—We much regret to announce the death, on December 1, at his residence, Caldew Lodge, Carlisle, of Mr. Charles John Ferguson, F.S.A., in his sixty-fifth year. Mr. Ferguson, who practised as an architect and surveyor at No. 50, English-street, Carlisle, and in Kensington, S.W., was, with his brother, the late Richard Saul Ferguson, M.A., F.S.A., Chancellor of the Diocese, a son of the late Joseph Ferguson, M.P. for Carlisle in 1852-7. He was a county magistrate for the Cumberland Ward. On leaving Shrewsbury School Mr. Ferguson was articled to the late Mr. Cory, of Carlisle, with whom he afterwards entered into partnership under the style of Cory & Ferguson, baving, in the meantime, been employed in the offices of Sir George Gilbert Scott.

He was elected an Associate of the Royal Institute of British Architects in 1864. Of Mr. Ferguson's principal architectural works we have published illustrations of the following:—Naworth Castle, additions and alterations for Mr. George Howard, M.P., comprising the Stanley Tower, external courtyard, kitchen offices with bedrooms above, two new staircases, and refitting of the library and music and billiard rooms (March 10, 1863, and September 19, 1865); the extensive additions, at a cost of some 20,000*l.*, to Tullie House, Carlisle (1865), purchased by the Corporation in 1860 for its adaptation for purposes of a school of science and art, public library, and fine art gallery and museum (May 9, 1891; and January 20, 1894, Castle-street entrance); Seascale Church, Cumberland (January 16, 1892); Badsworth Grange, Yorks, for the Misses Heywood-Jones, of Badsworth Hall (June 8, 1895); Clive Church, near Grinshill quarries, Shropshire, general restoration, with new chancel and oak

screens, vestries, tower, and spire (July 3, 1897, with two views of the interior as restored and refitted, and March 5, 1904, perspective view); and his drawn plan of Lanercost Priory, Cumberland, which formed the basis of one made by Mr. E. Ridsdale Tate (October 1, 1898—No. XXVII. of our "Abbeys of Great Britain" series). Amongst his other more important works, we should mention the extensive alterations and improvements he carried out for Lord Armstrong, at Bamborough Castle, of which he exhibited a notable model in the Royal Academy rooms, and which we fully described and illustrated with a plan in our issue of May 30, 1896; Edenhall; and Muncaster Castle. Mr. Ferguson prepared the plans and designs for the enlargement of Milton Hall, Cumberland (1886-7); the smoking-room at Dovenby Hall; the new wing and additional story, Town Hall, Carlisle (1897); the repair and restoration of Moilard Church, Westmorland, with new vestry, stalls, and roof; the column for the memorial to the late J. R. Creighton, erected at the south end of Eden Bridge, Carlisle, in 1893; the restoration of St. Mary's Church, Gosforth; the mission-room, Newtown, Carlisle; Garden House, Fairlaw, Kent; St. Aidan's Church, Warwick-road, Carlisle, with parish rooms and paragonage; the enlargement of "Tynholme," Howard-place, Carlisle, for Mr. F. Robinson (1899); the rebuilding of the central block, University College, Aberystwyth, after the fire in 1885, for the science "side," with laboratories, lecture-rooms, etc., and the official rooms of the college; the new church, Savile Town, Birtley, near Dewsbury, of which the first portion, for 500 sittings, was completed in July, 1900; and Stone Church. Amongst Mr. Ferguson's earliest works are Holy Trinity Church, Bournemouth, cruciform on plan with an apsidal chancel, designed after the Lombardic manner, in 1849; and, with his partner, the two wings of the Cumberland Infirmary, Carlisle. In conjunction with his brother, he was the author of a historical and architectural account of Lanercost Priory, of which fabric he restored the nave and the buildings on the west side some years ago. Mr. Ferguson contributed many papers upon kindred topics to the *Translations of the Cumberland and Westmorland Archaeological and Antiquarian Society*.

We regret exceedingly to have to announce the death, at the early age of thirty-seven, of Mr. F. W. Bedford, an architect whose name is well known to our readers, and whose buildings have often been illustrated in our pages. Mr. Bedford was the head of the firm of Bedford & Kitson, of Leeds, but about a year ago removed to London, though the firm still retained their offices at Leeds. Mr. Bedford was a son of the late Mr. James Bedford, manufacturing chemist, of Leeds, and was articled to Mr. William Thorp, of that city, and, upon the expiration of his indenture, he entered the offices of Messrs. Ernest George and Peto, of London. He subsequently won the Owen Jones scholarship at the Institute of Architects. He started in practice in Leeds in 1892. His early work included "two houses in the old gardens, Headingley, Leeds," two houses, Shireoak-road, Leeds; another house, Shireoak-road, Leeds; "alterations to Meyland House, Leeds; *gymnasium at St. Peter's School, York; *Dalguise, Harrogate; *Braham, Perth (a large house for Mr. R. D. Pullar); *Westwood Croft, Leeds. In 1897 he took Mr. Kitson into partnership. Their formal partnership ceased last year, when he migrated to London, although they continued to act in conjunction in certain work. Other buildings that he carried out were: House in North Hill-road, Headingley; "alterations, resating, and decoration of St. James' Church, Leeds; branch banks for the Yorkshire Banking Company, Ltd., at *Thirsk, *Ripon, *Middlesbrough, *Hunslet, and *York; the "Leeds Overseers' offices (alterations and additions); *St. Aidan's Vicarage, Leeds; "All Hallows Vicarage, Leeds; additions to Shadwell Grange, near Leeds; "Red Court, Scarborough; Free Library, Police Station, and Fire Station in Dewsbury-road, for the Leeds Corporation; the Leeds School of Art; the Leeds Public Dispensary; Red House, Chapel Allerton, Leeds; Webton Court, Chapel Allerton, Leeds; Pen-y-Bryn, Chapel Allerton, Leeds; "Aros," Chapel Allerton, Leeds; business premises, Willington-street, Leeds (alterations and decorations). Since going to London he won the second premium in the Newcastle Grammar School competition, and he designed a new organ case for Headingley Hill Chapel (in this year's R.A.), and he was engaged in other work at the time of his death.

*The asterisks denote those which have been illustrated in our pages.

DR. DRESSER.—We regret to hear of death, at Mulhouse, Germany, on 24th ult., of Dr. Christopher Dresser, of E. Bank, Barnes, London. Dr. Dresser had been well known as a decorative designer, and worked largely in producing designs for textile manufacturing firms. Christopher Dresser was born in Glasgow on July 4, 1854, of Yorkshire parents. His parents remained but short time in Scotland, and, after a few moves, spent some years in Bandon, Co. Co., and here he received all the little schooling he ever had. When about thirteen years of age they all moved to London, and he was placed at the old School of Design at Somerset House. At fifteen he gained a first scholarship, and from that time made rapid progress in drawing. He then took drawing to illustrate botanical works, a taking a great liking for flowers he gave attention to the study of Nature, and became Lecturer on Botany in the Department of Science and Art, and also in the London St. Mary's Hospital schools. He wrote about this time (1860) several works on botany, including "Unity in Variety," "The Rudiments of Botany," etc. He issued his first work, art in 1862, the "Art of Decorative Design," and in that year made his first intimate acquaintance with Japanese Art through exhibits shown in the exhibition by S. Rutherford Alcock. Many of these he made drawings of, and at the end of the exhibit bought some of these specimens, and thus commenced the collection of art objects which he ever since been his pride. By the time of the Paris Exhibition, in 1867, he had become well known to the manufacturers of the country, and many of the wall papers, carpets, and textile fabrics shown there bore design from his pencil. In 1875 he spent some time in Vienna, and wrote for the Press many articles on Art from that city. In 1876 he started on his journey to Japan, travelling *via* America, and visiting the Philadelphia Exhibition on his way. He delivered a few lectures on Art while in the States. His travels in the land of the Rising Sun, and his keen appreciation of Japanese Art, an interest in the people are told in his book written soon after his return home. "Japan: its Architecture, Art, and Art Manufactures." In 1876 he spent much time in Paris, both one of the jurors in the Exhibition. Of his years he had devoted most of his time to preparing designs for manufacturers, and in the enjoyment of his garden and flowers. His works on Art, besides those already mentioned, include "Studies in Design," a "Principles of Decorative Art," a "Modern Ornamentation." He wrote various Art journals, and lectured on Art in many towns in this country. He was for many years a Fellow of the Linnean Society of London, and of the Edinburgh Botanical Society, and was granted the degree Ph.D. by the University of Jena for his discoveries in connexion with natural science. He was a most genial companion and interesting talker, and never tired of discussing Art and the habits of the nations of the East, trying to trace their histories by their ornamental forms as a philologist does by the language. His daughter, Miss Ada Dresser, who had assisted her father for many years, has retained his staff of assistants, and tends to carry on his work.

GENERAL BUILDING NEWS.

NEW TOWER, ROCHESTER CATHEDRAL.—The tower of Rochester Cathedral, which has been rebuilt, with the addition of a spire, at an outlay of upwards of 5,000*l.*, was recently dedicated. The new central tower and spire had been designed as far as possible on the lines of the original work of Hamo de Hyth. This bishop raised the tower by the addition of a belfry story, and capped it with a spire of oak, covered with lead. This tower was almost rebuilt in the XVIIIth century. In 1826 it was said to be in a dangerous condition, and was taken down by Mr. C. G. Canning, at that time architect to the Dean and Chapter, who replaced the old spire by a square tower with corner pinnacles. The tower is stonework, and the spire is of wood covered with lead. On the upper part, over the belfry windows, are four small niches containing figures of the Virgin Mary on the east side, Bishop Hamo de Hythe on the north, St. Andrew, the patron saint of the cathedral, on the west, and St. Paulinus on the south. On the face of the parapet above the figures is a cornice ornamented with carved foliage, and above the parapet twelve shields, three on each face, bearing the east side the coats of arms of the present bishop and the late dean; on the north side the arms of Bishop Hamo de Hythe and Mr. T. H. Poord, the builders of the old

new towers respectively; on the west side the arms of the City of Rochester, of the Cathedral, and the County of Kent, and on the South side the Royal Arms and the arms of Canterbury. A new clock and chimes have been added, while the peal of bells has been increased from six to eight, four of the old bells having been recast. The architect is Mr. C. Hodson Fowler, of Durham, and the contractor, Mr. S. F. Halliday, of Stamford.

CHURCH EXTENSION, CHARWELTON, NORTHAMPTONSHIRE.—The work in connexion with the enlargement and restoration of Charwelton Church, has been completed, and the building was reopened by the Bishop of Peterborough on the 16th ult. The alterations include an extension of the chancel eastwards, a new roof, built to much the same pitch as the other part, a new east window, etc. The interior has been panelled with oak to a height of 10 ft., and the vestry has been turned into an organ chamber. The tombs and brasses in the chancel have also been attended to. The contractor for the extension of the chancel was Mr. John Bosworth, and Mr. Archer, of Northampton, did the paneling. The south doors of the chancel, which are of oak, were the work of Mr. Franklin, of Heleidon. Mr. Cecil Fabian, sculptor, of London, carved the angels and the emblem of the Holy Trinity on the exterior of the chancel, and the architect was Mr. Christopher Carter, of London. The cost has been about 1,600.

GERMAN CHURCH, BROMPTON-ROAD, LONDON.—Count Bernstorff, German Minister in London, attended at the consecration, on the 27th ult., of a new German Evangelical church in Montpelier-place, Brompton-road. The pulpit was made and carved in Berlin. The coloured windows were the work of the glass painter to the Bavarian Court. Some of the windows came from Cologne. The electric light fittings were by Messrs. Drake, an English firm. Upon Mr. Charles G. F. Rees, the architect, the Emperor has bestowed the insignia of the Fourth Class of the Imperial Order of the Red Eagle.

WESLEYAN CHURCH, BUSHEY.—The foundation-stones were laid a short time ago of the new Wesleyan church, which is now in course of erection at New Bushey. The new building faces London and King Edward roads, and is being built by Mr. Charles Brightman, from plans prepared by Messrs. Bell, Withers, & Meredith. The structure is to accommodate 750 persons, and its erection involves an expenditure of 6,768.

CHURCH RESTORATION, LYNG, SOMERSET.—The reopening of the Lyng parish church, which has recently been restored, took place on the 22nd ult. The restoration has been carried out by Mr. H. J. Spiller, of Taunton, under the supervision of Messrs. Samson & Cottam, architects, of Taunton, at a cost of more than 600. While the restoration was in progress, an ancient door-keft was discovered on the north side of the church, and a piscina in the opposite wall, near the pulpit.

CHURCH, LEMINGTON, NORTHUMBRIA.—A new Methodist New Connexion church has been erected in Union Hall-road, Lemington, by Mr. Thirlwell, of Benwell, and Mr. Jackson, of Gosforth, from designs prepared by Mr. B. R. Irvin, architect, Gateshead. Accommodation is provided for some 350 persons.

WESLEYAN CHAPEL, SEDGLY.—The work in connexion with the reconstruction of the Wesleyan chapel at Sedgley has been completed, and the new building was recently opened. The premises now consist of a chapel, with stained-glass windows, a schoolroom, three classrooms, and a minister's vestry. The building work has been carried out by Mr. Tomkinson, Wolverhampton, to the plans prepared by Mr. W. de la Haye, Sedgley. The total cost of the scheme amounts to 1,620.

WESLEYAN CHAPEL, UPPER TOOTING.—The new Wesleyan chapel on the High-road, Upper Tooting, was recently opened. The site was secured at a cost of 3,000., and the building itself represents an expenditure of 11,675. The builders were Messrs. Johnson & Son, of Wandsworth Common, who carried out the work from the plans of Mr. James Gibson, architect.

BAPTIST CHAPEL, HADDENHAM, CAMBRIDGESHIRE.—The memorial-stones were laid recently of the new Baptist chapel at Haddenham. The site is on the north side of the village green, and the buildings are to include a church to seat 337 adults, or a mixed congregation of 450 persons, and vestries, cloakrooms, etc. The buildings will be in the late Gothic style, and the walls are to be faced with red bricks, and bath stone will be used for the spire and for the dressings to the doors, windows, etc. Provision will be made for the choir and organ in the south transept, and a small gallery at the front end. The baptistry

will be of marble, and will be placed in front of the rostrum. The two vestries, with the usual conveniences, will be at the rear. The Arrangements are to be made for heating by hot-water low-pressure system. The architects are Messrs. John Wills & Sons, of Derby and London, and the contract for the work has been placed with Mr. H. Feast, of Haddenham. The cost of the building, exclusive of the land and architects' fees, is estimated at 2,500., and the total outlay involved is put down at 3,200.

A ROWTON HOUSE FOR NEWCASTLE-ON-TYNE.—The prospectus of the Northern Rowton Houses, Ltd., was issued on the 21st ult. The company has been formed for the immediate purpose of acquiring a site in Newcastle, and erecting thereon a building to be used for the housing of the working classes, and also to acquire other sites for a similar purpose in Newcastle and the northern counties, such establishments being similar to those known as "Rowton Houses." In the first place, it is intended to erect a house capable of accommodating 250 men on the Dog Bank, at the foot of Pilgrim-street, according to plans prepared by Mr. J. C. Maxwell, architect, which have already been passed by the Town Improvement Committee. The site of the proposed building has a frontage of 162 ft. to the Dog Bank and 49 ft. to Pilgrim-street, and contains an area of 1,000 sq. yds. It will contain a separate residence for the superintendent and an office; entrance hall, with shop for the sale of goods to the lodgers; dining-room, recreation-room, reading-room, smoking-room, kitchen, and 250 cubicles, lodgers' scullery, lockers, baths, foot-washing troughs, lavatories, wash-house, and other conveniences, with separate accommodation for the caretakers and bedmakers. The premises will be lighted throughout by means of electric light, and be heated by means of a low-pressure hot-water system. There will also be a disinfecting chamber. The charge for each lodger will be 6d. per day.

CLUB, BOSCOMBE, BOURNEMOUTH.—The new men's club in connexion with the parish of St. John's was opened recently. The new club premises are situated in the Shelley-road, and consist of a recreation-room (which portion was formerly used as the St. John's Mission Hall), a reading-room, a billiard-room, a refreshment buffet, and bathrooms. The recreation and reading rooms are separated by a folding screen, and when thrown into one form a hall which will be available for use as a mission hall on Sunday evenings. The recreation-room is 49 ft. in length by 20 ft. in width, whilst the dimensions of the reading-room are 25 ft. by 19 ft. The billiard-room, which is beyond the reading-room, is 28 ft. in length by 19 ft. in width. In the basement, lavatory and bath accommodation has been provided. Mr. Charles T. Miles was the architect, and Councillor George Mitchell the builder.

BRADFORD TECHNICAL COLLEGE EXTENSION.—The sanction of the Board of Education to the proposed extension of the Bradford Municipal Technical College has been received by the clerk to the Bradford Education Committee. A report upon the proposed extension was submitted to the City Council at their October meeting. This report, which was drawn up by Professor Barker and Mr. Whitehead, was supplemented by an estimate of the cost of the extensions, prepared by Mr. F. E. P. Edwards, the City Architect. The estimate of the cost, as prepared by Mr. Edwards, makes an allowance of 23,078. for buildings, 24,102. of which is for the main block, the remainder being for the spinning and weaving sheds. Machinery and fittings are expected to absorb 10,000., the land required for the textile school (5,092 super. yds., at about 12s. 6d.), 3,122. 10s., and the land for a future extension or resale (7,169 super. yds., at about 8s. 3d.), 2,943. A sum of 7917. 10s. is allowed for contingencies.

PUBLIC LIBRARY, PAISLEY.—A new wing of the Free Public Library and Museum, Paisley, has just been opened. The addition has been built to the east of the main building, and is in the same style. From the vestibule on the right is the indicator-room, from which there is an entrance to the new reading-room. The rooms are lighted from the roof. In the upper chambers of the building there is a reading-room for ladies and also a boys' reading-room. The building throughout is heated with a system of radiators and fitted with the electric light. Messrs. Honeyman, Keppie, & McIntosh, Glasgow, were the architects.

PUBLIC HALL, CROFT, LEICESTERSHIRE.—On the 30th ult. the Hon. Philip Stanhope, M.P., opened a new public hall and club at Croft. The building consists of a hall measuring 33 ft. by 22 ft., exclusive of the recesses, which consist of a platform, 16 ft. by 8 ft., an

ingle nook fitted with seats on each side of the open fire, and a gallery over. Retiring-rooms are provided on each side of the platform, communicating with it and with the hall, and in the foundation space is a billiard-room. The base of the building has been constructed of local granite. The superstructure is built of local made bricks, partly finished with selected red bricks, but in the main coated with rough-cast composed of cement and granite clippings. The verandah is supported on oak posts and timbers, and the roofs are covered with hand-made red tiles from Staffordshire. The building was erected by the staff of the Croft Granite, Brick, and Concrete Co., under the direction of Mr. C. H. Robottom, the manager, from the design of Messrs. Barry Parker & Raymond Unwin, architects.

MISSION ROOM, TWICKENHAM.—The new mission room, in Milford-road, St. Margaret's, was recently dedicated by the Bishop of Kensington. The building, designed by Mr. J. S. Alder, London, provides accommodation for 350 persons. The scheme, when completed, provides for a number of club and class rooms, with a gymnasium, but for the present only the hall, with two small rooms, and lavatory, and storeroom for seats have been built. The total cost has been a little over 2,000.

INEBRIATES' HOME, HAIRMYES, LANARKSHIRE.—An inebriates' home, erected by the Lanark County Council, at Hairmyres, was opened on the 1st inst. The building has been constructed from the design of Mr. Paterson, architect, Hamilton, and provides accommodation for ten patients. The home is built on the cottage system, and in addition to the quarters for the patients there is a section for the administrative part of the institution. Accommodation is provided for the nurses in the home, which contains fourteen bedrooms, this arrangement allowing a separate bedroom for each patient.

PRESBYTERIAN HALL AT FOREST HALL, NORTHUMBRIA.—The foundation-stones of a Presbyterian hall has just been laid at Forest Hall. Mr. Walton Taylor, of Newcastle, is the architect. The new hall (including platform) is 52 ft. by 28 ft. 5 in., and the principal entrance is from the main road. On each side of the entrance corridor there are cloak-rooms provided for each sex, and a ladies' room on the first floor occupies the whole frontage. At the opposite end of the hall is a raised platform, so arranged that it can be divided into two classrooms by means of movable partitions. In addition there is an infants' room and a kitchen. The new minister's vestry, which has a separate entrance giving access to new hall and church, is a continuation of the new buildings, and faces the main road. The new premises are to be built of stone. The contract has been let to Mr. John Craven, builder, of Newcastle.

ISLINGTON HOSPITAL, WALTON.—The new fever hospital, which has been erected at Walton, was opened a short time ago. The buildings consist of an administrative block, which contains living accommodation for the nurses to be employed at the hospital. The block called Ward Block A contains two wards of four beds each. They are heated by a central stove, and each has a lavatory and sink accommodation at the end. The wards will accommodate four males and four females respectively, and this block is intended for scarlet fever patients. Ward Block B contains two wards, each with two beds, and fitted with kitchen and other accommodation. This block will be used for typhoid and diphtheria patients. The outbuildings comprise a mortuary, ambulance shed, laundry, and ironing and furnishing room for linen. The buildings are of brick, with overhanging roofs of brinded Ruabon tiles. Half-timbered work is introduced in the design, and the site is bounded with a rustic fence of oak. The floors of the wards are of maple, sanded, and wax polished. The whole scheme has been designed and carried out by Mr. F. E. Dixon, Engineer to the Walton-to-Dale Urban Council. The contractor for the work was Mr. M. Shorrocks, and the sub-contractors were Mr. Richard Bashall, Messrs. Tullis, Mr. Robert Hull, Mr. Breakell, Messrs. W. Cook & Sons, and Messrs. Sanderson & Southworth.

BAKERY, NORWICH.—A new steam bakery has been erected in West End-street, Heigham, by Mr. F. H. Bassingthwaite. The premises consist of a red brick building, 5 1/2 ft. in length, and two stories high. The upper floor will be used as a flour store, and the lower floor is divided into three portions—the bakery, the breadroom, and the loading-room. The bakery is 36 ft. by 23 ft. The walls are faced with white enamelled bricks, and the floors throughout the building are laid in mosaic. The whole will be lighted by electricity. Messrs. Morgan & Buckingham.

were the architects; Mr. W. J. Hammett, the builder; and Messrs. A. Pank & Sons, plumbers.

BREWERY, DUBLIN.—A new brewery has been erected in Dublin for Messrs. Guinness & Son. The building occupies a rectangular plot of ground of 2,330 sq. yds., with a frontage of 150 ft. to Robert-street, and Grand Canal-place respectively, the pile rising to a height of 130 ft. above the street level, and containing nine floors, ranging from 10 ft. to 19 ft. The structure has been built on cement concrete foundations, varying in depth from 14 ft. to 17 ft., upon which have been erected stanchions of rolled steel. These in turn support rolled-steel girders, fixed horizontally, the whole forming the framework for the floors and walls. The walls are of bricks of an average thickness of 2½ ft., and the dressings are of white enamelled bricks. The floors are of concrete. The outer faces of the walls are broken at intervals with a base 12½ ft. high, and strings and cornices of chiselled and moulded granite from the Ballyknock Quarries. The roof is composed of wrought-steel principals, supporting timber purlins and boarding, Mellows' patent glazing, and slates capped with sheet lead. The building contractors were Messrs. McLaughlin & Harvey, Ltd., Dublin, and their manager, Mr. Anthony Campbell, organised and superintended the work. The steel-construction work was carried out by Sir W. Arrol, Messrs. Ross & Walspole were the contractors for the steel roof work; Mr. Wm. Osborne supplied the granite work; and Messrs. Oates & Green were the manufacturers of the white enamelled bricks. The design of the building and the supervision of its erection were under the control of the engineer-in-chief, Mr. A. H. Hignett, and his staff. Mr. Arthur Dudgeon, Dublin, was the surveyor and measurer of the works.

PROPOSED EXTENSION OF CO-OPERATIVE COMPANY'S PREMISES, ABERDEEN.—A deputation from the directors of the Northern Co-operative Company, Aberdeen, accompanied by Mr. Geo. Watt, architect, attended a recent meeting of the Plans Committee of the Aberdeen Town Council for the purpose of laying before the meeting plans of a reconstruction of the premises of the company in Loch-street. It is practically proposed to rebuild the entire elevation facing Loch-street and to make it a height of four stories instead of three as at present. The probable cost of the rebuilding will be about 5,000.

COTTAGE HOMES, DOWNDEN, GLOUCESTER.—The new Cottage Homes at Downden, which were opened on the 24th ult. by the President of the Local Government Board, have been provided by the Bristol Board of Guardians at a cost of about 20,000. The site comprises 20 acres, 12 acres of which are fenced off and retained for agricultural and market garden purposes. The group of buildings comprises a lodge entrance, seven blocks of fourteen semi-detached houses, a convalescent home, and a small hall for general, including school purposes. Each of the houses contains a hall, a dayroom, 17 ft. by 15 ft., a kitchen of like dimensions, scullery, larder, usual domestic offices, and officers' sitting-room. On the upper floor are two bedrooms for children, measuring 17 ft. by 15 ft., with observation window to officers' room, an isolation-room, 12 ft. by 10 ft., bathroom, lavatory, and officers' bedroom. The convalescent home contains on the ground floor two dayrooms, 25 ft. by 17 ft., one of these being for boys and the other for girls; a dining-room of the same size, cloakroom, kitchen, larder, scullery, and an officers' sitting-room. On the first floor there are on the boys' side three bedrooms, 17 ft. by 15 ft., bathroom, lavatory, etc. The accommodation on the female side is similar, and the two departments are separated by a house-parent's bedroom. There are three bedrooms on the upper floor, together with store rooms and other conveniences. The hall is 50 ft. by 30 ft., and in front of the building is a large piece of grass ground available for games. The homes will provide accommodation for 168 children. The buildings have been erected by Messrs. Geo. Downs & Sons, from the designs of Messrs. La Trobe & Weston.

ALMSHOUSES, BRADFORD.—A commencement has been made with the preliminary work in connexion with the new almshouses, which are to be erected at Daisy Hill. The site lies on either side of Daisy Hill-lane, the principal portion—some 18 acres—being between the top of Hazelhurst-road and the Daisy Hill reservoir. Close by is a smaller plot—about 8 acres. The larger plot is to be the site of the new test workhouse. Its construction is not, however, to be immediately undertaken. On the smaller plot the Guardians are about to erect sixty-six cottages for the accommodation of the aged and deserving poor. The

cottages will be built in blocks so arranged that each looks out on an expanse of grass plot set with trees. With each block will be a recreation-room or sewing-room, and a common kitchen. An administrative block, with accommodation for a caretaker and his wife will be provided as an adjunct of the kitchen. Each cottage will be a single-roomed dwelling devised to hold two persons. They will be built of brick, covered with rough-cast, with stone dressings, and roofed with Yorkshire stone slates. There will be a bath-house for each block. The plans and designs for this scheme, which have been prepared by Messrs. Empsall & Clarkson, architects, of Bradford, have just been approved by the Local Government Board, and the first part, consisting of twenty-eight cottages, will be put in hand without delay.

ENLARGEMENT OF THE CATTLE MARKET, YORK.—On the 22nd ult. the extensions, which have been made to the York Cattle Market, were opened by the Lord Mayor. A large area has been added to the covered market, and two new auction rings and offices have been added, with a façade to Paragon-street. These include additional settling-rooms and offices for the auctioneers conducting the sales, lavatories, and other accommodation. Between the two rings is a glazed verandah for the accommodation of those attending the sales. The auction rings are fitted with domed roofs. In the well is an iron pen in which the animals will be shown, and round this is a passage-way, from which rise tiers of seats with an auctioneer's rostrum facing the cattle entrance. The two rings are connected by an alley-way to enable buyers and dealers to obtain easy access from one ring to another. The total area of the market now affords accommodation for 7,680 cattle, 9,465 sheep, and 500 pigs. The improvements have been carried out from the plans of Mr. E. Creer, the City Engineer.

SANITARY AND ENGINEERING NEWS.

WHARF, PORTISHEAD, BRISTOL.—The new timber wharf at Portishead was recently opened. The structure is 600 ft. long, and the bottom of the dock has been dredged to allow a vessel drawing 22 ft. of water to be berthed alongside. For the construction of the wharf, timber piles, upwards of 50 ft. in length, were driven into the ground, and they were then braced and fastened together. To fix the bracing it was necessary to construct a watertight dam enclosing the whole wharf. The ground at the back of the wharf has been levelled up so as to form a stacking area. It has been provided with a system of railway sidings connected with the Great Western Railway Company's line, and terminating in a gridiron, 450 ft. long, consisting of eight sets of railway lines. To effect the junction with the Great Western Railway it was necessary to build a small bridge over the Portbury Stream Diversion. The steel girders and flooring of this bridge rest on foundations carried on timber piles. Two open sheds covering an area of 1,800 sq. yds. have been erected close to the railway sidings with a covered way between them. To facilitate the handling of timber three steam cranes with specially-designed curved jibs to reach over high stacks of timber have been provided. On the wharf there are two steam travelling cranes with elevated bases and long jibs. A jetty, 200 ft. long, with berths on both sides, has been provided for the accommodation of barges, and a crane lifting 6 tons, has been erected at the end to deal with log timber. The stacking ground is furnished with a system of fire hydrants connected to the water company's main, and hose-boxes with standpipes and nozzles are fitted at convenient places. The contractors for the main work were Messrs. Joseph T. Firbank, Ltd., of London. The cranes were supplied by Messrs. Stothert & Pitt, Ltd., of Bath, and the open sheds were erected by Messrs. J. Lysaght, Ltd., of Bristol. Mr. W. W. Squire is the docks engineer, and the cost of the undertaking has amounted to 30,000.

WATERWORKS, SKIPTON.—A commencement has been made with the laying of the pipe track which is the initial step in Skipton's new scheme of water supply sanctioned by the Skipton Water and Improvement Act of this year. A 12-in. main, which is to be permanent, is now being laid to the site of the intended reservoir at the foot of Embsay Moor. It will then be taken outside the top water line of the intended reservoir to the stream known as Moor Beck, where a weir will be made. This weir, which will be about 730 ft. above sea level, will be so constructed that it will pass the compensation water required by Act of Parliament, the surplus

water being taken through the main to the town. To ensure the best water being supplied, the Whitfield Springs, which in themselves yield 150,000 gallons per day, will be conducted to the weir. The Embsay Moor reservoir, which is two miles one furlong from the centre of Skipton, will have one embankment right across the valley in a line indicated by the trial shafts that have been sunk. The capacity of the reservoir will be 120,000,000 gallons, and the surface level of the water in the reservoir is full will be 700 ft. above sea level. The drainage area is 700 acres. The total estimated cost of the new scheme is about 70,000, and Messrs. G. H. Hill & Son, Manchester, are the engineers, assisted by Mr. J. Mallinson, Engineer and Surveyor to the Skipton Urban Council, who has charge of the preliminary work of laying the permanent pipe track that is expected to be available for water supply augmentation purposes by next spring.

PROPOSED ESPLANADE, KIRKCALDY.—Messrs. Sang & Lockhart, C.E., Kirkcaldy, have submitted a report to the Kirkcaldy Town Council on the proposal to form an esplanade from the harbour to Rose-street, a distance of 1,995 ft. They detailed several schemes, in each of which a concrete wall the whole length of the esplanade would be necessary. The top of the wall would be on the same level as the proposed new pier, with a parapet 3 ft. high. Inside the wall would be a heavy concrete footway 50 ft. wide, sloping towards the wall, and at the inside of the footway one or two steps leading down to a macadamised roadway 60 ft. wide, and on the inner side of this roadway, along the new building line, a concrete footway from 10 ft. to 15 ft. wide would be formed. Opposite the Port Brae a cart road 12 ft. wide would lead down to the beach, with two stairways along the wall at distances of 170 yds. The plans showed a complete scheme at an estimated cost, including engineering and inspection, of 16,800,000. Another scheme, costing about 14,000, would be to form a concrete footpath 20 ft. wide along the wall, and, at a suitable distance from the new building line, to form a roadway 28 ft. wide, and the space between the roadway and footway could be levelled up with ashes to form a promenade.

SEWAGE DISPOSAL SCHEME, CARLISLE.—Mr. Sandford Fawcett, M.L.S.C.E., on behalf of the Local Government Board, held an inquiry at Carlisle, on the 5th ult., respecting the application of the Carlisle Corporation for power to borrow 55,000, for a sewage disposal scheme for the city. Mr. H. C. Marks, the Carlisle Surveyor, who is engineer for the sewage disposal scheme, produced plans and explained the scheme in detail. They had had, he said, an experimental bacteriological scheme dealing with part of the city sewage for several years, and so satisfactory was its operation that the City Council decided upon the extension of the scheme before the inspector, Mr. George Chatterton, engineer, of Westminster, also gave evidence in support. Professor Diddon, analytical chemist, described the effluent after it had gone through the bacteriological process at present in use as almost as clear as ordinary river water. There could be no fear of pollution. Mr. Joseph Graham, engineer, Carlisle, said he agreed with the continuous system being adopted for Carlisle, but thought the land for the works ought to have been on the Eberby side of the river.

PIER IN THE ISLAND OF MULL.—A new pier is being erected at Saen, Mull, from the design of Mr. James Deas, C.E., Glasgow. It consists of a sub-structure of concrete carrying a pierhead of open timber work, approached by a wooden gangway, the whole estimated to cost slightly over 5,000. The contractors are Messrs. George Halliday, Ltd., Rothsay.

MISCELLANEOUS.

BROOKS'S PARABOLA CURVE.—This instrument, which the rules of grammar suggest should be described as a "parabolic" curve, is a piece of transparent celluloid sheet cut in the form of a parabolic segment, and intended to be used in the same manner as a set-square. Its convenience is increased by the inscription of a line representing the axis, and of a second line serving to locate the focus of the parabola. In drawing diagrams the instrument can be employed for delineating curves to represent all parabolas, if suitable vertical scales be adopted—a course that will often save much time, as it is far more easy to construct an additional scale than a new parabola. In connexion with the study of mathematics, the curve should be appreciated by teachers and students alike, for by its aid a true parabolic curve can be

drawn in a few moments. It is only necessary to rule a straight line for the axis, and upon this mark a point to represent the focus. The elliptic curve is then placed in position with its inscribed axis and focus upon those previously marked on the paper, when the curve can be instantly drawn. By marking the distance of the focus on the other side of the vertex of the parabola, the directrix can be ruled with equal facility by the aid of the straight-edge at the base of the instrument. An additional advantage is that the curve is proportioned for use on squared paper, the unit adopted being in. The employment of such an appliance has been suggested by writers on mathematical subjects, but we believe the patentee of this curve deserves the credit of being the first to produce an instrument of the kind in a commercial form.

WIRE-WOUND WOODEN PIPE.—According to a report furnished by the United States Consul at Vancouver, a Canadian company has installed a plant there for the manufacture of wire-wound wooden pipes, for which several orders have already been executed, and others are on hand. It is claimed that this pipe is superior, for water-supply purposes, to iron pipe, and can be furnished at less than half the price. Besides this, it is much lighter to handle, and is not so liable to burst upon freezing as pipe made of iron. Large quantities of this pipe are being put into use by mill owners and mining engineers, as its use results in the saving of water and repair.

AGATE QUARRIES.—The onyx quarries at Ain Snava are very extensive, covering fully 7,500 acres, and the beds vary in width from 6 ft. to 55 ft. The following are the principal qualities of onyx found there and the width of the beds:—

Quality.	Width of Bed.
	ft. in.
Golden, with a seam	33 0
Cloudy	13 0
African	13 0
Red African	13 0
Red agate	10 0
Denticulated	1 8
Jasper agate	7 0
Oxidated red	3 0
Rose agate	3 0

From the first two seams columns can be produced with the exceptional length of from 12 ft. to 15 ft. The monolithic columns for the Roman Catholic cathedral at Westminster were obtained from these quarries, which are in the hands of a house at Marseilles, by whom the stone is sent to France to be dressed. The district of Bône is renowned for alabaster of the same density as that of Valterra, in Tuscany. The stone, of great transparency, takes a fine polish and is fully equal to the finest alabaster of Italy and Scotland. An important marble and onyx quarry, situated at Ouled-Rahmoun, is now being worked by a French company. The stones obtained include golden onyx, spotted onyx, clouded onyx, red onyx, African red onyx, pink agate, and other varieties. Most of the marbles are similar to those in the ancient monuments of Rome and Carthage.

WHITE SEA TIMBER EXPORTS.—Sir Capel Wolsey, British Vice-Consul at Archangel, in his annual report recently received at the Foreign Office, states that the export of timber from all the White Sea ports amounted in 1903 to 1,097,914 ft., or about 267,000 tons, less than in 1902. He explains that this year (1904) is the fourth in succession of depression in the timber trade. Among the circumstances which have contributed to this long-continued setback may be mentioned the refusal of the Crown Lands Department either to abate the high rates to which they raised the price of standing trees after the prosperous years 1899 and 1900, or to offer for sale sufficient timber to keep the mills in constant work, even if the owners were prepared to pay the high prices asked. Again, some merchants, in view of the increase of trade which followed the conclusion of peace between France and Germany in 1871, purchased at high prices in anticipation of a large demand from South Africa, and consequent improvement in the general market. The non-realisation of these anticipations may be considered as contributing to the depression of the timber trade. In 1903 the general depression was but little affected by the rise in the price of red wood. Profits on this class of timber were more than counterbalanced by the losses on white wood, the price of which had fallen considerably owing to the increased import to the United Kingdom of Galatz white wood. At the same time the London merchants combined to force down the price of all Archangel timber. This combine was resisted by the Archangel shippers, who, at the close of the season, sold some wood to London buyers at their own prices. At the autumn

sales, the Government demanding as before a heavy price for logs, many of the Archangel merchants, anticipating a continuation of low prices in foreign markets, refused to buy, with the result that about 500,000 white wood logs remained unsold. In consequence of this diminution of supply many mills, having sawn all their available logs, laid idle for some three or six months. The 500,000 unsold logs are this year included in the Government offers for sale at the same price as before. The saw-mill owner's present position appears to be a critical one. If he refuses to buy, his mill must be closed as soon as the supply of logs in hand has been sawn; his capital will thus lie idle, and in two years—i.e., in 1906—he will have no sawn wood goods to export. If, on the other hand, he buys logs at the Government price, and the market for sawn timber does not materially improve, he must inevitably suffer heavy loss. It is supposed that, were the merchants to combine in refusing to purchase, the Government would lower its prices; but such action, to be effective, requires a unanimity impracticable in the present case, when any merchant holding aloof from the combine would become possessed of an exclusive supply of timber, with the prospect of sale at a considerably enhanced price. A small saw-mill at Archangel, managed by an Englishman, commenced sawing last year, and exported one cargo. A mill erected in 1901-2 at Korda, in which British shareholders were principally interested, was closed in 1903. A new mill at Peshora, owned by a syndicate comprising five Archangel houses and one London firm, commenced sawing last autumn, and export this year. The export of logs increased from 94,000 to nearly 116,000; that of sleepers from 25,000 to 107,000. Notwithstanding repeated representations by the local authorities the Russian Government has not yet imposed a prohibitive tax on the export of round timber. One cargo of poles, 13,000 pieces, was sent to the United Kingdom. About 65 per cent. of the timber shipments were destined for the United Kingdom.

A NEW WINDOW SASH.—Mr. Tate, of 47, Emond-road, Kilburn, has submitted to us a model exhibiting the latest of the many contrivances for working a sash window without weights. The sashes are raised by cords passing over pulleys at the top and brought down the side to winding drums in a box below the sill. By means of a winch the sashes are raised by turning the drum. A coiled spring is connected with the gearing to prevent the sash in any case coming down with a run. The sash is held up wherever desired by spring bolts passing through the frame at the side, and released on pulling a cord. Springs are always a weak point in fastenings of this kind; they are apt to lose their grip in course of time; though the compressing spring at the bottom, already mentioned, would probably always retain sufficient resistance to prevent an accident. The thing is, we are afraid, a little too complicated for general adoption, but it is ingenious and worth attention.

COMBINED DRAINAGE.—The Battersea Borough Council recently wrote to the President of the Local Government Board asking him to receive a deputation from metropolitan municipal bodies on the subject of combined drainage. In reply a letter has just been received stating that the President is of opinion that it is unnecessary to trouble a deputation to wait upon him, and suggesting that all the borough councils favouring immediate legislation in the matter should pass resolutions and forward same to the Board.—Kensington Public Health Committee have reported having passed the following resolution:—"That a communication be addressed to the President of the Local Government Board pointing out that, owing to the present unsatisfactory state of the law with regard to combined drainage, the borough councils throughout the metropolis are now frequently called upon to carry out, at the public expense, works of reparation and reconstruction tending solely to improve the private property of the individual owner, at a great and constantly-increasing cost to the ratepayers, and urging him to do all in his power to remedy, by early legislation, the injustice at present suffered."—The Works Committee of Paddington Borough Council reported on Monday having passed the following resolutions:—(1) That the Battersea Borough Council be informed that, in the event of their convening a conference of the metropolitan borough councils for the purpose of considering the question of combined drainage, and of formulating a proposition for the amendments required in the existing law relating thereto, with a view to making a joint representation on the subject to Parliament, this authority will send representatives; (2)

that the London County Council be informed of this action; also that this authority is prepared to support a joint representation to the Government with a view to the question of combined drainage being dealt with as a public measure.

WHITECHAPEL ART GALLERY.—A report of the inquiry in respect of this charity which was held by the Charity Commissioners has just been issued. The endowment consists of the site and buildings, which cost nearly 15,000l. There are no invested funds, but an annual grant of 500l. for maintenance is made by the central governing body of the City Parochial Foundation. Eleven exhibitions have been held since the establishment of the institution under the Charity Commissioners' scheme of February, 1899. The trustees' accounts for last year show receipts of 655l. and expenditure 599l., a balance of 66l. being carried forward.

DRAINAGE PLANS.—On Saturday the Public Health Committee of the Kensington Borough Council reported having had under consideration a letter from the London County Council forwarding a copy of a communication received from the Royal Institute of British Architects expressing the view that compliance with the by-laws of the County Council respecting the deposit of plans of drainage work involved great and unnecessary expense, and suggesting that the said by-laws should be modified so that they should only require the submission of a block plan and a written description of the pipes and apparatus. In compliance with a request from the authorities at Spring-gardens upon the foregoing, the Committee had passed a resolution to the effect that, while they concurred in the views put forward by the Royal Institute of British Architects as regards the desirability of some modification being made in the by-laws in the direction indicated in their communication, the Committee was of opinion that experience has shown that with regard to blocks of flats, and other large and complicated buildings of like nature, sectional drawings in addition to block plans and detailed descriptions are really indispensable.—On Monday the Works Committee of Stepney Borough Council reported that the Borough Engineer had sent them the following communication on the subject of the letter from the Royal Institute of British Architects:—

The result of my experience is that it is impossible to arrive at a correct conclusion from a block plan whether the construction of a drainage system is likely to be, when carried out in accordance with the statutory provisions relating thereto. There are other matters beyond that of drainage which have to be considered, such as the sufficiency and position of water-closets, lavatory accommodation, open spaces, etc. Numerous instances have occurred in this borough where building owners and even professional architects have submitted plans which have not complied, at the first application, with the regulations, and many cases the positions of the water-closets, etc., have been shown in most unsuitable positions; in fact, had block plans only been submitted, it is more than probable that the buildings would have been completed before the defects referred to were discovered. I therefore submit that in these cases the owners of properties have been saved a considerable amount of trouble and expense by the fact that proper plans were sent in in the first instance. Then, again, as to the great cost and trouble involved in complying with the requirements in connexion with any but the smallest buildings; as a matter of fact, it is found in actual practice that the architect or builder frequently sends in *two* copies of the building plans, so that the question of "trouble" does not arise, and the extra expense involved is very small even in large buildings. With regard to the statement that "the expense becomes infinitely greater in connexion with existing buildings, as it becomes necessary to measure up the whole of the old buildings and preparation of complete set of drawings," so far as this borough is concerned the statement does not apply. Although a large number of public and private buildings have been dealt with, in no case has a builder or owner been requested to furnish more than a block plan and attention or addition, and then only have plans been asked for dealing with the portion of the building where the structural alteration has taken place. The Committee stated that they had decided that a copy of the above be forwarded to the London County Council with an expression of opinion that, for the reasons given by the engineer, they disagreed with the proposal that the by-laws should be modified as suggested by the Royal Institute of British Architects.—The Public Health Committee of Chelsea Borough Council reported on Monday that they had adopted a communication sent in by the Borough Surveyor and the Medical Officer of Health, in which these gentlemen suggested that the by-laws referred to by the Royal Institute of British Architects should be modified in the following manner:—

(a) A detailed plan of the lowest floor of the house, showing the position of the proposed under-

ground drains and manholes, and of the existing drains, the position of water-closet, sinks, gullies, soil and vent pipes, rain water and other waste pipes. (b) A section in block of premises to be drained showing the gradient of underground drains, and positions of soil and ventilating pipe. Note.—These plans to be on a scale not less than 16 ft. to one inch, and all plans to be in duplicate. (c) A key plan showing the position of the premises proposed to be drained in conjunction with neighbouring premises. Scale 4 ft. to one inch.

The foregoing suggestions are to be forwarded to the London County Council.—The Highways and Sewers Committee of the Wandsworth Borough Council, in a report circulated on Monday, state that they have decided that the London County Council be informed that the Wandsworth local authority finds the by-laws useful in obtaining plans of drainage works, but that the block plan required by the by-law is all that is insisted upon in Wandsworth, and that the written description mentioned in the letter of the Royal Institute of British Architects is not considered necessary.

THE MYSTERY PLAY, LINCOLN'S INN.—The Christmas mystery play held on Wednesday at the Lincoln's Inn Hall must be reckoned a great success. It is to be hoped that the experiment will encourage the production of such plays in this country. They have a very definite value in the religious and artistic sense, and though their establishment here, as at Oberammergau, may be impossible and undesirable, original work like that of "Eager Heart," the title of Wednesday's play, will always be acceptable, and command large audiences. We do not know the names of the actors, or of those responsible for the staging, but we believe it was entirely an amateur performance. The play is written by Miss A. M. Buckton, and is published in book form. The story is based upon a legend telling how Christ, as an infant in the arms of Mary his mother, accompanied by Joseph, travels through the land every Christmas Eve seeking the home prepared for their reception. "Eager Fame" and "Eager Sense" make ready to receive the divine visitor with every show of pomp and circumstance. Their humble sister, "Eager Heart," stays at home in her poorly-furnished room. The travellers arrive as beggars, soliciting food and shelter, unrecognized by all; they find shelter in the room of Eager Heart. Here they eventually discover themselves to be the three Kings, the shepherds, and Eager Heart. The music is taken from Bach's Christmas Oratorio. The dresses were of the Florentine period; they and the staging were agreeable and effective. Once or twice the colour grouping was very fine. The acting, too, was restrained and in excellent taste throughout.

PROPOSED NEW RESERVOIR, BARNSELY.—An inquiry was held on the 30th ult. at the Town Hall, Barnsley, by Mr. F. H. Tulloch, Local Government Board Inspector, into the application of the Town Council for permission to borrow a further sum of 60,011*l.* for the completion of the Midhope reservoir. In addition to the Inspector, there were present at the inquiry Mr. H. Horsfield (Town Clerk), Mr. C. E. Hawksley (Consulting Engineer), and Mr. J. H. Taylor (Borough Surveyor and Waterworks Manager).—The Town Clerk explained that in 1896 the Corporation obtained an Act to construct the reservoir, which was estimated by Mr. Hawksley to cost 170,000*l.*, and the work was now nearing completion, and on June 7 last the actual cost had been 296,668*l.*, on which date it was estimated by Mr. Hawksley that 19,339*l.* would still be required. The works were perfectly satisfactory excepting the filter beds.—In the course of his evidence Mr. Hawksley explained that the amount now sought for was made up of 14,574*l.* 2*s.* 5*d.*, the estimate outstanding, which included 10,000*l.* for filter beds, 1,000*l.* for the reservoir service reservoir, and 1,000*l.* for the reservoir keeper's house. Engineer's commission to June 9 amounted to 6,040*l.*; estimated commission on the work yet to be done, 725*l.*—a total, less 2,000*l.*, the estimated value of the plant, of 19,339*l.* 2*s.* 5*d.* The reservoir keeper's house included a committee-room, stable, and coach-house.—After some questions had been asked by the Inspector the inquiry closed.

A NEW LIFTING AND CONVEYING APPARATUS.—We have recently had an opportunity of examining a simple and ingenious form of apparatus which should be of considerable service to constructional engineers, bridge builders, and others, for lifting and conveying girders, rails, heavy pipes, baulks of timber, and other materials. The apparatus, which is made by Messrs. Selig Sonenthal & Co., of Queen Victoria-street, E.C., consists of one or more vertical rectangular frames, formed of four steel posts connected at top and bottom by horizontal rails so as to constitute a frame of great strength and rigidity.

Between the two ends of the frame is a horizontal roller, each end of which is fitted into a bearing in a horizontal cross-bar having screwed bores at the ends, through which pass two vertical screwed shafts. These shafts are made in pairs, screwed with right and left hand threads, and fit at the bottom into foot-steps attached to the pedestal of the frame, while at the top they pass through bearings secured to the top framing, each shaft being fitted with a worm wheel, and a worm between each pair of wheels is actuated by means of a handle at the end of the worm shaft. The horizontal roller is employed for raising and lowering loads, and it can be worked up and down quite easily, owing to the great purchase afforded by the worm gear, which also permits the load to be stopped at any point without the slightest risk of dropping. The roller itself can be rotated on its axis by means of a handle, thus giving a traversing movement, right or left hand as desired, for conveying the material in a longitudinal direction. To prevent the roller from rotating when supporting irregularly-shaped objects, a ratchet wheel and catch are provided. The frames are fitted with four handles to facilitate adjustment, and those intended for use on level floors can be fitted at the bottom with travelling wheels or runners. In using the apparatus, the girder or other piece of material to be moved is slightly raised, so that the horizontal roller can be brought beneath it. The roller is then raised by means of the worm gear and vertical shafts, and, as soon as it comes in contact with the load, the latter can be moved forward or backward by rotating the roller. In many cases only one of the lifting frames is required, but when the material has to be transported for more than a few feet it is necessary to use two of the frames, advancing first one and then the other until the distance has been covered. A still more convenient method is to use three frames, of which any two are always supporting the member to be transported, and the third is placed in advance to afford a fresh bearing. Then, after the load has been moved forward so as to rest upon the two front frames, the hindmost one is brought up to the front, and the same cycle of operations is repeated as often as may be necessary. By suitable placing and adjustment of the apparatus, material can be conveyed over all sorts of obstacles, such as ditches, mounds, and irregularities of the ground, or across gaps in masonry and other structural work. It can also be applied with great advantage in engineering shops and erecting yards as an auxiliary to machine tools, and for other purposes, and, in fact, wherever material has to be lifted or moved about. The frames are made in various sizes, with lifting capacities ranging from 1 ton to 3½ tons each, and special types are available for certain classes of work. The apparatus described is exceedingly simple, and can be used by ordinary labourers without previous instruction.

CROWN LANDS.—A Bill will be introduced in the course of the ensuing Session to make better provision for the management and regulation of the Royal Forests, and for giving the Commissioners of Woods and Forests increased powers for exercising control over the discharge of sewage, the placing of refuse, the erection of encampments and hoots, and the exclusion of gipsies, hawkers, rogues, and vagabonds. The Bill also provides for a transfer of any fore-shore under the Commissioners' management to that of the Board of Trade, and *vice versa*, and for authorising the Commissioners and the Board of Trade, and the Chancellor and Council of the Duchy of Lancaster, respectively, to compromise claims to fore-shore as between the Crown and the Duchy, and claims to management as between the Commissioners and the Board of Trade, and for the abolition of the obligation to devote allotments to the Crown in East Beres, Alice Holt, and Parkhurst woods, co. Southampton, to the growth of timber.

SCIENCE AND ART DEPARTMENT, BOARD OF EDUCATION.—The report for the year 1903 on the Victoria and Albert Museum, the Royal Colleges of Science and of Art, the Geological Survey and Museum, and the work of the Solar Physics Committee has just been issued. The number of visitors to the science library shows an increase of about 10 per cent. over the number for the previous year, but a slight decrease in the attendances of readers (exclusively of Royal College of Art students) in the National Art Library of the Victoria and Albert Museum, and a decrease in the number of visitors to the branch museum at Bethnal Green. During the session 1902-3 of the Royal College of Science the total number of students under instruction was 304, of whom 165 were Government students. The students in the

Royal College of Art were 167 in all, as compared with 185 in the last preceding session. There was a marked increase in the number of classes who visited the Western Galleries with their teachers for scientific instruction and research.

CAPITAL AND LABOUR.

BIRMINGHAM BUILDING TRADES' FEDERATION.—For some years past (writes a correspondent) there has been a federation in Birmingham called the "Birmingham Building Trades' Federation." Its operations affect all five districts of Birmingham within a radius of five miles from Stephenson-place. The federation consists of sixteen trades engaged in building operations, and it is managed by an executive elected annually at the general meeting. For some time past certain sections of the trades—namely, the plasterers and painters—have been agitating that, in case of any dispute arising between employers and men, the whole of the trades combined should withdraw their men from the job or jobs upon which they were engaged until such employer had agreed to their terms. Owing to the decision in the Taff Vale case the executive of the federation could not see their way to comply with such demand. On a specially large building in course of erection by a well-known employer in Birmingham painters, etc., had been employed and not paid the standard rate of wages. This case was brought before the federation in the month of December, when the federation, through the plasterers and organising secretary of the painters and representatives of the painters demanded the withdrawal of all the men on November 14. The executive could not see their way to adopt this course owing to the arrangements existing between the men and the Conciliation Board of Masters, and, in consequence, an adjourned meeting was held on Thursday last week at the Trades' Hall, Hurst-street, when the following resolution was passed after strong and determined opposition:—"That, seeing it is impossible to carry out the principle of the work the federation was formed for, and always aimed at, through all societies refusing to combine for that purpose at the present time, the federation be at once dissolved, according to rule 20." It was also decided that "the executive committee of the federation should, in conjunction with the trustees, treasurer, president, and secretary, take steps to see that the income over expenditure year by year be proportionally divided among the societies contributing to the federation during the years the federation has been in existence; and that the cost of winding-up the federation should be equally borne by all societies federated." The cash balance is upwards of 1,000*l.* The effect of the resolution passed is that each society will have to stand upon its own basis; that is, the labourers in any case will not have the support of the carpenters, plasterers, etc., and, of course, *vice versa* throughout all trades. What the ultimate result will be is doubtful. Whether it will mean a reduction in wages by the Masters' Association after attacking first one and then the other of the trades in question, or whether they will only attack those that have caused such divided opinion in the building trade, remains to be seen. Meanwhile the most thoughtful and calm members of the societies affected are anxiously awaiting the effects of the split.—*Birmingham Daily Post.*

Legal.

POINT UNDER THE METROPOLIS MANAGEMENT ACT, 1855.

In the Court of Appeal, composed of the Master of the Rolls and Lords Justices Stirling and Mathews, on the 6th inst., the case of the Metropolitan Water Board v. the Mayor, etc., of Westminster, was heard, on the appeal of the Water Board (the successors of the New River Company) from a decision of a Divisional Court of King's Bench, consisting of the Lord Chief Justice and Justices Wills and Kennedy, affirming a decision of Mr. Brox, the Metropolitan Sidespender. (The case before the Divisional Court was reported in the *Builder* of May 21, 1904.) The matter came before the Court in the form of a special case, from which it appeared that the Company were summoned before the magistrate by the respondents for neglecting to pay a certain sum alleged to be due to the respondents for expenses incurred in filling, making good, and maintaining the pavements in streets in Westminster when the same had been broken up by the Company, in pursuance of its statutory powers to execute work in the City of Westminster. The sum which

the respondents claimed included a charge of 10 per cent. on the cost of the work to cover the respondents' estimate of the expense to which they had been put for superintending the work during its execution by a contractor. The Company's contention was that by virtue of section 114 of the Metropolitan Management Act, 1855, the respondents were not entitled to make any charge for supervision or superintendence, notwithstanding that it was given, and that the same formed part of the general administrative duties of the respondents. The respondents, on the other hand, contended that the employment of officers to superintend and supervise such work was a necessary expense incurred by the Corporation in carrying out the work of reinstatement. The learned magistrate came to the conclusion that the respondents were entitled to recover a sum for the expenses incurred in respect of the supervision or superintendence of the work, but he reserved the question of the amount to which the respondents were entitled in respect of such superintendence and supervision, and whether it should be calculated on a percentage or other basis pending the decision of the High Court as to whether the respondents were legally entitled to make any claim in respect thereof. The Divisional Court upheld the decision of the learned magistrate, and remitted the case to him in order that he might determine the question of amount. From this decision the Water Board now appealed.

During the course of the arguments Mr. Morton Smith, for the respondents, stated that the only claim put forward was for the cost of superintendence thrown upon the respondents, which would not have fallen upon them had the Water Board or their predecessors done the work themselves.

Mr. Coulthorpe Munroe did not agree with this statement. The claim put forward in the police court was to 10 per cent. on the actual expenditure for supervision.

The Master of the Rolls said the case must go back to have a direct finding of fact whether there had been, in this case, any substantial extra expense incurred by the respondents owing to their undertaking the work themselves. When this was ascertained the Court would be in a position to decide on the true construction of the Act of Parliament.

ACTION AGAINST A BUILDER.

The case of the General Accident Assurance Corporation, Ltd., v. Day came before Mr. Justice Buckley in the Chancery Division, on the 1st inst.—an action by the plaintiffs against defendant for an account of the wages paid by him during the time he was insured against his liability under the Workmen's Compensation Act, 1897, the Employers' Liability Act, 1839, or at Common Law in respect of accidents to his workmen.

The facts giving rise to the action were these:—The defendant, a builder, in September, 1901, signed a proposal to the plaintiff company for an insurance against his liability in regard to accidents to his workmen. The defendant therein stated that the total estimated amount of the wages paid by him and his sub-contractors yearly was 3,000*l.*, and he agreed to pay premium of 5*s.* 6*d.* per cent. on the total amount of wages and salaries paid, and to render to the plaintiffs at the end of each period of insurance a statement, in the form required by the Corporation, of all wages actually paid, and to pay premium on any wages paid in excess of the amount estimated in the proposal form. The policy, which was issued on September 21, 1901, recited that the defendant had paid a sum of 3*l.* 5*s.* on account of premium, and had delivered a proposal in writing which was to form part of the contract, and that the plaintiffs agreed to indemnify him against liability as before mentioned. The 4th clause of the policy provided that the first and all future renewal premiums that might be accepted were to be regulated by the amount of wages and salaries paid to employes, and sums paid to sub-contractors by the employer during each year. It further directed that the names of every employe and sub-contractor, with the sums paid, should be entered in a proper book, and that no claim should be covered by the policy unless this should be done. It was also provided that every sub-contractor should, as far as possible, be required to keep a similar wages book so as to ascertain the employes entitled to call upon the employer for compensation; but in the event of the wages paid by any sub-contractor not being so ascertained, then, for the purposes of the policy, they were to be taken to be a sum equal to 60 per cent. of the sum agreed to be paid to such contractor for such work. Another term of the policy was that the employer should at all times allow the Cor-

poration to inspect the wages book, and would, on request, supply to the Corporation a correct account of all sums paid during any year of insurance, and if the total amount so paid should differ from the amount on which premium had been paid, the difference in premium should be met by a further proportionate payment to the Corporation, or by a refund by the Corporation, as the case might be. The policy was in force until September, 1903, when the defendant allowed it to lapse, and insured in another office. The plaintiffs, after making applications to the defendant for accounts of wages actually paid without receiving any answer, commenced the present action for an account of such wages during the two years in which the defendant was insured. The defendant, by his defence, denied that he was now bound to account, and his counsel stated that the wages he had paid were really less than the estimated amount.

At the conclusion of the arguments of counsel his lordship held that the plaintiffs were entitled to the account and the costs of the action up to the present time, the further costs being reserved.

Mr. Astbury, K.C., and Mr. Edward Ford appeared for the plaintiffs, and Mr. Buckmaster, K.C., and Mr. Humphry for the defendant.

HODGSON v. WAUGH.

On the 5th inst., Mr. Montague Lush, K.C., mentioned this case to the Lord Chief Justice in the King's Bench Division. (A report of the case appeared in last week's issue of the *Builder*.)

The learned counsel said his lordship would remember that the action was brought by Mr. Hodgson, the proprietor of an estate in Hertfordshire, known as Hexton Manor, against the defendant, Mr. John Waugh, an architect and civil engineer, for damages for alleged negligence in connexion with certain extensive alterations and repairs at Hexton. His lordship would also probably remember that, at the close of the case, in which his lordship reserved judgment, he (counsel) said he wished to disclaim any intention of imputing to the defendant any charge of fraud or dishonesty on his part. His lordship at that time asked if such disclaimer was made on the authority of the plaintiff, and he (counsel) was unable to say that it was, seeing his client had at that time left the court. Since then he had had an opportunity of communicating with his client, and he was now authorised and entirely approved of the withdrawal of any charges that had been made against Mr. Waugh of fraud or dishonesty. Mr. Hodgson had understood that no suggestions were made, and personally he had not wished them to be made.

The Lord Chief Justice said that certain questions which had been put were only consistent with charges of improper conduct, but the withdrawal was satisfactory, and would relieve him of a difficult part of the case. He was glad that the withdrawal of the charges was made with Mr. Hodgson's authority, and he hoped that publicity would be given to it. His lordship said he hoped to be able to give judgment on Monday week.

PATENTS OF THE WEEK.

APPLICATIONS PUBLISHED.*

24,473 of 1903.—F. JACOB: *Device for Opening and Closing Windows of Greenhouses, and the like.*

A device for closing and opening casements and windows to any required degree, characterised by the fact that a chain passing round a pulley is provided upon one end with a handle, and is connected by its other end to the casement or window rod to be operated, this chain comprising hollow oscillating links arranged alternately, a pawl oscillating upon a block to which the pulley is fitted, and engaged normally in one of the hollow links of the chain permitting the latter to move for opening the window, but preventing all motion of the chain in the opposite direction, an oscillating lever, arranged upon the said block, releasing, when a force is exerted thereupon with the handle end of the chain, the said pawl, and thus permitting the movement of the chain for closing the casement, this movement being stopped at any required instant by ceasing the pressure upon the said lever, and several levers being adaptable to said block, to correspond with the operation of several casements arranged in nearly the same place.

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

24,618 of 1903.—A. SILBGER: *Building and Decorating Materials.*

A building and decorative material formed by the combination of cement and asbestos, kieselguhr or vegetable fibre in the proportions of from 10 per cent. to 25 per cent. of asbestos, kieselguhr or vegetable fibre, and from 90 per cent. to 75 per cent. of cement, subjected to great pressure in the humid or plastic state.

26,168 of 1903.—P. KIRKUP, A. P. STOKER, F. BOWMAN, and W. ALDERSON: *Machines for Cutting Coal, Stone, and other Hard Substances.*

Machines for cutting coal, stone, or other hard substances, consisting of a frame supported on a skate or skates on the coal side, and rollers on the side remote from the coal "face," or by a skate or skates on both sides, and provided with a fender adapted to bear against the "goaf" props or cblocks, and also with a horizontal roller adapted to bear against the coal "face," said fender and roller being disposed in the same plane or nearly so as the horizontal outer of the machine.

27,919 of 1903.—J. HARRIS: *Machinery or Apparatus for Making Tiles.*

A tile-making machine, consisting of a main horizontal cylinder revolving in bearings in a frame, an upper parallel cylinder revolving in adjustable bearings in the same frame and pressed down by springs, an inclined frame provided with freely revolving rollers and having one end adjustable in the frame of the machine above the main cylinder and capable of slight movement horizontally and its other end adjustable vertically in the upper end of an independent vertical frame at a sufficient distance from the main frame, a flexible endless apron or band passing over the upper cylinder and thence down and back between the two cylinders and down round the outer side of the main cylinder, then forward and inclining downward from a sufficient distance, and over and round a roller turning in adjustable bearings, in the outer end of a more or less horizontal frame pivoted near its front end to the main frame of the machine, and provided with freely revolving rollers on its upper side, and back below this pivoted frame and under and round a roller upon the inner end of the pivoted frame, thence up in front of the machine and over a guiding roller carried by the main frame, and up to the top of the upper cylinder at the point where it started so as to form an endless apron, flanges upon the lower main cylinder between which the upper cylinder revolves, fine strong adjustable wires stretched at suitable distances apart between the flanges on the main cylinder, for the purpose of cutting into the required lengths a strip of clay delivered continuously forward from a pug-mill upon the rollers at the back end of the upper adjustable frame, and forced between the two main cylinders of the machine which is kept in movement by the weight and pressure of the strip of clay.

308 of 1904.—R. C. HUGHES: *Window Sash Fastener.*

A window sash fastener, comprising a socket or casing attachable to one part of a window and having a cylindrical bolt provided with a helical spring, one end of which is secured to the bolt while the other end is fixed in or to the casing, a catch on the said bolt, means for retaining the catch when the bolt is in the bolted and unbolted positions, and a hole or holes in the other part of the window adapted to receive the bolt.

444 of 1904.—C. MATHEWS: *Water Waste Preventers.*

A water waste preventer, consisting in the combination with the tank and the ordinary pull chain or lever of mechanism which, when operated by the said chain or levers, opens a supply tap or inlet valve and closes outlet pipe or its valve, and means whereby the water, when it reaches a certain height in the cistern, shuts or closes the supply tap or inlet valve and opens the outlet pipe or its valve to permit the contents of the tank to escape.

512 of 1904.—P. BLOWES: *Treads for Stairs, Passages, Paving, and other like Surfaces.*

Tiles for forming treads for stairs, passages, paving, and other like surfaces, manufactured of artificial stone with projecting parts or pebbles disposed so as to leave passages or channels between them leading into main channels formed in the fronts and sides of the finishing tiles.

613 of 1904.—H. C. CLEAVER: *Open Fire-places.*

A fireplace for burning anthracite and like refractory or non-caking fuel upon an open grate, consisting essentially of a forwardly inclined apertured fire grate, a hopper

adapted to continuously deliver fuel by gravity to the upper extremity of the grate, a fence or kerb situated at the lower extremity of the grate so as to limit the descent of the grate so as to limit the descent of the gaseous products of combustion from the space beneath the grate.

1,470 of 1904.—A. J. BOULT (Internationale Siegartwaben Gesellschaft): Apparatus for Cutting Artificial Stone, Beams, Girders, and other Structures.

An apparatus for cutting a composite cast plate of artificial stone into separate sections characterised by a single cutter movable in a vertical plane vertically or obliquely relatively to the section to be cut, which cutter is carried by slides, guided in a movable frame and provided with toothed pinions which engage with toothed racks arranged in the frame, movement being transmitted to the toothed pinions by means of worm wheels and worms.

20,210 of 1904.—R. H. McWILLIAMS: Mode of and Means for Copying the Grained Surfaces of Wood and Transferring same to other Wood, Paper, Fabric, Floor Covering, and the like.

A method for producing a printing surface, which consists of thoroughly cleaning the surface of a selected piece of wood, then covering the same with oil to render it non-adhesive, then applying to the prepared surface a sensitive composition with a backing of fabric material.

21,280 of 1904.—M. ROSEN: Construction of Theatres, Hospitals, and Similar Buildings. This invention relates to the construction of theatres, hospitals, barracks, schools, and like buildings. The object of the invention is to provide exits which, in case of fire, allow a great number of people to leave the rooms at the same time. This invention consists in the substitution of the stairs by flat gangways with suitable inclination.

21,619 of 1904.—E. ESCHWEGE: Folding Furniture.

This relates to folding furniture, and consists of a pair of rods, a sheet of fabric secured to the same, removable bars holding said rods apart, and supporting members removably secured to the frame so formed, whereby the fabric may be rolled up on the rods, the removable members having first been detached and placed therein.

27,378 of 1903.—C. ALLEN and G. A. HAWTHORN: Spouts, Waterways, and Cornices for Buildings.

A spout or waterway constructed of a series of contiguous sections, each section consisting of a brick or block of stone or other material suitably curved or channelled and otherwise fashioned so as at the same time to serve an additional purpose beyond that of a spout section.

19,493 of 1904.—B. A. STEVENS: Apparatus for Preventing the Spread of Fire in Theatres, and the like.

This relates to an auditorium, consisting of a flue, leading therefrom a second flue within the first-named flue, combustible material in said first-named flue, and means for igniting said combustible material at the commencement of a fire, means for closing the first-named flue, arranged to be removed to open said flue when ignition takes place.

SOME RECENT SALES OF PROPERTY: ESTATE EXCHANGE REPORT.

Table listing property sales with columns for date, location, and price. Includes entries for November 28, December 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31.

Table listing property sales with columns for date, location, and price. Includes entries for December 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31.

TO CORRESPONDENTS

NOTE.—The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors. We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for notices or samples sent to or left at this office, unless he has specially asked for them. Letters or communications (beyond mere news items) which have been duplicated for other journals are NOT DESIRED. All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications. We are compelled to decline unpaid orders and giving addresses. Any communication to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance. All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

MEETINGS.

Table listing meetings with columns for date, location, and time. Includes entries for Friday, December 9, Saturday, December 10, Monday, December 12, Tuesday, December 13, Wednesday, December 14, Thursday, December 15.

An Appeal to the Profession.

As we mentioned last week, the Institute of Architects has so far advanced from its non-committal attitude in regard to the question of the ownership of architects'

drawings, raised in the case of *Gibbon v. Pease*, as to have passed a resolution to follow the lead of the Surveyors' Institution in promising a contribution of 100% towards the cost of endeavouring to get a reversal of the verdict, or an order for a new trial, in the Court of Appeal. But we think that a direct appeal should be made to the profession at large to assist in this matter.

The Court of Appeal, should its decision be favourable to the defendant's case, may, if we understand rightly, take one of two courses; it may either overrule the precedent of *Ebdy v. McGowan* and decide that it does not apply, or it may order a new trial on the ground that the evidence on one side was not heard. The former would be of course the far more satisfactory as well as the least costly result, but the latter is the more probable; and in that case the pecuniary support promised by the two representative professional Societies would probably fall very far short of what would be required to carry out the campaign.

On this consideration, we revert to the suggestion made a week or two back by our correspondent "A Provincial Architect," that we should open a fund for assisting the defendant in this action to obtain a reversal of a legal decision which, if it is allowed to stand, will involve a most serious injury to the

interests and prestige of architects. We wish architects clearly to realise that, by the law as it is now apparently to be interpreted, *any client may claim all the architect's drawings, and specification, and sketches and memoranda in reference to a building as his own property*, and may, if he be so minded, bring the architect into court and obtain an order on him to give them all up. This state of things affects, or may affect, most prejudicially every architect in the United Kingdom, and nothing ought to be left undone to get it altered. On this ground therefore we beg to say that we shall be glad to act on the suggestion made by "A Provincial Architect," that the editor of this journal should invite and take charge of subscriptions to be applied towards the cost of obtaining a definite decision in reversal of the present assumed reading of the law in regard to the ownership of architects' drawings. A special bank account would be opened for the fund, and a full report published subsequently as to the receipts and application of the fund. The Provincial Architect whose letter we published backed his suggestion by a cheque for five guineas; how many will follow his example?

We said just now the "assumed" state of the law, because we think that the decisions which have caused so much consternation to architects are really the result of a reading of the judgment in *Ebdy v. McGowan* apart from the circumstances and the evidence. We have been told by lawyers, in the most positive manner, that the judgment in that case affirmed the client's property in the drawings without any reservation whatever. So it does if you read it alone; but surely the logical interpretation is to read it in connexion with and in relation to the evidence and the circumstances of

the case, which was one in which drawings were completed and the building not carried out; and we do not think the ruling logically goes any further than to cover that particular case.

If it does; if it is to be upheld that *Ebdy v. McGowan* covers every case and gives the client the ownership of all drawings, then we say that such a law could only have been passed under the influence of a misunderstanding of the architect's profession on the part of those who administered the law, and that we must get this point pressed upon those high authorities who have the power to order a revision of the law. For this purpose it might be necessary to take the matter ultimately before the House of Lords; which is all the more reason for being prepared with the sinews of war. We are told by lawyers (some of them—for lawyers differ like other mortals) that the House of Lords would not be likely to reverse a law which has stood accepted for so long a period—reckoning from *Ebdy v. McGowan*. We reply, that it has only been tacitly accepted through ignorance of the fact, and that few or no architects had any conception that such a sword of Damocles hung over their heads; Then there is the example given by the law in other countries. In both France and Germany the practice is for the architect to keep the drawings; there are certain reservations, which we have not space to go into just now, under which the client may ask for copies of the drawings or of part of them, but only either under special restrictions or by special payment over and above the fee for carrying out the building. No other country permits the architect to be ridden over and his rights trampled on as our law, if correctly interpreted, does; and if it does stand so, it is time it were altered.

THE CARE OF ANCIENT MONUMENTS.

BY PROFESSOR BALDWIN BROWN.

II.

IN the last paper some notice was taken of the popular movement on the Continent for the protection of buildings of historical and artistic interest. In the present article it will be seen how foreign States endeavour to compass the end in view through official agencies such as Monument Commissions, and how some continental cities safeguard their historical aspect by special building regulations. The subject of State Monument Acts, with the contrast between our own legislation and that of our neighbours across the sea, will occupy the third paper of this brief series.

In almost all continental countries the normal system of monument administration centres in a State-appointed Commission, that serves as a council for the Minister under whom is placed the department of the Fine Arts. The Minister in question may be Minister of the Interior, or of Religion and Education, or of Public Works, but there will always be some responsible head of a public department who takes historical and artistic monuments under his charge. He is the executive officer in any question relating to this subject, but acts always after taking the opinion of his Commissioners. The Commission, on the other side, is served by a body of inspectors and local correspondents, and sometimes by trained architects, who supply it, as it were, with eyes and hands. In certain countries, as in Switzerland, the already existing council of some proved antiquarian body of national scope is charged with the functions of a State Commission, while in others a Commission is made up for the purpose from known experts in historical and artistic studies. Many of these Commissions are of old standing. That of France, the "Commission des Monuments Historiques," dates from 1837. The "Central Commission for the Investigation and Maintenance of Artistic and Historical Monuments," of the Austrian Empire, may serve as a type of the rest. This was founded in 1850, but received in 1873 the form which, with certain alterations in 1899, it now possesses. There are twenty members chosen for five years, and the service is an honorary one. They are aided by a staff of 146 "conservators," while 348 "correspondents" are distributed about the different districts, 167 in number, into which, for this purpose, the provinces of the Empire have been divided.

It is the duty of the conservators to keep in touch with local societies and individuals, and to influence public opinion everywhere in favour of the safeguarding of the memorials of the past. They have to form inventories of the treasures existing in their districts, to secure for the Imperial museums movable objects, especially of classical antiquity, that from time to time come to light, and to deal in the best manner open to them with all questions of the restoration and upkeep of architectural monuments. One of their functions is to report to the Commission upon projects for new railways, roads, and other

public works, in view of any injury that these may threaten to ancient monuments. For ordinary purposes the Commission has a fixed income, but for any special demand an appeal may be made to the Minister of Religion and Education. In the case of one monument, the most important in the whole Empire—the palace of Diocletian at Palatino, in Dalmatia—there is a project for independent legislation, and in the spring of 1903 a special committee of experts spent fourteen days in examining the building and drawing up a report on its condition and requirements. The Central Commission issues as its main publication the well-known and valuable *Mitteilungen*, and, besides this, publishes in each year a report on its operations.

It is important to note that the Commission and its conservators can make no attempt to exercise compulsion on private owners of monuments. The conservators are charged to deal with these by way of persuasion and tactful management, so as to secure as far as possible that private monuments shall be as well treated as those actually the property of the State. They possess at their back, however, no legal powers. In this respect the Austrian Commissioners differ from their brethren the members of the French Commission des Monuments Historiques. For the half century from 1837 to 1887, the latter worked as the former work now, armed with official authority, but without direct legal powers of compulsion.* In the last-named year was passed the French law on historical monuments, which gave to the Minister of Public Instruction and of the Fine Arts, under whom the Commission acts, certain legal powers in favour of monument preservation. A notice of some of the chief provisions of this law will be given in the succeeding paper.

Prussia is another country where there is no Monument Act, but an organised system of conservation by means of provincial agencies, and the same applies to nearly every one of the German States that hold together under the Empire. One important department of monument administration is in Germany particularly advanced, and this is inventorisation. In nearly every case, it is one of the chief functions of the State-appointed Commission to draw up a list of the historical and artistic monuments within the limits of its survey. In Holland, only last year, there was established a "Rijkscommissie," under the presidency of the distinguished architect, Dr. P. J. H. Cuypers, charged to draw up without delay a summary inventory of all artistic and historical monuments in the country, both immovable and movable, to be followed by a full publication of the more important objects. 1850 is the limit of time up to which monuments of value may be included, and these are roughly classified as:—(1) Pre-historic and Roman; (2) town walls, gates, etc.; (3) castles; (4) civic structures of a public kind; (5) churches and charitable institutions; (6) private buildings; (7) miscellaneous objects.

* Indirect powers of compulsion, through the process of compulsory purchase or expropriation, had always been at the command of the French Government. See *infra*.

It needs hardly to be said that no State inventory will be likely to take note of all the older domestic buildings and interesting details to be found in the towns and villages of the dominions. The great German State-subsidised publications, which are so numerous, deal, as a rule, with monuments of public importance. In all the German kingdoms and duchies these official inventories are in progress, and some of them are on a monumental scale. The number of separate works is nearly fifty, and in 1901 it was reported that the tale of volumes would soon reach 200. Distinct from these are the inventories that certain towns have drawn up of their ancient buildings and other artistic treasures. The Commissions and Societies mentioned previously at Paris, Vienna, and Lyons are engaged in this work. Hildesheim and other German cities have such inventories, and a list of all the old houses in Cologne is used effectively in the interests of preservation.

We are brought into contact here with an interesting phase of the general movement for the care of monuments in European lands—the independent activity in self-protection of the older towns. "Monument" is a convenient general term, embracing all the objects of the pious and patriotic activity under notice, but a distinction must be drawn between the comparatively few monuments of outstanding importance, which would find a place in any State inventory, and the numerous examples of antique civil and domestic architecture, and relics of military works, which, singly of small importance, combine to give their historical aspect to our older cities. With these, not the State, but the town or district has to deal, and the attention paid to structures and relics of this kind is a marked feature of the modern German "Denkmalpflege."

As compared with France, Germany is a decentralised country. The numerous States included within the Germanic Empire have their own bodies of domestic legislation, and Monument Acts are matters for each State to consider for itself. Furthermore, within the several States, the towns have a considerable amount of independent life of their own, fed by memories from the days when each was for practical purposes a self-governing community. There was an epoch not long ago when the State seemed disposed to take everything into its own hands, and the independence of the towns was seriously curtailed; but there came a reaction from this, and, as a consequence of the so-called "Dotationsgesetz" of about 1875, the towns have come now to manage their own affairs with considerable freedom and spirit. Hence there is in Germany a town "Denkmalpflege," as well as a State "Denkmalpflege," and in connexion with this there emerge matters of much practical interest to ourselves in Britain.

All civilised States possess Local Government Acts under which the different civic communities are empowered to make their own by-laws, of course within limits fixed by the Acts. In some of the German States these general Acts appear to allow, and even encourage, local authorities to make by-laws in the interests of amenity, while others do not

directly authorise such a proceeding. In Prussia proper the general Local Government Act is unfavourable, and only allows municipal authorities to forbid any absolute open disfigurement of a town (Verunstaltung), more refined aesthetic requirements not being covered by it. In Hanover, on the other hand, in which province lies Hildesheim, the Prussian law is not in force, and the regulations which there obtain allow of building prescriptions that take full account of aesthetic demands. Building Acts in Württemberg and Hesse are also said to be favourable to those who desire to restrict the freedom of constructors or destroyers in the interests of piety and good taste. In the Kingdom of Saxony, a general Building Act was a year or two ago under consideration, and the draft of this Act contained provisions perhaps in advance of any others in Acts of the kind:—"Building operations which threaten to involve an open disfigurement to a place can be forbidden. By local regulations there can be fixed a higher architectural standard for new buildings to be erected in certain streets or parts of streets."

Bavaria seems to be the classic ground for these local prescriptions, and the older cities of the kingdom, which are some of the most famous in Europe, cities such as Nürnberg and Augsburg, have taken full advantage both of the favouring general laws and of the benevolent attitude of the Government, and have framed local building laws in the interests of amenity of a somewhat drastic kind. On January 1 of the present year the Bavarian Ministers of the Interior and of Religion issued a joint minute with directions to local authorities which would have delighted the soul of the late William Morris. Civic and communal authorities are recommended to frame their local regulations on the following general lines:—

"(1) The ancient works of fortification, with their fosses, city walls, gates, towers, and all thereto appertaining, are to be preserved as carefully as possible; for every constructive alteration on them permission must be obtained.

"(2) Constructive alterations, interior or exterior, on other buildings of historical or artistic importance must depend on official permission. It should be a condition that, in rebuilding or alteration, the style and character of the original must be conformed to.

"(3) In the case of all new buildings or alterations in the vicinity of the fortifications, or of structures mentioned in the last paragraph, the character of the latter must be taken into account. Especial attention should be paid here that the new fabric should, as regards its proportions, take its proper place in the general picture, and in its details and ornament should be in harmony with the older surroundings. In order to avoid anything that would offend the eye in the general view of the town, the form and material of the roofs should be carefully considered.

"(4) When new lines of houses are in contemplation, care should be taken to safeguard the picturesque views of streets and open spaces, and the tyranny of the engineers' rule and level must of course be resisted. In general, in the

case of all new buildings, especially in the older parts of cities, it should be made a matter of duty to adhere as closely as possible to the traditional building style of the place, and in this connexion again the form and the covering of the roofs become of importance.

"(5) In the case of new buildings in other (suburban) situations, especially when fresh quarters have to be laid out, it would be enough to keep general aesthetic requirements in view. Directions, however, in such matters as the proper plastering of rubble walls and the correct slope of mansard roofs would always be welcome."

It should be understood that the minute from which the above has been extracted is not issued by any militant society for the protection of ancient buildings, or by some individual lover of monuments, such as William Morris, but is the combined production of two responsible Ministers of State in a European kingdom. Moreover, cases have recently arisen in which the Bavarian Minister of the Interior and the upper courts of law have upheld the towns in the enforcement of their local regulations, when interested parties have called these in question. Thus at Nürnberg in 1899, on the occasion of a peril which threatened the so-called Nassauer Haus (opposite the western end of the Lorenz Kirche), the magistrates issued an order which forbade any alterations either in the interior or on the exterior of a historical and monumental building without leave of the local authorities. This order was appealed against to the law courts, but the decision of the magistrates was upheld, and it was stated that the Minister of the Interior approved of the magisterial proceedings.

No discussion of the kind in Germany can be complete without the pronouncement upon it by the Kaiser. On the occasion of an Imperial visit to Hildesheim in 1900 august lips framed some excellent sentences in praise of the care the citizens were taking of their older monuments:—"I congratulate the citizens on the civic spirit which dwells in this town, for from their ancient buildings, their reverend churches, their noble town hall there breathes to us, not a sophistic imitation of antiquity, but the impression of the great and beautiful."

The question of the general policy of such local regulations in the best interests of monument preservation is one on which a good deal might be said. It is worth noting that it is fully recognised in Germany at large, for it is not only Bavaria that is concerned, that proper care must be taken in the framing and enforcement of restrictive ordinances of the kind. They may easily go too much into detail, and may lay down the law on matters on which people of good taste may take different views, or they may be applied too widely, without observation of the distinction noted in the Bavarian minute between the old parts of towns, where a jarring note may too easily be struck, and new quarters, where more freedom can be allowed. Again they may be enforced too often and too rigidly, and, by producing a feeling of irritation in the minds of the citizens, do more harm than good.

The municipal authorities of Hildesheim, in the province of Hanover, now under Prussian rule, have an elaborate set of local building regulations in the interest of amenity, and they consulted the Prussian Minister on their proceedings. He replied in encouraging terms, but at the same time advised them to use tact and caution in the enforcement of their restrictions.

Local building regulations of the kind contemplated are in operation in the Bavarian towns of Augsburg, Würzburg, Nürnberg, Rothenburg, Amberg, Lindau; also in Frankfurt, Hildesheim, Danzig, Lübeck, and other places. Most of them wisely limit the restrictions to the central and oldest parts of the cities. A few go rather too much into detail, and lay themselves open to the charge of pedantry.

Several of the towns in Bavaria and in other parts of Germany are like professional beauties whose face is their fortune, and they depend for a good part of their prosperity on the visitors attracted by their picturesque charm. Rothenburg on the Tauber and, to some extent, Hildesheim and Nürnberg are in this position. The preservation of this charm is accordingly a matter of enlightened self-interest, and the citizens have wit enough to recognise this fact. One wishes that the same recognition were more common among the citizens of our own older towns, such as Chester and Edinburgh. It is of more practical interest to ourselves to note that some important and busy cities, which are by no means run on antiquarian lines, are adopting the same measures for the preservation of their older historical features. Frankfurt, for example, which has been so transformed within the last twenty years that a visitor would think there is not an old house left in it, has awakened to a sense of the irrevocable loss she has been suffering, and is determined to preserve what she has left of her beautiful antique structures. The following is a local ordinance for Frankfurt-am-Main issued in the year 1900.

"Sec. 1.—For the preservation of the artistic and antique character of the following historically interesting streets and public places (here follows a list of seven such localities), all buildings which are to be erected thereon, in so far as they are visible from the street, must be so treated externally that the existing aspect of the streets be not disfigured or essentially altered. For the attainment of this end, the authorities may limit the otherwise legal height of the building, or of its stories.

"Sec. 2.—These provisions apply also to the case of alterations in older structures which already agree with these prescriptions, as well as to the case of important alterations, enlargements, etc., on buildings which do not yet agree thereto. (In the last case the authorities may in certain circumstances relax these restrictions.)

"Sec. 3.—The local authorities shall decide whether the above prescriptions have been fulfilled, and, before their decision, they must consider a report from a special civic commission, consisting of the custodian of the city antiquities, a member of the civic commission for art and antiquities, two members of the

association of architects and engineers, and one member from the magistracy, who acts as president."

In the instance of Lübeck, where new building regulations were issued in 1903, regard is had to the natural surroundings of the city as well as to its architectural character. The following are extracts:—

"All new buildings and additions to existing structures must, on every side that is visible from thoroughfares or public places, be so carried out that they do not injure either the aspect of the streets or the natural surroundings of the city, nor injuriously affect the appearance of existing buildings, especially those of historical value.

"Placards, posters, bills, and other such arrangements for advertising, or coloured surfaces that disfigure the streets or the landscape, or injuriously affect historic buildings, are prohibited."

In connexion with the treatment of those of our own older towns in Great Britain in which new interests are in conflict with the old, it is interesting to note what is being done in Mainz on the Rhine, a town which has greatly increased of recent years, and has been considerably altered by the change in the situation of the railway station. Mainz is in the Grand Dukedom of Hesse, and therefore in a region covered by a recent State Monument Act, of which an account will be given in the next paper of this series. It is also under the oversight of an official Conservator of Monuments for Rhenish-Hesse, and contributes members to the Council on Monuments of the Hessian State. A few months ago the Conservator issued a report on Mainz in 1903, in which, after discussing sundry problems connected with old buildings and new improvements, he goes on as follows:—

"Other works are now in preparation. Thus, in last January there was set on foot a systematic survey of all public monuments of architecture and of those private buildings which are to be included in the official schedule of monuments, in relation to their position in the general lines of the streets (im Strassenbild) and to the alterations in the direction and the width of streets which will be necessary within the next ten years. This procedure will be kept in operation, so that the effect on the general aspect of the streets of any unavoidable alteration in the main lines of communication may be carefully considered as part of a general scheme, and not in a hap-hazard way just when occasion arises. By these means it will be possible in the fullest measure to secure the preservation of the historical character of the city by safeguarding all existing buildings of importance and keeping new structures to a style in harmony with the old."

WESLEYAN CHAPEL, BARROW.—A new Wesleyan chapel has just been opened at Barrow. The building is in the Gothic style of architecture. The exterior is of red Ruabon brick, faced with terra-cotta ornamentations. The roof contains an ornamental turret, constructed for ventilation purposes. The interior contains seating accommodation for about 120 people. The fittings are of pitch-pine, and the windows contain cathedral glass with coloured margins. The flooring is of modern blocks. In addition to the chapel is an adjoining schoolroom, which, by a removable partition of wooden shutters, can be made as part of the chapel. Messrs. Lockwood & Sons were the architects, and Messrs. G. Wright & Sons, Kelsall, the contractors for the work.

NOTES.

The Proposed
Shakespeare
Memorial.

It is proposed to erect a great architectural and sculptural monument to the memory of Shakespeare, on some site to be selected in London. Such an idea ought to be enough to inspire artists to their highest efforts, but it is amusing to see how already the typical English mind, with its usual dread of art, is aroused in opposition to the idea. The *Spectator*, a paper essentially political and literary, publishes in its last issue an article throwing cold water on the scheme, and demanding that something "useful," like a memorial library, should be erected. That is so very English. The *Spectator* doubts whether we shall get anything good, and scoffs at the London public statues as now existing, not being apparently the least aware that English sculpture has made immense progress in the last twenty years, and is now second only to French, and not far behind that. The most characteristically English idea of all is the insinuation that a monument to Shakespeare is not to be made a mere opportunity for artists to exhibit their talents. The idea that a noble artistic monument is a gain to the nation, and not a mere advertisement for artists, seems to be beyond the writer's perception.

Party
Walls.

THE Court of Appeal in the case of *Leadbetter v. Marylebone Corporation* have given an important decision under the London Building Act, 1894. The plaintiff and defendants owned freehold premises adjoining. The house on the plaintiff's land was pulled down, and the building operations necessitated the rebuilding of the party wall and the construction of one of greater strength, and a notice under section 90 of the Act was served by the building owner upon the defendants. The defendants were contemplating building operations which would require the wall to be of exceptional strength, and they served a notice upon the building owner under section 89 setting out their requisitions. The questions between the parties were submitted to arbitration under section 91, and the arbitrators' two surveyors gave their decision, by which an exceptionally substantial wall was to be erected, the extra thickness to be on the defendants' land, but they further awarded that the defendants were to have the right to raise the party wall at any time as they might desire. About two years later the defendants, having commenced their building operations, proposed to raise the party wall, but the plaintiff objected on the ground that the latter part of the award was *ultra vires*, and they claimed to be entitled to a building owner's notice under section 90 of the Act. The Court supported this contention, holding that section 91, which gives the surveyors power "to determine the right to do, and the time and manner of doing, any work and generally any other matter arising out of or incidental to such difference" to be limited to the work in respect of which notice has been given and not to confer a power to determine the rights of the parties generally and at any time. The Court also construed section 95 as applying not to an

alteration in the structure of a party wall but only to increased user of an existing wall. This case emphasises the point that the arbitrators must be careful not to exceed their powers. In *Stone v. Hastie* (see our Note October 31, 1903) the Court of Appeal decided that arbitrators in determining the rights of the parties under section 91 must confine themselves to the questions raised in the building owner's notice, and have no power to award a sum in respect of extra user of a party wall.

Hire and
Purchase
Agreements.

IN our issue of April 4, 1903, we commented upon the case of *Lyon v. London City and Midland Bank*, and the law relating to hire and purchase agreements of fixtures when the premises to which they have been affixed have been mortgaged by the hirer. The latest decision on the point is that of the House of Lords in the case of *Reynolds v. Ashby and Son* (Current Law Reports). The appellant had let certain heavy carpenters' machinery on a hire and purchase agreement to the lessee of certain land, who had built a factory thereon. The machinery was bolted down to a concrete bed by means of bolts imbedded in the concrete, which passed through holes in the machinery, which was held down by nuts. The factory owner or builder had previously mortgaged the premises, and subsequently the mortgagees took possession of the premises, and default having been made in payment of the sums due under the purchase and hiring agreement, the issue was raised as to who was entitled to the machinery, the lessor of it or the mortgagees of the premises. It was contended that since the hirer of the machinery had not paid for it, he could not mortgage it, but the House of Lords, whilst admitting that the law as laid down in the decisions was not satisfactory, held the principle as between mortgagor and mortgagee to be too well established to enable a departure now to be made, and since the machinery was affixed to the freehold, and the mortgagees had entered into possession before the lessor of the machinery had reclaimed it, decided in favour of the claim of the mortgagees. It must, however, be carefully noted that in this case there was nothing in the hire and purchase agreement showing the intention of the parties that the machinery was not to become attached to the freehold. In *Lyon's* case, which the House of Lords in this decision approve, there was such an intention to be gathered, since the things let were capable of being used as movables, and were only fixed to the freehold at all owing to the order of an independent party, the Town Council. The law is now settled, and it is useless to point out that it is unsatisfactory in that the mortgagee who advances money is the person really to be put on inquiry as to the security he is taking, whilst the lessor of machinery cannot know if it is being mortgaged or not. The only practical lesson to be learned is that lessors of such articles should take care clearly to express their agreements in such a way that the articles hired out may remain chattels and not become fixtures.

Motor Traffic. PUBLIC bodies who have sunk large sums of money in tramway tracks and equipment may be recommended to consider some of the points made in the lecture recently delivered by Mr. C. S. Rolls. Quite apart from the great possibilities of the motor vehicle in connexion with traffic between large cities and outlying country districts, and with the conveyance of light merchandise, it is perfectly clear that the motor omnibus has many advantages over the tramcar for urban and suburban highways. When the streets are narrow, as at Hackney, Brentford, and elsewhere in London, and in towns such as Ipswich, the tramway system is nothing less than an intolerable nuisance. Even in wider thoroughfares tramcars form a serious obstacle to traffic, and particularly so when, as often happens on the southern lines of the London County Council, a breakdown fills up any of the routes with a standing succession of cars half a mile or more in length. So far as can be judged at the present moment, the motor omnibus is the public vehicle of the future, and the sooner municipal authorities recognise the correctness of this forecast, the better it will be for the pockets of the ratepayers and for the convenience of the general public.

Street Widening in the West-End. JUDGING by the strong recommendation contained in the recent report of the Improvements Committee of the London County Council, there is reason for believing that the widening of the last remaining narrow portion of Piccadilly will be taken in hand without unnecessary delay. The thoroughfare in question is an important part of the main highway between Piccadilly-circus and Hammersmith. But it should be remembered that it is not the only part requiring attention, for in spite of improvements on the southern side, Knightsbridge still offers a considerable obstacle to through traffic. An opportunity too good to be lost now exists for securing an important area on the northern side, where the leases of several houses have fallen in. These buildings are situated between the park railings and the French Embassy, and before definite arrangements have been made for the erection of structures on a larger and more costly scale, it is very desirable that the site should be secured by the authorities. Part of the land could be added to the park, and part used for the much-needed street widening. We are glad to observe that a petition has already been presented to the Commissioner of Works and the London County Council, advocating the necessity of the improvement, and, although no evident result has followed, we trust the authorities jointly interested will not allow this golden opportunity to pass by.

A Concrete Railway Viaduct. At the meeting of the Institution of Civil Engineers on Tuesday this week the application of concrete to bridge building was discussed in a paper, read by Mr. A. Wood-Hill and Mr. E. D. Pain, describing the construction of the Cannington

Viaduct on the Axminster and Lyme Regis Light Railway. This viaduct includes ten three-centred arches each of 50-ft. span and 16-ft. rise, and has a total length of 600 ft., while the maximum height to rail level is about 92 ft. The arches spring from piers of mass concrete supported on concrete foundations of dimensions calculated for earth loads ranging from 1½ to 3 tons per square foot beneath the various piers. In the construction of the vertical faces of the arches concrete blocks were employed, with the object of simplifying and reducing the cost of the centring, the haunches and all other parts being formed of mass concrete. For the purpose of providing for expansion, four joints were made in each arch, one at each springing and two on either side of the crown. We doubt the advisability of constructing piers of mass concrete, for any undetected flaw or fault caused during the progress of the work, or developed after its completion, must involve the most serious consequences. On the other hand, if piers be built up of concrete blocks made long enough beforehand to enable their condition to be definitely ascertained, there should be every reason for confidence in the security and durability of the masonry. It was stated by the authors that the foundations were originally designed for an earth pressure of 3½ tons per square foot, this being afterwards reduced, by enlargement of the foundations, to the values mentioned above. That still further reduction would have been advisable is shown by the fact that the west abutment and the adjacent pier settled to such an extent as to crush the crown of the first arch. We wonder that the engineer responsible for the design did not think of adopting concrete-steel foundations, which would have permitted considerable lateral extension of the footings without extra expense. With some criticisms that were made on the appearance of the viaduct (by an engineer who thought his own viaduct more beautiful) we do not by any means agree. There is nothing to object to in it at all, and it forms, in fact, a picturesque feature in the landscape.

Kirkstead Abbey Church, Lincolnshire. A FUND is about to be opened for the proposed reparation of Kirkstead Church, near Tattershall, which has been closed, by reason of its untoward condition, during many past years. In the earlier half of the XIIIth century Hugh Fitz-Eudo, surnamed Le Breton, a son of Eudo, a follower of the Conqueror, founded a Cistercian Abbey in Kirkstead, dedicated to St. Mary the Virgin, which at the dissolution was valued at 338*l.* 13*s.* 11*d.* per annum. The abbey church then became the parish church of the village, as a "peculiar" in the private property of the owners of the estate, and for a long period during the XVIIth and XVIIIth centuries it was used as a Presbyterian chapel. The walls are now out of the perpendicular, and the stone vaulting is in danger of falling down. The principals are carried by dwarf shafts resting upon a string-course, and divide the ceiling into four square compartments. The mutilated effigy of Robert de Tattershall, 1212, is a valuable

exemplar of armour of that period; the suit of rare banded mail is covered with a short surcoat; the head, wearing a cylindrical flat-topped helmet, rests upon a cushion.

Mr. Clausen on Painting. MR. G. CLAUSEN's lecture on the "History of Painting" at the London Institution on Monday afternoon was to a considerable extent a repetition of points from his Royal Academy Lectures, put in a somewhat more popular form; but there was a distinct aim pervading the discourse. The History of painting, as he said, was far too large a subject to be even sketched in outline in one lecture; he only aimed at showing how early as well as infantile work was confined to a hald transcription of facts; how there was evidence that the ancients did understand modelling by shadow, an art which was lost in the dark ages, and slowly revived again by the early (not the earliest) Italian Renaissance painters. He pointed out too, and illustrated with examples, how like Japanese art, so far as it dealt with figures and landscape, was to the earliest Renaissance art and to the drawing of clever children; an example of the latter class of work, thrown upon the screen, was exceedingly characteristic in its mixture of really very correct outline with the entire absence of surface modelling; the face all one colour, the dress all one colour, laid on flat. We rather wish, however, that Mr. Clausen would not go about telling audiences that the distinction between pictorial and decorative painting is only imaginary. It is a conclusion which seems to us contrary to visible facts. All pictorial pictures should in a sense, no doubt, be decorative; but decorative pictures are not pictorial: there is a distinct difference of aim possible in works which may nevertheless each be admirable in its way. Decorative painting is that in which something of natural effect has been left out in order to assimilate it more closely with architecture. It is exactly analogous to the conventional treatment of floral forms in ornament. Nor can we accept it as a decorative merit that some of the Renaissance painters would carry on the solid architectural features of an interior into their pictures in order to make them more essentially a part of the decoration. It is interesting as an occasional characteristic of painters of the period, but it is after all a kind trick-of-illusion, and if a modern painter did the same we should call it had art.

Drawings by Mr. A. H. Hallam Murray. WE suppose we are to regard Mr. Murray, who is connected with the eminent publishing firm in Albemarle-street, as an amateur artist; but if so, he is an amateur of quite unusual powers. His collection of water-colour drawings exhibited at the Fine Art Society, under the title "On the Old Road through France to Florence," shows work both in landscape and architectural subjects of the greatest beauty and delicacy, and the treatment of architecture is especially satisfactory. That showing the Romanesque arch at Aix in Provence (28) is quite an ideal hit of architectural

water-colour in regard to drawing, colour, and texture. "Narbonne—le Canal des Deux Mers" (30) is noticeable equally for its charming and real effect of sunlight and colour. Among others that we noticed particularly were "Amboise" (2); "Cahors" (7), with the two square towers white in the sunshine; "Cheou-ceau" (13), the château so picturesquely but not wholesomely built on arches over a river; "Valence" (32); and "San Domenico—view across the plain" (54). All, however, are good, and architects should find a great deal of interest in an exhibition of drawings dealing so largely and so ably with picturesque architectural subjects.

THE exhibition of the Women's International Art Club at the Grafton Gallery is, we think, a better one than last year, though its interest is really confined to the works of but a few exhibitors, the rest being a collection of mediocrities. The International element is not very prominent, nor are the foreign pictures among the ornaments of the collection, excepting Middle. Fortunée de Lisle's "Réveuse" (46) and "A Merovingian Princess" (139), a portrait in water-colour, and Miss or Middle. Kinsella's frame of very clever sketches at Bizerta; and both these ladies with foreign names date from London addresses. Of the pictures actually sent from abroad, the German are mostly such as one endeavours to forget. Mrs. Deric Hardy has a clever life-size pastel study of a woman with a nude infant, "Summertime" (44); Miss Vera Christie exhibits a good portrait of a pretty lady (75), and Miss Clare Atwood a very good work of the same kind; and Miss Robertson, an English lady painting in Paris, though two of her portraits show that studied avoidance of all charm or beauty of colour which seems to be the aim of one set of Parisian artists, surprises us agreeably by one portrait (388) which presents interest both of colour and character, and is quite different from her other works. Miss Gloag's child with the angels round its cradle (109), illustrating a well-known pious nursery rhyme, is more successful as regards the infant than the angels, but the picture has its attractions. Miss Atwood's "The Inventor" (127), as a study of an imagined type of person, is very clever and original; a character in a novel might be founded on it. Besides these, the best things are landscapes, mostly small. Among these are Miss Molony's "By the River" (77), a picture which is Corot in composition but not in texture; Miss Anna Birch's "Wayside Study" (98); Miss Evelyn Howard's three studies, two sunsets and a dawn (153 to 155), hung together, make a most attractive group, showing sentiment and poetry as well as facility with the brush; Miss Hagarty's "The Marsh Meadows" (174), "The Village by the Sea" (239), and—the best of all—"Changing Pastures" (354), a really beautiful water-colour landscape; Miss Warrack's "The Baptistery, St. Marks, Venice" (179), a well treated architectural subject; Miss Hoyland's trio of landscapes (183 to 185); Miss Kirkpatrick's "In St. Ives Harbour" (217); Miss Mary Barton's "Above Rapallo"

(238); Miss Lancaster-Lucas's "In Brittany" (294) and some others; and Miss Barbara Porter's "Rye Harbour" (311), a comparatively large work of much excellence, especially noticeable for the force and realism with which the boat rowing up to the foreground is shown. Miss Gloag, whom we have already mentioned, has also a very clever study of "Launce and his Dog" (258), superior to her baby and angels picture. At the end of the further gallery is a small collection of sculpture, in which Miss Roper's work is predominant and is all charming; and the "Seaside Studies" of Miss Emmeline Halse is a clever bas-relief panel of nude children on the beach. Marriage (among women) seems to be unfavourable to the arts, for we notice that nearly all the names in the list at the end of the catalogue have "Miss" before them, the married names being almost nowhere—we only counted ten in the whole list extending over nine pages. Marriage, we suppose, takes a lady from the studio to the nursery.

Messrs. Dickinson's Gallery. MISS PEACHEY'S oil sketches in Brittany, at Messrs. Dickinson's Gallery in Bond-street, show much feeling for landscape effect; and one or two sketches of winter snows in the Engadine are interesting as showing an aspect of that region with which most of us are not familiar. The character of country is well given, too, in such sketches as "Ile de Batz" and "La Forêt, from Concarneau"; and in the vigorous sketch of "Threshing with Flails" there is a reminder of the energy of Millet in subjects of this class. A series of studies of animals by Miss Gertrude Whelpton form part of the same exhibition. These also are of no little merit; "The Yeoman's Horse" is a capital study, showing very good drawing, and the studies of cats, especially the one "Left Behind," are worth attention.

The Dutch Gallery. AT Mr. Wisseling's Dutch Gallery, which has now migrated, apparently, from 14, Brook-street to 14, Grafton-street there is an un-catalogued collection containing some very good pictures; notably one of the finest examples of J. Maris that we have seen; one or two good examples of Vollen, and a very fine coast scene by Mesdag.

Pictures of Norway. THE title of "Norway" appended to the collection of water-colour drawings by Mr. Jungmann which are on view at Messrs. Dowdeswell's, suggests something very different from what the visitor will find. These are not drawings of the grand scenery of Norway, but what may be called details of the country and its inhabitants. As far as the figures are concerned, Mr. Jungmann's decorative style comes in very well; much of the interest of the figures lies in the picturesque costume, and this is treated by the artist in a painstaking and effective manner which produces pictures a little stiff, it is true, but admirably decorative. But it is a different thing with the scenes (we say purposely "scenes" rather than "scenery"). The villages with their naive timber architecture are painted in a way that shows the facts carefully,

but fails to make a picture. The structure and appearance of the buildings are most carefully given—you might almost write a specification of them. But they do not blend with the scene the least; it is not a picture but a diagram.

EXHIBITION OF ACADEMY STUDENTS' WORK.

THE Travelling Studentship in Architecture has only attracted three competitors. The subject was "An Art School for a London Borough," and it has been won by Mr. Leslie Wilkinson, whose design is certainly the best of the three, but not one to excite much enthusiasm. In the plan the three departments of Antique and Life, Painting, and Architecture, are on three sides of the building and all lighted at the side, with the consequence that they cannot all have an equally good light; south is avoided, but the architecture school has west light, which is a bad one in summer. Otherwise the plan is well arranged, and the elevation fairly pleasing but rather wanting in refinement, and the shape given to the gables of the end pavilions—a wall cut out into an overhanging curve on each side, is a detail that is quite out of scale with its position and surroundings. In an Academy drawing somewhat more care should be required in putting in the sculpture on the building; the sketching of figures with balloon-like curves of drapery is a little too easy a way of doing it. In the design numbered 166 the author has done worse with the lighting, for he has given the architectural classroom a side-light to the south—an aspect, in summer, almost intolerable for working.

Only one design has been submitted for the prize for an elevation treated in colour (the east end of a church); the silver medal has been awarded to the one competitor, Mr. W. Harvey, whose colour harmony in the composition is very good, though it seems rather ragged in detail.

Five students have competed for the Architectural drawing prize, the subject being the Rood screen of the Church of St. John, Bois-le-duc. A first silver medal is awarded to Mr. Swarbrick, and a second to Mr. W. Harvey. There is not really much to choose in merit between the two, only that the former being tinted, and the latter only in line, the former is the more effective. The careful drawing of the figures and other details in these two sets is proved by their great similarity. As an example of the aberrations which will occur in what profess to be careful drawings from the actual work, it was rather amusing to compare the left hand sculptured figure on the upper part of the screen as shown in the two prize drawings, with the same figure as shown in the sets numbered 171 and 172; it was impossible to suppose that they were meant for the same thing; both attitude and proportion being completely different in each, both from each other and from the prize drawings.

For the prize for perspective drawing for architectural students only one competitor appeared, Mr. Leslie Wilkinson, and to him the prize has been awarded for a good drawing of the interior of St. James's Church, Piccadilly, accompanied by a drawing showing the construction lines of the perspective.

In the upper school of architecture the 25th prize for a set of drawings of an architectural design is awarded to Mr. Percy I. Elton for a set of drawings of a Chapter house. This is a pure Gothic study, on an octagonal plan. The large-scale half section is a very good drawing. Among the others that numbered 177 was a good and rather original study. In the lower school the 15th prize is awarded to Mr. Bayley for a set of drawings of "A Livery Court Hall for a small city." This is the best thing among the architectural drawings; a good plan with a suitable and satisfactory architectural treatment. The 10th prize was awarded to Mr. Leslie Wilkinson for designs for a college hall, late Gothic in character.

The subject given for a sketch for a figure picture was "Cain Killing Abel." The subject, only demanding two figures, is simpler and easier than many that have been set, but the results are not very promising. Mr. E. G. Solomon obtained the prize for what is perhaps the best design, though we were rather struck with one representing Cain standing in remorse

and terror over the dead body of Abel, with a stormy sky behind. It may, however, have been considered that this did not strictly carry out the subject.

Sculpture, as usual, shapes best among the exhibits. The subject for the model of a design was "Samson and Delilah," and the prize-winner, Mr. Merrifield, has produced a model which is full of promise, as it is both expressive and truly sculptural in line and building up. Delilah is seated with Samson kneeling and bowed over her knees in sleep, white shie, with a cruel expression of face, beckons to his enemies. The group is concentrated and pyramidal in composition, and altogether of great merit; it would be well worth execution on a life-size scale. The second prize model, by Mr. Sands, is also good in line, but much more commonplace in conception. The sets of models from the life show very good work. For the Figure and Ornament prize—subject, "A frieze for a temple of Neptune," the prize was won by Mr. G. Alexander for a bas-relief composition in which nude children, fish, and a sea-angel, are combined in a very decorative manner. It was unquestionably the best of the three or four designs sent in, but there was merit in No. 154, a conventional frieze of sea-horses and riders, of a very architectural character.

The Creswick prize—subject, "Scotch firs on a Common," attracted far more competitors than anything else except the sculpture model; though, as usual, few or perhaps none of the works could really be accepted as satisfactory specimens of landscape-painting. Miss Walford's, which obtained the prize, is undoubtedly the best in execution, though less effective in composition than some others. The tall fir-tree stens shut in the view—they look rather too flat and seem to want modelling a little; the sky, the best portion of the picture, shows through their foliage; the foreground is rather weak in effect and harsh in its green. Among the others Nos. 7 and 16 were above the average. The exhibition of these pictures serves to indicate (if the indication were required) how very difficult an art landscape-painting in oil really is, when we see that so many students who are not mere beginners, who have learned to handle the brush with ability, cannot among them produce what can be called a really complete work of art. To represent a scene is one thing; to treat it so that it becomes a work of art in landscape is another and a rare accomplishment.

The subject for the Cartoon of a Draped figure was a difficult one—"A Greek girl dancing," involving the expression of action as well as mere pose and design. It is probably for this reason that the set are not so good as we have seen in some former years. The prize drawing, by Miss Lilian Price-Edwards, is very pretty, but not very Greek; there is too modern a feeling and expression about it; something that may be described as *espèglerie*, a quality distinctly not Greek.

For the prize for perspective open to all students there were but two competitors; if students only realised how often even eminent painters fail in the perspective of buildings, they would see the advisability of giving more attention to this subject. The prize is won by a lady, Miss Dovaston, with satisfactory drawings.

The subject of the Decorative painting for the wall of a public room was "Peace," and the prize has been awarded to Mr. G. H. Short for a design which is certainly the best, and is a very able and original one, but which may be open to the objection that it is scarcely a real rendering of the subject. It represents the globe of the earth revolved in space, beneath the stars, by two flying nude figures, who seem to turn it round; an inscription round the margin, in rather cryptic characters, among which were to be made out the words "Seed-time and Harvest, Summer and Winter shall not fail," indicates that the idea in the author's mind was that of the promise after the Flood; but it is a somewhat too fanciful reading of the subject given. However, it is good both in colour and design, and distinctly decorative in character, and the life-size cartoon of one of the figures is a very clever drawing. Among the others perhaps the most successful was No. 31, in which two old people, picturesquely designed, are seated on a stone bench on the right of the composition, looking at the setting sun; there is poetry in this, as well as good composition, though a little too much of landscape effect for a decorative picture. No. 30

was good in colour, but the figures rather commonplace; No. 24 also good in colour. In No. 23 the seated draped figure on the top of the arch is well posed and comes out well in the life-size cartoon; the composition rather wanted definite line.

MAGAZINES AND REVIEWS.

THE *Art Journal* opens with an article by Mr. F. Maclean on a rather new subject, "Positions and accessories in portraiture." The illustrations selected remind one how great a change in taste in these matters has taken place during the last hundred or hundred-and-fifty years. It would hardly be possible to paint a portrait of a child nowadays, as Reynolds painted Master Wynn, "in the character of St. John," attended by a lamb, and holding a cup to catch water from a spring streaming from a rock. Nor do we see ladies now painted as muses and what-not-else of allegorical characters. There is a feeling that this kind of treatment is in a false and pretentious taste. The author notes also that in portraits of naval and military heroes it is no longer usual to represent them wielding a sword or pointing a telescope in the thick of battle, with a cloud of smoke as a background; though such portraits are generally painted in the uniform of the profession. Mr. Maclean thinks that we "have lost some of our inventiveness" in portraiture; but the inventiveness of the old school was hardly of the right kind; there was something of the mock-heroic about it. There is something to be said for introducing into the portrait of a man celebrated for any special professional acquirement some indication of his work; a good example is Millais' remarkable portrait of Sir James Paget, lecturing on anatomy before a blackboard with chalk sketches on it. We do not know whether the writer means to continue the subject; it is by no means exhausted in this article. Sir W. Richmond's remarkable Gladstone monument forms the subject of two illustrations, photographed from the plaster model, now complete. This will be a fine and very original example of monumental design when completed. Calvert, Blake's friend, and a somewhat kindred spirit in art, is the subject of a short article accompanied by two illustrations, and one of the separate plates is a successful and powerful reproduction in colour of the "Autumn" of Mrs. Stanhope Forbes, whose work is the subject of another article.

In the *Burlington Magazine* is a short editorial note on "The picture exhibitions of the future," in which we are exhorted to scorn the large exhibitions, which are only to catch the shillings of the populace, and find more intellectual interest in small exhibitions such as that recently seen at the Leicester Galleries of the work of Mr. Conder and Mr. Rothenstein. These kind of exhibitions of eccentricities, with bad drawing of figures, or no drawing, are now the higher art! It is an amusing though somewhat irritating phase of contemporary art-criticism. Select exhibitions of the work of one man are often of the highest interest, when he is really an artist who is at the centre of things and not making eccentric side-shows out of the art of painting. That there is much in the larger exhibitions only calculated for the popular mind is true enough; but we have the chance of a great picture or two in them, worth more in itself than scores of would-be intellectual eccentricities. An article on the late Mr. Forbes's Millet drawings is accompanied by a number of very interesting illustrations, all of course of Millet's peasant-painting era, which has now obscured to most people all recollection of his earlier and equally powerful paintings of abstract and nude subjects. Millet opened a new chapter in modern painting in his treatment of peasant life, but it will some day be recognised that the artistic element in these has been somewhat over-rated—that many of them are not so much pictures as moral lessons. Mr. Clouston's essay on "Minor English Furniture Makers of the XVIIIth Century" deals in this issue with the work of Matthias Lock, whose style, as Mr. Clouston says, is essentially that of Adam and his drawings very like those of the eminent architect. The design for the table and mirror reproduced from one of his drawings we cannot admire except in regard to the treatment of the mirror frame and its method of connection with the accessory ornament; but this latter, and the design of the table legs, are very bad, and better forgotten than preserved in the illustration.

Lock's sketch of a one-armed oval chair, with no tawdry ornament, is good; it was the ornament that led these people astray. The number includes two fine illustrations of a beautiful bronze Hermes, one of the Parameythia set, lately presented to the British Museum by Mrs. Hawkins, with a historical and critical note on it by Mr. Cecil Smith.

The illustrations in the *Berliner Architekturwelt* are devoted mainly to a single house, No. 38 Benderstrasse, Berlin, by MM. Hart & Lesser, which are very interesting. Almost the whole of the interiors of the house are given; and though there are touches here and there of that taste for twists and curves which is so prevalent in modern German work, on the whole they give a very favourable idea of a first-class Berlin street house. The exterior is treated soberly but not ineffectively; the walls are broken into vertical pilaster-like strips between which the windows are grouped. The plan is of some interest, especially in the grouping and arrangement of the bedroom floor, with its suite for the owners and suite for guests, each shut off within itself.

The *Architektonische Rundschau* contains an article on the interesting subject of "Friedhofskunst"—literally "churchyard art"; the works illustrated, however, are what may be called "mausolea," family vaults treated architecturally; a kind of architecture to which the Germans, as everyone knows, pay much attention, and which their architects often treat in an original and impressive manner. Most of the illustrations given are (naturally) German examples, but there are four of American origin. That there are no English examples need not surprise us; English architects have not done much in this way; but we should certainly have thought that French examples, which are numerous and often good, might have found a place in the article. Among the plates is a photographic reproduction of a warehouse in the Kosenenthalstrasse, Berlin, by Herr Alfred Messel, perfectly awful in its detail, though undeniably clever in what may be called its putting together. The only other illustration worth special mention is a successful colour-print of a good water-colour sketch by Herr Weigle (Stuttgart) of part of the castle of Reifenstein, near Sterzing.

Among the serial articles in this month's number of *Technics*, we need only notice those of special interest to our readers. Mr. Parshall and Mr. Hobart, continuing the subject of "The Mechanics of Heavy Electric Traction," refer briefly to the varying conditions associated with the use of several types of motor, and with the varying characteristics of motors of individual classes. They next give two series of speed-time and speed-distance curves which, considered in conjunction with curves reproduced in previous articles, show that the influence of accelerating conditions diminishes steadily with the increase of distance between stops, and with the reduction of the average speed for a given distance between stops. The charts in question should enable the student to draw many useful conclusions. Two other sets of curves near the end of the article show clearly the great increase in schedule speed rendered practicable by electric traction in short distance runs. Professor J. A. Fleming, as a part of the general subject of "Electric Waves," discusses the nature of the electrical phenomena which, owing to their similarity to those evidenced in acoustic resonance, are said to be due to *electric resonance*. The principles of resonance are admirably elucidated by several illustrations, and an interesting part of the article is that in which the writer explains the connexion of resonance with the Hertzian wave or wireless system of telegraphy. Proceeding a step further in his explanation of "The Electro-Magnetic Theory," Mr. Edser explains how quantitative information may be obtained as to the properties of electric tubes of force, the results applying with small modification to the magnetic tubes. In the ensuing investigation the writer deduces by most simple means several formulae of great importance in electrical engineering. A most useful contribution to the series on the "Theory of Structural Design," by Mr. Etehell, relates chiefly to brackets on steel stanchions, which cause bending stresses so far in excess of the direct compression that the ordinary column formula become quite valueless. The procedure recommended by the writer of the article is to compute the extreme fibre stress (f_b) due to bending by the non-axial load, and adding this to the direct compressive stress

(f) due to axial load, to design the stanchion by an ordinary column formula to carry an equivalent central load of $(\frac{1}{4} + f_2)$. A tons, where A equals area of the stanchion in square inches. A further simplification of radius of gyration formula, and some remarks on the effect of heat on the strength of steelwork are useful features to this instalment. In view of the generally admitted opinion that chemistry should form an important part of the scientific training both of the engineer and of the architect, the article by Professor Travers on "The Determination of Relative Atomic Masses" should be of interest to many of our readers. An article on "The Elements of Chemical Engineering," by Dr. Grossman, is the first of a new series intended to make clear the nature of the apparatus necessary for the economical manufacture of products which the student is taught to make on a small and generally expensive scale in the laboratory. Mr. Percy Longmuir contributes the first of what promises to be a most interesting serial article upon "The Metallurgy of Steel." The present contribution is illustrated by several views showing the micro-structure of iron and steel as cast and after heat and mechanical treatment, the differences exhibited being very strikingly presented. Finally, we may mention a description by M. Jacques Boyer, of "The International Bureau of Metric Standards," an institution under the management of an International Committee, armed with authority by the General Conference on Weights and Measures. Altogether, it will be seen that this issue of *Technica* is fully up to the standard set in former months.

The *World's Work* publishes an article on "Bungalows for people of moderate means," some of the illustrations to which show good points in planning. The editor should require those who furnish or lend plans to see that a north point indicator is put on them all; some have it, some have not.

Knowledge contains an article on the newly-discovered ninth satellite of Saturn, together with some suggested explanation of the remarkable fact, not certified till after about a year's observation, that its motion in its orbit is retrograde, or contrary to that of the planet's revolution.

In *Macmillan* is a short but thoughtful article by Mr. E. M. Congreve on "Nature in Greek Art." His question is whether the Greek really cared for and appreciated natural scenery; his conclusion is that he did, but that in art (and almost in imagination) "he was ever ready to see it in a personal form, to give a history to every hill or stream, bird or star." This is the same idea that was long ago expressed in a fine passage in the fourth book of Wordsworth's "Excursion"—the passage (too long to quote) commencing—

"Once more to distant ages of the world
Let us revert."

The *Pall Mall Magazine* contains a symposium on the subject "Is London growing more beautiful?" in which the speakers are Mr. Thackeray Ritchie, Mr. John Davidson, Mr. Boughton, Mr. R. Blomfield, Mr. Marriott Watson, and the Rev. R. J. Campbell. The title of symposium given to this kind of joint article by various authors is rather a misnomer, as a symposium should be an interchange of ideas, not a mere succession of unrelated opinions. We do not think any of the remarks come to very much practically except one of Mr. Blomfield's, who doubts whether London is improving, but thinks the failure is due not so much to want of buildings that are individually good as to the inadequacy of "the municipal idea of architecture."

"In London, for instance, in the last twenty years, there has been the failure of Shaftesbury Avenue, with its inadequate roadway and unconscionable vista. Then there was the Strand improvement scheme, in which the final setting out was determined in the teeth of competent advice so far as architecture was concerned, and a competition was held which ended in space. There is indeed the monumental Gaiety block; but who is to maintain that heroic scale? and indeed there are signs in the neighbourhood that it will be ignored at the first opportunity. And here we come back to the more particular point—there are the public parks and spaces laid out in the last twenty years. Complacent county councillors may pat each other on the back, and protest to their constituents: 'See, this we have done for you,' but to the mere artist few things are more depressing, even more irritating, than the deplorable vulgarities of recent public parks, where the eye is eternally met by the same trivial paths, meaningless planting, and trade-catalogue ornament. As to the moral side of their work, no doubt, the London County Council might make out an excellent case; but in their aesthetic aspect their failure is absolute."

With every word of which we agree.

In *Scribner*, under "The Field of Art," Mr. Russel Sturgis has something to say about the new bronze doors of the Boston Library, of which we think we have already mentioned a description and illustrations in another American magazine. Each of the six doors (hung in pairs) contains a low-relief model of a symbolical draped figure large enough to occupy most of the surface of the door, and in a relief which, in comparison with the width of the door, is proportionally no greater than the relief head on an ordinary coin. That is no doubt the right way to treat such work. The illustrations are very small, but convey an impression that the design of the figures is very graceful and pleasing. The manner in which the best art that could be obtained has been expended on the Boston library should be a lesson to public institutions and corporations in England.

The *Century* contains an article by Mr. G. H. Grosvenor on Dr. G. T. Moore's method of purifying water from typhoid germs by dissolving a small proportion of copper sulphate crystals in it. This is a method applied not to the family cistern so much as to reservoirs, etc., on a large scale, the method being to tow coarse sacks full of the crystals, slung from boats, across and across through the water. The success of the experiment on several fouled reservoirs is described in the article, the proportion of the copper sufficient to destroy the algae being too small to affect the drinkers of the water. The article is at all events of considerable interest, and goes fully into the subject.

"London Films" is the title of an article in *Harper* by Mr. W. D. Howells, the well-known American novelist, which is really a record of his impressions of London city and London Society. It is, as may be supposed, cleverly written, and in regard both to City and Society recognises very candidly that London has desirable elements which New York has not—for it is between London and New York that the comparison is especially made. One reason Mr. Howells prefers the effect of London to New York is in the unbroken line which our streets present, while in New York the horizontal line is checked and interrupted constantly by the vertical lines of the high tower buildings. We learn, therefore, that all Americans, at any rate of the most cultured class, do not think the high building such a blessing.

The *Revue Générale* has an article on the subject of the legend of St. Francis as treated in early Italian art, by M. Arnold Goffin, whose articles on artistic subjects in this excellent review we have often alluded to. He remarks that it is only among the "Primitifs" that the Franciscan legend is treated with the simplicity and spirituality which its illustration in art demands; the painters of a later age get too far removed from the spirit of the legend.

In the *Gentleman's Magazine*, under the title "Mother Moscow" (a familiar Russian appellation of the ancient city) Miss Emily Richings writes a picturesque description of the city, its principal buildings and the general impression it gives to the eye of a visitor.

THE ACROPOLIS OF ATHENS.

On Saturday last at the British Museum Professor E. A. Gardner, M.A., lectured before the members of the University Extension Guild on "The Acropolis of Athens." The lecturer's remarks were illustrated by drawings. Commencing with an outline drawing of the hill, he placed in position representations of the buildings as he described them. In the course of his address Professor Gardner said that there were only two places in the world where one could properly study the Acropolis—one, of course, was on the site itself, and the other was the Elgin Room in the British Museum. He wished that day to bring before them the various stages by which the Acropolis of Athens became that wonderful harmony of buildings and walls which was so familiar to them. The Acropolis of Athens was not always so distinctive in its shape, and so different from all other sacred citadels as it was now. In early days it was simply a rock of somewhat irregular shape standing at a considerable height above the surrounding country, and which must always have been conspicuous in the Athenian landscape. It was situated at a convenient distance from the sea, which was a great consideration in early days, when the inhabitants were likely to be attacked by pirates. It was fortified with a massive wall, of which some traces might still be seen. The only accessible side was the western, but on the northern side there

was a staircase which was a kind of postern similar to those in the citadels of Tiryns and Mycenae. There was one other means of access, which was the tunnel and cave which was used by the Persians to capture the Acropolis at a later date. They had not much trace of the early gate of the Acropolis, but they had remains of a great flanking tower. It was situated on the right, so that any one approaching the defenders could be assailed. There were some traces of a zig-zag path on the western side. They could also trace the walls and towers at intervals of this ancient citadel. They had little in the way of architectural form up to this, for the walls followed the contour of the rock. The first change to more architectural form was the temple, which Homer told them expressly was the favourite abode of Athena. They were told how Athena set Erechtheus in her rich temple. The form was much like that of later temples. They did not know by whom the temple was built, but it was of very early date, and probably went back some time before the Tyranny of Athens, in the Vith century. Pisistratus, somewhere about 550 B.C., seemed to have thought the temple was too plain for the goddess, and placed columns around it. It was a colonnade of the Doric order, but by no means the earliest type of Doric. In this state, probably, things remained during the time of the Tyranny, although no doubt, of course, smaller buildings were erected which had disappeared. Some were destroyed by the Persians, but although they had many fragments they could not with certainty restore the plans and say exactly where they stood in the Acropolis. At this time the Acropolis was still a fortress, and things remained so up to the revival of the Athenian Democracy, in 510 B.C., when the principal gates were broken down so that there should be no temptation for any powerful citizen to seize the fortress. It was probable that about this time the idea arose of building a temple for the great Athenian goddess, but to enable this to be done on the highest point it was necessary to make a structure to carry the temple. The great temple was raised upon a substructure of extremely massive character, built entirely of stone quarried from the neighbourhood. Many books said this temple was not projected until after the Persian wars in 480 B.C., but he thought it was extremely probable that the original project was twenty or thirty years earlier. It was also probable that the first intention was not to make such a magnificent temple as the Parthenon. They could recover the walls of the substructure deep beneath the earth, and this building no doubt went on during the earlier days of the Athenian Democracy. After the battle of Marathon, 490 B.C., it was apparently decided to make the temple more magnificent than was at first intended, and instead of building it of limestone to build it of Pentelic marble. At the same time probably the entrance of the Acropolis was taken in hand. A kind of marble hall was placed at the entrance, and a facing of marble was given to the wall there, including the bastion which protected the gates in earlier times. The temple he had referred to was being built when the great event came; the victory of Marathon in 490 B.C. had only deferred the victory of the Persians for ten years, and in 480 B.C. the Persians invaded Greece. The Athenians had been warned by the God of Delphi to seek shelter behind wooden walls, and most of them took to their ships. A few waited at the Acropolis, and paid heed to the oracle by building a wooden barricade. For a long time the Persians could not get in, but at last through treachery they got into the citadel by means of the cleft and tunnel he had referred to, and, taking the defenders in the rear, slew them. The Persians burned down all they could, and threw down the buildings. They set fire to the scaffolding round the temple, and damaged severely the marble drums, which were in position. When the Athenians returned after defeating the Persians at sea they found their temples thrown down or burned. The sacred olive tree, which stood outside the House of Erechtheus, was burned too, but they were told by Herodotus that a long shoot the next day was seen to grow out of it. Themistocles fortified the north side, and into the walls built a great deal of the materials used in the temples pulled down by the Persians. The place was left pretty much as it was till 483 B.C., when Cimon, who had accumulated a great deal of spoil, proceeded to build the magnificent wall of the Acropolis on the south. In

this he departed from the practice of his predecessors, and made a magnificent sweeping wall, which gave an entirely new character to the hill, and made it as we see it at the present time. It was the great wall of Cimon which gave the Acropolis its regular aspect. Another thing he did was to erect the colossal statue of bronze which stood in the open air facing the old gate house, and which was the most conspicuous thing to be seen as one approached from the sea. Then they came to the age of Pericles, who devoted the treasures which had been gathered together for the protection of the Greeks against the Persians to the decoration of the Acropolis in such a manner as to embody in it for all time all that was most perfect in Greek architecture. They could trace from different records the stages of the work, and the earliest building was the little temple of Niké Apteros, or the Wingless Victory, which stood on the bastion on the west wall. His next great project was to build that temple which they knew now as the Parthenon, and this was built on the sub-structure which he had dealt with. It was, however, somewhat different from the plan originally decided on in the building which was commenced before the Persian invasion, and was made broader and somewhat shorter. He need say nothing of the Parthenon, but it was the temple from which the bulk of the sculpture in the Elgin room came, and was the second of the Greek works carried out by Pericles. Another great undertaking was to replace the earlier and somewhat antiquated marble hall at the entrance by the Propylæa, which still remained to a large extent *in situ* at Athens. The plan of this building was originally a very magnificent one, but to have carried it out would have meant interfering with revered objects of worship, and so the southern wing was finished off in a curious way, and certainly not in the way the architect would have liked. There was great opposition on the part of the more religious and conservative Athenians to the interference with sacred objects, and the plan had to be given up, but there was no doubt that the architect would never have consented to have had his plans mutilated, but that he felt he would in time overcome the opposition, and be able to carry out his original plans. Another of the great buildings of the Acropolis which might possibly have been begun under Pericles, but which some authorities said was not begun until later, was the Erechtheion, and this was doubtless intended to take the place of the early temple of Athena and Erechtheus. In some ways, of course, the Parthenon took the place of this ancient temple, but the Athenians never allowed it to take chief place in the worship of the goddess. The sacred image was kept in the older temporarily restored building, as well as many other sacred objects, which may have been in other temples prior to the Persian invasion. The plan of the Erechtheion was unique, and doubtless was planned in the way it was to include various sacred objects, such as the imprint of Poseidon's trident. It was very probable that the first plan of this temple was modified, and in all possibility after it was built the ancient temple of Athena was removed. The Erechtheion was built in the Ionic style, and the Porch of the Caryatides was still in a state of preservation. A building which they could not date, but which was probably of the late Vth or early IVth century, was placed on the south wall—the Chalcotheke, a great storehouse for bronzes. It was at a lower level than the Parthenon, and did not interfere perceptibly with the view of the Temple. The Acropolis remained in this state during the IVth century, except that, of course, numerous statues were erected. It was not, however, until Roman times that any other monuments of any importance were erected. In the time of Augustus there was set up in front of the entrance a pedestal, which carried the statue of Agrippa, and which formed the most conspicuous object then to anyone approaching the Acropolis. The last of the buildings was the little temple set up in front of the Parthenon, dedicated to Rome and Augustus. It was built by the architect who probably restored the Erechtheion, and it marked work of the Vth century. While it was good work, yet it could not stand any comparison with the earlier work of the Greek architects.

Professor Gardner, at the conclusion of his lecture, accompanied the members of the Guild in a tour of inspection of the Elgin statues.

PROPOSED EXCAVATIONS AT HERCULANEUM.

At the Royal Academy of Arts on Tuesday, Dr. Charles Waldstein (Slade Professor of Fine Art in the University of Cambridge) gave a lecture on "Herculaneum and the Proposed International Excavations." Sir E. J. Poynter presided.

The Chairman said he wished to state briefly what had led to the meeting. It might be a matter of surprise that the excavation of the city of Herculaneum, which led to such wonderful discoveries of antiquity and art more than a century ago, should for so many years have been suspended. The general explanation given by those who had no intimate knowledge of the facts was that Herculaneum was overwhelmed with a stream of lava which was a material it was impossible to deal with. They might be sure that there was no want of enterprise on the part of those engaged in the work of exploring the buried cities of the Bay of Naples, but there were peculiar difficulties in pursuing the work of investigation. Those difficulties, however, were not insurmountable, and resolved themselves rather into a matter of expense. The excavation of Pompeii had gone on steadily with few interruptions since they were first started in 1755. The problem there was comparatively simple. The town was covered under an accumulation of fine ash from the volcano, but the roofs of the buildings were not completely covered, and the soil to this day was loose and friable and easy to remove. Herculaneum, on the other hand, was overwhelmed by a sea of mud, and the labour and cost of clearing it away was so great that the opening of the remains to the light of day had always been considered to be out of the question, and tunnelling appeared to be the only method of reaching the buildings; the most serious difficulty however was the existence of Portici and Resina over the ancient city, and the attempt to excavate in 1860 was abandoned, and there had been no further serious efforts made to discover the treasures which were buried underneath. As they knew, by far the largest portion of the Greek art in the Naples Museum was found in Herculaneum, and much remained to be discovered. It would be a sort of miracle if the first house that was excavated should be found to be the only one of any value. Dr. Waldstein had conceived the idea of making further excavations of this ancient city an international enterprise. He had met with much success, but his idea was that the scheme should take definite shape in England. Under those circumstances it appeared to him (the speaker) that these discoveries being an artistic matter, the Royal Academy of Arts was the proper place from which the scheme should take its inception. The Council of the Academy took up the suggestion warily, and the invitations for that meeting were issued. He had the assurance that the Italian Government was deeply interested in the matter, and, of course, without the consent and approval of Italy it would be an impertinence for foreign nations to step in.

Dr. Waldstein said he must first thank the Council and Fellows of the Royal Academy for allowing him to promulgate his scheme. It was most appropriate that of all archaeological excavations on concerning the ancient Herculaneum should, as a scheme, take its inception in that hall. The proposed excavations would, no doubt, have an immediate bearing on problems of history and on archaeological questions, but there was equally no doubt that they would be directly concerned with things of beauty and works of art. As they knew, Vesuvius had remained quiescent for many centuries, and the inhabitants of the Campanian district were in no way led to expect an eruption before it came. It was true there was a great earthquake in 63 A.D., which was only sixteen years before the final eruption, and this destroyed a part of Pompeii, and no doubt a portion of Herculaneum; but in the intervening sixteen years the part destroyed was rebuilt. It was on August 24, 79 A.D., that at half-past one in the afternoon a great volume of smoke issued from Vesuvius, and in Sir R. Jebb's translation of the letters of Pliny the Younger to Tacitus they had the whole scene described in vivid language. What was important to them and always to be borne in mind was that the effect of the eruption was very different upon Pompeii and Herculaneum. The wind, as was described in the letters of Pliny, came from the north-

west, and this blew the ashes to the south-east and south. Pompeii and Stabia were covered with hot ashes and pumice-stone, while a great stream of fluid mud poured down from the mountain and covered Herculaneum and the whole district around. It was so plastic that it entered every crevice, and this had preserved instead of destroying. It had been shown by the investigations of geologists that there was no trace of lava, and it was curious how widespread was this misapprehension. Nearly everyone said, "I know that excavations are impossible because you have hard, impenetrable lava." He had tried to find who was the first authority for such a statement, but had failed. He, in company with Mr. Shoo-bridge and experts, had examined the site, and they found no trace of lava. Professor Hughes, of Cambridge, Guy Lussac, and other eminent geologists had all distinctly stated that it was hardened mud and ashes with bits of stone mixed up, and this had hardened where it was exposed to the air, but it was perfectly friable and workable. Moreover, it was proved by the excavations which had been made; and it seemed to him strange that, in the light of the wonderful works found, and the marvellous state of preservation in which they were found, which filled the Museum of Naples, excavation had not been made, for the finds taught an interesting lesson with regard to the state of preservation of articles found in the two cities. In Pompeii the bronzes were a good deal destroyed, the wood was burned, the marble calcined, and the glass molten; but in Herculaneum they did not find this. There they found the bronze with beautiful patterns remaining, and manuscripts had been found which could be read. Pompeii was situated on an eminence and was never completely covered, and there was evidence that the inhabitants returned and searched for their lost treasure. On the other hand, Herculaneum was at once and completely covered with a mass of liquid mud to the height of 80 ft. in parts. It was completely obliterated; the catastrophe was sudden and overwhelming, and while he did not wish to be wanting in sympathy and compassion for the poor people who perished, yet he must confess it was so long ago that he had a feeling of joy, so far as the remains they hoped to find were concerned, that it was a wonderful preservation and not a destruction. At the height of the life of this glorious town life was arrested and fixed for centuries, and it remained for them to restore that life again to at least an artistic vitality. There was a great difference between Pompeii and Herculaneum. It was true that the whole district was settled by Pelasgians and Oscans, but Pompeii was of more Oscean origin, while Herculaneum was a Greek settlement. No doubt Herculaneum was affected by the Samnite war, but although the Samnites overran the country Greek culture prevailed and survived. Then the Samnites who had settled in the plains were overcome by the more hardy Samnites from the mountains, and it was not until the social war between 90 and 80 B.C., that Pompeii and Herculaneum became Roman towns. Herculaneum, however, always remained Greek, and they found that the Greek artisans who worked in Pompeii lived in Herculaneum. Pompeii was, after all, a town of pure mercantile interest, whereas Herculaneum was a centre of the higher intellectual life, where people congregated and had their villas. One fact alone would bear that out. At Pompeii they could not say that a single manuscript had been found, whereas in the one villa excavated at Herculaneum 750 papyri were found. The only bits of writing they had in Pompeii were a few interesting wax tablets, but these merely contained receipts for auctions. Then again at Herculaneum the works of art were of the finest character, representing the highest phase of Greek taste, but few came from Pompeii. Unfortunately the literature which had been found in the Villa Piso was that of an abnormal being like himself—the literature of a specialist, who was devoted to Epicurus. The whole of the 750 manuscripts concerned Epicurean philosophies. But the others who lived in Herculaneum could not have been specialists, and it made them giddy to think of what they might discover—the lost books of Livy, the whole of Aristotle, and lost Greek tragedies. One villa at Herculaneum had yielded as many works of Greek art as the whole of Athens, if the Parthenon was excluded. Although he did not claim for Herculaneum that it was one

of the greatest centres of civilisation, still there ancient Greek art was kept alive, and it was the only centre where they had any reason to go for a more or less complete restoration of ancient life at its height. Dr. Waldstein at this point exhibited a large number of lantern slides, showing the bronzes, statues, papyri, ornaments and domestic articles found at the Villa. Piso, and said he brought these to show the state of preservation of the objects, and what culture and civilisation the inhabitants of Herculaneum were possessed of. In 1738 the first excavations were begun under Royal authority, but the work was unsystematic, and in 1750 to 1760 the villa of Piso was excavated. Piso was supposed to be the father-in-law of Casar, and the opponent of Cicero. The discovery made a great stir in Europe, and in 1800 the Prince of Wales, afterwards George IV., undertook to have the papyri deciphered. From 1828 to 1837, and from 1869 to 1875, excavations were carried on, but since 1875 they had been completely stopped. The reason was because of the expense, and because the town of Resina was above, but the British Consul at Naples had promised to inform him of the cost of property, and said that work for many years to come could be carried on without touching any house property of any value. The cost was such that Italy could not afford it, but they ought to be very grateful to Italy for what she had done. The work would be so expensive that he did not think any one nation could do it. It had been his dream to see it done, and the scheme was very simple. It was that the committees should be established in any country having claim to civilisation, to collect funds, and above all there would be an international committee, with, he hoped, the King of Italy at the head. This committee would be trustees of the funds, and communicate with the local committees with regard to the international staff which was to work the site. Last spring they succeeded in gaining the enthusiastic support of the King of Italy and of the Prime Minister. King Edward had expressed himself as deeply interested, and Secretary Hay had written stating that the President of the United States was taking the keenest interest in it, and would put himself at the head of the American Committee. In France, President Loubet had given his consent, and in Germany the Emperor had shown vigorous interest. In Vienna a strong committee had been formed, and the King of Sweden was interesting himself in the matter. The following day he was going to America and on his return he hoped they would be able to form the committee in England.

LONDON TOPOGRAPHICAL SOCIETY.

The sixth annual meeting of this Society was held in the rooms of the Society of Antiquaries, Burlington House, on Tuesday, under the chairmanship of Mr. F. G. Hilton-Price (Vice-President).

Mr. B. Gomme (Secretary) read the report of the Council, which showed that a steady increase in the number of members continued, and there were now 165 members, as against 150 last year. There were 46 libraries and institutions in membership, and during the year special communications, with full information as to the publications, etc., of the Society, had been addressed to all the principal curators and librarians, both in the United States and the Colonies. The principal duty of the Council during the past year had been to arrange for the publications to be issued for the current year. Their choice fell upon Morden & Lee's map of 1677—a large map of London, Westminster, and Southwark—drawn to the scale of 3.30 ft. to the inch. They had also put in hand a reproduction of the map attributed to Ralph Agas, and probably drawn early in the reign of Queen Elizabeth. Virtue's version, founded on this map, was well known, and it might be said, without a suspicion of ingratitude, that since the reproduction made by the City Corporation some years ago the means available for work of this kind had been greatly improved. It was a pleasure for the Council to report that the City authorities had promised every facility of access to the rare original copy of the map in the Guildhall Library, while the master of Magdalene College, Cambridge, had been equally obliging in respect of the original copy, which was one of the treasures of the Pepsian Library in the College. These two copies varied in this respect, that age and use had affected them differently—portions which

had faded or become worn in the one being in a good state in the other. The distinction of the Society's facsimile would be that it would combine the best parts of each, thus effecting a restoration of the map nearly approximately to its original appearance. With the second volume of the "London Topographical Record," issued during the year, the Council were able to distribute the copies of the book entitled "Signs of Old Lombard-street," which the author, Mr. F. G. Hilton-Price, presented to all members of the Society. All students of London would rejoice that Mr. Hilton-Price was continuing the publication of his further collections on this interesting subject. The contribution in the second volume, dealing with the signs of Ludgate-hill, Ludgate-street, Old Bailey, Little Old Bailey, Ave Maria-lane, Creed-lane, Amen-corner, Warwick-lane, and Ivy-lane, would be continued in Vol. III., which was in preparation, and would complete the matter relating to St. Paul's Churchyard. Colonel Pridcaux was at work on the commentary on the plan of the turnpike road from Hyde-park-corner to Cooter's-bridge, which would appear in the same volume. The outline of a plan for a new edition of Stow's "Survey of London" would be contributed by the editor, and it was hoped that the volume might be enriched by further valuable papers by some of the specialists and authorities who take an interest in the Society's work. A full record of current topographical changes had not yet been realised. It was felt that if undertaken by this Society such a record must be complete, and cover the whole field. But the organisation of such a result presented so many points of practical difficulty that it might be open to question whether some such account as that given in the Society's first volume, admittedly inadequate though it was, should not be continued in default of a better. As a record of topographical changes at an earlier period the photographs taken by Mr. Win. Strudwick between 1862 and 1870, and reproduced in the last volume, had been much appreciated. What was now required was a photographic record of all that existed of Old London, which would be a source upon which they could draw for their annual volume in the future. The report also dealt with the decease of various members, including Mr. W. W. Gwyther, F.R.I.B.A., whose loss, it was stated, would be the more regretted because the Society had in its ranks too few representatives of his profession.

On the motion of Mr. T. Blashill, seconded by Lord Belhaven and Stenton, the report was adopted.

The meeting proceeded to the election of the President (Lord Rosebery), vice-presidents, council, and officers; and on the motion of Mr. Fowler, seconded by Mr. W. F. Preedy, a vote of thanks was passed to the retiring council and officers.

Mr. Hilton-Price then delivered an address dealing with the antiquities of Old London, which was illustrated by a large number of objects from the speaker's own collection. He pointed out that there was little remaining in the City of London which might be called Old London—that was what was in existence before the Great Fire of London in 1666. Not only had the substructures gone, but the foundations of the old buildings were being rapidly swept away, and therefore it was to be greatly hoped that someone was keeping a watchful eye upon all new buildings where there were excavations for the foundations. It was specially the foundations which should be watched, and the earth beneath the foundations. In the last sixty years there had been numerous changes in the City, the topography had been altered to a certain extent, and the City had been practically rebuilt. Few of the ordinary people seemed to take any interest in the clearing away of London of the past, but, judging from the many fragments of marble and other things denoting wealth and luxury which had been found from time to time, he could not help thinking that in Roman times London was a handsome city, and in mediæval times there must have been many handsome buildings; while many interesting buildings which were erected after the Great Fire had been pulled down, nearly all the old houses inhabited by bankers and merchants, and the old coaching inns, had gone, while, owing to the value attaching to the sites, a number of churches had also been demolished. In many instances whole streets had been swept away where thoroughfares required widening, and also for railway

termini. For the making of Cannon-street Station many buildings were demolished, and the same was the case in Upper and Lower Thames-street. St. Paul's-churchyard had been almost rebuilt in recent years, and outside the City they knew what had been done in the case of Clare Market, Drury-lane, and Westminster. Interesting old houses had given place to fine stately stone buildings, and to erect these buildings the builders had to clear away the old foundations right down to the virgin clay. After the Great Fire in 1666 the greater part of the new buildings were erected upon the foundations of the old buildings, and as nearly the whole City was destroyed a new city sprang into existence upon the debris of earlier times. There were before the Reformation several monasteries and religious houses dating from the XIIIth and XIVth centuries in the City, but after the Reformation they were put to more or less base uses. They were demolished by the Great Fire, and new houses were erected upon the splendid old crypts, which were afterwards used for wine vaults, cellars, and even kitchens. As a consequence of building on the debris of the past the level of the City had been raised, and a large number of antiquities had thus been preserved which would not have been the case had the present method of digging down deep for foundations been adopted. It was in the digging out for foundations that they came upon layers which belonged to different times, and at times they found the Roman layer went down a very considerable depth. It varied, however, very considerably in different parts of the City, and between Eastecheap and Threadneedle-street it varied from 15 to 26 ft. It was well for them that there had been archaeologists in the past, who had personally watched the excavations and who had in the proceedings of the Society of Antiquaries and of other bodies handed down their experience and had enriched the British Museum and the Guildhall Museum with their finds. The British Museum acquired the collection of London antiquities which belonged to Mr. Roach Smith, but the Guildhall contained the largest collection of such antiquities. The greatest collector of late years was the late James Smith, of Whitechapel. Smith was a costermonger and a scrap metal dealer, but he visited with his small cart every part of London where there were excavations going on, and he picked up an enormous number of articles. When his house became full from top to bottom he sold the whole collection. He sold one collection to the Guildhall, and he (the speaker) bought another collection, which Smith was pleased to describe as "the whole shoot." Smith could neither read nor write, but had a wonderful knowledge of antiquities, and could describe an article he had disposed of which he had not seen for years. Mr. Price proceeded to deal with a large number of articles of antiquity which had been unearthed at various periods and which are now either in public museums or private collections. In Lombard-street a Roman pavement was found 12 ft. from the surface, and at Foster-lane a pavement, glass, and pottery were found at a depth of 18 ft. Cannon-street was evidently a portion of London thickly populated by the Romans, for numerous articles were found there. At the corner of Camomile-street a pavement was found 4 ft. from the surface, while singularly enough in Lombard-street Roman pavement had been found at various levels. Fine specimens of pavement had also been found in Leadenball-street 12 ft. from the surface, Lothbury at from 11 to 12 ft., and in Threadneedle-street, Broad-street, and Bucklersbury. Most of the principal Roman buildings appeared to have been on the banks of the Wall Brook, and the course of that stream had been traced by Mr. J. Price. Many brass coins and other interesting objects had been discovered in the black mud of the Wall Brook, and they were found to be perfectly bright like gold. The Wall Brook appeared to have formed the western boundary of the first London city, and Roman cemeteries had been found in Whitechapel, Spitalfields, and the Minories. Later on the Roman city was considerably extended, as was evidenced by the discoveries at various times of pieces of the old Roman walls. Many bronze objects and statuettes had been dredged from the Thames, while a Roman pottery kiln was discovered in St. Paul's-churchyard. Just under London Bridge thousands of coins were found, and Mr. Roach Smith observed that they were dredged up in chronological series, as if they had

been deposited. It was possible that they were deposited on the building or repairing of the bridge. In conclusion, Mr. Price referred to the many interesting objects of everyday use which had been found of dates ranging from the XIIIth to the XVIIIth century.

Mr. P. Norman, in proposing a vote of thanks to Mr. Price, said the lecturer had thrown out a hint for a new departure by the Society. They had so far done valuable work in the way of making maps and giving drawings of old buildings, but perhaps even more valuable work might be done by going back earlier and helping to elucidate the problems in connexion with old Roman London. There had been so far no systematic attempt made to explore Roman London, and he felt if they could do that they would learn as much about it as they knew of Silchester.

Mr. F. Ordish seconded the motion, which was carried.

CIVIL AND MECHANICAL ENGINEERS' SOCIETY.

A MEETING of the Civil and Mechanical Engineers' Society was held at the Caxton Hall, Westminster, on Friday, December 9, when Mr. H. E. Bellamy, City Engineer of Rockhampton, Queensland, read a paper on "Portland Cement."

Mr. Bellamy having made some historical references to the cement industry, said the engineer, architect, or builder was confronted by no problem more difficult than to say whether a particular kind of cement, when placed in any work, would behave in a pre-determined way. Especially was this true with an artificial cement. The difficulties arose from the fact that tests must be made on a product not in its final stage. With reference to the various tests, he said good Portland cement should be of a grey or greenish-grey colour. A brown colour indicated an excess of clay, and showed the cement was inferior. The test for specific gravity should always be carried out. Experiments which he had made showed that the specific gravity of good K. B. and S. English cement slightly exceeded 3.0, while an inferior cement was only 2.8. It was a well-established fact that, other things being equal, the finer the cement the greater would its sand-carrying capacity be—that was, it would show much greater strength with the same charge of sand, or equal strength with a greater charge. There was no doubt but that the cementitious value of the material resided in the very fine part. To ascertain the cementitious value of the material a new form of testing apparatus—known as the Goreham Flourimeter—had lately been devised. It was of very simple construction. The tests of strength might be divided into compressive and tensile tests, the latter including the transverse test made by breaking a beam of the cement. Tests of compression were certainly of some importance, but the apparatus required was rather cumbersome, and these tests were very rarely carried out. The ratio of compressive to tensile strength for the same class of cement was perfectly uniform. It might be assumed that resistance to compression was about twenty times that of the tensile strength. For many years Portland cement was always tested neat. The consensus of opinion, however, was that the test to sand, prescribed by the German Government, viz., 3 parts of sand to 1 of cement, was preferable, as it more nearly approached the conditions under which cement was used. Especially was this test essential if the mortar was to be used in work on the Monier system. No matter how excellent a cement might appear to be in other respects, it was imperative that it be not used if unsound. The temperature of air and water and the quantity of water affected the time of setting. Specifications, as a general rule, contemplated a temperature varying not more than from 10° to 62°F., and the quantity of water for Portland cements was 20 per cent.

Mr. H. Anderson (London) said the enormous variety and the fads of the numerous specifications called for by engineers was most confusing, and difficult and expensive to supply. The standard specification would be issued this month, and it was to be hoped that the complaint would not lie against this as being a stumbling block to cement progress in this country. The terms of the specification he had seen, and it was really very moderate in its clauses, and, to his mind, might have been with advantage in some points made

slightly more stringent; but as it was advisable to run before they could leap, it was probably advisable to test the working of the clauses as they would be issued, and then at a later date revise it in the points where it was found advisable to do so.

THE ARCHITECTURAL ASSOCIATION.

A SPECIAL general meeting of this Association was held at No. 18, Tufton-street, Westminster, on Friday last week, Mr. Louis Ambler, Hon. Secretary, presiding in the unavoidable absence of the President, Mr. E. Guy Dawber.

On the motion of the Chairman, seconded by Mr. Francis Hooper, the following new-by-law was agreed to without discussion: "The Association shall not make any dividend, gift, division, or bonus unto or between any of its members."

The ordinary general meeting was then held. The minutes having been read and confirmed, the following gentlemen were elected, i.e.: Mr. W. Baird, London; Mr. F. L. Hunt, Tooting; and Mr. W. H. Brerley, of Leeds, who was elected by acclamation.

Building Fund.

The Chairman announced the following further donations to the Building Fund, i.e.: Messrs. J. Carmichael, 50*l.*; W. Cowlin & Son, 5*l.* 5*s.*; J. W. Penfold, 5*l.* 5*s.*; R. F. Chisholm, 5*l.*; George Wragge, Ltd., 3*l.* 3*s.*; Sir John Taylor, 2*l.* 2*s.*; C. A. Sharp, 1*l.* 11*s.* 6*d.*; R. W. Collier, 1*l.* 1*s.*; F. E. Lloyd-Downes, 1*l.* 1*s.*; G. H. Lovegrove, 1*l.* 1*s.*; G. H. Oatley, 1*l.* 1*s.*; L. Simmons, 1*l.* 1*s.*; Neil C. Smith, 1*l.* 1*s.*; H. Tanner, junr., 1*l.* 1*s.*; and E. G. Theakston, 1*l.* 1*s.*

The Late Mr. Bedford.

The Chairman said that many of them had seen the notice of the death of Mr. F. W. Bedford, and all who had done so would have seen it with regret. Those of them who knew Mr. Bedford well would join with him in an expression of sympathy and condolence with the relatives of the deceased. Mr. Bedford, who was a brilliant student, and who carried off a great many prizes, had been in practice in Leeds for several years, but recently he returned to London. All who knew Mr. Bedford's work must admire it, and they would all regret that they would have no more of it.

The motion was agreed to in silence.

On the motion of the Chairman, a vote of thanks was accorded to Mr. F. T. Verity for allowing a party of members to visit his new theatre in Tottenham-court-road on Saturday, December 3; also to Messrs. Allen & Son for providing refreshments on that occasion.

Mr. Ambler also announced the following donations to the library: "Specifications in Detail" by Mr. F. W. Macey, presented by the author; "The Conduct of Building Work," by Mr. J. Leaning, presented by Mr. B. T. Batsford. A vote of thanks was accorded to the donors.

Some Architectural Reflections.

Mr. T. Raffles Davison then read the following paper, entitled "Some Architectural Reflections":

"The architectural divinity which we worship is the cause of much uncertainty and illusion. At one time she is all smiles and charm (when we have just received a commission); at another she is petulant and frowning (when our builder goes wrong, or our design has turned out to be a failure). If we have been enjoying the ecstasy of design, or, better still, the tangible products of it, we see nothing but the heaving smile of our goddess. But when we are plunged in some of the thousand troubles which seem to dog the architect's path, we find our charmer cold and fickle. You may say this is only the lot of all trades and professions. But it has always seemed to me that a pursuit which needs for its very start and impetus a spirit of inspiration and enthusiasm, the art of architecture is peculiarly liable to rebuffs, discouragement, and disappointment.

Influences.

Sometimes when we regard the calm, calculating, scholarly man who really thinks his own thoughts, we are apt to doubt whether he is really much under the influence of others. Well, in proportion as his work is scholarly, he is very much under the influence of others, and it is a question whether any of us are as free of influence as we imagine. There have been, and are, amongst the ablest of architects, those who hold that the only safe road for architectural development is in the path of

tradition, and that no sound progress can be expected except little by little in the development of what we have already laid before us. If this be true, we must acknowledge and yield to influences as one of the prime factors in our life. One can hardly doubt that the monumental treatment of Mr. Geo. Gilbert Scott's Liverpool Cathedral has its being partly through the influence of the late Mr. J. D. Sedding and Mr. Henry Wilson, grafted on to the scholarly ability of the late Mr. Gilbert Scott.

Personality.

And now the question of influence leads on to the consideration of personality. To my mind, for good or ill, we are here for an individuality of existence, and our concern should be with the upholding, and upbuilding of that individuality. For the progress of art it seems to me individuality is the most precious asset. Years ago I remember its being suggested to me to go to a certain place to sketch. When I objected that So-and-so and So-and-so had been, and that, in fact, everybody had been there, the reply was: "What is that to you? Have you been?" Now this is surely the essence of art. Why, when the Greeks had earned undying fame by their work, was there room for the Romans? Why, after St. Peter's was there room for St. Paul's? Why, after the countless gems of Gothic art need Mr. Scott try to do it again at Liverpool? Because, surely, of the need of individuality to exercise itself—the individuality of our age speaking through the individuality of the architect. Herein lies our hope and our pleasure. If we are to be the characterless transmitters of a type, where does the joy of our life come in? Is impersonality a desirable feature in architecture? Or is it possible? When we think of the distinctions that were expressed in the work of Burges, of Street, of Pearson, and of Sedding, do we not know that there is no such thing as impersonality in art? And do we not feel how dull and sad it would be if it were possible? I think if you look round your acquaintances you can carry this study of personality a little further. Is it not the little eccentricity—may we not say the little fault—that gives a flavour to our friends? Should we really like our friends so well were they all quite perfect and ready for Heaven? And can we quite dissociate this feeling from architecture? The quiet, smooth, scholarly work of Pearson might sometimes spell monotony; the vivacious interest of Sedding's work might sometimes mark unrest. Do we, therefore, forget the debt we owe them? Assuredly not, and if they have the defects of their qualities, it serves to drive home and enforce the lesson they had to give us. Now, the emphasis of certain characteristics which make a man into a Smith, a Brown, or a Robinson, give vital interest when applied to architecture. We are told that Nature cares only for the type, and not for the individual; that we must think of architecture, and not of architects, but we need never forget that we have to create the type and the art by means of individual effort. If an architect is worthy of the name, he is sure to stamp his work with a certain something by which you will know it to be his, just as you would tell his handwriting.

A scholar and a reverent student of type will show by his efforts that he is trying to keep them in mind, but his own inclinations will appear through all, and one has only to compare the work of men like Bodley, Champneys, and Jackson to realise how true this is. They were all supplied with the same material, and they have all done something definite for modern English architecture, but they have all made an individual and legible rendering of their art. It is not, of course, by a conscious effort to pose as individualities that this comes about, but by the serious effort to put one's mind into one's work. All good art comes by a following of Shakespeare's advice to be true to ourselves, and not to affect the methods of others; that is, to let our own personality dominate our efforts. Why should we sacrifice our own aims and desires in imitating another man who has been successful in quite different methods? Why stir up the cold soup of the Queen Anne period if we prefer the fiery spirit of the Spanish Renaissance? Why fit up the details of a Gothic church in the archaic simplicity of an Eastern style if we ourselves are sympathetic to the ornate decoration of the perpendicular period? Why adopt coupled dormers which another man has made effective

if our conscience rebels against the costly gutter between them? Why copy the latest competition success if it goes against your sympathies? Why change your style of architecture every week to suit the supposed leanings of each new assessor whose judgment seat you have to face? Why? To catch the favouring breeze that will waft you to success? To show your versatility? To show your largeness of mind? But the architectural studio is not a draper's shop to fit the passing fashion or the client's whim. It is the school in which you are learning to develop your own aim by a steady light of firm belief, and it cannot be illuminated by Will-o'-the-wisps or shooting stars. I think I remember when all gables did not have little kicked-up kneelers; when there were fewer country cottages with long, sloping buttresses; when there were no gable apices like those at Scotland Yard, and when there were perhaps no modern boundary walls built up from pier to pier with inverted arches. Yet these interesting little details by Messrs. Bentley, Voysey, Norman Shaw, and E. S. Prior have been clung to for salvation by many who were drowning in a sea of influence for want of the lifebelt of individuality.

Catholicity.

Some folk might construe this adoption of nice bits into catholicity of mind. Well, if we come to that we must make a strong stand for catholicity of temperament. For no wide culture, no liberal art, can be at its best without it. The architects whose work I esteem most have a charitable eye for the work of others, speaking, of course, of work which can lay a claim to be called architecture at all. It is quite impossible for any two or three, or even twenty or thirty men, to embody all the good there is in the work of a generation. Neither is it possible to pretend that the marvellous ingenuities and graces of a great Gothic church sum up all the virtues any more than do the stately repose of a Greek temple, or the ponderous richness of a Renaissance chapel. You may find telling mass, and a kind of dignified picturesqueness in a great modern brewery, even if you have to come to it direct from the finality of repose and dignity in the pyramids themselves. You have found pleasure in a white glazed frontage in a narrow city street, for its gaiety, if not for its proportions; have felt the stimulus of life and interest in a building where all was bad but the modelled ornament; you have appreciated the quiet simplicity of a building which would have been maddening if repeated in big doses; you have noted many a lesson in good detail where the general shape and sky line of the building was sadly at fault. We all see these things, and the spirit of catholicity is to take the good from wherever it comes.

Restraint.

But the snare of catholicity is its possible degeneracy into a weakening of sound principle and a lack of restraint. From the very outset of our career we all feel that architecture is peculiarly an art for the constant exercise of restraint. Not alone in the thousand and one practical necessities of cost, size, uses of material, etc., which press on us most hardly in our younger days, but the absolute need of reticence and restraint over the impulses of design which we feel more and more the older we grow. A very able architect said to me lately he had been learning the art of "wiping out" all his life. But then his practice had been largely in big things. You can wipe out too freely in some things—in house design, for instance, and, if I may venture to say so, I think the wiping out process in that direction has gone too far with some people. The restraint is not a question of form alone; it is also to be remembered in the matter of colour. A gentleman whose work you all know and esteem said to me the other day he was convinced that you could not make a great or noble building in two or more contrasting colours. I am very much of his opinion, and within a few days of hearing the remark I came across a small country house roofed with grey stone slates, and walled in white rough-cast, which emphasised this opinion. The blending of grey and white in tones of one colour made this house extremely broad and telling in contrast with its neighbours. It is perhaps not the first duty of a house to look big, but it enforced on my mind the opinion my friend had just expressed. I have always left the same influence of breadth in Mr. Hare's municipal buildings at Oxford, which, with all their elaborate detail and picturesque treatment,

have that quality by the blending of grey stone slates with the stone walls.

Character.

But with all the need for an ever watchful restraint we cannot afford to lose expressiveness and character. I have heard it said that anything is better than 'sleepiness.' Now this is perhaps a debatable point in architecture. A certain amount of 'sleepiness' is perhaps very good, for you surely want first of all to convey the impression that your building is satisfied with its site, and that so much of repose is imparted to it as will convey that feeling. Sleepiness is greatly preferable to *l'art nouveau*. It is traversing well-known ground to say that the exterior expression of a home should be homeliness, of a bank dignity, strength and repose, of a music-hall brightness and gaiety; in a palace of justice, calm dignity, and so on. But really we find these necessary initial characteristics are often quite ignored. We see the small house built with features only suitable to a large one, and a great house made up of petty triflings. We find bank buildings fussy, restless, and mean; music-halls heavy, lifeless lumps of buildings; hotels dull and dreary; and churches frivolous, and every kind of ingenuity tried to evade the one vital character needful. But the special character needed for each particular building will always be controlled and affected by the personality of the man who designs it. Let your building be ever so simple in style, the ingenious architect will make his ingenuity apparent; or on the other hand, however elaborate in detail a building may be, an architect of a stolid, unemotional character can easily clothe it with deadly dullness. You can be dull with a rich feast, and gay with a poor one.

Just as in going to a certain painter we hope to get his special gifts, so in going to a particular architect you must hope to obtain his characteristic vein of art. For his own home an architect might very much prefer to see the characteristic art of Mr. Smith, but for his business store he might vastly prefer Mr. Brown, who will give him more life and advertisement for his outlay. The quiet, scholarly work may be delightful for a literary institute, but might work with dullness in a house or stable. The designer of broad surfaces and large masses will not so readily give satisfaction in small work requiring interesting and dainty detail; the individual character of the man will be apparent in his work, and should be good enough asset for all his needs. If we make a trade of art, of course it would be our duty to supply to the order or whim of our client whatever he asked for, and if he desired a Bodelian church, or a Jacksonian college, or a Dawberian house we should make haste to supply it either by servile imitation on our own part, or by the employment of capable ghosts. But this is surely a wrong way to look at the art of architecture. We shall best serve the advancement of the art by trying to put something of ourselves into the study and practice of it. We shall use the knowledge we have acquired by education, and all the helpful influences about us, to do something of our own, and show whatever there is in us of individuality of character.

Disillusion.

Disillusionment awaits us at every turn of our life, and there disillusionments which are to be welcomed. But we must not get disillusioned about everything. It is well to know that if we only pay sixpence a cube foot for our foundations we may likely enough have half-a-crown to pay for our tower. We want no illusions about practical necessities or commonsense requirements. It is well to have no illusions about our friends, nor about the fine quality of our own productions. An architect once told me of the very kind and flattering appreciation of his work which his lady client bestowed upon it, and how he valued it, until one day she asked him if he had seen a very charming house by a certain other architect, which he knew to be the very poorest stuff imaginable. But these knockdown blows to a legitimate pride in our work must not bring a disillusionment which would check our ideals. The architect just referred to did not alter his style to the fancies of his fair client, but has gone on doing better and better work in his own manner, buoyed up by a consistent ideal of high quality. How often one hears the young architect exclaim against the want of proper appreciation of his public, forgetting they are not blessed with his own trained vision and sense. How dif-

ferently placed is the architect to the musician! In the musical world there is a wide circle of sympathetic hearing to count upon, and really good work seems sure of its reward. But the architect can reckon on no such audience, and beyond the appreciation of his fellows there is little to count upon. Of course, in great works like the Palace of Justice at Brussels, the general public are undoubtedly affected in a sense by the size, ponderosity, and richness of the group, but the finer intellectual qualities of architecture are felt by very few indeed. The sooner a proper disillusionment on this point is arrived at, the more an architect is thrown back upon his own beliefs for guidance and support, the better for him. And it must never be forgotten that the want of this self-support leads architects to look about for direction in the work of others who appear to succeed in pleasing the public. Thus individuality is sacrificed, whilst no really sustaining encouragement is obtained. One has only to watch the lead which is given by successful competitive designs to realise that.

But we must not let the disillusionment penetrate the armour of our faith. We know this to be founded upon the best architecture of all ages, and that our little villa, or church, or stable, is the product of some study and some knowledge of what is right and good in outline and mass, in nice proportion of solids and voids, and in good architectural emphasis and keeping. We have admired the calm repose and stability of the pyramids, the rhythmic proportion of the Greek temples, the sturdy picturesqueness of English Gothic, the elegant daintiness of those marvellous mixtures of French Gothic and Renaissance, the rich rococo of the Spanish churches, and the abiding charm of old English houses. We have learnt the spirit of these things, and we know that each of them conveys for us a lesson in architecture which may come every day into our practice. These are the sheet anchors of our art, and whilst we may never build a pyramid or a Greek temple or a Gothic church, we know that we may follow the principles which have guided the builders of such works with safety and success.

Gentlemen, when I look at the productions of our modern architects I often feel that our students need someone at their elbows to whisper in their ears something about first principles, about law and order in design, about inspiration, about self-reliance and personal enthusiasm. Art is a big word—it includes a vast field of human effort, and it is very difficult to talk wisely about, but with all its cold-water douches of needless repression, I feel that architecture ought to kindle a live and enthusiastic desire which would carry the earnest student through his life with happiness and success. A gentleman whose ability is supreme once said to me when going as a visitor to a class:

'I have to visit a class of students to-day, and I wish I knew what to tell them.'

'Well,' I replied, 'all they want to know is how you do it.' 'Ah,' said he, 'I'm afraid that's just what I can't tell them!'

That is just it. This gentleman could not convey the steadily balanced enthusiasm of many years' experience to more youthful minds; all he could do was to reiterate eternal principles of good, and to leave it for the natural instinct to adapt and work upon. It is not a shouting enthusiasm which can be of use in architecture (as it might be for the actor or the singer), but I maintain the enthusiasm should be there all the same, or the result of all our hard work will be very dull and lifeless show.

You have, perhaps, taken for granted that bills of extras, prices of materials, valuations, or any question of that kind would be left out of my view to-night. Even if I knew more about them than I do I should still want to take this opportunity to emphasize the essential fact that an architect has to be an artist, first and foremost. It is the only excuse for his existence. The term 'art-architect' is an absurdity. All architects are artists—at least, nearly all. Perhaps 500 out of every 5,000 are, at all events.

It is impossible to deny that the man who can advise as to the best kind of foundation, the best and cheapest building materials, who can secure the best builder at the lowest price, who can avoid costly encounters with the authorities or neighbouring property owners, who can obtain the best return for the building outlay, who can insure a sound and durable building, is a most useful person. But that alone would not constitute him an architect.

To be an architect worthy the name he must be something much more than this. Many an architect with all his ability is less of an architect than the clerk whose artistic instinct has failed to bring him more than a fair living. But, strange to say, whilst the man who creates the beauty of a building is often ill-paid and unknown, the businesslike man who poses as an architect trades on it to most profitable results. This has long been a standing reproach to the profession that the value of art is not even paired off as equal with the knowledge of business affairs and practical details. We must admit the great importance of business capacity, and of practical knowledge, but the art of beautiful design is an instinct that is the very crown and flower of our profession, and until this is better realised we shall never do great work; whilst a lasting service would have been done to London had the practical knowledge and skill that created the Tower Bridge been really emphasised by lines of beautiful form, instead of being masked by a falsity of architectural trimming which great engineers themselves must despise! In this country the art in such things is a matter of ornamentalism which can readily be applied and bought at a very small cost: it is not a development of the lines of construction into beautiful form, which could only come about by that uncommon genius, an artistic engineer, or by a thorough and serious collaboration of architect and engineer.

Your motto says, 'Design with beauty, build with truth.' These two things have got to be done together. Building with truth alone will not do, though some of the latest apostles of art would almost seem to suggest it will. Truth is often a very disagreeable thing by itself. The truth alone about many of our modern street frontages would be a terrible exhibition of girders and stanchions, though it is even worse when clothed with the beauty of false ornament.

No more difficult motto could be devised than this watch-word of the Architectural Association. We are delivered over into the arms of these two glorious creatures—truth and beauty, and it is not difficult for any student of human nature to know which of them makes the easier conquest. Beauty is very captivating even when her falsehood is only half concealed, whereas truth is always a little frigid. Beauty is always luring us on into unknown paths of wonder and delight. Truth is ever arresting our steps with warning in her voice. Beauty is always kind and silver-tongued; truth is always reading us a lecture; truth often seems to hate beauty's presence, but beauty always pretends to think well of truth. Truth seems grudging and niggardly, whilst beauty is prodigally generous. It really seems easier to cast in our lot altogether with one or the other, but very difficult to please both together.

One of the worst difficulties about the whole matter is that men have been trying for ages to find a sensible answer to the questions: What is truth? and What is beauty? and have been unable to do it. Of course, we all know that there is a sort of answer to be made to both, but it will depend on the character of each individual what answer he himself makes. Here is the point that we are called upon to decide. What shall be our critical balance between these two often apparently opposing elements, and how far shall we allow ourselves to be guided by one or the other? You can no more be absolutely truthful in your design than you can be in your speech. We none of us want to be the most perfect man in the nastiest way possible. We cannot afford to allow the jealousy of truth to banish beauty, and we must be ever on our guard against the lurking falsehood in beauty's heart. Who of us has not admired the effect produced by a good mass of walling in a position where it was not only perfectly useless, but horribly expensive? And can we find it in our hearts altogether to blame a really clever architect for doing such things? We have to 'shut the other eye' very often in architectural design. I could illustrate my point by references to some of our best architects.

But what I want to emphasise is the peculiar kind of tight-rope walk one has to make between the abyss of dull utilitarianism on the one hand, and the deep waters of ideal beauty on the other. Shall we say one word in passing for our practical friends who can tackle the many difficult problems of construction, of prices, or of tactful management of affairs which are so very useful to the successful architect? One

need not undervalue the services of such men whilst pointing out the high ideal of artistic endeavour which should form the goal of every real architect. It has almost come about, nowadays, in the bustle of modern life that we need another race of specialists who might be called architectural surveyors, and who without any trouble about aesthetics might devote themselves to the more practical problems which are their delight. Of course, they would be sane, capable men, and would probably be registered! They would earn the confidence of everybody because they could nearly always see that buildings cost less than was expected. They would not be hoodwinked by builders, quantity surveyors, clerks of works, or committees; and, generally speaking, would avoid all the faults of the artist.

The real artist must, however, always risk something. His mind is filled with ideals; he is generous not only with other people's money, but with his own time and strength, and if he completes his aims he is content to sacrifice a good deal of personal comfort. He thinks more of his art than its profession. He hopes to leave in concrete form some thoughts of beauty which have filled his imagination, and which may bestow pleasure on others. He is not engaged in tasks, but in delight; therefore, if he is not paid adequately in coin or goods, he has still had reward. We have heard of a good many such men. Literary artists who, to the commercial mind, have lived a life of mere suffering toil, but who to themselves have been blessed with visions which lifted their eyes above all their troubles—makers of pottery who were not owners of great works of world-wide fame, but were merely toiling away in obscure places to get glaze or colour to their liking, and who lost everything else to obtain it—painters of pictures who were willing to be accounted mad so that they enjoyed their own dreams in their own way—designers of great architecture who filled the offices of poorly-paid surveyors so that they might live with the building-up of a fabric that they loved. These are men who really live their lives, and of such rank and kind should be the architect. Through the thousand and one worries that encounter the realisation of graceful designs—the evil of bad workmanship, the folly of committees and the scamping of builders, the adjustment of accounts, the irritating restraints of cost and materials, bad building laws, bad assessors, and bad competitors—the architect must still live up to his ideal, and finally leave some impression of his art in the finished structure. The more he does this, the less he will be valued by his clients, the greater plague he will be to the authorities, the more annoying to his builders, and the more exacting to his employees, and, to crown all, the less he may be understood by the public, or appreciated by the critics. I can tell you that recently a well-known architect sent in with pleasurable anticipation to his clients a design which contained three features he had never carried out before, that he had designed with especial pleasure, and not relied upon to give interest and expression to his building. I saw him afterwards, and he told me that his committee with prompt and unerring discrimination ruled those three features out. They were not the best judges, but they were the dictators, and, as the late Geo. Gilbert Scott says, they got all they paid for in a good practical building, and the art, which was by-the-way, could never have been paid for adequately. The hardship lay not with those who never realised their loss, but it was a sample of the rebuffs an architect has to meet.

You may think the comfort is cold, and the reward visionary, which a true architect may expect, but art is a matter which lifts us above the beatitudes of trade, and the artist should learn to look for rewards from the same source whence his inspirations flow. Directly the breath is out of a man's body, the measure of his days is complete; his reputation is very much like his legacies of real property—it soon fades away. It is surely well to build our joys upon something less unstable than public estimation or something less uncertain than personal belongings.

For the artist the one great lesson to learn is to find the highest reward in the work itself, and that no art does more pertinently apply than that of architecture. It is so undervalued by the public, so little understood by the critics, that we are best to form our own public and our own criticism. We are

told again and again that the profession is not one in which fortunes can be made except by the very few. But all who enter it can set themselves determinedly to find their pleasure in its practice; to have great ideals and live up to them. The art is the noblest and most useful the world knows. It ministers to the wants and to the sentiments of all, and the architect may find happiness for himself beyond the common measure in learning how to design with beauty and build in truth. You cannot suppose I have followed the doings of architects for many years, and made over ten thousand drawings of architecture, without realising that there is a way to successful accomplishments in the profession. There are men who one admires as architects, and respects as personalities, who have kept alive their efforts through years of earnest work and sustained endeavour. They point the way for us all to emulate. The lesson of their work is its persistent hold on what is good, in the constant thought of fine outlines, good proportions, refined details, and expressive character. You can do no more, and you can do no better, whatever style you affect, or however eclectic you choose to be. You can aim high even in the simplest work. As surely as you do this you will find out what architecture can really be, and realise to the full the difference between the ephemeral meanness of a Cockney villa and the elemental grandeur of the pyramids."

In the discussion which followed,

Mr. Francis Hooper said he should like to propose a cordial vote of thanks to Mr. Davison for his paper, which had been read with such enthusiasm. The Association welcomed him as an old friend—if not personally, yet through his sketches, which had been of such value to them, not only in drawing attention to the beauty of the country and the architecture of bygone days, but in bringing before architectural students the best work of our best architects, and for that he deserved the thanks of them all. Many of the remarks in the paper were to some extent truisms, and if tending to make his audience exalt the work of architectural designers his labours would not have been in vain. In reference to one part of the paper, it was the need of every member of the profession, whether old or young, to try and appreciate the good work done by other people. It was so easy to find fault, and it was so difficult to do well, and Mr. Davison made a point of urging that all should try to acquire the spirit of catholicity, and take the good from wherever it comes. At the close of his paper Mr. Davison drew attention to the sacrifices which had been made by men in the furtherance of their art, and that should be of encouragement. There were to-day as self-sacrificing men as in the days of Palissy and the painters of Italy, Holland, and Spain. There were men who were seeking ideals, and their work might be but small, yet it would last.

Mr. A. Cox said he had much pleasure in seconding. He hoped to hear Mr. Davison lecture again, for he was always so full of enthusiasm.

Mr. Louis Jacob said they had all enjoyed Mr. Davison's admirable paper. He had been very much interested in the remarks as to individuality, for whenever he read those discussions which occasionally took place on originality in architecture he had always thought that the speakers had got hold of the wrong word altogether. There was no such thing as originality, for there was nothing new under the sun. What was wanted in architecture—and Mr. Davison had expressed it well—was individuality. As to the closing remarks about the men who lived long ago striving for the success of their ideals, that reminded him of the definition he had heard of heroism, i.e., a giving out of oneself. Every true and lasting thing which we could do must be heroic, and that could not be without that element of self-sacrifice.

Mr. A. H. Belcher supported the vote of thanks. There were two points impressed on his mind, and the first was as to individuality. He was glad that had been mentioned, for it got rid of the question so much talked about as to styles. If they studied architecture with a view to carrying out the motto of the Association, i.e., to design with beauty and build in truth, and kept that before them, he did not think they would be troubled as to which style to design in, for they would carry

out what was required by means of their individuality, and with the knowledge they possessed. The other point was as to business. He felt that they should remember that they should carry out to the best of their ability all the wishes of their clients. Mr. Arnold Mitchell made some excellent remarks some time ago when he said that the architect lived to please his client. The client paid for the work and the design, and architects should endeavour to please the client even down to the smallest detail. It was said that some architects would build a house and forget to put cupboards in the rooms. In some rooms there was a difficulty in arranging cupboards, but the point should always be kept in mind, for if they could get a cupboard in every bedroom they would please the client in most cases. It was the same in other little matters. If they could put the hot water cylinder at the bottom of a cupboard, and arrange for the upper part to be used for linen, there again they would please the client. If they pleased the client in small business points they would find that the house would become beautiful to the client even on those grounds.

Mr. H. Passmore said they must all be obliged to Mr. Davison for taking them into higher heights of architectural thought than what they were accustomed to. As to restraint, he entirely agreed with Mr. Davison when he said that restraint had been rather overdone. To knock a square hole in a wall and call it a door was hardly making architecture, though, of course, no one could over-estimate the value of proper restraint.

The Chairman, in putting the vote of thanks, said he should like to express his admiration for Mr. Davison's work—both his sketches of old buildings, and his drawings of modern ones. Many of the points in the paper had been treated in an admirable and poetical way, and he appreciated very much what Mr. Davison said. As to originality, what was often called by that name was mere eccentricity, and he was glad that Mr. Davison had drawn the proper distinction between individuality and originality. As to sketching, some people took to making collections of drawings of works of art which were admired, and of which they desired to have records, and this was an important point; it was not merely a question of individual study; one tried to add to the accumulation of records for the use and pleasure of others. Mr. Davison said they ought to try to see beauty or beauties in everything. He quite agreed with that, for the importance of that was very often under-estimated, and one tried to find faults rather than beauties—not only in modern work, but in architectural work of all kinds. One was so apt to criticise and express dislike without looking for the beauties which were often to be found. He also agreed as to "wiping out" having been seen in recent years one could only describe the buildings or the styles as archaic; the square hole for the door, and the plain masses of brickwork, or whatever it might be, with absolutely no ornament or moulding to give it relief, was carrying restraint too far. He was glad that Mr. Davison referred to the beauty of buildings of grey stone and slates, and he (the speaker) might mention the beauty of "rustic" slates, which came from Preecey, in Wales, and were of a pale green colour, with a most beautiful film or covering of golden yellow and brown tints. Everyone would agree with Mr. Davison that all buildings ought to express their character as far as possible. One could not have that too often impressed on one. With regard to "ghosts," it seemed to him that a man who employed "ghosts" was not an architect at all in the proper sense of the word, but a tradesman—a purveyor of architecture. Mr. Davison referred to the appreciation of music, and distinguished that from the appreciation of architecture. Of course, the appreciation of music was largely a natural gift; one was musical without any special education, and could appreciate to a large extent even the most classical, as well as what was called the music of the future—Wagner, or any modern composer. The more one knew of music the more one appreciated it, but that knowledge was not essential to the appreciation of music as knowledge of architecture was to its appreciation. One could not appreciate architecture without some education in architecture. As to the question put to the architect who was going to hold a class, there was another question which might be asked. In addition to "How

to do it," they might ask, "How do you get it to do?" As to the expression "Art architects," it was a most ridiculous combination of words. An architect ought, of course, to be artistic, and if he were not he had no right to call himself an architect at all. It was just as ridiculous to use those words as it was to use the expression, "art colours." Mr. Davison's general conclusion seemed to be that if an architect was an artist that was sufficient.

Mr. Davison: I am afraid I hardly go so far as that.

The Chairman said it certainly was not his view. An architect must be, to some extent, a business man and a scientific man. The man who was an artist only could not expect to be successful; he must be much more than an artist only. Architects who were only brilliant designers, and were no good as business men, failed to get the amount of work they ought to get, and for that very reason. When one heard of architects whose works cost three or four, or more, times more than the client wished to spend one could not be surprised that the client ceased to employ them, and that other men were employed—men a little less artistic, perhaps, but with more business capacity. It always seemed to him that those architects who were artists only should be associated with business men as partners if they found they did not understand the business part of the profession. That was their only chance of getting on as they deserved. Very few architects could be satisfied with the beauty of their own work—they had to build up a reputation as well as erect buildings, and they could not expect to get more work if they always exceeded the cost a great deal; they must consider their client's as well as their own interests, and they must not think of beauty at all cost. Nor should the architect be the enemy of the builder, as Mr. Davison appeared to suggest. He (the speaker) did not hold that view at all. An architect ought to look upon the builder as his friend, as the man who carried out his works, and without whom he (the architect) could not expect to succeed in his work. Architects could not put up their buildings with their own hands, and they depended on builders to realise their creations.

The vote of thanks was then put to the meeting, and very heartily agreed to.

Mr. Davison, in response, said he looked upon the Association almost in the light of a personal friend. He had wished that some practical gentleman had spoken and given a corrective to his dreams and visions. As to the main object he had in view, what he had been saying was the sort of thing that might have been told to an assemblage of cobblers or of the House of Commons—earnestness and truth. The only difference with architects was that they had to add beauty to that. There was no need to urge anybody to follow the pursuit of beauty; we all follow and were all the victims of it. They had to apply the corrective, to use the instinct for beauty entirely subservient to the austere goddess of Truth. That was the finality of all things.

The Chairman announced that the next meeting would be held on January 6, when Mr. A. Cox will read a paper on "Libraries."

The meeting then terminated.

THE SURVEYORS' INSTITUTION:

Bricks and Tiles.

An ordinary general meeting of the Surveyors' Institution was held on Monday afternoon at No. 12, Great George-street, Westminster, S.W., Mr. H. T. Steward, President, in the chair.

The minutes having been read and confirmed, Mr. J. C. Rogers, secretary, read a list of donations to the Library and the Library Fund, and on the motion of the Chairman a vote of thanks was accorded to the donors.

Mr. J. Jopling then read a long paper entitled "Notes on Clay-Working. More Particularly Bricks and Tiles." In the course of his remarks he said that there are between four and five thousand brick and tile works in the Kingdom, employing a large number of hands and a huge amount of capital, much of the latter being unproductive. The author gave a description of the various kinds of bricks and their methods of production, commencing with—

Stock Bricks, or London Stocks.

This description, he said, was, as a rule, given to hand-made, clamp burned bricks, although large quantities not called stocks were made in exactly the same way, in a mould on a stock,

but were kiln burned. They might therefore take it that as a rule a stock brick was clamp burned. The system under which they were produced was a very ancient one, in many ways hardly varying at all from that pursued in the times of the ancient Egyptians. The method of production was shortly as follows: The brickearth or clay was dug in winter, and curbed up to let the weather get at it. Some of the earth was washed in a mill, screened, elevated, conveyed by wooden shoots or perhaps pumped through iron pipes and delivered on the top of that already put up. Chalk, in varying proportions, was also washed into slurry, and added. When the water had been run off ashes (called soil) were then added, all in perfectly regular layers of even thickness. The actual making lasted through the fine weather of late spring, summer, and early autumn, about six months, according to the weather, and was conducted as follows:—The temperer breaks into the back, or heap of prepared earth, cuts down the layers of material already referred to into a heap, and wets, mixes, or tempers it. It is then taken to the pugmills by tram or harrows and pugged. The pugmills are so arranged that the pugged dirt is delivered to the moulding tables, and from the moulder to the hack ground, with the least possible labour. At the moulding table the moulder and his assistant, the walk flatter, takes it in hand, and the clot, or walk of clay, for each brick, having been flatted, or worked roughly into shape by the walk flatter, the moulder moulds the brick, places it upon a pallet board, and then on to the page, or direct on to the off-bearing barrow. The off-bearing wheels the bricks to the drying ground, and hacks them up to dry; they are in due course skinned, and when dry wheeled on a crowding barrow to the clamp, set, and burned. When burned sufficiently, the clamp is broken into, and the bricks sorted and loaded or stacked, as the case may be. Some stock bricks are moulded five or six at a time (instead of moulding by hand) by means of a combined pugging and moulding machine, all the other operations being the same, but in this case the material has to be somewhat softer, and consequently difficult to pile on the hacks, and taking longer to dry.

The product of a clamp varies a great deal, and the bricks are called stocks, hard, yellow, bright, and washed stocks, shippers, grizzles, place, shuffs, and burn-overs, the latter being those under burned, and to be burned over again. All of these vary in value, although they have cost the same to produce. Much depends upon the burner who manipulates the draught by means of clamp boards. The fuel consists of the ashes, or soil contained in the body of the brick itself, and breeze in layers, between the bricks, at the lower part of the clamp. In the ordinary way all the bricks in a clamp, except shuffs, should stand the weather, although place bricks are generally used for internal work. A well-made, properly burned stock was one of the best all-round bricks for use, and he, for one, was sorry that this system is being extinguished; but it is practically impossible to burn a clamp with the usual fuel without giving off fumes that are very objectionable, if not injurious to health, and so far he had not been able to discover anything to take satisfactorily the place of the ashes. Some of the very finest examples of brickwork existing, both as regards appearance and durability, are of stocks or clamp burned bricks. Look, for instance, as regards strength and durability, at the brickwork in heavy railway work, arches, etc., all over London, built many years ago when the rush was on, and anything that looked like a brick was accepted. Although designed to carry traffic of less weight, speed, and frequency than is now the case, the majority of the work is as good as ever, and unless removed, will be good when much of the work of late years has gone.

Plastic, Hand-moulded, Kiln-burned Bricks.

These bricks, produced very much on the same lines as the stock brick, except that they are burned in kilns instead of clamps, comprise the highest quality of bricks we have at command. The material is, or should be, dealt with as before described, except of course that in the case of reds no chalk is added, for lime in any form is fatal to a good red colour. Ashes are of course not used, and sand is used for mixing with the clay, and for shading the washed earth, when drying in the washbacks. For buff or white bricks, sand from the river is needed. They are moulded in the same way as stocks

but more carefully, and in wooden moulds instead of steel, and the drying, whether in the open or in sheds or dryers, needs careful watching. When dry, they are burned in kilns, with coal as fuel. Some are pressed, this being usually done in the sheds with portable presses, when the brick is leather dry. Ornamental bricks, or odd stuff, are moulded in box moulds, not on a loose stock. The product consists of various qualities and shades of red, buff, white, etc., according to the material used and varying also with the degree of heat applied in burning. From the quality point of view we get the best in this class, and he personally preferred, so far as appearance goes, a sand-faced brick to those with a smooth face.

Efforts have been made, with considerable success, to supersede hand moulding by using moulding machines for high-class facing bricks in order to avoid the irregular application of moulding sand, and yet turn out a sand-faced brick. Some of these machines are worked by wheel, or lever, others are driven by power. The cracks and flaws in this class of brick are usually the result of carelessness on the part of the moulder in preparing the clot or cleaning his mould, and there is great difficulty in overcoming this, for the liberal use of sand lightens the moulder's work. Cutters and rubbers, as well as odd stuff, require great care throughout, and in some cases the whole of the material is washed and carefully screened. Plastic, hand-made, kiln-burned bricks are probably the most profitable to the maker, their extra value being much in excess of the extra cost.

Plastic, Machine-made, Kiln-burned Bricks.

An enormous quantity of excellent bricks are produced at a moderate cost by this system, and in view of the fact that clamp burning has fallen into disrepute upon ordinary sanitary grounds, it was his opinion that the plastic, machine-made, kiln-burned brick is the common brick of the future, whilst a goodly proportion of the total would be excellent facing bricks. Extra care in handling and pressing will (apart from the sand-face appearance, which, of course, is a matter of taste) give results in quality and colour equal to the hand-made bricks. For all general purposes they are strong and hard, if properly burned will stand any weather and any strain that can be put upon them in practice, and, what is more, they can be produced at a low price. The method of production is to dig the material, sometimes to weather it, more often to convey it direct from the face by barrow or tramway to the machines, and having machined it in whatever way one's judgment or experience dictates, a stream is expressed through a die on to a cutting-off table, where it is cut by wires into bricks. These are conveyed by barrows or on pallets and cars to perhaps an open drying ground, but preferably to a drying shed or dryer, and there dried. If dealt with in a tunnel or subclike dryer, they remain on the cars, which travel on rails from the machines to the kilns. If partly dried in a shed they are racked up, then pressed or trimmed, and afterwards passed through a dryer, but this applies more particularly to pressed facings and ornamental bricks. If the clay is very strong, that made into common bricks may have a small percentage of coal dust incorporated in the body of the brick, but this requires great care, and is of doubtful advantage.

Dry, or Semi-dry, Machine-made, Kiln-burned Bricks.

In this system you have the acme of cheapness, or, rather, low cost. Makers of this class of bricks, and of the plant for producing them, call them by all sorts of names, such as dry process, semi-dry, semi-plastic, stiff plastic, etc., but it all means the same thing, that is to say, it describes a brick in the manufacture of which the object in view is to eliminate water as far as possible, and thus save the expense of drying, depending upon enormous pressure and the burning, to so consolidate the various constituents as to make the brick homogeneous, but actual results in this case fall short of theory according to the material used and the way it is handled.

The system is as follows: The material is dug and kept as dry as possible (if too damp it is dried in sheds just as bricks are dried). It is then worked by pans or disintegrators into granular form, screened, elevated, and conveyed to the moulding machines or presses, thence direct to the kilns, where it is burned with coal fuel. The product is good in appearance, and is much in favour as a common building brick, its very low price being a great inducement.

This class of brick has been much improved of late. His experience, both in making and using them, went back nearly thirty years, and although the process is the same, the detail operations have been much improved and the product is more reliable than it used to be. In his opinion, these bricks, while most useful for filling in, or backing external walls above the damp course, and for all internal work (especially if not to be plastered) are not suitable for external work, foundations, or chimneys, and should certainly never be used for arches. The outer skin is intensely hard and dense, but the same degree of density throughout the brick cannot be transmitted by pressure, and the water contained in the brick is forced through the dense skin by the burning, causing minute cracks. Through these cracks the weather operates, the outer skin comes away, and this is soon followed by disintegration of the body of the brick.

Various other Bricks.

Speaking of other bricks, the author said:—"Blue bricks from the Staffordshire district have a great reputation for heavy work, paving, and many other purposes, but there are the real blue bricks and the so-called blue bricks, the latter only blue outside by reason of their being moulded in manganese or like material, the body of the brick being a dull red, and softer than a genuine blue brick. For strength and durability, apart from appearance, blue bricks cannot be beaten, but by reason of the heavy firing they undergo, and more particularly if pressed, the outer skin is dense and smooth, hence they are not desirable for arches. The hard, smooth skin prevents them from adhering to the mortar or cement, no matter how good it may be. This must have been palpable to anyone who has closely watched blue bricks being used. The smooth skin in laying attracts a film of water and does not adhere as it should. My own opinion is that this had a good deal to do with the regrettable viaduct disaster that occurred lately on the Great Western Railway."

A Standard Size for Bricks.

As to a standard size for bricks, the author said:—"Considerable attention has been given of late years to this question. . . . At one meeting I expressed the opinion that, to bring about a standard size, architects, engineers, and surveyors, in whose hands lies the power of specifying what they desire, should fix upon a standard size and specify it. The brickmakers would very soon supply what was specified. Since then a standard size has been decided upon, and that is about as far as we have got. There is no doubt it would be desirable to have one size applicable to the whole country, but custom has fixed the size in the Midlands and the North far in excess of that in vogue in the South; and it will take time to bring the conflicting ideas into line. There is little or no mechanical difficulty, and we can all help, but you will not, I think, get much help from the brickmakers, for there seems no unity of purpose among them, each individual or firm playing his own game, and cutting his neighbour in the most unreasoning manner. When you specify that the bricks shall be of a standard size, it ought to be clearly defined what deviation will be permissible before the bricks (otherwise perfect) can be rejected as not of standard size. Unless this is done hardship will result, for the rejected bricks, however good, would at once become of less value on the market, apart from the expenses attending rejection. This is all the more important, because in spite of all that is said by patentees and others regarding kilns, dryers, and machines, and by the competing manufacturers themselves, the fact remains that no matter by what plant or process produced, or in what kind of kiln they are burnt, there is a variation in the finished size.

Testing Bricks.

Many manufacturers make a strong point of their certificates giving results of crushing tests, etc. I am afraid I do not attach much weight to these, not that they are not genuine and correct, but they seem to me almost irrelevant. It is difficult to conceive in practice a properly burnt brick of any kind, in a position where it would be crushed by the superincumbent load. I have never seen such a thing. Of course, we have all seen cases where, through negligence, odd, under-burned bricks have been used which have to be replaced, but this does not apply. If by way of illustration it is estimated that the maximum pressure would be 1 ton on the square foot, and you use bricks that you know will

carry 10 tons, why be influenced by a certificate setting forth that certain bricks will carry 30 tons? There is no advantage whatever. Among other tests is a rattling test. This I cannot understand. We try to avoid rattling bricks, and bricks are made to build with, not to be rattled, and no one would say they are earthquake proof. I presume the idea was to note the effect of the rattling on the arris of a brick; if so, would it not be better to watch the effect of the handling they would receive in actual practice?

Tiles and Pottery.

The making is an important branch of the clay-working industry, and the demand for tiles is increasing. I am glad it is so, for although slates are a most useful and economical roof covering, we shall all I think agree that, as regards appearance, health, and comfort, tiles are preferable. Let your eyes roam over the suburbs and country towns, and note the difference of the red tile as against slates, while the difference of those living in the houses can only be realised by those who have tried both forms of covering. Of course, the timbering must be somewhat heavier for tiles, but really the difference in cost is not much, and tiles are made now so thin, accurate in size, and regular in camber that they compare more favourably than ever as regards weight and lying close. Whenever I have control of new buildings on estates, nothing would induce me to allow slates to be used for roof coverings. In the manufacture of tiles the processes, except in a few details, are much the same as in brick making. Of course, mild, sandy brick-earth will not make tiles. The bulk of those on the market are machine made and pressed, but there is still a demand for hand-made, sand-faced tiles, which, although thicker and less regular in shape, are preferred by many for their better appearance. Ornamental, hip, valley, ridge, and other tiles are, of course, used with the plain roofing tiles, and are made from the same kind of material, the majority by machine (band or steam power), while some of them, together with finials and snub like, are produced by hand. Pottery for building, domestic, garden, and ornamental purposes is another branch. A plastic clay, tough and elastic, is needed, and the common London clay makes very good ordinary pottery. The preparation of the clay needs more care than for bricks, or even tiles, but how this should be done depends entirely upon the clay itself and what form or class of pottery is to be produced. Drying is effected on pallets, racks, or shelves, in sheds artificially heated. There are many ways of doing this, but I have found the small bore hot water system the most easily controlled and economical, requiring practically no attention, except to the furnace, and that but little. The burning is generally done in intermittent kilns of the circular down draught type. Common goods are set open to the fire, the better class in seggars, and the closer the goods can be nested, or packed together, consistent with a proper draught, the better they will be burned and the less fuel will be used. This remark applies to all kilns and all clay goods. Prices for common pottery are small, but a fair profit can be made."

The author then spoke at some length as to starting, etc., new works; transport of the material and the product; management of works; supervision, stocktaking, book-keeping; the rating of brick fields; transfer of land for clay working; valuations; and dryers and kilns; fuel consumption, etc.

In the discussion which followed, Mr. W. E. Woolley proposed a hearty vote of thanks to Mr. Jopling, and in doing so referred to the old pantile as being an excellent material for roofing, especially for roofing farm buildings, and it had this advantage—it was easily repaired. He was glad that Mr. Jopling recommended canal transit for bricks. In his opinion, more use should be made of the common brick in buildings and less of the ornamental brick. Fine odd brick buildings could be seen in the southern counties—beautiful old farmhouses, etc.—and in their construction would be found none of the ornamental brick work he referred to; the effect had been obtained by the proper use of the ordinary red brick.

Mr. J. L. Crouch seconded the motion, and referred to the difficulties in the way of the standardization of bricks—the great difference in the thickness of the bricks made in the North as compared with those of the South. The Institute of Architects allowed a margin

in its standard, and when a margin was allowed the standard ceased.

Mr. G. Tucker said that Mr. Jopling had referred to the unsuitability of blue bricks for heavy arches, but if the author had said that pressed blue bricks were not suitable he would have been more correct. The wire-cut blue brick, with its face rough, was admirably adapted for arching; there could be nothing more substantial than a blue brick wire cut, and that applied to almost every brick used for similar purposes. Dry pressed bricks were of various qualities—in some districts they were good and in others they were bad. In his opinion the best bricks produced at the present time were hand-made bricks.

Mr. Thomas Blashill said that the question of the standardization of bricks had been thoroughly worked out, and that to that end the Science Committee of the Institute of Architects were assisted by brickmakers, engineers, and others in working out the matter two or three years ago. The result was the R.I.B.A. standard size of bricks, and he suggested that that might be embodied in the paper.

Mr. E. W. Hudson and Mr. W. Eve having made some remarks, the vote of thanks was heartily agreed to, and Mr. Jopling replied.

It was announced that the next meeting will be held on January 16, when Messrs. A. R. Stenning and Menzies will read papers on "The Form of Rural Building By-laws." The meeting then terminated.

THE ARCHITECTURAL ASSOCIATION: VISIT TO A NEW THEATRE.

WHEN the old Prince of Wales's Theatre, near Tottenham-court-road, was closed playgoers felt that London had lost one of its historic places of entertainment, and certainly the lapse of some twenty years, during which the old buildings were in process of decay, has given little hope of restoration. It will, however, be of considerable general interest to know that the past associations are to be revived in a fine new playhouse about to be opened—a house in every way a splendid addition to the increasing list of London theatres.

A large body of members of the Architectural Association visited the new buildings on Saturday, December 4, by kind permission of the architect, Mr. F. T. Verity, who, together with his chief assistant, Mr. Gill, described the structure and explained the methods by which the difficulties of the scheme had been overcome. The following notes are intended to convey general impressions gained from a tour of the theatre, to which it should here be said no name has yet been given.

Although excellently planned so far as the seated audience was concerned, the old theatre was terribly deficient in the extent and nature of its approaches and outlets, and this may be said to have been the main reason for its compulsory closure. We gave a historic reference to the building on October 26, 1901, mentioning the founders and some of the more important players who achieved many triumphs within its walls. The whole of the old premises were demolished last year with the exception of the original portico spanning the pavement in Tottenham-street, now marking the new stage-door. In order to provide exits to two streets, and to conform to other L.C.C. regulations, properties bounding the old site on the west and south were acquired, so that the site becomes practically doubled in length and in width for the new scheme. The north-west corner is planned as a two-floor restaurant with basement kitchen and offices, and the uppermost stories are arranged as residential suites, part of which overlap the theatre buildings.

The main entrance is now transferred to Charlotte-street, and other entrances and exits are provided in Tottenham and Pitt streets, thereby giving excess in means of escape. The generous space in the halls and gangways is one of the many wise provisions in the design.

With regard to the exterior, it is to be regretted that the Charlotte-street, or principal front, has little to proclaim the presence of a fine playhouse; the stone doorway is massive enough, but the superstructure, faced in brick-work with cement dressings, loses force by the smallness of parts necessary to the restaurant and flats already mentioned. The opportunity for the broad masculine treatment of a façade is supplied by a theatre in such a way that few public buildings offer, but the designer is not always responsible for omitting to seize the chance.

To the interior the importance of a theatre belongs, and in the example under notice no pains have been spared to produce a convenient and roomy house. The first impression received is that here is a playhouse designed and decorated by one mind—a truly architectural interior, even to the drop-scenes depicting Hampton Court Palace and the Palladian bridge at Wilton. The effect is satisfying to the esthetic mind, although it may appear heavy to the lay observer; but, it is extremely gratifying to find that the "gilt-compo" demon has been exorcised.

The seating accommodation of this "two tier house" is, approximately, for 1,250 persons disposed in almost equal groups in stalls, pit, dress and upper circles, and gallery. Only two private boxes, one on either side of the auditorium, are provided, to which unusual prominence is given by making them large structural features taking up the minor order of the interior. The cornice of this order is carried over the segmental arch of the proscenium opening, which makes a welcome departure from the hard, square outline of the universal lintol form. The principal innovation, however, is the introduction of two flights of steps in the auditorium descending from the cross circle to the stalls, and this produces an effect as pleasing as it is unusual. Each of the staircases passes below one of the private boxes already referred to, at which point a doorway leads from a half-landing to a refreshment saloon, so that occupants of the best seats of the house have ready and convenient means of retiring. Commodious saloons are arranged for the pit and upper circle.

We should say that this theatre is capable of rapid emptying, for, practically speaking, four exits are provided to each part of the house—two at the upper and two at the lower levels. The "sighting" of the seats is very satisfactory throughout, and the gallery is liberally considered in the matters of space and view. We anticipated that some mechanical means of ventilation would have been introduced to assist the natural method employed to purify the auditorium—especially in the gallery—but no such precaution is considered necessary. Some underground departments, however, are supplied with electric fans.

The design of the interior is broad and simple, having a large order carried round the body of the house. The cornice, panelled features, and walling are executed in a French composition stone—"stuc"—made and fixed by Parisian workmen. The texture is, of course, uniform, the joints are white and well marked, and the colour a warm sandstone resembling "Craigleith." Some excellently designed marble doorways relieve the general tone, but it may be said that colour, as usually applied to theatres, is absent and gives place to material.

"Behind the scenes," the interior presents the usual appearance of a stage. A new feature, however, is seen in the limelight gallery on each side wall to avoid confusion with operations in the "flies." The electric lighting arrangements, by Messrs. Higgins & Griffiths, are very interesting, and were put through various scenic changes for the benefit of the visitors. The drop scenes already referred to were designed by the architect and painted by Mr. T. K. Brown. Messrs. J. Allen & Sons are the general contractors. The President of the Association, Mr. E. Guy Dawber, made some very appreciative remarks upon the success of the visit, which was brought to a close by an animated expression of approval by the members.

AMERICAN STONE INDUSTRY.—It is officially notified that the figures collected by the Geological survey put the value of the stone quarried in the United States in 1903 at 73,384,200 dols., an increase of 3,553,649 dols. over 1902. In spite of troubles in the building trades, Pennsylvania surpassed all other States in the product of its quarries during 1903. The value of its stone amounted to 13,913,220 dols. New York is third, with a stone product valued at 5,742,853 dols., and Ohio is fourth, with a product worth 5,114,051 dols. The production of every other State was considerably less. The value of the output of the different kinds of stone in 1903 were as follows:—Granite 15,703,795 dols.; trap rock, 2,732,294 dols.; sandstone, 9,492,802 dols.; blue stone, 1,779,457 dols.; marble, 5,362,696 dols.; limestone for building, 26,642,551 dols.; limestone for flux, 5,423,732 dols.; slate, 6,256,895 dols.

Illustrations.

EAST WINDOW, ALL SAINTS' CHAPEL, ST. CHAD'S CHURCH, GATESHEAD-ONTYNE.

HIS window is the first of a series intended to represent Christianity as exemplified in the lives of her saints; selecting representative heroes of England, such as King Alfred, the Ven. Bede, Sir Philip Sidney, and Grace Darling.

This, the east window, is meant to bring into prominence the human aspect of the life of Christ. In the centre light he is represented as the Good Shepherd, and beneath as washing the disciples' feet. In the right hand light is St. John the Evangelist (the beloved disciple), who is represented in the predella, supporting the steps of the Virgin (who has been committed to his care) as they follow the hier on which the body of our Lord is borne to the sepulchre. The left hand light represents the Virgin with the infant Christ, and beneath the finding of Christ in the Temple.

The first aim of a stained glass window is to give a fine effect of colour. In early Gothic glass drawing is of very minor importance. The beauty is due to fine colour composition and to the gem-like quality of the glass. This quality owes much to the very imperfections of the material, its uneven thickness and variations of colour, and to the heavy leading due to the primitive method of cutting. The limitations of a craft are often its safeguards, and it is of the greatest importance that the designer should understand those limitations; should be, in fact, a craftsman as well as an artist. To ape archaic drawing whilst using flat, inferior modern glass and thin leads is to combine the defects of two periods. To be content with a flat rather than a pictorial effect, and to seek simplicity of line and dignity of pose is the lesson to be learnt from our early masters.

WESTBURY MANOR, BUCKS.

This drawing shows the alterations and additions to the old manor house, which comprise new library, drawing-room, and boudoir, and entirely new kitchen offices. The front of the old house has been remodelled, and the whole of the work done in local stone with Bath stone dressings and Leicestershire green slates. Messrs. J. Parnell & Sons, of Rugby, were the contractors, and the architect is Mr. Clyde Young, of London.

FRONTS IN TOTTENHAM COURT-ROAD AND OXFORD-STREET.

The front forming Nos. 216-219, Tottenham Court-road was built for Messrs. Bartholomew & Fletcher as show-rooms for their antique and modern furniture. Messrs. Jas. Smith & Sons, Ltd., of Norwood, were the contractors, the stone carving and modelling over the entrance being executed by Mr. W. Aumonier.

Nos. 455-459, Oxford-street, and 22, North Audley-street, were built for Messrs. Champion & Wilton, with spacious workshops at the back; the upper part of the building is divided into flats.

Messrs. Holloway Brothers, of Belvedere-road, Westminster Bridge, were the contractors, and Messrs. Walter Smith & Wheaton did the stone carving.

Messrs. Read and Macdonald are the architects. In this case we did not ask the architects for plans, regarding these designs mainly as additions to the visible street architecture of London, which is governed rather by lines of frontage than by special considerations of plan.

HOUSE, HEADINGLEY, LEEDS.

This is one of the houses carried out by the late Mr. F. W. Benford, whose early death we had to chronicle in our last issue. It is one of the buildings mentioned in our obituary article.

MISSION HALL, SEATON FIRST.—A new mission hall is being erected in Third-avenue in connexion with St. John's Church, Seaton First. When completed the building will accommodate 300 persons, and will be seated throughout with chairs. The dimensions will be 59 ft. by 27 ft., with a vestry at the west end, 27 ft. by 12 ft. Plans have also been prepared by Messrs. Hicks & Charlewood, of Newcastle, for the enlargement of the church. The plans provide for a west extension of 32 ft., and a south aisle, 80 ft. long and 19 ft. broad. The accommodation will be doubled.

HOUSE AT HEADINGLEY, LEEDS.—THE LATE FRANCIS W. BEDFORD, F.R.I.B.A., ARCHITECT

THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of the London County Council was held on Tuesday, in the County Hall, Spring-gardens, S.W., Mr. J. Williams Bonn, Chairman, presiding.

Loans.—On the recommendation of the Finance Committee, it was agreed to lend Hackney Borough Council 2,500*l.* for the construction of an underground convenience at Lower Clapton-road; Lewisham Borough Council, 5,065*l.* for erection of buildings at Home-park depot; and Wandsworth Borough Council, 17,700*l.* for street improvements.

Physical Deterioration.—The General Purposes Committee presented a report upon the improvement recommendations of the Inter-Departmental Committee on Physical Deterioration. The report pointed out that the opinions gathered from the great majority of the witnesses examined did not support the belief that there was any general progressive deterioration in the nation, physical deterioration being, as one witness put it, "practically confined to the poorest and lowest strata of the population, whose children are improprietly housed, and whose parents are improvident, idle, and intemperate." The committee stated that if this view was correct they felt that remedial measures were comparatively easy of application, as "the task of dealing with a concentrated rather than a scattered evil manifestly presents fewer difficulties." The General Purposes Committee now recommended that the most important recommendations of the Inter-Departmental Committee should be referred for consideration to the various committees of the Council most closely identified with the matters dealt with.

The recommendation was unanimously adopted.

Enlargement of School, Hackney.—On the recommendation of the Education Committee, it was agreed that the estimate, 3,690*l.*, submitted by the Finance Committee be approved; that expenditure not exceeding 3,942*l.* be sanctioned in respect of the enlargement of the Windsor-road school (Hackney, S.) by 180 places, and of the other works proposed to be carried out at the same time; that the work be executed by the Council without the intervention of a contractor, and that the drawings, quantities, specification, and estimate of 3,667*l.* be referred to the Works Committee for that purpose.

Islington and Hornsey Drainage.—On the recommendation of the Main Drainage Committee, it was agreed, after a long discussion, that the estimate of 27,500*l.*, submitted by the Finance Committee, be approved; that an agreement, in the terms of the draft presented to the Main Drainage Committee on October 27, 1904, be entered into with the Islington Metropolitan Borough Council and the Hornsey Corporation relative to the drainage of the Stroud-green area; and that the seal of the Council be affixed to the agreement. That so soon as the agreement between the Council, the Islington Metropolitan Borough Council, and the Hornsey Corporation shall have been completed, an advertisement be issued inviting tenders for the work of constructing a new sewer along Stroud-green-road, Tollington-park-road, and Grove-road into the Holloway storm relief sewer. That the operation of the standing order relating to the time for the submission to the Council of schemes involving applications to Parliament be suspended in order that the following recommendation may be considered. That Parliamentary authority be sought, in the session of 1905, to give effect to the provisions of the agreement with the Islington Metropolitan Borough Council and the Hornsey Corporation relative to the drainage of the Stroud-green area, and to give effect to the award, when made, upon matters referred to arbitration under the agreement.

Shelters at New Theatre Building, Charlotte-street.—In an adjourned report of the Building Act Committee, it was recommended that the Council, in the exercise of its powers under sections 22 and 73 of the London Building Act, 1904, do consent to the erection of iron and glass shelters to a theatre building abutting upon the east side of Charlotte-street, south side of Tottenham-street, and north side of Pitt-street, St. Paneras, submitted in connexion with the application of Mr. F. T. Verity on behalf of Mr. E. D. Maddiek; that the whole of the work be executed to the satisfaction of the District Surveyor; that no advertisement, sign, lettering, or device, other than the name of the

premises, be placed over or upon or affixed to such shelters.

The recommendation was agreed to.

Piccadilly Widening.—The Improvements Committee recommended:—That the estimate of 72,500*l.*, submitted by the Finance Committee be approved; and that the Finance Committee be authorised to take all necessary steps to secure the widening of Piccadilly to a minimum width of 80 ft. between St. James's-street and Duke-street, as shown upon the plan presented to the committee on September 30, 1903, subject to the Council of the city of Westminster agreeing to contribute one-seventh of the actual net cost of the improvement, provided however that if the actual net cost exceeds 72,500*l.*, the contribution from the City Council shall be limited to 10,493*l.* (which bears the same relation to the total cost as the amount originally offered by the City Council bore towards the original estimate), and also provided that the contribution from the City Council shall be paid in proportionate instalments as each section of the improvement is completed.

Captain Hemphill moved as an amendment that the improvement should only be carried out if the Westminster City Council consented to contribute 18,125*l.*, one-fourth of the cost.

Mr. Dickinson seconded the amendment, and after discussion it was rejected by thirty-nine votes to thirty-four.

The recommendation of the Committee was adopted.

Reconstruction of Warwick-road Bridge.—The Bridges Committee recommended, and it was agreed, that the Council's statutory consent be given to the reconstruction by the Paddington Metropolitan Borough Council of the bridge carrying Warwick-road over the Regent's canal in the manner shown upon the plans presented to the Bridges Committee on May 11, 1904; subject to these being so amended so as to permit of the construction of a conduit tramway over the bridge, and to such necessary minor alterations being made in the plans as may be agreed upon between the chief engineer of the Council and the surveyor of the borough council; and that a contribution be made by the Council, on the usual conditions, of one-third of the net cost of the improvement, provided however that if the total net cost exceeds 8,500*l.*, such contribution shall be limited to 2,834*l.*

Erection of Buildings in Euston-road.—The Building Act Committee brought up a long report in regard to an application of Mr. W. C. Jones on behalf of the Worshipful Company of Skinners for consent to the erection of buildings on the site of Nos. 45-113, Euston-road, to an advanced line. In the course of their report they stated:—"Having regard to the circumstances connected with the Marylebone, Euston and Pentonville roads, to the importance of preserving existing open spaces, and to the immense value to London of a magnificent boulevard 3 miles in length and in most parts nearly 140 ft. in width, such as we hope it may in time be possible to form out of these roads, at a comparatively small cost; if the Council strenuously resists every endeavour to build over the existing forecourts, we are of opinion that it would be very detrimental to the public interest to allow any advance to the building line in the case of the premises Nos. 45-113, Euston-road. In view of the importance of the question, which affects not only the boroughs in which the Marylebone, Euston and Pentonville roads are situated, but the whole of London, and in order to enable the Council to estimate the probable effect of granting the present application, we have given instructions for a cartoon plan of the roads as at present existing to be hung in the Council chamber. We recommend that the resolution of May 3, 1904, refusing the application of Mr. W. C. Jones, on behalf of the Worshipful Company of Skinners, for consent to the erection of buildings on the site of Nos. 45-113 (odd numbers), inclusive, Euston-road, to an advanced line, be adhered to."

Mr. Goldsmith moved, and Dr. Beaton seconded, that the matter be referred back to the Committee, but the motion was defeated, and the Committee's recommendation was carried.

Housing.—The Housing of the Working Classes Committee recommended that the estimate of 4,000*l.*, submitted by the Finance Committee in respect of a proportion of the cost of carrying into effect the London (Norfolk-square, Islington) Improvement Scheme, 1892,

be approved; that the payment of 3,048*l.* 2s. 3d. to the Council of the Metropolitan Borough of Islington as part of the agreed contribution towards the cost of the scheme be authorised; and that it be referred to the Finance Committee to make the payment.

The recommendation was agreed to.
Wenlake-buildings, Roby-street, St. Luke.—**Sub-letting of Contract.**—The same Committee reported as follows:—"The Haslemere Builders, Limited, have asked for sanction to the sub-letting of the gas-fitting work required under their contract for the erection of Wenlake-buildings in Roby-street, St. Luke. We see no objection to the application being granted, subject to the usual conditions, and we accordingly recommend that the Haslemere Builders, Limited, be allowed to sub-let to Messrs. H. Davis & Co. the gas-fitting work under their contract for the erection of Wenlake-buildings in Roby-street, St. Luke, subject to the principal contractors being responsible to the Council for the work being done under the same conditions as if done by themselves."

Mr. Dew moved that the recommendation be referred back on the ground that the firm in question had already sub-let a good deal of the work for the erection of Wenlake-buildings.

The motion, however, was lost.
Mare-street—Paving, etc., Works.—The Improvements Committee recommended, and it was agreed, (a) That the working drawings, bills of quantities, specification and estimate of cost (24,200*l.*) of the paving and other works in connexion with the widening of Mare-street between Dantley-road and the Triangle, authorised by the London County Council (Improvements) Act, 1900, be approved, and be referred to the Works Committee with a view to the work being carried out without the intervention of a contractor; (b) that the employment of a clerk of works in connexion with the works in Mare-street be authorised at a cost not exceeding 250*l.*

Chiswick Drainage.—The Main Drainage Committee recommended, and it was agreed, "That an agreement, on the basis indicated in the foregoing report, be entered into with the Chiswick Urban District Council relative to the reception into the London main drainage system of sewage from certain premises in the urban district; that the solicitor do complete the matter; and that the seal of the Council be affixed to the agreement."

Indication of Houses of Historical Interest.—The Local Government Committee brought up the following report, the recommendation being agreed to:—

"We consider that the residences of Dante Gabriel Rossetti, at 38, Charlotte-street, Portland-place; of Charles Darwin, at 110, Gower-street; of W. M. Thackeray, at 16, Young-street, Kensington; and of Edward Jenner, at No. 14, Hertford-street, W., should be commemorated. We have verified the facts connected with the houses referred to, and have also obtained the necessary consents to the fixing of memorial tablets. We recommend—that the undermentioned houses of historical interest be commemorated by means of memorial tablets: (a) No. 38, Charlotte-street, Portland-place (Dante Gabriel Rossetti); (b) No. 110, Gower-street (Charles Darwin); (c) No. 16, Young-street, Kensington (W. M. Thackeray); and (d) No. 14, Hertford-street, W. (Edward Jenner)."

London Building Acts (Amendment) Bill, 1905.

—The Parliamentary Committee reported as follows:—"We have prepared, in accordance with the instructions of the Council on November 13, 1904, and on the general lines indicated in the report of the Building Act Committee, presented on November 8, 1904, the London Building Acts (Amendment) Bill, which seeks to amend the Acts relating to buildings in London. With regard to the proposed reconstitution of the Tribunal of Appeal, we are unanimously of opinion that it is undesirable to give effect to the Council's resolution."

After consultation with the chief officers concerned, we have satisfied ourselves that the Council's object will be best met if provision is made in the Bill requiring the Tribunal to state their reasons when giving a decision, as the Council is required to do when refusing to sanction the adaptation of ways for streets, and this has accordingly been done. We have given directions for copies of the Bill to be circulated to all the members of the Council, and we also propose to submit the Bill as soon as possible to the various professional bodies and local authorities for their consideration and views."

The Committee recommended:—

"(a) That so much of the resolution of the Council on November 15, 1904 (p. 2,063), as provides for the reconstitution of the Tribunal of Appeal constituted under

the London Building Act, 1894, be rescinded; and that in lieu thereof provision be made in the Bill to amend the London Building Acts whereby the existing Tribunal of Appeal shall be required to state their reasons when giving a decision.

"(b) That the London Building Acts (Amendment) Bill be approved; that the seal of the Council be affixed to a petition for leave to bring in the Bill; and that the Bill and petition be deposited pursuant to the standing orders of Parliament and with such necessary alterations (if any) in the Bill as the Parliamentary Committee may consider desirable."

The Building Act Committee brought up the following special report on the same subject:—

"Our attention has been drawn to the report with regard to this Bill which the Parliamentary Committee will submit to the Council on Tuesday, December 13, 1904. The Council on November 15, 1904, resolved that provision should be made in the Bill.—For increasing the number of members of the Tribunal of Appeal from three to five, for one member to be appointed by the Council, but not to be a member of the Council, and for the fifth to be a barrister of not less than ten years' standing, to be chosen by the other four, and to act as Chairman of the Tribunal; also that no architect or surveyor practising in London shall be eligible for membership of the Tribunal, and that the powers of the Tribunal shall be restricted to the limitations of the section under which the appeal is made. The Parliamentary Committee now propose that instead of the necessary provisions being inserted in the Bill to give effect to the resolution of the Council of November 15, 1904, with regard to the Tribunal of Appeal, the provision should be inserted requiring the Tribunal to state their reasons when giving a decision. The limited time at our disposal does not admit of our putting the matter fully before the Council, but it is of the importance of the question we think it necessary to point out the principal reasons why, in our opinion, the proposal of the Parliamentary Committee should not be adopted. There are some very important matters which, under the London Building Act, 1894, may form the subject of appeal to the Tribunal, but of these the most important are the formation of streets, the general line of buildings in any street, part of a street, place or row of houses, and space at rear of buildings. The decision of the Tribunal on an appeal from the certificate of the superintending architect with regard to the general line of buildings may have a very wide reaching effect and result in a very serious loss to the public of light and air space. Dealing as the Tribunal does with matters of great consequence to the well-being of the general public, it appears to us a matter of the highest importance that its constitution should be such as to inspire the greatest confidence in the impartiality of its decisions. As the Council is aware, section 175 of the London Building Act, 1894, prescribes that the Tribunal shall be constituted as follows—one member appointed by the Secretary of State for the Home Department, one by the Council of the Royal Institute of British Architects, and one by the Surveyors' Institution. It appears to us that a Tribunal consisting of three members, two of whom are appointed by the professional bodies whose interests are closely connected with those of the owners of land and property, cannot be regarded as the best form of Tribunal, and the objections to it are intensified when as is now the case the persons appointed by the professional bodies are architects and surveyors in active practice, whose own work may become the subject of an appeal to the Tribunal, and be adjudicated upon by them in their capacity as members of the Tribunal. We considered several alternative proposals for providing an appeal from the Council's decisions, amongst others, that all appeals should go to a county court judge or judge of the High Court sitting with two professional assessors or advisers or should be settled by arbitration. We came to the conclusion, however, that the most practicable course was to endeavour to remove the chief objections to the present form of constitution of the Tribunal. We quite admit that it may be possible to suggest a better solution of the difficulty, and if the Council adheres to its decision of November 15, 1904, it will, if the Bill goes to a Committee of the House, ensure a full discussion of the subject, and some better arrangement may be the result. We fall to see that the proposal of the Parliamentary Committee will have any useful effect, and as it does not involve any amendment of section 175 of the London Building Act, 1894, its adoption by the Council would, we understand, make it almost impossible to raise the question of the amendment of the constitution of the Tribunal in a Committee of the House. As we are convinced that an absolutely impartial Tribunal of Appeal is essential in the interest of all parties concerned, we have unanimously asked our Chairman to move an amendment to the recommendation of the Parliamentary Committee, and with a view of enabling the Council to judge of the importance of the question, we have had prepared a cartoon showing a portion of the Fulham-road and having marked thereon the general line of buildings as recently defined by the superintending architect and as afterwards defined by the Tribunal of Appeal."

Captain Hemphill, Chairman of the Building Act Committee, said he was disappointed in the attitude of the Parliamentary Committee. The Building Act Committee had had an analysis made of every case which had been before the Tribunal of Appeal, and they had very much fuller information on the subject than the Parliamentary Committee, and in every case dealing with lines of frontage, where an appeal had been made to the Tribunal the line of approach had been advanced. The sole motive which seemed to have guided the Tribunal was to benefit the owners of property. The Committee did not think it a proper thing that men who had to decide questions of lines of frontage while sitting as the Tribunal should be men who were interested in such questions professionally while not sitting on the Tribunal, and for that reason the Committee thought that members of the Tribunal should not be composed of gentlemen who were practising in London, and who were more or less interested

in such work. He, therefore, opposed recommendation (a).

Dr. Napier, Chairman of the Parliamentary Committee, said that the action of his Committee was in order to lighten the opposition to the Bill. The Bill, which had not been submitted to the professional or local authorities of London, would be bitterly opposed, and it was no good putting in needlessly aggressive clauses. It would be possible to bring in a small Bill next year dealing with this point if thought desirable.

The question was then put, recommendation (a) being defeated, and (b) being agreed to.

London Squares.—The Parliamentary Committee recommended that the London Squares and Enclosures (Preservation) Bill, 1905, be approved. The measure seeks to secure that the garden squares and enclosures in London shall be permanently preserved as such, and that such squares and enclosures when so preserved shall be free from any future legislation relating to the taxation of ground or site values. The Bill, while prohibiting the erection of buildings on the scheduled land and exempting the lands from assessment and rating on the basis of site values, also includes provisions (a) to enable the Council to make agreements with the owners of any of the scheduled lands with respect to the maintenance thereof, the erection of buildings thereon, and generally as to the preservation of such lands in their present state; (b) to empower the owners to require the Council to take over and maintain for the public squares and enclosures in cases where the owners desire to be relieved of the cost of maintenance; and (c) to enable owners in the rearrangement of their estates to utilise a portion of their garden squares or enclosures, should they desire to do so, on condition that an equivalent area of open space to the satisfaction of the Council is provided. These two latter provisions have been inserted at the suggestion of the Chancellor of the Exchequer and the Commissioners of Woods, who, on behalf of the Crown, have expressed their willingness that Bessborough-gardens, Clarence-gardens, and Munster-square should be placed in the schedule to the Bill. The Committee further stated that they proposed to send a copy of the Bill, together with the schedule containing all the garden squares and enclosures in London, to each of the owners whose squares or enclosures were comprised therein, with an intimation that, if after the introduction of the Bill and before the committee stage in the first House, they expressed to the Council their wish that their squares and enclosures should be withdrawn from the compulsory provisions of the Bill, the Council would, with regret, comply with such request. They were strongly of opinion that by adopting a conciliatory attitude they were most likely to gain the sympathy of the landowners concerned, and they trusted that, as the result of further negotiations, the Bill might result in securing the permanent preservation of many London squares and enclosures.

Lord Ludlow said that he had from the beginning taken a keen interest in this movement and had either personally or by letter approached the great ground landlords of London, with the result that a large number of them had expressed their sympathy with the Bill, and the owners of seventeen squares had consented to have their property scheduled to the Bill. There was every reason to believe that a great many more would come in. In the Edwardes-square (Preservation) Bill of last Session Mr. Dickinson wanted to make the measure compulsory; it was in fact a confiscatory Bill, and anything in that way he (Lord Ludlow) would oppose as strongly as he was supporting the present Bill.

Mr. Dickinson said that no one recognised more than he did the well-intentioned services of Lord Ludlow in this matter, but he contended that this was clearly a case in which some measure of compulsion was necessary. The present state of affairs was an abuse of the power of the landlord interest against the public interest. If they did not have a compulsory Bill they might save certain of the squares owned by high-spirited and municipally patriotic landlords, but they would not save the very squares they were most anxious to preserve, those which were on the point of being sold for building purposes. At any rate he thought that they might leave the door open for a compulsory measure, and he accordingly moved as an amendment to add to the recommendation the words "provided that the

Council do report further to the Council before accepting the squares or enclosures of any particular ground landlords." In that way they would discover in time who were willing to come in and whether a compulsory measure was necessary.

Mr. Jackson seconded the amendment. Mr. Burns, M.P., supported the Bill. He pointed out that theoretically he was in favour of the nationalisation of the land, but this was a matter of expediency, and he was anxious to save the squares. It would be nothing short of a calamity if they lost the 412 London squares through a mistaken policy.

The amendment was rejected on a show of hands.

The Bill was then approved. The Council adjourned soon after eight o'clock.

APPLICATIONS UNDER THE 1894 BUILDING ACT.

The London County Council at their meeting on Tuesday dealt with the following applications under the London Building Act, 1894. The names of applicants are given between parentheses:—

- Lines of Frontage and Projections.**
- Lewisham.**—Six buildings on a site abutting upon the west side of Perry-hill and south side of Vancouver-road, Catford (Mr. S. C. Hart for Messrs. E. Clarke & H. Kerwen).—Consent.
- Lewisham.**—A building on a site abutting upon the east side of High-street, and north side of Limes-grove, Lewisham (Messrs. Owen & Ward for Mr. W. Stephens).—Consent.
- Hackney.**—An iron and glass porch at No. 12, Lower Clapton-road, Hackney (Mr. F. H. Coles for Dr. F. P. Bremner).—Consent.
- Lambeth, North.**—A boiler-house at St. Thomas's Hospital, Lambeth Palace-road, Lambeth (Mr. P. Curry).—Consent.
- Lambeth, North.**—Removal of existing covered way at the entrance to block No. 1 of St. Thomas's Hospital, fronting upon Westminster Bridge-road, Lambeth, from one position to another.—Consent.
- Fulham.**—A porch and balcony at No. 77, Ellerby-street, Fulham (Mr. J. Coleman).—Consent.
- Fulham.**—Projecting arches between the bay windows of two blocks of flats on the west side of Vera-road, Fulham (Mr. H. G. Braze for Mr. A. L. Horlock).—Consent.
- Hampstead.**—A deviation from the plans approved for the erection of additions to All Souls' Church, Loudoun-road, Hampstead (Messrs. Nicholson & Corleite).—Consent.
- Hampstead.**—Three blocks of working-class dwellings upon a site abutting upon the east side of Upper Park-road and north side of Lower Cross-road, Hampstead (Mr. O. B. Winter for the Council of the Metropolitan Borough of Hampstead).—Consent.
- Hampstead.**—A conservatory at No. 48, Frogual, Hampstead, to abut upon Arkwright-road (Mr. F. S. Hammond for Mr. R. Hart).—Consent.
- Hampstead.**—Three houses upon the west side of Roscroft-avenue, abutting also upon the north side of Hollycroft-avenue (Mr. W. J. King).—Consent.
- Marylebone, East.**—A porch at No. 38, Finchley-road, St. Marylebone (Messrs. Anseombe & Ringland for Mrs. Lupton).—Consent.
- Paddington, South.**—An oriel window at the ground-floor level of No. 62, Oxford-terrace, Paddington (Messrs. Carr & Parr).—Consent.
- St. George's, Hanover-square.**—A verandah at the first-floor level of No. 10, Berkeley-square, St. George's, Hanover-square (Messrs. Woodrow & Haldson for Messrs. J. Andrews & Sons).—Consent.
- St. George-in-the-East.**—Projecting lamps at St. John's and King Henry's wharves, High-street and Dundee-street, Wapping (Messrs. R. G. Hall & Co.).—Consent.
- Wandsworth.**—Four dwelling-houses on the north-western side of Church-lane, Tooting, westward of Lucien-road (Messrs. Nash & Lillywhite).—Consent.
- Dulwich.**—Buildings on the south side of Barry-road, Dulwich, abutting also upon Lordship-lane (Messrs. Harrington & Ley for Mr. J. Redapple).—Refused.
- Lewisham.**—A block of residential flats at No. 155, High-street, Lewisham, of bay-windows and balconies overhanging a roadway leading out of the southern side of High-street (Mr. C. A. Ceep).—Refused.
- Marylebone, East.**—Buildings upon a site abutting upon the northern side of Albert-road, eastern side of Avenue-road, and southern side of St. Edmund's-terrace, St. Marylebone (Mr. A. F. Faulkner for Mr. W. Willett).—Refused.

Stepney.—A projecting hood over the entrance to "Carr House," Holloway-street, Commercial-road. Steptoe (Messrs. Joseph & Smith) for the Council of the United Synagogue.—Refused.

Wandsworth.—A house on the north side of Hazlewell-road, Putney, to abut upon Campion-street (Mr. J. C. Radford for Mr. A. E. Pierce).—Refused.

Width of Way, Lines of Frontage, and Construction.

City.—A deviation from the plans approved for the erection of an open iron and concrete gangway across Water-street, City, so far as relates to an alteration in the position of such gangway (Messrs. Cheston & Perkin). Consent.

Width of Way and Lines of Frontage.

Lewisham.—A building upon a site abutting upon the northern side of Ewart-road and the western side of Garthorne-road, Forest Hill, with a forecourt fence at less than the prescribed distance (Mr. G. Dunsmore for Messrs. Dunsmore Brothers).—Consent.

Midle End.—The retention of a two-story addition erected at the rear of No. 32, Trodegar-square, abutting upon College-street, Mile End, with external walls at less than the prescribed distance from the centre of the roadway of College-street (Mr. J. M. Knight for the Guardians of the Hamlet of Mile End Old Town).—Consent.

Lewisham.—One-story buildings on the western side of Perry-vale, Lewisham, adjoining Forest Hill Railway Station (Messrs. F. Chambers & Son).—Refused.

Lines of Frontage and Construction.

Marylebone, West.—A one-story wooden office building on part of the forecourt of No. 498, Edgware-road, St. Marylebone (Messrs. D. C. Martin & Son).—Refused.

Conversion of Building.

Strand.—The adaptation of St. Clement Dane's Schools, Stanhope-street and Kingsway, for the purposes of a common lodging-house (Mr. O. Archer for the Salvation Army).—Consent.

The recommendations marked † are contrary to the views of the local authority.

ARCHITECTURAL SOCIETIES.

DEVON AND EXETER ARCHITECTURAL SOCIETY.—At a meeting held on the 13th inst., Mr. Chas. Cole in the chair, the hon. secretary opened a discussion on "The ownership of Drawings as Affected by Recent Cases." He reviewed these decisions, and referred to the clearly put article in the *Builder* of November 26, also quoting the report of Elyd v. McGowan, which really only dealt with one phase of the question—viz. : (a) that for plans of works partly carried out by the architect but finished without him, and which may in this case have necessitated the handing over of the plans; but such a ruling is quite on another footing when applied to (b) plans for works not carried out; (c) plans for works carried out by the architect; (d) plans for works carried out by the client without the architect's supervision. The latitude of the Surveyors' Institution and that of the R.I.B.A. having been contrasted, as well as a compliment paid to the *Builder* for the stand it is taking, an interesting discussion followed, leading up to a resolution that, as it is the custom of architects in this locality to retain the drawings, the attention of the R.I.B.A. be drawn to this important matter, and that the Board of Professional Defence be asked to take steps to obtain another pronouncement on this question.

LIVERPOOL ARCHITECTURAL SOCIETY.—A meeting of this Society was held in the Law Library, Castle-street, on the 5th inst., Mr. P. Thicknesse in the chair. Messrs. Sydney Maddock, of Frodsbam, and D. H. Richards, of Birkenhead, were elected associates. Afterwards, Mr. Maurice B. Adams, F.R.I.B.A., read a paper on "Modern Libraries." He pointed out that the value of public libraries as an adjunct to education was not yet realised in this country as was the case in America. Libraries were crippled by the limit of the penny rate, fixed when the movement was an experiment. This limit led to inefficiency and waste. On the whole, he advocated State aid for libraries as part of the education grant. Every class should be catered for. It would increase the usefulness of libraries if the Cardiff system was more generally adopted. In Cardiff they had juvenile reading-rooms and school lending libraries, and lectures and classes on the use and value of books, as well as special lectures for adults and artisans. Mr. Adams insisted

that architecturally libraries should be among the best features of a town.

MANCHESTER SOCIETY OF ARCHITECTS.—At a meeting of the Manchester Society of Architects, held in the Chartered Accountants' Hall on the 8th inst., Mr. E. T. Hall, of London, gave a lecture on "Hospital Design and Construction." Starting with the canon that architectural treatment must always be subordinated to the fundamental objects of a hospital, Mr. Hall spoke of the importance of providing the maximum of sunlight and the best possible system of ventilation. The hospitals of the XVIIIth century were, he said, often a great danger to the patients. For instance, the Hôtel Dieu in Paris contained from 700 to 1,000 patients in one ward, and the beds were made to accommodate four patients each, and often had to hold six. Some 5,000 patients were banded on a site of three acres, which allowed only 30 ft. per patient. It was not surprising to hear that the mortality in the Hôtel Dieu of the XVIIIth century was as high as 22 per cent. Mr. Hall traced the gradual evolution of hospital construction, and pointed out that our modern hospitals have an area thirty times as large, and our modern fever hospitals an area from sixty to a hundred times as large, per patient as that provided in the old Hôtel Dieu.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.—The ordinary monthly meeting of this Society was held on the 8th inst. in the lecture hall of the Literary and Philosophical Society, Leopold-street, when a lecture was given by Mr. E. M. Gibbs on "Architecture in Eastern Europe." The lecturer said it was not a critical essay he had to deliver, but only a number of views of buildings taken or purchased by him on an eighteen days' cruise in the Mediterranean, with a few odd days on shore, visiting Taormina, Constantinople, Smyrna, Ephesus, Athens, Corinth, Mycene, and Tiryns. As the antiquity of the architecture he had to illustrate was almost in reverse order to that in which the cities were visited, he commenced with Tiryns and concluded with Constantinople. Tiryns was shown by limelight to be a shapeless ruin of unwhewn stones without mortar. Mycene, the lecturer said, was of nearly equal early date, and Cyclopean. The huge stone beam to the Lion Gate was relieved of weight by the corbelling over it, and the triangular space filled with sculpture. The tomb of Agamemnon was shown, as also was a portion of the surrounding circular wall, within which are five towers, the gold and other ornaments of which, the lecturer said, filled many cases in the Athens Museum. The tomb of Queen Klytemnestra, which was shaped inside like a beehive, had all the roof built in horizontal courses of stone, and showed that the radiating joints of domes had not then been invented. It had partly fallen in consequence. The Corinth of Apostolic times was now a mere hamlet, and contained nothing much of interest except a few columns of the Temple and a bath. The modern canal across the isthmus was a great engineering work $\frac{3}{4}$ miles long, with water 100 ft. wide and 26 ft. deep. Athens was so pre-eminently beautiful and interesting that the lecturer could not refrain from devoting a large number of slides to it, but no slides could convey any idea of the beauty of the combination of blue sky, fine hills, and white marble buildings stained with age, and of the most perfect architecture. Some snapshots of architectural fragments interesting to students were also shown. Mr. Gibbs said the Stadium had recently been restored at the cost of a Greek merchant; it had a course about 100 ft. longer than Bramall-lane, and had seats in white marble on three sides raised in sixty tiers, so as to hold 50,000 people. It was formed out of a natural valley. Views of modern buildings in Athens showed how excellently the architects worked in the ancient style. The views of Ephesus were limited to a few snapshots taken during a visit which was shamefully hurried by the guides, considering its great historical interest and its immense wealth of Grecian-Roman remains. One view showed a street nearly a mile long, all of white marble, with the remains of columns down each side, and out of this street opened many public buildings, and it led up to the great theatre, which seated 24,500. The remains of the Temple of Diana are now in a great hollow and difficult of access because of water; the best of the work is to be seen in the British Museum. The excavations of the city are being rapidly proceeded with, and any traveller to the east should visit Ephesus. The ruins show in what

magnificence and beauty the old Greeks and Romans loved to dwell, and made the lecturer desire that the time should come when a rich nation like the English might in like way more fully appreciate noble architecture. Views were shown of Constantinople, and of its mosques, fountains, palaces, bazaars, and streets. The wealth and beauty of the marble and mosaic decoration of S. Sophia were equalled by its wonderful arched and domed construction, which has stood the test of earthquakes for 1367 years; it was over 900 years old when it came into possession of the Turks, and they have preserved it almost intact, with the exception of obliterating the figures of saints. It was also remarkable that the mosques built by the Turks in Constantinople so very many years afterwards were all adaptations of the general arrangement of S. Sophia. The museum contained some twenty-one sarcophagi discovered in 1887 in Siron. Two of them were illustrated, the one called the Tomb of Alexander being evidently of that period of Greek art; it was of white marble, and was sculptured on all sides. The other tomb was called The Weepers, because of the figures all around it. The marble shows traces of vivid colouring. The bazaars dated from the time of Constantine, and were very interesting. The fountains were wholly Turkish work. On the motion of Mr. J. Smith, seconded by Mr. W. J. Hale, and supported by Messrs. A. Howe and Horace Wilson, a hearty vote of thanks was accorded Mr. Gibbs for his lecture, which was illustrated by lantern slides exhibited by Mr. J. Atkinson, of University College. On the motion of Mr. E. M. Gibbs, seconded by Mr. J. Smith, and supported by the President (Mr. T. Winder), a resolution was unanimously carried expressing satisfaction, and congratulating the hon. secretary (Mr. W. C. Fenton) on his appointment as chairman of the School of Art managers.

ROYAL INSTITUTE OF ARCHITECTS OF IRELAND.

—The Annual General Meeting of the Royal Institute of the Architects of Ireland was held on the 8th inst., at Lincoln-place, Mr. William M. Mitchell, President, in the chair. The President, in the course of his address, said that the Government had treated the profession in Ireland very unfairly by appointing an English architect to design the new College of Science, and the appointment was taken to mean that the Government did not consider any Irishman qualified for the post. They need not be surprised, therefore, if public bodies, as well as private individuals, acted similarly to the Government. Referring to the proposal of the Ulster Society to reduce the scale of fees for certain buildings, he greatly feared the tendency may be to lower the commission on all buildings whatsoever to the reduced scale. He said that the recent appointment of a Board of Architectural Education in order to promote a uniform system throughout the United Kingdom, would do much for their young architects, and properly equip them for their profession. He stated that a Registration Bill for Architects would help to solve the system of education, and since their last meeting much progress had been made in that direction. The allied societies were deliberating on the subject of registration, and would shortly issue their report. The object was an excellent one, and would prevent unqualified persons from assuming the title of architect. In conclusion, the President stated they should become fully equipped by scientific study and training to adapt their methods to any problems which might confront them in the future.—The annual report was then read, in which regret was expressed that the budding trade was still in a depressed condition owing to the difficulty in raising invested money. As to the proposed reduced scale of fees by the Ulster Society, the council expressed its disapproval of any change which would go to alter the standard commission. The memorial deprecating the employment of municipal officers to carry out important works in urban districts was supported by the council, which had asked the Dublin Corporation to receive a deputation on the subject. Dealing with the appointment of an English architect for the new College of Science, the report regrets and strongly deprecates the action of the Government, which professes to have the betterment of Ireland at heart. It also regrets the increasing tendency to bring over English and Scotch architects whenever occasion offers. Mr. A. E. Murray proposed, and Mr. G. C. Ashlin seconded, the report, which was unanimously adopted. The hon. treasurer's report was also adopted. The

following council was elected for the ensuing year:—Messrs. Sir Thomas Drew, G. C. Ashlin, C. J. McCarthy, G. Sheridan, Frederick Batchelor, C. A. Owen, W. Kaye Parry, A. E. Murray, and W. H. Hill. Messrs. J. Rawson Carroll and F. G. Hicks were elected as hon. auditors.—The annual dinner of the Institute was held in the evening at the Shelbourne Hotel. Mr. William Mitchell, P.I.A.L., presided. The loyal toasts having been honoured, the President proposed the toast of "The Royal Institute of Architects of Ireland." He said that the Institute had attained quite a respectable age, having been founded in 1859. The body, he was glad to say, was progressing with encouraging rapidity, and had now reached a position and a state of prosperity to which it had never previously attained. It comprehended in its membership pretty well all the qualified architects in Ireland. The toast "Our Guests" was next given by the President, and the Dean of St. Patrick's, in responding, referred to the work of the architects of Ireland. Those who had been in Dublin felt that they owed a great debt of praise to the members of the architectural profession for the treasures with which they had enriched the city. Dr. Smyly, President of the College of Physicians, also responded, and paid a high tribute to the work of the architects in connexion with the Dublin hospitals. Mr. Chance, President Royal College of Surgeons, Mr. Laurence Waldron, M.P., Mr. Cochrane, President Civil Engineers Institution of Ireland, Mr. James Beckett, President of the Master Builders' Association, and Mr. Webb, President Architectural Association, also responded.

ENGINEERING SOCIETIES.

SOCIETY OF ENGINEERS.—The Fiftieth Annual General Meeting of the Society of Engineers was held on Monday, the 12th inst., at the offices of the Society, 17, Victoria-street, Westminster, Mr. D. B. Butler, President, in the chair. The following gentlemen were duly elected by ballot as the Council and officers for 1905, viz.:—As President, Mr. Nicholas James West; as Vice-Presidents, Messrs. Maurice Wilson, Richard St. George Moore, and Joseph William Wilson; as Ordinary Members of Council, Messrs. Joseph Bernays, George Abraham Goodwin, George Green, William Henry Holtum, Edward John Silcock, Diego Andrew Symons, John Aird, and Alexander Graham Drury; as Honorary Secretary and Treasurer, Mr. George Burt; as Honorary Auditor, Mr. Samuel Wood, F.C.A. The President announced that the following Premiums had been awarded by the Council for papers read during the past session, viz.:—The President's Gold Medal to Mr. William Edward Storey for his paper on "Condensing Machinery"; the Bessemer Premium of Books to Mr. R. G. Allanson-Winn for his paper on "Deep Sea Erosion and Foreshore Protection"; a Society's Premium of Books to Mr. A. S. E. Ackermann for his paper on "British and American Coal-cutting Machines"; and a Society's Premium of Books to Mr. Frank Latbam for his paper on "Some Recent Works of Water Supply at Penzance."

THE INSTITUTION OF CIVIL ENGINEERS.—At the Ordinary Meeting on the 13th inst., Sir Guilford L. Molesworth, K.C.I.E., President, in the chair, a paper "On the Construction of a Concrete Railway-Viaduct," by Mr. A. Wood-Hill, Assoc. M.Inst.C.E., and Mr. E. D. Pain, Stud. Inst.C.E., was read. The following is an abstract of the paper:—The viaduct in question is situated at Cannington, on the Axminster and Lyme Regis Light Railway, which now connects Lyme Regis with the Yeovil and Exeter line of the London and South-Western Railway. It consists of ten elliptical arches of 50 ft. span, its total length being 600 ft., width over spandrels 16 ft., maximum height to rail-level 92 ft., and gradient 1 in 80. It affords an example of the recent application of concrete to viaduct construction, and to arches of somewhat large span. With the exception of the concrete blocks in the vertical faces of the arches, the work throughout is mass concrete. The geological strata are greensand and blue clay. The foundations, originally designed for a pressure of 3½ tons per square foot, were enlarged to give pressures ranging from 1½ ton to 3 tons per square foot. The concrete used consisted of crushed flints and Portland cement, the crushing yielding sufficient grit to make the addition of sand unnecessary except in special cases. The concrete was hand-mixed, and for

transporting this and other materials a cable way of 1,000 ft. span was erected across the valley, the piers being built without scaffolding. The piers were carried up in rectangular lifts of diminishing size, instead of having a continuous hatter, the lifts being 6 ft. deep. The concrete was deposited in wooden boxes of this depth, which were bolted up on the ground and hoisted into position. The mode of filling and striking the boxes, of which there are eleven, is described. The work in all the piers was advanced as far as possible at the same rate. Two rows of corbels were built in the top lift of the piers, to support the arch-centring. This consisted of four-built ribs, the centre portion of which was tied by a framework, in the form of a Warren girder, supported in the middle by raking struts from the lower row of corbels. The ribs, including the lattice-work, were set in one piece, and four tie-bolts were placed in the span to assist the piers in taking the thrust. The faces of the arches were built in concrete blocks, of which two similar ones on opposite sides of the viaduct were set simultaneously by a rail attachment to the cableway; and by adjusting the chains attaching the blocks the latter were suspended at the angles required by their position in the arch. The blocks were keyed in advance of the mass concrete, in order that the adhesion of the latter to the toothing of the blocks might relieve the centres of some of the weight. Expansion joints were formed through the arches, spandrels and parapets, and are found effective in giving play for expansion and contraction, and any slight movement due to settlement. In turning the arches, the centring, although apparently light, was found to be sufficiently rigid, and the setting was facilitated by the ribs being made in one piece. The settlement of the piers was for the most part fairly even, and, being adjusted as the work proceeded, did not affect the concrete; but the settlement of the west abutment and first pier was greater than elsewhere, and crushed the crown of the first arch. Two diaphragm-walls were built in brickwork in cement in the third span, to enable it to act as an abutment, and concrete needles were built in the embankment between the first and second piers; the crushed portion of the first arch was cut out and made good in brickwork, and the parapets over this arch were completed. Particulars are given of the cost of the viaduct, and a schedule is appended of the results of tests of sample blocks made from materials used in the concrete. The authors believe this is the first instance in which piers of a similar height have been built without scaffolding, and in which the centres of a 50-ft. arch have been designed for setting in one piece.

COMPETITIONS.

MEMORIAL TO SIR HECTOR MACDONALD.—On the 7th inst. the sub-committee for this memorial met to make a final selection from three designs which had been specially set apart for consideration, and selected that under the motto "Gael," by Mr. James S. Kay, Skirving-street, Shawlands. 150 drawings and 12 models had been sent in, from which 10 were first selected for special consideration, which were afterwards reduced to three for final selection. The other two were "Kudos," by Mr. E. C. H. Maidman (Edinburgh), and "Duty," by Messrs. Macdonald & Currie (Glasgow). The monument is to be erected on the "Green Hill," Dingwall. It will be in the form of a square mediæval keep or tower in the old Scottish Baronial style of architecture. It is proposed to use the ground floor as a small museum.

WESLEYAN METHODIST HALL, WESTMINSTER.—Sir Aston Webb has issued his report on this important competition. He states that there has been a very good response to the invitation, and does not consider that the trustees will have any necessity to exercise the right they reserved to invite final designs from architects other than the original competitors; instead of doing that he would advise them to invite the authors of nine of the designs to take part in the final competition, receiving a fee of 100 guineas each on satisfying the conditions. The authors of the nine designs recommended are:—Messrs. Crouch, Butler, & Savago (Birmingham); Messrs. Lanchester & Rickards; Messrs. Cheston & Perkin; Messrs. Waddington Son & Dunkley; Mr. James S. Gibson; Mr. James A. Swan (Birmingham); Mr. E. Vincent

Harris; Mr. W. Flockhart; and Messrs. C. E. Mall and A. W. S. Cross: all of London except where otherwise stated.

Correspondence.

THE GAS EXHIBITION.

SIR,—We notice in your issue of December 10, pages 601-2, you make reference to dynamos and arc lamps exhibited on the stand of Messrs. P. Simon & Co. We would like to point out that these dynamos and arc lamps are of our manufacture, and, in addition to supplying light for the stand and showing the possibilities of gas engines driving electrical plants, they were used for supplying power to various electric motors in use on many of the stands in the exhibition.

JOHNSON & PHILLIPS.

REINFORCED CONCRETE.

SIR,—Referring to the report in your issue of the 10th inst. of the discussion on "Reinforced Concrete" at the meeting of the R.I.B.A., I see that Mr. E. Robins claims to have taken out the first patent for armoured concrete in 1869. I am afraid that he is mistaken in supposing that his patent was the first. The late principal of this firm, who was the pioneer of *in situ* granite concrete paving, patented a reinforced concrete floor on October 27, 1854, using wire ropes suspended (as sketch*) for the tensional reinforcement.

It is interesting also to note that Mr. Wilkinson took out a patent two years later for hollow tubular plaster partitions, which, except that they were ¼ in. thick, were identical with the general construction of many of the present-day partitions.

For W. B. WILKINSON & Co., LTD.,

HUBERT TODD, London Manager.

* The diagram was sent too late for reproducing.

METROPOLITAN ASYLUMS BOARD.

The usual fortnightly meeting of the Managers of the Metropolitan Asylums Board was held at the offices, Victoria Embankment, on Saturday last week.

Twining Be Asylum.—Among the correspondence received was a communication from the Local Government Board approving of the plans of the additional blocks to be erected at this asylum, at a cost estimated at 36,250l.

Belmont Asylum.—It was agreed to apply to the Local Government Board for their sanction to the Managers inviting tenders for wiring the Belmont Asylum for electric lighting purposes from six selected firms, and entering into a contract or contracts for the execution of the necessary works, without, in the first instance, advertising for sealed tenders.

Brook Hospital.—A scheme for providing additional means of access to the subways of this hospital, at a cost of some 375l., was approved.

Offices of the Board.—It was reported that the total cost of completion of this building had been 57,230l. 6s. 2d.; slightly under the amount authorised by the Local Government Board.

Emergency Works.—It was agreed (the resolution applying to all institutions) that, except in cases of emergency (which shall be forthwith reported to the Clerk to the Board), no work which shall involve alteration or repairs to any drain, gas or water pipes, boilers, machinery, electric light installation, or lighting conductor, be authorised until the same shall have been reported on by the Engineer-in-charge, and any work so authorised shall be carried out under his supervision.

The Board of Unemployed.—The Clerk read a letter from the London Unemployed Fund asking whether the Board could assist them in any way in providing work for the unemployed. The Clerk had replied that the Board possessed no land whatever that would give work to the unemployed. The letter was referred to the Works Committee. A

supplemental report by the Works Committee, submitting for acceptance a tender by Messrs. W. H. Wheeler, of Blackfriars, for the execution of certain street works at Joyce Green Hospital, produced some discussion, and a motion to refer back was lost. Several Managers considered that the work should be taken in hand by direct labour, so that some of the unemployed of London might be benefited, but ultimately the Committee's recommendation was agreed to.

The Student's Column.

ASPHALT: ITS COMPOSITION AND PROPERTIES.—II.

NATURAL ASPHALT.

HE advocates of natural asphalt contend that the "mixed bitumens" are only to be found pure in the rock which they have permeated when in a state of vapour and under enormous pressure. Dr. H. Lotz, after examining the Ragusa deposits in Sicily, states quite recently that, like other bituminous deposits described by Messrs. Malo and Delano, they are the result of the sublimation or upward percolation through fissures of gaseous or liquid hydrocarbons. The bitumen in the Sicilian and Seyssel rocks is solid and tough, whilst that contained in Val de Travers is soily; and the tendency of the latter to creep under heat and rolling contact may be corrected by a judicious blending with the former or better, by the admixture of a percentage of old with new. The "total bitumen" may be separated from the pulverised rock by dissolving it in carbon bisulphide, and its percentage composition has been found analogous to that of indiarubber having the same hydrocarbons for its ingredients.

The molecules of natural asphalt are held together, not by cohesion—which, as it existed in the carbonate of lime, has been destroyed by the interpenetration of hydrocarbon vapour—but by agglutination, the test being to heat a small piece on an iron plate, when it will fall to pieces. The unimpregnated limestone found in an asphalt mine will not crumble on being pressed.

To test its compressibility a small press with moulds or a tube with a plug and hammer may be used. Imperfect asphalts, after being subjected to a pressure of 6 tons per sq. in. in a closed space, will afterwards crumble under pressure of the fingers.

The percentage relation of "total bitumen" to limestone or sandstone, as the case may be, is shown for various types in Table I. from data furnished by Mr. Delano.

The writer has compiled the table in three sections, Nos. 1 to 7 being natural asphalts,

having a limestone basis in all cases except No. 3, where sand predominates; Nos. 8 and 9 of Bastennes bitumen, and a mixture thereof with Seyssel rock (this bitumen is now exhausted); and Nos. 10 and 11 of gas-tar and the mixture thereof with ground fireclay and chalk to make an artificial asphalt. Of the first section, No. 6 represents Forens, with a low percentage of bitumen, No. 2 with high bitumen content but abnormal in iron and sulphur, whilst Nos. 1, 4, and 5 show what are still regarded as standard materials. Each section is comparable within itself, but it is not intended that the three sections of the table should be wholly comparable with each other, because the basis of computation is necessarily different, the bitumen or gas-tar being employed always in conjunction with some inorganic base. M. Durand Clave devised a quantitative method for enabling natural bitumens to be distinguished from the products of coal-tar by a comparison of the colour which the extracts assumed under various reagents, but as this technically belongs more to the domain of the chemist, and it has also been followed by a more complete differentiation, no further details need be given.

The following analysis recently made at the laboratory of the Imperial Institute shows a fuller statement as to the nature of the bituminous content, and at the same time gives information respecting a deposit of asphalt rock in the Island of Bahrein, Persian Gulf, within the area of the Geological Survey of India.

On heating in a crucible it yielded moisture 0.59; volatile matter 17.47; fixed carbon 5.30; and ash 76.63 per cent. The amount of bitumen contained in the asphalt rock was determined by extraction, first with acetone to remove the liquid bituminous matter (called "petroleum"), and subsequently with chloroform, which dissolves out the solid bitumen (called "asphaltene"); with the following results:—

Matter soluble in acetone	Per cent. 10.47
Matter soluble in chloroform	7.20
Total bituminous matter	17.67

This comparatively high content was associated with a mixed base, in which siliceous constituents are predominant. The following is its percentage composition as shown by the ash, after driving off the carbonic acid from the limestone:—

Silica (SiO ₂)	66.24
Alumina (Al ₂ O ₃)	9.54
Ferric Oxide (Fe ₂ O ₃)	2.31
Lime (CaO)	15.78
Magnesia (MgO)	2.22
Soda and potash	3.85

TABLE I.—COMPOSITION OF ASPHALT ROCKS, ETC.

Number of Specimen	Composition of Asphalt Rocks, etc.										
	1	2	3	4	5	6	7	8	9	10	11
Place and District of Origin	Val de Travers, Switzerland	Lithman, Alsace	Maritima, Spith	Ragusa, Sicily	Seyssel, France	Forens, Department of the Alps	Chianti, Italy	Recent natural bitumen (D. of Landes)	Seyssel melted with No. 8.	Gas Tar.	Imitation Asphalt.
Water and volatile matter at 100° centigrade	0.35	3.40	0.40	0.80	0.40	0.25	0.35	0.30	0.15	0.05	0.60
Bitumen, matters soluble in bisulphide of carbon	8.70	11.90	8.80	8.85	9.10	2.25	7.75	69.35	14.05	65.70	20.65
Bitumen matter, not soluble, but combustible	—	—	—	—	—	—	—	4.50	—	33.00	18.45
Inorganic matter as below	90.95	84.70	90.80	90.35	90.50	97.50	91.90	25.85	85.80	1.25	60.33
Residue insoluble in acids	—	—	—	—	0.10	0.05	0.40	20.35	4.55	—	18.05
Alumina and peroxide of iron	0.30	1.25	4.35	0.90	0.05	0.15	0.25	2.85	0.85	—	2.65
Lime	49.50	38.90	57.10	49.10	50.50	54.95	50.45	0.70	45.00	1.25	22.20
Magnesia	0.10	0.15	3.85	0.45	0.05	0.10	0.70	0.10	0.05	—	a trace
Sand	0.60	3.05	57.40	0.60	—	—	—	—	—	—	—
Pine or combined silicate	—	—	11.35	—	—	—	—	—	—	—	—
Carbonic acid and waste	40.16	31.92	8.15	39.40	39.80	42.85	40.10	1.85	35.35	—	17.40
Sulphur	0.08	4.99	—	—	—	—	—	—	—	—	—
Iron combined with sulphur	0.21	4.44	—	—	—	—	—	—	—	—	—

The above analyses were made under the direction of M. Durand Clave, Engineer-in-Chief and Director of the Laboratory of "Ecole des Ponts et Chaussées," Paris, who makes the following notes:—
 Sample No. 1 is an almost pure limestone impregnated with bitumen. It is a true asphalt.
 Sample No. 4 is an asphalt almost absolutely pure.
 Sample No. 2 is an asphalt, but the iron pyrites, amounting to 9.43 (iron and sulphur), may give rise to oxidation and consequent disintegration after a time.
 Sample No. 3 is a siliceous rock, somewhat argillaceous and impregnated with bitumen.

To make it suitable for paving, 70 per cent. of powdered calcite or limestone should be added so as to have a finished product containing not more than 10 per cent. of bitumen, and consolidating by heat and pressure into a compact and impermeable roadway.

OBITUARY.

MR. RICHARD MAWSON.—The death of Mr. Richard Mawson, of the firm of Messrs. Mawson & Hudson, architects, of Bradford, takes our recollections back to the days of Gothic, when the firm of Lockwood & Mawson was prominent in competitions for town halls and other large buildings in the revived Gothic style. Mr. Mawson was the son of a printer in Leeds, and was taken into partnership with Mr. Lockwood at an early age, a circumstance which indicates that he was recognised as a young architect of special talent. The firm were, as is well known, the architects of the Bradford Town Hall, besides many other large and important buildings. Mr. Mawson was seventy at the time of his death.

GENERAL BUILDING NEWS.

BAPTIST CHURCH, BEVERLEY-ROAD, HULL.—The foundation-stone of this church was laid on the 7th inst. The church, which will accommodate over 1,000 persons, mostly on the ground floor, is designed in a late period of Gothic, a bold square tower being the feature at the corner of the site. The contract amount for the church, five vestries, large church parlour, cloakrooms, etc., is 5,500l. The architects are Messrs. George Baines & R. Palmer Baines, Clements-street, Strand, London, W.C.

BAPTIST CHURCH, SHIREHAMPTON, GLOUCESTERSHIRE.—Memorial-stones of a Baptist church at Shirehampton were laid on the 5th inst. The contractor's price for the building is 2,044l., and accommodation will be provided for a congregation of about 300. The chief entrance will be from Pembroke-road, the church being entered through a porch, on both sides of which will be a lobby. At the further end of the building will be vestry-rooms and other offices. The plans were designed by Mr. Benjamin Wakefield, of Bristol, and the work is being executed by Messrs. Bis & Sons, of Portishead. The church will be 50 ft. by 27 ft., and the height from floor to ridge 22 ft. The east and west walls will be panelled on the inside to the height of 4 ft. 6 ins., these panels being movable so that they may be pulled out to form sixteen classrooms. The roof will be an open timber one covered with red tiles, and the floor will be of pitch-pine wooden blocks.

BAPTIST MISSION CHURCH, BROADWATER.—The foundation-stone of this new building was laid on Wednesday, December 14. The portion at present in course of erection is the mission church, which will form eventually the schoolroom when the future church is built. The building is designed in a free treatment of late Gothic, and is faced in red brickwork. The contract is let to Messrs. P. Sandell & Sons, the amount being 463l. 15s., and the architects are Messrs. George Baines & R. Palmer Baines, London.

CHANCEL, BRIGHOUSE CHURCH.—The work of erecting the new chancel at Brighouse Parish Church is now completed. The work has been done under the superintendence of Mr. Hodgson Fowler, architect, of Durham, and it has cost over 3,000l.

METHODIST CHURCH, BELFAST.—The new Methodist church, erected at Jenynmount, Shore-road, was opened on the 3rd inst. The building is 76 ft. in length and 57 ft. in width, and in addition to it there is a lecture hall and schoolroom at the rear. The pulpit, gallery front, and pews are of pitch-pine, and the gallery front being picked out in colour, and finished on top with a mahogany capping. The heating is by hot water, the apparatus having been supplied by Messrs. Musgrave, Ltd. Mr. Harrison McCloy had charge of the plumbing. Mr. Stanley Johnson carried out the gas-fitting, also the laying of the wires for the electric lighting, under the supervision of Mr. John Woodside. Cathedral lead lights have been supplied by Messrs. Campbell Brothers. The contractor for the entire work was Mr. James Kidd, and the architect Mr. W. D. R. Taggart. The cost is estimated at 5,000l.

WESLEYAN CHAPEL, DUFFIELD, DERBYSHIRE.—The new Wesleyan chapel, which has been erected at Duffield, was opened on the 7th inst. The work has been carried out from the designs of Mr. J. Jameson Green, architect, Liverpool, by Mr. Andrew Hingley, builder, Duffield, at a cost of 3,154l.

FREE CHURCH HALL, WENWICK, LANCASHIRE.—The foundation-stone of this building was

laid a short time ago. The architect is Mr. G. T. Oakley, of Bristol.

WORKHOUSE EXTENSIONS, CHESTERFIELD.—The new workhouse infirmary and the alterations and additions which have been made to the workhouse, at a cost of over 40,000l., were open to inspection a few days ago. The new buildings consist of an infirmary, a nurses' home, porter's lodge, laundry, kitchen, boiler and engine house, workshop, mortuary, disinfectant, additions to wards, entrances, stores, administration block, and a general remodelling of the workhouse. The infirmary is parallel with, and close to, Newbold-road, in front of the old workhouse premises. It is in three connected blocks, the central building being devoted to administration purposes. There is accommodation for 204 patients. The place is illuminated by electricity, and heated throughout by hot water. The nurses' home provides accommodation for twenty nurses. The laundry is situated on the west side of the workhouse. Messrs. Rollinson & Son, Chesterfield, were the architects; Messrs. Maule & Co., Chesterfield and Nottingham, the contractors; and Mr. J. Rushton, Chesterfield, was the clerk of the works.

CO-OPERATIVE SOCIETY'S NEW PREMISES, CARLISLE.—New premises have been erected for the directors of the Carlisle South End Co-operative Society, in Botchergate. To obtain the large shop accommodation required, the architect, Mr. T. Taylor Scott, of Carlisle, adopted a central arcade scheme with a wide approach from Botchergate, which gave a total frontage of window space of about 350 ft. The front elevation has been constructed with white polished ashlar stone and dark slip granite pilasters, with iron caps. It is in the Renaissance style, freely treated, with large gables at each end, and a balustrade between same, divided by ornamental gables. The arcade is covered over by an ornamental iron roof and glass, with ventilating glazed decklights, and round the four sides on each floor has been constructed overhanging fireproof balconies, protected by ornamental railing, access to each balcony being obtained by means of a fireproof staircase. The balcony on the second floor, besides leading to all the showrooms, gives access to the large public office, strongroom, and check-room, and the private offices for the secretary, treasurer, and manager. The balcony on the third floor is mainly used for the large hall, capable of accommodating between 800 and 900 people. The platform occupies part of one side, and the roof is a large span open iron structure. A storage-room and caretakers' room occupies one end. The board-room has also been arranged on this floor, with panelled pitch-pine dado, and boarded walls and ceiling, together with committee and waiting-rooms. The boot-repairing shop, etc., with electric-driven machinery, is also on this floor, and a dining or refreshment room for the assistants. The fourth floor contains workrooms. The clerk of works was Mr. S. Jack, and the local contractors engaged were Mr. William Baty, builder; Mr. R. Nelson, carver; Mr. G. Black, joiner; Messrs. R. M. Ormerod & Son, plasterers; Mr. Thomas Sowerby, plumber; Mr. F. Hart, slater; Messrs. R. M. Hill & Sons, painters, electric light, and ventilating engineers' work; Mr. John Corbett, ironwork. The outside contractors were Messrs. Mackenzie & Moneur, Ltd., heating engineers, Edinburgh; Messrs. Bladen & Co., ironfounders, Glasgow; Messrs. Pickering & Co., Ltd., electric hoists and machinery, Stockton-on-Tees; Messrs. Merryweather & Co., fire appliances, London; Messrs. Pilkington & Co., mosaic work, Manchester; and Messrs. Maw & Co., Ltd., tile-work, Shropshire.

CONSERVATIVE CLUB, PARKSTONE.—A new Conservative club has just been opened at Parkstone. It has been erected by Messrs. A. & F. Wilson, builders, from plans prepared by Mr. E. E. Clarke, architect. On the ground floor there are an attendance hall, waiting-room, and other offices, whilst a billiard-room is in course of erection. On the first floor are a cardroom and reading-room, a luncheon and tea room, committee and club room, chess and whist room, lecture, debating, and assembly room. On the second floor are a cloakroom, bathroom, members' lavatory, and caretaker's room. There is also another billiard-room; provision has been made for lighting the building by gas and electricity. The installation of the electric light, together with erection of a 5½ h.p. gas-engine and a 60-light dynamo, are in the hands of Mr. A. W. Hine, A.M.Inst.C.E.

UNIVERSITY SETTLEMENT HALL, CARDIFF.—A new University Settlement hall has been erected at the corner of Walker-road and Spott-road, Cardiff. Mr. R. W. Schultz is the architect, and the cost has been 1,800l. The walls are built of red brick, and the roof is of red tiles.

CONSERVATIVE CLUB AT HOYLAND, YORKSHIRE.—The Countess Fitzwilliam laid the cornerstone, at Hoyland Common, on the 6th inst., of a new Conservative club. Mr. E. J. Sykes is the architect, and Mr. A. Hemingway the builder.

RIDLEY HOUSE, BETHNAL GREEN.—Ridley House, which forms an addition to the facilities for developing church work in the parish of St. James the Less, Bethnal Green, was opened by Lady Wimborne on Saturday last. The Building, of which Mr. E. Hoole is the architect, affords accommodation, on the ground floor, for a young men's club and Bible class hall, and for a medical mission and surgery; on the first floor for four club-rooms and rooms for curates, and for the University men; and on the second floor for bedrooms and cubicles for young men, with dining-room and kitchen.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—Mr. Charles Lee, formerly General Manager and Secretary to Messrs. Hobbs, Hart, & Co., Ltd., Arlington-street, Islington, has recently been appointed Managing Director of the Company.—Mr. B. G. Wilmer, who has traded under the name of Ashton & Green Iron Co. for over fifteen years and is, and will continue to be, the sole proprietor of the business, announces that, on and after January 1, 1905, the title will be changed to Wilmer & Sons.

INSTITUTE OF CERTIFIED CARPENTERS.—The annual Report of this Institute states that the number of new members elected this year has been thirty-two, as against sixteen last year. The Institute numbers 130, exclusive of Honorary Members. Among the proceedings of the past Session was the opening of a discussion by Mr. W. Middleton, on "Failures in Carpentry and Joinery," which was illustrated on the blackboard by sketches, and was continued at the succeeding meeting, a visit to the Victoria and Albert Museum, in course of erection at South Kensington; a visit to Messrs. Walker, Parkers & Co's works, Belvedere-road, S.E., on this occasion the party being conducted over by Mr. Palmer; to St. Paul's Cathedral, Sir John Riddell conducting the members over, and another visit to inspect the dome and roofs. In September a new departure was taken by the members in organising an outing, the party taking train to Egham, where an inspection was made of the old timber roof of Egham Palace.

APPOINTMENT.—Mr. Alfred Griffin, of No. 34, Coleman-street, E.C., and Blackheath, has been appointed Surveyor to the Trustees of Morden College, Blackheath, from the beginning of next year, upon the retirement of Mr. Thomas Barnes-Williams.

EDINBURGH AND LEITH BUILDING TRADES' ASSOCIATION.—The annual dinner of the Edinburgh, Leith, and District Building Employers' and Allied Trades' Association, in conjunction with the Building Trades' Exchange, took place on the 8th inst. in the Royal British Hotel, Princes-street. Councillor Neil McLeod, President of the former body, presiding over a gathering of about 150. The coupriers were Messrs. Patrick Knox, John D. Burn, and James Millar. Replying on behalf of Leith to the toast of "The Corporations of Edinburgh and Leith," Bailie Kinnaid said that, according to a statement he had received from the Burgh Surveyor, warrants had been granted during the year for buildings of a total value of 180,000l., as compared with 270,000l. in 1903, and had it not been for the new poorhouse, the total value would have been less by about one-half. The prospect of the building trade in Leith, he said, was not very bright, and, judging by the number of unlet houses, the supply seemed to be greater than the demand. In acknowledging the toast of "The Architects and Surveyors," Mr. A. Lorne Campbell said that, at the present time, they had not much prosperity to share. With the builders they were brothers in affliction, but they hoped for improvement in the course of another year. He quoted the remark of a public official in the city who had said to him in conversation that for the last forty years he had not seen such slackness in work, and that when the city was half the size he had seen double the work doing. Mr. James Millar, in replying to the toast of the evening, said that, while they were passing through a strain at the present time, they knew it could not last for ever.

DRAINAGE PLANS.—The Public Health Committee of Battersea reported on Monday having considered the circular letter from the Royal Institute of British Architects, suggesting that the London County Council by-laws respecting drainage plans should be modified. The Committee was of opinion that no alteration in the by-laws was necessary.—

The Works Committee of Hammersmith Borough Council reported on Tuesday having agreed in favour of informing the London County Council that their experience does not show that the suggested modification of the by-laws is necessary.—On Tuesday the Public Health Committee of St. Pancras Borough Council reported that they had decided that the communication from the Royal Institute of British Architects be marked "Received."

COMBINED DRAINAGE.—Lambeth Borough Council has passed the following motion:—"That the President of the Local Government Board be urged to promote remedial legislation on the subject of combined drainage in the coming Parliamentary Session."

WATER SUPPLY, TEIGNMOUTH.—At the meeting of the Teignmouth Urban District Council on the 6th inst., a report was presented by the Surveyor, Mr. C. F. Gettings, of alternative routes for the laying of pipes to bring in a supply of water from Paiguiton Urban District Council. After some discussion the further consideration of the subject was adjourned for a fortnight.

UNDERGROUND ROOMS IN ST. PANCRAS.—The Public Health Committee of the London County Council reported as follows at Tuesday's meeting of the Council:—"We have from time to time reported the progress made by the St. Pancras Metropolitan Borough Council in dealing with illegally occupied underground rooms in that borough, and are glad to state that, from a report recently issued by the Medical Officer of Health of St. Pancras, it appears that between July, 1903, and July, 1904, 538 notices were served upon the owners of underground rooms which were occupied as dwellings in contravention of the provisions of the Public Health (London) Act, 1891: 165 of these notices referred to premises in South St. Pancras, and 373 to premises in Central St. Pancras. The notices were served in eight separate groups at varying intervals, the occupants being allowed from two to four months in which to obtain other dwellings. All the notices were complied with, with the exception of two. In one of these two cases proceedings were taken, with the result that the magistrate gave the defendant one week in which to clear the room; in the other case the occupiers locked up their room and left London to go hop-picking, and have not yet returned, but in this case the landlord has promised to deal with the matter as soon as they do return. The Borough Medical Officer states that the 538 notices above referred to deal with all the known underground sleeping-rooms separately occupied which have their ceilings less than 1 ft. above the level of the adjoining street or ground."

MUNICIPAL COUNCILS AND ARCHITECTURAL WORKS.—At the meeting, on Tuesday, of the West Ham Corporation, the Works Committee reported having had under consideration a memorial from the Royal Institute of British Architects and the Architectural Societies in alliance therewith throughout the United Kingdom, urging upon county and municipal authorities:—(1) That architectural work be not placed in the hands of engineers or surveyors; (2) that where it is deemed desirable for architectural work to be carried out by county or municipal officials, such officials shall be required to have passed the qualifying examinations of the Royal Institute of British Architects; (3) that the work of an official architect be restricted to structures of secondary importance, and that all buildings of a monumental character be entrusted to independent architects, to be selected in such a way as may seem best to the local authority. The Committee was unable to recommend that any action be taken with respect to the memorial. The report was adopted.—On Tuesday, the Public Health Committee of St. Pancras Borough Council reported having decided that the memorial be merely received.

HOUSING SCHEME, MANCHESTER.—The Manchester City Council, having asked for leave to borrow 13,780l. for the purchase of land for building purposes, Major C. E. Norton, R.E., held an inquiry at the Town Hall on the 8th inst. The land to be purchased is in Cheetham Hill-road, Queen's-road, and Boyle-street. It is required for the purposes of part 3 of the Housing of the Working Classes Act, 1890. Mr. Hudson, Assistant Town Clerk, stated that the land mentioned in the application was part of a larger plot containing 7½ acres belonging to the Earl of Derby. The price was 6d. a yard at twenty-four years' purchase. Not less than 22,938 sq. yds. was to be used for housing purposes. The remainder would be set apart for a school, and the widening of Cheetham Hill-road. Mr. T. de Courcy, the City Surveyor, produced a plan of the property to be acquired. The site, he said, contained a net area of 22,938 sq. yds., and is about one mile and a third from the centre of the city. The ground is almost

level and well adapted for the purpose for which it is intended. A large number of working-class dwellings are in course of erection by private owners in the immediate neighbourhood.

THE NATIONAL REGISTRATION OF PLUMBERS.—The Committee appointed by the Conference of Health and Water Authorities, Architects, and Plumbers, held at Birmingham in October, 1900, held another meeting this week in the Guildhall, London. The Committee is composed of Health and Water Authorities and Plumbers in equal proportions, and elected on a basis of a minimum population of a quarter of a million. Mr. W. D. Caroe, Architect to the Ecclesiastical Commissioners, Warden of the Plumbers' Company, presided. Representatives attended from Birmingham, Bradford, Bristol, Glasgow, Leeds, Manchester, Newcastle, Norwich, Nottingham, and Plymouth. The Committee considered the resolution passed in the Municipal Section of the Sanitary Institute Congress, recently held at Glasgow, as to its being necessary to the effective administration of the Public Health and Water Acts that the authorities should be recommended and empowered to require the competency of plumbers employed to execute or inspect plumbers' work under the public regulations, should be certified by the Plumbers' Company under the conditions appertaining to the National Registration of Plumbers, or such other body as may be set up by statute, or be approved by the Local Government. A considerable discussion arose on the subject of the terms of the recommendation, and closed to all applicants who did not pass an examination in practical work as well as theoretical subjects. It was urged that this would be unfair to some of the older men, and, having regard to the divergent views taken by the district councils in various parts of the country on the subject, it was resolved to extend the period to December 31, 1905. The returns showed that upwards of 2,500 plumbers had been registered by the Company. Resolutions were passed recommending for general adoption apprenticeship for plumbers on the lines of the indenture settled by the London Apprenticeship Board, and further recommending that all apprenticeships should be in writing, as it was shown that the loose practice of taking lads upon verbal agreements varied greatly, and resulted in their being, in some cases, insufficiently trained, and also offered inducements to jerry builders and others to employ apprentices only partly trained. Communications were laid before the Committee from the Royal Institute of British Architects, and Societies allied to the Institute, as to the nomination of local authorities to act on the district councils. Resolutions were passed giving effect to this arrangement, and to the election, *ex officio*, of persons in virtue of their holding official positions in connexion with public health and water administration. Plumbers were appointed from Birmingham, Bristol, Glasgow, and Manchester, to act with the London Board of Examiners in settling tests of workmanship, etc. Resolutions were also passed referring questions relating to the examination of students in planning classes to local authorities and the Board of Education.

INTERNATIONAL SOCIETY OF SCULPTORS, PAINTERS, AND GRAVERS.—At the third annual general meeting of the International Society of Sculptors, Painters, and Gravers, the Vice-President, Mr. John Lavery in the chair, the Hon. Secretary, Mr. T. Stirling Lee, reported that the last exhibition had been entirely satisfactory. The number of works submitted was greater than it had hitherto been, and the financial result was such as to defray all expenses. The great loss of the Society this year has been the retirement from office of the Hon. Secretary, Professor George Sauter, whose services were greatly appreciated, and his retirement much regretted. The issues to the Society by death were:—Mr. J. Saatsa Forbes, Mr. Fred Sandys, Mr. D. Vierge, and Mr. John Galsworthy. By the death of Mr. Staats Forbes the Society had lost one of its best friends and financial supporters. It is hoped that the works of Mr. Sandys and Mr. Vierge will be adequately represented in the forthcoming exhibition. An arrangement has been come to with the Corporation of Manchester to take on the exhibition at its closing in London. The arrangements for this exhibition are most satisfactory, and appointments have been made likely to be of the greatest service to the Society, by selecting delegates aboard and in America. The following artists will act for next year:—Mr. Blanche for France; Mr. Neven Du Mont and Professor Sauter for Germany; Mr. Fragaanno for Italy; Mr. Zorn for Sweden; Mr. Claus for Belgium; Mr. Breiter for Holland; Mr. Chase for America; and Mr. Walton for

Scotland. It is ensured that in this way the Society will succeed in obtaining a more representative exhibition from each country. The Memorial Exhibition of the late President, Mr. Whistler, will take place in the New Gallery during the latter part of February and March, 1905. The following gentlemen were elected to act on the Selecting and Hanging Committee for 1906:—Messrs. H. Wilson, J. Pennell, B. Priestman, A. Neven Du Mont, C. H. Shannon, J. H. Furse, W. Strang, and Grosvenor Thomas.

BOLTON ARTS GUILD.—"FLORENCE AND THE RENAISSANCE."—In connexion with the Bolton Arts Guild, Mr. Marshall Robinson delivered on Tuesday last, at the Guild Rooms, a lecture on "Florence and the Renaissance." He said the term "The Renaissance" was usually applied to the revival of classical art in the XVth and XVIth centuries, but it applied also in a much more interesting degree to that earlier period following immediately upon the time known as the Dark Ages, when there was a general awakening in Italy, and a desire to revive the arts and civilisation of the ancient Greeks and Romans. Mr. Robinson sketched the decay of art up to the reign of Constantine, who attempted to revive it, and afterwards referred to the reign of Charlemagne in the VIIIth century and his partial success in the revival of art and civilisation. He next referred to Pisa, where the seeds of the revival were sown. Florence was next touched upon, as well as Fiesole, the ancient Etruscan city from which Florence sprang. He sketched the history of Florence up to the time of Dante in 1265, and, returning to Pisa, he illustrated the monuments—the cathedral, the baptistry, the leaning tower—and the work of Niccola Pisano. He next took his hearers to Siena, and, returning to Florence, followed the development of early art both in sculpture, architecture, and painting; through the Byzantine Giottoesque schools as regards painting, with Ghiberti, Donatello and others as regards sculpture, and Arnolfo Di Cambio, Giotto, Orcagna, Brunelleschi, etc., as regards architecture. To illustrate the various stepping-stones in the development of art, Mr. Robinson brought to his aid some 130 slides, taking the various branches of art in their chronological sequence. The lecture dealt mainly with the early revival, and it is the intention of Mr. Robinson to deal with the later development of art in a second lecture to be delivered in February.

Legal.

CASE UNDER THE LONDON BUILDING ACT, 1894.

At the North London Police Court on the 12th inst. Mr. Alfred Louis Camille was summoned before Mr. J. Dickenson, at the instance of Mr. W. G. Perkins, District Surveyor for West Hackney (a) for doing work to, in, or upon, a building without notice; (b) for failing to comply with a notice of irregularity served by the District Surveyor.

The defendant had fixed, or set up, in a stable at No. 101, Dalston-lane, Hackney, a smith's forge or furnace, having an iron chimney or flue carried up into and through the roof.

In reply to the magistrate, the defendant contended that the District Surveyor could not, as he had by the notice of irregularity, require him to substitute a brick flue for the iron pipe, as pipe flues were permitted by section 65 (3) of the Act.

The District Surveyor argued that section 65 (3) was a rule applying to close fires only, and not to a forge or furnace, and that, having regard to section 64 (4) and (12), the chimney or flue therefrom should be enclosed with brickwork. It was also pointed out that there was a large amount of woodwork both in this stable and the adjoining stables to be considered.

The defendant was fined 7s. with 2s. costs, for doing work without notice, and ordered to comply with the Surveyor's notice within twenty-one days, and pay 2s. costs on the second summons.

Mr. C. V. Young, solicitor, appeared for the District Surveyor.

ACTION BY ARCHITECT AGAINST BUILDING OWNER.

The case of Stocks v. Dean came before Mr. Justice Kennedy, in the King's Bench Division, on the 9th and 10th insts.—an action, brought by Mr. Frederick Wm. Stocks, an architect and surveyor, of Middlewich, Cheshire, against Mr. E. Houghton Dean, of Hawkehead, Lancashire, to recover 370l. for services rendered, and also for damages for alleged wrongful dismissal.

The defendant denied that there was anything due to the plaintiff, and alleged that he was justified in dismissing the plaintiff.

He also counterclaimed against the plaintiff for damages for alleged negligence, which the plaintiff denied.

Mr. Ellis Griffiths and Mr. Owen Roberts appeared for the plaintiff, and Mr. Samuel Moss for the defendant.

Mr. Ellis Griffiths, in opening the case, said the plaintiff had thirty years' experience in building and engineering work. He had been employed by the Duke of Buccleugh, and the Ecclesiastical Commissioners, had been Assistant Surveyor to the Accrington and Clitheroe Urban District Councils, and was now Surveyor to the Middlewich Council. In 1891 he was engaged by the defendant to act as his architect and surveyor for the development of an estate in Knutsford, which it was calculated would take five years, but on December 16, 1902, he was dismissed without notice. The cost of the work was estimated roughly at 40,000l., and plaintiff was to have a commission of 4 per cent. on the cost of the buildings when erected. There were three and a half years of the contract still to run, during which period he would have received 1,650l.

His lordship said he had never tried a case before in which a professional man paid by fees sued for wrongful dismissal. It was rather a strong thing to say that the defendant had tied himself to giving the plaintiff all the work for the five years, and if it was a question of employment with reasonable notice he could not see how he was going to deal with the matter.

Mr. Ellis Griffiths submitted that the mode of payment made no difference. The character of the occupation must be looked at, and, in his opinion, the plaintiff was entitled to the same notice as if he were receiving a salary.

His lordship: You are putting yourself in the position of a servant, and I do not think a professional man would care for that.

Mr. Moss admitted that, if his client was not justified in dismissing the plaintiff, the latter would be entitled to some damages.

Mr. Ellis Griffiths said the defendant alleged three justifications for the dismissal. He said that the cost of the buildings exceeded the estimate by 10 per cent., that there had been a lack of skill and want of care on the plaintiff's part, and that he had been guilty of improper conduct. The last two were very serious charges to make against a professional man, but he would be able to dispose effectively of them.

The plaintiff was called and corroborated his counsel's opening statement.

In cross-examination, he denied that any of the work charged for was done after the date of his dismissal. The cost of some of the buildings exceeded the estimate by 10 per cent., which was a very moderate excess. He admitted that in one case there was an excess of 30 per cent., but that was due to the work having been altered in various details. He knew that two of the drains had been taken up, but that was not due to any fault in the original laying of them. A contractor had offered him 10l. to get him a contract, but he refused the money, and told the defendant of the matter. Subsequently the contractor sued him for 26l., and plaintiff, acting on the advice of his solicitor, counterclaimed for the 10l.

In re-examination, plaintiff stated that about six weeks before his dismissal defendant told him he greatly appreciated his work, and, as he had been put to a great deal of trouble, he made him a present of 100l.

Mr. John Holden, F.R.I.B.A., F.S.I., and Mr. J. T. Ashton, an architect and surveyor, gave evidence that, in their opinion, plaintiff's charges were reasonable.

This being the plaintiff's case, Mr. Leason, an architect and surveyor, of Manchester, gave evidence on behalf of the defendant that he found some of the drains not jointed with cement.

Mr. R. B. Newhall, a plumber and sanitary engineer at Knutsford, examined, said that in November, 1903, he was called in to examine the drainage of one of the defendant's houses in St. Peter's-avenue. It took about thirty hours to find the man-holes—they were buried, which was a most unusual thing. After he found the man-holes, he tested the drains. He applied the smoke test, and found that the drains were very wrong. He found that most of the drains had mortar joints—93 per cent. of mortar and 10 per cent. of cement.

In answer to his lordship, Mr. Moss said that the contract specified cement joints.

Examination continued. If the architect had applied the water test or the smoke test the defect would have been easily discovered.

At the conclusion of the evidence and the addresses of counsel, his lordship, in giving judgment, said the plaintiff was a gentleman who had entered into a contract, contained in

the correspondence, with the defendant who had property which he wished to develop as a building estate. The defendant also, apparently, employed the plaintiff in other business matters which, though they appeared on the pleadings, were now removed from his consideration, and would be dealt with elsewhere. By the terms of the contract, as ultimately agreed, the plaintiff was to receive from the defendant 4 per cent. upon the cost of the actual works executed. The first question he had to decide was, whether the plaintiff was rightly dismissed, as he was by the defendant in December, 1902. When he said "rightly dismissed," he did not mean at all, and it must not be taken that he had implied, that, so far as competence was concerned, plaintiff could not, if he gave his mind to the matter, have been competent. All he meant by that was to ask himself whether the plaintiff had performed his duties in such a way that the employer could say that they could not go on any longer together. It was clear that the defendant would be justified in dismissing the plaintiff if, in addition to his not doing his work with care and skill, he had acted dishonestly in his building relations with the contractors. That was a point which had given him great anxiety, because one realised what such a charge was against a professional man—viz. that he had betrayed the interest of his employer, and had acted dishonestly. The alleged dishonesty was not known at the time of the plaintiff's dismissal, therefore it was not insisted upon as a ground for it. But it was clear law that, to justify a dismissal, a good defence could be raised upon misconduct, although it did not form the actual ground for dismissal. The question was, had the plaintiff acted dishonestly with regard to the transactions referred to in the evidence. His lordship, having referred to the evidence on this part of the case, said that, in his opinion, the charge was distinctly not made out. He thought, on the facts, he ought to come to the conclusion that, although the plaintiff was offered the 10%, he did not intend to take it, and he thought the plaintiff had acted as a gentleman in telling his employer, as he did, and he was perfectly willing to believe that the plaintiff had acted honourably in so doing. The awkward part of it was the thing which the plaintiff brought upon himself, and that was when an action was brought against him for money which it was said he owed, a counterclaim was set up, and amongst other things in the counterclaim was a claim for the 10%. His lordship did not know where the blame was, but sometimes a man did not tell the whole facts to his solicitor, and probably the whole thing was a mistake. He thought that the balance of evidence showed that the plaintiff had acted honourably and as a professional man should act. Balancing the whole of the evidence together he would only say this, that it was not proved to him that anything dishonest had been done by the plaintiff. Although he thought there had been unbusinesslike transactions, he did not think he ought, in a case such as the present, to form an opinion hostile to the honesty of another man without stronger evidence than he had then before him. Then came the question of conduct on which the plaintiff was dismissed by the defendant—viz. that the plaintiff had gone so badly wrong that defendant could not really give him anything more to do. Although the defendant might have made alterations as the work went on, he thought the work cost considerably more than what the defendant intended to spend. Of course some margin must be allowed, because building owners would change their minds; but there was a serious blunder made in one case which had made a difference of 150% over and above the contract price. There was no doubt a considerable increase in the cost of the work over the estimates, which would, of itself, not have justified the defendant in putting an end to the contract; but he thought, with regard to one matter, a case had been made out, that there had been a want of care and skill on the part of the plaintiff. He thought the matter of the drains had been badly neglected. When the drains were opened up it was found that there was practically no cement in the joints, and he thought that no architect, using reasonable care to his employer, ought to have passed them. The jointing in cement was actually specified, and it had been omitted. He could not doubt Mr. Newhall's evidence on that point. He thought the state of these drains, which had cost the employer 23% to set right, was a thing for which the plaintiff was blamable. Then there was a complaint about two cellars, which it was said were damp. That was really only a comparatively minor matter, but it had cost the defendant about 31% 10s. to put right. Again, there was a

question as to a wall which was carried over a drain in such a way that, unfortunately, the wall had subsided for a certain length. The plaintiff said that was largely due to the alteration of the plans by the local authority. He was loath to say that there was anything serious in his want of care with regard to that. That stood on a different basis to the mischief caused by the bad drains and to the bad cellars of the house. He held, therefore, on those grounds that the defendant was justified in dismissing the plaintiff. His lordship, having gone at some length into the figures, entered judgment for the plaintiff on the claim for 118% 4s. 7d., and for the defendant on the counterclaim for 35% 13s. 5d., the plaintiff and the defendant to have the costs of the issues on which they had individually succeeded.

ARCHITECT'S JURISDICTION UNDER A BUILDING CONTRACT—IMPORTANT QUESTION OF CONSTRUCTION.

THE case of *Robins v. Goddard* came before the Court of Appeal, composed of the Master of the Rolls and Lords Justices Stirling and Mathew, on the 15th and 14th insts., on defendant's appeal from a judgment of Mr. Justice Farwell, sitting as an additional judge of the King's Bench Division.

The action was brought by the plaintiff, Mr. A. W. Robins, a builder, of Wanstead, against the defendant, Mr. T. F. Goddard, of Croxley Green, Rickmansworth, for a sum of money alleged to be due upon the certificates of the defendant's architect pursuant to a building contract. Defendant denied liability, and he alleged that the amounts which purported to be allowed by the certificates for work and materials were not in accordance with the provisions of the contract, and were unreasonable and excessive, and that some of the work and materials were not in accordance with the contract or as specified, but were defective, with the result that he would have to incur great expense in re-executing much of the work and in the purchase of proper materials. He accordingly counter-claimed for damages for the plaintiff's alleged breach of contract. Mr. Justice Farwell gave judgment for the plaintiff for the amount claimed, and held that there was no case on the counter-claim. The defendant now appealed.

Mr. C. A. Russell, K.C., and Mr. C. B. Marriott appeared for the appellant, and Mr. Duke, K.C., and Mr. Beddall for the respondent.

Mr. Russell, in opening the case, said several actions had been consolidated, which were brought by the plaintiff upon certificates of an architect under a building contract to which a defence and counter-claim were pleaded by the defendant, the building-owner, alleging defects in the work and such like matters. Upon the case coming on for trial before the learned judge, he decided that the certificates were absolutely conclusive, and he gave judgment for the plaintiff, the builder, upon the certificates, and held that the defendant was not entitled to go into his counter-claim at all. The question ultimately came to be one as to the construction of a few clauses in the building contract. The contract was dated October 15, 1902, and it was in the form which was issued under the sanction of the Royal Institute of British Architects. He thought he should be able to show their lordships that the scheme of that form of contract was far from being what the learned judge had held it was, and really was just the opposite. The work was begun by the builder early in 1903. It was apparent from the first that the defendant was dissatisfied with the plaintiff's work, and in February, 1903, his dissatisfaction had gone so far that he wrote to the architect asking him not to give any further sums to the plaintiff. The architect, in spite of that, issued the first set of certificates, which formed the subject-matter of the action. In May, 1903, the defendant formally served the architect with notice requesting him not to issue any further certificates. Their lordships would see, when they looked at the contract, that the effect of the architect not issuing certificates would have been to leave to the arbitrator appointed under the contract the question of what was due to the builder, and whether the certificates had been properly withheld. Notwithstanding that notice, however, the architect went on issuing certificates. He issued a further certificate on May 25 for 300% odd, and his final certificate in July for 1,055% odd. The first action was commenced on May 12 on the three certificates, and then the plaintiff applied for summary judgment under Order XIV. The defendant took out a cross-application that the whole matter should be referred under the clause of the contract, but the master took the view that the proper order to make was to give the defendant leave to defend, and subsequently, the other actions being commenced, they were all consolidated.

The matter ultimately came before the Court of Appeal on the defendant's appeal from the order restraining the reference, and that appeal was dismissed. The next step was the trial of the claim and counter-claim before Mr. Justice Farwell. The learned counsel then referred to the material clauses in the building contract. He said the first clause he wished to refer to was No. 30, which provided that the contractor should be entitled under the certificates to be issued by the architect to the contractor within fourteen days of the date of each certificate, to payment by the employer from time to time by instalments when, in the opinion of the architect, work to the value of 100% (or less at the reasonable discretion of the architect) had been executed in accordance with the contract, at the rate of 80 per cent. of the value of work so executed in the building, until the balance retained in hand amounted to 200%, after which time the instalments should be up to the full value of the work subsequently executed. The contractor should be entitled, under the certificate issued by the architect, to receive payment of 100%, being part of the sum of 200%, when the works were practically completed, and in like manner to payment of the balance within a further period of two months, or as soon after the expiration of two months, as the works should have been finally completed, and all defects made good according to the true intent and meaning thereof, whichever should last happen. It also provided that the architect should issue his certificates in accordance with the clause, and that no certificate of his should be considered conclusive evidence as to the sufficiency of any work or materials to which it related, nor should it relieve the contractor from his liability to make good all defects as provided by the agreement. Mr. Russell said the defendant's counter-claim, which the learned judge held was not maintainable, alleged insufficiency of work and materials to which the certificates related. In respect to that provision, his lordship had held the certificates were absolutely binding on the defendant. The arbitration clause No. 32 ran: "Provided always that, in case any dispute or difference shall arise between the employer or the architect on his behalf and the contractor, either during the progress of the works or after the determination, abandonment, or breach of the contract, as to the construction of the contract, or as to any matter or thing arising thereunder (except as to the matters left to the sole discretion of the architect under clauses 4, 9, 16, and 19, and the exercise by him under clause 18 of the right to have any work opened up), or as to the withholding by the architect of any certificate to which the contractor may claim to be entitled, then either party shall forthwith give to the other notice of such dispute or difference, and such dispute or difference shall be and is hereby referred to the arbitration and final decision of" (certain named persons). "Such reference, except on the question of certificate, shall not be opened until after the completion of the alleged completion of the works, unless with the written consent of the employer or architect and the contractor. The arbitrator shall have power to open up, review, and revise any certificate, opinion, decision, requisition, or notice, save in regard to the said matters expressly excepted above, and to determine all matters in dispute which shall be submitted to him, and of which notice shall have been given as aforesaid in the same manner as if no such certificate, opinion, decision, requisition, or notice had been given." The rest of that clause dealt with the giving to the arbitrator full power as to the costs. Clauses 16 and 17 of the contract were important. Clause 16 ran: "The architect shall, during the progress of the works, have power to order in writing from time to time the removal from the works within such reasonable time or times as may be specified in the order of any materials which, in the opinion of the architect, are not in accordance with the specification or the instructions of the architect, the substitution of proper materials, and the removal and proper re-execution of any work executed with materials or workmanship not in accordance with the drawings and specification or instructions, and the contractor shall forthwith carry out such order at his own cost. In case of default on the part of the contractor to carry out such order, the employer shall have power to employ and pay other persons to carry out the same; and all expenses consequent thereon or incidental thereto shall be borne by the contractor, and shall be recoverable from him by the employer, or may be deducted by the employer from any monies due or that may become due to the contractor." Clause 17 was as follows: "Any defects, shrinkage, or other faults which may appear within twelve months from the completion of the works, arising, in the opinion of the architect, from materials or

workmanship not in accordance with the drawings and specification or the instructions of the architect, or any damage to pointing by frost appearing within the like period shall, upon the directions in writing of the architect, and within such reasonable time as shall be specified therein, be amended and made good by the contractor at his own cost, unless the architect shall decide that he ought to be paid for the same; and, in case of default, the employer may employ and pay other persons to amend and make good such defects, shrinkage, or other faults or damage, and all expenses consequent thereon or incidental thereto shall be borne by the contractor, and shall be recoverable from him by the employer, or may be deducted by the employer from any moneys due or that may become due to the contractor." By clause 13 the contractor had, at the request of the architect, within such time as the architect should specify to open for inspection any work covered up, and, on his refusal or neglecting to comply with such request, the architect could demand other workmen to open it up. The learned counsel in the effect of the learned judge's judgment was conclusive in favour of the contractor unless the architect himself, under clause 17 of the contract, expressed an opinion unfavourable to the contractor. It might be that the architect here, having regard to what he had done, was not personally satisfied with the contractor's work. That would be a most important matter to be tried when the counter-claim was tried, viz., whether the work was or was not satisfactory. But the fact that the architect was not dissatisfied was not conclusive on the employer that the work was satisfactory. There was no provision in the contract that the employer should not complain unless the architect was of opinion that the work was not satisfactory. He submitted that the questions raised by the defence and counter-claim as to the amount of the certificates and the sufficiency of the work and the materials used should be considered. An arbitrator could clearly have dealt with those questions, and have determined the matters in dispute as though no certificates were given. The question he would have asked himself would have been the amount for which the certificates ought to have been given. The general principle had been laid down again and again that where an architect's decision on such a matter as payment was not final against one party, it was not final against the other. Here the withholding of the certificate was not final against the contractor.

The Master of the Rolls said that it looked to him as though the learned judge had construed the contract without reference to the arbitration clause at all, and that the arbitration clause did not apply. He asked if the counter-claim was limited to materials, or particularised.

Mr. Russell replied that defendant complained about the pointing, as to defects in the drains, defects in the brickwork, and plastering, and so on. The particulars as to the complaints extended to several pages. In some cases the complaints were as to workmanship, and in others as to materials. The defendant also claimed damages against the plaintiff for delay in completing the work, and it was difficult to see how a claim for damages for delay could be shut out in the way it had been. He contended that the decision of Mr. Justice Farwell should be reversed.

Mr. Marriott, having followed on the same side,

Mr. Duke, on behalf of the respondent, said the right of appeal under the contract did not arise until after the completion, or alleged completion, of the works. That provision in the arbitration clause was the reason why the attempt to refer the interim certificates failed before the Master.

The Master of the Rolls: Was that action brought before the completion of the contract?

Mr. Duke replied in the affirmative. There were three consolidated actions tried before the learned judge, first for payments outstanding on the three certificates, the second was for the whole amount of one certificate, and the third was for the full amount of the final certificate. The final certificate was dated July 24, 1903. On August 11, the plaintiff gave notice under the arbitration clause. On August 13 there was a preliminary meeting before the arbitrator which the defendant did not attend. On September 1 the defendant issued a summons to restrain the plaintiff from proceeding with the arbitration, and upon that application an order was made by Mr. Justice Walton restraining the plaintiff from proceeding to arbitration. It did not lie in the defendant's mouth to say now he was prevented from taking that proceeding. To succeed in that Court defendant must show he could disregard the contract,

and that he had a resulting cause of action at common law. The question was whether the terms of this contract were to be set aside by the building owner, and he was to be left at large to pursue the remedies he had at common law. He (counsel) did not assert that the architect's certificate was an award, but he did say that, by the contract, his certificate was final unless it was appealed against, and it had not been appealed against. Lord Justice Stirling: The burden is upon you to show that the jurisdiction of the Court is excluded.

Mr. Duke agreed. He said that, when the work was nearly completed, the defendant undoubtedly gave the architect notice not to proceed with the work under the contract. The architect thereupon replied, "dismiss me," but the defendant declined to dismiss him and said he would retain him as architect but forbade him to exercise his functions.

The Master of the Rolls: You suggest that was a breach of contract on the part of the building owner?

Mr. Duke: Yes; I ask your lordships to hear in mind the dilemma in which the builder was placed. The view I ask your lordships to take is that these elaborate provisions for conferring power upon the architect are intended to have effect, and that it cannot be said that this is an open building contract for work and labour which leaves the builder in the same position as though the builder were only to supply materials. Our view was that the interim certificates were to be paid within fourteen days. What happened with regard to the final certificate was that, when notice was given to the building owner that there were disputes, and that we desired a reference to the arbitrator named in the clause and we got an appointment before him, the building owner took proceedings to stop his arbitrating and brought his counter-claim, not only against the final certificates, but also against the interim certificates. I venture to submit on those facts that it is not fair that the builder should be deprived of the right for which he had contracted.

The Master of the Rolls asked if the parties could not agree on some gentleman to try the case.

Mr. Duke said that he was willing that the President of the Institute should name an arbitrator. This protracted litigation was ruinous to the plaintiff.

Mr. Russell said that defendant would prefer an official referee.

After some further discussion, it was arranged that the learned counsel on both sides should endeavour to come to an agreement on some special referee to whom the case could be referred.

In giving judgment, the Master of the Rolls said he thought the case was really unarguable. The point was whether the certificate of the architect was conclusive in the circumstances. The learned judge, for some reason, had ignored the arbitration clause in the contract, and, ignoring it, he thought the construction of the contract was clear. He (the Master of the Rolls) could understand, if clause 32 were not in the contract, that it might be contended that the certificate of the architect was final. The effect of that clause was to cut away the ground from beneath the plaintiff's contention that the defendant was debarred by the architect's certificate from setting up that bad workmanship or materials had been introduced into the building. The matter was to be dealt with by the arbitrator as if no certificate had been given. The common law jurisdiction of the Court remained, and the counter-claim was maintainable. But for the fact that Mr. Justice Farwell had ignored the existence of the arbitration clause he must have come to the same conclusion, as he (the Master of the Rolls) had. He thought the appeal must be allowed.

The Lords Justices concurred.

The costs of the appeal were made the defendant's in any event, the costs of the action and counter-claim being reserved until the result of the inquiry was known.

ACTON ANCIENT LIGHT DISPUTE.

The case of *Kine v. Jolly* came before the Court of Appeal, composed of Lords Justices Vaughan Williams, Romer, and Cozens-Hardy, on the 8th, 9th, 13th, 14th, and 15th insts. on the defendant's appeal from a judgment of Mr. Justice Kekewich in the Chancery Division.

(The case was reported in the issues of *The Builder* of July 23 and 30 and August 6, 1904.)

This was an action by Mrs. Sarah Kine, the owner of a freehold house and premises, known as "Woodthorpe," Acton-road, Acton, against the defendant, Dr. Jolly, the owner of neigh-

bouring premises, for a mandatory injunction, and alternatively for damages, in respect of the alleged obstruction of the ancient lights of the plaintiff, and also for trespass. From the amended statement of claim, it appeared that the ground floor of the plaintiff's premises had on the west side two windows, lighting respectively the drawing-room and a smaller sitting-room, and a door with glass panels and a window or fanlight over it, lighting the entrance-hall. The plaintiff alleged that, in spite of remonstrances made on her behalf, the defendant had erected and maintained a high building near to the said window, glazed panels, and fanlight, and had thereby materially obstructed the light from entering into her house, and thus interfered with her in the use and enjoyment of the said land and dwelling-house. The plaintiff also alleged that the defendant's building projected over and overhung her land, and that the defendant, by erecting and maintaining his said building, trespassed on her land; the defence was generally a denial of the allegations in the statement of claim. A great deal of expert evidence was given at the trial, and in the result Mr. Justice Kekewich held that, although there was some obstruction by the defendant's building with the light of the plaintiff's drawing-room, it still remained a well-lighted room. He therefore, in accordance with the rule laid down by the House of Lords in the case of the *Horne and Colonial Stores v. Colls*, could not deem the obstruction of the light to that room actionable, and he decided that, taking that room alone, the plaintiff had no cause of action. He, however, found that the obstruction by the defendant's building to the plaintiff's morning-room was substantial, and such as to constitute an actionable nuisance within the meaning of the authorities on the subject. His lordship also considered that there was an obstruction to the light of the plaintiff's hall, and he made a mandatory order on the defendant to pull down so much of his house as caused a nuisance to the plaintiff by the obstruction of the light to the windows of the morning-room and the hall, as the same existed previous to the erection of the defendant's house, and he directed the defendant to pay the costs of the trial. Hence the present appeal.

Mr. Hughes, K.C., and Mr. Vernon appeared for the appellants, and Mr. P. O. Lawrence, K.C., and Mr. Cann for the respondent.

Mr. Hughes, in opening the case, said their lordships would probably remember something about it, as it came before that court last sittings. Mr. Justice Kekewich had granted a mandatory injunction in the case before the decision of the House of Lords in the case of the *Horne and Colonial Stores v. Colls*. When the appeal came before their lordships from Mr. Justice Kekewich's decision, Mr. Lawrence, for the plaintiff, agreed he could not support the judgment, and admitted that the learned judge had misdirected himself. Mr. Lawrence agreed that the judgment could not stand as it was, and consented to the order being discharged and to the case being sent back to Mr. Justice Kekewich for a new trial. Their lordships accordingly sent the case back to Mr. Justice Kekewich to be retried, on the ground that they did not think that either the learned judge or the witnesses had directed their minds to the real issue to be tried. The matter had accordingly been before Mr. Justice Kekewich again, and, after hearing the evidence, his lordship adhered to the view he took before, and granted for the second time a mandatory injunction. The defendant now appealed from that decision. He (counsel) said, in the first place, there was no cause of action at all for an injunction or for damages, and, secondly, that, even though the plaintiff might be entitled to damages, there was certainly no case for a mandatory injunction. The short facts were these: The plaintiff, a widow lady, lived with her daughter and son-in-law, and she owned a freehold house in Acton-road, Acton, and there was no doubt that her lights were ancient. The house had been built something over twenty years upon a plot which formed part of a building estate, where it was always contemplated building on the adjoining plots—one house to each plot. The defendant's plot was about 90 ft. wide. The defendant began to build about the latter part of 1902. His walls were almost completely up about February of 1903, and the plaintiff and the members of her family said that they felt the inconvenience, but they waited until April, 1903, when the walls were completely finished, before doing anything. It was said, with regard to that, that there had been an interview between someone representing the plaintiff and the defendant's architect, when something was said about the light, and that then the defendant's architect said he would take

care that plaintiff's light would not be injured. The architect completed the building, and he, at least, was still of opinion that the plaintiff's lights were not injured. Mr. Justice Kekewich took the view that the plaintiff was entitled to wait until the defendant's house was up to see if there was any injury done before coming to the Court. He (counsel) thought it was rather a novel proposition that a person could wait and see if he was injured before taking action for a mandatory injunction.

Lord Justice Vaughan Williams: Your case is that the plaintiff has lost her rights by believing what you said?

Mr. Hughes said the learned judge had found no actionable injury at all as regarded the light to the plaintiff's drawing-room. The main complaint was as to the light of the morning-room at the back—the north room in the plaintiff's house, which had one window looking towards the north and one towards the west, where the defendant's house was. Really, the only ground on which the learned judge had decided in favour of the plaintiff was in consequence of the injury done to the western window of the morning-room. That was a small room, some 13 ft. square, having two French windows, one looking north and the other west. The light was entirely unobstructed from the north-west, and really the obstruction was of a very slight character. The room was now admittedly well lighted. The witnesses admitted that it was, and the learned judge found that it was. As he (counsel) understood the decision of the House of Lords in the Colls case, it was a complete answer to the plaintiff's action. The plaintiff's morning-room had a much better light than such rooms usually had.

Lord Justice Vaughan Williams: Is it quite right to say that the House of Lords laid that rule down irrespective of the locality of the house?

Mr. Hughes: Not entirely, my lord. You, of course, apply different considerations to houses in town and to houses in the suburbs.

Lord Justice Vaughan Williams: Does the plaintiff say that she lives in town?

Mr. Hughes: No; in Acton.

Lord Justice Vaughan Williams: Well, I take it that Acton is in the country.

Mr. Hughes, continuing, said that the House of Lords had certainly laid down that, if a person had sufficient light for ordinary purposes, he had no ground for complaint. Here it was important to remember that the defendant's building plots fronting a suburban road, and everyone must have known it was intended to build houses in the road fronting one another. It was important to consider whether you could, in such a position, expect to have your light not interfered with.

Lord Justice Vaughan Williams: You say you have left to this lady quite as much light as she can expect?

Mr. Hughes: Yes; and all she can expect for ordinary purposes. I would go this length and say that, even as the law was understood before the decision in the Colls case, there was no substantial interference with the plaintiff's light at all. The learned judge found at the first trial, in case he was wrong as regards the mandatory injunction, that the damages would be 100*l.* for the morning-room and 50*l.* for the drawing-room. At the second trial he thought the damage to the morning-room alone was 400*l.* The whole house was bought for about 1,600*l.*

Lord Justice Vaughan Williams: There are people who would say they would not live in a dark house if they were paid to do so.

Lord Justice Romer: I can understand it being said that the plaintiff's house would be considerably more valuable if it should have no other house near it. The plaintiff must, however, admit that people were entitled to build so long as they did not interfere with the 45 degrees, to say the least of it. Therefore the damage can only be for the excess—damages for the wrong-doing.

Mr. Hughes agreed. He said the effect of the decision of the House of Lords in the Colls case was that the plaintiffs in that case, the Home and Colonial Stores, had no right to complain when, after the defendant's building had been erected, they had as much light as other people had in Worship-street.

Lord Justice Vaughan Williams: That is it exactly.

Mr. Hughes then read the judgment of Mr. Justice Kekewich, and referred at some length to the evidence given in the Court below.

After some further argument, Lord Justice Vaughan Williams, addressing the learned counsel, said that, as at present advised, the Court agreed in his contention that this was not a case for a mandatory order, and it would perhaps be convenient that Mr. Lawrence should be heard at once on the subject. Whether it was convenient to do so or not at that stage must depend more or less on the argument Mr. Hughes meant to address to the Court on the question of damages, and the

quantum of damages. The difficulty his lordship felt was this. If he had had to deal with the case himself he did not know how far he should have agreed, or how far he should have refused, on the decision of Mr. Justice Kekewich about the light to the morning-room. He was inclined to think that, notwithstanding the decision in the Colls case, he should have been more against the defendant as to the obstruction to the light to the drawing-room.

Mr. Hughes replied that, with respect, he thought it was impossible to say that the drawing-room had been injured.

Lord Justice Cozens-Hardy said his opinion was that, if the defendant's appeal had come on before the decision of the House of Lords in the Colls case was given, it would not have been a very hopeful one.

Mr. Hughes said that probably that would be so. If you could regard the west window of the drawing-room alone, it was probably more affected than the morning-room, because the obstruction was more immediately opposite to it. The learned judge had found that the morning-room was not originally well lighted before, and was even now well lighted. That came exactly within the ruling of the House of Lords in the Colls case. The House of Lords said, in effect, that what you had to look at was not what you took away, but the quantity of light left. Lord Davey said that the use of light for a special purpose did not give one a higher right than he would otherwise have had.

Lord Justice Vaughan Williams: Is there any authority before that for such a proposition?

Mr. Hughes: I do not think that had been much considered before that. But that does not come in question here, because there was no extraordinary amount of light required.

Lord Justice Vaughan Williams: But there is a question of a house in which the occupier may expect a reasonable amount of light, having regard to the fact that she lives in the open suburbs and not in the close town.

Mr. Hughes: I submit she has still got that. The only special user suggested by my learned friend, and adopted by the learned judge, was that this morning-room had very special value as a temple consecrated to the mental affections. It was really the least cheerful room in the house, and the smallest sitting-room, and it is very difficult to believe that it is of such immense value. The plaintiff's witnesses did not really dispute that the morning-room was still a well-lighted room. For these reasons I submit the judgment is erroneous, even on the findings of the learned judge, and should be discharged.

Mr. Lawrence, on behalf of the respondent, supported the judgment of Mr. Justice Kekewich. He said the learned judge had most carefully considered the evidence given on both sides, and before arriving at the conclusion he had done, had reserved his judgment. What his learned friend Mr. Hughes did, was to invite their lordships to reverse Mr. Justice Kekewich's decision on a pure question of fact. He submitted that the learned judge had not misdirected himself, and that this Court would shrink from reversing his decision on a pure question of fact.

Lord Justice Romer: Supposing we come to the conclusion that no mandatory injunction; then the judgment of Mr. Justice Kekewich must be attacked.

Mr. Lawrence replied that the plaintiff had said all along that she wanted a mandatory injunction. He submitted that the ruling of the House of Lords in the Colls case was meant to apply to the obstruction of light to business premises in the City or in towns.

There were cases which had gone to the House of Lords where it had been held that if the owner of the owner of a dwelling-house was materially disturbed by the obstruction of light, that constituted a nuisance. The first question in the present case was, aye or no, was there a nuisance established? He thought the Courts would have to draw a distinction between a nuisance to business premises and a nuisance to dwelling-houses. In the case of business premises the Court had to find out whether the nuisance was such as would prevent the plaintiff carrying on the business as beneficially as he had hitherto done. In the case of a dwelling-house the question for the Court to determine was, whether the occupants of the house had been interfered with by what had been done, and whether the building was in a sensible degree less fit for the purpose of occupation. The test was not as his learned friend had put it, whether there was sufficient light left. In the case of a dwelling-house it was no defence to say that the plaintiff had as much light as other people had.

After some further arguments, the learned counsel submitted that the question which the

Court had to decide was not how much light had been left to the plaintiff. The Court had not got to find out whether there was a standard of light to make a house comfortable. Supposing he (counsel) had a nice light library in a house in the suburbs, why should he be told, if some of his light was taken away, that it was not a nuisance because somebody else in another suburb had not got such a light room.

During the course of the learned counsel's address, a suggestion came from their lordships that the parties should endeavour to come to settlement of the whole litigation. They said that the case was one of great difficulty.

Mr. Lawrence replied that, if the Court thought that the plaintiff's claim ought to be reduced to a claim for damages, and that the mandatory injunction should be discharged, he would agree to that course, and leave it to their lordships to say what the damages should be. That offer, of course, was given on the understanding that the whole of this litigation was permanently ended, and that the defendant should pay all the costs of the two trials and of the two appeals. He also made an alternative offer that, instead of damages, the defendant should alter his house by taking off 18 in. from the top of the gutter-board, that was to say, that the roof was to be sloped down, and the two chimneys removed. He was informed that the chimneys could be sloped up so as to come more into the middle of the house, and not be on the outside wall.

It was arranged that the defendant should have until the next morning to consult his counsel on this offer.

On Thursday Mr. Hughes stated that the defendant had considered the proposal made by his learned friend Mr. Lawrence, and he had come to the conclusion that he could not accept his offer.

Their Lordships intimated that, as that was so, the arguments must proceed.

Mr. Cann, following Mr. Lawrence, on behalf of the respondent, submitted that his client was entitled to a mandatory injunction. He argued that damages were not an adequate remedy in this case.

Mr. Hughes then replied on behalf of the appellant. The learned counsel, during the course of his address, apologised for taking up so much of their lordships' time, but he said the case had now become a most important one.

Mr. Hughes had not concluded his reply when we went to press.

PATENTS OF THE WEEK.

APPLICATIONS PUBLISHED.*

25,430 of 1903.—W. WRIGHT: *Water-Closets, Commodes, Bed-pans, and the like.*

Water-closets, earth-closets, urinals, commodes, bed-pans, and like utensils or appliances which consist in the employment of a foul air exhaust pipe or shaft connected direct to the bowl of the closet or other utensil or appliance and by which the foul air and stench is continuously removed during the actual use of such urinal or appliance.

25,874 of 1903.—J. PEARSON: *Hoisting Apparatus.*

A hoisting apparatus, consisting of a pinion having connected to it a disc furnished with teeth, inclined planes or cams adapted to engage corresponding teeth, inclined planes or cams on a disc loosely mounted on the pinion shaft in such a manner that the rotation of the pinion in one direction causes the pinion and loose disc to move sideways into contact with friction discs.

27,490 of 1903.—J. I. COOPER: *Domestic Fire Grates.*

This invention consists of a series of staple secured in rotation to a bar in an upright position; these form a grate for the purpose of fitting inside or outside of the fire grate to prevent cinders rolling out of the fire, the whole being made from wrought iron or the like, and being bent by the user to suit any shaped fire grate.

27,918 of 1903.—J. BLANC: *Pipes, Vessels, Tiles, and similar Articles.*

Pipes and other articles of paste-board or wood pulp, saturated with a hot mixture of coal tar previously raised to a high temperature, or other similar material having a base of mineral resin and plaster or cement.

28,804 of 1903.—R. MURRELL: *Greenhouses and like Buildings.*

This invention relates to greenhouses and like buildings. According to this invention, the greenhouse is preferably constructed with

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

span roof upon an iron framework, chiefly of a suitable joined up and so arranged that the framework shall support the sash bars preferably without any centre uprights or timber pultrils, and this is contrived by a system or series of stays and cross-bars, also of tubing, secured in tee pieces or by other suitable means, to the framework. This tubular framework is fitted with back nuts or other suitable means, and is so arranged and adjusted as to counteract and prevent any possibility of warp, twist, or vibration. The tubing, being in whole or part connected to the heating apparatus, is so arranged that it may form an additional circulatory and heating apparatus for the house.

70 of 1904.—J. W. PIPER: *Grates for Stoves and Furnaces.*

The combination of a grate, consisting of a grate ring and a series of grate bars having laterally-curved, tapering bodies, pivoted at their larger ends at equal intervals on said ring, each of said bars being provided on its outer side with a wing adapted to overlap the next bar to prevent the escape of fine fuel between adjacent bars when the same are in operative position, and means for swinging said bars simultaneously toward or away from the centre of said ring.

331 of 1904.—A. E. WHITEHEAD and H. J. McCHEYNE: *Stoves.*

The stove consists of an exterior, ornamental or plain frame, with an interior or fire box, movable, and revolving on two pivots slotted into the exterior and having its axis horizontal. When the interior, or fire box, is revolved by pulling up the bottom to the top, it so reverses the interior by bringing the back to the front, and on the back there is an ornamental casting, which, when revolved and brought to the front, closes in the fire place and forms an ornamental screen. There is a movable hood, which is fitted over the interior or revolving fire box, also slotted into the exterior, which regulates the draught as required, and also provides for the efficient ventilation of the room when the interior is revolved or closed in, and leaving an aperture over the top of the interior or revolving fire box to be regulated as required for a current of air.

722 of 1904.—H. LOSSIER: *Trusses for Cement and like Constructions.*

A truss for cement and like constructions, comprising a main truss bar or bars for extension or compression, and a number of cross-bars forming a secondary truss (shear truss), the cross-bars being rigidly connected to at least one of the main bars in such a manner as to prevent displacement of the truss with regard to the corresponding main bar without the aid of the surrounding material and without decreasing the cross section of said main bar.

811 of 1904.—T. BEEVERS and THE SAFETY THREAD SYNDICATE, LTD.: *Mode of Constructing Staircases.*

A method of constructing staircases which consists in building into the walls metal blocks or plates having a roughened or corrugated outer side and adjustably fixing thereto correspondingly corrugated brackets to receive either temporary or permanent treads.

946 of 1904.—E. FOSTER: *Construction of Unclimable Fencings, Railings, Gates, Grilles, and the like.*

This relates to the construction of unclimable fencings, railings, gates, grilles, and the like, consisting in the employment of such double-flanged sections and dimensions of bars forming the component parts of the same, that the bars running in one direction may be passed through suitable holes in both flanges of the bars running in a transverse direction, so as to allow of the bars being locked together, without the aid of rivets, bolts, wedges, or other loose fastenings, by pressing outwards or otherwise distorting the flanges of the inserted bar between the flanges of the transverse bar.

1,065 of 1904.—T. G. RHODES and R. GAUNT: *Valve Discharge Apparatus for Flushing Cisterns.*

A valve discharge apparatus for flushing cisterns, consisting of a vertical, cylindrical casing formed with a side outlet, pipe communicating with the flushing pipe of the cistern, said casing being closed at its upper end, while its lower or open end is provided with a base ring having an upturned, annular flange forming a valve seating and a weighted disc valve within the casing, having an india-rubber disc on its underside adapted to engage with the seating of the casing, together with means for operating the valve.

5,253 of 1904.—W. A. SIMPSON: *A Ventilating Appliance for Windows.*

A portable ventilating appliance for windows, furnished with hand hooks or the like, and

arranged to be removably introduced between the window frame and the top or bottom sash, and provided with a ventilating chamber

14,963 of 1904.—M. MENDOZA: *Flushing Apparatus for Water-closets, Lavatories, and the like.*

A flushing apparatus for water-closets, lavatories, and the like, comprising a casing having a water inlet and a water outlet, a valve adapted to close said water outlet, and means for unseating said valve, in combination with an air inlet tube and a valve for automatically closing said tube when the water level reaches same.

16,591 of 1904.—G. HARMAN and J. WING: *Holdfasts or Clips for Roofing Gutters.*

A small iron clip made of any strong metal in the shape of an S, the upper part being opened upwards so as to grasp the roofing gutter. The upper end is pierced with a hole to admit of the passage of a screw, which passes over the top of the gutter and is fixed into the wood under the roof, thus holding the gutter in a rigid and firm position. The object of these clips is to reflex roofing gutters which are or are likely to become dangerous at a small cost and with expedition.

19,376 of 1904.—S. MONTGOMERY: *Picks.*

A pick, consisting in the combination with a lead having an arm, and a socket in one end of said arm, said socket having one wall cut away to form a slot, of a bit adapted to abut against the arm, and having a tongue integral with and extending from said bit, said tongue fitting snugly within the said socket and slot, and means for securing the tongue within said socket.

20,240 of 1904.—F. A. WERNER: *Attachment for Window Sashes.*

An attachment for window sashes, comprising in combination, a resilient sheet-metal strip of step-like form, disposed longitudinally of the bottom rail of the sash, transverse strengthening straps, and screws passing through the said transverse straps and said strip, and entering the sash rail.

21,871 of 1904.—C. WRIGHT: *Fireplaces for Ranges and Stoves.*

A fireplace for ranges and stoves, distinguished by having the bottom grate pivotally mounted at or near its inner end upon rockers or arms, pivoted to the side of the fireplace, and being supported at its outer or front end by legs which fit upon projections or catches formed in grooves or hooks on the front of the fireplace.

21,999 of 1904.—A. GASPARY: *Moulding Apparatus for Artificial Stone.*

An apparatus for simultaneously moulding a number of artificial stone slabs, the distinguishing feature being that the division plates which are swung in a mould that is open at both ends are mounted to rotate on a single shaft supported by lever arms pivoted on the mould.

22,121 of 1904.—J. DAVEY: *Domestic and other Analogous Heating Apparatus.*

A domestic or analogous water-heating apparatus, having a hot-water cylinder or reservoir, consisting in the employment of a relief valve contrivance, fixed upon the said cylinder or reservoir.

960 of 1904.—A. DISS: *Drain, Rainwater, and other Pipes, Sanitary Traps, Junctions, and the like, Applicable also to Gullies, Channels, Guttering, and the like.*

A drain, rainwater, gas, or like pipe section of telescopic construction, and comprising a sleeve and a draw pipe slidable therein, the outer ends of the sleeve and draw pipe being adapted for connexion with adjacent pipe sections, traps, junctions, or the like, and that end of the sleeve in a mould that is open at both ends are mounted to rotate on a single shaft supported by lever arms pivoted on the mould.

1,350 of 1904.—W. BAYLIS: *Construction of Wood Paving and Flooring Blocks, and Fasteners for Securing Together Component Parts of such Blocks.*

A wood paving or flooring block, built up of a number of smaller pieces placed side by side vertically, of which some of the pieces are shorter than others, and are assembled therewith in a manner which leaves a number of depressions in the upper surface of the block.

11,944 of 1904.—W. P. THOMPSON (M. J. Kerns): *Apparatus for Shoring to be used in Connexion with the Construction of the Foundations of Buildings, Piers, and other Structures, and the like, and the Sinking of Wells, Shafts, and the like.*

A shoring apparatus, comprising plates which can be sunk side by side and at opposite sides

of the cavity in the earth, said plates having a solid round edge or bead engaging a socket or slot in the edge of the adjacent plate so as to lock them together and collectively form a shoring or wall, in combination with stretcher stays and cross stays so arranged as to bind the plates on either side of the cavity secured together, and prevent them from collapsing or expanding.

COMPETITIONS, CONTRACTS, AND PUBLIC APPOINTMENTS.

(For some Contracts, &c., still open, but not included in this List, see previous issues.)

COMPETITIONS.

Table with 5 columns: Nature of Work, By whom Required, Premiums, Designs to be Devised, and Date. Includes entry for 'Designs for School, etc., at Caversham' by County of Oxford Education Comtee.

CONTRACTS.

Main table with 5 columns: Nature of Work or Materials, By whom Advertised, Forms of Tenders, etc., supplied by, and Tenders to be Devised. Contains numerous entries for construction projects across various locations like Bradford, Glasgow, Plymouth, and London.

CONTRACTS.—Continued.

Table with 4 columns: Nature of Work or Materials, By whom Advertised, Forms of Tender, etc., supplied by, and Tenders to be Delivered. Includes entries for Dwelling House at Ringmore, Shaldon; Five Labourers' Cottages, Monastery, Powerscourt; One Cottage, Glaskenny, Powerscourt; Two Cottages, Kilmalin, Powerscourt; One Cottage, Fassava, Delgany; 800 tons of Quenast, etc.; Steam Boilers, etc.; Heating of Pavilions, etc.; Electric Light Installation; Extension of Waterworks, Bettwa-y-Coed; Embankment, etc., at Fynon Llwyg; Finishing Machine, Ruchill Wash-house, Fossilpark; Rebuilding Ship Hotel, Crane-street, Pontypool; Roadworks, Colechester; Additions, etc., to Lock-up, Aspatria; Pull Down & Re-erect, Masham Restaurant, Bradford; Restoration of Church, Wanborough, Wilts.

PUBLIC APPOINTMENTS.

Table with 4 columns: Nature of Appointment, By whom Advertised, Salary, and Applications to be in. Includes entries for Surveyor's General Assistant, Assistant Superintendent of Works, Two Senior Draughtsmen, and Clerk of Works.

Those marked with an asterisk (*) are advertised in this number. Competitions, iv. Contracts, iv, vi, viii, x. Public Appointments, xix.

TENDERS.—Continued from page 649.

HARROGATE.—For street works in roads off Otley-road and Bower-road, for the Corporation. Mr. F. Jagshaw, Borough Engineer and Surveyor, Harrogate. Quantities by Engineer.—

Roads off Otley road. E. Long, 5, Albert-terrace, Starbeck*. £879 12 6. Back Road at rear of Nos. 4 to 34, West Terrace-avenue. G. Parsons, Harlow Hill, Harrogate*. £275 8 10.

Roads off Bower-road. Barker & Co., Lower-arcade, Harrogate*. £211 7 2.

HENSTRIDGE (Somersetshire).—For 720 yds. of cast-iron mains. Mr. Cyrus Combes, engineer, Tisbury.—

S. Ambrose... £303 0 0 Smith & Mar- W. H. Smith & Son... 195 19 0 chant, Shep- P. Tryhorn & Son... 195 19 0 ton Mallett. £178 5 6

KILMARNOCK.—For waterworks, for Kilmarnock District Committee. Mr. J. Sturrock, jun., engineer, Victoria Buildings, 65, King-street, Kilmarnock.— Murray & Milne, Prestonpans*. £2,920 0 6

IPSWICH.—For erecting at the workhouse, Wood-bridge-road, a temporary iron structure, for the (Canadian) Messrs. Brown & Burgess, architects, Princess-street, Ipswich.

For Iron Structures. Fenn & Co., Ipswich... £321

Messrs. Fenn will also provide the drainage, lighting, heating, and water supply, and other matters not included in the specification at an estimated price of £793.

KING'S NORTON.—For private street works, Ashfield-avenue, King's Heath, and Kitchener-road, Selly Wick, for King's Norton and Northfield Urban District Council. Mr. A. W. Cross, surveyor, 23, Valentine-road, King's Heath.—

J. White, jun., Boulton-y-Ashfield-avenue... £548 11 8. J. Kitchener-road... £320 19 6

LARNE (Ireland).—For erecting a library at the corner of Victoria-street and Thordale-avenue, for the Urban District Council. Mr. N. Fitzsimons, architect, 13, Lombard-street, Belfast. Quantities by Messrs. W. H. Stephens & Son, Belfast.—

McRoberts & H. Keth... £2,162 0 0. Armstrong... £2,240 0 0. W. McNeill & Sons... 2,152 11 7. J. Ferris... 2,236 10 0. J. Less... 2,295 0 0. W. Dowling... 198. Crom-well-road, Belfast*. 2,020 0 0. T. Kidd... 2,176 11 6. J. McMillan... 2,165 0 0.

LEYTONSTONE.—For alterations and improvements to the Gann Hall-road Schools (Wanstead Slip), for the Education Committee of Leyton District Council. Mr. W. Jacques, Architect, 2, Pen-coat, Fenchurch-street, E.C.3.—

Osik Building Co., Ltd... £2,499 0 0. G. J. North... 1,569 0 0. W. Wisdom Bros... 1,939 0 0. R. Woolston & Co... 2,249 0 0. F. J. Coxhead... 1,717 0 0. A. J. Shephard... 2,230 10 8. W. Gregar... 1,675 0 0. E. W. Harris & Co., Ltd... 2,097 0 0. A. E. Symes... 1,633 0 0. H. M. Upson... 2,085 0 0. H. C. Horswill... 1,613 0 0. H. M. Patrick... 1,943 0 0. W. J. Maddison... 1,509 0 0. Simpson & Co... 1,897 0 0. W. Manders... 1,885 0 0. L. Kind... 1,885 0 0. W. J. Weyman... 1,487 0 0.

LONDON.—For repairs to Nos. 1 to 24, Knott's-terrace, Tanner's-hill, Deptford, and 47, Tanner's-hill, for the Deptford Borough Council. Mr. T. Corfield, Borough Surveyor, 493, New Cross-road, S.E.1.—

P. J. Lilford, 16, Alpha-road, New Cross, S.E.1... £183 14

LONDON BOARD OF EDUCATION TENDERS.

Haggerston, Gapsall-street (Cleaning).

(First Competition.) G. S. S. Williams & J. Stewart... £295 5. Son... £450 0. J. Grover & Son... 283 0. H. Runham Brown... 441 0. J. Marchant & Hirst... 261 0. W. Silk & Son... 303 0. R. Woolaston & Co... 210 0. C. Deaning & Son... 304 5.

(Second Competition.) G. S. S. Williams & J. Stewart... £272 0. Son... £450 0. H. Boucaut, 1A & H. Runham Brown... 441 0. 2, Royal Victor- J. Stewart... 295 5. place, Old Ford* 233 0. W. Silk & Son... 291 10.

Walworth, "Michael Faraday" (Cleaning during Easter Holidays, 1905).

 R. Spencer .. 201
 H. Morecroft .. 197
 T. Free & Sons .. £186
 A. & B. Hanson .. 181
 J. Jackson .. 181
 W. H. Wheeler .. 166
 T. Watson, Southall* .. 155

SOUTHALL.—For sewerage and surface water drainage, Dorners Wells-lane, for the Southall-Norwood Urban District Council. Mr. R. Brown, Engineer and Surveyor, Southall. Quantities by Engineer:—
 G. Hirst & Sons .. £2,002
 Killingback & Co. .. 1,958
 Foster Bros. .. 1,628
 R. Morecroft .. 1,618
 W. H. Wheeler .. 1,608
 H. Morecroft .. 1,528
 T. Free & Sons .. £1,523
 A. & B. Hanson .. 1,517
 J. Jackson .. 1,353
 T. Watson .. 1,316
 Southall* .. 1,136

SOUTHALL.—For sewerage and surface water drainage, Western-road, for the Southall-Norwood Urban District Council. Mr. R. Brown, Engineer and Surveyor, Public Offices, Southall. Quantities by Engineer:—
 Killingback & Co. .. £1,170
 H. Morecroft .. 837
 Foster Bros. .. 803
 G. Hirst & Sons .. 798
 R. Spencer .. 790
 T. Free & Sons .. 751
 J. Jackson .. £744
 W. H. Wheeler .. 699
 T. Smith .. 635
 T. Watson, Hin .. 654
 A. & B. Hanson .. 647

SWANLEY (Kent).—For new stone accumulation at White Oak School, for the Metropolitan Asylums Board. Mr. W. T. Hatch, Engineer-in-Chief:—
 J. J. Richards .. £490 0
 Morley & Myer .. 370 0
 T. Pearce .. 345 18
 T. Cole .. 317 18
 Gardner & Hazell .. 299 0
 A. W. Jaggors .. 285 0
 J. Lansdale .. £284 0
 T. Knight .. 281 0
 W. & D. Wilkins .. 260 0
 B. W. Ghenny, Romford* .. 252 0

UPMINSTER, BORNCHURCH, AND CRANHAM.—For 3,200 ft. of granite kerb, for the Romford Rural District Council. Mr. G. Lapwood, Highway Surveyor, Victoria-road, Romford:—
 British Pricing & Granite Co. .. £735 0 0
 T. W. Marsh .. 320 13 9
 J. W. Logan .. 313 6 8
 W. E. Westgate .. 282 15 0
 Wilson, Borden, & Co. 275 10 0
 R. A. Bonnett, .. £273 6 8
 A. W. Porter .. 246 13 4
 J. Jackson .. 265 0 0
 P. Inland .. 260 0 0
 B. W. Ghenny, Romford* .. 253 5 0

 Stone Merchants & Contractors.
 Chief Office, Warwick Road, KENSINGTON.
 Norway, Guernsey, and Leicestershire
 Granite, Kerb, Pitching, and
 Yorkshire Stone.
 ESTIMATES GIVEN FOR EVERY DESCRIPTION OF
 ROAD MAKING.

WALLESEND.—For erecting schools, for the Education Committee. Mr. W. R. Knowles, architect, 37, Grainger-street, Newcastle-on-Tyne:—
 W. Worley, .. £15,888 17 8
 J. & W. Lowry .. 15,875 0 0
 R. Veitch & Son .. 15,368 0 0
 E. T. George .. 15,200 0 0
 T. Lumsden .. 15,200 0 0
 Davidson & Bolam .. 15,040 14 10
 S. P. Davill .. 14,995 0 0
 Elliott Bros. .. 14,990 13 0
 W. Kennedy .. 14,905 0 0
 R. Smith .. 14,504 0 0
 J. C. Hope .. 14,716 4 2
 R. C. Whitfield .. £14,603 13 10
 N. Ritchie .. 14,600 0 0
 Glen .. 14,553 9 1
 S. Sheriff .. 14,503 14 6
 J. Mackarg .. 14,447 10 6
 W. Hall .. 14,402 6 2
 J. W. Braithwaite .. 14,262 10 9
 J. & W. Simson .. 14,135 0 0
 G. Bain .. 14,052 0 0
 J. Hunter .. 13,999 5 0
 J. & G. Douglas .. 13,842 11 7
 W. T. Weir .. 13,831 0 0

WOODFORD (Essex).—For main road works (Contract No. 1), for the Urban District Council. Mr. W. Farrington, Surveyor, Council Offices, Woodford Green:—
 W. J. Logan .. £3,124 0 0
 T. W. Marsh .. 2,680 16 7
 T. Adams .. 2,573 13 7
 E. Rogers & Co. 2,563 0 0
 Moss & Sons .. 2,525 0 0
 W. Griffiths & Co. 2,508 3 6
 O. T. Gibbons .. £2,442 0 0
 Free & Sons .. 2,406 11 0
 Parsons & Parsons .. 2,387 12 7
 W. & C. French, Buckhurst Hill .. 2,360 4 4

WOODFORD (Essex).—For road improvements (Contract No. 2), for the Urban District Council. Mr. W. Farrington, Surveyor, Council Offices, Woodford Green. Quantities by Surveyor:—
 W. J. Logan .. £1,595 0 0
 T. W. Marsh .. 1,303 15 0
 W. Griffiths & Co. 1,290 0 7
 T. Adams .. 1,273 9 0
 Free & Sons .. 1,260 11 1
 O. T. Gibbons .. 1,191 0 0
 Moss & Sons .. 1,190 0 0
 Parsons & Parsons .. £1,165 5 8
 E. Rogers & Co. 1,143 0 0
 W. & C. French, Buckhurst Hill .. 1,125 0 9

WRENTHAM.—For 290 yds. of 9-in. stoneware sewer, etc., for the Rural District Council. Mr. J. Price-Evans, C.E., Argyle Chambers, Wrentham. Quantities by Engineer:—
 G. Halbert .. £159
 T. Rogers .. 159
 E. Robinson .. 149
 W. Barwick .. 145
 J. A. Jones .. £136
 R. Williams .. 134
 T. H. Shumons, Gwryll, Wrentham* .. 108

WRENTHAM.—For metalting and making good Edward-street, for the Corporation. Mr. John England, Borough Surveyor. Quantities by Surveyor:—
 G. Halbert .. £242
 W. Hughes .. 224
 H. A. Jones .. 185
 J. W. Harris, Shrewsbury* .. £130

A Note on Street Architecture.

THE paper on "Street Architecture" read by Mr. T. G. Jackson at the Society of Arts, a report of which will be found on page 661, was of much more value than the discussion which followed it; but the paper and the discussion together suggest one or two points for special consideration.

The often-vexed question of grouping and symmetrical design in street architecture, as against the effect of individuality, or independent treatment for each property, naturally comes up once more; and we are glad to find that Mr. Jackson recognises the importance of symmetrical architectural treatment, if he does not advocate it in all cases, and he commented strongly on the manner in which the design of Regent-street, "the one fine and consistent piece of street architecture in London," has been practically destroyed by the intrusive alterations which have been permitted to be made in it. To call Regent-street, in its original state, "fine" architecture is what we should hesitate to do *sans phrase*, but "consistent" at all events it was, and has now ceased to be so, and people are beginning to find, when it is too late, that they have destroyed something which was of architectural value to London. Regent-street would have been respected had it existed in Paris. An owner of one or two houses in the Place Vendôme wished some little time ago to raise them, thereby spoiling the architectural design of the square; he was not allowed to do so.

Our own opinion is that massing of street architecture, if not for a whole street, at all events in large blocks, in a symmetrical design, is an almost necessary expedient if the highest dignity is to be given to the architecture of a city. It is owing to the prevalence of this symmetrical street architecture that Paris has that grandiose air which makes it seem a city so much more, in the full sense of the word, than our own capital. Of course it may be said that the Paris street architecture is somewhat cold and formal and wanting in variety; so it is, but something must be given up either for the picturesque on one side or the stately on another; and to our mind it is the stately element that is most proper to a capital city, at all events. The manner in which the County Council have let slip the opportunity for stately and symmetrical design in Aldwych and Kingsway, after laying the foundation for it by instituting a competition for designs, is absolutely lamentable. The mischief is done now in Aldwych, but there is still some place for repentance in regard to Kingsway.

The demand for special treatment and special material for shop front architecture was rather more emphasised by Mr. Jackson than we should have expected. He urged that was no reason why stanchions and bresssummers should not be treated architecturally if there was an absolute demand for entirely glazed shop fronts; and this was naturally echoed by an eminent engineer present, who said that if architects were to meet the commercial requirements of the present day they must forget a great deal about Greek and Roman and Gothic architecture, which "was not suitable for modern commercial life"; and he

defended iron construction by the examples of Southwark and Blackfriars bridges, which he appears to group together; whereas in fact Southwark is a fine and sober piece of actual construction, and the Blackfriars' spans are a piece of pretentious vulgarity. So much for engineering criticism of the aesthetic. We have heard all this of course, very often, but without being convinced. We do not think that steel bresssummers and stanchions are capable of as much architectural effect as stone piers and arches, though we quite agree that if that glass ground-story is indispensable, the means of supporting the building above it should be openly shown, and treated in a way characteristic of the material; and it is too true that this is very seldom done at present, and we see arches or imaginary stone lintels, that could not possibly stand put up in order to comply with what are supposed to be the demands of architecture. That of course is all wrong; and visible steel structure is much better than sham stone structure. But after all, real stone structure is better than either; and whatever the "honesty" of the steel construction, we have still the disagreeable effect of the empty space as the base of an architectural design. But the question is, whether people are not getting hold of the whole matter the wrong way about. Is it really necessary to the prosperity of a shopkeeper that he should have the whole front of his shop scooped out and filled with plate glass? Is it not merely a superstition of the tracing mind? And is it not possible to convert the shopkeeper to a perception that a dignified architectural masonry front, even if arched, is worth more to his trade than filling up the spandrels with glass?

THE CARE OF ANCIENT MONUMENTS.

(Concluded.)

BY PROFESSOR BALDWIN BROWN.

WE now come to the question of formal Monument Acts passed by State Legislatures for the preservation of national treasures in the form of historical and artistic monuments. A list with dates of the principal European Acts of the kind was given in the first paper (*ante*, p. 594). There is no space to attempt a notice of them all, but it may be said generally that they differ according to the objects specially aimed at in the legislation. Thus, movable works of art are sometimes specially considered, and the aim is to prevent these being sold out of the country to the foreigner. This aim is prominent in Italian monument legislation, and the recent Act of 1902 of Canton Bern, in Switzerland, mentions in the preamble the too-frequent sale of works of art to the foreigner as one reason for legislation. Some countries, again, have to provide specially for the care of excavations and for the disposal of objects which these may bring to light. The Monument Act of 1881 for the kingdom of Hungary lays stress on these points. Other Acts again contemplate chiefly immovable objects, and are framed with a view to the preservation from injury of a certain special class of architectural and other monuments of outstanding importance that are entered in a schedule. This is the character of the British Ancient Monument Act of 1882 and of the fuller law passed in France in 1887. The most comprehensive of the recent measures is the one passed in the Grand Duchy of Hesse in 1902, but it is possible that when the projects for monument legislation now under consideration in Prussia, Austria, and Bavaria pass into law we shall have something still more complete and satisfactory. It is understood that the forthcoming Prussian Act will contain a provision for arming urban authorities with legal powers to give effect to aesthetic requirements.

A comparison of Monument Acts, however, and of drafts for such Acts, shows that in the more advanced countries of to-day it is not easy to carry through the legislature any very stringent provisions for the protection of monuments. Very many of these are in private ownership, and in advanced communities respect for the rights of private property is often elevated into a sort of fetish. Again, in such communities questions of public health and of convenience in the means of intercourse are of great importance, and in any conflict of interests that may arise between the new and the old, the ancient monument is too often sacrificed. Sir John Lubbock, now Lord Avebury, had to battle for ten years before he could pass the Act of 1882, mild as it is, because Parliamentary opponents cried out that the rights of private property were being invaded. Most modern Acts were more drastic in draft than in their final form, and the claims of the public interest in what are after all national possessions have had to be compromised in face of the opposition of the private lords of the soil. For downright uncompromising

prohibitions we have to go to the Monument Acts of countries like Turkey, or some of the Danubian kingdoms. The French Act of 1887 has provisions framed especially for Algeria, and these are more severe than those applicable to the mother country. The French protectorate of Tunis has a Monument Act far more searching than the French people would have accepted for themselves.

It will be convenient to notice first of all this French law on historical monuments, which may be taken as sufficiently typical of other similar measures. It is not the most recent, nor the most comprehensive, nor most drastic, of European Acts of the kind, nor is it by any means faultless in content or expression, but it enjoys the prestige attaching to all the institutions connected with art in its favoured country.

The French law, like other such Acts, makes a distinction between monuments belonging to the State, or to public bodies over which the State has some control, and those in the hands of private corporations or individuals. A list has been drawn up by the Commission on Historical Monuments, in which an endeavour is made to schedule all those objects of historical or artistic interest that are held to be of national importance. The number of monuments actually thus scheduled, or, as the French say, "*classés*," is about 2,200, and of these about 308 are prehistoric monuments, such as dolmens or standing stones. The effect of this insertion in the schedule is that, in the words of the fourth article of the Act, "the monument that has been 'classified' cannot be destroyed even in part nor become the object of a work of restoration or repair, nor of any sort of alteration, unless the Minister of Public Instruction and of the Fine Arts has given his consent." It will be seen by this that complete protection is secured in the Act for the scheduled monuments, but it does not follow that this schedule includes everything in the country that is specially worth preserving. It is a provision of the Act that no monument can be "classified" without the consent of the body or individual that owns it. When the owner is a Government department or a public body, pressure can be brought to bear on it by the Council of State, so that consent to enrollment can practically always be obtained. In the case of the recalcitrant private proprietor, who will not allow a monument to be "classified," it is possible to proceed by the process of compulsory purchase or expropriation. This process had all along been available, for the general law in France allows of expropriation on grounds of public utility, and it had been officially recognised that considerations of art and of historic interest come under this head. Even before the passing of this Act of 1887 the weapon of compulsory purchase had been effectively used in favour of historic monuments, so the Act introduced in this matter no new principle, but only emphasised already existing provisions.

The main result of the French Monument Act, accordingly, is that it gives practical security to all monuments that belong to public bodies, while to those in private hands it opens the

way to safety though through a course of procedure that is somewhat cumbersome as well as expensive. It is something, however, gained to a country when legislation has definitely ensured to it a method by which any national possession that may be actually upon private land can be, if that country choose, preserved to all future generations: In this island there is no such method, for the Government can only purchase monuments by agreement with the owner, and, in view of the portentous "dourness" exhibited (though not in connexion with monuments) by some British property-owners, one trembles to think what might happen to some monument of world wide value were war declared between a private proprietor and the public at large.

The two most important Monument Acts of more recent date than that of France are those passed in 1902 by the legislatures of Italy and of the Grand Duchy of Hesse. The main result of each of these Acts, so far as architectural monuments are concerned, is similar to that of the French Act. The Italian law, like Italian monument-legislation in general, devotes a good deal of attention to movable objects of artistic worth, the exportation of which from the country has always been a vexed question in the peninsula, and deals also in some detail with the State regulation of excavations and "finds." The Hessian law, over and above the main provisions, has some of a novel character that represent an advance in monument legislation. Conspicuous among these is the clause empowering the State to delegate to local bodies the right of expropriation in the interests of monuments which belongs to it. Other provisions of the kind relate to the protection of natural sites, the control of the advertisement-field, etc. It will be well to analyse this Act somewhat at length as one of the last official utterances on monument administration.

The Hessian law is rendered all the more instructive by the fact that the author of it, Freiherr von Biegeleben, gave a full account of it to the German Monument Congresses of 1901 and 1902, and explained the difficulties which had to be encountered and the changes which the draft underwent in its passage through the Legislature. He has also reported more recently on its satisfactory working to the Congress held at Mainz in September, 1904.

The Act, which came into force on October 1, 1902, falls into seven sections and contains thirty-nine articles; each of the main and subsidiary divisions has a useful heading. The first section, articles 1 to 8, is concerned with monuments in the possession of corporations and public bodies, and the expression "monuments" includes movable objects as well as architectural structures, and takes in documents as well as works of art. These bodies are forbidden not only to destroy or alienate any monument in their possession, but to effect on it any alterations or restorations without previously obtaining the permission of the authorities, such permission being given or withheld upon considerations of an artistic or historical kind. Alterations in the adjuncts or surroundings of a monument are included

in this provision. The authorities in question are the "Kreisamt," perhaps roughly corresponding to our County Councils, and there are appeals to higher bodies up to the Minister of the Interior. On the "Kreisamt" is enjoined the duty of drawing up an inventory of all monuments belonging to public bodies within its district.

The second section, articles 9 to 17, is concerned with monuments in the possession of private persons. Movable objects in such ownership are excluded from the operation of the Act, and with regard to other (architectural) monuments, only those are protected which are included in an official list. The task of drawing up this list or schedule (which is quite distinct from the mere inventory kept by the "Kreisamt") is in the hands of a Council on Monuments ("Denkmalrath"), the constitution of which is defined in article 32 of the Act. It is called together by the Minister of the Interior, and consists of representatives of the Catholic and Protestant churches, at least two members of the Hessian antiquarian, historical, or artistic societies, and two resident Hessian owners of architectural monuments. A private proprietor of a monument must be informed when it is in this way scheduled, and is allowed to appeal against the inclusion to the Minister of the Interior. Any proposed alienation, alteration, or restoration of a scheduled monument in private hands must be reported to the "Denkmalpfleger," that is, the general Conservator of monuments for the State at large, and, unless the proprietor receives official sanction, he is bound to take no steps involving a carrying-out of the proposal till six weeks have elapsed. During that interval, if the proposal seem to involve danger to the monument, the Conservator has to exercise what moral pressure he can on the proprietor to induce him to modify his intentions, and, to give time for this, the Minister of the Interior may prolong the period of six weeks to one of three months. In case of a proposal on the part of the proprietor to destroy the monument or to alter injuriously its surroundings, permission must be asked either from the "Kreisamt" or from the "Denkmalpfleger." If permission be refused, the proprietor may appeal to the Minister of the Interior within a period of four weeks, to which no extension can be allowed. If the answer to the request for permission be not sent within a space of six weeks (which the Minister can extend to three months), then the proprietor is allowed to carry out his original proposal. In case the permission be refused or only granted partially, and the appeal to the Minister of the Interior be rejected, then the proprietor can within six weeks claim compensation from the Minister for the curtailment of his rights of disposal over his property, or can call upon the State to acquire the monument or its surroundings at a valuation.

Section three, articles 18 to 24, deals with special cases. Article 19, entitled "Right of Expropriation in the Interest of Monuments," is of enough importance to be quoted in full.

"The State is authorised to limit the

rights of private property in laud to such an extent as is needful:—

- "(1) To secure the preservation of an architectural monument, the maintenance or security of which is being neglected in such a manner as to endanger its existence or the upkeep of essential parts of it; or
- "(2) To effect such an opening out of a monument as is demanded by artistic or historical considerations, provided that no overpowering public or private interest come in the way.

"The proprietor, in so far as circumstances make this reasonable, may demand, in place of the limitation of his rights, their entire acquisition by the State.

"The State is empowered, by a rescript of the Minister of the Interior, to transfer the right of expropriation given to it in the first paragraph of this article to the commune, the district, or the province, in which the architectural monument is situated." (This last provision has been already referred to as a novel and important one.)

Other articles of this section secure to the State the right of visitation and of making plans and drawings of monuments, and the right of ordering a proper expenditure on monuments on the part of public bodies that own them.

Article 23 provides that any projected road or railway line that threatens the existence or amenity of a monument shall not be made without leave of the Minister of the Interior. Also that, in the interest of the amenity of an architectural monument, local regulations may be made to prevent new buildings being erected within a certain distance of it, or the buildings in its vicinity being raised above a certain height.

The fourth section, articles 25 to 30, is concerned with the question of excavations and "finds." The former cannot be undertaken without previous notice to the authorities; the latter must immediately be announced to the burgomaster or "Kreisamt" of the locality.

Land may be expropriated for the purpose of carrying on excavations.

The fifth section, articles 31 and 32, deals with the organisation of the bureau for the care of monuments, etc.

Section six, articles 33 to 36, introduces us to a new and interesting feature in Monument Acts, the care of "Naturdenkmäler," or natural scenes and objects. Article 33 begins as follows:—

"Natural phenomena of the earth's surface, such as watercourses, rocks, trees, and the like, the maintenance of which is a matter of public interest on grounds of history or of natural history, or from considerations of the beauty or special character of a landscape (natural monuments) can be placed under a special protection to be exercised by the 'Kreisamt' on the demand of the Department of Forests, etc., in the Ministry of Finance.

"This protection can be extended to the surroundings of a natural monument."

The owner, be it a public body or a private person, is to be informed that the natural monument is scheduled, and can appeal, as in the case of the monuments referred to in previous sections.

Article 34 continues:—

"Operations which threaten the continued existence of a natural monument that is officially protected, or promise to injure either this or its officially protected environment, can only be carried out after the permission of the 'Kreisamt' has previously been obtained.

"Such permission is to be refused when the proposed operations give rise to apprehensions in respect to the maintenance of the monument, or to considerations of the kind referred to in article 33, and when such apprehensions outweigh the public or private interests that may be injuriously affected by the refusal."

Article 35 will appeal to the sorely-tried British lover of amenity and quiet.

"Prohibition of Advertisements, Posters, etc.

"On a natural monument-officially protected, or in its officially protected environment, no advertisements, nor the like, nor objects such as posters shall be placed or set up of such a kind as to injure the effect of the monument.

"At the bidding of the 'Kreisamt,' advertisements, or objects of the kind referred to, which at the time of the promulgation of this Act are already in existence, must be removed. The proprietor can demand from the State an indemnification for the loss sustained by him through the removal of what he had put up.

"It shall be competent for district authorities, through local police regulations, to forbid the importation or display of advertisements, etc., or of objects which in localities of great natural beauty are injurious to the landscape; and, further, to direct the removal of those already in existence at the localities in question."

In the seventh and last section, articles 37 to 39, there are provisions for penalties for breach of the Act. These are fines up to 50*l.* or imprisonment.

The provisions of our own Ancient Monument Act of 1882 are probably sufficiently well known to make any analysis unnecessary. It was based upon a schedule embracing sixty-nine monuments, all but seven of which were of the prehistoric class, to which seventeen or eighteen others have since been added. Under the Act, the Commissioners of Works, who have the administration of it, can punish anyone but the owner who injures or defaces any scheduled monument. An owner may, if he choose, constitute the Commissioners guardians of any ancient monument in his possession, and in that case he is no longer able to work his own will upon it. By arrangement, the Commissioners may become the owners of the monument, but there is no power from their side of compulsory purchase. The Commissioners are now guardians of about forty monuments, but they have never actually purchased any. Very little money has been laid out by them on the monuments in their guardianship.

In Ireland, ancient monuments are much better off, and the danger here is that they may receive only too much attention at the hands of well-meaning "restorers." When the Irish Church Act was passed in 1869 there was a clause added by which ruined or disused places

of worship that had a historical or artistic interest were handed over to the care of the Irish Commissioners of Works, and a sum of money amounting to 50,000*l.* was set apart for their maintenance. Furthermore, in 1892, a special Monument Act was passed for Ireland enabling the Commissioners to apply the Act of 1882 to other structures of interest, besides those of the prehistoric or sculptured-stone classes to which its operations were at first confined. The result has been that the Irish Commissioners of Works now rejoice in the guardianship of no fewer than 189 ancient and national monuments, and spend upon them the handsome sum of about 1,000*l.* a year.

In the year 1900 a very distinct advance was made in the official care of monuments in Great Britain. By a short amendment-Act, the functions with regard to monuments previously in the sole hands of the Commissioners of Works were extended to County Councils, who were empowered to purchase by agreement or become the guardians of any monument possessed of historic, traditional, or artistic interest. This provision is of the best promise for the future, as introducing the decentralising process in monument administration, which has been adopted with good effect both in Italy and Germany. There is another clause to the effect that Commissioners of Works or County Councils may receive voluntary contributions towards the upkeep of any monument under their charge, and enter into an agreement with an owner or "any other person" as to its "maintenance and preservation, and the cost thereof." This, again, is a most promising stipulation, as it brings official authorities into touch with private societies, such as the "National Trust," as well as with individuals who may take special personal or local interest in some monument or group. This common action of the official and the private agencies is of the utmost importance for a healthy "Care of Ancient Monuments" such as we may hope to see established in our own country in the near future.

NOTES.

The Venice Campanile. ACCORDING to a recent report, work is proceeding slowly and carefully on the foundation for the new Campanile at Venice. The authorities have wisely decided to leave the old foundation undisturbed but to surround it by a belt of concrete supported on piles. This belt will be 15 ft. wide, and the necessary excavation has already been completed. The trench is lined with sheet piling, and 8 in. square piles are now being driven close together in the bottom. The progress of every pile is carefully watched, and driving is stopped immediately a satisfactory bearing is obtained. We understand that a grillage will be formed over the heads of the piles so as to provide for uniform distribution of the load. Examination of the old foundation revealed the fact that the centre portion had been filled in with loose stones, about 6 in. or 7 in. square. Thus, the original footings formed a hollow square, transmitting the load due to the superstructure directly to the

supporting piles. The present condition of the foundation testifies to the correct judgment of its designers, as the collapse of the tower demonstrates the danger of tampering with ancient masonry structures after the manner followed at Venice in the XVIIth and XVIIIth centuries.

London Fogs. CONSIDERING its position and meteorological conditions, it is morally certain that

London must always be subject to fogs, even if coal fires were entirely abolished. The substitution of purified gas for coal as a source of heat would certainly reduce the blackness, density, and irritant effect of fogs, and the universal adoption of electricity as a source of light and heat would be still more beneficial, but could not obviate the formation of white fogs—cold, damp, and laden with carbonic acid gas and other objectionable vapours. As remedial measures on a comprehensive scale are out of the question, Londoners must be resigned to their fate, and the most practical course of action at the present time is to inquire more fully into the possibility of forecasting fogs for the guidance of electric lighting authorities, railway companies, and the travelling public. Some useful work in this direction has already been done by the Meteorological Council, whose recent Report is an interesting and instructive document. So far, however, it appears unlikely that it will be possible to derive a warning for one district of the metropolis from the observation of actual fogs in other districts, although the hope is held out that such warnings may be afforded by special readings of thermometers and barometric instruments. Further investigation is still necessary, but the conduct of this involves expenditure, which the Meteorological Council cannot undertake with the limited means placed at its disposal.

The Law of Light. THE important case of *Kine v. Jolly*, which was the subject of an article in our

issue of September 3, has been carried to the Court of Appeal. It will be remembered that the action was brought in respect of obstruction of light to three rooms, that the judge decided there was such an obstruction to the light of the morning-room as to amount to nuisance in that the room had lost its characteristic cheerfulness, and that this, taken in conjunction with the loss of light to the hall, entitled the plaintiff to a mandatory injunction. We discussed the case fully in our former article, and we commented on the fact that the learned judge had granted an injunction since it appeared to be a case in which, according to the *dicta* of the House of Lords in *Colls v. Home and Colonial Stores*, the remedy should have been damages. The Court of Appeal have now varied the judgment of the Court below to this effect. It is, however, noteworthy that, while the majority of the Court upheld the finding of Mr. Justice Kekewich that there was a sensible interference with the comfort and convenience of the house as a dwelling house amounting to nuisance, Lord Justice Romer dissented and failed to see any nuisance since the finding of fact was that the morning-room remained a well-lighted room. This case, therefore,

leaves the question of what is the test to be applied in such cases as to the existence of nuisance still undetermined.

The New York Rapid Transit Subway. ALTHOUGH the new underground railway of New York

has only been opened for a few weeks, considerable complaint is made as to the unpleasant character of the air. Americans are not generally prone to criticise their national works in any adverse spirit, and in the technical press there appears to be an effort to explain away the close and disagreeable condition of the atmosphere in the new subway. We are told that ferry boats across the East River are more offensive, that Pullman trains are as stuffy, and that so long as unwashed people travel in closed cars the air will not be agreeable to persons of delicate sensibilities. Comments of this kind are simply evasions of the main question. Further, we are informed that there are so many large openings into the subway and so many trains to act as pistons in moving the air that it will be difficult to convince any engineer that the air is really so bad as to render special ventilation necessary. This is just the same sort of argument that was used in London after the opening of the City and South London and the Central London railways, but in point of fact the air grew steadily worse in each of these tubular lines. Our American friends will have to face the position and profit by experience on this side of the Atlantic. In this connexion we may say that atmospheric tests are already being made by Professor Chandler, and it is said by one hopeful writer that so far as they have gone the tests indicate "the air of the subway to be entirely satisfactory." We shall be interested to notice what they show after completion, and if the results prove quite satisfactory we shall be pleasantly surprised.

Union Bridge, Aberdeen. WE hear that it is being found necessary to widen

Union Bridge, Aberdeen, which was built in the first years of last century to connect the old town and the new across the deep depression or valley called Denburn, and give access to Union-street. The bridge is a fine work in the dignified and severe classic style in which new Aberdeen was mostly carried out. Both Rennie and Telford were consulted about it and made designs, and the actual design is probably Telford's, from the documentary evidence, though the appearance and treatment of the arch remind one strongly of Rennie's work at London Bridge. A local history which has been published claims it for a local man, Fletcher by name; but this is very doubtful, as it is known that Fletcher proposed a balustrade of Gothic arches, while every detail in the bridge as carried out is the severest classic. It is odd that the width of the bridge, at first intended to be 50 ft., was reduced to 40 ft., not only for economy, but because "it would tend much to beautify it." Had the first intended width been retained, it would probably not now be necessary to widen it. We hope nothing will be done to interfere in any way with its original severe and monumental character.

Test of a Large Concrete-Steel Beam. A CONCRETE-STEEL beam, having the unusually long span of 55 ft. between supports, forms the chief support of the gallery in the New Lyric Theatre in Cleveland, U.S.A. This beam has a T-section, the upper flange measuring 20 in. wide by 10 in. deep, and the vertical leg 12 in. wide by 50 in. deep, the total depth of the beam being 60 in. The concrete used was mixed in the proportions of 1 part Portland cement, 2 parts river sand, and 4 parts silica gravel, and the reinforcement consists of seventeen longitudinal round bars in the tension and compression areas, in addition to stiffening bars for resisting any tendency to buckling, and 400 stirrups of different sizes for resisting shearing stresses. An interesting feature is that the beam is separately supported on concrete-steel columns, and thus no part of its weight comes upon the rest of the building. Owing to the small area presented by the upper surface of the beam and the great weight necessary for testing it was decided to adopt the novel device of applying the test load by hanging a platform from a limited portion of the beam on either side of the central point. The platform was laden with pig-iron up to the maximum load of 44 tons. No deflection was observed on the application of the first 4 tons, but beyond this load deflection commenced and increased at the rate of about $\frac{1}{8}$ in. per ton of load, the total deflection for the maximum test load being $\frac{1}{4}$ in. It is satisfactory to note that close examination revealed no evidence of cracks in the concrete, and the architects are to be congratulated upon the success attending this bold example of construction.

Dust Destroyers and Electric Lighting. THE paper recently read by Mr. W. P. Adams to the Institution of Electrical Engineers is of general interest, as well as being of great value to electricians. He discusses in a very able manner the question of the combination of dust destructors with electricity works. In a lecture to the Society of Arts, given twelve years ago, Professor G. Forhes stated that if all the refuse then collected in Paddington were properly burnt and used in the most economical way, it would provide enough electricity to light one 8-candle power lamp for two hours every night of the year for each of the inhabitants. We learn from this paper that the results obtained at Hackney and Fulham practically do this already, and in a few years even better results will be obtained. Mr. Adams calculates that approximately one million tons of refuse are collected every year in London, most of which is taken out to sea by barges at considerable expense to the ratepayer. On a moderate estimate, the value of the potential capacity of this refuse for steam raising for electric engines is 100,000,000 per annum. We think the author has proved that, with the improved dust destructors now in use, there is a substantial gain, in most cases, in combining dust destructor and electricity works. The exceptional cases are when the refuse has a very low calorific value. At Llandudno and at Royton in Lancashire, for example,

the refuse is of little use for steam raising. It is curious to note that the dust of great calorific value comes from poor neighbourhoods. At Bermondsey its value is particularly high. Mr. Adams suggests that the explanation is that the working classes, unlike the middle classes, rarely sift their ashes. In considering the question of dust destructors, the first point to be settled by municipalities, therefore, is the heating value of the refuse collected. This can be determined experimentally without much difficulty, and the value remains wonderfully constant in a given neighbourhood. The revenue earned by a dust destructor is due mainly to the supply of steam to the electricity works, but this steam can be sold for many other purposes as well.

Portland Cement. IN a paper recently read before the Civil and Mechanical Engineers' Society, Mr. H. E. Bellamy presented a useful series of notes upon Portland cement, embodying therein some of the experience gained during the execution of works in Queensland, which necessitated the use of several thousands of casks of cement. There is a strong family resemblance among all papers and articles dealing with the material in question, and the chief claim of the communication to which we now refer appears to be that it sets forth the views and conclusions of an engineer who, in the capacity of a purchaser and user, has been obliged to examine and compare numerous descriptions of cement made in England, America, Germany, and in Australia. A point of some importance to British cement manufacturers is that surprising quantities of foreign cements find their way into the Colonies, owing to their high tensile resistance and rapidity of setting. While pointing out the objection to abnormally high tensile results, the author speaks in terms of approval with regard to cement having the property of setting quickly. We feel certain that the best English cements are unsurpassed by any of foreign make, and that the results they give in testing are notably uniform and constant; but if users in the Colonies desire a product having certain distinctive characteristics, it is clearly worth while for our manufacturers to comply with these. If they do not, foreigners will continue to obtain undue advantage in purely British markets.

Sheffield Sewage Works. AN inquiry was held at Sheffield last week by Mr. A. A. G. Malet and Dr. Theodore Thomson, on behalf of the Local Government Board, the purport of the inquiry being the city's proposal to borrow 300,000, for new works of sewerage and sewage disposal. Nearly the whole of the money is required for the sewage disposal works. The evidence showed that the existing works were completed as recently as 1887 at a cost (including intercepting sewers) of nearly 200,000, and the Town Clerk (Mr. Sayer) had evidently determined that the two Commissioners should not fail to learn the part played by the Local Government Board in the preparation of the scheme of precipitation by lime which

was then adopted and which has since been condemned by the Board. "The Local Government Board," he said, "approved the plans for the precipitation works in every respect and made various suggestions in regard to them," and also "referred several municipalities, including Glasgow and Manchester, to the Sheffield works as an example of the best method of dealing with sewage." It would seem unkind of the Town Clerk to hint that the Local Government Board is not infallible, but the hint is evidently designed to prevent (if that be possible) the new Commissioners from repeating the mistake of suggesting any improvement in a scheme recommended by the city of Sheffield. That there is, or was, a possibility of the hint being disregarded is shown by the Commissioners' evident reluctance to accept the opinions of the witnesses that single contact-bed treatment, after preliminary sedimentation and settlement, would produce a satisfactory effluent. It is, at any rate, a sign of the times that a city with a population of over 400,000 and a great variety of industries should ask the Local Government Board to sanction a scheme of bacterial treatment pure and simple.

Architects' Drawings. We hope all who are practically interested in this question will read the spirited letter of "A Provincial Architect" published under the head of "Correspondence" in this issue. Although all architects appear to be agreed on the principle of the matter, a good many seem to be very much wanting in spirit and determination in resisting the claims made. Mr. Hayward's and Mr. Hubbard's letters also may be studied with advantage. If architects and architectural representative societies stand by each other and show a firm front, something will probably be done to amend the law or its application; but nothing will be accomplished by a half-hearted policy.

BROMLEY MUNICIPAL BUILDINGS COMPETITION.

THE Borough of Bromley, in Kent, having reached a stage when it is necessary to extend its municipal offices, has secured land for the erection of various administrative departments, and the new Council Offices and Court House, for which competitive designs were on view on December 19, will form the nucleus of the general scheme. We were favoured with an opportunity of inspecting the forty-three sets of drawings (crowded together in badly-lighted rooms), amongst which much excellent work is to be seen.

Mr. J. S. Gibson, F.R.I.B.A., was the assessor, with whose selection of first place we are in agreement; we cannot say, however, that we approve of the choice of the four premiated designs.

The accommodation asked for is that usual for municipal offices, with the addition of a large education department and county court with accessory rooms. The site is an open one fronting three streets, and the cost of the buildings is limited to 20,000.

Mr. R. F. Atkinson, of London, is awarded first place for what is a simple, straightforward plan, in which the buildings front the three roads, leaving a clear space in the middle of the site. The design of the main elevation, in brick and stone, is very suited to the suburban character of the borough; no perspective is submitted. The matter of future extension is well considered. The principal entrance and staircase occupy the central position on the main facade, leading up to the council chamber on the first floor, which overlooks the interior of the site. Corridors and entrances

are well arranged. In criticising the design, we should say that certain improvements can be effected with slight alteration. We do not like the rates office being approached from the main entrance hall, as there is always considerable traffic in this department. Most of the officials' private rooms have fireplaces, but the overseer, rate collector, and borough accountant surely deserve equal consideration? The staff lavatories are placed at the south extremity of the offices, which is anything but convenient and entails great loss of time. The councillors' conveniences, on the first floor, are quite separated from the robing-rooms, involving the traversing of the main corridor. Two doors into the council chamber would be found better than one, and the public gallery, which occupies a lateral position, would become a mere passage when the future extension, indicated by the author, is made. This gallery will be very useful for ventilating the chamber! The caretaker's apartments, although of no great importance, need careful revision; the ill-lighted corridor, the absence of coal-place, the south light to the larder, and the top-lighted bedroom are points which suggest hurried planning. These, however, are not insuperable blemishes in a scheme of which the merits are simplicity of plan and moderation in cost.

Messrs. H. Ashley & Winton Newman, placed second, send a design, illustrated by a well-drawn perspective, in which a good stone central part, crowned by the lead dome of the council chamber, takes a very satisfactory place with the brick and stone wings; the latter, however, are feeble. The plan is on the lines of the successful design, but the public gallery staircase and staff lavatories are in much better positions.

The design awarded third place, by Mr. G. H. Norton, is L-shaped in plan, having the head to the main road, and a central corridor throughout the body of the figure. This corridor is wholly top-lighted. The future extension, as indicated, would ruin the lighting of the offices already built. Placing the caretaker in the basement at such an open site as most unhappy. The four doors in the council chamber would constitute an annoyance to its occupants. Although the main front has dignity, there is much wasteful planning in the offices and vaulted corridors.

Messrs. Hall & Phillips are awarded fourth place for a plan which shows a completed scheme; if built to suit initial requirements, however, the elevations would have very irregular forms. A wide mass of buildings is contrived with two large internal areas, and the council chamber and county court have internal situations. This is a wise provision in a noisy town, but hardly necessary at Bromley; moreover, it involves wasteful entrances and corridors for officials, public, and prisoners. The abruptness of the central stone features of the main front is unsatisfactory, and the authors wisely submit only a part-perspective.

The fifth premiated design, by Messrs. Lanchester & Rickards, has a very compact plan with the various departments arranged in a square, thus forming a large internal area. This compression forces the sanitary inspector's private and public offices into a basement lighted from an external area and approached by a small staircase. The council chamber is placed above the main entrance and appears to be too large for its purpose. The Mayor's seat is in a kind of bay-window, which is carried down to the ground-floor, forming the chief projection of the front. The external appearance is of a heavily-moulded nature devoid of any dignified proportion and commonplace in its use of features. The lighting of the entrance hall is not satisfactory. The police-court is square in shape, with the bench placed in a large recess; the plans do not indicate an outside entrance for magistrates or for prisoners. This scheme does not lend itself for convenient future extension.

Of the remaining designs the following are some of the more successful, the names of the authors not being disclosed. A good pencil perspective view illustrates design No. 42, which in grouping somewhat resembles the accepted scheme, and is an excellent brick and stone building. The lighting of the council chamber, the limited provision for doors, and the many top-lighted rooms next the county court are not good points.

No. 32 follows the general arrangement, except that the education department is placed on the south boundary with the corridor next

the town hall site, so that it may be used when that building is erected; but the plan errs in the extent of its corridor space. The ground floor accommodation for the caretaker, who will be enabled to study the backs of the office buildings, and have full enjoyment of the main entrance on Sundays, is poor. By scheming important offices on both sides of an unlighted corridor No. 43 destroys all chance of success in a building of this order. There is no object in closing up the same corridor on the first floor with doors, but this is only one of other impossible ideas which a respectable elevation does not warrant.

No. 41 is a simple and, in many ways, an admirable plan; but the council chamber has too much outside wall, and the attempt to reconcile its external expression with that of the town clerk's rooms is one of its defects. No. 14 has a large mass of building necessitating two long top-lighted corridors—an arrangement suited to a scheme double the size in a large town.

A design deserving a premiated place is No. 24, which is illustrated by charming drawings. The plan is symmetrical, having two large internal areas, while future extension is intended to be placed above the two side wings. Here lies the cause of the wasteful nature of the initial form of the buildings, but the general idea is excellent. It is pleasing to find an over-hanging eaves, as shown in No. 36, in place of the usual cornice or parapet; this elevation, however, would be all the better for a heavier centre in place of the twin hips lying behind a small pedimented stone feature. The plan is poor; the idea of compelling councillors to enter and escape from their lavatories direct from the council chamber is very bad.

The chief defects in an excellent scheme numbered 35 are the change of level between the mayor's and councillors' robing-rooms and the council chamber; the necessity of the caretaker and his family to use the grand staircase from the first floor level downwards and to keep the perambulator in the main entrance. In spite of these blemishes the design deserved a better fate.

No. 18 is perhaps the best elevation in the competition; the plan is economical, in that the council chamber is placed above the county court. The oblong form and single entrance to the chamber, the distance of mayor's and robing-rooms, and the prominence given to the education store are the only weak points in a beautifully-drawn design, which should, without question, receive a premium.

A departure from custom in works of this nature is seen in No. 13, where two staircases, each in straight flights, are proposed; it does not suggest the dignity which was asked for. No. 5 errs in this respect, for his main entrance and stairs are much too cramped.

No. 26 achieves dignity in a popular manner by placing a high-pitched roof and *flèche* above the council chamber, and leads up to the height in the composition with two circular turrets on the building line, each of which contains a public gallery staircase. The plan is practical and easy working, but the placing of the education offices upon the south boundary overlooking the future town hall, combined with excess of cost, has prejudiced the author's chances of success.

No. 38 is surprising in that a main angle entrance is contrived, from which a clever and unnecessary form of plan is evolved. The ball and stairs are too extensive and lead up to nothing. The dual use of the circular stairs to serve the galleries of the court and council chamber is adroit. The elevations are "fresh," leaning more to a domestic manner, to the exclusion of regulation competition features.

A large clock tower—the only one in the whole series—meets the eye in No. 10, and terminates an angle in the building front, whilst the council chamber, with main entrance, finishes the corresponding corner. It would have been better to have reserved the tower for the future town hall.

Throughout the competition a combination of three pediments—two of which are segmental—is largely introduced. Nos. 29, 28, and 8 are prominent in this respect. No. 4 has an excellent elevation, but the enormous expanse of lead flats quite prohibits serious consideration.

No. 9 has a closed-in building so far as the ground floor is concerned, with abundant top-lighted corridor. The main elevation, which is perhaps the shortest submitted, has a delightful brick and stone treatment, with stone mullioned windows, steep roof, and ridge balustrade. No. 7 is overloaded with heavy

pedimented projections where a greater use of an uninterrupted wall would have had more force; the planning is very good in all general respects, but there are six staircases leading to too many independent basements. No. 17 is the only competitor who provides large sheets of glass in the windows, and the design suffers in consequence.

ENGINEERING FEATURES OF THE LONDON COLISEUM.

Quite apart from architectural considerations, the engineering features of the London Coliseum possesses much interest. Every effort has been made to secure the safety of the public by the adoption of fire-resisting construction for the walls, floors, and other main parts of the building. Nearly all the interior woodwork is of oak, and where pine and deal are used they have been rendered non-flammable by chemical treatment. Hydrants, alarm bells, and other fire appliances are liberally provided, and further assistance in case of any local outbreak of fire will be given by the complete telephone installation, which affords means of communication between all parts of the stage and the auditorium. Owing to the favourable situation of the building it has been possible to provide so many exit doors that the house can be cleared without difficulty in about three minutes. The stage is fitted with a fire-resisting curtain of asbestos and steel, and this curtain, 55 ft. in width, is raised and lowered by hydraulic machinery.

In the auditorium the Plenum system of heating and ventilation has been adopted, the installation being very similar to that applied by the architect at the Hippodrome, and on the stage heating is effected by direct radiation. The whole of the interior is lighted by incandescent electric lamps, but a few arc lamps are employed for special scenic and other effects.

A unique feature is to be found in the provision of lifts to convey the audience to the upper floors. Two electric lifts, each capable of accommodating eleven persons, communicate with the smoking lounge in the basement, the grand saloon, the foyers on the first and second floors, and the roof garden above. Although the extreme convenience of lift accommodation has been for many years demonstrated at the Albert Hall, it is a singular thing that no theatres in this country have previously been fitted with lifts, and we believe the same applies to Continental theatres. Another novel device, upon which the architect is to be congratulated, is the movable lounge by which visitors will be conveyed from the Royal entrance of the building to the Royal box. When the entrance doors have been thrown open the visitors will step directly into what appears to be a handsomely furnished apartment of the building, but really is a large car moving upon a track formed in the floor, through the saloon and into a foyer containing the entrance to the Royal box. The car, remaining in position at this entrance, will serve as an ante-room during the performance. A door opposite to that through which the visitors enter from the street gives access to the Royal box, and the first-mentioned door communicates with the foyer, from which the public will be excluded when Royal visitors are present.

But the most remarkable engineering feature in the Coliseum is the revolving platform occupying a central position in the stage. The stage itself is one of the largest in this country, being 140 ft. wide by 85 ft. deep, and, being constructed entirely of steel, concrete, and teak, is practically non-combustible. The revolving platform consists of three concentric tables, the outer ring being 75 ft. in diameter. Each portion can be rotated in either direction by electric motors fixed in the basement at any speed up to 20 miles an hour. Immediately behind the revolving platform an electrically operated panorama can be placed, and it will readily be understood that an almost infinite variety of startling scenic effects may be obtained by the aid of these moving accessories. The operating switches for the revolving platform and the panorama are situated on a board at the back of the proscenium, so as to be under the immediate control of the stage manager. Above the stage a large grid and extensive flies are provided for raising, lowering, and manipulating the scenery, which can be rapidly moved in almost any direction by quick-running electrically-driven overhead carriers. The whole of the mechanical and electrical

equipment, was installed under the direction of Mr. E. Wingfield Bowles as consulting engineer, the architects being Messrs. F. Matcham & Co., and the general contractors Messrs. Patman & Fotberingham.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

The usual fortnightly meeting of the Royal Institute of British Architects was held at their Rooms at No. 9, Conduit-street, Regent-street, W., on Monday, Mr. J. Belcher, the President, in the chair.

Architecture and Building Acts.

The minutes of the last meeting having been taken as read, papers on "Architecture and Building Acts" were read by Mr. Lacy W. Ridge and Mr. J. S. Gibson.

The title of Mr. Ridge's paper was "Building By-laws, Specially in Rural Districts." He trusted, he said, to be enabled to lay before the meeting the broad outlines of a scheme fit to be submitted to the Government, and embodied with proper consideration and due technical drafting in a Bill for presentation to Parliament in the coming session. That the oppression and inconvenience of the existing by-laws was being constantly more and more widely felt, was particularly shown by the formation of the Building By-laws Reform Association. As regards Mr. Justice Grantham's case, it could be no small degree of annoyance that could cause a Judge of the High Court to come down from the Bench in order to resist this action of the local authority in his district. Architects might take up the judicial position in this matter. Though the trouble these by-laws gave them was great, the quarrel was not directly theirs. Their views were the views of experts.

Dealing with the main grounds of objections to the rural by-laws, Mr. Ridge said that primarily and chiefly they were an interference with the liberty of the subject, out of all proportion to the necessities of the case or the good done by them. Again, the whole scheme was founded on the fallacy that in every district there were a large number of fit persons able and willing to serve on local administrative bodies, with no axes to grind, with plenty of time on their hands, and capable *inter alia* of drawing up a code of workable building by-laws. Another objection to the system was its unnecessary clumsiness. This was illustrated more particularly by the requirement of the deposit of drawings, and that no building could be begun without the previous approval of the local authority. Things in themselves manifestly of no importance had to be complied with to save the face of the by-law. This hard-and-fast ruling and keeping to the strict letter of their regulations by bodies who could not trust themselves to administer with common-sense in practice, put the public at the mercy of the least intelligent member on the board. It was said that local bodies should insist on the letter of the law all round, or there would be all sorts of jobbery. Perhaps that might be so. That was just his point. To say that was a confession that one could not secure in these rural districts, by popular election, men to be trusted with any discretionary powers, and if they were not fit to exercise discretion, they were not fit to have authority at all over the buildings of their district. The present condition of things was stopping building in the country, and, above all, was cutting off the supply of labourers' cottages. It was now generally recognised that there was no efficient way out of the difficulty except by legislation. With respect to this it was important to realise the proper limits of legislation. It was not for the law as a fairy grandmother to lay down in such a case as this that which was desirable or comfortable or even economical or good building, but only that which the public safety demands should be enacted and enforced by officials appointed for the public and paid at the public expense.

A Rough Draft of By-laws.

Mr. Ridge proceeded to submit a rough draft of by-laws which he considered would suffice for the general regulation of building so far as the public interest was concerned in ordinary rural districts. These proposals dealt with—(A) Notice to the local authority of the kind of building intended to be erected; (B) Width of Road; (C) The provision of Open Space for purposes of light and ventilation; (D) Damp Layer and Course—being a shortened form of By-laws 3 and 4 of the Local Govern-

ment's Model of 1903. The draft also contained regulations relating to sanitary arrangements; (E) Lobby to Closets; (F) Privy; (G) Soil-pipes and Wastes; (H) Disposal of Sewage.

Speaking of the disposal of sewage, Mr. Ridge asked: Have we not somewhat recklessly admitted the system of removing by water-carriage away from our houses matter which ought to have been returned to the land? Is not our wrong-doing constantly finding us out both in the smaller cases which we architects have to treat, and in the larger problems involved in the disposal of the sewage of our city?

One other subject (I) Party-walls, not included in the Model Rural By-laws of 1903, should, Mr. Ridge considered, most certainly be added, and be of universal application. The efficiency of the party-wall on small buildings for preventing the spread of fire was manifest. The Royal Institute had already submitted to the Local Government Board a carefully drawn clause on this subject, but it was neglected in the New Model in favour apparently of provisions as to the sizes of windows and heights of stories, which seemed to assume that the proposed buildings were to be carried out by lunatics. The Institute did not suggest that party-walls should be carried through the roof in small buildings, while in warehouses it suggested increased height, as in the London Building Act.

The by-laws proposed, Mr. Ridge considered, might be made universal in this country without oppression or inconvenience to the public. The system required no submission of drawings, no assent before building was to be given or withheld by any local authority, and the points were so little technical that such supervision as was needed could be given by any man who was fit to be appointed an inspector at all. When the local authority furnished sewers for the use of its district a new stage was reached. Plans showing the drains needed must be submitted, and the works to be executed agreed to as a condition precedent to having the use of the sewers. The author counselled the local authority and their officers to co-operate with architects in doing the best for the buildings under the special circumstances of each case, rather than regard their by-laws as the laws of the Medes and Persians, however useless and inapplicable they might be. The administration of by-laws with respect to the formation of roads and streets in the spirit of agreement rather than of command, would also do much to remove irritation.

Nothing, however, should be done to diminish the power of local authorities to deal with dangerous structures or places unfit for human habitation. On the other hand, it should be distinctly understood that these powers might be extended to deal with new buildings, should necessity arise.

The system proposed, well administered, would be far more useful to stop bad building than hard-and-fast by-laws. The local council and their inspector would soon discover the cases where intervention was necessary, and would leave the reputable builder, contractor, and architect alone.

Leaving London and the large towns out of consideration, the author considered his scheme sufficient for all practical purposes. In the most open country, and universally throughout England, space would be left for the roads, the cottages would not be huddled together, the laws of common cleanliness would be observed in sanitary matters, and material protection from the spread of fire would be afforded. The system suggested was simple, elastic, worked at small trouble to the local council, and with but few officials, and was applicable even in the smaller towns—in fact, until the stage was reached at which the community was justified in employing a really competent professional adviser.

Architectural Design and the Building Act.

Mr. Gibson, whose paper was entitled "Architectural Design and the London Building Act," said that the Building Act of 1894 was probably to the majority of London architects a series of regulations with which the artistic spirit was continually in conflict. The objects to be attained by a Building Act for such a city as London were twofold: first, in all matters relating to the construction of buildings it must contain such provisions as are necessary for the safety, health, and bodily well-being of the inhabitants, and in the arrangement and design of streets ample facilities for the carrying on of their daily work; while, secondly,

its regulations should be such as would encourage the mental growth of the people by providing an environment likely to stimulate thought and invention.

Laying Out Streets, etc.

As regards the primary object—viz., the safety, health, and bodily well-being of the inhabitants, generally speaking this had already been attained by the London Building Act. As regards the second, the design and arrangement of streets to afford ample facilities for the carrying on of our daily work, he thought the Act was not wholly inadequate, but had not even touched the fringe of the subject. This was amply proved by the constitution of a Royal Commission on the Traffic of London Streets. In the *personnel* of that Commission it was rather amusing to find that all architects had been ignored; and as far as he knew, no architect had appeared before it to express any views on the laying-out and design of London streets, yet if Sir Christopher Wren's scheme for laying-out the new streets of London after the Great Fire had been carried into effect, it is very probable there would have been no need for the present Royal Commission on Traffic, and Sir Christopher Wren was only an architect and surveyor.

When one realises the enormous annual loss to the community directly occasioned by the inadequate widths of the main streets in the central part of London, the lack of broad and direct lines of street communication east and west, north and south, on both banks of the river—when this is manifested day after day by the congested traffic in practically every main street within a radius of one mile of St. Paul's, group after group of cabs, motor cars, and buses intermixed with slow moving drays and carts stopped every quarter of a mile, the dislocation of streams of traffic occasioned by the loading and discharge of vans in Fleet-street, the Strand, Chapside, Bond-street, and such like thoroughfares, it must be patent to even the most indifferent that the time has come when, to put it on the lowest commercial grounds, the whole great question of the realignment of the main traffic arteries and their enlargement to the work to be done must be seriously taken in hand.

All new streets and the widening of those already existing should be part of one great scheme, conceived on large and generous lines, so that ultimately we should have a city of noble streets. As regards the laying-out of new areas on the outskirts of London, large estates are being continually cut up by the speculative builder into vast tracts of mean streets, lined with meretricious or vulgarly pretentious houses, disposed as he thinks best for himself, and with no regard to the surroundings, the main lines of traffic, or the fact that his area is an integral part of the whole town. The time has come when steps should be taken to compel the owners to lay out their land in the interests of the community as well as in the interests of the owner.

The utter failure of Shaftesbury-avenue, either as an adequate roadway or as an example of architectural street design, has evidently not been lost upon the authorities, for we find the London County Council setting out the Kingsway at 100 ft. wide instead of the 60 ft. of Shaftesbury-avenue, and this is a step in the right direction.

The author went on to compare the widths of important thoroughfares in London with those of Continental and American cities, and thought there would be general agreement with him that any amended Act should authorise the Council to provide for streets up to 100 ft. in width if the inadequacies of the present were to be obviated in the future.

Height of Buildings and Width of Streets.

The next point was the relation of the height of building to the width of street. In this connexion the author referred to an article in *The Builder*, of February 29 last, which, he said, dealt thoroughly with the point, and which he quoted at some length. The writer of the article expressed astonishment that in considering section 49, "the Institute Committee had made no protest against the absurd anomaly by which, according to the existing Act, a street 6 in. less than 50 ft. in width is restricted to buildings the same height as the width of the street, while a street 6 in. over 50 ft. in width may be lined with buildings 80 ft. high."

In buildings in the City of London the dominant factor governing the height was

usually the rights of lights of the opposite owners, and this had often determined the reasonableness of the heights of new buildings. When streets are increased beyond a width of 60 ft. the heights, he thought, might be also increased beyond the width of street without detriment to its architectural aspect. The author suggested the following as a schedule of maximum heights for streets within a radius of $\frac{1}{2}$ miles of St. Paul's Cathedral:—

Width of Street.	Ratio of Height of Buildings to Width of Street.	Approximate Lowest Buildings.	Approximate Highest Buildings.
Feet.		Feet.	Feet.
40 to 60	1-000	40	60
60 to 80	1-125	67	90
80 to 100	1-250	100	125

For streets outside the $\frac{1}{2}$ miles radius from St. Paul's Cathedral and within a 3 miles radius the heights should be equal to the widths of the streets, while outside the 3 miles radius the heights should be less than the widths of the streets, with a maximum height of $\frac{7}{5}$ of the width for streets of 100 ft. wide.

Air Spaces between Houses.

Another point of great importance is the provision of air spaces between the houses in the outer zones. The German regulation which stipulates for the outskirts of Berlin and other towns that there should be a space between the houses for aeration is a provision worthy of our serious consideration.

A further point is the provision of air-spaces to buildings, more particularly on corner sites in London, where by section 41, sub-section 4, the height of the building is limited to 30 ft. upon such part of the space at the rear of the building as the Council may think fit. It would tend to continuity of street frontage design if the restrictions as to heights of buildings on such rear spaces were abolished and percentages of areas of land to be covered substituted, and would render unnecessary the special applications to the Council which architects resort to only after they have tried every other expedient to obtain the effect they desire.

Minor Details of the Act.

Coming to the minor details of the Act which bear upon the design of buildings, the author dealt with the regulation governing the areas of openings and recesses in external walls. Section 54, he thought, was not properly drawn, even for a plain wall with openings and recesses in it, and as a regulation governing the whole subject of the relative areas of solids and voids in external walls of varied design and construction it was wholly inadequate.

The projection of cornices is a matter of very considerable importance in architectural design, and the arbitrary limitation to 2 ft. 6 in. met with wholesale disapproval. It should not be necessary, in streets of ample width, to set back the building line in order to obtain an adequate projection of cornice, as had practically been done under the present Act. Further, in streets of 50 ft. width and over, the projection of cornices, balconies, oriel, and bay windows should have fixed ratios to the width of street, and their erection permitted without having to make special application to the Council.

Some provision should also be made for overhanging eaves and verges, which do not strictly come under the heading of cornices, as there are great artistic possibilities in the treatment of wall-heads, gables, and pediments with overhanging eaves, and these would not interfere with the amenity of the streets in any greater degree than cornices of similar projection.

As regards the regulation governing shop-fronts, it would be a step in the direction of sober and logical design if it were made impossible to erect huge sheets of glass on ground and first floors. The public would welcome a return to more modestly-designed shop-fronts, and trade, he thought, would not suffer in consequence of the change.

The Institute had made some suggestions dealing with this matter whereby sufficient piers or other supports of granite, stone, brick, metal or other approved materials should be constructed from the level of the ground to the main wall of the superstructure above, and these piers should not at any time be covered with mirrors or otherwise concealed.

Mr. Gibson concluded by referring to three matters which he claimed to be of grave public importance:—

First, the lack of any provision in the present Act for the use of protected steel construction in buildings. Considering the advantages to be obtained by its adoption, the saving in floor space, the important bearing it had on the areas of support, the difference its proper use would make on the proportion of solids and voids in external wall design, it was greatly to be regretted that its adoption as a building material was not foreseen and provided for. Buildings were constructionally erected in this material, and then the external and other walls built around the steel in the same huge masses of brick and stonework as were necessary for buildings erected of the latter materials only. Practically the whole advantages of steel construction were nullified, and enormous masses of materials and labour absolutely wasted.

Secondly, he protested against the exemption of certain buildings of railway, canal, and dock companies from the operation of clauses 6 and 7 regulating matters of construction and design. One could only think with indignation of such atrocious structures as Broad-street, London-bridge, Ludgate-hill, and Victoria stations, to mention a few examples of the ill-doing of these private companies. It was nothing less than a public scandal that a great city like London should be powerless to insist on the instant removal of such structures.

The third point of public importance was the great desirability of all District Surveyors being practising architects. Nothing could be more inimical to the interests of the public, to the growth of architecture, to the beautifying of our streets, than to have as interpreters and administrators of a complex Building Act persons who, although highly skilled in technical knowledge and masters of routine, were inexperienced in the erection of buildings. In the interpretation of the various regulations dealing with complex modern buildings it was essential to have men who were experienced in modern architectural practice, men who knew the difficulties that were constantly arising, who were intimately conversant with the schemes of architects as judged by their designs. He commended to the consideration of all District Surveyors the second section of the Building Laws of New York—viz., "This ordinance is hereby declared to be remedial, and is to be construed liberally, to secure the beneficial interests and purposes thereof."

The author hoped that the attention of the City Corporation and the London County Council would be given to all the matters raised by the reading of the papers that evening, and that they would use every means in their power to further the development of London on lines that would give them a noble city.

Mr. Reed (Hon. Secretary of the By-Laws Reform Association) in proposing a vote of thanks to the readers of the papers, said they both dealt with subjects of immediate interest, but he could not help, perhaps maliciously, pointing out that they were somewhat mutually destructive. Mr. Ridge advocated legislation somewhat in detail as a remedy, while Mr. Gibson, who was dealing with the London Building Act, pointed out how rigidly that Act had been dealt with. That Act, if he might say so, was nothing but a glorification of by-laws put into an Act of Parliament. He hoped Mr. Ridge would forgive him if he differed from him in that part of his paper. He was glad to testify from his immediate experience of rural by-laws, and from past experience in connexion with the London Building Act of 1894, to the enormous assistance that gentlemen of his profession derived from being brought into contact in these matters with members of the architectural profession. He was one of those who felt that they should be able, outside the walls of Parliament, to meet and determine amongst themselves those things which were simply matters of detail, for it was impossible on the floor of the House or in Committee Rooms to deal adequately with questions of the construction of buildings, to use that as an example. If they were to get assistance in the matter, especially of rural by-laws, he would urge upon that Institute the desirability of avoiding anything like detailed legislation. That legislation was needed he entirely agreed, but what was wanted was legislation which would enable them as architects to have a free hand, so that they would be able, so long as they were doing what they considered was best for their clients, and their clients were doing what they considered was right for their

tenants and the public, to build such buildings as their experience had taught them were good and necessary for the purposes for which they were intended to be used. It might be Utopian, perhaps, to think they had only to say that a building should be good for the purposes for which it was intended. Of course, they had to meet with by-laws administered by local authorities as they found them, and not as they would have them, and his view was that it would be better to work in the direction of getting exemptions from by-laws and not in the direction of re-enacting by-laws which would get them into possible trouble. His view was that a code of by-laws might be framed which might be administered with the existing machinery without unduly hampering those who had to provide either large houses for the well-to-do or small cottages for the poor. This last point had been brought into a great deal of prominence lately, but he would not refer to any specific case. It had become a burning question how to make it possible to provide adequate accommodation within the means of those gentlemen whose incomes were derived from land, and it seemed to him that if they provided sufficient space and sufficiently sound cottages, beyond that nothing should be required. The Building By-Laws Reform Association had laid before Mr. Long their Bill, the main features of which he would give. The first point urged in the Bill was that houses, whether small or large, in places other than those covered by special building Acts, such as London and other large cities, should, subject to certain space being provided around them, be freed from all structural building by-laws. The second point was that the Local Government Board, where it finds the laws sanctioned by it are oppressive and unsuitable to the district in which they were being applied, should have power to substitute other by-laws. It seemed to him that these two things would enable the central authority and the local authority adequately to protect public interests in all directions. Probably the whole question was summed up in two small things. If they were really anxious to get immediate relief it could only be done by bringing forward a Bill which would offer the fewest points for opposition, because in the present state of legislature in the country, unless the Government would itself bring in a Bill, there was little chance of its being carried unless it contained the minimum of points for consideration.

Mr. Ridge said the last speaker had not quite followed out his proposition with regard to the Act of Parliament. His point was that the Act of Parliament should be passed solely and simply to enable the Local Government Board to take away all the powers which they had so foolishly granted to these urban bodies, and to substitute for them such simple by-laws as it should seem to them right to enact. That was his proposition, which could not be shorter.

Mr. G. Hubbard, in seconding the resolution of thanks, said they had heard two extremely interesting lectures. There was one point in Mr. Ridge's remarks which was not quite clear to him. Mr. Ridge spoke of seven new by-laws he was suggesting for the urban district councils. One was that the area at the back of the building should be of the full width of the buildings.

Mr. Ridge said that was not quite so. His suggestion was that the space area of every cottage and house should be equal to its own area on the ground floor level. His point was that they might put it where they liked, and in that way they would get rid of the question as to what was rear and what was front.

Mr. Hubbard said that did away with his point, and was much better than the present London Building Act, which required an area of the full width of the building at the rear. He did not know whether it had ever occurred to them that by-law made the building of terrace houses round a crescent utterly impossible. An architect he happened to know submitted some plans to the London County Council for some terrace houses round a crescent, and the London County Council, in their wisdom, refused to pass those plans because they said they were not in accordance with the London Building Act, and their argument was that it was impossible to build terrace houses on a crescent because of necessity the area at the back must be less in width than the width in front. The London County Council squared the matter. They said they wanted some

land on the other side of the road, and that if the architect's client would give up that land to them they would be quite prepared to pass the plans. Of course, it was not a proper equal exchange, but still the matter was got over in that way. Another absurdity of the matter of the width of roads must be apparent to them all. The London County Council had done it themselves, but other people could not do it without their consent, and that was to construct a crescent road; because the Act required that all new roads must connect directly between existing roads, and the County Council had resolved that a crescent was not a direct road, and, therefore, under their own regulation it was impossible to build a crescent road. The absurdity of the urban district councils by-laws was very much brought home to him some little time ago. He had received instructions to build a house for a client, and he had to set the building line 40 ft. from the road. After the house was complete his client wished him to add a billiard-room, and the only possible way of adding the billiard-room was by projecting 2 ft. 6 in. in front of the building line. He sent his plans to the urban district council, and gave notice that he would begin building. It was not necessary to obtain their consent to do that, for the Act only required that they should submit plans to them. He submitted his plans, and began his building, and their surveyor came down and viewed the trenches and approved of them, and saw the concrete, and so on; and he was putting on the roof of his billiard-room when he received a communication from the urban district council to say that the plans had not been passed. He inquired as to what was the matter, and was told that his billiard-room was 2 ft. 6 in. in front of the building line. He told them that the surveyor had passed it, and asked what they wanted him to do, and they replied, "set back the billiard-room." He told them it was impossible to do that, and the next thing was he was served with an injunction from the council, and he went before the magistrates. The magistrates said they were very sorry for him, and that the council had, in a sense, condoned the offence as their surveyor had passed the work from time to time, but they could not be blind to the fact that it was an infringement of the Public Health Act, and they fined him 20s. Well, he thought he had got off very lightly, and he again went on with his work. To his utter surprise he was again informed by the urban district council that he was not to proceed, and that they were going to bring another action against him. They said "that billiard-room is still in front of the building line." He replied that he had paid 20s.; and they said "that does not settle the matter; you paid 20s., but that was to condone the offence up to the time of the action, but the evil is still being continued." They brought another action, and he took it to the High Courts and judgment was given against him, and he had to pull down the billiard-room. When they came to consider that this was a large house standing in its own ample grounds, as the agent would describe it, and that there was not a house within a quarter of a mile on one side, and the occupants of the houses on the other side could not see the billiard-room at all, they would see the hardship. It was an absurdity that he should have been compelled to pull down a room which projected 2 ft. 6 in. from the building line where the house stood 40 ft. from the road. On the matter of the building line, there was something absolutely absurd in the working of the Act. Clause 3 of the Public Health Act said: "It shall be unlawful in any urban district without the written consent of the urban authority to erect or bring forward any building or any part of such building beyond the front main wall of the house or building on either side thereof." That meant that without written consent they could not bring forward any portion of their building in front of the main front wall of an adjoining building. Now, they could imagine a road with plots of land, and the man who put up the first building determined the building line. Perhaps the man next door wanted a large bay window, and as that must not be set beyond the main wall of the first building, the house has to be set back, and so a new building line was established. The next man might like a large front garden, and if he built right at the back of the land, under this Act no one could go in front of him, and the remainder of the sites would be absolutely worthless.

Mr. W. Woodward thought the papers were so important that the discussion on them should be adjourned to the next business meeting.

The Chairman said there was a business meeting on January 9, at which the discussion could be continued.

A member said that at the next business meeting they would have to deal with Bills before Parliament, and he would suggest that the discussion on Mr. Ridge's paper should not be mixed up with the discussion on the London Building Act.

Mr. Ridge said that he felt it would be a good thing if they could separate the two subjects, for they were totally different.

The discussion was then continued on Mr. Ridge's paper.

Mr. Woodward said that one of the great features of Mr. Ridge's paper was the very proper attack upon officialism. The whole base of architects carrying out architectural work was the interference of gentlemen more or less acquainted with the subjects with which they had to deal. They as architects knew of the narrow-minded interference which did not give any benefit to the public, but only led to loss of temper on the part of the architects and loss of money on the part of their clients. Take, for instance, the enormous number of drawings which they had to submit to the various local bodies. These authorities were not satisfied with one set of drawings, and in some cases a third copy had to be provided. They were inundated with paper and red tape, and the sooner they got rid of it the better. It had been asked why, with regard to the London County Council requirements for drawings, the architect should object as he did not have to pay for them. He was certain, however, that every architect would agree that one of the great difficulties they had to deal with was having to ask their clients to pay for the enormous number of unnecessary drawings. With regard to rural by-laws, they must all sympathise with Mr. Justice Grantham, for it was an instance where the whole trouble had been created by men not sufficiently informed upon the subject brought before them. It was impossible for the gentlemen composing local bodies to deal adequately with the matters brought before them, and if an architect or surveyor were employed he would be able to go through the drawings and initial them, and that was all that was necessary. What they had to deal with now, however, were delays and constant revision of drawings for no earthly good. In the case of drains, for instance, they had to submit drawings and plans of sections of each floor simply to show a water-closet on the first or second floor, and this was an absolutely unnecessary expenditure of time and money. If they only imported common sense into all the questions they would find that the evils which had been referred to would be disposed of. He could not agree with the Secretary of the By-Laws Reform Association that legislation should not be provided, and he thought that the by-laws suggested by Mr. Ridge were just the sort of outline by-laws which everybody should conform to. He agreed with Mr. Ridge that the area of the vacant land should be equal to the land covered with bricks and mortar wherever it might be. That would get rid of a great difficulty, and would ensure the necessary health space. As to being able to start a building before the drawings were approved, he did not see why a man should wait until it suited the convenience of local bodies before he could make a start. He thought that a man should be able to submit his drawings and then make a start, and if the surveyor saw that he was doing anything wrong he should call the attention of the architect to it, and not allow the man to go on with his building when he knew that something was being done in contravention of the by-laws. He believed that Mr. Ridge's paper would do a great deal of good, and if he could succeed in doing away with officialism and in reducing the consumption of red tape, and finally abolish the central authority in Whitehall, he would be doing a good thing.

Mr. Maurice B. Adams said that with regard to the question of drawings they must remember that a great many buildings were not carried out by architects at all, and this was important. They had to submit to a certain amount of red tapeism, and he felt that they ought to willingly submit to a certain amount and to go as far as Mr. Ridge suggested. One question which Mr. Ridge alluded to he spoke somewhat

feelingly about, and this was with reference to the width of roads. So far as he could understand the law at present the district council had no power to define the width of a road other than the minimum width of it. Very often great hardship arose where the road was made through a property adjoining other property. Perhaps a man had a plot of land and another man bought land at the back, and to develop this land he made a road with a width of 40 ft., which is the minimum width. If the road was made of this width right through, that might leave a strip of 5 ft. at the side of the first plot, and so the man making the road made it 45 ft. at this point, and did away with his strip, and so did not have to pay for the making up of the road. The local authority said they had no power, and that the person whose land was made to abut on the road would have to pay for the making up of the road.

He happened to be the possessor of a piece of land where that had arisen, and his tenant told him he should expect when his term expired to pay less rent, while he (the speaker) would have to pay for the making up of the road he did not want. That was a little instance of where it was necessary to fortify and assist the local council in order that they might protect the interests of the public and of individuals against that which was manifestly unfair. He did not know whether Mr. Ridge proposed that councils should have power to determine the width of roads, but so far as he understood at the present moment they had no such power.

Mr. J. H. Ball remarked that the debate had been rather disappointing, and he would like to ask whether the adjourned debate would be upon the regulations of rural district councils, or would it be upon any proposed by-laws.

The Chairman said it would be a continuation of their present debate, and they would take both. At times they all felt the oppression of rural by-laws, and they had great sympathy with those who had such experience. The chief point which both the readers of the paper had impressed upon them was the increase of officialism. What they wanted to have were men who could be responsible and who would not shrink responsibility; who would be men who had great experience and who were probably in active practice and who were able to determine each case on its merits. Mr. Ridge had suggested by-laws which concerned the community at large. Those were the points on which they required legislation, and then came the common sense of the official who would regulate their details. What was really required was a responsible individual to take up these things and deal with them separately.

The debate then stood adjourned till January 9.

STREET ARCHITECTURE.

A MEETING of the Applied Art Section of the Society of Arts was held on Tuesday evening, at the Society's premises in John-street, Adelphi, W.C., Dr. Longstaff, L.C.C., presiding, when Mr. T. G. Jackson, R.A., read a paper on "Street Architecture."

Ten years ago, he said, a paper was read in that room on the same subject by Mr. Beresford Pite, and he remembered saying that the old Strand had always struck him as being one of the most picturesque streets in Europe. It was too soon to pass a final verdict on the architectural result, but the old Strand which had delighted their eyes for so long had gone for ever, and it remained to be seen whether its successor would charm equally though in a different way. It was right, when sweeping changes, like those that were transforming this part of London, were being effected, to seek for and examine the principles that ought to govern street architecture. But these principles should not be kept for these occasions alone, and it was important that the true principles of street architecture, if they could be discovered, should be applied to works on a small scale as well as to those of grand dimensions. There was nothing, for instance, but good principles to prevent any freeholder from building or rebuilding his house in some incongruous fashion which would spoil a whole street. One principle which ought to govern street architecture was surely that consideration should be had for neighbouring buildings; because street architecture was social architecture, and it ought to conform to those rules of convention by which men in society were governed. Buildings in a town street could not indulge in the freedom that was

permissible to a house in the country any more than the owner could live in town with the same easy disregard of appearances that he enjoyed when he was away. Architecture might be guilty of social offences quite as much as the architect. Violent interruptions, startling contrasts of demeanour, disregard of the conventions of society, efforts to shout down and overpower his company, which would put a man outside the pale in the civilised world, find a very close analogy in the pretentious buildings that one often finds thrust into the streets and squares of London without the least regard for the style of the work they interrupt or the scale of the buildings they overshadow. Could anyone look without irritation at the north side of Cavendish-square, where the fine symmetrically-placed houses in the severe classic of 1770 were crushed by an enormous pile of nondescript architecture on one side of them; or look with satisfaction at the strange sky-scraping structure that mars the wholesome brick architecture of Hanover-square; or view without dismay the appalling intrusions that were breaking up and destroying the design of Regent-street, the one fine and consistent piece of street architecture in London? These offences were more flagrant and mischievous in proportion to the architectural value of the neighbouring buildings that suffered by them. An example was to be seen at Great Malvern, where a huge pile of building had been allowed to grow up actually touching the west end of the Priory Church, and overshadowing it. There was another at Bath, where a monster hotel overtops the east end of the abbey close by. A familiar instance is to be found at Milan, where the west front of the Duomo, despite its enormous size, is crushed into comparative insignificance by the new buildings, and the prodigious front of the Galleria on the north side of the Piazza. The first principle that he would lay down for town architecture was that there should be a consistency, a regard for the surroundings, an absence of vulgar rivalry in display, corresponding to that consideration for others which was the essence of good manners among individual men and women; that ordinary houses should subordinate themselves to buildings which, from their public uses or their architectural importance might fairly claim precedence; that, in fact, there should be a "comity" of conduct in architecture as well as in society; any violation of which should be condemned by public opinion as in bad taste, inartistic, and intolerable. Another consideration that arose out of this, especially when there was a question of cutting through old towns and forming new thoroughfares, was that when the alterations approach or touch beautiful buildings whether old or new, they should be designed so as to fit them, and bring out their beauties and enhance their architectural effect. This was a principle that had been much more attended to abroad than with us. The Louvre must have gained enormously by the construction of the Rue de Rivoli, and the old Tuileries by the formation of the gardens and the Place de la Concorde. With us, hitherto, this principle seemed rarely if ever to have been thought of, new streets and roads having been planned solely for convenience, easy gradients, and economy, with very little thought of artistic effect. What splendid opportunities had been missed, for instance, when the alterations were made at Hyde-park-corner, which, though they had facilitated traffic to some extent, had destroyed the little there was of orderly arrangement, when Decimus Burton's arch and screen stood in some sort of relation to one another. A still worse failure was that at the site of the old circus where Regent-street joins Piccadilly. The fault did not always rest with those who lay out thoroughfares in London. Considerations of economy had to receive attention, but they should not always be allowed to prevail over every other. When unusual opportunities occur of making a beautiful street, as for instance in the alterations of the Strand now in progress, it would be unworthy of a great capital to treat the matter solely or even mainly from the commercial point of view. It must not be forgotten that the present chance of making a fine thing would not occur again, and that a mistake made now from a too parsimonious motive would lay up a store of disgust and irritation in the future, and a bitter regret for a wasted opportunity. This however was what we are threatened with in the case of the Strand between Wellington-street and the Law Courts. As far eastward as the end of St. Mary's Church there seemed

nothing to complain of in the frontage line adopted. The debatable line was that east of St. Mary's, running from it to St. Clement's, about which there had been a great deal of discussion, and would probably be more. The new frontage lines as approved by the County Council signally failed to fit the lines of the churches of St. Mary and St. Clement, and it was one in which the very elements of true architectural treatment were not so much neglected as deliberately rejected. In no other capital in Europe would the economical question have been allowed to prevent so grand and important a scheme from being carried out in the best way possible. On such an occasion the Council could not fairly be accused of extravagance if it sacrificed something to those aesthetic considerations which had been brushed aside as if they carried their own condemnation with them. Another principle to be observed in altering or improving an old town should be that the general lines of the main streets ought to be respected whenever possible, and the general conformation of the plan as little altered as was consistent with public convenience. Considerations of convenience on the one hand and of beauty or sentiment on the other were seldom wholly irreconcilable. Streets were not, or should not be, mere mechanical contrivances for getting from point to point as speedily as possible. They had never been so regarded at any age but our own. One might almost say they were not so regarded now in any country but this. They should be beautiful and interesting, and so disposed as to show off their buildings to advantage and to preserve faithfully their historic traditions. One very awkward result would be avoided if the lines of old thoroughfares were taken in laying out new ones. Everybody must have noticed the sharp triangles to which corner houses come in most of the new streets that have been driven through crowded districts of London. They were caused by the fact that the general trend of the old streets lay obliquely to the line chosen for the new ones. In the new Kingsway towards the Holborn end the line was fairly square with the streets it passed through, but as it came south the street hears off obliquely, and this unsightly result would have the usual bad effect, unless the adjoining streets were altered also for some way outwards. But bad as these sharp-ended sites were for architectural effect, and inconvenient as they must be for internal plan, they were not so bad as the rounded ends and corners which had been the fashion in new streets. Rounded angles were seldom agreeable in architecture, and were best avoided. They deprived one of the firm outline and positive drawing which the eye demands in builder's work, and substituted for it a certain weak indefiniteness which was destructive of true form, and confused the elements of proportion. Whether in large or small buildings this rounding of the mass was equally injurious. Small buildings, perhaps, needed sharp square forms and positive outlines even more than large ones, and yet nothing could be less satisfactory to the eye than these rounded fronts on a great scale, as, for instance, the Grand Hotel at the corner of Trafalgar-square. In the case of a street entirely new from end to end, like Kingsway, many difficulties were absent. This was particularly so in the matter of scale. The buildings that lined Kingsway might be as large as they pleased. But in the case of the Strand this was not so. The proper scale was given there by the two churches and by Somerset House, and the new buildings must conform to that scale, if they were not to spoil the picture. Unfortunately this was not likely to be a consideration with either the London County Council or the lessees of the new sites, if one might judge by the beginning that had been made. Perhaps it was not too late to induce the Council to fix a height for the Strand fronts properly proportioned to the scale of the old buildings which gave the Strand its peculiar charm. We did not want an "imposing effect" as the report of the Improvement Committee called it, on the north side of the Strand. Let the "imposing effects" be reserved for Aldwych and Kingsway; but even there it was to be hoped that megalomania would not be allowed to run riot. In hot countries, where the sun was an enemy to be shant out, narrow streets between lofty houses were reasonable. But in England the sun was a visitor who never or rarely overstayed

his welcome, and we wanted as much of him in our streets as we could get. The houses of Regent-street and Oxford-street and of the untouched parts of the Strand were of the ideal height for our dim murky London streets. As to the best way of laying out street architecture on a general scheme, should it be treated as one whole, a single design to which every builder of a part must conform, or was the building line to be the only rule, and was all style, scale, and architectural treatment to be left to individual taste? Was the architecture of the street to be individual or collective, accidental or regular? There was much to be said for either alternative; but the unrestrained genius of the commercial architecture of to-day was to be regarded with misgiving. The result would probably be a competition in which every house would try to outshine its neighbours by cramping on more ornament, overpowering them in splendour and overtopping them in height. Better far than this the monotony of Gower-street or the unloveliness of Wimpole-street. The tide of self-advertisement was rising. It had laid nine-tenths of our architecture at its feet. Art was supposed to consist in ornament, and ornament was valued according to its quantity, not its quality. Perhaps the crucial difficulty of street architecture was the shop-window. In these days of display, it was thought necessary to abolish the front wall of the ground floor and to substitute huge sheets of plate-glass. The architect must reckon with these shop fronts, but how were they to be treated architecturally so as to be tolerable, or actually an element of beauty in a façade? To bring the new construction, consisting of two steel stanchions and a beam across, within the domain of art, it was only necessary that it should be visible. There was no reason why the stanchions and bresssumers should not be treated architecturally, instead of, as now, being concealed, so that the building appeared to be supported on the edge of a plate-glass shop front. Until we made up our minds that, if we accepted the new mode of construction by iron, we must break definitely with the traditions of brick and stone there would be no hope for us. Never was there so much talk about the advancement of art. Art schools covered the country and scholarships were showered on the students; but we should surely stultify ourselves if, when the time came for putting our pretended interest in art to the test, we chose the worse way of doing an important work instead of the better, from purely utilitarian motives.

The Chairman, in opening the discussion, said that the great problem was to impress on our municipal bodies the importance of those aesthetic considerations which were now so much despised. Unfortunately, aesthetic perceptions were not often found in combination with the sort of character which would lead a man to toil over municipal work day after day. As a rule, our municipal bodies did not represent the average taste of the nation. Not nearly enough attention was given to architecture as an art in this country. Architecture might be taught in connexion with history as well as with art, and then better-cautions of taste might be hoped for in the public. Our aediles in the present day did not know what was good and what was bad. The most hopeless thing in modern town architecture was the height of the buildings; but he feared there was no hope of imposing greater restrictions in this direction.

Sir J. Wolfe Barry said that at present the streets of London were inadequate for traffic which they had to accommodate, and there would probably be a great effort in the future to make new and wider streets, to prevent the loss due to congestion of traffic which now fell principally on the wage-earning classes. It was most desirable that these future street improvements should be considered from the artistic point of view as well as from the utilitarian; but of course utilitarian considerations must come first. The architect of the future must discard a great deal of what he had been taught of Roman, Greek, and Gothic architecture, which was not suitable for modern commercial life. He must study steel and iron construction and see how it could be made artistic. There was no reason why steel and iron should not produce a beautiful and harmonious whole. It would be difficult to improve, for instance, on Southwark-bridge as an iron structure, and the great arches of Blackfriars-bridge were not unworthy of admiration. If the big shop-window was a necessity of modern street architecture, the treated form of construction was the only one

which could adjust itself to the conditions. Until architects set themselves free from traditions which were not applicable to modern requirements, we should continue to be confronted with bastard styles of construction, both ludicrous and unsatisfying.

Mr. Reginald Blomfield said that architects must look to civil engineers to teach them how to deal with iron and steel. In this country we had not yet a sufficiently high standard of taste to warrant the setting up of an artistic directory of control in architecture. But it was the absence of any definite principle in the designing of our streets that had led to some of the horrible fiascos of the London County Council.

Mr. T. Blashill pointed out that taste changed radically in twenty years; and he thought that individualism ought to prevail over collectivism. If the public wished to have elevations to suit their taste, they would have to pay for them. When land was let by auction there was a limit to the restrictions which could be placed on designs. But if it were desired to have control over designs, why not let the land for a fixed sum, subject to the approval of the design, which thus would be seen before the bargain was completed?

Mr. Halsey Ricardo exhibited a design for a model street fulfilling modern requirements.

Mr. Mark Judge urged that there must be something wrong when land in such a position as that fronting on the Strand remained uncovered for months together.

The proceedings terminated with a vote of thanks to Mr. Jackson for his paper.

THE BRITISH ASSOCIATION OF WATERWORKS ENGINEERS.

THE annual winter meeting of the British Association of Waterworks Engineers was held in the Lecture Theatre of the Geological Society, Burlington House, London, on Saturday, December 10. Mr. F. J. Bancroft (Hull), President, was in the chair, and among those present were Messrs. P. H. Palmer (Hastings), Dr. Kemna (Antwerp), W. Whitaker (London), C. E. Jones (Leyton), J. Hutton (Scarborough), C. Sainty (Windsor), T. N. Ritson, H. E. Stilgoc, W. Matthews (Southampton), W. Watts, Percy Griffiths, Secretary, and others.

The President read the report of the scrutineers, to the effect that Mr. P. H. Palmer (of Hastings) had been elected President, Messrs. W. Millhouse (Scarborough) and C. Sainty (Windsor), Vice-Presidents; and Messrs. C. Greenslade, W. Matthews, H. Ashton Hill, W. H. Humphreys, C. E. Jones, H. E. Stilgoc, J. S. Pickering, T. Bower, J. J. Lackland, and C. C. Smith, members of the Council for the ensuing year.

Mr. Palmer thanked the members for his election as President, and promised them a hearty welcome on the occasion of their visit to Hastings.

The President, on behalf of the members who attended the summer meeting of the Association in Belgium, presented Dr. Kemna with a silver tea and coffee service, suitably inscribed, in recognition of their appreciation of his services. He said that Dr. Kemna's urbanity, his stock of technical knowledge, and the heartiness with which his brother managers came to his assistance—all these things combined to make the visit an unqualified success.

Dr. Kemna, in acknowledgment, said a good deal of the appreciation of the members was due to the fact that they were favoured with good weather, and to his countrymen and friends, the waterworks engineers of Brussels, having done all they could to show how pleased they were to receive their visitors.

Warrington Waterworks Extension, Appleton.

A paper by Mr. George Mitchell on the "Appleton Extensions of the Warrington Waterworks" was read by the Secretary. He said the Appleton Waterworks were designed by the late Mr. J. F. L. Bateman, and were carried out in 1846, being extended in 1859 and 1901. Previous to the execution of the 1901 extensions (which were carried out under the Warrington Corporation Act, 1899), the works consisted of a storage reservoir of a capacity of 62 million gallons; two filters, having a sand area of 915 square yards; and a pure water tank of a capacity of 300,000 gallons. The pure water tank was originally covered by flags laid on girders, supported by cast-iron columns, but as the roof had been allowed to get into a bad

state of repair it was entirely removed about eight years ago. The effect, however, was the production of large quantities of green growth in the water, in consequence of which it was resolved to construct a new covered pure-water tank, and, the filtering area being inadequate at certain seasons of the year, the old tank was converted into two filters.

The old filters were rather shallow, so a slight excavation was necessary before the re-construction could be commenced. A thin layer of fine concrete was then spread on the bottom and carefully smoothed over. The bitumen sheeting was laid on this, and covered with a layer of fine concrete 5 in. thick, with a finishing coat of cement rendering. The sheeting on the slopes was protected by means of blue-pressed Staffordshire brick-on-edge paving, finished off with stone coping. Considerable difficulty was experienced in laying the bitumen sheeting owing to the pressure of the ground water during wet weather; but, holes being made good and the paving completed after the brickwork had set, no further trouble was experienced.

The filtering material consists of 2 ft. of sand, supported by gravel of an average depth of 10 in., supported on a false bottom of perforated tiles laid on lines of brindle bricks. This form of under-drainage has been in use on other works for at least thirty years.

The inlets to the filters are provided with Glenfield and Kennedy's non-concussive ball valves (fitted to act also as stop valves) to keep the water at a constant level, and the main drains discharge into wells containing Glenfield-Jones automatic regulators. The water is used exclusively for trade purposes, and the filters are merely required for the clarification of the water. Had the removal of bacteria been essential, the author would have increased the depth of sand to 30 in., and used finer sand for the top portion.

The capacity of the pure-water tank or service reservoir at the Appleton Works is 683,000 gallons. It is circular in plan, and constructed almost entirely of Portland cement concrete. As the trial pits disclosed the presence of a fairly good clay all over the site, the author at first proposed to use puddle-clay work, but after looking further into the matter this idea was abandoned, and it was determined to use Callender's bitumen sheeting as the water-tight medium. The chief objection to the use of this class of material being the high cost of the necessary protective covering (which sometimes exceeds 10s. per square yard), it occurred to the author that in such a shallow reservoir it might be possible to place the sheeting at the back of the wall instead of at the front, by which means, the soil being clay without any stones, all protective covering would be dispensed with. After consultation with Messrs. Callender this method was decided on. On the concrete foundation for the walls bitumen sheeting was laid of a width sufficient to leave a considerable lap at both sides, and, the walls having been built, the sheeting was continued up the back, being tied into the walls by small bolts with 6-in. cast-iron washers, placed about 30 in. centres horizontally and vertically.

With regard to the roofing of reservoirs, the author is of opinion that where thoroughly good work can be secured, cast-iron pillars form the ideal support, and these would have been adopted in this case had it not been for the difficulty experienced at the High Warren reservoir in securing the delivery of such in reasonable time.

In the Appleton Reservoir, therefore, the roof was supported on blue-brick pillars, 1½ bricks square. These were very long in proportion to their sectional area, and the author found great difficulty in arriving at their safe working strength, data on this point being very scarce. The pillars were recommended immediately the excavation was got out, in order that they might be thoroughly set before being loaded, and the greatest care was taken in selecting the materials and in levelling and planking the work at very frequent intervals. In fact, the labour charges of this work amounted to at least six times as much as in ordinary brickwork. The roofing consisted of 4 to 1 concrete, 4½ in. thick, with a tension bond of No. 8 expanded steel, carried on rolled steel joists at 7 ft. 8 in. centres. Care was taken to ensure the expanded steel being completely surrounded with cement mortar. The steel joists were not cased with concrete, but were given five coats of "siderosthen" paint, having

first been thoroughly brushed with wire brushes; a mechanical water-level indicator is fixed on the reservoir. The discharge takes place through an ordinary bell-mouthed pipe, with its invert 4 in. above the bottom. The cost of the reservoir was at the rate of about 3,400s. per million gallons capacity, which the author believes is fairly low considering the small size of the reservoir. The following details may also be of interest: The 6 to 1 concrete in walls cost 17s. per cube yard; 4 to 1 concrete in roof cost 23s. per cube yard; rolled-steel joists cost 9s. per cwt. fixed.

The Water Supply of Penzance.

A paper by Mr. Frank Latham, M.Inst.C.E., Borough Engineer and Surveyor, Penzance, on the water supply of Penzance and the hydrogeology of Cornwall, was also read by the Secretary. He said that until recent years the town of Penzance was entirely supplied with moorland water by gravitation from two open reservoirs of 12 million gallons total joint capacity. A few years ago, owing to improved sanitation and increased population, this storage became insufficient to meet the full requirements of a constant supply, and it was found necessary to supplement the works accordingly. During the winter months the reservoirs are well replenished with water, the quantity collected from the moorlands and conveyed into them being abundant, and more than 50 per cent. in excess of the consumption so long as the average winter rainfall lasts; but as soon as this decreased, that is from the end of May, the reserve is soon drawn upon.

In order to augment the supply during the four or five months of drought, pumping from a new well has been resorted to for the past three years. Pumping is limited to the periods when the supply of moorland water is insufficient, so that the cost of pumping is not continuous throughout the year. The water obtained from the well is much appreciated during the summer months on account of its low temperature.

During the first year of the new well being used the water thus obtained was mixed with the moorland water in the uncovered reservoirs, which by the middle of the summer contained more well water than moorland water. This well water, being now exposed to the action of the sun, favoured an abundant growth of objectionable green weeds of considerable length, and during the summer of 1902 the amount far exceeded anything of the same character seen in previous years, when mainly moorland water had been enclosed. These weeds gave a flat taste to the water, decomposed rapidly, and clogged the filters. When the quantity of well water was but small compared with the quantity of moorland water, the water stored in the reservoirs was found to remain pure and free from large growths of weeds for a much longer period. As regards chemical purity, the well water is far better for drinking and domestic purposes than the moorland water, but whether owing to its hardness or the presence of carbonic acid, or some other cause, the growth of vegetation develops to a remarkable degree directly it is exposed to sunshine.

A scheme has now been carried out which answers the twofold purpose of preventing the growth of weeds and giving additional water pressure to the higher portion of the town. For this purpose the author designed and built a covered service reservoir at a higher altitude than the existing reservoirs, and the water from the well is pumped into this, and not allowed to mix with the moorland water in the larger open reservoirs. The mains in the town have now been divided into two systems or districts, each having a separate supply main, one connected to the open reservoirs containing the moorland water, and the other connected directly to the big-level covered service reservoir containing the well water, which supplies the higher part of the town at a better pressure than was previously the case.

Seeing that the pumping operations are suspended during the winter months, some arrangement was necessary for continuing the higher pressure requisite for the upper district during that period. This was effected by close-piping the stream which conveys the moorland water to the reservoirs, the pipes, which were of cast-iron, being laid far enough up the stream to obtain a sufficient head for feeding the big-level reservoir. The object of storing well water in closed

reservoirs being to exclude sunshine rather than air, they should be effectually ventilated.

Dr. Kemna (Antwerp), Mr. W. Whitaker (London), Mr. C. E. Jones (Leyton), and others took part in the discussion of the paper.

Electrically-Driven Pumping Plant for Water Supply.

Mr. J. Hutton (Scarborough) read a paper on electrically-driven pumping plant for water supply and storage of water under pressure. He said this was a description of a pumping plant with reservoirs, etc., recently installed by him for the water supply of the village of Wykeham, Yorks, and for a nobleman's residence in that district.

It was at first proposed to use a windmill, but the high initial cost and unsightly appearance of these otherwise useful appliances decided him to recommend the use of an electric motor, worked by current obtained from the electric plant primarily installed for the lighting of Wykeham Abbey, which is situated about 1,200 yards from the spring. The motor is automatically controlled, so that no continuous attention is required, and the reservoir is continuously kept full. The well, generating-station, and reservoir are situated at the three corners of a triangle, the sides of which are from 800 to 1,200 yards in length.

The generating plant—which consists of loco-type boiler with enlarged fire-hox for burning inferior fuel; a compound medium-speed engine by Robey & Co., of Lincoln, developing 40 b.h.p.; dynamos; hooster; and 200-volt storage battery with a capacity of 470 ampere hours—is of the type usually adopted for electric-lighting. Current is conveyed from the generating plant to the pump motor through a concentric cable carried underground. The pumping plant consists of a three-throw pump with pistons 4 in. diameter by 6-in. stroke, working at a speed of 60 ft. per minute. The reservoir is situated 900 yds. from the pump-house, and is supplied through a 3-in. cast-iron pumping main.

The water-level in the well is 8 ft. below the surface of the ground, and the spring gives a supply of 90 gallons of water per minute, which is fairly constant all the year round.

The reservoir, built of blue bricks in cement, has a capacity of 45,000 gallons, and is divided into two parts in order that cleaning operations and repairs may not involve the stoppage of the supply. The total head against which the water is pumped is 98 ft., and the pump normally delivers 3,500 gallons per hour.

At the reservoir all supply and delivery valves are duplicated, and, in addition to the Wykeham village supply, a 5-in. main is carried to Wykeham Abbey, a distance of 900 yds., furnishing the ordinary water supply, in addition to feeding sixteen fire-hydrants placed round and inside the Abbey.

The plant, which has now been in operation for over a year, has quite equalled the author's expectations, having worked constantly without a hitch. The cost of the working has been found to be exceedingly low, and although it is somewhat difficult to give exact figures, owing to the power being used for electric-lighting as well as pumping, the cost of the proportion of energy used by the plant in fuel certainly does not exceed a penny per 100,000 ft. gallons.

The author has since had occasion to design a similar plant for supplying a neighbouring village, which, being situated on the top of a hill, involved the building of a water-tower, etc., obtaining working head by other means. This plant is practically identical with that just described, except that in this case, instead of a float, a pressure switch is used, it being opened or closed as the air pressure on a diaphragm is increased or decreased.

The author ventures to think that the problem of using electrical power for pumping the water supply of towns and villages is one which must inevitably come prominently forward in the near future.

Mr. R. S. Lloyd, Mr. T. R. Smith, Mr. C. Sainy (Windsor), Mr. C. E. Jones (Leyton), and Mr. Hutton contributed to the discussion.

The meeting closed with the customary votes of thanks.

"WILLING'S PRESS GUIDE."—"Willing's Press Guide" for 1905 (published at 1s. at 125, Strand, W.C.) is the thirty-second annual issue of a very well-arranged and reliable work. The present issue has been revised, and for conciseness and clearness it leaves little or nothing to be desired.

THE POST OFFICE LONDON DIRECTORY.

PROBABLY no yearly publication is so well known in London as the "Post Office Directory," and certainly no similar work can equal it for usefulness or surpass it for accuracy. The issue for 1905—the 106th annual issue—which has just been published by Kelly's Directories, Ltd., 182-4, High Holborn, W.C. shows that the same care in its compilation has been taken which characterised previous issues, while this year the labours of its editors have been considerably increased, for with the Directory has been included a considerable section dealing with the London County suburbs. In the combined work, the "Post Office London Directory" has been kept distinct from the section dealing with the county suburbs, and remains much the same as before, but the complete volume will be found to cover the whole of the County of London—that is, for the first time, to include those areas which have been previously looked upon as beyond the scope of the "Post Office London Directory" itself. The complete volume contains in its two divisions 4,600 pages (exclusive of advertisements), but, by the use of a finer paper and the resetting of a portion of the county suburbs section, the bulk of the combined directories in one volume is not greatly in excess of the "London Directory" alone in its usual form. Still, the combined work may be found by some people to be inconveniently bulky, and, to meet this possible objection, the "London Directory" can be had in the same form as in past years, printed on the same paper, but, of course, brought up to date. Or if subscribers prefer to have the combined work they can obtain it in two volumes. The Directory has been brought well up to date and other additions include: A list of the Metropolitan Water Board and a large map of the suburbs of London. The new Education Act has caused the omission of the London School Board, and has also rendered necessary a re-arrangement of the elementary schools.

Rapidly as the Metropolis grows, its growth would be far greater, were it not for a tendency on the part of many of its inhabitants to take up their residence in the Home Counties. In order to meet the want which the publishers believe to exist, they propose issuing the Directory of the Six Home Counties more frequently. A new edition of the first volume—containing the counties of Kent, Surrey, and Sussex—will be published about the middle of 1905, followed in 1906 by a new edition of the second volume, containing the counties of Essex, Herts, and Middlesex. These books will include the whole of their respective counties outside the boundary of the County of London.

DIARIES, ETC.

FROM Messrs. Hudson & Kearns (83, South-wark-street, S.E.) we have received specimens of their special diary blotting pads, which are very attractive and serviceable productions of their kind. No. 8A is a specially useful form, containing, in addition to blotting pad, a calendar, a diary with index and a tear-off indicator, and space for memoranda of appointments. The Banker's pad is another useful form, as also is No. 4, a portfolio pad.

A useful diary for architects and surveyors is Messrs. Waterlow Brothers & Layton's "Architects', Surveyors' and Auctioneers' Diary and Almanac for 1905." It includes full lists of members of the Royal Institute of British Architects, the Surveyors' Institution, and other professional bodies; information as to provincial architectural societies, and Government and public offices; an abridgement of the Towns Improvement Clauses Act, 1847; the London Building Act, 1894; Regulations and rules as to applications for the L.C.C. sanction, etc., under the London Building Act; and a list of District Surveyors, with their offices. The diary also includes much additional information of use to architects, surveyors, and others, but sufficient has been said to indicate the usefulness of this excellent annual. It is a handy and well arranged work, and is published at Nos. 24 and 25, Birchin-lane, E.C., at 3s. 6d. and 6s., according to binding.

The "City Diary" is a little work which gives three days to a page, is interleaved with blotting-paper, and contains a great deal of City information. The "Diary" gives a complete list of members of the Corporation, ranged alphabetically, and also according to their wards; and of the City churches, with the

names of the rectors, curates, organists, and other officials; of the City companies, with the names of the clerks, and the situation of the halls; and of the various municipal, social, and parochial institutions that have their headquarters in, or are in any way associated with, the City. The work is issued at 1s., and the publishers are Messrs. W. H. & L. Colling-ridge, 148-9, Aldersgate-street.

Calvert's "Mechanics' Almanack and Workshop Companion for 1905" is the thirty-second year of publication of a useful little work for artisans and handicraftsmen. In addition to information usually found in an almanack, it contains nearly seventy pages of notes and data for those connected with mechanical, electrical, engineering, building, and other trades. It is published at 4d.

Messrs. Bemrose & Sons, Limited, Snow-hill, E.C., have sent us specimens of their tear-off Shakespearian, etc., calendars and monthly diary, the published price of which is 1s. each. The tear-off calendars are made to open out and stand upon a table, or they can be hung upon a wall.

Messrs. Sprague & Co., Limited (4 and 5, East Harding-street, E.C.), have again issued their excellent little diary and tables, as well as a flat pocket-book suitable for the breast pocket. Both are very neat and useful little issues. The present is the thirty-sixth annual edition of the diary.

The Builders' Accident Insurance Co., Limited (Bedford-street, W.C.), have sent us a neat little pocket-book and a date indicator, which, presumably, they have issued to their subscribers.

The "Gloucester" Diary and Directors' Calendar for 1905 is the tenth year of issue of a diary published by Mr. Brooke, of Gloucester, for The Gloucester Railway Carriage and Wagon Company, Limited. The chief feature of the work is a list of stations and junctions attended by the company's wagon repairers.

Messrs. George Wragge (Manchester) send us a very characteristic calendar designed for them by Mr. Sydney E. Castle. It is in twelve square sheets, one for each month, with specially designed lettering and borders, and a sketch in line at the side of each sheet, illustrating the various kinds of work which the firm carry out.

THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, S.W., Mr. J. Williams Benn, Chairman, presiding.

Loans.—On the recommendation of the Finance Committee, it was agreed to lend Bethnal Green Borough Council 14,481l. for purchase of land, etc.; Fulham Borough Council 16,800l. for acquisition and laying out of open space, and 7,700l. for baths and wash-houses; Guardians of Hackney Union 24,600l. for poor-law purposes; St. Pancras Borough Council 7,515l. for electric light installation; Shoreditch Borough Council 9,189l. for street improvements and paving works, and 1,257l. for street lighting purposes; and Woolwich Borough Council 15,000l. for street improvement.

Lack of Employment.—The General Purposes Committee brought up the following report, the recommendation being agreed to:—

"In our report dated December 12, 1904, now before the Council, we stated that we had considered a letter from the Central Committee of the London Unemployed Fund with regard to the provision of facilities for the creation of work of public utility, for genuine unemployed workmen, and the matter was engaging the earnest consideration of the various committees. We have now to inform the Council that the committees have suggested certain works, such as digging, levelling, and preparing ground in connection with the Council's parks, improvements, housing schemes, etc., which will afford employment of the nature suggested by the Central Committee. We should point out that in view of the distress prevailing, owing to the lack of employment, the various spending committees had already taken steps to put in hand during the winter months as large an amount of work as possible. If the result of the distress prevailing, owing to the lack of employment, the various spending committees which are providing opportunities of work may proceed during the recess, we recommend—that the General Purposes Committee and the several committees which are providing opportunities of work to meet the exigencies of the unemployed in London be empowered to act during the recess, subject to the standing orders regarding expenditure."

Non-Provided Schools.—Replying to Mr. Pope, Sir J. W. Collins said the architect had now surveyed 332 non-provided schools, and the chief inspector had inspected 287 such schools, with regard to the staffing arrangements.

Enlargement of Royal-hill School, Greenwich.

—The following recommendation of the Education Committee was agreed to:—

"That the amended estimate of 4,415*l.* to be submitted by the Finance Committee in respect of the enlargement of the Royal-Hill School (*Greenwich*) by 172 places, and of other school-proper houses to be carried out at the same time in accordance with the finished plans approved by the Board of Education, be approved; that the work be executed without the intervention of a contractor, and that the drawings, quantities, specification, and estimate of 4,080*l.* be referred to the Works Committee for that purpose."

Sanitary Works, Old Castle-street School, Whitechapel.—The following was also agreed to:—

"That, subject to the Board of Education approving the plans and specification, an estimate of 1,016*l.* 11*s.*, to be submitted by the Finance Committee in respect of the execution of sanitary and drainage works at the Old Castle-street School (*Whitechapel*), be approved; and that the work be carried out without the intervention of a contractor as a jobbing work under the schedule in force for architectural jobbing works."

Proposed Adaptation of a House for House-wifery Centre, etc., Offord-road, Islington, S.—It was also agreed:—

"That the estimate of 603*l.*, to be submitted by the Finance Committee in respect of the proposed adaptation of the house, No. 6, Barnsbury-park, for the purposes of a house-wifery centre and school-proper house in connexion with the Offord-road site (*Islington, S.*), be approved; that . . . the work be executed without the intervention of a contractor as a jobbing work under the schedule in force for architectural jobbing works; and that the drawings and specification be referred to the Works Committee for that purpose."

School, Monteth-road, Bow and Bromley.—On the recommendation of the Education Committee it was agreed that the estimate of 5,75*l.*, submitted by the Finance Committee, be approved; that expenditure not exceeding 5,96*l.* be sanctioned in respect of the erection of a school for the accommodation of 80 mentally defective children on the Monteth-road site (*Bow and Bromley*), and also in respect of the provision of a science-room and a drawing class-room in connexion with the graded school; that the work be executed by the Council without the intervention of a contractor.

Roof Covers for Electric Cars.—The following recommendations were agreed to:—

"(a) That the estimate of 3,502*l.*, submitted by the Finance Committee, be approved; and that expenditure on capital account, of sums not exceeding that amount, be sanctioned in connexion with the provision of 100 additional roof-covers for the electric cars used on the London County Council Tramways.
 "(b) That the 100 roof-covers for electric cars, referred to in the foregoing resolution, be constructed by the Council's tramway staff, under the supervision of the chief officer of tramways.
 "(c) That an agreement be entered into with Messrs. Miles, Voss, & Co. for the payment of a royalty of 4*l.* 10*s.* for each of the 100 roof-covers to be made by the Council for its electric cars; that the solicitor do prepare, and obtain the execution of, this agreement; and that the seal of the Council be affixed thereto when ready."

Storm Floodings.—New Pumping-station in Battersea.—The Main Drainage Committee recommended and it was agreed:—

"That the estimate (No. 4,368) of 7,000*l.*, submitted by the Finance Committee, be approved; and that expenditure not exceeding that amount be sanctioned on account of the cost of the erection and equipment of a pumping station, on a site at the junction of York-road and Creek-street, Battersea, for the purpose of relieving floodings in Wandsworth and Battersea."

Office Accommodation.—The Establishments Committee recommended, and it was agreed, that the alteration of the premises known as Nos. 56 to 60, Strand, be executed by the Council without the intervention of a contractor, and that the drawings, specification, and bills of quantities be referred to the Works Committee for that purpose. The amount of the architect's estimate is 3,502*l.*

Lee-green Fire Station.—The following recommendations of the Fire Brigade Committee were agreed to:—

"(a) That expenditure not exceeding 12,700*l.* be authorised in connexion with the establishment of the proposed new Lee-green fire-station.
 "(b) That, in the event of the Works Committee being prepared to undertake the work at the amount of the architect's estimate (to be reported after the Christmas recess), the work of erecting the Lee-green station be executed by the Council without the intervention of a contractor, and that the drawings, quantities, specification, and architect's revised estimate be referred to the Works Committee for that purpose.
 "(c) That, in the event of the Works Committee not being prepared to undertake the work of erecting the Lee-green station at the amount of the architect's estimate, tenders for the erection of the station be invited by public advertisement."

Housing.—It was agreed, on the recommendation of the Housing of the Working Classes Committee:—

"That the estimate of 10,000*l.*, submitted by the Finance Committee in respect of part of construction to be made by the Council towards the cost of the acquisition and clearance of property on the Brantone-place and Prospect-terrace areas, be approved; that a payment on account of 10,000*l.* to the Council of the Metropolitan Borough of St. Pancras in respect of the expense of carrying into effect the Brantone-place and Prospect-terrace (*St. Pancras*) schemes, 1896, be authorised."

Suggested Removal of Charing-cross Station.—

A joint report was submitted by the Bridges and Improvements Committee on the reference made to consider the question of removing Charing-cross Railway Station to the south side of the river; to widen Hungerford Bridge; and to construct a double line of tramways over the bridge so as to link up the northern and southern systems of tramways. The Committee were of opinion that, having regard to the very large expense involved, and also having regard to the attitude of the South-Eastern Railway Company, there was no alternative but to advise the Council for the present not to give further consideration to the matter.

At the request of Mr. J. Burns the report was ordered to stand over until after the recess.

Paving.—The offer of Messrs. J. G. White & Co., Limited, to execute, at an estimated cost of 1,602*l.* 12*s.*, the paving and other works connected with the widening of Camberwell New-road, authorised by the London County Council (Tramways and Improvements) Act, 1901, was accepted.

It was also agreed that, in the event of the Works Committee being prepared to undertake, at the amount of the chief engineer's estimate, the execution of paving, etc., works connected with the widening of Blackheath-road, authorised by the London County Council (Improvements) Act, 1900, such works be effected by the Council without the intervention of a contractor.

It was agreed that the offer of the Council of the Metropolitan Borough of Battersea to undertake, at an estimated cost of 2,732*l.* 19*s.* 7*d.*, the paving and other works connected with the widening of York-road, between Edmond's-place and York-place, authorised by the London County Council (General Powers) Act, 1898, be accepted.

Main Drainage Extension and Storm Relief Works.—The Main Drainage Committee brought up the following report:—

"We think the Council may wish to be informed of the progress which has been made since March 31, 1904, in connexion with the scheme for the extension of the main drainage system and the scheme of flood relief works. The extension of the main drainage system additional main sewer accommodation in consequence of the large growth in population since the main drainage system was established. The estimated cost of the scheme is 3,600,000*l.*, and the actual or estimated cost of works completed or in progress amounted to 3,100,000*l.* on March 31, 1904, to 1,014,400*l.* Since that date the construction of the final section (2) of the new northern outfall sewer has been undertaken by the Works Committee, and work has already been commenced. The new sewer will extend from Old Ford to Barking. The length of section E, which extends from a point near East Ham manorway to the outfall works at Barking, is about 11 miles, and the estimated cost is 147,280*l.* The tender, amounting to 82,510*l.* 2*s.* 4*d.*, of Messrs. W. Kennedy, Limited, for the construction of section No. 1 of the northern low-level sewer No. 2 has been accepted, and work has been commenced. The new sewer will extend from Hammersmith to Bow, and section No. 1 comprises the portion between the River Lee, near Bow-bridge, and the western side of the Regent's Canal at Whitehouse. The tender, amounting to 348,417*l.*, of the Westminster Construction Company, for the construction of section D of the southern outfall sewer No. 2, has been accepted, and the work is about to be commenced. The new sewer will extend from the Crossness outfall works to the Deptford pumping-station; and section D, which is about 4½ miles in length, comprises the portion of the sewer from Deptford pumping-station to a point near Plumstead Railway Station. The tender, amounting to 81,252*l.* 19*s.*, of the Westminster Construction Company, for the construction of a portion of the new southern outfall sewer No. 2, has also been accepted; and under this contract, known as contract C, two sewers, each nearly half a mile in length, will be constructed, and the work has already been commenced. The borings for the portion of the new high-level sewer No. 2 between Plumstead and Catford, and for the new low-level sewer from Hyde Park-corner to Stepney, have been completed, and the surveys and construction of sewers have advanced. It is hoped that the contract for the sewer from Plumstead to Catford will be ready for letting in March next; and this sewer, when completed, will relieve the floodings in Leamhithe-ville. Lewis, in regard to the scheme of flood relief works, upon which we reported on February 16 and 23, 1904, considerable progress has been made. Application is being made to the Secretary of State for power to acquire compulsorily certain land required for the site of a new pumping-station at the junction of York-road and Creek-street, Battersea. A similar application is being made with regard to land required for a site for a new pumping-station at Shad Thames, Bermondsey, and the drawings and surveys for the new sewers in connexion with this station are well advanced. The tender, amounting to 30,732*l.* 8*s.* 7*d.*, of Mr. D. B. Peterson, for the construction of a sewer about 1½ miles in length from Cornwall-road, Notting-hill, to Upper Addison-gardens, Kensington, has been accepted; and this sewer, when constructed, will relieve the floodings in North Kensington. Messrs. D. D. Nowell & Sons, tender, amounting to 41,978*l.* 13*s.* 6*d.*, has been accepted for the construction of sewers, about 1½ miles in length, from the junction of South-street with High-street, Wandsworth, to the junction of Vardon-road with North-side, Wandsworth-common, and thence to the site of the new pumping-station, above referred to, at the junction of York-road and Creek-street, Battersea. The drawings for this pumping-station are being pre-

pared; and in response to an advertisement tenders have been received for the supply of the gas engines which will be required at the pumping-station. Tenders are also being invited from selected firms for the supply of centrifugal pumps, which will have to be connected with the engines at the pumping-station. This station and the sewers to be constructed in connexion therewith, will provide relief for the floodings in Wandsworth and Battersea. The plans for the new relief sewer from Holloway to the Thames are being prepared, and negotiations are in progress with respect to the land required. The plans for the relief sewer, about 14 miles in length, from Hornsey and Stroud-green, have been completed, and tenders will be invited as soon as the Council is in a position to proceed with the work. A plan, showing the several works referred to in this report, will be sent to members of the Council."

New Theatre, Shaftesbury-avenue.—The Theatres and Music-halls Committee reported that they had considered plans, submitted by Mr. W. G. E. Sprague, of a theatre proposed to be erected at the junction of Shaftesbury-avenue and Rupert-street. The site does not strictly comply with the regulations, as only one-tenth abuts on to a street of 40 ft. in width instead of one-sixth as required, but in other respects the site is a good one. The proposed building is shown to have seating accommodation for 1,144 persons. The application was agreed to on certain conditions.

The Council at its rising adjourned until January 24.

APPLICATIONS UNDER THE 1894 BUILDING ACT.

The London County Council at their meeting on Tuesday dealt with the following applications under the London Building Act, 1894. The names of applicants are given between parentheses:—

Strand.—An iron and glass shelter at the main entrance to the "Coliseum" on the east side of St. Martin's-lane, Strand (Messrs. F. Matcham & Co. for the London Coliseum, Ltd.).—Consent.

Hammersmith.—That the Council do approve of the elevation of a proposed gangway over Wood-lane, Hammersmith (Mr. I. Kiralfy).—Agreed.

Hackney, North.—Buildings on a site on the north side of Manor-road, Stoke Newington, between No. 4 and the Great Eastern Railway (Messrs. Turner & Holditch for Messrs. H. Merritt & F. W. Matthews).—Consent.

Hackney, Central.—A two-story addition at the rear of No. 16, Stanard-road, Dalston, to abut upon Riseton-road (Messrs. J. Hunt & Sons for Mr. G. Withey).—Consent.

Brixton.—Buildings on the site of Nos. 422 and 424, Coldharbour-lane, Brixton (Messrs. W. & J. Peacock for Mrs. M. J. Lockhart).—Consent.

Wandsworth.—Retention of one-story shops in front of Nos. 81 to 91 (odd numbers only), inclusive, Replingham-road, Southfields, Wandsworth (Mr. W. Hunt for Mr. J. R. Mayfield).—Consent.

Marylebone, West.—Permission to retain enclosures to a porch at No. 7, Mandeville-place, Wigmore-street, St. Marylebone (Mr. F. Cornelius-Wheeler).—Refused.

Wandsworth.—Four one-story shops on the east side of Cavendish-road, Wandsworth, abutting also upon the north side of Grove-road (Messrs. J. D. Mathew & Son for Mr. J. King).—Refused.

Whitechapel.—A building on the west side of Charlotte-court, Fieldgate-street, Whitechapel, with external walls at less than the prescribed distance from the centre of the roadway of the street (Mr. G. E. Nield for Mr. M. Abrahams).—Consent.

Battersea.—Retention of a building at No. 110, Church-road, Battersea (Messrs. J. A. J. Woodward & Sons for Mr. J. Draper).—Consent.

Width of Way and Lines of Frontage.

Wandsworth.—Cottages, with bay-windows, on the site of "Swiss Cottage," Garratt-lane, Tooting (Mr. B. Woollard for Mr. C. Clements).—Consent.

St. Pancras, West.—A porch addition in front of "Rowton House," Arlington-road, Camden Town (Mr. G. J. Earle for Rowton House, Ltd.).—Refused.

Width of Way, Line of Frontage, and Construction.

Southwark, West.—A deviation from the plans approved for the erection of a luffing crane and platform on the north side of Bankside, and of a gangway across that street so far as relates to the erection of an enclosure to the crane tower (Mr. W. J. Perkins for Messrs. Harrison & Crossfield).—Consent.

Deptford.—A wood and iron building on a site on the northern side of Trundley's-road, Deptford, eastward of the Grand Surrey Canal (Mr. L. A. Jouques).—Refused.

St. Pancras, South.—For permission to retain teak and glass enclosures to the sides of an iron gangway connecting the third floors of premises on the north and south sides of Beaumont-place, Euston-road, St. Pancras (Messrs. Maple & Co., Ltd.).—Refused.

Formation of Streets.

Clapham.—That an order be issued to Mr. J. Cobeldick sanctioning the formation or laying out of new streets for carriage traffic upon the Heathfield estate, West Side, Clapham Common, Clapham.—Consent.

Clapham.—That the Council do not consent to the application of Mr. J. Cobeldick for an extension of the period within which new streets for carriage traffic upon the Heathfield estate, West Side, Clapham Common, Clapham, were required to be defined and thrown open to the public.—Agreed.

Wandsworth.—A barrier across Okburn-road, Totterdown estate, Tooting (Mr. R. Robertson for the Housing of the Working Classes Committee of the Council).—Consent.

Mile End.—That an order be issued to Mr. A. Davis, sanctioning a new street for foot traffic only at the rear of houses in Hessel-street (late Morgan-street), Stepney.—Consent.

Deviations from Certified Plans.

Whitechapel.—Certain deviations from the plan certified by the District Surveyor, so far as relates to the proposed rebuilding of No. 1 and 2, Parliament-court, Artillery-lane, Whitechapel (Mr. C. H. Lovegrove).—Consent.

Means of Escape from the Top of High Buildings.

City of London.—Means of escape in case of fire proposed to be provided in pursuance of section 63 of the Act, on the fifth and sixth (top) stories of Blocks "D" and "E," Broad-street-place, Eldon-street, City, for the persons dwelling or employed therein (Mr. C. D. Martin for the London Property Development Syndicate, Ltd.).—Consent.

Widening of Street, Width of Way, and Line of Frontage.

St. Pancras, North.—The erection of a building upon the site of Nos. 9, 11, 13, 15, and 17, Highgate-road, St. Pancras, to abut also upon Greenwood-place, and in connexion with such building the widening of a portion of Greenwood-place (Mr. G. H. Creetback for Mr. W. A. Curnock).—Consent.

Alteration to Buildings.

St. George, Hanover-square.—An alteration to Nos. 1 and 2, Thomas-street, Oxford-street, St. George, Hanover-square, so far only, however, as relates to the proposed construction of a bay-window at the rear of the premises, without such premises being in conformity with Part V. of the Act (Mr. L. Sharp for Mr. E. J. Rossier).—Consent.

Space at Rear.

Wandsworth.—A modification of the provisions of section 41 with regard to open spaces about buildings, so far as relates to the proposed erection of a building on the northern side of Carratt-lane, Tooting, with an irregular open space at the rear (Mr. B. Woollard for Mr. C. Clements).—Consent.

St. Pancras, East.—A modification of the provisions of section 41 with regard to open spaces about buildings, so far as relates to the proposed erection of a building at the rear of the "Mother Red Cap" public-house, No. 174, High-street, Camden Town (Messrs. F. J. Eedle & Meyers for Mr. E. L. Summers).—Refused.

The recommendations marked † are contrary to the views of the local authority.

ARCHITECTURAL SOCIETIES.

NORTHAMPTON ARCHITECTURAL AND ARCHAEOLOGICAL SOCIETY.—The Annual Meeting has just been held of the Architectural and Archaeological Society for the Archdeaconries of Northampton and Oakham. The Rev. A. W. Pultney presided, and Mr. R. P. Brereton gave an address on "Some Unrecorded Saxon Work in Churches in the Neighbourhood of Peterborough." Mr. Brereton prefaced his remarks with an explanation of a recently published book on pre-Conquest work, by Professor Baldwin Brown. In that book Northamptonshire figured, so far as numbers were concerned, fourth in England; but Mr. Brereton thought it would be agreed that in point of importance and general interest Northamptonshire stood second to none. Nine instances of Saxon work in churches in the county were given. These churches were Brixworth, which was the most complete, if not the most ancient, Saxon church Northamptonshire possessed; Earl's Barton, which contained the finest Saxon ornament

known; Barnack, Brigstock, Whittering, Geddington, with its almost, if not quite, unique arcade; Pattishall, Stowe-nine-Churches, and Creen's Norton. The chancel at Stowe was certainly Saxon, and a very fine example, but the whole tower ought to be added as an example of Saxon building. It might not strike an observer as such, however, by its appearance, and the natural inference would be that the tower was a recent addition. The nave of the very fine church at Creen's Norton was well preserved. There were other examples in Northamptonshire of which no notice had been taken in the hook to which Mr. Brereton had referred, two in particular. At Nassington there was an opening of a very decided Saxon character with a triangular head, and there were in the south aisle wall through-stones of typical long and short Saxon work. Another church, Wansford, possessed good specimens, which, if post-Conquest in point of date, were pre-Conquest in regard to style. Woodstone west window was also Saxon. At Thornhaugh there was an example which had previously been quite unobserved and unrecorded. Another interesting specimen—an ornament—had recently been discovered in the crypt of the church at Oundle. Mr. C. A. Markham, F.S.A., read a paper on "The XIVth Century Manor House at Yardley Hastings." This interesting and unique fragment of a bygone age, said Mr. Markham, once formed part of the large and important Manor House. It was probably erected by John Lord Hastings about 1330.—The annual report of the secretary was presented by Mr. C. A. Markham, and the Rev. E. L. Tuson, M.A., presented the financial statement. The officers and committee were re-elected *en bloc*, on the proposition of the Rev. A. O. James, seconded by Rev. R. C. Randolph.

EDINBURGH ARCHITECTURAL ASSOCIATION.—On the 14th inst. Mr. Nelson Dawson, London, addressed the members of the Edinburgh Architectural Association on the subject of metal work. The meeting was held in the Lecture Hall of the Geographical Society, instead of the Architectural Association's own rooms in George-street, and Mr. H. O. Tarbolton presided. Mr. Dawson's lecture was illustrated by lantern slides of examples of iron, silver, gold, and enamel work. At the close, Professor Baldwin Brown moved a vote of thanks to the lecturer. He made a passing reference to the proposal to utilise the Royal High School buildings for the purposes of art, remarking that whatever difference of opinion there might be regarding the suitability of the buildings for that purpose—and there was room for difference of opinion—they were all agreed that there must be no tampering with the exterior of the Royal High School. Mr. Ross seconded, and Mrs. Traquair supported the vote of thanks, which was cordially awarded.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.—At the rooms of the Society on Thursday, the 15th inst., Professor Capper, of Manchester University, read a paper on "Choisy's Researches in Ancient Building Construction," Mr. C. B. Bulmer, President, in the chair. The lecturer said that Choisy's researches into ancient Egyptian building construction follow his previous detailed studies, along similar lines, of Roman and Byzantine work, extending over a period of more than thirty years. To Egypt he has brought the same power of penetrating analysis of constructive fact, the same keen insight into the practical necessities of building organisation and method, that illumined so admirably his account of ancient Roman building, as well as of the succeeding school of architecture at Byzantium. Choisy's researches in Egypt, though not apparently the result of prolonged residence, and suffering from a curious ignorance of much recent work on Egypt and new data so derived, give undoubtedly an epoch-making study, presenting some well-known facts in altogether new relationships, and giving us daring and reasoned solutions for many problems hitherto apparently insoluble even to experienced Egyptologists. As one of the most important of these solutions of long-standing enigmas, the lecturer gave in detail, with lantern illustrations from Choisy's book, the minute study of Egyptian brick walls, built with undulating bedding, a puzzle that has hitherto baffled every inquirer. As demonstrated by Choisy, these curious walls, which occur on a large scale at Karnak, Abydos, El Kah, Philae, and elsewhere, are the logical outcome of Egyptian crude-brick building on

sloping sites, given the scanty foundations possible in Egyptian soil, where these walls are liable to attack by the waters of the Nile. Similarly Choisy, by a single illuminating paragraph, accounts for the well-known bench on the sides of the ascending gallery in the Great Pyramid, admittedly unexplained in Professor Flinders Petrie's classical book on Gizeh. The lecturer then gave an account of Choisy's explanation of the transport of material, whether in the enormous blocks of obelisk or colossal statue or of the materials of more moderate dimensions used in ordinary building, and of his very ingenious demonstration of the use of sand for the nice adjustment of the great blocks in position.

MANCHESTER SOCIETY OF ARCHITECTS.—The forty-first annual dinner was held on the 16th inst., at the Queen's Hotel, of the Manchester Society of Architects. Mr. J. W. Beaumont, President of the Society, occupied the chair. In submitting the toast of "The Royal Institute of British Architects," the President said that at the present time there was no country in the civilised world in which there was not a member of the Royal Institute of British Architects. If the registration of architects became law the Institute would become the registering and examining body. But if this did not come to pass the Institute was intending to take into more serious consideration the education of architectural students, upon which the good of the profession seemed to him to stand. Mr. T. E. Colcutt, Vice-President of the Institute, and Mr. John Slater responded to the toast. Mr. A. J. Murgatroyd proposed "The Victoria University of Manchester." Vice-Chancellor Hopkinson, in his reply, said nothing had given him more satisfaction than to know that the School of Architecture was an accomplished fact. The manner in which it had been started was a model of how things ought to be done in Manchester. The University and the Manchester Society of Architects had worked harmoniously together from the first, and he could not fail to acknowledge the obligations of the University to the two representatives of the architectural profession—Mr. Beaumont and Mr. Ogden. Dr. Hopkinson regarded the fact of the University and the architectural profession working together as one of the indications that Manchester recognised there was a future for English architecture and that that future would only be brought about by the union of architectural skill and knowledge, artistic study, and talent with those who were engaged in theoretical studies, the study of letters and of history.—The toast of "The Architectural Association" was proposed by Mr. Charles Heathcote and responded to by Mr. E. Guy Dawber (President of the Association). Mr. Alired Darbyshire proposed "The Manchester School of Architecture," and Mr. Charles Rowley replied. Mr. Rowley pointed to the successful working of the school as an augury of still better things for architecture and a love of the beautiful in Manchester. He was quite certain, he said, that in Manchester there were some of the finest buildings to be found in any city.

ULSTER SOCIETY OF ARCHITECTS.—The annual dinner of the Ulster Society of Architects was held in Ye Olde Castle Restaurant on the 15th inst. Previously the annual general meeting of the Society had been held in its offices, 13, Lombard-street, under the presidency of Mr. W. J. Cilliland. The report of the Council and of the honorary treasurer's account were of a satisfactory nature. The following office-bearers and council were elected:—President, Mr. W. J. Gilliland; vice-president, Mr. J. J. McDonnell; honorary secretary, Mr. W. B. Fennell; assistant honorary secretary, Mr. W. W. H. Patterson; honorary treasurer, Mr. F. H. Tulloch; council, Messrs. H. Seaver, N. Fitzsimmons, and R. M. Young; associate members of the council, Messrs. Thomas Houston and E. R. Kennedy; auditors, Messrs. Vincent Craig and J. St. J. Phillips. Mr. Benjamin Morrison was elected a student of the Society. At the dinner Mr. W. J. Cilliland again presided. The usual loyal toasts having been submitted from the chair and honoured, that of "The Learned Professions" was submitted by Sir Thomas Drew. Rev. Dr. Hamilton, in reply, mentioned the great service rendered to the nation in the capacity of architect by Sir Thomas Drew, and said that lately he had the distinction of being the architect of the new cathedral in Belfast. It seemed to him that of all the professions

having a claim to be included in that toast architecture stood out prominently. Their President made an admirable statement, adducing almost irrefutable arguments before the Royal Commission on University Education in Ireland two or three years ago, when he preferred a strong claim for suitable training of candidates in architecture. Mr. Gilliland asked that in any arrangements made for the development of university education architecture should have an acknowledged place, and that a Chair of Architecture should be provided for it in Queen's College. He (Dr. Hamilton) hoped the time would come when a great change would be made in all the university arrangements, and when that time came, he hoped the architects would receive the recognition to which they are justly entitled, and that a profession which has done so much for the health of the people would be admitted to the position it ought to hold in the learned professions. The toast was acknowledged also by Dr. Calwell, President of the Ulster Medical Association. Mr. Vincent Craig then proposed "The Royal Institute of Architects of Ireland," testifying to the efficient guidance of the parent body, and response was made by Mr. Mitchell (President) and Mr. Open (Honorary Secretary). Mr. R. M. Young, J.P., submitted the next toast, that of "The City and Trade of Belfast," Messrs. A. Cooke, H. A. Cutler (City Surveyor), and R. B. Henry responding. The toast of "Our Guests," submitted by Mr. Henry Seaver, had associated with it the names of Professor Symington, President of the Natural History and Philosophical Society, and Mr. John Vinycomb, President of the Ulster Arts Club. President Hamilton proposed the toast of "The President of the Ulster Society of Architects," and Mr. Gilliland briefly responded.

ARCHITECTURAL ASSOCIATION CAMERA AND CYCLING CLUB.—At the meeting on December 29, Mr. Arnold Mitchell gave an address on "The Study of Mediæval Architecture." Commencing with an illustration of the nave of Southwell Minster he emphasised the nobility of Norman architecture and the way in which the builders had grasped the great principles, such, for example, as the desirability of massing the ornament and of ornamenting construction. The ornament is of the simplest and easily made with the axe on the small stones employed, and yet it is effective; the orders of the arches were recessed owing to the small size of the stones, each order being composed of one stone. The small size of the stones played a very great part in the construction of XIIIth century buildings, since the piers were, in consequence, far larger than was otherwise necessary, and the roofs of naves could not be vaulted. Mr. Mitchell then traced the growth of vaulting from the "concrete dome" of the crypt at Canterbury to the quadripartite ribbed groined vault over the aisles at Peterborough, and so on to the vaults over the Chapel of Henry VII. in Westminster Abbey, and at Cowdray Castle, which have again become ornamented domes unsupported by the ribs. The ribs were at first introduced to support the groins, but were multiplied until they only ornamented the vault, and did not support it. Dealing with the arch, Mr. Mitchell showed the growth from the triangular arch built of Roman tiles at Colchester to the semi-circular arch also formed of Roman tiles at Brinworth, until the true arch with voussoirs was built. The triangular arch of tiles was no better than two concrete beams laid sloping, with a vertical joint at the head, and the semi-circular arch of tiles was supported by mortar voussoirs separated by tiles, since they alone had the correct shape. The arch became sub-divided into two lights by smaller arches, and the tympanum was at first ornamented simply as in the westernmost bays of the triforium on the north side of the choir at Peterborough, but later was pierced as in the eastern most bays, and from this sprang window-tracery, or ornamented with sculpture, as in the "Priest's" door, at Ely.

Mr. Francis Bond, in proposing a vote of thanks to Mr. Mitchell, suggested that the arches were built in recessed orders in order to save centring, wrought wood being scarce, and that the same cause may have been the reason why the greater spans in our cathedrals were not vaulted; while the small size of the stones used may have been caused by the bad state of the roads rendering the carriage of large blocks impossible. Mr. T. C. Yates seconded the vote of thanks, and referred to the traces of colour and gilding he had found when measuring the Angel Choir at Lincoln.

Mr. R. Wellby thought the Roman roads would still be in good condition in the great building period. The next meeting will be held on January 10, when Mr. W. M. Dodson will lecture on St. David's Cathedral.

ARCHÆOLOGICAL SOCIETIES.

BRITISH ARCHÆOLOGICAL ASSOCIATION.—The second meeting of the session was held at the rooms, 32, Sackville-street, Piccadilly, on Wednesday, December 14, at 8 p.m., Dr. W. de Gray Birch, the Treasurer, in the chair. Dr. Winstone exhibited a fine pewter tankard and drinking cup, both bearing the pewter stamp, and seemingly of the XVIIth century, the tankard being the older of the two. Dr. Birch, having examined the coat of arms upon them, expressed the opinion that they had belonged to the Kent branch of the Baker family. Dr. Winstone also exhibited a very nice example of Battersea ware in the shape of an oblong snuff-box and the Rev. Dr. Astley in character to the Battersea specimen, but which, Dr. Birch said, was of German make and intended for sweetmeats; both were of the XVIIIth century. Rev. Dr. Astley exhibited, on behalf of Mr. Selley, some interesting finds from the Bristol neighbourhood, including a stone knife and flint implements, and a perfect pigmy arrow head. The Chairman exhibited a Cypriote antiquity of about 500 B.C., found by Cesnola, consisting of a rude kind of toy horse of clay, in perfect condition.—Mr. Emanuel Green read a paper upon "Bath old Bridge and the Chapel thereon," which had special interest for the meeting as the recent Congress had been held in that city. The question of the origin of early bridges, he said, is of interest, as, possibly, leading to a knowledge of some curious point or episode in local or personal history. Any very early notice, however, could only be met with by chance. On making a reference to local histories it would be found that the writers said little or nothing of the bridges, necessarily so, because nothing was known about them, yet, notwithstanding, bridges and bridge building were matters of public importance and of general taxation from which no one could be excused. Ducange mentions a guild of bridge builders known as *Frates Pontis*, the habit worn being white with a cross on the breast. The *Saxon Chronicle* tells us that after his attack on London, 1013 A.D., King Sweveic went "westward to Bath and sat there with his force." To him came the Western Thanes and submitted and gave him hostages. Whether any Thane crossed the Avon by a bridge or by a ford there was no mention. Florence, of Worcester, and others, mention the coming of a party from Bristol, in rebellion against William Rufus, when Bath was burned and pillaged, but there was no intimation that it was approached by a bridge. In 1209, 1212, 1213, and again in 1216 when King John came to Bath, he must have crossed the river, but there was no reference to a bridge or a ford. Licences for pontage, i.e., a duty paid on all articles carried across a bridge, could be occasionally found for other cities, Bristol, for example, but there was not one for Bath. This arose from the fact that the early bridge there was at some distance from the south gate, was not united to it and did not form actually a part of the city. The first and only early mention of a bridge at Bath was in 1273, in the Hundred Rolls, Edward I., but there must, with fair certainty, have been a bridge before that date, probably, built mostly of wood. The early local historians knowing nothing of the early bridge were in difficulties, and their descriptions of the bridge and chapel are quite inaccurate. The chapel spoken of by them was built upon one of the piers of the bridge, and was too small to have been anything more than a resting place for some painting or image, or a housing (to use a word found in early writings), or a place for a passing prayer. The paper was illustrated by reproductions of the unique and exquisite views, now in the British Museum, which were taken in 1718; they preserve for us a clear idea of the structure, chapel, piers, gate, and abutments complete. The Chairman, Mr. Kershaw. Mr. Gould, Rev. Dr. Astley, Mr. Bagster, Mr. Patrick, and others joined in the discussion which followed.

QUEEN VICTORIA MEMORIAL, SHEFFIELD.—The erection of the Sheffield memorial to the late Queen is now nearing completion. Mr. Alfred Turner is the sculptor of the monument.

THE TRAMWAY AND LIGHT RAILWAY ASSOCIATION.

On December 16 a visit was made by the members of this Association to the works of the Great Northern and City Railway, and of the City and South London Railway.

The Great Northern and City Railway, as most of our readers are aware, is a low-level tubular line with one terminus at Finsbury Park, beneath the Great Northern Railway station, and the other at Moorgate-street, with intermediate stations at Drayton-park, Highbury, Essex-road, and Old-street. The tunnels are the largest of the kind hitherto constructed in London, being 16 ft. in diameter. Therefore, it is possible to take main-line vehicles, or even the largest Pullman cars, into the tubes. The diameter of the station tunnels is 21 ft. in the case of intermediate stations, and 25 ft. at each terminus. The crossover just outside Moorgate-street station is 32 ft. high by 50 ft. wide. In the construction of the running tunnels a new method was introduced, on a considerable length of the line, by forming the lower half of the ring of brickwork, the upper half being of the ordinary cast-iron segments. This arrangement was proposed by Mr. E. W. Moir, M. Inst. C.E., and, we are informed by the officials, that it gives a more elastic road-bed than is the case where iron segments are used entirely. A noticeable feature is that, throughout the line, no combustible materials were used in the tunnel or platform construction. The rolling stock consists of motor and trailer cars, made up into trains of various lengths to meet the traffic requirements. Each motor-car is fitted with two 125 h.p. motors, the controlling gear of which is placed in a fireproof compartment at the end of the coach. All the cars are fitted with Westinghouse quick-acting brakes, and each motor-car carries an automatic, motor-driven compressor. The sidings, car-sheds, and repair shops are situated at Drayton-park, where the line emerges into the open air. Of the lifts provided for conveying passengers to and from the trains, those at Moorgate-street and Essex-road are electrically-driven by motors placed over the lift shaft. At Highbury and Finsbury Park stations they are of the direct-acting hydraulic type.

On arrival at Moorgate-street station, the visitors were met by Mr. R. P. Brousson, the Engineer and Traffic Manager of the Great Northern and City Railway, by whom the working of the line was explained at length. After inspecting examples of the rolling stock the party proceeded to the crossover outside the terminus, where the most interesting feature is the arrangement of the running rails and electric conductors. Contrary to the ordinary practice, two conductors, negative and positive respectively, are employed, both of these rails being electrically insulated. Current is collected by eight slippers attached to each motor-car, two being placed at each end, and four at intermediate positions, so as to bridge over gaps at points and junctions. The party next visited a typical signal cabin at Old-street station, where the method of signalling was clearly demonstrated. The system employed is entirely automatic, and has a "treadle" control worked by the cars. The necessary low-voltage current being supplied from the running rails of the permanent way. A train entering any section controlled by a signal sets this signal to danger, and locks it until the train has passed out of the section, when a controlling relay is energised, and the last coach makes contact with the treadle and releases the signal. It should be noted, however, that the signal in advance must have been placed in the danger position before the signal in the rear can be operated by the treadle. From Essex-road station the visitors walked to the generating station, situated on the southern bank of the Regent's Canal, close to the New North-road bridge. Outside the power-house, a building on an L-shaped plan, and close to the canal bank, are a coal bin, an ash bunker and shoot, and a small pumping station. Coals are unloaded from barges by a Hone's grab, delivered into the bin, and mechanically conveyed to the coal bunker inside the boiler-house, all the coal passing through an automatic weighing-machine on its way to the bunker. When required, the same conveyor brings back ashes, which are delivered into the bunker, whence they are loaded up into barges or carts by means of the shoot. The pumping station is situated below the coal bin, and draws water from a well, for augmenting the ordinary supply, and for use in case the latter should be interrupted. Near the pumping-house is a vertical shaft, at the bottom of which a heading runs to the railway tunnels at a point between Essex-road and Old-street stations. The heading serves as a conduit for the electric cables, as well as to convey fresh air, propelled by a fan, into the railway tunnels for

ventilation purposes. In view of the large cross-section of the tunnels, and of the fact that the greatest underground length is not more than two and a half miles, it is believed that this heading will be adequate for the provision of fresh air. Another favourable circumstance is that the openings between the two tubes are strictly limited, both in size and in number. Hence the movement of the trains will afford considerable help in the way of ventilation.

The generating plant consists of four Musgrave vertical, cross-compound, condensing engines, each of 1,250 h.p., direct-coupled to British Thomson-Houston direct-current, compound-wound generators placed between the high and low-pressure cylinders, and furnishing 575-volt current at full load. Two auxiliary generators, driven by high-speed Davy-Paxman engines, supply current for lighting. These generators are rated at 120 kw. each, and give the same voltage as the main generators. The main switchboard is arranged so that, if necessary, the lighting circuits can be supplied from the traction panels. The steam generating plant includes ten "Economic" type boilers, each capable of evaporating 11,200 lbs. water per hour. The boilers are fitted with Vicar's mechanical stokers, driven by electric motors in the basement. The stokers are fed from the coal bunker at the top of the boiler-house, the storage capacity of the bunker being about 1,000 tons. Ashes are raked from the boilers into hoppers below the floor of the boiler-house, each hopper having a valve at the lower end which discharges into the conveyor buckets. Messrs S. Pearson & Son were the contractors for the construction and equipment of the line, under the supervision of Sir Douglas Fox as consulting engineer.

The members of the Association next paid a visit, at the invitation of Mr. Thomas C. Jenkin, the general manager, to the new power station of the City and South London Railway, at Stockwell. The original generating station contained four 400 h.p. generating sets, but the extension of the line to Clapham Common and the further extension to Islington, necessitated a great increase of power, and more suitable means of conveying it to the trains. The two-wire system at first used became inadequate owing to the increased length of the line, heavier trains, and more rapid services. Hence the company decided to adopt the three-wire system, which, although largely used for electric lighting, had not been applied to traction.

About the same time, an entirely new power station was built, capable of extension to double its present capacity, the old generating station being dismantled and utilised for locomotive and repair shops. The new station is a brick and steel building, 200 ft. long by 90 ft. wide, the engine and boiler houses being practically under one roof. The power house contains fourteen dry-back marine type boilers, and seven generating sets, with a maximum engine capacity of 5,500 h.p. Part of the line is supplied with current at 500 volts direct from the generating station, but more distant sections are supplied from substations at London Bridge and Islington, where current received at a potential of 1,000 volts is stepped down to 500 volts. At each point of supply, storage batteries are installed to provide for station lighting, and for working the electric lifts. The batteries also steady the generator loads, and are available for the supply of current in case of temporary interruption to the station supply. To afford accommodation for increasing traffic, more powerful and faster locomotives have been provided for hauling four-coach trains. Ten new four-coach trains of improved design have been brought into service, and the older cars are being reconstructed on similar lines. The rolling stock of the company now includes fifty-two locomotives and 140 coaches, as compared with fourteen locomotives and thirty coaches four years ago. In conclusion we may mention that the station tunnels at Islington and Clapham Common are each of 30 ft. diameter, and are the largest in the world.

APPOINTMENT OF SANITARY OFFICERS.—The Local Government Board has sanctioned the appointment of Mr. T. Fairhurst as a sanitary inspector in the Metropolitan Borough of Southwark, and the temporary reappointment of Mr. W. Peverett as a sanitary inspector in the Metropolitan Borough of Hackney.

CHINGFORD OLD CHURCH.—The Rector of Chingford is desirous of obtaining contributions for repairs to the chancel, porch, and tower of Chingford Old Church, necessitated by the recent fall of the roof of the nave. Every effort will be made to preserve the picturesque character of the ruin, which was illustrated in the *Builder* of July 2 last.

WESTMINSTER CITY COUNCIL.

A SPECIAL meeting of this Council, convened for the purpose of receiving reports from the Highways and Works Committees as to providing further work for the unemployed, was held at the City Hall, Charing Cross-road, on Friday last week.

The Works Committee's report dealt with the advisability of at once repaving certain macadam roads in the City and the repaving of Exhibition-road with wood. The City Engineer stated that provision could be made for the employment of additional men by engaging additional steam-rollers for the repair of macadamised roads and by relaying wood pavements in various sections of Shaftesbury-avenue, Great Windmill-street, and Kensington-road with materials now in stock. The Committee recommended that the work should be put in hand at once; but in the case of Exhibition-road, they considered that the work was not a suitable undertaking to be put in hand for the relief of the unemployed. The Finance Committee submitted an estimate of 2,800*l.* in respect of the proposed work.

The Highways Committee's report stated that they were unable to find work for any more men as scavengers and road sweepers. After discussing the matter for nearly two hours the Council decided to agree to the recommendation of the Works Committee. This will mean that employment will be found at half-time for about 120 men.

COURT OF COMMON COUNCIL.

The usual fortnightly meeting of the Court was held at the Guildhall on Thursday last week, the Lord Mayor presiding.

Tramways.—Alderman Sir J. Bell presented a petition, signed by over 3,000 ratepayers, asking the Corporation not to give their assent to the proposal of the London County Council to run tramways over Blackfriars Bridge and along the Victoria Embankment. There was also a petition from the Vestry of St. Anne's, Blackfriars, in favour of the scheme. Both petitions were referred to the Streets Committee.

The Streets Committee reported relative to the London County Council's application for the Corporation's assent to the tramways over Blackfriars Bridge, etc., and stated that they had adjourned the further consideration of the matter until after the first meeting in the New Year, in the hope that by that time the report of the Royal Commission on London Traffic would be in the hands of the Corporation.

Blackfriars Bridge.—Mr. Fortescue moved:—"That the Bridge House Estates Committee be instructed to consider the advisability of widening the north end of Blackfriars Bridge, so as to do away with the acute angle which now exists at its junction with the Thames Embankment, and thereby greatly facilitate the traffic at this dangerous point."—The motion was referred to the Streets Committee.

Fire Protection.—The Streets Committee reported having taken the necessary steps for the introduction of a Bill in the next session of Parliament empowering the Corporation to inspect all buildings and require owners to provide proper means of exit through the roof by fixed ladders and other methods of escape from fire.

Contracts.—It was agreed to accept a tender of Messrs. H. Greene & Sons, Ltd., for carpenters', plumbers', painters', smiths', and engineering jobbing works for three years from January 1 next at 17½ per cent. below schedule prices, and a further 5 per cent. discount for cash payments.

Building Act Amendment.—The following resolution, passed at a meeting of the Bartholomew Club, was submitted:—"That, in reference to the new Building Act Amendment Bill now being promoted by the London County Council, without consultation with the Corporation or the local and professional authorities, this meeting advises that the campaign adopted in the case of the London Building Act be agreed to, and that, if the Bill be pressed, the Lord Mayor be asked to call a public meeting of protest by the citizens at the Guildhall."—This was referred to the Streets Committee.

Underground Convenience.—In consequence of difficulties having arisen, the Streets Committee reported that they had abandoned the site in the Guildhall-yard, by St. Lawrence Jewry Church, for an underground convenience, and they recommended in lieu thereof that an underground convenience be constructed under Guildhall-buildings, opposite the City of London Court, at an estimated cost of 3,000*l.*—This was agreed to.

Duke's Head-passage.—The Improvements Committee reported again with reference to

the proposed widening and converting of Duke's Head-passage into a carriage-way, between Ivy-lane and Paternoster-row, and recommended that no further action be taken in the matter.—Mr. S. J. Sandle moved that the matter be referred back to the Committee for further consideration, and this was carried.

City Surveyorship.—The Court sat in private to consider the election of a City Surveyor from the following selected candidates:—Mr. Frederick Brown, Mr. James Leonard Crouch, Mr. Sydney Perks, Mr. William H. Prescott, Mr. Frank Sumner. The voting resulted in the selection of Mr. Sydney Perks, of 5, Crown-court, Cheapside, E.C., formerly assistant to the Surveyor to the Board of Trade, and who has been in private practice since 1890.

Illustrations.

A CHRISTMAS VISION: AFTER TENNYSON.

R. CONRADE'S drawing is the result of a commission from us to make an illustration of an imaginary picture described in Tennyson's "Palace of Art." He devotes a series of stanzas to describing, one after another—a stanza to each—various pictures in the fabled palace; and in the catalogue occurs this one—

"Or the maid-mother by a crucifix,
In tracts of pasture sunny-warm,
Beneath branch-work of costly sardonyx,
Sat smiling, babe in arm."

The "branch-work of sardonyx" evidently has a kind of Byzantine suggestion, which the artist has followed in the framing of the picture, though his Virgin is perhaps somewhat too naturalistic a figure for the surroundings. However, we have the "Madonna della Seggiola" as a precedent.

INTERIOR, ST. JAMES'S, PICCADILLY.

This drawing by Mr. Leslie Wilkinson, is the one which gained its author the Academy silver medal for perspective drawing, open to architectural students alone.

It is hardly necessary to say anything about this well-known church; but the drawing illustrates very well Wren's admirable way of working in the gallery (then considered a practical necessity) into a classic composition.

GRAMMAR SCHOOL, MARLBOROUGH.

The new grammar school at Marlborough, built from the designs of Messrs. Silcock & Reay, of Bath, is intended to accommodate eighty scholars, forty boys and forty girls. It is built on the site of the old grammar school, but set a little further back from the road.

There are two entrances, one for boys and one for girls, with cloakrooms, changing-rooms, and lavatories attached, and the building contains on the ground floor a central assembly-hall, with four classrooms and teachers' room opening out of it, and on the first floor four classrooms, a lecture-room, and a music-room. The physics laboratory and cookery-room are on the ground floor, and the chemical laboratory and the art-room are on the first floor. There are two playgrounds, with a playshed and a bicycle-shed in each, and with a manual instruction-room in the boys' playground.

The building is heated by hot water, and rooms ventilated by means of extraction flues and inlet-ventilators.

The builders are Messrs. Downing & Rudman, of Chippenham, and the clerk of the works is Mr. A. H. Davies.

HOLY TRINITY CHURCH, SOUTHPORT.

This is a re-building of an already existing church at Southport. The drawing shows the design of the west end, which shows a rich and effective treatment, the west window having two orders of tracery, one outer one standing in front of and partially veiling the actual window tracery. The western façade of the nave is treated as a panelled stone screen, the gable rising behind it.

The estimated cost is 10,000*l.* for the nave and aisles, 7,000*l.* for the tower and west end, and 3,000*l.* for the morning chapel and transept.

The materials used are Bath stone for exterior dressings, Runcorn stone for internal arcades, and Chorley bricks for the brickwork.

The builders are Messrs. J. C. & F. Woods, of Bolton and Southport, and the architects Messrs. Mearns & Simon, of Liverpool.

A CHRISTMAS VISION: AFTER TENNYSON—DRAWN BY MR. A. C. CONKADE

MEMORIAL GATE AT MONTON CHURCH, MANCHESTER.
MESSRS T. WORTHINGTON & SON, ARCHITECTS

NEW RECTORY, OXTED, SURREY.

The house is built of local stock bricks of a purple red, with red sand-faced bricks for dressings and quoins. The roof is of local red tiles.

A thick belt of trees shuts out both view and, to a great extent, sun on the south and east sides of the site, which is only one acre in extent, and therefore the dining and drawing-rooms were both given a westerly aspect, where there is a pretty view over Oxted village.

The cost of the house and boundary fences was 3,200l., Messrs. J. Brasier & Son being the contractors, and Mr. C. M. Oldrid Scott the architect.

MEMORIAL GATEWAY, MONTON CHURCH, NEAR MANCHESTER.

The boundary wall and gateway here illustrated were erected as a memorial.

They were executed in Darley Dale stone by Messrs. Deakin & Greenwood; the gates and railings were the work of Messrs. George Wragge, and the statue in the niche is by Mr. John Tweed, A.R.A.

The architects are Messrs. Thomas Worthington & Son, of Manchester, who also designed the church, with the schools and keeper's house.

COMPETITIONS.

MUNICIPAL BUILDINGS, BROMLEY.—The assessor in the competition for Bromley municipal buildings, Mr. J. S. Gibson, has now delivered his award, with the following result, viz.: First, Mr. R. Frank Atkinson, 8, Sackville-street, W.; second, Messrs. H. Ashley & Winton Newman, 10, Gray's Inn-square, W.C.; third, Mr. G. Harold Norton, 14, Bedford-row, W.C.; fourth, Messrs. Hall & Phillips, 6, Great James-street, Bedford Row, W.C.; fifth, Messrs. Lanchester & Rickards, 1, Vernon-place, Bloomsbury-square, W.C.

BOOKS RECEIVED.

JOHN N. RHODES—A YORKSHIRE PAINTER: 1803-1842. By W. H. Thorp. (Bemrose & Sons.)

SEA DEFENCE WORKS AT CLACTON-ON-SEA.—By their Bill, deposited for the next Parliamentary session, the Clacton-on-Sea Commissioners are seeking power to construct a sea wall in the parish of Great Clacton, with promenades or roadways for foot passengers. The estimated cost of the undertaking is 60,000l.

CRYSTAL PALACE ENGINEERING SCHOOL.—The award of certificates was made on Friday last week, at the close of the thirty-second year's work of the Crystal Palace Company's School of Practical Engineering. The chair was occupied by Mr. Charles Hawksley, Past-President of the Institution of Civil Engineers. From the reports of the Examiners, Mr. J. F. J. Reynolds, A.M.Inst.C.E., Mr. C. W. Sandish, A.M.Inst.C.E., and Mr. J. G. W. Aldridge, A.M.Inst.C.E., it appears that the general merit of work in the Mechanical, Civil, and Electrical Sections of the school has been fully maintained. The high percentage of marks—280 out of a possible 296—obtained by Mr. G. O. Sharpe, in the Lecture Examination on "Materials and their Manufacture," is deserving of special mention. Another noteworthy feature is the importance attained by the Electrical Section, whose continued growth testifies to the fact that absolute knowledge of electricity is now an adjunct essential to the well-trained engineer. The certificate of honour for six school certificates, none lower than third in order of merit, was secured by Mr. J. M. S. Culbertson, and the "Wilson" premium for a paper read before the Engineering Society on "Railway Practice and Construction in India," was awarded to Mr. L. H. C. Palmer. In the course of his address to the students, Mr. Hawksley expressed his regret that the present generation of engineers neglected the example of their predecessors, who combined utility with aesthetic design. The speaker had been so much struck with the ugliness of modern engineering works that he hoped to establish a premium in connexion with the Institution of Civil Engineers for designs combining good taste with utility and strength.—Other papers read during the session were "Water-boring in South Africa," by Mr. W. D. Cornwell; "Portland Cement," by Mr. N. G. Watson; and "Irrigation in India," by Mr. N. H. J. Daniell. Mr. S. Y. Knight (a former student), of the Llantwit Engineering Company, also read a paper upon "Railway Brakes."

Correspondence.

ARCHITECTS' DRAWINGS.

SIR,—It was with great satisfaction that I read your first article on the case of Ebdy v. McGowan which brings up the question of ownership of drawings so forcibly, and I am still more pleased that you are continuing the discussion and are proposing to do something practical to show how important it is to the profession, and indeed to artists similarly situated outside the profession. In response to your appeal, I shall be happy to add a cheque for five guineas to the one so promptly offered by "The Provincial Architect" and hope many others will do the same.

One of my earliest contentions—as a young architect—was on this very point, and I succeeded in proving my case to a large church building committee, advised by a very shrewd solicitor. My drawings were my tools, not to be handed to anyone else to do my work, but to be retained by me for future use if need be, at any rate, for my own purposes. I argued that I was not a draughtsman to make pretty drawings, but an architect to build buildings, with or without such tools as these drawings, models, or diagrams—according as circumstances required.

Since then (nearly half a century ago!) I have always stuck to the point and always succeeded, having never given up a drawing in my life under compulsion, and have found the use of my old drawings frequently—my clients often being glad to find I could produce what they themselves would have been sure to have lost, in the case of alterations, enlargements, drainage works, etc. I have always been glad to give drawings or copies which might be of use or importance, but never if demanded as a right, unless specially paid for.

C. F. HAYWARD.

SIR,—If the report of the case of Gibbon v. Pease, your clear exposition and criticism of the facts, and your powerful appeal to architects as a body are insufficient to disturb the lethargic, selfish isolation into which it is the habit of architects, whether as units or as corporate bodies, to plunge themselves, I do not flatter myself that anything I could say would be usefully supplementary.

Nevertheless, I may perhaps offer the following points for consideration:—

(1) To contest successfully the very important question of the ownership of architects' drawings and to bring out clearly all the factors in the case require not only plenty of "the spew of war," but, what is almost equally necessary, the evidence of "custom" as demonstrated by the pronounced and unmistakable anxiety of architects, individually and collectively, lest they should be deprived of the benefit and protection of such "custom." Consequently, I should like to see many far greater sums than my own 5l. 5s., and also many lesser amounts, subscribed to the fund you are good enough to open, so that it may be made quite apparent that from the man who can only afford 5s. to the one who would not miss 100l. the unanimous spirit and intention of architects is to preserve their rights and "custom" in this matter, whether by the law as it may, on appeal to the highest courts, be held to stand, or by the law as it may require to be amended so that justice and law may be, as regards architects, synonymous expressions. And it should be borne in mind that apparently even the measured drawings and sketches of student-days could be demanded by a client, under such an iniquitous *original claim* as that of Gibbon v. Pease, had the knowledge so gained been applied to the preparation of the drawings of a client's building.

(2) Architects as units (and as corporate bodies through their various societies) have, in the case of Gibbon v. Pease, an opportunity of obtaining an important legal decision, at a cost of a few pounds each, which would cost them many hundreds of pounds to strive to obtain individually, with probably, as merely an individual's action, less satisfactory results. And, further, the value of even one set of drawings, which under the decision in Gibbon v. Pease had to be surrendered, would be far in excess of the cost to each architect of the collective appeal against it which is proposed to be taken.

(3) Had action similar to that now contemplated in the case of Gibbon v. Pease been taken in the case of Ebdy v. McGowan, a great deal of subsequent hardship to architects, which has

been held justified under that decision of the law courts, would have been avoided, and probably the case of Gibbon v. Pease would never have arisen, and, had such a case arisen as Gibbon v. Pease, the difficulties of obtaining a reversal of the present decision in that case would not have been increased by the need of explaining away what will certainly be considered by lawyers an awkward "precedent," however much it may be repudiated by architects as being totally inapplicable to the case under review.

(4) Similarly, if means are not taken to reverse the present decision in Gibbon v. Pease, the next thing will probably be that clients ignorant of what architects really ought to be and of what architecture (worthy of the name) actually is will be led to suppose that every portion of a piece of architecture has been or should have been made the subject of elaborate sealed and full-sized drawings and of legally-phrased specifications and contract forms, and the next lawsuit to be anticipated by architects would probably be one for "negligence" or "legal fraud," because, perchance, some architect could not produce to his client on demand elaborate and painfully mechanical drawings and written descriptions of every moulding or scrap of carving connected with some building, or because some client with a taste for microscopical investigation had been able to detect that in execution of the work a departure from "studio designing" had been found by the architect to be more architecturally pleasing or desirable.

In fact, it only requires a very small expenditure of mental reflection for every architect to realise how very serious are the issues raised by the case of Gibbon v. Pease—for himself selfishly, and unselfishly for architecture, and to be fully convinced that it is in the interest of every single architect in England (in other countries, happily for them, the need does not exist, for in them architecture is better appraised at its true value) to prevent the abrogation of the "time-honoured custom" regarding the ownership by architects of their drawings and specifications.

(5) Lawyers delight in precedents. When, therefore, any one of them makes such absurd remarks as those respecting sculptors and sculpture to which you referred in your leading article of the 26th ult., he may perhaps be well referred to the practice which prevails in the more commercial world of gun-makers, engineers, and ship-builders. Let him inquire whether the purchaser of a piece of ordnance obtains with it all the experimental and completed drawings and specifications, all the calculations, particulars, and tests, and all the patterns, foundry-plant, and tools as well; or let him ask himself whether such firms as that of Armstrong or of Krupp would have even come into existence had every purchaser of a new form of gun been able to claim as part of the bargain and without payment the brains which, had the purchaser himself possessed them, would have rendered an Armstrong or a Krupp a superfluity. Let him also make similar inquiries amongst engineers and ship-builders, and say whether the results of such investigation were not similar. And then, whether he looks upon the practice of architecture as "an art or a profession," and whether or not the "registration of architects" (as of solicitors) be the one thing needed to establish the right of architects to treatment as fair as that which more "commercial" workers receive, it will not be difficult for him to gather quite a posse of precedents in support of that view of an architect's position, of his responsibilities to his client, and of his own rights and privileges which every architect has hitherto supposed to be so clear and obvious that even a lawyer, befogged as he may be by "case-law" and "precedent," ought not to fail to appreciate and to concede.

I beg to thank you as one architect for kindly undertaking to receive subscriptions towards the cost of the appeal, on behalf of architects generally, against the present decision in the case of Gibbon v. Pease, and to enclose my promised cheque for 5l. 5s. Should further monies be needed to carry the appeal to the highest courts or otherwise, I shall hope to be able then to make a further subscription, and I can only hope that, as in the case of Colls v. Home & Colonial Stores, Limited, a similar exhibition of courage and determination in the case of Gibbon v. Pease may effect as much needed a change in the legal estimation of architects and architecture as has taken place regarding the less human, though at one

time apparently, more hopeless, subject of "ancient lights."

A PROVINCIAL ARCHITECT.

Sir,—After the extremely energetic manner in which you have taken up the subject of the ownership of architects' drawings, I am very glad to find that you are further assisting matters by kindly offering to receive subscriptions towards the cost of an appeal.

Mr. Chorlton James, of the firm of Messrs. James & Morgan, of Cardiff, has very generously forwarded to me a cheque for 5*l.* 5*s.* towards the cost of this appeal, and I have forwarded this to the solicitors who have charge of the case.

This public spirited action on the part of Messrs. James & Morgan will, I hope, induce others in the provinces to also assist towards the necessary expenses.

The action which Mr. Pease is proposing to fight is of so much importance to the whole profession that every architect ought to make a point of sending a contribution, as undoubtedly the great cost should not bear unduly on the shoulders of any one individual when the case is being fought to maintain a principle.

The arguments you have brought forward both in the *Builder* and elsewhere have been so convincing that very little remains to be said.

To my mind architects above all others should know what it is they are selling when they receive their fees for professional assistance.

It seems almost as reasonable for an employer to insist upon having the plans—which are in fact the architect's working tools—as it would be for a customer to insist upon having the tailor's brown-paper patterns from which he cuts his cloth in making a suit of clothes.

I have much pleasure in herewith handing to you my cheque for 10*l.* 10*s.* towards the cost of the appeal.

GEORGE HUBBARD.

THE JOINERY TRADE.

Sir,—It would be interesting to know if "A London Builder" has tried to turn out work at the price and in such quantities as "A Shop Foreman" mentions. "A Shop Foreman," however, must not be too sure that the foreigner will raise the price of deals, etc., should joinery be taxed. The price of every article of commerce is regulated to a great extent by the supply and the demand, and, after getting as much as he can on "forward contracts," the foreigner consigns large quantities of timber to our London auction rooms to fetch what it will. On the other hand, should "A London Builder" get his 10 per cent. tax, he may find it hardly worth the candle. By the time the (say) doors are valued as low as possible for taxation, and numerous little dodges resorted to for the purpose of evading the same, it will probably work out at about 6*d.* or 9*d.* per door, a difference which can easily be made in the manufacture at home. "A London Builder" claims a "modern plant of machinery," but it can hardly be well managed, if his buying and joinery shops are. While a joiner is placed in charge of every joiner's shop in the country, anyone is considered competent to take charge of the machine work, instead of an experienced machine hand, and yet good results are expected. I know places where it costs more to grind a saw than it would do to buy

a new one, and they are often in hand too, yet the person in charge would be the first to point out his splendid system. This is only one point; but how can we expect to compete with foreigners on these lines? Wages and taxation are always to the front. Good management and enterprise seem to be secondary considerations. There are plenty of competent men to be found, some prepared to purchase an interest in a substantial firm, but—opportunity is a fine thing. I hope this discussion will be continued for our mutual benefit.

MILL FOREMAN.

NEW WESLEYAN METHODIST HALL COMPETITION.

Sir,—We have this week learned that the correct address of the last-named firm in the list of successful competitors published in your last issue is "Messrs. C. E. Mallows & A. W. S. Cross, London."

ALBERT CLAYTON.
* * The mistake of course was not ours. The names were sent to us, type-written, and we could only give them as sent.—En.

The Student's Column.

ASPHALT: ITS COMPOSITION AND PROPERTIES.—III.

ASPHALT MASTIC.

THE sample of balrinc asphalt rock referred to in our last chapter contains in its natural condition too much bitumen for "compressed asphalt," but approximately correct for "mastic," which is, however, usually made by boiling together rock asphalt containing about 10 per cent. of bitumen with a proportion of refined bitumen of suitable quality. After being thus heated to 400 deg. Fahr. and mixed mechanically in a boiler it is run into blocks of about $\frac{1}{2}$ cwt. It should contain 15 per cent. of total bitumen, be thoroughly homogeneous after stirring, and, unlike asphalt rock, should not fall to pieces on being heated. To obtain this homogeneity the rock must be ground very fine, the mixture with the bitumen amalgamated by fusion, or "cooking," in a thorough manner. For roadways it is usually laid in two thin layers, of a total thickness of 1 in., whereas the compressed kind is usually 2½ in. For footpaths, where the wear is not so great, grit (hard and clean) is added, 33 per cent. for temperate and 50 per cent. for tropical countries.

It is air, water, and vermin proof, is elastic to the tread, absorbs vibration, and is a non-conductor of electricity. It is unaffected by heat or cold—that is, the expansion and contraction which are caused by change of temperature do not produce cracks in the material. These properties make it very suitable for a damp-proof course because of its accommodation to any settlement of the building without break in the continuity of the protection, and because it need not be so thick as to squeeze out under the pressure of the superincumbent mass. Ordinary asphalt or mastic is not capable of resisting acids, because of the immediate effect of the latter upon the limestone contained as the base, but by mixing bitumen with pure silex an acid-resisting

mastic may be made and applied like ordinary mastic. This kind is used for electric accumulator rooms and baths for electrolysis, etc. Reference to the effect of petroleum spilt upon asphalt and of gas leaking under asphalt roadways will be made after more detailed reference has been made to the components of the "total bitumen" of Trinidad pitch and other bituminous substances.

Whilst the governing factor in asphalts (compressed or mastic) is the bituminous portion, yet the condition or size of the grains of the base (limestone) is not without effect. In Seyssel, Val de Travers, and Servas rocks the grain is fine, whilst in the Sicilian it is coarse, so that the specific gravity of the latter rock is less than that of the former.

Liquid asphalt, or asphalt mastic, footpaths of a $\frac{3}{4}$ in. layer weigh 80 lb. per sq. yd., equal to 143 lb. per cubic ft.

The use of bitumen is not confined to admixture with asphalt rock for the production of "mastic," but is used on its own account for watertight linings, for electric insulation, and the composition most suited for these several purposes must now be considered.

BITUMEN.

The several varieties of this substance are determined mainly by the proportions of the percentages of the more volatile constituents, but also in a less degree by the sulphur content. In this latter respect the nearly pure bitumen of Barbados is superior to that of Trinidad, being almost free from sulphur, whilst as much as 8 per cent. has been found in some samples from the last-named island. In both cases it is called manjak, and sometimes glance pitch, and is in appearance very much like Cannel coal, having a conchoidal fracture and being possessed of low elasticity. This makes it of service for use in making black varnish or for electrical insulation, but not for purposes where elasticity is of prime importance.

G. du Bois made a test of the best quality of Barbados manjak, and found 95.5 per cent. to be soluble in benzene, which is almost equal to carbon bisulphide as a solvent. Of the soluble matter, 63.63 per cent. was volatile on distillation and 32.27 per cent. of coke was left, whilst 4.10 per cent. consisted of impurities and earthy matters. Of the volatile constituents, 40 per cent. formed a good oil, suitable for the production of petroleum.

This purity in sulphur and ash makes the Barbados manjak valuable for coatings to prevent rusting of iron, or for varnish made by dissolving in turpentine, and is accordingly largely employed in the United States for the manufacture of Brunswick black and as an insulating material for electric cables; but for purposes where elasticity is needed it is by itself unsuitable, and where it is required to mix with natural rock asphalt its high melting-point is against it.

A sample recently tested at the Imperial Institute laboratory having the following percentage composition: Carbon, 81.18 per cent.; hydrogen, 8.43 per cent.; and oxygen, 10.39 per cent., melted at 327 deg. Fahr., whilst a sample of Trinidad manjak melted only at 428 deg. Fahr., because it contained only 12.6 per cent. of "petroleum."

NOTES.—Nos. 4 and 5 compared with Nos. 1 and 5 of Table I. show higher percentages of bitumen (total).

No. 6. A deposit consisting of a mass of sea-shells cemented by bitumen.

No. 9. A so-called asphaltum taken from a vein in Richlie county.

Nos. 10 and 11. Hard and soft artificial asphalts; petroleum distillation residues, California.

No. 12. From Franklin-avenue, Buffalo, N.Y. It was laid in 1878, in use for fifteen years. Made of Trinidad asphalt, wax tailings, and sand.

No. 13. From Governor's Island, age not known, but disintegrated by age.

No. 14. Made by adding sulphur to hot Lima petroleum tar.

For purposes where "accommodation" is an essential, as in water-tight linings, and where incorporation with natural asphalt requires an approximately similar melting-point, it is therefore necessary to have recourse to "Trinidad pitch" as the less oxidised and more tractable component.

Trinidad pitch is known also as "asphalt" and as "lake asphalt," from the extinct crater (in appearance like a lake), where the purest form is obtained; and this is sub-divided into liquid asphalt, semi-liquid asphalt, and solid asphalt; according to the consistency, which in turn is determined by the percentage composition of its petroleum-like components. The quality is also affected by the percentage of earthy matter that has gained admixture with the asphalt, and is greatest in "land asphalt," which is mined outside the crater referred to.

We have already mentioned the fact that means have been devised for differentiating the substances usually grouped under the term "bitumen," this having been found necessary in view of the great variety of natural rocks, natural pitches, and the introduction of petroleum and gas-tar pitches, or other analogous substances as substitutes.

Unfortunately no one method has as yet been found sufficient to ascertain these facts, and we have therefore to examine those most generally accepted for each feature, leaving out of our notice others which differ in details only.

The method devised by Peckham and Lynton is based upon a separation that originated with Boussingault, who found that bitumens yield to certain solvents a portion of their constituents to which he gave the name of "Petroleum," and to certain other solvents another portion which he called "Asphaltene." The first step in the process is to separate and estimate the water and then to digest the substance with petroleum spirit (sometimes called petroleum ether). The percentage weight of material removed by this solvent is called "Petroleum." To what remains undissolved boiling spirits of turpentine are added, and the digestion is continued for several hours, or as long as any coloured matter continues to be extracted. After this the process is repeated with chloroform in the place of turpentine, after which the matter still remaining insoluble is ignited and the residue weighed (with proper precautions) to determine the amount of organic matter and mineral matter respectively.

The table No. II. is given to act as a connecting link with Table I., and to show the components of West Indian and American products. The first section of Table III. has been compiled from the results obtained by S. F. Peckham, and recorded in the *American Journal of Science*, Vol. I., fourth series, the first six items by the officials of the Imperial Institute for the purpose of showing the varieties that exist in the district of La Brea. The value of the differential method has been confirmed by Mr. Clifford Richardson, who has made many tests of material and inspected the sites where the samples were taken, and his summary of Mr. Peckham's returns is also embodied in the third portion of the table.

He says: "These analyses, although carried out on somewhat different lines from mine, permit of the same conclusions in regard to the changes which have taken place in the land samples; and the additional determinations of bitumen made by Professor Peckham with chloroform furnish some additional and conclusive evidence of the differences between the two kinds of material."

"These show that the average 'land' specimen contains 2.4 per cent. more of its bitumen in the form soluble only with difficulty, while iron pitch, which is acknowledged to be of no value for paving purposes and is always rejected in digging land pitch, has 7.3 per cent. more of its bitumen in this form."

From this we can draw the inference that the land pitch collected by Professor Peckham is one-third converted into iron pitch and of so much less value than lake pitch for paving purposes. In fact, his results are as conclusive evidence of the difference between lake and land pitch as any that have been offered, and confirm the results of experience with the asphalt from the land deposits in the laying of street pavements."

The essential features of the investigations just referred to are embodied in sections I and 3 of Table III., and those of E. Donath and B. M. Margosches by a somewhat similar method in sections 2 and 4 of Table III.

Instead of using boiling spirits of turpentine and chloroform after petroleum spirit, the last-

named gentlemen employ benzene and carbon bisulphide. Notwithstanding this, the independent investigations prove quite confirmatory. They show that the bitumens in refined Trinidad pitch are practically identical with those of the standard rock asphalts, viz., that the "petroleum" is twice the percentage of "asphaltene," say 66 per cent. of the former, 33 per cent. of the latter, with about 1 per cent. extractable by the most searching solvents chloroform or bisulphide of carbon.

The table shows also the great improvement that takes place in the refining of the Trinidad pitch, mainly by removing the portion which is difficult to dissolve, viz., the chloroform, and incidentally shows that there is more of the improvement to be effected in the case of land pitch than in lake pitch.

The figures show also how much nearer the

petroleum pitch is to the natural bitumen than is coal tar pitch. This is not difficult to understand, seeing that the former is akin in origin and mode of formation and in the temperature of its distillation, whilst the latter is a product of high-temperature distillation in which a different order of carbon compounds, viz., the aromatic, is produced. The presence of these last named, such as anthracene, furnish a means for detecting the presence of coal-tar pitch.

The resemblance between petroleum pitch and Trinidad pitch is also in the percentage of organic matter undissolved, and means of differentiation of the components of this will be hereinafter mentioned. There is a difference in the mineral matter or inorganic residue in the separated bitumens, but as supplied commercially mixed with a base; this does not

afford a reliable method of discrimination. On account of these difficulties the extracts have been further examined by Dr. G. Lunge and V. Krepelka, whose recent researches are embodied in Table IV.

Before considering those results, it will be well to give the conclusions which Mr. E. Donath and Mr. Margosch have reached. After referring to the manner in which individual products may be distinguished by dry distillation, viz., wood-tar pitch, coal-tar pitch, lignite tar, petroleum, stearine, wool-tar pitches, and asphaltum, they go on to say that "natural asphaltum, when treated with alcoholic potash, colours the liquid only slightly at first, but more intensely after some time; lignite tar pitch colours the liquid immediately, and petroleum pitch gives either no coloration or an extremely weak one. The behaviour on successive extractions with petroleum spirit, benzene, and carbon bisulphide also affords a means of distinguishing between lignite tar pitch, petroleum pitch, and asphaltum. In the case of the last named, the insoluble residue consists entirely of inorganic mineral matter. In practice the most common form of adulteration is the addition of coal-tar pitch to natural asphaltum."

They recommend successive extraction as just mentioned, and if coal-tar pitch be present the residue will be black and will give a brownish red solution with concentrated nitric acid. The presence of anthracene and the production of a coloured fluorescent solution with methyl or ethyl alcohol or chloroform yield additional evidence of the presence of coal-tar pitch." Dr. Lunge states that petroleum spirit will give a precipitate with the chloroform solution of the tar pitches, but not with those of the natural asphaltums or petroleum asphalt.

"STUDENT'S COLUMN" PAPERS ON PORTLAND CEMENT.

We are deeply annoyed, for every reason, to have had evidence laid before us that the writer of the articles headed "Notes on Portland Cement," which appeared under the heading of "Student's Column" in the earlier pages of the present volume, has made a use of Mr. D. B. Butler's book on "Portland Cement" (published by Messrs. Spott in a manner which constitutes an infringement of copyright; as we find that many sentences have been transferred almost *verbatim* from Mr. Butler's book to our columns. Both author and publisher need hardly be told that we regret this, since it is in fact an even greater injury to us than to them. The writer of the articles, who was previously unknown to us, gave us what appeared to be satisfactory evidence as to his capability to deal with the subject, and we accepted his articles in good faith. He had never contributed to our columns before, and we need not say that he never will again.

OBITUARY.

SIR LOWTHIAN BELL.—By the death of Sir Isaac Lowthian Bell, at the age of nearly 89 years, the world has lost one more of the few remaining veterans who helped to build up the great engineering industries of Great Britain, and one who had acquired a world-wide reputation as a scientific and practical metallurgist. Born at Newcastle in February, 1816, Sir Lowthian Bell has for many years been one of the eminent men whom Tyne-siders delight to honour, and, although his more important work was performed on the banks of another river, he never forgot the city of his birth. After attending Mr. Bruce's school in Newcastle, he went to Germany and Denmark for further instruction, thereafter becoming a student at Edinburgh University, and the Sorbonne, Paris, and finally, at the age of 24, he joined the ironworks at Walker-on-Tyne, of which his father was part proprietor. In 1845, Mr. Bell succeeded to a portion of his father's interest, and at that date the firm were already smelting ironstone from the Yorkshire coast in a furnace designed by him for the purpose. The discovery of the Cleveland ironstone, at Eston, a place further inland, came as no surprise, and, about the year 1850, Mr. Bell and his two brothers at once threw themselves into the new enterprise suggested, and built the now celebrated ironworks at Port Clarence, on a site that was then a mere salt marsh on the north bank of the Tees. At about the same period Mr. Bell was also connected with the chemical works at Washington, North Durham, in association with Mr. H. L. Pattinson, F.R.S. He enlarged

these works very considerably, and installed extensive plant for the manufacture of oxychloride of lead, as well as one of the first plants in England for the production of aluminium by the Deville process. We cannot here attempt to trace the progress of the Clarence Ironworks, but one or two points may be mentioned for the purpose of indicating the capable methods characterising the subject of this memoir. The new venture, starting with three furnaces in 1854, soon had to face severe industrial depression, and the hostility of the Stockton and Darlington Railway. After a Parliamentary struggle Messrs. Bell Brothers succeeded in obtaining independent access to their mineral rights by the formation of the Cleveland Railway Company. Further sources of ore having been secured for insuring ample future supplies, the firm was instrumental in obtaining powers for an extension of the line to Loftus. Attention was next turned to the question of fuel, and three collieries were successively acquired.

In the meantime the number of furnaces had been increased from three to six, and in 1865, after an exhaustive examination into the theory of the combustion of fuel in the blast furnace, Mr. Bell satisfied himself as to the desirability of larger furnaces, and built two with a height of 80 ft., and a diameter of 16 ft. Step by step the old furnaces were replaced by others of the new type, and four additional furnaces were erected, raising the number to twelve, the output per furnace being raised from 150 tons to over 300 tons per week. Mr. Bell was one of the first to recognise the advantages to be derived from the utilisation of furnace gases for heating the air blast, and, in fact, he played an important part in connexion with all the improved metallurgical processes which were introduced in those days. At a later date, as Sir Lowthian Bell, he conducted a series of experiments, at a cost of between 30,000l. and 40,000l., which demonstrated the possibility of producing steel on a commercial basis from Cleveland iron. This development had the important effect of rendering unnecessary the importation of Spanish ores for steel making, and opened up new fields for the application of Middlesbrough steel. Besides being a far-seeing and competent business man and an expert metallurgist, Sir Lowthian was a scientific and practical chemist, and an able statistician. Moreover, he was always a student and an investigator, and ever ready to communicate the results of his researches for the benefit of the world. Many of his writings have been translated into French and German, and are justly regarded as classic works. To enumerate the papers he has contributed to various scientific societies would involve a lengthy catalogue. Some of them have been published in book form under the title, "The Chemical Phenomena of Iron Smelting," and another well-known work of his is a book on the "Principles of Iron and Steel Manufacture." In 1858, Sir Lowthian (then Mr.) Bell was elected a member of the Institution of Mechanical Engineers, of which he became President in 1884; in 1867 he joined the Institution of Civil Engineers as an associate, being transferred to the class of members in 1873. He was one of the original founders of the Iron and Steel Institute, formed in 1869, and occupied the position of President from 1873 to 1875. In 1875 he became a fellow of the Royal Society, and he was elected an honorary member of the American Philosophical Society. He was also a member of the Chemical Society, and received the first Bessmer gold medal, as well as George Stevenson, Howard, Telford, and other medals and awards in the course of his professional career. He was created a baronet in 1885, and received the degree of LL.D. in 1895 from Edinburgh University. Sir Lowthian Bell was twice Mayor of Newcastle, and was also a justice of the peace, deputy-lieutenant, and sheriff for the County of Durham, and for five years member of Parliament for Hartlepool.

MR. W. PROSSER.—The death took place, on the 12th inst., at Wandsworth Common, S.W., of Mr. William Prosser, for over twenty years clerk of works under Sir Geo. Gilbert Scott, and afterwards with Messrs. Ernest George & Peto, in connexion with Rousdon, Devonshire. Mr. Prosser had retired from work for the past thirteen years, and reached the advanced age of eighty years.

DEMOLITION OF A PORTSEA CHURCH.—Under the powers sought for in the Naval Works (Portsmouth Barracks Site) Bill, the site of Holy Trinity Church, Portsea, and of the vicarage house will be transferred to the Admiralty, who contemplate demolishing the church and vicarage and utilising the site for the erection of barracks. The ecclesiastical parish will be united with one or more contiguous parishes.

GENERAL BUILDING NEWS.

BIBLE CHRISTIAN CHURCH, HOVE.—A new Bible Christian church is being erected in Old Shoreham-road, Hove. The church, when completed, will measure 160 ft. by about 68 ft., and will have frontages to Old Shoreham-road, Montefiore-road, and to a new road which it is intended to construct. The church will seat 412 on the ground floor, including a choir of forty-two; provision will also be made for an end gallery to be added when the need arises. The plan of the church shows a nave with shallow transepts, chancel, and organ chamber, entrance vestibules, and a minister's vestry. There will also be a lecture hall to seat about 250, and beneath the lecture hall there will be eight classrooms, three of which will readily form into one room. A ladies' cloakroom and a kitchen are included in the scheme, and the building will be heated by the low-pressure hot-water system. The walls will be faced on the exterior with rubble flint work, with dressings of Bath stone and buff-coloured bricks, and the roofs will be covered with Brosley tiles. The windows are to be glazed mostly with tinted glass in leaded quarries. The architect is Mr. Edwin J. Hamilton, of Brighton, and the builders are Messrs. Hookley & Co., of Grantam and Brighton.

CONGREGATIONAL CHURCH, SANDGATE.—The foundation-stone has just been laid of the new Congregational church, Sandgate. The church is designed in the Gothic style, and is to be built of Kentish rag stone, with Wallis' patent stone dressings. The roof will be of open pitch-pine, fitted with Messrs. Shorland's Patent extract ventilator, and both church and schoolroom will be fitted with ventilating panels. The windows of the church are two-light, with circular light over, filled in with tinted leaded lights, and at the east end there will be a four-light tracery window. The flooring of the church, vestry, and schoolroom will be wood blocks, laid by the Westminster Flooring Company. The seating accommodation of the church will be 260, and the schoolroom, situated at the rear of the church, will hold seventy-five scholars. The building throughout will be heated by Messrs. Werner, Pfeleiderer, & Perkins' small horse system of heating. The contractor for the work is Mr. J. Brissenden, of Sandgate, and the architects are Messrs. Bowles & Hawkins, Dover.

CHURCH, STOCKTON.—The Bishop of Durham presided at a meeting, held at Stockton on the 12th inst., at which an appeal was made for funds towards the extension of Holy Trinity Church, Stockton. It was explained that the extension of the chancel for which the design of Mr. C. Errington, Newcastle, had been accepted, would cost about 1,400l., and the entire scheme nearly 3,000l.

NEWINGTON CHURCH, SITTINGBORNE.—The new work in connexion with the restoration of the fabric of this church was dedicated on the 16th inst. The church is a structure of various dates, the earliest part being the present vestry, which was built apparently as the lower part of a tower by Richard de Lucy, Lord Chancellor of England, between the years 1154 and 1178, in the reign of King Henry II. The stonework of the two lancet windows in this chamber was quite decayed, and has been replaced by new, and a new vestry doorway with oak door has been inserted. The other work consists of rebuilding the defective parts of buttresses and renewing such portions of the stonework of windows, string courses, etc., as were in an advanced state of decay, and restoring the west gable of the south aisle, which has been patched with modern brickwork. The whole of the work has been carried out by Mr. W. Parmenter, builder, of Braintree, Essex, under the superintendence of Messrs. James Brooks, Son, & Godsell, of London, who also restored the XVth century western tower about three years ago.

CLUB PREMISES, DOVER.—The enlarged premises of the Dover Institute were opened a short time ago. The work has been carried out by Messrs. R. & G. Brisley from plans drawn by Mr. F. G. Hayward.

SCHOOL, GRANTHAM.—New school buildings have been opened for the Governors of King's School, Grantam. The Governors appointed Mr. John Bilson, F.S.A., of Hull, as their architect, and, after consultation with him, they decided to erect a new school building next the Brook-street frontage, and new dormitories and accommodation for boarders next the Castle-gate frontage, and to remodel the kitchen offices. The new structure is two stories in height, and has four classrooms on each floor, approached by a wide corridor from the principal entrance in the centre of the Brook-street frontage, and from the two entrances from the playground. Of the ordinary classrooms, seven are planned to accommodate twenty boys each, and one thirty boys. The classrooms are fitted with single desks, and heated by ventilating firegrates.

This building also includes the rooms for science teaching. The physics laboratory, on the ground floor, is 36 ft. long by 24 ft. wide, and is fitted with working benches for twenty students, sinks, cupboards, and sliding blackboards. Above this is the chemistry laboratory, also 36 ft. long by 24 ft. wide, fitted with working benches for twenty-four students. The lecture-room, which adjoins the chemistry laboratory, is 25 ft. long by 24 ft. wide, with accommodation for forty students. The buildings are faced with Ancaster stone, and the roofs are covered with Colleyweston stone slates. Over the entrance doorway are the Royal Arms, with three shields below, displaying respectively the arms of Bishop Fox, of Corpus Christi College, Oxford, and of the town of Grantham. The extension of the boarding-house was commenced in February, 1903, and it has been occupied since the middle of this year. It comprises a new building next Castle-gate, with a return connected with the older dining-hall and dormitory. These buildings are partly of three and partly of two stories in height. On the ground floor is a large day-room, masters' sitting-rooms, studies, changing-rooms, and lavatory. On the first and second floors are three new dormitories providing additional accommodation for thirty boys, masters' bedrooms, bathrooms, etc. The school has been almost entirely retained.

NATIONAL BANK OF SCOTLAND.—An extension of the premises on the east side of Nicholas-lane, Lombard-street, is being built by Messrs. George Trollope & Sons and Colls & Sons from plans and designs made by Mr. J. Macvicar Anderson. The adjoining premises, now occupied by the National Bank, were taken over by them about thirty years ago from the Agra Bank.

PRESBYTERIAN CHURCH HALL, PELAW.—The memorial-stone of church buildings at Pelaw-on-Tyne has just been laid. The estimated total cost is 1573/. The architects are Messrs. Badenoch & Bruce, of Newcastle, and the contractor is Mr. Wm. Foster, of Pelaw. The hall is designed in a plain treatment of Early English work, the walls will be faced with red pressed Pelaw bricks, and finished with stone dressings. The length of the hall is 50 ft., and its width 36 ft., and it is divided into nave and aisles by cast-iron columns and arches, the nave being carried up above aisle roofs and having clerestory windows, and open timber roof. The aisles will be divided off by curtains into classrooms for Sunday school purposes. The entrance is at the west end, and gives access to framed and glazed inner porch. Behind the hall are classroom and vestry, and a corridor for exit. All the joiners' work will be in pitch-pine, stained and varnished. The floors throughout will be wood block laid on the herring-bone pattern on concrete, and the seating will be by chairs; the heating by low-pressure hot water, Messrs. Emley & Sons, Ltd., having secured the contract for this work.

PALACE THEATRE, GRIMSBY.—The new Palace Theatre and buffet, which is situate at the corner of Victoria-street and Corporation-road, Grimsby, has just been completed. Externally the buildings are principally of red Accrington bricks, with buff terra-cotta dressings. The elevation to Victoria-street is early Victorian in style, and the central feature is a triumphal archway, with a pediment, capped with cupola and flagstaff; this is flanked on either side by smaller octagonal turrets, with a terra-cotta gable in the centre supporting an allegorical figure representing "Music." Along the whole frontage to the theatre is placed an ornamental iron and glass verandah. The buffet adjoining is placed at the junction of Victoria-street and Corporation-road. There are eight exits provided from various parts of the house, and the building is to accommodate 2,000 persons. The theatre consists of a pit, orchestra stalls, grand circle, four private boxes, and a gallery. Retiring-rooms for ladies and gentlemen, together with promenades at the rear of the grand circle, etc., are provided. The main entrance is placed in the centre of the building in Victoria-street through a hall, with staircases right and left leading to the circle, the walls of which are lined with ornamental tile dado. The decorations are carried out in Louis XV. style, the principal colouring being cream and gold, relieved with turquoise-blue and rose tints. The whole of the theatre will be lighted by electricity. The stage is 60 ft. by 30 ft. Dressing-rooms and other apartments contiguous to the stage are arranged at the back thereof. The architects are Messrs. Owen & Ward, of Birmingham, and the general contract has been carried out by Messrs. Hewins & Goodhand, of Grimsby. The other sub-contractors engaged on the works are Messrs. Mallin & Co., of West Bromwich, who have executed the fibrous plaster work and decoration and the Uralite fireproof curtain to

stage. Messrs. Ludlow & Knight, of Birmingham, are the electricians.

ISOLATION HOSPITAL, NEAR CHESTERFIELD.—A new isolation hospital for the Chesterfield district was opened on the 7th inst. by the Mayoress of Chesterfield. The hospital, which is situated at Penmore, Hasland, has cost 9,400/, and it has been erected by a joint committee representing the Chesterfield Corporation and the Urban District Councils of Whittington, Newbold, and Brampton. It comprises five distinct blocks, standing about 20 yds. apart, on an extensive site, with a southern aspect, about 200 yds. from the Chesterfield and Mansfield main road. The administrative block is a three-story building, with accommodation for eight or nine nurses. The scarlet fever block provides sixteen beds, and the enteric fever block ten beds, and there is a third block, with four beds, for cases of diphtheria. There is a laundry for disinfecting clothing. In the upper story of the building for scarlet fever cases is a sun bath. It is a large room, the outer walls and roof of which are mainly composed of glass. In this room juvenile patients will be allowed to play when there is sunshine. On the ground floor of this block are wards which may be used for delicate cases or for private and paying patients. The block for diphtheria cases has two wards, with two beds in each ward. All the buildings are of plain brickwork, and the fever blocks are provided with glass verandahs on the south side. The convalescent patients are provided with a space in which to promenade. Mr. G. E. Bolshaw, of Southport, was the architect, and Mr. D. Brown, of Hasland, had the building contract.

NEW CHEMICAL LABORATORIES, GLASGOW UNIVERSITY.—The new chemical laboratories at Glasgow University are now almost ready for use. Although between 10,000/., and 12,000/., has been spent upon the structures alone, they are intended only for temporary occupation. The main purpose of their erection was the necessity for coping with the great increase in the number of students who have taken advantage of the chemical laboratory at Gilmorehill in recent years. The buildings were designed by Mr. J. J. Burnet, architect. Formerly, students of all grades worked in one laboratory, now, however, the juniors and the seniors have each their own buildings. These are almost side by side, and are connected by a covered passage or bridge. The senior work will be undertaken in a building of three stories—on the top floor being the physical laboratory, and on the middle floor the laboratory for the study of organic chemistry, while the metallurgical department is housed in the basement. The physical laboratory is a large apartment, fitted with all the latest appliances. Several smaller rooms are adjacent to the laboratory. These include a private research laboratory, a dark-room for photography, a workshop, and a small lecture hall of semi-circular shape. From the lecture desk the gallery for the accommodation of students rises at a precipitous angle almost to the ceiling. It is seated for 100 persons. On the second floor, leading off the lecture hall, there are a preparation-room for the lecturer, and a small private laboratory. The main hall for the study of organic chemistry, like that in use up to the present, is well arranged and splendidly appointed. The whole of the new departments are supplied with draught chambers, into which air is driven by two fans each of 1½ h.p. In addition to the organic laboratory there are on the second floor, rooms for gas analysis and microscopic work (with a dark-room for photo-micrography); also a combustion furnace-room, and a bomb-room—the latter so named because experiments involving slight explosions will be conducted there. The metallurgical department in the basement is a valuable addition to the equipment of the University. It includes a cellroom with accumulators, and a 50 h.p. cable, and a special room where the fan apparatus is placed. This apparatus is driven by electricity, and is set in operation by switches in the lecturer's office. Adjoining the fan chamber there is a furnace-room, which supplies hot water for the heating of the whole establishment. The junior laboratory has accommodation for seventy-six students. Surrounding it are a series of apartments for special branches of work.—*Glasgow Herald.*

NURSES' HOME, AIRDIE, N.B.—On the 15th inst. the nurses' home, erected at the corner of Clark-street and Motherwell-street, Airdrie, for the nurses of the Airdrie and District Nursing Association, was opened. Mr. J. Maurice Arthur was the architect.

NEW OFFICES, WESSOX FOUNDRY, DARLINGTON.—These buildings, recently completed from the designs of Mr. W. Hargreaves Bourne, architect, Darlington, are built of Huncote plastic red bricks. The corridors,

halls, staircase, etc., are covered with a dark-green tile dado 4 ft. high, and white tiles 5 ft. high in lavatories, above which the plaster is brought flush, and the floors are laid with black-and-white tiles by Messrs. Doulton & Co. All the ground floor rooms are laid in pitch-pine block flooring. The staircase is of Stuart's granolithic stone. A special feature of the design is the entrance waiting hall, with gallery running round on first floor, open to a domed ceiling light, filled in with coloured leading lights. The board-room has a ceiling in elliptical section to obtain extra height. The drawing-room is open to the apex of the roof, and ceiled to the underside of the rafters, the principals showing in the room. The whole of the internal fittings and fixtures have been supplied by the North of England School Furnishing Company, Darlington. The contractor was Mr. Frederick Shepherd, of York, his sub-contractors being Messrs. Lishman & Son, plumbers; Messrs. Robinson & Son, plasterers; and Messrs. Mossom & Son, painters; all of Darlington.

NORWICH AND LONDON ACCIDENT INSURANCE PREMISES.—The new head office, which the Norwich and London Accident Insurance Association are building in St. Giles-street, is being erected from the designs of Messrs. Skipper, architects, Norwich. Messrs. John Youngs & Son are the builders, while the stonework has been executed by Mr. E. W. Potter.

WORKHOUSE INFIRMARY, CHESTERFIELD.—Messrs. Benham & Sons ask us to mention that in this building, briefly described in our last issue, the whole of the cooking apparatus, laundry apparatus, and hot-water work was carried out by their firm.

PEOPLE'S PALACE, BELFAST.—A section of this building was recently opened. The structure stands on a site with frontages to Donegall-road, Utility-street, Felt-street, and Eureka-street, the main entrance facing Donegall-road. The architect for the work is Mr. W. J. W. Roome, the builders being Messrs. McLaughlin & Harvey. Messrs. Musgrave & Co. are responsible for the heating arrangements, and the plumbing work has been carried out by Mr. John Dowling.

CLUB PREMISES, MELTON MOWBRAY.—On the 15th inst. the Constitutional Club, which has been erected in Sherwood-street, Melton Mowbray, was opened by Lady Victoria Manners. The building is a two-story one, consisting of red bricks and stone dressings. It has been erected by Mr. C. Barnes, whose tender amounted to 1,740/., from plans prepared by Mr. E. Jewis.

SANITARY AND ENGINEERING NEWS.

THE UPPER PENN SEWAGE WORKS.—The present population of the district drained is 3,155. The works are, however, designed to deal with the sewage from a population of 3,500, and are so constructed as to be easily capable of extension should that become necessary at any future time. The area of the district is 1,995 acres; the area of the land purchased for sewage purification purposes is 2356 acres. The area sewered is a most straggling one, and has necessitated, in comparison with the population dealt with, a very great length of sewers. Altogether there have been about 25 miles of sewers laid, consisting of 6-in., 9-in., 12-in., and 15-in. earthenware and cast-iron pipes. The whole of these sewers gravitate into the receiving chamber at the entrance to the outfall works. From this chamber there are three outlets, one being the main 15-in. sewer to the tanks, which carries the ordinary dry-weather flow of sewage, and also any excess up to three times the dry-weather flow, this being the maximum quantity which will be dealt with through the bacteriological tanks and filters. Any excess over this quantity, from three times up to six times the dry-weather flow, will be conveyed to the high-level portion of the land through a separate 12-in. stoneware and half-pipe carrier, and will be treated over an area of about 9 acres. The third outlet from the receiving chamber is a 9-in. pipe leading direct to the brook, and this is so arranged that in time of flood any excess over six times the ordinary flow of sewage will be carried direct to the brook. The sewage, before flowing into the tanks, passes through two detritus and screening chambers, for the purpose of arresting road detritus, flocculent matter, etc. From these chambers the sewage flows by means of submerged inlets into the covered bacteriological tanks. These are two in number, and are each 80 ft. long by 17 ft. 6 in. wide, with an average depth of six feet. The total capacity of the two tanks is 105,000 gallons, which is equal to one day's flow of sewage from a population of 3,500 people at 30 gallons per head. During its passage through the tanks, the sewage is broken down and

liquefied by bacterial agency, and prepared for treatment on the filter beds. The tank effluent passes off by means of submerged outlets, and is conveyed to a measuring chamber centrally situated with regard to the three circular filters. From the measuring chamber the tank effluent will be discharged automatically at intervals of from twenty minutes to half an hour, varying with the flow of sewage, through patent revolving spreaders on to the surface of the filter beds.

These spreaders are so designed that an equal dose per square yard of filter area will be given at each application. With the ordinary flow of sewage the tank effluent will be discharged on to the filters at the rate of 60 gallons per square yard per twenty-four hours. With the maximum amount of three times the ordinary flow the rate will be 180 gallons per square yard per twenty-four hours. The three percolating filters are circular in plan, and each 73 ft. in diameter. The filtering material is local gravel, varying in size from about 2½ in. to 1 in. The sewage after percolating through the filters is collected by means of aerating effluent channels, and conveyed into carriers round the outside of each filter, from which it is conveyed on to the lower portions of the land, over which it will be finally irrigated before being allowed to pass into the brook. Half-pipe distributing carriers are to be constructed for the purpose of distributing storm water, or raw sewage if desired, over the land, and the land will be under-drained with open-jointed, socketed pipes. The whole of these under-pipes will gravitate to an effluent discharge chamber, to be constructed at the lower corner of the field, from which the effluent will pass to the brook. The estimated cost of the whole of the works described was 14,000. The Rural District Council, however, were fortunate in letting the contract at a very favourable time, which not only enabled the carrying out of the contract, but also various additional works, without exceeding the estimate. Messrs. R. E. W. Berrington & Son are the engineers.

WATER SUPPLY, PORTPATRICK, N.B.—The new water and drainage scheme at Portpatrick is now nearing completion. Mr. W. Robertson Copland, C.E., Glasgow, was appointed engineer for the scheme, and in December, 1902, the District Committee of the County Council decided to proceed with it. Four acres of ground were secured at Enoch, two miles from the town, and 340 ft. above sea-level. Messrs. T. Forgan & Son, Perth, were the contractors, their tender being about 7,000. Early last year the work was commenced under the direct supervision of Mr. William Forgan, C.E., Perth, for the contractors, and Mr. Robert Millar, Mauchline, inspector of works, for the engineer. The reservoir at Enoch has a storage of 8,000,000 gallons, and the filtered supply in the clear-water tank is 35,000 gallons. In all about three and a half miles of water pipes have been laid. For the sewage, over two miles of pipes have been laid in the town area, the sewage discharging into the sea at Culvert Bay, on the north side of the town.

VENTILATION OF SEWERS.—On Monday the Public Health Committee of Kensington Borough Council reported having had under consideration a letter from the Lewisham Borough Council forwarding copy of a report of the Borough Surveyor adopted by them with regard to the ventilation of sewers, in which an opinion is expressed that the best means of remedying nuisances of smells emanating from surface road ventilators would be to require such ventilators to be placed much closer together than at present, and that steps should be taken with a view to the repeal of the London County Council Drainage By-law, made on October 30, 1900, under section 202 of the Metropolitan Management Act, 1855, which requires the trapping of drains, and asking co-operation in approaching the London County Council with the object of obtaining the repeal of the by-law referred to. The report of the Kensington Committee proceeded as follows:—

The efficient ventilation of the sewers of the metropolis being a matter of such supreme importance and urgent necessity, we consider the question can only be satisfactorily dealt with by united action on the part of all the authorities concerned; and with a view to a solution of the difficulty we consider that the London County Council should be invited to convene a conference with the Metropolitan Borough Councils, in order that a comprehensive scheme on scientific lines could be formulated. We much deprecate any such makeshift action as the substitution of existing road gratings, the nuisance from which is, in our experience, continually on the increase. We are of opinion that the suggested omission of the intercepting syphon, and where the main drain passes under or through residential or business premises (which is very largely the case in Kensington), be exposing the inhabitants and workers to grave risks, without any appreciable alleviation of the evil complained of; and we strongly deprecate any inter-

ference with the recognised standard of domestic sanitation as set up by the London County Council in their by-laws.

The London County Council are to be asked by the Kensington authorities to convene a conference to consider the best means of ventilating the sewers throughout the metropolis.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—The executors of the late Mr. Richard Hardy, C.E., brewers' and maltsters' architect, Nottingham, have entered into agreement with Mr. A. Miller Baily, architect, brewers' and maltsters' consulting engineer, 9, St. Peter's-gate, Nottingham, whereby the two practices will in future be carried on by Mr. Baily, under the style of "Hardy & Baily," Bentinck Buildings, Nottingham. Mr. Baily was for ten years managing chief assistant to the late Mr. Hardy.

PROPOSED NEW WATERWORKS, BUGLE.—An inquiry was recently held at Steneales by Colonel A. G. Durnford, R.E., Local Government Board Inspector, on the application of the St. Austell Rural District Council for sanction to borrow 2,300l. for works of water supply for Bugle and Steneales, including the construction of a reservoir, with a capacity of 173,000 gallons, at Steneales. Mr. H. S. Hancock, engineer, is responsible for the scheme.

THE MARSHES, WALTHAMSTOW AND LEYTON.—Six acres of common land in the marshes are marked for appropriation by the promoters of a Bill for the construction, upon the "tube" system, of an electrical railway from Bridge-road, Hammersmith, by way of Piccadilly, Gracechurch-street, Stoke Newington, and Palmer's-green, to Walthamstow.

THE SANITARY EXAMINERS.—At an examination in Practical Sanitary Science held in London, December 9 and 10, nineteen candidates presented themselves. The following six candidates were awarded a certificate:—A. J. Catley, Reading; Lahnolot A. Cooper, West Ealing; James Ewing, Lloyd-street, W.C.; E. Bertram Hartfree, Camberley; A. E. Powell, Stoke Newington; and G. H. Stevenson, Shipnal.

CEMENT PRODUCTION IN THE UNITED STATES.—From a report recently issued by the Department of the Interior at Washington it appears that the total production of hydraulic cement in the United States in 1903 was 29,839,140 barrels, valued at 31,931,340 dol., as compared with 25,753,504 barrels, valued at 25,366,380 dol., produced in 1902. Of the total production in 1903, 22,342,973 barrels, having a value of 27,715,319 dol., were Portland cement. The production of natural rock cement was 7,030,271 barrels, valued at 3,675,520 dol. The production of Pozzolano, or slag cement, was 525,896 barrels, valued at 542,502 dol. The increased production of Portland cement in 1903 resulted in a glutted market, which made the artificial product so low in price in the eastern part of the country as to interfere seriously with the production of natural rock cement. Many of the plants whose output is exclusively the natural cement were, for this reason, shut down during a large part of the year.

SHEFFIELD MASTERS' ASSOCIATION.—The usual monthly meeting of this Association was held at the Builders' Exchange on Thursday evening last week, Mr. J. D. Cook, President, occupied the chair. In addition to the usual business of the monthly meeting, there was the investiture of the President with a new gold chain and medallion, as a badge of office. This ceremony was performed by Mr. A. J. Forsdike, who briefly stated the origin of the idea of obtaining this presidential badge, and referred to the able, energetic, and whole-hearted way in which Mr. Cook had carried out the duties of President. Councillor Longden and Mr. J. Biggin also joined in the congratulations to the President. Mr. Cook, in reply, thanked Mr. Forsdike for the kind words he had expressed, and compared the position and status of the Association at the present day with what it was years ago, and said he felt that, great as had been the improvement, there was still work to be done, and he hoped that the future presidents would be encouraged to use every effort to further the work of the Association. The badge, which consists of gold links, bearing the names of past presidents, with a button representing the York Rose between each link, and a pendant with the Sheffield coat of arms, and bearing the name of the Association, is the work of Messrs. W. & H. Ashken. Another feature of the meeting was the presentation, by Mr. Arthur Mastin, of a large framed portrait of his father, the late Mr. Joseph Mastin. A vote of thanks was accorded to Mr. Mastin for the gift.

CHURCH BUILDING SOCIETY.—The incorporated Society for Promoting the Enlarge-

ment, Building, and Repairing of Churches and Chapels, held its usual monthly meeting on the 15th inst. at the Society's House, 7, Dean's-yard, Westminster Abbey, S.W., the Rev. Canon C. F. Norman in the chair. Grants of money were made in aid of the following objects, viz.:—Building a new church at Nether-ton, All Souls, near Maryport, Cumberland, 140l., in lieu of a former grant of 100l.; rebuilding the churches at Forton, St. John, near Gosport, Hants, 250l., in lieu of a former grant of 200l.; and Highweek, St. Mary, near Newton Abbot, 85l.; and towards enlarging or otherwise improving the accommodation in the churches at Clevee Prior, St. Andrew, near Evesham, 30l.; Newington, St. Mary, Kent, 10l.; Oxenton, St. John the Baptist, near Cheltenham, 15l.; and Feckenham, St. John the Baptist, near Redditch, 30l., in lieu of a former grant of 20l. Grants were also made from the special Mission Buildings Fund towards building mission churches at Tunstall, St. Chad, Staffs., 30l.; and Woodland, St. Mary, near Butter Knowle, Co. Durham, 15l. The following grants were also paid for works completed:—Lydbrook, The Holy Jesus, near Ross, 15l.; Hither Green, St. Swithin, Kent, 50l., making in all 150l.; Great Sturton, All Saints, near Horncastle, 15l.; and Broadheath, Christ Church, near Worcester, 80l. In addition to this, the sum of 125l. was paid towards the repairs of ten churches from trust funds held by the Society.

PROPOSED NEW TOWN HALL AND MARKET, DARTMOUTH.—Mr. Edmund Pearse, Inspector of the Local Government Board, held an inquiry at Dartmouth recently into an application of the Town Council for a Provisional Order under section 303 of the Public Health Act, 1875, to enable the Corporation to provide a new market house, town hall, and municipal offices. The Town Clerk said the present market house was in a very old and dilapidated condition, and the Council, therefore, desired to demolish the existing building, and to substitute an entirely new structure comprising a market house, with modern stalls, accommodation and conveniences, and a town hall, with municipal offices. To enable that scheme to be carried out it would be necessary to provide a sum of money estimated approximately at 7,000l. Mr. Smith, the Borough Surveyor, having given evidence, the inquiry closed.

CAPITAL AND LABOUR.

EMPLOYMENT IN THE BUILDING TRADES.—Employment in the building trades continued dull during November, and was rather worse than in October. It was much worse than a year ago. Employment with carpenters and joiners was bad generally, and worse than a month ago and a year ago. The percentage of unemployed trade union carpenters and joiners was 10·1 at the end of November, compared with 8·3 at the end of October, and 6·1 at the end of November, 1903. With plumbers it was bad in England and Ireland, and worse than a month ago and a year ago. In Scotland it was moderate, rather better than a month ago, but worse than a year ago. The percentage of unemployed trade union plumbers was 10·2 at the end of November, compared with 9·1 at the end of October, and 7·2 at the end of November, 1903. With bricklayers employment generally was dull, and about the same as a month ago, but worse than a year ago. With masons it was moderate in England, and worse than a month ago, but about the same as a year ago; in Scotland it was very dull, and worse than a month ago, but somewhat better than a year ago. With painters employment continued bad generally, and was worse than a year ago. Employment with plasterers was very slack, and worse than a year ago. With slaters and tilers employment was dull generally, being about the same as last month, but rather worse than a year ago. With builders' labourers employment was bad, and worse than either a month or a year ago. The returns received from seventy employers' associations show that employment generally was dull, and worse than a month and a year ago.—*Labour Gazette.*

Legal.

THE CHALEY RURAL DISTRICT COUNCIL v. SIR W. CRANTHAM.

THE case of the Chaley Rural District Council v. Sir W. Crantham came before the Lewes Bench on Thursday morning, when the magistrates gave their decision. The chairman said the Bench found that defendant had sufficiently complied with certain of the by-laws, but that he had not sufficiently complied

with others. At the same time it seemed to them that defendant's plans were intended by him to indicate that the buildings he proposed to erect would conform to the requirements, and if he had failed in some particulars it had been due to misapprehension for which he was not wholly responsible. In the circumstances of the case, therefore, the Bench hoped it would not be necessary for them to give a more definite decision.

Mr. Grantham asked that upon the finding the summons issued under by-laws 45 and 46 be dismissed.

The Chairman: It is not a decision. We call it a finding, and we do not comply with your request.

Mr. Crauthan said that after the intimation now given it might be necessary for Sir William's advisers to consider what steps had best be taken to compel the Rural District Council to adopt the arbitration decision of the Local Government Board, and to move the High Court on other grounds. He presumed there was no chance of the Bench coming to a decision.

The Chairman: If pressed we might come to a decision, but we hope it will not be necessary.

Mr. Grantham: Defendant wishes counsel to say he cannot be a party to any compromise on the evidence.

The Chairman: The Bench hope to hear nothing more of the case, and that the parties will be able to come together and proceed amicably.

CASE UNDER THE LONDON BUILDING ACT, 1894.

THE case of the *King v. Kettle* and the London County Council (*ex parte James Ellis*) came before a Divisional Court of King's Bench, composed of the Lord Chief Justice and Justices Kennedy and Ridley, on the 19th inst., for argument on a *rule nisi*, calling upon Mr. Kettle, the magistrate sitting at the Woolwich Police Court, and the London County Council to show cause why the magistrate should not deliver to Mr. Ellis, the applicant, a case, stated and signed by the magistrate, between the applicant and the London County Council. The facts were shortly as follows:—The applicant was summoned in August, 1903, by the London County Council for erecting a building in Cedar-grove, Charlton, beyond the general line of buildings contrary to the provisions of the London Building Act, 1894, and he was ordered to pull down a portion of the building, and was fined 40s. The applicant then asked the magistrate to state a case for the opinion of the High Court, but the magistrate declined. In August, 1903, the applicant told the magistrate that he wished to enter into a recognisance, and the magistrate told him that he should require a recognisance by himself and a surety in 50l., and these recognisances were taken. On August 20, 1903, the applicant obtained a *rule nisi*, calling upon the magistrate to show cause why he should not be called upon to state a case, and in the following December the rule was made absolute. In September, 1903, the surety died, and the following month the applicant was made a bankrupt. When the order of December, 1903, was served on the magistrate, he held that fresh recognisances were necessary, and he declined to deliver the case, which had then been stated and signed, before fresh recognisances were entered into, but he offered to deliver the case on a fresh recognisance in 50l. being entered into. The applicant then obtained the present rule.

Mr. Daldy appeared to show cause against the rule, and Mr. Frank Gover supported it.

In the result their lordships held that the magistrate, in the circumstances of the case, was wrong in refusing to deliver up the case without further security, and the rule was accordingly made absolute, with costs, against the London County Council.

CASE UNDER THE PUBLIC HEALTH ACT, 1875.

THE case of the Redruth Brewery Company v. the Redruth Urban District Council, on the 20th inst., was decided in a Divisional Court of King's Bench, composed of the Lord Chief Justice and Justices Kennedy and Ridley.

This was an appeal by the Brewery Company against a conviction by the magistrates under the Public Health Act, 1875, the magistrates having stated a special case for the opinion of the Court.

Mr. Clavell Salter, K.C., and Mr. Soper appeared for the appellants, and Mr. Foote, K.C., and Mr. Turrell for the defendants.

Mr. Clavell Salter said this was a case stated by the magistrates, and it raised the question whether certain works done upon a building in Redruth brought that building within one

or other of the clauses created by the Public Health Act, in relation to which the work done upon an old building was to be considered as the erection of a new building. The facts were shortly these:—The houses in question were situated in the main street at Redruth, and they consisted, before they were touched at all, of a beerhouse, with dwelling-house over and behind, and next door a hairdressers, also with living-rooms. The property belonged to the Brewery Company, and the Brewery Company were desirous, in the first instance, of pulling the property down and building new houses. They accordingly sent in plans to the defendants. The defendants, as the local authority, declined to pass those plans unless the Brewery Company would agree to set back their frontage and facilitate the street widening. The Brewery Company and the local authority could not come to terms, and therefore the Brewery Company elected to do some alterations instead. They proceeded with these alterations, and thereupon the local authority came down upon them and took these proceedings against them, and alleged that the Brewery Company were making a new building. The houses were built before 1849, so *prima facie*, the by-laws did not affect these houses at all. The local authority had to satisfy the Court that they were not dealing with old houses, but new ones, and this they had done.

The Lord Chief Justice: Do you say if you take down half of your wall and put up a new half, and then remove the other half and put up another new half, leaving the roof as it was on the old building, you would not be putting up a new building?

Mr. Salter: I submit no, because the old roof remains.

After hearing further argument, the Lord Chief Justice, without calling upon counsel for the respondents, in giving judgment, said he did not think the Court ought to interfere in this case, as it was stated. Where people did things to old houses they must take the consequences if it brought them within the purview of the Act. He came to the conclusion that the finding was one of fact, and that on the law there was no other evidence to come to a different conclusion than that the magistrates had.

Justices Kennedy and Ridley concurring, the appeal was accordingly dismissed.

ACTION ANCIENT LIGHT DISPUTE:

MANDATORY INJUNCTION DISCHARGED.

IN the Court of Appeal, composed of Lords Justices Vaughan Williams, Romer, and Cozens-Hardy, last week, the hearing was concluded of the case of *Kine v. Jolly*, on the defendant's appeal from a judgment of Mr. Justice Kekewich, in the Chancery Division.

(The case was reported in the issues of the *Builder* of July 23 and 30, August 6, and December 17, 1904, and the facts of the case have been sufficiently stated.)

Mr. Hughes, K.C., and Mr. Vernon appeared for the appellant, and Mr. P. O. Lawrence, K.C., and Mr. Cann for the respondent.

Mr. Hughes, in replying on behalf of the appellant, contended that, on the findings of fact of Mr. Justice Kekewich, the plaintiff had failed to prove that the defendant had committed a nuisance, and, therefore, the action should be dismissed.

During the course of the arguments their lordships stated that they would accept the findings of fact of Mr. Justice Kekewich.

Lord Justice Vaughan Williams, in giving judgment, said that the question what tests ought to be applied in actions brought for obstruction of ancient lights, so as to ascertain whether a plaintiff had a good cause of action, had recently been very much discussed in the House of Lords in the case of the *Home and Colonial Stores v. Colls*, and the House of Lords intended to lay down rules which should be applied in future in cases of this class. Speaking without disrespect of the judges in the days gone by, he thought the decided cases were not quite consistent as to the tests to be applied. It was, therefore, obviously desirable that the differences, such as they were, in the principles laid down by those judges, should be settled once and for all. The great point of distinction between the two lines of cases was this. By one school of law the right of the house-owner gained by prescription, whether after the Prescription Act or before, was regarded as a mere right of property. By the other school this prescriptive right was regarded, not as a right of property to light, but as a negative easement, being a right to prevent a landowner from using his land so as to constitute a nuisance to the owner or occupier

of a house on the adjoining land. The House of Lords had adopted the view that the only right gained by prescription was in the nature of a negative easement. That view was shortly expressed by saying that the rights which were to be enforced in respect of this prescriptive easement were those which would be properly enforced by an action of nuisance. An action of nuisance was distinguished from an action of trespass. An action of trespass was brought where a person's property had been invaded. An action of nuisance was brought when there was no invasion of another person's property, but where the wrong consisted in so using your own land as to injure your neighbour. An action of nuisance would not lie unless that which was complained of amounted to a substantial interference with the plaintiff's comfortable or profitable occupation of his dwelling-house or warehouse or house of business, as the case might be. It was desirable that somehow or other no man should be allowed to enforce rights, the enforcement of which would interfere with the good and progress of the community. He came to the conclusion that the result of all the judgments of the law lords was that, in order to constitute an actionable nuisance, the obstruction to the access of light must be such as to sensibly interfere with the plaintiff's comfort and convenience in the use of his premises, having regard to their character according to the ordinary notions of mankind in this country. Unless the obstruction amounted to that there was no cause of action. Mere proof that a certain percentage of light was taken away was not sufficient.

Applying the principle laid down by the House of Lords in the *Colls* case to the findings of fact of Mr. Justice Kekewich, he agreed with the learned judge that there was here a good cause of action. He differed, however, from Mr. Justice Kekewich in thinking that the remedy ought to be damages and not a mandatory injunction.

Lord Justice Romer did not agree. In this case the house alleged to be injured was occupied by ordinary people for the common purposes of domestic living. It was not a case in which there was any extraordinary user of any kind of the premises. He considered, having regard to the decision of the House of Lords in the *Colls* case, that the principle to be applied to a case like the present was that the plaintiff must establish a nuisance. Taking the law as laid down in the case of the *City of London Brewery Company v. Tennant*, and strictly limiting it to the case in hand, an owner of ancient lights was entitled to sufficient light for the ordinary notions of mankind, for the comfortable use and enjoyment of his house as a dwelling-house, if, as in this case, it was a dwelling-house. In considering the question of the sufficiency of the light, the locality ought to be borne in mind, and light coming from other quarters ought not to be disregarded. Applying that law to the facts of the present case as found by Mr. Justice Kekewich, he (the Lord Justice) came to the conclusion that the plaintiff had failed to prove that the defendant had committed a nuisance. In arriving at that conclusion he was greatly impressed by the finding of Mr. Justice Kekewich that the plaintiff's morning-room was still a well-lighted room. To his mind the inference was that the plaintiff had now sufficient light for the ordinary purposes for which the room was used.

Lord Justice Cozens-Hardy agreed with the judgment delivered by Lord Justice Vaughan Williams.

By a majority of the Court, therefore, the judgment of Mr. Justice Kekewich was varied by the order for a mandatory injunction being discharged, and an inquiry as to damages being directed.

ACTION BY AN ARCHITECT.

THE case of *Ayrton v. C. Arthur Pearson, Ltd.*, came before the King's Bench Division and a special jury in the King's Bench Division on the 16th and 19th insts., an action brought by Mr. Ormrod Maxwell Ayrton, A.R.B., to recover from the defendants, 173l. 5s., the value of certain drawings he alleged had been wrongfully detained by the defendants. The plaintiff also alternatively claimed damages from the defendants on account of the drawings having been lost or destroyed in consequence of the defendants' alleged negligence.

Mr. H. F. Dickens, K.C., and Mr. R. E. Moore appeared for the plaintiff, and Mr. Montague Shearman, K.C., and Mr. A. B. Cano for the defendants.

Mr. Dickens, in the course of opening the case, said his client had formed the idea of making studies for weather-vanes which should be applicable to particular buildings.

The plaintiff had made certain designs, amongst others being a design of a coach and horses which would be appropriate for an inn. Another was a sportsman with a gun and dog, for a gamekeeper's cottage, and there was also a design of a man engaged in studying the line of a putt, with a caddie standing at the flag, which would be suitable for a golf clubhouse. The pictures were not easy to compose, it being necessary that the figures should be so arranged as to make the surface greater on one side than the other. Certain of these designs were published in a journal called the *Studio*, and the editor of *Pearson's Magazine* seeing them wrote to the plaintiff asking him to supply some of his designs in order that they might be reproduced in that paper, together with an explanatory article. The plaintiff ultimately agreed to supply sixteen designs and an article for the sum of 10*l.*, and in due course the article and designs were sent to the editor. The editor, in the course of his correspondence with the plaintiff, had written saying he should not require the full copyright of his designs. On December 3, 1903, the plaintiff wrote to the editor asking for the return of his drawings, and received a reply stating that the original drawings had been mislaid or lost. Five of the drawings which had not been used were returned to the plaintiff. The designs which the plaintiff had made were not for sale, so that their value must be assessed by what they were worth to the plaintiff for exhibition purposes, and for hanging in his office to enable his clients to see the kind of work he was capable of doing.

The plaintiff was called, and stated that he valued the drawings at an average of fifteen guineas each.

Cross-examined,

He knew of no custom where pictures sent for a magazine article belonged to the people who published the article. He had not registered the copyright, either in the pictures which had been returned or in those which were published.

Mr. Arthur Blomfield, F.R.I.B.A., gave evidence that the pictures had very great artistic merit, and, in his opinion, were worth the sum plaintiff valued them at.

Professor Moira, of the Royal College of Arts, and Mr. A. L. Baldry, an art critic, also gave evidence to the same effect.

For the defence, Mr. Clement Shorter, editor of the *Sphere*, said that, in the absence of contract to the contrary, it was the custom that illustrations sent with articles became the property of the proprietor of the paper to which they were sent. He thought the price the plaintiff asked for his drawings was absurd.

Mr. G. Hammond, art editor of the *Illustrated London News*, Mr. Stanley Wood, an artist, and Mr. H. P. Adams, an architect and surveyor, also gave evidence in support of the defendants' case.

In the result the jury returned a verdict for the plaintiff for 40*l.*, and judgment was given accordingly.

ACTION BY BUILDING OWNER AGAINST ARCHITECT.

The Lord Chief Justice, in the King's Bench Division, on the 13th inst., delivered a considered judgment in the case of Hodgson v. Waugh. (The case was reported in the *Builder*, December 3 and 10, 1904.)

In this case, the plaintiff, Mr. George Herbert Hodgson, a loom maker, of Baldon, near Bradford, Yorkshire, sued the defendant, Mr. John Waugh, an architect and civil engineer, practising in Bradford, to recover damages for alleged negligent breach of duty as architect, and also damages for alleged breach of contract. The defendant denied the alleged breach of duty and contract, and counter-claimed for fees for work done and services rendered.

The short facts were these:—In 1900 Mr. Hodgson, the plaintiff, purchased a large estate in Hertfordshire, known as Hexton Manor, situated halfway between Hitchin and Luton. It consisted of a large hall, and some 1,600 acres of land, and there were also residences, known as "Summerville," Hexton Lodge, Peggion Lodge, and Meg Cottages. The property had been in the hands of mortgages for some twenty years, and a great amount of alteration and repair being necessary, the plaintiff, being acquainted with the defendant, engaged him to do the work. The plaintiff alleged that, during his absence abroad in consequence of ill-health, the defendant had caused work to be done, and buildings to be erected which were not in accordance with the plans and estimates he had prepared, and which had been submitted to and approved by the plaintiff. The plaintiff alleged that, in several instances, the defendant had not followed his instructions,

and had expended a much greater sum on the different works than he knew plaintiff had intended spending. Defendant, on the other hand, justified everything he had done, and asserted that he had acted in the best interests of his client. During the course of the trial a great mass of detailed evidence was given with regard to the items of which the plaintiff complained—viz., as to the work on the various buildings on the estate, the cleaning of a lake, work upon a mill stream, a trout stream, and ponds, and, on November 23, his lordship reserved judgment.

Mr. Montagu Lush, K.C., Mr. Clavell Salter, K.C., and Mr. Compton appeared for the plaintiff, and Mr. Tindal Atkinson, K.C., and Mr. F. P. M. Schiller for the defendant.

His lordship delivered a long and elaborate judgment, in the course of which he said if he had understood the character of the case at the first he would not have tried it, but have sent it to an official referee. There was no doubt that the plaintiff had made charges against the defendant of a most serious character, but these had been rightly abandoned. One of the suggestions made was that the defendant had passed off as original plans of his own plans prepared by other people. Mr. Lush, at the close of the case, had stated that he did not suggest that the defendant had been guilty of fraudulent conduct, and a few days later he made a similar statement in Court to the effect that the plaintiff did not wish to suggest that the defendant had been guilty of fraud. All charges of fraud were therefore withdrawn, and that was quite proper. Those charges ought never to have been made. His lordship then dealt at considerable length with the oral and documentary evidence relating to the various heads of claim in the statement of claim (fully reported in our columns), and came to the conclusion that there was no justification for the allegations that had been made against the defendant in his capacity as an architect. There was, he said, no doubt that the plaintiff did complain of the amount the alterations, etc., had cost him, and which, unquestionably, exceeded his expectation, and this, perhaps, led to charges being made which were now quite properly withdrawn. His lordship was of opinion, on the evidence, that Mr. Dean, the holder of the plaintiff's power of attorney while the plaintiff was abroad, had been in the absence of the plaintiff as his authorised representative, and that the defendant consulted with him as such as to the works that were being effected. Mr. Dean also made reports to Mr. Hodgson from time to time as to the character of the work carried on. No suggestion was made that Mr. Dean had not carried out his duties properly. He was of opinion that the evidence was wholly insufficient to satisfy him that there had been any breach of contract on the part of the defendant. His lordship then went *seriatim* through the particulars in the defendant's counter-claim, and, in the result, found that defendant was entitled to 1,018*l.* He accordingly entered judgment for the defendant on the claim, and also for him on his counter-claim for 1,018*l.*, with costs. He said, in conclusion, that he sympathised a great deal with the plaintiff, as he certainly, at the outset, had thought the various works on the estate would be carried out at a much less cost than the contract price. The plaintiff at the time the works were executed was away from home, and was seriously ill, and he was satisfied that his memory betrayed him as to many points as to which he thought he had cause for complaint, and he was led to make charges against the defendant which he ought never to have made. He was satisfied that the defendant, in what he had done, had acted honourably, and that he had done nothing which gave the plaintiff a cause of action against him.

Mr. Clavell Salter: I ask your lordship to stay execution.

His lordship said he would on the terms that, if the plaintiff wished to appeal, he paid the defendant's solicitors the taxed costs of the action on receiving from them the usual undertaking to return the costs if the appeal should prove successful, and the plaintiff would also have to pay over to the defendant the 1,018*l.* found due to him on his counter-claim. There was no reason why the defendant should be kept out of his money any longer.

ALTERING LEASEHOLD PREMISES WITHOUT LESSORS' PERMISSION.

The case of Bailey and others v. Lewis came before Mr. Justice Swinfen Eady in the Chancery Division on the 9th inst., on a motion by the plaintiffs that a fit and proper person might, at the cost of the defendant, be appointed to carry out such of the acts required to be done so as to comply with the

mandatory injunction granted by the judgment in the action as modified by an agreement of November 1, 1901.

It appeared that the defendant was lessee of premises Nos. 16 and 17, Holles-street, W., and, by the lease, he was prohibited from altering the premises and using them for trade purposes. Defendant, however, made certain structural alterations in the premises. He pulled down the party wall and constructed flues to enable the premises to be heated with hot air. The plaintiffs commenced an action against the defendant, and obtained an order in the Chancery Division, on February 3, 1901, restraining defendant from altering the premises, and from permitting the alterations he had made to remain without the plaintiffs' consent. The defendant, not complying with this order, the plaintiffs obtained leave, on October 24, 1901, to issue a writ of attachment against the defendant. After that an agreement was entered into on November 1, 1901, between the plaintiffs, Lord Howard de Walden, and the defendant, an order being obtained discharging the order of attachment and staying its operation, this order being without prejudice to the judgment of February, 1901, save and except as the same was modified by the agreement, and of the plaintiffs' right to apply to the Court to enforce obedience to the said order. The defendant, having failed to obey the order as modified by the agreement, Mr. Justice Swinfen Eady directed that a writ of attachment should issue against him, and he was imprisoned. That was on June 12, 1903. The defendant was released from prison on July 10, 1903. In the affidavit that the defendant had made in support of his application for release from prison the defendant stated that he had instructed his architect to give orders to the contractors to carry out the judgment as modified by the agreement, and apologising for his contempt. It was now stated that the defendant had complied with all the requirements of the mandatory injunction except as to the flues, the defendant's case being, however, that the flues had been built with the plaintiffs' consent, and, therefore, that there was no obligation on him to remove the flues and restore the fireplaces formerly in the premises.

At the conclusion of the arguments of counsel, Mr. Justice Swinfen Eady, in giving judgment, said that the defendant had been playing with the Court, and he directed that the works should be carried out under the direction of the Court. He referred the matter of the appointment of a fit and proper person to carry them out to Chambers, and ordered the defendant to pay the costs of the motion.

WORKMEN AND THE CHECK SYSTEM.

MESSRS. F. & H. F. HIGG, builders, of Loughborough Junction, were summoned at the South-Western Police Court, on the 16th inst., by two of their bricklayers, Charles James Oford and William Back, who sought to recover sums deducted from their wages. The case was treated by the parties concerned as a test one.

The defendants, with a view of checking their workmen, and satisfying themselves that they were in daily attendance at their work, instituted a system by which each man was required to take a ticket, identified by a number, and place it in a box for reference. Defendants held that, if the men neglected to observe these conditions, they forfeited all claims unless they reported themselves at once to the responsible official. There was no attempt to deny that the complainants actually worked; in fact, this was admitted; but as they failed to observe the rules and regulations, payment was withheld.

After a lengthy argument the magistrate thought it unreasonable to refuse payment when work was actually done. He therefore made an order for payment of the amounts claimed, with costs.—*Daily News*.

PATENTS OF THE WEEK.

APPLICATIONS PUBLISHED.*

26,509 of 1903.—W. NICOL: *Windows*.

This invention relates to windows. According to the invention the sash frames are mounted to swivel on hinges, and, when these sash frames are made to slip up and down, the hinges would consist of plates with longitudinal bowled ends coiling into each other, the part of hinge screwed to fixed frame being formed with a flush plate which extends past the hawl part of hinge and prevents the other hinged plate and sliding part from rubbing

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

against woodwork in sliding up and down, and makes same easier fitted, the flush plate acting as a guide and giving a double thickness of metal and corresponding strength in screwing plate to fixed frame. In windows where the sash frames do not slide, the hinged plates would be formed of a knob or bent shape at the part where the bowl of hinge begins to form.

45 of 1904.—J. RICHMOND and R. F. CAREY: *Electrically-controlled Lifts.*

Mechanism for operating and controlling lifts, characterised by the employment of two travelling conducting wires connected to an insulated block attached to and moving with the balance weight or counterpoise of the lift, in such a manner that the conditions of installation and standardising of the parts are fully secured, said travelling conducting wires being employed in connexion with means for establishing electrical connexion from each floor or from the cage to either wires and a negative main, and a switch to determine the direction of movement of the cage.

1,570 of 1904.—R. STANLEY: *Manufacture of Tiles, Quarries, Paving Blocks, and Bricks.*

This invention relates to tiles, quarry, paving blocks, and bricks moulded from plastic or powdered substance, and is especially applicable to tiles and quarries made from clay or terra-cotta. The invention consists firstly of means and method for forming grooves in the edges of the tile, quarry, or other article during the process of manufacture, such grooves afterwards holding the cement when the articles are laid in position, with the useful result that the latter do not work loose or drop out of place after being set.

1,613 of 1904.—A. HOCH and C. HANNEMANN: *Telescopic Tables, Telescopic Desks, and the like.*

A table, desk or the like, and consists in the combination with a table board, of a prolongating plate, lying, if out of use, parallel to and beneath the table board, and means for guiding the prolongation plate into its proper position, consisting in substantially horizontal parallel grooves combined with inclined grooves.

1,619 of 1904.—E. WALDEN: *A Vertical Spring Gate or Door Latch.*

A vertical spring gate or door latch, consisting of a hollow cylinder provided with arms and plates for securing same to a gate or post, the cylinder made according to this invention being a latch rod working therein, the top portion of the latch being provided with a knob or ring, while the bottom is shaped to slide in a slot and engage with a catch plate.

1,740 of 1904.—J. A. LIDVALL: *Method of Manufacturing Radiators for Heating Purposes.*

A method of manufacturing radiators having vertical flanges on the outer sides, which consists in making the side walls of several flat or curved pieces, and in putting together the same with suitable top and bottom pieces so as to form radiators of wave-shaped or similar horizontal section.

1,758 of 1904.—ASHWORTH, KIRK, & CO., LTD., and W. T. PEARCE: *Feeding Mechanism of Wood-Moulding or the Wood-Working Machines.*

According to this invention the upper feed roller is made in the form of a truncated cone, and with a flange on its reduced end, say, about the same external diameter as its larger end. This flange is let into the fixed fence, which is recessed to admit it, so that the face of the flange is flush with that of the fence, and practically forms part of the same. The axis of the conical feed roller is preferably parallel to that of the lower feed roller, and it is tapered so that the angle between its face and that of the lower roller corresponds to the angle between the upper and lower face in section of the saw lengths of timber which are being moulded.

1,938 of 1904.—H. LINGARD: *Construction of Joints of Earthenware Drain Pipes.*

This consists in the combination with the socket end of an earthenware drain pipe, of an encircling flange (being an integral part of same) provided with an internal groove to receive liquid cement, and having an opening through the top for the insertion of same.

5,057 of 1904.—A. T. BUNTING: *Flouring Cramps.*

A floor cramp, consisting of an eccentric frame surrounding said eccentric, a face plate pivoted to said frame, tongues on said frame to engage grooves in the body of the cramp,

and means for effecting the working of the eccentric.

5,257 of 1904.—R. MORGAN: *Safety Guard for Hatchets and Adzes.*

The guard is made of tin to fit the sharp or cutting end of hatchet or adze, and is so made, by means of a row of holes and pin, to fit in same that one can fit several sizes. The bottom piece is made of wood. A lock could be placed on same when necessary, to prevent an offender taking the guard off and using hatchet or adze, as the case may be.

22,301 of 1904.—A. J. BOULT (Bayerische Betonbau-Gesellschaft, G.m.b.H.): *Building Blocks or Structures.*

Heavy blocks for ceilings, and the like, characterised by the construction of the hollow stone being reduced from a parallel girder with intersecting ribs, each block containing two or more intersecting ribs, and at the same time a projecting edge on one side, and a recess on the other side.

22,423 of 1904.—W. FAIRWEATHER (A. B. Nettleton): *Composition of Matter for Fire-proof Paint or Coating.*

A fireproof composition, consisting of equal parts of finely-powdered carbide of silicon, and semi-liquid silicon of sodium, and from three to ten parts of calcium carbonate in 100 parts of the composition.

22,729 of 1904.—J. O. PARKINSON: *Removable Wall and Ceiling Coverings.*

A covering for walls or ceilings, consisting of a suitable frame, composed of parallel bars and two series of plates or tiles, one of which series is adapted to be engaged with the bars of said frame by means of an oblong flange or two oppositely projecting lugs formed at the free end of a concentric trunk thereon, and the other of which is adapted by means of a concentric screwed shank, to be fixed to nuts slidably carried by said bars, two series of plates or tiles being formed with grooves and tongues so that they engage with each other.

22,730 of 1904.—C. H. SHOFFER: *Facing Bricks.*

This invention relates to improvements in the bricks described in the Specification to Patent No. 17,881 of 1891. According to this invention, instead of making the dovetail at the back of the brick extend from end to end as before, it is now divided into two or more parts with spaces, preferably dovetailed between. By this means the bricks are not only lightened, but a more secure hold is also provided for the concrete.

22,896 of 1904.—A. L. LAVALLEY: *Garden Frames.*

A garden frame, comprising, in combination, a base frame or box, having ends of inverted V-shape, or span roof-like contour, a sash or light, consisting of two parts foldably connected together, and a rack and pin device at each side of the said parts.

1,899 of 1904.—J. GLOVER: *Method of and Appliances for Testing the Joints of Pipes.*

A method for testing pipe joints, which consists in forming a circumferential fluid-tight chamber round the joint on the inside of the pipe, forcing fluid under pressure into this chamber, and then observing where the pressure in the chamber remains constant or diminishes, whereby any leakage through the joint can be ascertained.

1,769 of 1904.—J. MORE: *Construction of Theatres and like Public Buildings.*

This relates to theatres and like public buildings, and consists in providing a flue above the stage, the flue being fitted with a damper adapted to be automatically or otherwise opened on a fire occurring upon, or in the vicinity of, the stage, in order that resulting flames or gases may be deflected therethrough and prevented from entering the auditorium.

6,045 of 1904.—F. A. WILKINS: *Supports for Street Decoration.*

A means for decorating and for supporting decorations, comprising light trellis or other arms adapted to secure to venetian masts, electric light and similar standards, or to houses whereby decorations can be extended over the street or in any other desired direction.

15,123 of 1904.—W. ECKSTEIN: *Treads for Staircases, Landings, Foot Paving, Floors, and the like.*

This consists in the arrangement and construction of staircase treads, landings, pavings, or the like, so as to allow of the interchange of such renewable portions or panels giving a number of different exchanges of wearing or working surfaces, by turning the panels round from back to front, or right to left, or by interchanging them one with another so as to obtain a maximum of wearing qualities from the surfaces treated.

22,547 of 1904.—H. H. LAKE (Chemisch Technische Fabrik Dr. Alb. R. W. Brand & Co., G.m.b.H.): *Process for Colouring Natural Stone.*

A process for staining or colouring marble and other natural stones throughout their substance with metallic deposits, consisting in dissolving metallic oxides in essential oils, and introducing them into the stone simultaneously with strong organic acids.

SOME RECENT SALES OF PROPERTY:

Table listing various property sales including ESTATE EXCHANGE REPORT, ROYDON, ESSEX, HAMMERSMITH, and various other locations with details on acreage, price, and terms.

Table listing various construction materials and services with prices. Includes entries for Holloway, Tollymore, Southgate, and various brick and stone products.

TO CORRESPONDENTS.

W. M. (We cannot undertake to find answers to such questions). NOTE.—The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples, sent to or left at this office, unless he has specially asked for them.

Letters or communications (beyond mere news items) which have been duplicated for other journals are NOT DESIRED.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

We are compelled to decline pointing out books and flying addresses. Any commission to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

PRICES CURRENT OF MATERIALS.

* * Our aim in this list is to give, as far as possible, the average prices of materials, not necessarily the lowest. Quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

Table listing prices for various materials including Hard Stocks, Facing Stocks, Shippers, Flettons, Bed Wire Cuts, Best Farnham Bed, Best Bed Pressed, Buabon Facing, Best Blue Pressed, Staffordshire, Do. Bullnose, Best Stourbridge, Fire Bricks, GLAZED BRICKS, Best White and Ivory Glazed, Stretchers, Headers, Quoins, Bullnose, and Double Stretchers.

Table listing prices for BRICKS, &c. (continued), including Quoins, Bullnose, Double Stretchers, Double Headers, One Side and two Ends, Two Sides and one End, Splays, Chamfered, Squints, Second Quality, White and Dipped Salt Glazed, Thames and Pit Sand, Brown Whited, Best Portland Cement, and Best Ground Blue Lias Lime.

Table listing prices for STONE, including Bath Stone, Portland Stone, Ancaster in blocks, Beer, Greenhall, Darley Dale in blocks, Bed Corsehill, Closeburn Red Freestone, and Bed Mansfield.

Table listing prices for YORK STONE—Robin Hood Quality, including Scappled random blocks, 6 in. sawn two sides, 6 in. rubbed two sides, and 3 in. sawn two sides.

Table listing prices for HARD YORK, including Scappled random blocks, 6 in. sawn two sides, 6 in. rubbed two sides, 3 in. sawn two sides, and 2 in. self-faced random flags.

Table listing prices for HOPTON WOOD (Hard Bed) in blocks, including 2 3/4 per ft. cube, 6 in. sawn both sides landings, and 3 in. do.

Table listing prices for SLATES, including 2 1/2 x 10 best blue Bangor, 20 x 12, 20 x 10 first quality, 20 x 12, 16 x 8, 20 x 10 best blue Portmadoc, 16 x 8, 20 x 10 best Eureka unfading green, 20 x 12, 18 x 10, 16 x 8, 20 x 10 permanent green, and 18 x 10.

Table listing prices for TILES, including Best plain red roofing tiles, Hip and Valley tiles, Best Brosey tiles, Do. Ornamental tiles, Hip and Valley tiles, Best Buabon red, brown, or brindle do., Do. Ornamental do., Hip tiles, Valley tiles, Best Red ornotted Staffordshire do., Do. Ornamental do., Hip tiles, Valley tiles, Best "Rosemary" brand plain tiles, Best Ornamental tiles, Hip tiles, Valley tiles, Best "Hartshill" brand plain tiles, Do. pressed, Do. Ornamental do., Hip tiles, and Valley tiles.

Table listing prices for WOOD, including Deals, Battens, Foreign Sawm Boards, Fir timber, and Second yellow deals.

Table listing prices for JOINERS' WOOD, including White Sea, 3 in. by 11 in., Battens, Second yellow deals, and White Pine.

Table listing prices for Yellow Pine, Yellow Pine oddments, Kauri Pine, Danzig and Stettin Oak Logs, Wainscot Oak Logs, Dry Wainscot Oak, Dry Mahogany, Dry Walnut, and Teak.

Table listing prices for Prepared Flooring, including 1 in. by 7 in. yellow, planed and shot, 1 in. by 7 in. yellow, planed and matched, 1 1/2 in. by 7 in. yellow, planed and matched, 1 in. by 7 in. white, planed and shot, 1 in. by 7 in. white, planed and matched, 1 1/2 in. by 7 in. white, planed and matched, 3 in. by 7 in. yellow, matched and beaded or V-jointed brds., 1 in. by 7 in. do., 1 in. by 7 in. white do., and 6 in. at 6d. to 9d. per square less than 7 in.

Table listing prices for JOISTS, GIRDERS, &c., including Rolled Steel Joists, Compound Girders, Angles, Tees and Channels, Flitch Plates, and Cast Iron Columns and Stanchions.

Table listing prices for METALS, including Iron, Common Bars, Staffordshire Crown Bars, Merchant quality, Staffordshire "Marked Bars", Mild Steel Bars, Hoop Iron, Galvanized, Sheet Iron, Black—Ordinary sizes to 20 g., 24 g., and 26 g.

METALS (continued).

Table listing various metal products such as Sheet Iron, Galvanized flat, ordinary quality, and their prices per ton in London.

LEAD, &c.

Table listing lead products including Sheet, English, 3lb. and up, and various pipes, with prices per ton.

ENGLISH SHEET GLASS IN CRATES.

Table listing different sizes of English sheet glass in crates, such as 15 oz. thirds and 26 oz. thirds, with prices per 100.

OILS, &c.

Table listing various oils including Raw Linseed Oil, Turpentine, and others, with prices per gallon.

VARNISHES, &c.

Table listing various types of varnishes such as Fine Pale Oak, Superfine Pale Elastic Oak, and others, with prices per gallon.

TENDERS.

Communications for insertion under this heading should be addressed to 'The Editor' and must reach us not later than 10 a.m. on Thursdays.

Table of tenders for Alderley Edge, listing contractors like G. Fresman, J.S. Dawson, and others, along with their respective amounts.

Table of tenders for Blaenavon, listing contractors like R. L. Roberts, J. Hatherley, and others, with their respective amounts.

Table of tenders for Bristol, listing contractors like W. Cowlin & Son, J. A. Hayes, and others, with their respective amounts.

Table of tenders for Brockley, listing contractors like F. H. Eley, W. & D., and others, with their respective amounts.

Table of tenders for Great Grimsby, listing contractors like Rands & Lindup, M. Hatcliffe, and others, with their respective amounts.

Table of tenders for Great Missenden (Bucks.), listing contractors like Mr. Alfred Dunnhill, R. High-road, and others, with their respective amounts.

CUCKFIELD.—For 3,400 yds. of 4-in. and 400 yds. of 3-in. cast-iron water mains, for the Rural District Council.

Table of tenders for Cuckfield, listing contractors like J. & R. Ritchie, H. Green & Co., and others, with their respective amounts.

GRIMSBY.—For plumbing work required for new observation block and new discharging ward at the Smallpox Hospital, Lacey.

Table of tenders for Grimsby, listing contractors like D. J. Dobby, J. W. Robson, and others, with their respective amounts.

HEBBURN.—For street works, for the Urban District Council. Mr. H. Paterson, Surveyor, Argyle-street, Hebburn.

Table of tenders for Hebburn, listing contractors like J. MacHarg, J. Wardlaw, and others, with their respective amounts.

HORLEY.—For the erection of a new council school, for the Surrey Education Committee.

Table of tenders for Horley, listing contractors like T. Vaughan & Sons, A. White & Co., and others, with their respective amounts.

GREAT YARMOUTH.—For 800 tons of steel girder tramway rails, for the Town Council.

Large table showing tender prices for Great Yarmouth, categorized by Straight Rails, Curved Rails, Fish-Plates, Sole-Plates, Tie-Bars, Bolts, and Total Tender amounts.

COMPETITIONS, CONTRACTS, AND PUBLIC APPOINTMENTS.

(For some Contracts, &c., still open, but not included in this List, see previous issues.)

CONTRACTS.

Nature of Work or Materials.	By whom Advertised.	Forms of Tenders, etc., supplied by	Tenders to be Delivered
Alters, etc., to Premises, Bridge-st. Downham Market	Co-operative Society	C. S. Bosdet, Sec., St. Helier's, Church-road, Downham Market.	Dec. 23

The Church of St. Germans, Cornwall.

HERE is no church in Cornwall that can compare with that of St. Germans in the richness of its historical and ecclesiastical associations; and there are few, if

any, that can rival the interest and variety of its architecture or the beauty of its situation.

In order to understand the nature of the fabric that now survives of a church that was at once conventual and parochial, it is imperative that a bare outline of its history should be given.

In the earliest pre-Norman period of existence the church of St. Germans is a collegiate foundation, served by a community of secular clergy or canons. It was founded in honour of St. German, who became Bishop of Auxerre, in France, in the year 425. He came over to Britain to oppose the Pelagian heresy, and his fame as a defender of the orthodox faith is still kept green. He travelled throughout England, Wales, and Scotland. Bishop German has left traces of his active missionary work on the maps of both Great Britain and the Continent, but nowhere with greater emphasis than on this widespread parish south-east Cornwall. There seems no reason to doubt that the tradition of his having made this place a centre of his st country preaching rests on a sound foundation.

Whether there was any earlier establishment of a bishopric for Cornwall than that which is known to have a historical existence in the IXth century is a matter of some doubt; but that St. Germans was the seat of the see of Cornwall at that period is an ascertained fact. Conan was bishop here in 931, and his sixth successor in the bishopric of St. Germans was Lyfing, who died in 1046. After that date Cornwall became united with the see of Devon, and remained so to our own times. A body of canons held half of the large parish of St. Germans at the time of the Domesday Survey in 1087. Of the church that they served, which was doubtless of considerable size, no part is still standing, so thorough was the rebuilding in Norman days. It is generally said that there are certainly no traces of it left above-ground. But this is not quite correct. In two or three places in the interior of the present church hewn stones have been noticed dressed in the pre-Norman manner, after a chevron fashion, which speak plainly of the subsequent use of Saxon material. Moreover, various squared stones dislodged during repairs of the current year (1904) showed clear traces of mortar adhering of an earlier date than when again placed in position by Norman masons. So that the skilled antiquarian eye would feel confidence as to the existence of a stone pre-Norman fabric on this site apart from all records.

The canons continued to serve this church until the episcopate of Bishop Bartholomew, of Exeter (1161-1184), in whose days they were suppressed for

irregular life and worldliness. The Bishop, in a charter yet extant, converted this church and its adjacent collegiate buildings into a priory of canons-regular of the order of St. Augustine. The Bishop died in 1184, before the transference to the Austin canons was fully completed, but we know that it was accomplished before the year 1190.

The new prior and his canons were not likely to be content with the old church and buildings, which were probably by that time, owing to the careless life of their predecessors, in considerable decay. From the genuine though late Norman character of much of the work now remaining at St. Germans, it is obvious that energetic rebuilding must have been at once undertaken by the new establishment.

The fabric of the church as it now stands consists of chancel and nave (in continuous line), south aisle, a quasi north transept and chapel, south-west porch, and two western towers. The interior length of the nave and chancel is 102 ft., and its width 23 ft. The south aisle is 25 ft. wide, narrowing by about 5 ft. in the two most eastern bays, that are level with the quasi-chancel. The interior width at the west end between the two towers is 61 ft.

Interesting and beautiful as are the remains of what must once have been a remarkably fine late Norman church, it is sad to think how much it has suffered, not only at the time of the dissolution of the monasteries, but even within the last hundred years.

In the Cornwall volume, of "Beauties

of England," published in 1801, the north aisle is described as "divided from the nave by five short, thick, round columns, each connected with a half-pillar opposite to it in the north wall by a low surbared arch; all the capitals of the columns are square, and curiously ornamented with Saxon (*i.e.*, Norman) sculpture. . . . Above these range six plain arches, some of them apparently of the same age and style with those in the nave of St. Alban's Abbey Church, Hertfordshire." Two years after this account was published the north side of the nave was said to be in a perilous condition, and so, to save the expense of proper repair, the whole of this good Norman arcade work and vaulted north aisle were swept away and the present north wall of the nave run up in its place. Parts of the piers and other Norman moulded fragments can be detected in the masonry. The traces at the west end of the present south aisle show conclusively that the nave aisle on that side of the church exactly corresponded with the north aisle. A paper of the Exeter Diocesan Architectural Society, read in 1848, mentions that at that date the lines of the lean-to roofs of both aisles could be clearly seen on the eastern faces of both the towers. Some singularly fine Norman clearstory windows, of considerable size and richly ornamented with zigzag mouldings, have been recently brought to light, during a repointing scheme, above the western part of the south arcade, two pillars and a respond of which are still of the original Norman design.

Careful examination seems to show that the Norman scheme was a nave of five bays, for parochial use (exclusive of the western bay between the two engaged towers), the most eastern bay being intended for the beginning of the conventual quire when the time came for rebuilding the Saxon chancel. There is no trace left of any transepts, which were probably left for later development; and a substantial screen would at that time cut off the parochial nave—necessarily large for the largest parish in Cornwall—from the canon's quire at the first piers from the east end of the new Norman structure.

The west front of the nave between the two towers and the basements of the two towers are of late but definite Norman work. Below the central gable are three large Norman lights, the one in the middle being the highest. Below these are two smaller lights, the inner angles of the bases of which are cut off by the steep-pitched roof of the projecting western doorway or portico, thus substantiating the idea that this singularly fine and enriched doorway was an afterthought, or, at all events, executed at a slightly later date. The width of this noble portico is 20 ft.; the actual door space is but 6 ft., and the remainder is occupied by the four shafts, alternating with zigzag or chevron mouldings. The arch is of seven orders; the two innermost are merely round, the third and fourth have the zigzag ornament, the fifth is rounded, and the sixth and seventh are also sculptured with the zigzag. The height of the doorway is 10 ft., and of the whole archway 16 ft. The outer arch is surmounted by a hood-

mould having head terminals, and much enriched with foliage, etc. Above the arch is a pediment surmounted by a four-nosed cross. The erection of the towers that flank this western portal was not continued until the Transition from the Norman was in vogue, *circa* 1200, and one of them seems to have remained uncompleted for some time.

Though there was no interference with the actual nave of the church in the Early English or First Pointed style, it is known from the remains still to be seen in the interior of the Earl of St. Germans' house, to the immediate south of the church, that the cloisters and refectory of the conventual buildings were rebuilt in the time of Henry III.

The towers are somewhat puzzling. Probably the two lower stages of each were finished about the same Transition date. This level is about the same as that of the nave roof, and here they most likely ended, being crowned with pyramidal tops. The additional octagonal story of the north-west tower has plain pointed lancets on each face, and clearly points to Early English work, probably about 1250-60, and, if so, of the like date with the rebuilding of the quire. The embattled summit is, of course, of later date, and the upper masonry shows pretty clear traces of having been then somewhat raised. The south-west tower is distinctly Norman in its basement stage, but the remainder has been a good deal altered as well as raised at later dates.

The arches under these towers, opening into the church to the east and on each side, are quite plain and supported on bold, clustered columns.

On the south side of the nave, at the west end, are the two remaining Norman piers, short, circular, and with cushioned capitals; but they now support pointed arches.

An entry in Bishop Bronescombe's register at Exeter states that he dedicated the conventual church (*conventualem ecclesiam*) of St. Germans on August 28, 1261. It is quite clear that this means that a new and extended quire for the canons was at that date consecrated. The nave of a church might be altered and extended, or new chapels added to a chancel, without any episcopal dedication being required, but when the site of the high altar was changed canonical law made fresh consecration obligatory.

The comparatively narrow Norman aisle on the south side of the nave was taken down at two different periods for the purpose of enlargement. The town of St. Germans stood on the south side of the church, whilst the conventual buildings were on the north side, the north aisle of the nave forming one side of the canons' cloister. The Bishops of Exeter had a residence not far from the priory, several families of distinction had manor and other houses in this widespread parish in the XIVth century, and greater church accommodation became necessary. The first alteration was the substitution of a south chapel 22 ft. wide in the three eastern bays of the 10-ft. wide Norman south aisle. This chapel, still very beautiful, must have been of singular perfection when first built. The east end is most unusual. There are two three-light windows with excellent though

slightly different tracery, and between them is a handsome recess for a life-size image, with crocketed canopy. There is a third two-light smaller pointed window high up in the apex of this east wall; but we know from Whitaker's history of this church, published in 1804, that it is comparatively modern, having been constructed by Lord Eliot, a little before Whitaker's time, from remains found in the quire ruins. On the south side of this chapel one of the original windows remains, the window to the east of it having been destroyed to make room for the great costly group of marble sculpture by Rysbrack, with the effigies of Edward Eliot, 1722, and his two wives, which now stands under the north-west tower. There is a single sedile of fine and perfect design to the south of the altar, and when the cumbersome marble monument was removed a lofty canopied recess was found under an ogee arch. The work of this recess had been cruelly hacked away to make room for the cumbersome monument, but enough remains to show that it was originally of exquisite workmanship.

Where work of such exceptional beauty is found, it becomes at once highly probable that there was some additional reason for the construction of such a chapel other than that of greater space. The annals of the church at once supply the cause in a remarkable incident that exactly corresponds with the period that architectural experts would assign to this chapel.

On the death of Prior Polgoner in 1355, John Precheur, the sub-prior, succeeded as superior. During his rule the priory became enriched with relics of the Saint whose name it bore. Sir Nicholas Tamorze, Kt., succeeded in obtaining from the abbot and convent of St. Germain of Auxerre a portion of the relics they possessed. A small bone of the arm and a portion of the shroud in which the body of St. Germain rested were given to the knight, who placed them in a silver-gilt reliquary and brought them across the sea to Bishop Grandisson, by whom they were conveyed to the priory of St. Germans, where provision had been made for their honourable keeping. The grant from the Abhey was made in March, 1358. On May 20, 1361, the Bishop granted a forty days' indulgence to all penitents who should make a pilgrimage to the shrine at St. Germans, or visit it at any time for the sake of devotion. There can be no reasonable doubt that this chapel was built at this period for the special reception of these relics, and that an amhray for their safe enclosure was placed within the canopied recess to the south of the altar. The image niche between the two windows would doubtless hold a statue of St. Germain. This niche has quite recently been filled with a statue of Our Lord as the Good Shepherd. If it was to be filled, it seems a pity that a figure of the great missionary Saint was not once again placed in the position designed to perpetuate his memory.

About a century later the western end of this chapel, which projected beyond the rest of the narrow aisle, was taken down and a wide south aisle was continued right up to the south-west tower, and four four-light large pointed windows

inserted in the south wall, one in each bay. The upper tracery of the three easternmost of these windows, though slightly different in each case, is of the kind known as fairly advanced "Perpendicular"; but the one nearest the tower has reticulated tracery and would generally be termed "Decorated." There is no necessity, however, to state that therefore the work of widening the whole aisle began at the west end, and was there interrupted for "at least fifty years." Close examination of the general masonry and of the jambs and hood-moulds, etc., shows that the work is all of the same date. One style was never quite driven out at a given date by its successor, and quatrefoil tracery not infrequently lingered on side by side with the later stiffer treatment well on into the XVth century. This is a fact which can not infrequently be proved in Norfolk churches. The terminals of the hood-moulds of these windows all bear heraldic and other devices. The arms of Bishop Lacy (1420-1450) are plainly discernible, and this yields the date of this effective aisle widening.

When the Norman aisle was thus widened, a south doorway in its western bay was taken out, and preserved as the west doorway at the end of the aisle. At the same time a charming little porch with an elaborately groined roof was built against the south wall of the south tower, forming a covered entrance to the aisle. This portico has doorways both on the south side and at its west end. The latter is a heavy doorway with spandrels, *circa* 1500. Of the same date is the blocked-up doorway under the easternmost window of the widened aisle. When the St. German relics chapel was erected in the XIVth century it would certainly have its own doorway in the projecting part of its western wall; and when the time came for the extension of the whole aisle a doorway would be transferred to the south wall. Such a doorway would doubtless be much used by pilgrims to the shrine—there would be crowds on the two festival days of St. German, July 31, his death day, and October 1, his translation; it seems to have been rebuilt on a wider scale, *circa* 1500, together with the west doorway of the porch. The pilgrims would enter by one of these doorways and depart through the other. It must not be supposed that the south aisle was the site of the parish altar; this would almost certainly be at the east end of the nave, and the ordinary parish entrance would be through the main west doorway. The year 1500 is said to be the exact date when the nave was re-roofed.

After the priory was dissolved, in 1539, the quire of the canons naturally fell into decay. The Champenowne family, to whom Henry VIII. granted the priory, used much of the walls in their adaption of the conventual buildings as a residence, and they actually built up a brew-house on the site of the high altar. This brew-house was standing in 1804, when Whitaker took some measurements. He found that the quire was the same width as the nave and extended eastward 55 ft. The parishioners, in adapting the nave for their use when the canons had gone, happily decided to move the great window from the east end of the quire

to a like position at the east end of the nave. It is a fine five-light window measuring about 35 ft. high by 20 ft. broad, and has a transom. The upper tracery forms a kind of crown. It clearly dates from the dawn of the Perpendicular period, and may safely be assigned to the reign of Richard II.

Carew, in his "Survey of Cornwall," printed in 1602, says of St. Germans Church:—"A great part of whose chauncell, anno 1592, fel suddenly downe, upon a Friday, very shortly after public service was ended, which heavenly favour, of so little respice, saved many persons lives, with whom immediately before it had been stuffed; and the devout charges of the well-disposed parishioners quickly repayed this ruine." This oft-cited statement has been hastily assumed to mean the downfall of the conventional quire; but it means nothing of the kind. We happen to know that the old quire was stripped of its lead almost immediately after the surrender of 1539, when the owners saw fit to turn much of it into a brew-house. That which fell in 1592 would be parts of the roof and very likely of the east wall of the nave that had been too hastily built up by the parishioners some fifty years previously to make themselves a chancel. When the north aisle was cleared away, in 1803, the scheme included the building of a kind of chapel or north transept for the Port Eliot pew, with a corridor leading to it. This paw has since been turned into an organ chamber, and the corridor into a vestry.

Considerable restoration schemes were carried out, at a large outlay, under the late Mr. Piers St. Aubyn, between 1887 and 1897. Repointing of the interior and many general repairs have been executed during the current year (1904). During the work a blocked-up niche for a holy-water stoup and a piscina niche have been uncovered in the south aisle.

The most interesting detail of the interior is the fine late Norman font, which was broken up and discarded in 1793. The fragments were, however, replaced and found to be almost perfect in 1840. The font is 33 in. square, and stands 39 in. high, and is of dark marble. In the four angles round the bowl at the top of the font are three three-leaved ornaments in slight relief and a circle or ring in the fourth angle. The north side of the bowl is carved with a round-headed arcade, and the other sides have much-worn patters; it stands on a central and four subsidiary shafts.

In the south aisle is a small, somewhat rudely-carved miserere stall or seat, which has been clumsily repaired. A good deal has been written and said about "the extraordinary antiquity" of this piece of church furniture, and one antiquary of recent times has described it as "a penitential sedile with a carved record of the trespass thereon." The misericorde itself is carved with the figure of a sportsman carrying a couple of rabbits and surrounded by dogs. The subject is locally known as "Dando and his dogs," as to whom there are some amusing childish tales. But, after all, the date of this carving cannot be older than late XIVth century, and hunting subjects are quite common in such positions: It is quite clear that it originally formed one of a set of small stalls.

Another interesting fragment is a piece of the XVth century rood screen. Part of the stairway to this screen may now be noticed in the south aisle.

There is some beautiful modern glass of Burne-Jones design and Morris execution in the large east window, and other fine figures in the debased six-light window of the south chapel.

The large west doors have recently been ornamented, with very questionable taste, by Byzantine-looking patches of bronze work and a great closing ring of like style. The metal workmanship looks to be well done, but is quite out of keeping in such a place. Moreover, the would-be hinges are mere shams, and have no connexion with the eyes of the staples.

Much money and care has evidently been spent on this interesting fabric during recent years, but the strongly-marked new pointing of the interior can scarcely be regarded as an improvement. The ivy needs to be speedily checked on the north-west tower.

Considering the number of old families that were for so long a period settled in this wide parish, the church is singularly barren of monuments of special note or antiquity. The oldest that bears any inscription is to the memory of John Glanville, second son of Nicholas Glanville, an ancient family long resident at Tavistock. The Glanvilles, of Catefrench, in this parish, held the great tithes of St. Germans for nearly three centuries, the lease having only run out in recent years. This John Glanville, born in 1599, married at the age of 15, and at his ordination was presented to the rectory of Withell, Cornwall; he died in 1631. At the head of this mural monument are the arms of Glanville (three crosses saltire, with a crescent for difference) impaling the old Norman coat of Glanville (a chief indented). This is a freak in heraldry; the impaled coat has no connexion with his wife, who was a daughter of the Rev. Jacob Pulston. Below the arms, which are flanked with the birth and death dates, appears the following remarkable and peculiarly ingenious Latin acrostic. The initial letter of each line yields "Johannes," the middle letter "Glanvill," whilst the terminal letters form the word "minister."

I	nditur in gelidum	G	regis hujus opit' bustu	M
O	nibus irriguus	L	acrynis, simul urbis et agr	L
H	ujus erit vivax,	A	que indecible nomen	N
A	rtibus et linguis,	S	enon virtute probat	I

E	rgo relanguenti	L	ict eluctatur ab or	E
S	piritus; aeternum	L	ucubit totus, ut aste	R

There are various later monuments to the Glanville family.

In the chapel on the north side of the church is the table-tomb of John Moyle, who died in 1661, aged 72. The arms of Moyle, which are a mule passant (an instance of canting heraldry), impaling those of Prideaux, are sculptured with much precision and care. There is a long Latin inscription to John Moyle, of Bake; he was sheriff of Cornwall in 1624. A floor slab close by bears an inscription to his wife, who bore the remarkable Christian name of "Admonition"; she was daughter of Sir Edmund Prideaux, Bart. Another much-worn stone commemorates their second son, Sir Walter Moyle, Kt., 1701.

The earliest monument to the St. Germans family is a floor-stone to Ann, relict of William Eliot, Esq., 1723.

RAILWAY FOG SIGNALLING.

ALL railway passengers are at one in thinking that the employment of detonators, lamps, and flags constitutes a very obsolete system of fog signalling. Railway engineers are, doubtless, of the same opinion, but, having always before them the safety of the travelling public, they will make no sweeping change until a perfect substitute has been found. Numerous inventors have patented the only rational system of fog signalling apparatus, and each invention is better than all the others—individually or collectively. If all these inventors had agreed upon an identical device things would be more simple, and the railway companies might easily be convinced. As matters stand, there are too many systems to choose from. And it is of no use to satisfy one company; all the railway companies must be satisfied. Except for purely local purposes, the system selected must be universally approved and adopted. Past experience in connexion with brakes and couplings shows that such a result can scarcely be expected save by compulsory legislation, which is not a hopeful alternative.

In a recent article we mentioned the electrical method of signalling on the Great Northern and City Railway. This, however, is not suitable for fog signalling on complicated portions of a railway system, although giving every satisfaction on a short electric railway. Another device, patented by Mr. W. Brierley, has been favourably spoken of by Colonel Yorke, and tried by the Great Northern Railway, with results that are said to be satisfactory as far as they go. The invention is mechanical in character, and involves the use of a "rocker" fixed on the permanent way and capable of being set at "danger" or "all right" from the nearest signal box. Assuming the apparatus to be in perfect order, one of these signals must be communicated to every passing train by one of two "triggers" attached to the engine, and the signal can be repeated by bell, whistle, or dial in the cab of the engine. The rocker and the two triggers are returned to the normal position by means of spiral springs. In our opinion the chief objection to this apparatus is that injury might result from the tremendous shock due to the impact of the trigger attached to a heavy train travelling at fifty or sixty miles an hour; and even admitting all the parts to be so balanced and adjusted that the force is taken up by the springs, any of these springs might fail at an early period in its existence through the development of some unsuspected flaw, or owing to the brittleness arising from frequent repetitions of stress. But there are numerous requirements to be fulfilled by any automatic or semi-automatic system of fog signalling. Among the foremost of these are:—Certain action, simple construction, slow deterioration, protection from damage, easy replacement of damaged parts, minimum attention, applicability for starting, differentiation

between home and distance signals, repetition in the signal box, a clearing signal given from the tail of the train, failure of action to give "danger" signal in the engine cab, and the apparatus to be unaffected by weather.

A form of apparatus which, it is claimed, complies with all these conditions is employed in the system of magnetic signalling without contact, patented by Mr. W. S. Boulton, and tried four or five years ago with successful results on the Great Northern Railway. This method avoids the disadvantages inseparable from mechanical contact; but, while appearing to have everything in its favour, has failed to secure the universal approval of railway engineers, except perhaps in a purely academic sense.

We do not for a moment believe that the problem of fog signalling is really difficult of satisfactory solution. If the chief railway companies could only agree among themselves to appoint a joint committee of experts it is probable that a thoroughly workable and reliable system could be devised or adapted within a few weeks or months. But the trouble is that the companies seem to have no desire for joint action. Each company prefers to hang back, waiting to see what the others will do.

NOTES.

The Sussex Building Case. THE proceedings taken by the Chailey Rural Council against Sir William Grantham have followed a course which is not of general importance to the public. The question seems to have resolved itself into one of fact as to whether the plans submitted were sufficiently intelligible and in compliance with the by-laws in force in the district. The magistrates, in coming to their so-called "finding," appear to have lost themselves, and the defendant has been neither convicted nor acquitted, nor does the verdict even comply with that known in Scotch law as "not proven." We have heard of decisions which amount to "not guilty, but don't do it again," and this would appear to be the verdict of the learned magistrates of the Lewes Petty Sessions. It is not a satisfactory conclusion, but it is perhaps the only one that was possible to the magistrates. The real questions are whether the by-laws affecting rural buildings are unreasonable in their operation, and whether the officials who have to enforce them are competent for their task. On the latter point there is no certain evidence, and probably the condition of things in this respect varies very much in different districts. On the former point the magistrates could scarcely have been expected to pronounce a decision; it would have been *ultra vires* for them to do so, and it is in any case a matter requiring very careful consideration. We certainly cannot recommend that building by-laws should be abrogated in the case of rural cottages; they should be simplified and confined to matters really affecting the healthfulness of a habitation; but it cannot be permitted that landlords, because they are willing to build cottages for their tenants, should be allowed to build just as they please; the results might be very injurious. The case under special con-

sideration is not so one-sided as writers in popular prints appear to think. The plans by Sir W. Grantham which we have seen published do not by any means lead us to think that he should be trusted to build cottages without supervision by the authorities. The case has been made the occasion, in fact, for a popular outcry which is by no means altogether reasonable, and is set up by people who do not know much about building or sanitation.

Labour and Trades Unions. THE reports of the Board of Trade show continued depression in the labour market affecting nearly every class of employment, yet there is a satisfactory decrease in labour disputes, the number of workpeople affected in November being about 13,000 fewer than in November of last year. The memorandum of the Board of Trade as to the position of Trades Unions in the year 1903 contains matter of considerable interest in view of the above facts. Despite a small decrease in membership the funds of the principal Unions attained a record amount, viz., 4,550,000*l.*, and this satisfactory state of affairs is attributed to the fact that last year there were so few disputes that only 170,000*l.* was expended on strike pay. This gives a percentage of only ten per cent. for strike pay, whilst the amounts expended in directly benefiting the workpeople was sixty-eight per cent. The twelve years, 1892-1903, give an average of eighteen per cent. strike pay. To what causes may this reduction in trades disputes be reasonably traced at a time of commercial depression usually so conducive to strikes? The only answer appears to be that it must be attributed to the salutary construction which has been placed on the law affecting Trades Unions, and it is to be hoped that the natural common sense of the working man may prevail against the Councils of the agitators, and that the above figures may show him how much it is to his own interests that the funds of the Trades Unions should be devoted to his direct benefit and not be frittered away in strike pay, and litigation, and agitators' expenses.

Construction of a Building Contract. THE case of *Robins v. Goddard*, in which a somewhat novel construction was placed by Mr. Justice Farwell upon a building contract in the form sanctioned by the Royal Institute of British Architects, and which was commented upon by us recently, has been carried to the Court of Appeal, where the decision has been reversed. The action was brought by the builder claiming sums due to him under the contract as certified by the architect, and the defendant counter-claimed in respect of defective work and materials. Clause 17 of the contract gave the architect power to order defective work to be made good, and Mr. Justice Farwell considered this clause excluded the jurisdiction of the Court over the counter-claim in the absence of any such order in the architect's final certificate. The Court of Appeal have, however, pointed out that under this contract this was not the exclusive remedy, since clause 32 contained an arbitration clause which also was applicable

to the matter in dispute. It is further to be observed that clause 30 specially provided that "No certificate of the architect shall be conclusive evidence as to the sufficiency of any work or materials to which it relates, nor shall it relieve the contractor from his liability to make good all defects as provided by this agreement." Mr. Justice Farwell so read this clause that he substituted for the word "nor" the words "so as to relieve, etc." and the Court of Appeal also dissented from this construction. In the result, therefore, the final certificate given by the architect was held not to be conclusive of the matters in dispute, and the order of the Court was that they should be referred to a referee to be agreed upon by the parties.

Electrification of the Underground Railways. WITH the exception of the new line between Harrow and Uxbridge, there is little indication of electric traction on the Metropolitan Railway, but we understand that the Baker-street and Harrow section will be thrown open to electric traffic early next week. This will give the public an electrically operated train service from Baker-street to Uxbridge, although steam locomotives will not be entirely abolished until a later date. Satisfactory progress continues in the equipment of the great generating stations of the two underground companies at Neasden and Chelsea and upon the distribution systems of the respective lines. At the present time it is impossible to say when the final act in the conversion of the inner circle may be expected. It is satisfactory to learn, however, that a complete understanding has been effected between the Metropolitan and the District companies as to the interchange of current for the purposes of operation. In the cars about to be employed on the Metropolitan line Londoners will find a fair sample of what may be looked for on the inner circle. The cars are on the corridor system, excellently lighted, and provided with electric heaters, and, more important still, no inflammable material has been employed in their construction.

Tramways and Municipalities. THE decision in the case of The London, Deptford, and Greenwich Tramways Co. and the London County Council is one which will surprise no one. The Tramway Company, which had acquired its Parliamentary powers at a time when no liability was incurred by such undertakings to bear some portion of street widening, in an arbitration to ascertain the value of the tramway for compulsory sale to the County Council claimed some 22,000*l.* on the ground of this immunity. This claim was disallowed, and indeed it seems more remote than even "moral and intellectual damages." The case, however, does serve to draw attention once more to the fact that it is to the interests of the ratepayers that such undertakings should be undertaken by private companies and not by corporations. In the former case the ratepayers are relieved at once of one-third of the cost of road widening, and as we pointed out in the case of the London United Tramway in an extension of only some seven or eight miles, this company

had to expend some 200,000*l.* on public improvements, and this system is, moreover, not confined to the jurisdiction of one corporation.

The Isle of Wight Coast. SINCE the publication of our last "Note" on this subject, further anxiety has been caused to the inhabitants of Freshwater owing to the action of unusually high tides and heavy seas. On Dec. 9 an Emergency Committee of the Isle of Wight Rural District Council visited Freshwater, and were much impressed with the serious damage done by recent storms. They had good reason for solicitude, for an enormous mass of concrete has been torn away from the sea wall, and so large a gap has been made in the esplanade as to imperil the foundations of various buildings. Still, so far as we are aware, no action has resulted from the visit of this Committee. On Dec. 22, however, a letter was received from the Local Government Board, goaded into action by an urgent representation from the Freshwater Parish Council, asking what the District Council were doing with respect to the question of protecting the threatened shore. This letter has produced some effect, for after discussion it was decided to take preliminary steps for carrying out the recommendation of the surveyor to the Hampshire County Council that the main road running along Freshwater Bay should be raised several feet, and protected by a substantial sloping wall. But we observe with regret that the Council merely propose "preliminary steps," and, as the County Council are to be asked to bear the cost of the works, it is much to be feared that the decision is merely intended to satisfy the Local Government Board, and that no serious attempt will be made to protect the coast unless the County Council are willing to provide the money. So far as can be judged by their past tactics the District Council would rather let the whole island be washed away than spend a penny on defensive works.

A Novel Lock for Canals. THE ingenuity of French engineering is well illustrated by the tilting lock-chamber invented by M. Cardot, of Paris. This device is intended for raising or lowering a barge or other vessel without the necessity for wasting any water. Below the upper lock gate of the canal a masonry chamber is constructed so as to be always in communication with the lower reach of the canal. The bottom of the chamber slopes from each end up to a ridge not far from the upper end, and on this ridge is pivoted the tilting chamber, formed with two walls of steel plate, water being held in the inner compartment, and air in the outer. In one position of the chamber a barge can enter through gates in the end, and when these gates have been closed the chamber can be filled by means of a heavy weight running along the bottom of the air compartment, the weight being moved by means of a wire cable and a suitable crab. When the chamber has been tilted, the water in the inner compartment is at the level of the water in the upper reach of the canal, and the barge can pass out through gates like those by which it entered. The reverse operation is conducted in

a similar way. A device of this kind might be useful in connexion with canals where traffic is liable to interruption owing to severe droughts, or where traffic requirements involve undesirably heavy expenditure by necessitating the use of more water than is essential for preventing stagnation.

Aqueducts. A PAPER on "Aqueducts, their Location and Survey," read before the Manchester University Engineering Society by Mr. A. H. Jameson, possesses considerable interest to those engaged in work of the kind considered by the author. After dealing with various methods of constructing water conduits, and discussing overflow weirs, washouts, automatic closing valves, and other details, Mr. Jameson described the method of surveying for a modern aqueduct, taking as an example that of the Derwent Valley Waterworks. The survey for that undertaking was evidently executed with the greatest care and a high degree of accuracy. For a great part of the distance the line ran over hilly country, and to facilitate correct linear measurements a steel tape was employed in place of the ordinary chain, the tape being adjusted horizontally by means of a spirit level. As the average gradient of the aqueduct was little more than 12 in. in a mile, it was necessary to be most particular with levelling and contouring work. Hence a circular spirit level was attached to the staff for the purpose of assisting the operator to adjust it in a perfectly vertical position, a device now generally adopted for accurate work. It is well known by surveyors that ordnance benchmarks can by no means be accepted as infallible guides, a view further confirmed by the experience of Mr. Jameson during the Derwent Valley survey. A noteworthy point made by the author was that the extreme accuracy of this survey resulted in the saving of some thousands of pounds in the actual construction of the aqueduct.

Steel at High Temperatures. THE results of some interesting tests by Professor Bach, of Stuttgart, of the strength of steel at high temperatures have recently been made public. In one set of experiments some of the bars were subjected to tensile tests at ordinary temperatures, and others at temperatures ranging from 200 deg. to 550 deg. C. From the results it became evident that strength had increased up to 300 deg. C., thenceforward falling approximately in proportion to the temperature to about half the original value. The ultimate extension at 200 deg. C. was less than one-third of the value at normal temperature, but at 550 deg. it was over fifty per cent. higher than the normal value. The contraction of area was reduced at 200 deg., but began to increase after the temperature of 300 deg. had been passed. Another series of bars tested were heated and kept under load for considerable periods, with the result that at 300 deg. C. a slight diminution of strength was observed, and more marked diminution at 400 deg. and 500 deg. C. At the same time it was noticed that the extension, and the contraction of area, increased between 300 and 400 deg. C., and decreased beyond 400 deg. until at 500 deg. C. the

average values were about 22 per cent. lower than those obtained by tests of the usual duration. The second set of experiments here mentioned indicates that for steel intended to be used at high temperatures, as in the case of steam boilers, for instance, it would be wise to insist upon the conduct of commercial tests at corresponding temperatures. An additional reason for the adoption of this course is to be found in the brittleness observed by Professor Martens and other investigators in steel at temperatures above 300 deg. C.

In a letter to the *Times*, published last Friday, Sir Oliver Lodge states that he is prepared to show to a deputation of municipal or other engineers the apparatus which he has invented for dispelling fogs. A description of the method he adopts will be found in patent No. 24,305 of 1903 which is entitled "Improvements in means for the production of continuous high potential electrical discharges applicable for the deposition of dust, fume, smoke, fog, and mist, for the production of rain and for other purposes." The principal claims made by Sir Oliver Lodge in his patent are in connexion with commercial methods of causing small particles in the atmosphere to coalesce into larger ones by means of high pressure electrical discharges from points. The larger particles fall by their own weight and so clear the atmosphere. The method is an extension of a discovery made by Mr. John Aitken, of Edinburgh, in 1880. He found that neither a cloud nor a mist globule could form without some solid basis as centre, so that in perfectly clear and dust-free air neither could mists form nor vapour condense. Every cloud or mist globule is slowly falling; if we make these globules coalesce, then the velocity of falling will become appreciable and the cloud or mist will soon be dispersed. C. T. R. Wilson, of Cambridge, discovered that condensation of vapour in dust-free air could be produced by Röntgen rays, each "ion" of electricity forming a condensation centre. If we produce, therefore, ions artificially on a large scale, the globules of water that are in the air will gradually increase in size and new globules will form round the ions. In addition, the electrification diminishes the surface tension of the water, and so the globules coalesce readily. This can be shown easily by rubbing a stick of sealing wax with flannel and holding it near a thin jet of water. The drops run together in a remarkable manner when the wax is held within two or three feet of them. We think that Sir Oliver Lodge's apparatus might be set up with advantage in the neighbourhood of Trafalgar-square, for example. The unsightly portion of it could be wheeled away, like the gas flares, when not required. We know that his apparatus has been successful over a space of about fifty yards in radius both at Liverpool and Birmingham, and if an equal area of London fog could be dispersed by the same means it would prove more economical than trying to illuminate it.

The Efficiency of Nozzles. DURING the last quarter of a century much has been done to increase the efficiency of nozzles such as are used for fire and power purposes. The most recent series of

experiments was conducted by Mr. H. C. Crowell and Mr. G. C. D. Lenth at the Civil Engineering Department of the Massachusetts Institute of Technology, Boston, for the purpose of determining the efficiency of the Doble nozzle. The characteristic features of the nozzle are the tip and the needle regulator within it. The latter, having the shape of a plumb-bob, is attached to a steel spindle provided with a hand-wheel for regulation. At the commencement the attention of the authors was at once directed to the clear and polished stream of water issuing from the jet and to the absence of all spraying near the tip, as compared with the feathery appearance of the stream from an ordinary fire nozzle. To find the reason for this was the first subject of investigation. After various experiments, it was concluded that the feathered appearance of the stream from an ordinary nozzle is due to the difference in the velocity of the particles of water, and that the amount of retardation of velocity of the outer layers determines the degree of feathered appearance. Inquiry was next made into the distribution of velocity in jets, and we notice that the most marked characteristic of all the velocity curves for the Doble nozzle is that the maximum velocity in the stream occurs quite close to the edge. Another remarkable feature is the high velocity in the centre of the jet from the same nozzle, even within half an inch from the needle. Notwithstanding variations of the centre velocity due to different settings of the needle, the velocity of the exterior particles of water changed almost imperceptibly, and the jet maintained its smooth, glassy appearance for a long distance from the nozzle. Twenty experiments were made to determine the efficiency of the jet under different conditions of head and setting, and, rejecting one or two doubtful results, the efficiencies under constant head varied between 96.4 and 99.3 per cent. This result shows the marked superiority of the nozzle in question over all forms of conical nozzles. The authors had hoped that the results would help them to establish the relation of efficiency to head, but unavoidable errors in measurement made it impossible to draw any definite conclusion with regard to this point.

Sanitary Condition of Itchen Urban District. DR. H. TIMBRELL BULSTRODE has made a Report to the Local Government Board on the sanitary condition of the Itchen Urban District, where there has been a prevalence of enteric fever. The state of things does not seem to be so bad, in a sanitary sense, as in many cases on which Reports have been sent in to the Board. Dr. Bulstrode considers that, generally speaking, there is no overcrowding of houses upon area, though in certain parts of the old village of Itcheu there is some very dilapidated property and some of the houses appear to have been deserted by reason of their being actually uninhabitable. The closet accommodation is in places inadequate, and one householder complained that in connexion with her house there was no such accommodation whatever. In what may be termed the strictly urban portion of the population

the supply from the mains of the South Hants Water Company is general, but in the rural portions of the district wells are still to be found, and these are for the most part dry steined only, and the coverings to the wells are not always such as to prevent the risk of pollution of the water by surface washings. In regard to sewerage, the urban district may be regarded as consisting of two parts—a smaller, the more populated, which is sewered; and a larger, the more rural portion, which is still unsewered. The sewered area is also, in a sense, divided into two portions—a larger, in which the sewage flows entirely by gravitation, and a smaller low-lying area, comprising a population of about 800, the sewage of which flows into a large circular tank, from which it is pumped into the high-level system. As regards the low-level system, there is evidence on the walls of the manholes of prolonged damming back of sewage both in the northern and southern sewers. This is due to the fact that up to the present time continuous pumping from the storage tank has not been resorted to. This damming back of the sewage in the above manner is, of course, objectionable, and if continuous pumping is not to be resorted to it will be desirable to lower the storage tank, if practicable.

St. John's Church, Newcastle-on-Tyne. THOUGH a sum of, it is stated, 200,000*l.* is offered for the site, the contemplated destruction of this church is strongly opposed in the locality. The Church of St. John the Baptist, in Westgate-street at the corner of Grainger-street West, is the most ancient in Newcastle; it was built for the most part in the XIIIth century, yet retains features of an earlier period. Edward Spoor restored the fabric in 1861, when he removed the galleries and opened out the roof by taking down the plastered ceilings; some further reparations were made subsequently, at a total expenditure of 11,000*l.*; and nine years ago a Norman window in the chancel was reopened. The church contains many old monuments; in the churchyard is the grave of John Cunningham, the pastoral poet, who died on September 18, 1773. At their meeting on December 21, the vicar and churchwardens unanimously declined to agree to a proposal submitted to them by the Bishop of Newcastle for the sale of the site and churchyard and the rebuilding of the fabric, with the existing stones, elsewhere.

Kensington Gardens. ON two or three occasions of late we have directed attention to the disfigurement and spoliation of Kensington Gardens by the wanton conversion of pleasant and secluded foot-paths across the turf into wide and formal gravel walks with iron fencing at the side. We find that yet another walk after that kind is being made over the lawns and through the trees from a junction with the Broad Walk, near the Basin or Round Pond, towards Queen's-gate. The gravel walk is laid through a comparatively unfrequented spot, lying at the foot of the slope, where the pines formerly flourished, and greatly impairs the natural charm and attractiveness of that part of the gardens.

Under this heading Mr. Strand T. G. Jackson makes in the Strand Improvements. Times a protest, with which we are entirely in sympathy, in regard to the want of consideration of existing buildings in the schemes for Strand improvement. He points out that the scale of the Strand architecture is set by Somerset House and the two churches, and that the threatened erection of immense buildings on the northern Strand frontage must have the effect of entirely overpowering these. In short, the true principle in such matters is to consider the character of the old buildings as well as that of the new ones; a consideration far too often lost sight of in what are called "street improvements."

BITONTO.

BITONTO is easily reached by steam tram from Bari, lying some eleven miles north-west of that city. Like many others of the Apulian cities, it was a Greek colony, though there are no remains of antiquity to be seen now. Coins have been found—one type with a head of Pallas armed and on the reverse an owl resting upon a branch of laurel, another with Pallas, and on the reverse an ear of corn, and the inscription "Bitontunon," and a third with an owl above a branch of olive and on the reverse striated clouds and the word "Bytontynon" in ancient Greek characters. In the Itinerary of Antonine Bituntus is mentioned as being on the Trajan way between Ruvo and Bari, and nothing is

known of its ancient history, but in 1010 the Greeks lost a battle here during Melo da Bari's insurrection. The earliest bishop about whom one can be certain is Otto, whose name occurs in 754; but the Cathedral is the latest of the great Norman churches, and must replace an earlier building. It was founded in 1175-1200, but although the main fabric was finished in these twenty-five years, work went on for at least forty years after, the high altar having been made by Mag. Gualterio di Riccardo da Foggia in 1240, and many chapels and altars were added in the XIVth and XVth centuries. Two of the bishops of Bitonto became popes; Giulio de Medici in 1523 as Clement VIIIth, and Alessandro Farnese in 1534 as Paul III. In the XVIIIth century a zealous bishop, Domenico Cedronio, beautified it according to the taste of the day, using a fund of 12,000 ducats left by his predecessor Giovanni Battista Capanus, who died in 1720, and some of this work still remains, though much of it has been removed. In 1818 the diocese was joined to that of Ruvo, so that the church is no longer a cathedral.

In 1248, 1252, and 1254 Bitonto was sacked, and there seems to have been little building done for a century afterwards, the palaces, of which a few examples still remain, indicating that it was once a rich city, being all of a later date. It was, in fact, in the XVth century one of the richest and most noble cities of Apulia, and its principal families—the Vulpano, Rogadeo, Scaraggi, Ferraris, and Bove—were in close commercial relations with all their equals in the other Apulian cities and with the most notable houses of Tuscany, Lombardy, and Venetia, to whom they were often united by ties of blood or marriage. The meeting-place of the merchants was either the house of

the citizens' "Universita" or the seats or "planchetura," of which the traces are still to be seen before the Cathedral or at the side of one of the churches. Of the magnificence of the earlier times but few remains exist, though two palaces of a later date are noticeable, the Palazzo Regna and Sylos-Galo. One palace, the Palazzo Sylos-Lahini, preserves its courtyard (Fig. 1), built for the Vulpano by local craftsmen in 1500, but designed by an architect of Lombardy. The elaborately-carved parapet wall shows busts and portrait heads, half-lengths of Scipio Africanus and Hannibal, the Carthaginian (so labelled) horsemen fighting, and two symbolical figures guarding the family arms—one a man in armour with drawn sword, seated on a curious wheeled throne, the other a crowned woman bearing a branch of some tree, whose seat shows the heads of two snakes, their bodies apparently coiled below, and who has clouds beneath her feet. The pillars are rather heavy, but the whole effect is imposing. At the side is a pretty little well ornamented with garlands. The Vulpano family gave to the town notaries, doctors, and priests, and had commercial relations with the Medici, Gaddi, and Serragli of Florence, the Tolomei of Siena, the Lampugnani of Milan, the Bragadino, Bembo, and Loredan of Venice. At the end of 1445 a Maestro Pietro di Giovanni of Bari, wood or stone carver, was owed more than an "oncia" of silver cavilli by Goffredo, the son of the notary Angelo di Vulpano, and names of sculptors from Bitonto occur about this time in the archives of Bari, showing that there was a school of carvers in the city. In 1446 an "Antonius Nicolai Sculturi de Botonto" is named, and in 1454 a "Maestro Bartolommeo di Maestro Nardo di Bitonto." The buildings put up in Bitonto during the last thirty years of the XVth

Fig. 1. Bitonto: Courtyard of Palazzo Sylos-Lahini.

century were due to—Maestro Matteo the Lombard; Maestro Bartolommeo di San Severino, living in Bitonto; Maestro Marco di Pietro di Maruggio; and Maestro Bartolommeo di Altamura, citizen of Bitonto—who are frequently named in deeds of the time. Matteo was originally a merchant, and came from Varese (near which was the home of the architects of Modena Cathedral), but gave up trade and took to being a master builder. These names show how the different styles of far-distant parts of the peninsula met and mingled in Apulia, as the names of the artificers of earlier date at Bari also show. The former cathedral is now dedicated to S. Valentine. It was originally a Benedictine church dedicated to S. Maria Assunta, founded by the judge Maggiore, son of Pasquale, King's justiciar of Terra di Bari, and given to the abbey of La Cava, which ceded it to the clergy and people of Bitonto in return for an annual tribute. It was consecrated by Bishop William of Siponto. It has a central nave and aisles with chapels beyond between buttresses, which were probably once outside the wall and which make the present exterior one straight line from transept to west end, except where the "porta della Scomunica" shows its original position. There are three apses masked by a wall between the two flanking towers as at Bari, and the western facade has

the Lombard pilaster strips. There is a crypt beneath the raised transepts and choir almost exactly like that at S. Nicola, Bari, except that none of the shafts or caps appear to be antique, and that the vault is painted instead of having stucco ornament. It has thirty-two columns and corresponding pilasters in the walls, roughly-cut caps and vaulting ribs, and is probably the oldest part of the church. The principal door has above it the Imperial eagle, and during the restorations several portions of busts were found which belonged to the external gallery draped as the figure of Frederick II. is on his angustals, which confirms the date ascribed to it, viz., 1200. There appears to have been a porch at one time, or perhaps the intention of erecting one shown by the springings of arches outwards at the ends beyond the side doors and on the pilaster strips. The bas-relief of the central tympanum shows the Harrowing of Hell. Below, on the architrave, are the Annunciation, the Salutation, the Adoration of the Kings and the Presentation in the Temple. Round the door runs a double band of arabesques; in the inner monsters intertwine with the stems in a masterly fashion, the outer has rosettes as the central feature of each convolution. Above is a projecting hood-mould richly carved with acanthus and volutes, which are made to form a band outside the foliage. The lower portion

of the composition is the usual crouching lion on a bracket-kind of pedestal, with a beautifully proportioned column and cap which supports rather more foolish-looking griffins than usual. The Imperial eagle on the summit of the arch looks like a later addition, and has no connexion with the design. Above it is a carved string course to which two two-light windows are connected by the ornament round them, and higher still is a round window with a hood-mould, at the top of which is a sphinx which is flanked by two lions on pillars supported by corbels. The gable finishes with a round, arched, corbelled cornice as usual, which also returns below the eaves of the nave wall. All the ornament is finely carved, and on the whole better than that of the external gallery. The side doors are simple square-headed openings beneath a round-arched tympanum; above each is a two-light window. The clerestory windows have pierced slabs of stone as at Bari, restored from fragments found. The chess-board billet-moulding was adopted by the Hautevilles as their device. Here it occurs at the top of the transept gable, in which there is a good rose window, below which are two stories of two-light windows much altered and built up. The lowest story has a blind arcading, four small arches beneath two larger in the usual manner, an enrichment which also runs along the base of the tower and of the apse. The "porta della Scomunica," a pointed arch beneath a round arch with a crucifixion in its lunette comes next to the transept, and is recessed between that and the walls of the chapels of the nave. The round arched arcade of this wall has single round-headed windows in four of the five spaces, the fifth being broader and pointed. The Venetian dentil is used to enrich the pilaster imposts. There is now one small campanile at the east end, built at the beginning of the XIIIth century but recast in 1484, and finished four years later when the clock was fixed in it. The names of the masters, Murzio Barba of S. Pietro in Galatina, Paolo de Borgogna, and Nicola Sauto of Bitonto are mentioned in connexion with it. The apse window is of the same character as at Bari but less ornate. High above it is another of a curious shape. The arch is almost four-centred, broad, and slightly pointed, with a row of four colonnettes in the spandrel of the wall, very low in proportion to the width.

The walls are solid, not filled with rubble, and the stones are keyed together so that they show no signs of failure, notwithstanding earthquakes and sieges. On each side of the nave are six arches, round, but with vousoirs deepening towards the keystone. The piers are square in plan, with half columns engaged on each face. The dividing walls of the chapels have a similar engaged half column opposite the pier, and the sides of the central apse have similar columns. The chapels are all newly decorated. The caps of the columns are very varied, showing animals and birds among the leaves. The triforium has been opened out again, the XVIIth century disfigurements having been removed, as also in the nave roof; but the apse and transept still retain them, and the flat ceiling of the latter hides the rose from view from inside. There are three arches beneath a larger one in each bay with caps and bases to the well-proportioned columns. A curious feature is that the outer arch is borne by a little squat pillar standing on the cap. There were originally no stairs to the first floor of the towers. During the restorations a little door was discovered towards the transept, and another on the other side in the aisle; the tower was approached by a drawbridge between these doors, called in ancient documents "gaifum," according to Sig. E. Bernich, under whom the restorations were carried out. In the nave are two ambos, which M. Bertaux considers to be of the same date, though they are very different in design. One (Fig. 2) is dated 1229, and signed "Nicolaus sacerdos et magister." This is the same man who signs the first story of the campanile at Trani. He was probably a Roman Benedictine. The whole inscription runs "Hoc opus fecit Nicolaus sacerdos et magister anno millesimo ducesimo vicesimo nono Docta manus ne fecit ad hoc ut lectio vite hic recitata ferat fructum mentes A," and below the book desk "Nicolaus Magister" is still legible. This is ornamented with arabesques underneath, and rests on an eagle with fine large feathers. It stands on a bracket, which is upheld by a seated figure. The curved projecting centre is decorated with rosettes in coffers, between which are bands of inlaid circles; the rectangular

Fig. 2. Bitonto: Ambo made by Nicolaus.

Fig. 3. Bitonto: External Gallery beyond Matroneum.

parts have panels and bands of ornamental interlacings. At each corner is a twisted column supporting a lion and a griffin respectively. Above the richly-carved cornice are ornamental terminations, which all consist of a ball of coloured marble above another carved like basket work, upon a base also carved with ornament. The side panels are plain. It is much inlaid with marbles of varied colour, and also with pieces of gilded glass with painting between glass and gold. The columns upon which it rests are of later date, and the stairs also must have been altered when it was placed in its present position, just within the rails of the choir on the right side. On the sloping parapet of the stair are carved figures of Henry VI., Constance his wife, Frederick II. with his son, and the Imperial eagle. Schulz describes the scene as the Adoration of the Kings. "Mary sits on a throne with a crown on her head, she has a lily sceptre in her hand. The kings have barbaric, broad faces, and short, full, pleated clothes. They stand on little corbels." The figures are beneath a corbelled arcade, with a boss beneath each arch ramping with the slope of the stairs. The font is of the same character as this ambo, and is the work of the same Nicolans. It has a large bowl with an arcade upon it radiating from the bottom with bands of XIIIth century ornament upon the archivolts, and a conical later cover. The nave capitals are much varied, and some of them very good. They also are ascribed to Nicolans, whose work they resemble. The other ambo, which is square with bands and panels of flat ornament, was the work of Mag. Bonifacio. It rests upon two columns, which were inlaid. The two front ones, with arabesques cut deeply, the back ones twisted. The panels of rosettes and interwoven cords were also inlaid with vitreous pastes, and in the centre of the larger compartments on one side creatures are painted upon the enamel. Sig. Avena says that this

pulpit makes one think that Arab artists worked here, but the design is not Oriental, and the Norman chequer appears in the abacus. The altar and ciborium, made in 1249 by Mag. Gualterio di Foggia, was destroyed in the XVIIIth century; part of the ciborium may be seen in the tomb of Bishop Carafa—small columns with varied caps. The inscription is preserved in the hall of the bishop's palace. The ancient frontal was discovered adapted to the altar in the chapel of S. Gregory Thaumaturgus. It has in the centre a little window, with columns and caps and a foliated architrave. In the treasury is an interesting silver-gilt chalice of XVth century Abruzzese work about a foot high. It is marked T E R beneath, and was probably the work of Nicolo Galucci of Guardiagrele, who worked at Teramo. The foot has six alternate compartments of angels, two coats-of-arms and a Madonna, the three latter with enamel backgrounds, etc., and arabesques. The knop has six panels beneath canopies with the Evangelists' symbols, the Pietà and Ecce Homo with enamel grounds, and above and below six other slighter panels similarly treated with half-length figures of the Apostles. The arms are those of the houses of Taranto and Acquaviva, and it was probably presented by Giulio Antonio Acquaviva, son of the Duke of Atri and Condottiere for his brother-in-law, Giovanni di Balzo Orsini, Prince of Taranto, who seized the city about 1460, on the occasion of the recognition Mass after he was confirmed in possession of the city in 1462 by King Ferdinand of Naples. The gallery outside the Matroneum (Fig. 3) runs above the chapels. It is of the period of Frederick II., and has been roofed and restored with judgment. At Bari similar galleries exist, but they have been built up. The carving of the caps shows great variety and fancy. Many of them have monsters seated back to back, griffins with men's heads, apes with the heads of cats, etc.,

and others fill the long side with interlacing stems and foliage. The columns have no bases, and are many of them ornamented with channelling, either twisted, zig-zag, or upright, in the last case pearly and interrupted with bands of Oriental detail, and the same influence appears in the curious secondary caps below the large ones by which the circular plan changes to square, cut out of the same piece as the shaft. The XIth century church at Altamura, altered in the XIIIth century under Frederick II., has several curious similarities to this of Bitonto. The pier, which here divides the nave arcade into two groups of three arches, at Altamura is repeated, and divides the seven arches into one group of three and two groups of two arches each; but from them transverse arches span the nave, as at S. Nicola, Bari. The aisles are groined and flanked by a line of chapels, of which the nearest to the transept becomes a recessed porch, as at Bitonto. On the other hand, fresh features appear at Altamura—the bays of the aisle are separated by pointed arches, and transept and apse are square and unbroken, a feature which is English, though occasionally occurring in France.

There are a few Gothic churches in the town, most of which have been sadly modernised. S. Francesco is perhaps the most noticeable, founded in 1283, and consecrated three years later, Romanesque in plan with Gothic details. It has a pointed doorway with carved ornament of pine cones or grapes, and palm or fir leaves a good deal conventionalised. Among these Apulian churches it is not so striking as it would be elsewhere. S. Domenico was built in the first half of the XIVth century by the gifts of Carlo di Durazzo, lord of Bitonto. It had a high altar made by Francesco de Oulato di Bitonto in 1388, at the expense of the noble Vito de Joannone. The door and the holy water basin are noteworthy, and the XVth century monument of Pichuccio Bove.

S. Anna belonged to the Rogado family till the middle of the XIVth century. It has a round-arched doorway with zigzag ornament.

Portions of the city wall remain, a round tower of the middle of the XIVth century, and a gate or two, which are picturesque but not remarkable architecturally. There is a good deal of good iron work, principally in the form of knockers and balconies. Many of the former remind one of others seen in far distant parts of Italy.

E. H. J.

RECENT DISCOVERIES IN THE ROMAN FORUM.

SINCE the appearance of my last article on this subject in the *Builder*,* there has been nothing of first-rate importance to chronicle, but the excavations are still being continued, though not, for the moment, with as much activity as heretofore. This has been largely due to Comm. Boni's absence in the summer upon a tour in other countries—including Ireland—undertaken with the object of studying the remains of primitive art there and comparing them with those discovered in the Forum, and also to the fact that it will not be possible to continue the excavations of the Basilica Aemilia upon the site bought for the purpose by a further gift from Mr. Lionel Phillips until the new building at S. Francesca Romana, which is to contain the Forum Museum, the directors' offices, etc., is at least ready for the reception of the latter so that the present structure can be removed.

The winter rains and the consequent rise in the level of the water have led to the temporary abandonment of the stratigraphic explorations in the open area of the Forum and to the further examination of the primitive cemetery close to the temple of Antoninus and Faustina, and work is at present proceeding only in the higher portions.

To the south-east of the arch of Titus, the work of clearing the foundations of the temple generally attributed to Jupiter Stator (*cf. Lanciani, Ruins and Excavations*, 200) has been commenced, and the north-east and north-west sides of the concrete core can now be distinguished from the later additions, which consist of a mass of concrete of the Classical period (perhaps the foundation of steps) on the north-east and of the lowest portion of the medieval *Turris Chartularia*, in which fragments of white marble are largely employed. A few of the large blocks of stone of the wall which supported the external columns are still *in situ*, and so, perhaps, are portions of the walls of the cellar of the temple. To the north-west of the arch stood, in all probability, the temple of the Lares—though some German authorities prefer to reverse the positions of these two edifices! Of this a portion has probably been discovered—a wall in *opus quadratum* of tufa, upon which rests a travertine pilaster base, upon the north-western edge of the road which ascends to the Palatine. A cross-wall runs for a short distance north-westwards, but both it and the main wall are soon interrupted, having been destroyed by the extensive reconstructions which have taken place. A mass of concrete foundation has been superimposed upon them, and a huge foundation wall of the same material was erected a short distance to the north-west, which has very likely been the cause of the destruction of a good deal of the temple. The building was reconstructed by Augustus, and to this period belong, apparently, the remains before us.

To the north-east, at a deeper level, a portion of the tufa rock of the ridge of the *Velia* has been laid bare; it has an artificially flattened surface, with a flight of steps cut in it, while to the north-west of the temple are the remains of a large house of the late Republican period, which have a slightly divergent orientation. The greater part of this building has been exposed for some time; it has been much destroyed by the massive concrete foundations of some building of the late Imperial period. The earlier pavement of the road ascending to the Palatine, belonging to a period previous to the erection of the arch of Titus, has been

* July 23, p. 88; *cf.* also August 13, p. 178.

† This building is of uncertain date and nature. From its orientation, it would seem to be contemporaneous with the Basilica begun by Maxentius (which generally bears the name of Constantine, who completed it), and was very likely a portico fronting upon the *Sacra Via*, which thenceforth ran between it and the Basilica, and then, turning at right angles, between it and the temple of Venus and Rome.

traced a little further up the hill (beneath it is a congeries of remains of drains and buildings of various periods), and that of the *Nova Via* is now being laid bare. It lies about 3 ft. below the late imperial or mediæval pavement, and shows surprisingly little sign of wear—unless it happened that it was "roughed" only a little while before it fell into total disuse, we may infer that it had comparatively little traffic to carry—and, indeed, the recent excavations have shown that it was a *cul-de-sac*. At the edge it seems to have been covered by a footpath of slabs of travertine, but this is hardly wide enough to account for the freshness of the surfaces of all the blocks now visible. The arches which are seen crossing the road and those which run parallel to the façade of the buildings on its south-west side* are posterior in date to this pavement, as their footings rest upon it. The drain which runs under the road is now being explored; it is crossed by drains belonging to the southern angle of the house of the Vestals, connected apparently with its enlargement in the time of the Flavian emperors (*Tribuna*, December 5).

Work has just been recommenced in the Basilica of Constantine, and the interior will be cleared down to the level of the original pavement. Some fragments of it, consisting of small pieces of coloured marbles, set in patterns, were discovered in the spring, and also fallen masses of the vaulting of the roof, the coffering being in some cases well preserved.

THOMAS ASHBY, JUN.

TWO OLD MAPS OF LONDON AND THEIR AUTHORS.

WE may opportunely devote a few words to the story, on its ichnographical side, of the two maps which the London Topographical Society will shortly issue to their subscribers. The bird's-eye view which is generally attributed to Radulph Agas possesses the greater antiquarian interest, though, regarded as a historical document, and allowance being made for its priority in respect of time, it is less valuable than the later one published by Morden & Lea. Of Agas's map—for so we must call it in default of a more authentic name—there are original copies in the Pepysian Library at Magdalene College, Cambridge, and in the Guildhall Library, London. The latter was printed without either date or scale. *temp.* James I., whose coat-arms it bears at top, yet the royal coat-arms of Queen Elizabeth are carried by the State barge. And since St. Paul's is drawn without the spire, which was destroyed in 1561, and not rebuilt, whilst the Theatre erected in the liberty of Halliwell, Shoreditch parish, in 1576 by Burbage is not delineated, we may fairly presume that the view was taken within that period. Agas was born in or about 1540 at Stoke-near-Nayland, Suffolk, and died there on November 26, 1621. He practised as a land surveyor chiefly in his native county during forty years, as he himself tells us, wrote several treatises relating to his craft, and by his own account was skilfully versed in the exercise of his calling. In the Lansdowne and the Additional MSS., British Museum, are two letters written by Agas to Lord Burghey; one, dated February 22, 1592-3, is described as "A Noate for the Perfection of Lande Measure and exact platting of Cities, Castles, Honors, Lordshippes, Maners, and Landes of all sortes," and mentions the "profitable staffe" and a theodolite of some 20 in. in diameter, with a protractor of at least 1 ft.; another describes his labours in the fen lands. His fame now rests mostly upon the views accredited to him of London, Oxford (1578), and Cambridge (1592). Examples of the latter two are in the Bodleian Library. George Vertue's fraudulent reproduction made in 1737 for the Society of Antiquaries of the London view may be rejected as untrustworthy. He inserted a date, "1560," in Roman characters, and made alterations and omissions—using some pewter plates now conjectured to be spurious. Of the copy belonging to the Corporation of the City, W. H. Overall, F.S.A., their librarian, brought out in 1874 an exact facsimile, executed by F. J. Francis; the original measures 6 ft. $\frac{1}{2}$ in. by 2 ft. $\frac{1}{2}$ in., and is printed from wooden blocks. Agas's map, into which he introduces many a little bit of

quaint verisimilitude, has the inherent defect of combining plan and perspective, the plotting of the foreground with its buildings merging northwards into illusive perspective. But not so with the map which Robert Morden and his coadjutor, Philip Lea, published in 1682 from a survey, to a scale of 300 ft. to the inch, made by William Morgan. His Majesty's cosmographer. Morgan's work formed the basis of many subsequent plans of parishes, city wards, liberties, etc., notably those by R. W. Seale, B. Cole, R. Bloome, Thomas and John Bowles, and others, for Seymour's and Strypes's editions of Stowe's survey, Maitland's "History of London," and similar works. A copy of Morden & Lea's first edition, 7 ft. 7 in. by 5 ft. 1 in., on eight sheets, is in the Grace Collection; at the base, along the entire length, is a view, from various positions, of the town. As a specimen of cartography it is superior to the map, 1677, of the City of London, to a scale of 100 ft. to the inch, prepared by Morgan and John Ogilby, and engraved for the most part by Hollar, who died in 1677. Of Ogilby & Morgan's map there are reprints, on eighteen sheets, 1732, by Morden & Lea, and by De Wit; and another edited by the London and Middlesex Archaeological Society ten years ago. Any such detailed plotting was not again attempted for London as a whole until Robert Horwood, of Liverpool, devoted the last ten years of the XVIIIth century to the map, to a scale of 2 ft. 1 in. to a mile, he made for the Phoenix Fire Office, engraved by Ash, and published in 1795-9, for which the Society of Arts gave him an honorarium of fifty guineas in 1802. Robert Morden, who died in 1703, traded as a map and globe maker at the sign of the Atlas in Cornhill, with, for a while, his partner, Thomas Cockerill. He published a large number of county and other maps for Great Britain and Tartary; he was the author of an "Introduction to Astronomy, Geography, Navigation, and other Mathematical Sciences," 1702, and of a description of a large quadrant constructed by H. Sutton, 1669. His maps were used for Bishop Gibson's edition, 1695, of Camden's "Britannia," and for the Reverend Thos. Cox's "Magna Britannia," 6 vols., quarto, 1720-33. With Philip Lea he brought out "An Actual Survey of London, Westminster, and Southwark," 1700, on two sheets, drawn and engraved by J. Harris; a quarto volume entitled "A Book of the Prospects of the Most Remarkable Places in and About the City of London," probably in 1700, and Hollar's map of London and the suburbs, 1675. The Corporation possess a later copy of their large map of London, which bears a dedication to William and Mary, with portraits of those Sovereigns, and was published by them at the Atlas and Hercules, Cheap-side, as well as at the Atlas in Cornhill.

ANOTHER NEW STONE-WORKING MACHINE.

IN our issue of September 3 a description was given of a stone-working machine, which represents the latest advance in this country towards the replacement of costly hand labour by cheaper and more efficient mechanical methods. We are now in a position to furnish our readers with some details of an invention of somewhat similar character, but which up to the present has been used exclusively in Germany. This machine is made by Messrs. Bercher & Gerhäuser, of Altengronau, and the sole British agent is Mr. A. Strauss-Collin, of London.

The machine in question is intended for moulding, planing, turning, and sawing marble, granite, syenite, and other stones. In general appearance it somewhat resembles the iron planing machine used by engineers. The front edges of the cast-iron uprights are shaped to form vertical guides, up and down which a table can be moved by means of a serewed shaft actuated by means of a hand wheel placed within easy reach of the operator. A secondary table works on horizontal guides, provided on the first table, and can be moved backwards and forwards by means of a second hand-wheel placed alongside that first mentioned. Thus it will be seen that the arrangement is akin to that of the familiar slide rest of a lathe.

To the secondary table is attached the cutting mechanism, all of which is enclosed to protect it from dust, and at the end of a shaft worked by the gear is a carbondrum cutting-wheel, or a diamond circular saw,

* The chambers fronting upon the road seem to have been shops. In one of them a mosaic pavement with a fine geometric design has recently been discovered.

running at from 1,500 to 1,600 revolutions per minute. By means of a hand wheel, the working shaft, with its cutting tool, can be moved through an angular distance of 180 degs. in a vertical plane, so as to suit different thicknesses of stone, or to permit the tool to be applied to any desired part of the work without changing the position of the main slide. By a simple yet ingenious device the cutting-wheel when in any position can be driven by the same belt which transmits power to the machine itself.

The table on which the work is clamped moves along horizontal guides, and has three speeds for the backward and forward strokes. The traversing motion is effected by means of worm gear fitted below the table, and adequately protected from dust, and a hand wheel is also provided for convenient adjustment.

Two attachments with which the machine is furnished deserve particular mention. The first is a device upon which circular slabs of any diameter can be finished, either plain or with ornamental moulding on the edges. This auxiliary consists of a cast-iron stand with a turntable, on which the work is fixed and rotated by a worm connected with the driving gear; it includes, further, a stand with a self-centring block, so that no previous determination of the centre is necessary. The appliance is driven by a flexible shaft actuated from the main shaft by rope transmission. The second attachment is a form of chuck to assist in the turning of small columns, balusters, vases, and other details, and in which several pieces of stone may be fixed at one time. Rotatory movement is given by means of suitable gear, so that as the chuck passes to and fro upon the travelling table all parts of the work are brought into contact with the cutting tool.

In virtue of the different motions and auxiliaries described, the machine is capable of manipulating the work horizontally, vertically, or at any desired angle, and the material to be worked may be of any length, with a width up to 80 in. and a depth up to 52 in. Moreover, the machine can be utilised for forming any required rectilinear, curved, and scalloped mouldings on slabs, irrespective of the height and width of the work.

Some idea of the rate of production may be gathered from the following statement, which refers to the formation of the shapes illustrated in the figure. These were cut in rough sawn marble slabs 2½ in. thick. The time required for cutting mouldings in granite and syenite is proportionately longer.

No.	1.....12	minutes per length of 40 in.
"	2..... 5	" "
"	3..... 5	" "
"	4..... 3½	" "
"	5..... 15	" "
"	6..... 3½	" "
"	7..... 11	" "

The machine measures about 17 ft. long, 10 ft. wide, and about 10 ft. high. At the present time twenty machines are in operation in various German towns, and we learn that one of the leading English marble-working firms has ordered a machine, which will shortly be erected in this country.

ROYAL EXCHANGE.—On December 19 the Lady Mayoress unveiled a fresco in a panel of the south wall, painted by Mr. Edwin A. Abbey, R.A. The picture is a gift of the Merchant Taylors' and Skinners' Companies, and represents the reconciliation in 1484, after a long dispute, between the two guilds, which they commemorate by a joint feast, to the present day, yielding precedence the one to the other in alternate years.

IMPROVEMENTS AT LLANDRINDOD WELLS.—In the next session of Parliament the Llandrindod Wells Urban District Council are asking for authority to extend their waterworks, acquire land for golf links, and erect reading and refreshment rooms in recreation grounds which may be acquired. They also ask for powers to provide a town hall, public hall, assembly rooms, and other public buildings, subject to the sanction of the Local Government Board.

OPEN SPACES AND THE SANDHILLS ESTATE, ST. PANCRAS.

It is stated that the Skinners' Company, who are owners of the property in trust on behalf of Sir Andrew Judd's Grammar School at Tonbridge, have agreed, with the concurrence of the St. Pancras Borough Council, to surrender a space 30 ft. wide along the forecourts of Nos. 45-113, Euston-road, for the bringing forward of the building line by 20 ft., as part of a scheme for the erection of a high-class hotel and improved residential property on the southern side of the main road, being of opinion that the existing forecourts "must be got rid of before any real improvement can be effected." They are prepared, further, to make over to the Borough Council the freehold of the garden in Burton-crescent for future up-keep by the Council as a public

space, and freely to convey as much land as will be needed for the proposed opening out of Burton-street on the east into Duke's-road. The property of the Skinners' Company in that quarter consists of lands purchased there (and elsewhere in London) by Sir Andrew Judd for the endowment of his school (1558), and vested in them for the benefit of the school by an Act of 1572. Judd bought the land for 346l. 6s. 8d. from John Gates and Thomas Thorogood. In his deed of bequest to the Skinners' Company it is described as:—

"A close of pasture with the appurtenances called the Sandhills situate lying and being on the back side of Holborn in the parish of St. Pancras of the yearly value of 13l. 6s. 8d."

A survey of the Sandhills estate dated May 2, 1783, shows that it then consisted of grass-land, about 27 acres in extent, traversed in its northern portion by the New-road (now Euston-road), with one house and a bowling-green, at the northern end of the later Thanet-street. The Sandhills estate was demised for a while at a small rent to the Duke of Bedford. In 1807 the Skinners' Company leased nearly all the land to James Burton for a term of ninety-nine years at a ground rent of 2,500l. per annum. Burton laid out the ground, building the streets which, with Burton-crescent, are situated within the area having Tonbridge-street along the north-east side, Leigh-street and Crescent-news South along the south-east side, Burton-street and Crescent-news North along the south-west side, and Euston-road along the north-west side. The outlying portion, about 5 acres, on the northern side of Euston-road has since been disposed of to the Midland Railway Company. The property, as laid out by Burton, has, from various causes, not realised the projector's expectations. The leases will terminate in 1906, and it is estimated that the new ground rents will then yield an increased income amounting to about 20,000l. per annum in favour of Tonbridge School. The statue, a poor thing, in Burton-crescent garden of Major John Cartwright, *obit* 1824, is by Clarke, of Birmingham. New-road was made in pursuance of an Act of Parliament in 1755-7 as a route offering many anticipated advantages from the end of the City-road to the Yorkshire Stingo at Lisson-green, and was laid out in terms of the statute as a kind of boulevard, the houses having front gardens or forecourts along nearly the whole of its length. In its conception it might have been one of the finest streets in London; but subsequent encroachments in advance of the building line—notably in the portion now called Euston-road—and other reasons, combined with the inferiority of the near neighbourhood in the St. Pancras and Pentonville districts, have contributed to its disfigurement and degradation, so that it has failed to take rank amongst the ornamental thoroughfares of the Metropolis.

CHINGFORD PARISH CHURCH.—Some carved oak stalls for the clergy and oak desks for the choir boys have been presented to the Chingford Parish Church. The stalls are made from designs prepared by the architects of the new portion of the church, Messrs. Blomfield, and are part of a plan for choir stalls for the men and boys which it is hoped may be carried out some day.

THE ARCHITECTURAL ASSOCIATION DISCUSSION SECTION.

At the meeting on the 14th inst. Mr. Theodore Fyfe read a paper on "The Natural Lighting of Interiors." The paper was illustrated by lantern slides of various interiors at home and abroad, and a number of photographs were also exhibited. He said that in the study of structure as evolved from plan, the importance of lighting as a means of effect was realised. In old work we often perceived that a noticeable light effect was the result of a careful study of the entire situation, often a necessity from the very nature of the case. In the Temple of Hathor at Denderah the light from the doorways penetrated a certain distance into the building. The central chambers had a few upper loopholes or slits, enough to prevent total darkness while preserving the mystery of the Temple shrine. But artificial light must also have been resorted to, even in the intense brightness of Egypt. The lighting of the Pantheon at Rome was unique in Europe, and nothing could be more majestic. The light was also perfectly adequate. In Santa Sophia, Constantinople, we got the effect of one vast and swelling hemispherical construction, so that the insistence of the strong band of windows at the base of the dome was just what was wanted to give point to the crowning feature. SS. Sergius and Bacchus, Constantinople, an eight-sided building with a sixteen-sided dome, showed beautiful lighting from small windows distributed high up. This was a feature of Byzantine churches generally. The Mohammedan tombs at Bitou had a different ideal. The predominant note of their interiors was the decoration in coloured tiles. To get the full effect of this, plenty of light was required, and we found the windows were large, placed low in thick walls, giving deep ingoings. In the Mohammedan and Coptic work in Egypt we found something more akin to the Byzantine methods. The Coptic church at Old Cairo was a wonderful example of a dimly-lit building. Of Lombard buildings in Italy, a beautiful example was San Michele at Pavia, one of the finest interiors in Italy. The aisles, transepts, and dome were lit by small windows, high up. The feature of the Italian Romanesque east end was a circular window placed high, and this was also used with fine effect by Brunelleschi in the Badia Church, near Fiesole. In the basilican churches of Italy and Sicily, on the other hand, the east end was apsidal and unlit, the aisles being occupied by chapels with little or no light, so that the buildings were dependent on the nave clerestory windows. Fergusson had eloquently described the effect of the Buddhist rock-cut temple at Karli, which resembled the western basilica in its plan, and obtained its light entirely from a large upper opening at the entrance end. The wood roofs in Italy were occasionally well lit, as in San Stefano at Venice, where semicircular windows cut into the roof with groining. Gothic work in its complete state represented the apotheosis of the stained-glass window, and this kind of architecture scored in a double way, as the decoration of the interior was obtained not in spite of but by means of the light. Of Renaissance ecclesiastical interiors, St. Peter's was the typical example in the one-dome plan. From the entrance, the dome appeared as a great well of light. On nearer approach we saw the great light space above the pendentives spreading itself down to the giant arms of the cross. In our London atmosphere, the colonnade round the dome windows in St. Paul's was unfortunate from an interior point of view. The aisles in St. Paul's were well lit, but the most original feature in the lighting is the series of windows in the spaces above the dome side-arches. The Laurentian Library at Florence was a good example of a large civil building of Renaissance times. It showed a fine vista which suggested comparison with the King's Library at the British Museum, but in the latter the sense of length was spoiled by the break in the centre. The Vatican Library suggested a cheerful and well-lighted crypt. The windows were ample and low, so that the decoration could be properly seen. Concerning modern work, it was impossible in the limited time to do more than briefly generalise. It was desirable that we should recognise the possibilities of lighting in small churches, and avoid being governed too much by convention in such window disposal. In churches, good well-thought-out lighting went far to redeem indifferent detail. Concerning east windows, it was best to admit little light from the end, to obtain what more was necessary from the sides, and to have small

windows generally at the east end, thus approaching the Byzantine method. Light coming only from the ceiling was unwelcome in churches, as in the Madeleine at Paris, a building where the interior was sacrificed to the exterior. Wren's churches showed ingenious and good lighting for a city atmosphere. Among others too numerous to mention, St. Margaret's, Lotbury, St. Mary, Abchurch, St. Mildred's, Bread-street, Christ Church, Newgate-street, and especially St. Stephen's, Wallbrook, showed lighting that was interesting and often very effective. Domestic work was, of course, their chief concern, and they could learn much about the perfect rendering of light effects in domestic interiors from the paintings of Pieter de Hooch and Terborgh. In the town they wanted, usually, as much light as they could get, but in the country they could often revel in the more open surroundings. Some rules that might be advanced were:—Light a room entirely, or mostly, from one side; be chary of introducing windows in fireplace walls; suit windows carefully to the shapes of the rooms they occupy. During the paper reference was made to photographs on the walls of many of the examples mentioned, and in concluding a number of slides were shown, representing some characteristic lighting at home and abroad.

The reading of the paper gave rise to an interesting discussion, in which Messrs. W. Wonnacott, H. Passmore, W. Curtis Green, Bernard Webb, W. L. Trant Brown, and the Chairman (Mr. H. Gregory Collins) took part. Mr. Henry T. Hare then summed up the discussion, as special Visitor, and said that although the subject did not lend itself to controversy in any great measure, as there could not be any hard-and-fast rules laid down, it was an important one to architects. He was glad that Mr. Fyfe had not attempted to lay down any rules, for he thought that a good many erroneous ideas were conveyed in this way. It was best to take mental notes, as they had that evening in looking at the illustrations, and then go home and think about them. He referred to the lighting of the Pantheon as the most successful he knew of, and mentioned the Picton Reading-room at Liverpool, which was most satisfactorily lighted in much the same way. The advantage of windows high up in a dome was the great diffusion of light obtainable, and the consequent small window area necessary in comparison to space lighted. Regarding domestic work, aspect and prospect considerably influenced the size and position of windows, and with reference to lighting from one side only, he was not a believer in this, as he knew of many successfully-lighted buildings where side and end light were combined, notably in some of Mr. Norman Shaw's work. The fixed rules for ratio of window to floor area, as determined and enforced by local and other authorities, were a great source of trouble—and to no good purpose.

Mr. Fyfe briefly replied, and the meeting then terminated.

ARCHITECTURAL SOCIETIES.

LIVERPOOL ARCHITECTURAL SOCIETY.—The third meeting of this Society for the present session was held in the Law Library, Cook-street, on the 19th inst. Mr. John Murray read a paper, illustrated by lantern slides and drawings, on "Scotch Plaster Work of the XVIth and XVIIth Centuries." He discussed a number of decorated ceilings of the period found in Scotch castles and country houses, and in the old town houses of Edinburgh, and showed the influence of Italian and French taste and the gradual increase of richness in the ornament. The work of the XVIIIth and early XVIIIth centuries was largely that of Adam or of his son. All the modelling was hand-wrought. In conclusion, Mr. Murray insisted on the importance of artistic plaster work in interior decoration. It was at least as important as decoration in wood or metal.

ENGINEERING SOCIETIES.

THE JUNIOR INSTITUTION OF ENGINEERS.—On the invitation of the Chairman, Mr. Samuel Cutler, junr., M.I.Mech.E., a large number of the members of this institution recently visited the International Gas Exhibition at Earl's-court. They were received by Mr. J. W. Helps, M.Inst.C.E., Chairman of the Advisory Committee of the Institution of Gas Engineers, under the auspices of which the exhibition was held, and shown over by him and Mr. S. Y.

Shoubridge, of the South Suburban Gas Company, Mr. A. E. Broadberry, of Tottenham, and Mr. A. W. Onslow, of the Royal Arsenal, Woolwich.

COMPETITIONS.

INFECTIOUS DISEASES HOSPITAL, SETTLE.—Six sets of plans, submitted by as many architects, in connexion with a proposed infectious diseases hospital for the Settle district, were rejected on the 20th inst. by the Settle Rural District Council as being too elaborate. It was agreed to pay the architects who had been invited to send plans a solatium of five guineas each, and the Council decided to entrust the erection of the hospital to the Sanitary Engineer (Mr. T. A. Foxerott). The Council think that 4,000*l.* will be quite enough to spend.—*Yorkshire Post.*

MUNICIPAL OFFICES AT BRIXTON.—The following are the conditions as adopted by Lambeth Borough Council on Thursday, December 22, for the competition in respect to the erection of municipal offices at Brixton-hill; Mr. Hare assessor:—(a) That the competition be open to all architects, in accordance with the principle laid down by the Institute in clause 5A of its Suggestions; (b) that in the instructions governing the competition, a clause be inserted to the following or similar effect, namely:—

"It is the intention of the Council to appoint the author of the design placed first by the assessor as the architect for the work, unless a sufficient reason exists to the contrary."

(c) That a prize be awarded and paid to each of the two authors whose designs are placed second and third in order by the assessor; the first of such prizes to be the sum of 200*l.*, and the second of such prizes to be the sum of 100*l.*; that no extra premium (over and above the regular commission) be paid to the author of the design placed first by the assessor; and that the three designs, so placed first by the assessor, be the property of the Council; (d) that the architect selected to carry out the accepted design be paid in accordance with the Schedule of Professional Charges, sanctioned by the Royal Institute of British Architects; (e) that if part only of the design be carried out, the architect be paid a sum to be agreed upon in respect of the deferred portion of his design, such sum to merge in the schedule fees upon completion of the buildings; (f) that in the event of the Council giving no instructions within twelve months to proceed with the work, the selected architect be paid a sum of 300*l.*, such sum to merge in the regular commission when the work is taken up; (g) that in the event of the Council abandoning the proposed work, the selected architect be paid a commission upon the estimated cost of the building at a rate of 1½ per cent.; (h) that the Institute's Suggestions numbered 4 and 6, as to drawings, be incorporated in the instructions to be issued by the Council; (i) that a deposit on the supply of instructions be required from every applicant, the assessor to suggest the amount of such deposit; such deposit to be returned on the receipt of a *bona-fide* design, or if the applicant declines to compete and returns the instructions, within a month after their receipt; (j) that a declaration be required from every competitor stating that the design is his own personal work, and that the drawings have been prepared under his own supervision; (k) that the five reasons put forth by the Institute in Suggestion No. 9, for the exclusion of designs be adopted; (l) that, with the consent of their respective authors, the designs submitted in the competition, except any design excluded under clause 9 of the Institute's Suggestions, be publicly exhibited after the assessor has made his award, and that the award be published at the time of exhibition.

PROPOSED TOWN HALL AND BATHS, WIGAN.—The Wigan Corporation propose, in their Omnibus Bill which they are promoting, to take land for the erection of a town hall, municipal offices, court-house, police stations, public baths, etc. The estimate for the site and building of the town hall and offices is 85,000*l.*, and for the furnishing of the buildings 5,000*l.* For the purchase of land and erection, furnishing, and fitting up of the baths, the estimate is 10,000*l.* In addition they propose to spend 4,000*l.* on street improvements, 31,000*l.* on tramways, and 30,000*l.* under the Public Health Act.

Correspondence.

GLASGOW INSTITUTE OF ARCHITECTS.

SIR,—I have been instructed to send you the enclosed letter regarding "presentations on the occasion of the laying of foundation-stones and other ceremonies," and my Council hopes that, as the matter is of general interest, you will be good enough to insert it in the next issue of your journal.

December 22. C. J. MACLEAN.

*The following is the circular letter referred to:—

"115, St. Vincent-street, Glasgow, December 22, 1904.

DEAR SIR,—The Council of the Institute has had under consideration the apparently increasing prevalence of valuable presents being given on the occasion of the laying of foundation-stones or formal opening of buildings by the architects concerned to those officiating, and even in some cases to their wives or relatives.

In such circumstances, and where the importance of the building warrants it, the presentation of a trowel or key by the contractors is often expected, and the action of the architect in co-operating in such cases, either financially or by designing and selecting the article, as also in representing those concerned at the presentation, is in no way criticised by the Council.

Anything beyond this, however, is considered objectionable, as setting up between architect and client a wrong relationship of donor and recipient, and as unfair to many of the profession in encouraging rivalry as to the importance and value of the respective gifts.

Such, after due consideration, being the unanimous feeling of the Council, it has been thought desirable to place these views before the members of the Institute generally, and to ask their co-operation in discouraging the practice referred to. The Council being assured that members will not only recognise the validity of its objections, but welcome its support in this matter.

In name and on behalf of the Glasgow Institute of Architects.

C. J. MACLEAN, Secretary."

*We are glad to publish the letter of the Glasgow Institute as they ask us to do so, and as we entirely agree with the opinion expressed; but we must add that we are not aware of any such practice in England (as distinct from Scotland); at all events, if it exists south of the Tweed, the fact has never come within our knowledge.—ED.

FERRO-CONCRETE.

SIR,—Reinforced or ferro-concrete systems of construction, although especially suitable for use in the erection of fire-resisting buildings, do not supply any new principle for protection against the action of heat; therefore, precautions, shown by experience to be necessary to secure fire-resisting qualities in other methods, must also be observed when erecting buildings with these newer systems, if protection against the action of fire is required.

The precautions referred to are now well known, being chiefly:—

(1) The use of incombustible materials that do not change to any important extent under the action of fierce heat and sudden cooling by powerful streams of water, and of careful workmanship properly applied.

(2) Complete encasement of all constructional metal with a non-conducting fire and water-resisting substance not less than 2 in. in thickness, secured so as to retain its position under the action both of great heat and streams of water.

(3) Limitations of buildings, or their securely separated compartments, to a moderate area and capacity, regulated by the nature of their contents.

(4) Protection from fires may occur outside the fire-resisting building.

It will be a great misfortune if, by taking liberties with these new systems of applying materials, they become discredited, as is now the case with earlier forms of so-called "fire-proof" structures, which practical firemen have found, when their contents are freely burning, to be the most dangerous and difficult buildings they meet with.

The importance of these precautions was shown in the case of the Fidelity & Guarantee Company's building, No. 111, East German-street, Baltimore, involved in the conflagration of February last. Part of this building, having basement, four stories, and attic, covering a ground area of 1,700 super. ft., was constructed in ferro-concrete, broken granite being used for the aggregate, with the result that exposed angles of the concrete in piers and beams, where subject to considerable heat, split off, exposing long lengths of the metal reinforcing rods.

With a continued high temperature, which may be the case when the stories of a building filled with combustible goods take fire, the tensile resistance of the metal would be seriously weakened, unless duly protected, leading probably to collapse. The action of

the concrete under heat also shows that better results would be obtained by rounding off all external angles in place of finishing them with a sharp aris.

In August, 1903, a fire test was made of a floor formed with reinforced, trussed, hollow concrete beams placed side by side; 5-16 in. iron reinforcing rods were embedded in the concrete, which was composed of sand and Portland cement, three to one; the thickness of concrete, from its surface to the metal rods, was about $\frac{3}{4}$ in. The floor was loaded equal to 224 lb. per foot.

When the temperature had reached 1,940 deg. Fahr., to which it had been raised from 64 deg. in 105 minutes, five out of the fifteen beams included in the test collapsed.

LONDON ANTIQUITIES: COLLECTION AND GUARDIANSHIP.

SIR,—At a recent meeting of the London Topographical Society, Mr. Hilton Price referred to a collector of antiquities by James Smith, a "coistermonger" who made large collections of antiquities and sold them entire when he could not store any more. I am informed that he was a Whitechapel dealer in old iron, etc., who was well known to excavators, and promised them good value for any articles discovered, of the genuineness of which he was a good judge.

It is indeed a matter of surprise that such a subject should have engaged the attention *con amore* of an illiterate man like "Totty Jim," the cognomen he acquired from the bag attached to his barrow for the deposit of the relics he bought. I understand that some of the "finds" are now in the Guildhall Museum, but cannot say anything of their description or importance; perhaps some of your readers can give information and say whether his collection was dispersed at his death. It seems strange that there is no official arrangement for securing all objects found in each borough, and that it should be possible for an amateur like Smith to make large collections.

Whether from want of space or of interest, it would seem as if there is no great anxiety to add to the City collection, nor much care shown in exhibiting and cataloguing it. Several years ago Mr. Longman, of Whitechapel, presented an interesting piece of sculptured Purbeck marble found on the site of Holywell Priory, Shoreditch. It is part of an effigy of a mediæval bishop from a table tomb, in the left hand the crozier staff and the right hand upraised in the act of benediction, both being gloved. It had a small corbel on one side of the shoulder with an unmistakable Gothic cap, a roll and hollow round the edge, and faint traces of colour in the folds of the drapery.* After lying for a long time without a descriptive ticket, it is now labelled "Portion of a male figure, probably Roman"! Another object, part of a XIVth century Gothic door jamb, is labelled "Portion of a fluted column, Roman period"! In the elaborately-illustrated catalogue, priced 1s. (and I am told some years in preparation) one would hardly expect any Roman-cing.

If this letter is not already too long, I should like to add that it is gratifying to antiquaries to find recently more toleration on the part of architects towards this study, which has been the subject of much cheap disparagement from some who, I fear, mistake oddity for originality in design. As witness, I would name a recent meeting of the A.A. when papers read were of an entirely antiquarian character. Can it be the unsuspected influence of the old Revivalists which lingers still around the spot that was the centre of their hope for a permanent school of English architecture which should push out the exotic from Italy for ever?

E. W. HUDSON.

ARCHITECTS' DRAWINGS.

SIR,—Your repeated advice to architects to join together with a view to obtaining a satisfactory judgment on the principles involved in the Gibson v. Pease case ought to bring about the desired result, though the lethargic isolation of architects referred to by "A Provincial Architect" is anything but a negligible factor. The question of drawings has been in an unsatisfactory state so long that it is specially desirable that the present opportunity of respecting it should not be allowed to slip.

My own practice is to insert a clause in every specification as hereunder given, and I have been able to point to it on more than

one occasion with satisfactory effect. The clause reads thus:—

"All drawings, tracings, specifications, quantities, papers, and copies thereof whatsoever are, and will remain, the property of the architect, and any given to the contractor must be returned to the architect in reasonably good condition on demand or otherwise at completion of the work."

I enclose cheque of 1l. towards the appeal. G. A. HUMPHREYS.

SIR,—As a careful reader of your valuable paper for the last twelve years I have constantly noted the curious lack of appreciation of the position of the profession as evidenced in your legal reports.

The present opportunity of endeavouring to vindicate our right to our drawings is one which must not be allowed to pass, and I trust that your spirited action in this matter may receive the support of all architects—whether members of the Institute or not.

I therefore have pleasure in enclosing cheque herewith for 2l. 2s. as the contribution from

QUARTER SCALE.
* * * We have received contributions from various architects towards what we will call the "Architects' Defence Fund" (including ten guineas from Mr. A. W. S. Cross and the same sum from Mr. Hubbard), which have been acknowledged by letter, but we should like a longer list of subscribers before publishing it formally. We have more to say on the subject next week.—Ed.

FAMAGUSTA.

SIR,—I have just recently seen a copy of the *Builder*, of date July 9, 1904, and have been much interested in the article on the churches in Famagusta, Cyprus, from which country I have recently returned home. I have some full-plate photographs of the ruins of Famagusta, which I shall be pleased to lend you for reproduction in your paper if you so desire.

The correspondent who wrote the article is, I think, somewhat mixed in his description of the various churches. The Cathedral of Famagusta (of which no mention is made) is Santa Sophia, built 1500-1512, now used as a mosque. It was, when a Latin church, called St. Nicolas. The church of which a plan and elevation are given on pages 32 and 33 is now almost a complete ruin, practically only the end walls standing. The church which is now used as a grain store, and which is the most complete, is known to the Greeks as SS. Peter and Paul. The church shown on pages 32 and 33 is dedicated to St. George, the patron saint of the island. All the churches were Christian, and at the Turkish Conquest, in 1570, the Church of St. Nicolas was turned (probably then) into a mosque, and called by them Santa Sophia. The same fate has happened to the once Christian Cathedral of Nicosia. FROM CYPRUS.

THE JOINERY TRADE.

SIR,—I am very glad to see the letters in the *Builder* of "A Shop Foreman" and "Mill Foreman" respecting the above, and as it shows they take an interest in their trade. On reading these, I do not think I was explicit enough in my letter to you, which appeared in your issue of December 3. My reference was to the foreign-made doors, and sashes, and frames of which we see so much used in the houses now being erected by the speculative builders on the new building estates in the suburbs, not to doors, and sashes, and frames made to the architect's detail drawings.

I will now give my experience. I have built several blocks of model dwellings, in which there have been used some hundreds of doors, sashes, and frames of which we see so much used in the houses now being erected by the speculative builders on the new building estates in the suburbs, not to doors, and sashes, and frames made to the architect's detail drawings. The quotation I received for these doors, foreign made, was 5s. 6d. each, and 4½d per ft. for the sashes and frames. I made several hundred of the doors in my own shops, also several hundred feet of the sashes and frames, but failed to get them out at the figure quoted by foreigners. Are "J. C. W." "A Shop Foreman," or "Mill Foreman" able to do so? I did not work piecemeal, the foreigner does. A LONDON BUILDER.

QUEEN VICTORIA MEMORIAL, LIVERPOOL.—The executive committee of the Memorial Fund have inspected and approved the clay model of the statue designed by Mr. C. J. Allen, of Liverpool, and decided that the model should be sent to the founders for the casting of the statue.

Illustrations.

THE ROOD LOFT OF THE CATHEDRAL OF SAINT JOHN, BOIS-LE-DUC.

HIS *jubé* is now preserved in the Victoria and Albert Museum, South Kensington, where it was re-erected in 1871. It formerly stood at the crossing of the Cathedral of Saint John (St. Jans-kerk) at 'S Hertogenbosch. 'S Hertogenbosch (called by the French Bois-le-Duc) is the capital of the province of North Brabant, Holland. The Cathedral is one of the three most important mediæval churches in Holland, the other two being the Cathedral of Utrecht and the Church of St. Nicholas at Kampen, both of which it surpasses in richness of treatment. The greater part of the present building was commenced in 1418, at the time of the rule of the Dukes of Burgundy, a period memorable in the history of Low Country architecture (*vide* "De St. Janskerk te 'S Hertogenbosch," 1900). In the year 1517 the work was completed; and about a century later, when the Gothic manner of building had been entirely superseded by that of the Renaissance, the rood loft that forms the subject of Mr. Swarbrick's drawings was erected. The materials employed were alabaster, with black and red marbles.

In the article entitled "La Cathédrale Saint Jean à Bois-le-Duc (Hollande)," by J. C. A. Hezenmans, in the "Bulletin Monumental," (vol. xxxix., 1873, page 631), it is stated that the original *jubé* was damaged by the Iconoclasts in 1566, and demolished in 1610, in order that the Renaissance *jubé* might be erected. "This, in turn," added the writer, "was unfortunately destroyed at the instance of some unintelligent people a few years ago; I regret its loss in spite of the unhappy effect of its colossal proportions on a church whose general aspect gave an impression of elegance and lightness." An earlier contribution by Monsieur Charles Piot, entitled, "Le Jubé de la Cathédrale de Bois-le-Duc (Pays-Bas)," appeared in the "Bulletin de la Commission Royale des Monuments" (Bruxelles, vol. vi., 1867, page 43); and was accompanied by a lithograph of the *jubé* in its former position in the church. In this article the reasons for its demolition were stated and some particulars of the structure itself given. The twelve chandeliers of copper were attributed to Antony, son of John, beater of copper at Bois-le-Duc; and the shields held by some of the figures are stated to have been formerly enamelled. According to Maubuchius ("Beschrijving van Sint-Janskerk te 'S Hertogenbosch," page 57), it is insisted the subject of the enamelled decoration was the Spanish coat-of-arms. Extracts obtained from the Bois-le-Duc archives, through Dr. Cuyppers, are also stated to show that the sculptor of the rood loft, Conrad van Nuremberg of Namur, received the citizenship of Bois-le-Duc in 1608. He was probably a son of Conrad, master-mason to the County of Namur (1571-1594). Two designs, it appears, were suggested for the Renaissance rood loft, and the one copied from the structure at Antwerp, by Raphael Vandon Broeck, was accepted on December 13, 1610. It is also recorded that Van Nuremberg received the contract on December 21 of the same year, and that the work was finished in 1613.

The drawings are by Mr. J. Swarbrick, of Manchester, and obtained the Royal Academy prize this year for architectural drawing.

HOUSE AT MUNSTEAD, SUREY.

The house is faced externally with Bargate stone and Portland cement rough cast. Bath stone being used for the window mullions, etc. The roof is covered with local tiles. The chimneys are red brick in small courses.

The builders were Messrs. Wm. Johnson & Co., of Wandsworth Common, S.W., and other work was executed by the following firms:—

Plumbing and heating apparatus by Messrs. Wenham & Waters (Croydon); sanitary work, Messrs. Doultons; casements, Messrs. Crittal & Co. (Baintree); lead glazing, Messrs. H. Hope & Son (Birmingham); and all metal work by Messrs. Ramsden & Carr (Fulham).

Mr. E. W. Mountford is the architect.

* See sketch in R.I.B.A. Journal, vol. v., p. 234.

THE OGROVNEY MEMORIAL TOMB, MAYNOOTH — MR. W. A. SCOTT, A.R.I.B., ARCHITECT

PHOTO LIND SPRAGUE, E.C. 11, 45 EAST HARRISON STREET, FETER LANE, E.C.

THE BUILDER, DECEMBER 31, 1904

MIDDLETON WESLEYAN
CHURCH & SCHOOLS
EDGAR WOOD
ARCHITECT
PLASTERER

PHOTO LIND SPRAGUE, E.C. 11, 45 EAST HARRISON STREET, FETER LANE, E.C.

THE O'GROWNEY MEMORIAL TOMB.
MAYNOOTH.

This is a rather unusual kind of memorial tomb, designed with a stern simplicity based on the suggestions of ancient Irish architecture. Everything about it has been made as solid and as imperishable as possible; concrete foundations, granite quoins at the angles, and a massive door of teak. In the upper part of this door are small lights made of bottle glass set in small bronze frames. The door is hinged also on bronze hinges.

Simple as the work is, it is the result of thought and an effort to produce something essentially monumental in character. The architect is Mr. W. A. Scott, of Drumcondra (Dublin), whose interesting church at Spiddal we illustrated a few weeks ago.

WESLEYAN CHAPEL AND SCHOOLS.
MIDDLETON.

The materials used in these buildings are common brick and warm-coloured stone with broken colour from the Runcorn district; the roofs are covered with stone slates. Many of the school buildings facing the quadrangle are finished in cement and whitened. The walls of the chapel inside are finished with common brick. The chapel and school have open timbered pine roofs.

The heating and ventilation are divided into two systems of the same type, the warm air being drawn in by the cold air being drawn out by the action of the heating of the air in the two ventilating shafts.

The seating accommodation of the chapel is for some 600 persons, with fixed pews and chairs.

The cost was 9,500*l.* for the total; the original site was very uneven, and a large portion had to be excavated to the extent of some 17 ft. in depth.

The principal contractors were Messrs. Nichol & Son, of Rochdale. The architect is Mr. Edgar Wood, of Manchester.

Books.

The Timbers of Commerce and Their Identification. By HERBERT STONE, F.L.S., F.R.C.I. London: W. Rider and Son, Ltd.

This is an excellent and useful book, though with some serious blemishes. Its object is to describe those properties of the timbers of commerce by which they may be most readily identified and distinguished one from another, and many of those properties, such as colour, smell, taste, degree of hardness, etc., are, of course, extremely difficult to describe on paper, especially since they are often liable to wide variation in woods of the same species. Of padouk, for instance, we are told that its colour is "rich red or crimson streaked with black" and "that its smell is little if any"; but, in the present writer's experience, the colour is often brown, whilst the smell, at all events of the red variety when freshly cut, is strongly aromatic. According to its degree of hardness, each wood is assigned to one of eight grades, of which ebony is placed in the first, oak in the sixth, and pine in the eighth; and here again, so far as English oak is concerned, we should very much doubt whether its hardness, as compared with that of ebony on the one hand and pine on the other, is placed high enough up the scale. Dry weight or density is easily ascertained and recorded, but liable to such variations in woods of the same species, and even in different parts of the same tree, that it is of little value for the purpose of identification. Roughly speaking, the higher the latitude in which a given species is found, the harder and heavier its wood is likely to be; whilst, as Goethe observed to Eckerman, wood on the north side of a tree is generally harder and heavier than that on the south, and was more highly valued for many purposes on that account by those old-fashioned craftsmen who loved to make their work as perfect as possible in all respects.

The means of identification mainly relied upon by the author of this book is, however, the anatomical character of the wood as studied through a microscope or pocket lens in the cross-section; and the work accordingly is admirably illustrated throughout by a series of photo-micrographs of these sections, carefully prepared for the purpose by Mr. Arthur Deane.

So extremely diverse in character are these beautiful, and necessarily faithful, figures, which will themselves bear further magnification through the pocket lens, that here at last, we are inclined to suppose, is an infallible method for the identification of all known woods; but here again in many cases we are destined to disappointment. In the first place, 179 figures have to serve for 247 species of wood—one figure, for example, for four species of oak—so that it would seem to be admitted that identification by this method is only possible up to a certain point. Now, as a matter of fact, the most business-like attempt yet made at the classification of woods—the key to the more important exogenous woods of North America, published by the U.S. Department of Agriculture*—also bases its distinctions mainly on the magnified cross-section, and clearly distinguishes the American red from the American white oak by this method, the distinction in the size and number of the pores alone being easily visible to the naked eye. It seems, therefore, somewhat remarkable that the same figure should have been used to illustrate three American, as well as the European, species of this most important tree. We take Mr. Stone's word for it that there is only one European species of oak, but the European varieties at all events are so diverse in value and character that here again greater elaboration of treatment would have been very desirable. Both British and Continental subvarieties of *Quercus pedunculata* and *Q. sessiliflora* are treated under a single heading, the only means given of distinguishing between the former and latter variety being that which concerns their barks. Now, as regards the former or "white oak," the English wood is so much heavier, harder, and "stronger" than the imported kinds, so much more difficult to use, and so much superior on account of its greater durability and finer surface, that, whereas the large majority of furniture manufacturers who aim first at rapid and cheap production will have nothing to do with it, modern craftsmen who consider the quality rather than the price of their work are seldom content with the Continental substitutes. A distinction between the two kinds, therefore, is clearly possible, and it would have been interesting to have had it defined by so scientific an observer as Mr. Stone. Whether the same distinction obtains between the British and European varieties of the brown oak we do not know, never having seen a specimen of the latter variety; but both in England and on the Continent *Q. pedunculata* and *Q. sessiliflora* are generally distinguished very sharply, not only in the attachment of their acorns, but by reason of the colour of their wood, the vulgar appellations "white" and "brown" being found in most European languages. In England, at all events, this difference of colour is often very pronounced; that of *Q. pedunculata* when freshly cut being of a brown so pale as to be literally almost white, whilst that of *Q. sessiliflora* is a deep rich brown, sometimes approaching coffee colour. This difference of colour, however, is quite unnoticed by Mr. Stone. Perhaps he inclines to the theory that the rich brown colour is not characteristic of the so-called brown oak, but occurs, perhaps in either variety, merely as the result of incipient decay, or of growth in some peculiar soil. Yet on this question again the opinion of an expert would have been most desirable.

If the oaks are insufficiently treated by Mr. Stone, the mahoganies are a class of wood by which he is frankly puzzled. He comes to the conclusion that very few of our commercial mahoganies are the wood of the true mahogany, *Swietenia mahagoni*, but that they are mostly cedars and cedrelas. The grand commercial distinction between "Spanish" and "Honduras" he sees barely to recognise; and, on comparing sections of these easily distinguished woods through a pocket lens with the figures given in this volume of *Swietenia*, *Cedrela*, and *Cedrela*, the present writer is unable to come to any useful conclusion. At all events, the distinction between the cold, hard, heavy "Spanish" wood, with its plainly visible white pores, and the lighter and softer baywood is a very real one, and will serve for all practical purposes until the difficulties raised in this volume can be cleared up.

Although Mr. Stone's main object is avowedly to provide a key for the identification of timbers,

he also devotes a paragraph in his description of each species to its actual or possible uses; and perhaps this part of his work leaves more to be desired than any other. It was not, of course, to be expected, in describing such a number of species, that he should go into those details of breaking strain, etc., which Laslett attempted to supply; but if, as appears from the insertion of these paragraphs, he wishes to advise the intending purchaser with regard to the selection as well as the identification of woods, he often omits information which might have been easily given, and which is essential to that purpose. He tells us, for instance, that one wood is inclined to warp and shrink in a great, another in a less degree; but this very important information is frequently omitted even in the case of woods in the most general use, such as oak and mahogany. We ought surely to have been told that the last-named is perhaps of all woods the least liable to give trouble, and oak one of the most dangerous, in this respect; we ought to have been told, what many joiners and timber merchants are often grossly ignorant of, that all woods are much less liable to warp or shrink in radial than in tangential section; so that the method of cutting oak on the quarter instead of plank-wise is even more valuable for the constructive than for the decorative advantage which is so obtained. This point needs strongly insisting on. A further reason for the practice of quartering, which the present writer has never yet seen stated, is that oak, and probably other wood, planes up at least three times more easily when the rays are parallel than when they are perpendicular to the surface planed. The old carpenters understood these advantages so well that their oak panels were usually cut with wedge-shaped sections radiating from the centre of a good butt; but the practice even of quartering is now almost entirely discarded by English timber merchants. In conversation with one of them upon this question the writer was told that one reason against the practice of quartering is that oak so cut might be mistaken for Continental wainscot; the mournful inference being that if a tree is cut up in the right way it was not cut up in England!

It appears thus that, except for tyros and amateurs, this volume has little useful information with respect to the better known classes of wood; but, as the author observes in his preface, the most experienced man will sometimes come across timber with which he is unacquainted, and then, no doubt, he would find the here useful clues to its identification. The book, moreover, should be possessed by all those who are interested in the subject, if only as a stimulus to further inquiry; and no more fascinating study than that of the various species of timber could well be undertaken by anyone with spare time and in need of a hobby. The great difficulty of studying imported or even native woods in the timber-yard arises from the fact that the leaves, flowers, fruit, etc., are seldom available; and it is by these, after all, that the species must be finally determined and classified. What is wanted next is a work illustrated with magnified cross-sections side by side with their appropriate foliage; but for this we shall probably have many years to wait, and, meanwhile, Mr. Stone's volume will certainly be regarded as a standard work on the subject he has so courageously tackled.

A History of English Furniture. By Percy MacQUOD. Vol. I, Part I and II. London: Lawrence and Bullen. 1904. 7s. 6d.

This sumptuous work is to be issued in about twenty monthly parts. The first part of the first volume contains an interesting preface indicating the divisions and subdivisions of the work. The main divisions are four. The first period to be dealt with is from 1600 to 1660, which the author calls the "Age of Oak," showing the evolution of the Renaissance from Gothic; the second dates from 1660 to 1720, when decided English characteristics are first evident; this period of the Restoration and Dutch influence Mr. Macquod calls the "Age of Walnut"; the third period, 1720 to 1770, the "Age of Mahogany," is much affected by contemporary French work. The years from 1770 to 1820 will be entitled the "Composite Age," the age of the classical revival and see-saw taste, the forerunner of the unprincipled and unbalanced fashion from which we are but now emerging.

It comes rather as a shock to be told that

* Bulletin No. 10, U.S. Department of Agriculture, Division of Forestry.

nearly all the early furniture was, until the peace after the wars of Lanca-hire and York, made abroad; and again, that the craftsman was influenced entirely by architecture, and, "being unimaginative, [Lorraine] required detail from either structure, metal work, or textiles; these being all designed, if not actually carried out, by foreigners." No doubt, while the crafts were in the hands of the Church, the principal movers were the clever brothers who travelled from one country to another, learning and instructing; but that does not imply that little interesting furniture was made in this country before 1480, when a cabinet-makers' guild is first heard of.

It is a great pity that there are so few remains of XIVth century work; yet we think Mr. Macquoid might have given us a chapter on work previous to 1500, even in an account of English furniture.

The subdivisions of the "Age of Oak" are three—"Gothic," "Elizabethan," and "Jacobean." For the Gothic period, as already indicated, there are but few examples on which to express an opinion; for the beds and chairs, for instance, we are almost entirely dependent on illustrated histories, romances, and books of Hours. A collection of reproductions of these would be a valuable addition to the literature of this subject. Chapter I. deals with this Gothic period, giving an excellent and most interesting account of the furnishing and disposition of a Gothic house. After drawing attention to the almost universal use of surface colour decoration, rich valances and hangings, and bright and costly cushions, which make us long for illustrations, this chapter describes several fine examples of furniture. The illustrations of these are mostly from photographs, exceedingly well done and reproduced. There are also three coloured plates by Miss Shirley Slocombe. The illustrations show some fine old livery cupboards, with pierced door panels for ventilation, forming a most effective decoration; credence-tables and chests of this period are also given, bringing us to the later period of linen-fold or parchment panels of Flemish origin. The dossier and canopied seat, which was placed on the dais at the head of the room, is only illustrated by the nearest remaining approach to it, *i.e.*, choir-stalls. Mr. Macquoid attributes their complete disappearance to the fact that they were usually fixed pieces of furniture built into the wall of the room.

Chapter II. deals with credence-tables and cupboards. The descriptions of their use is no less interesting than their design. Both these pieces of furniture are evolved from the early chest. Very interesting, too, are the author's remarks on the colour of the oak and its treatment. Varnish was not used in this country until the middle of the XVIth century; Gothic and early Renaissance furniture was neither wax-polished nor oiled, but left untouched. So-called black oak is the result of deep-toned varnish. The latter half of this chapter deals with the beginnings of Italian influence, which becomes markedly apparent in the illustrations. Chapter III. promises to deal with chairs.

The second part, Vol. I., of this sumptuous publication is a continuation of the "oak period." Several fine early chairs are illustrated, as well as some beautiful stools, showing still lingering enchantment of Gothic fancy; these make all the more regrettable the absence of earlier work. With the XVIth century Italian ideas and Italian workmanship pervades everything. A description is given of inn accommodation in the middle of the XVIIth century, besides many domestic details of interest, such as bedding, testers, valances, cushions and embroideries, as well as curious manuscripts giving insight to the manners of our forefathers of this period. XVIIth century furniture shows architectural detail encroaching where it should not. One chest illustrated in the present work represents the elevation of a classic façade; cabinets and chests are naturally more subject to this form of abuse than the less square forms of furniture. Some of the most satisfactory work of the period is the leather-covered chests, bound with brass, and studded in handsome patterns with brass-headed nails; age has lent to these a richness and softness of colour that cannot be easily surpassed.

A considerable portion of this part is devoted to the grand old bedsteads of the Oak period. "Our ancestors considered the price of furniture connected with their birth, marriage, and death as most important, and emphasised this

by a corresponding expenditure of money over it." These bedsteads and their accompanying furniture are especially mentioned in the wills of the nobility and gentry of the period. The illustrations of these are particularly well chosen; indeed, a feature of this book is the subjects illustrated, nearly all being from private collections not accessible to the public. The Part concludes with tables of this period. The fine oak trestle table at Penshurst is shown. It measures 27 ft. long, by 3 ft. wide, and the top has no joint in its length. The Duke of Devonshire's superb walnut table, inlaid with marqueterie, is also illustrated. We read that tables with plain tops, when not in use for meals, were often covered with a fine Persian rug.

How to Collect Old Furniture. By FREDERICK LITCHFIELD. (London: George Bell & Sons, 1904.)

This book is not a history of furniture; there is occasional valuable historic information, but its object is to give elementary and practical advice to amateur collectors of old furniture. It opens with the XVIth century, and gives a concise description of the Renaissance, showing the effect of architectural evolution on furniture. The chest, table, chair, livery cupboards, etc., are briefly described and their origins pointed out. Chapter II. deals with Jacobean furniture, a period of considerable interest, beginning as it does under the refining influence of Inigo Jones, who reduced the exuberant fancy of late Elizabethan design to an agreeable severity. The XVIIIth century saw the wider introduction of upholstered furniture and much greater richness in English furniture, generally owing to its importation from Holland and France. The chapter on Dutch furniture shows how considerable was the influence of Holland, not only by importing direct, but also by the arrival of King William and Queen Mary, who brought many Dutch families to England in their train. The settlement of the Huguenots was also an influence upon the industrial arts of considerable importance. Thus outside influences make it a matter of no slight difficulty to distinguish English from foreign made furniture, and no doubt much of the so-called English furniture of the XVIIIth century is Dutch. The architectural influence is marked during this century; the tradition of both architecture and the crafts was on established lines, and the result is very thorough workmanship and reasonable design.

The chapter on the XVIIIth century is the most interesting. With the Georges we come to a period of makers known by name. The chapter contains much of interest regarding Gillow, Chippendale, and their less-known contemporaries; Heppelwhite, the Adams brothers, and Sheraton. The "drawing" table was not, however, invented by Gillow, who may have patented it, but the idea dates back to Jacobean times. This chapter ends with an account of the painted furniture of the period, and has something to say about polishing.

French furniture played so great a part in the design of all furniture of the early XIXth century that the chapter on the earlier French periods is quite necessary to a knowledge of the subject; we commend this chapter as particularly concise and to the point. It describes the different periods known under the Louis and the methods of the well-known makers, such as Boule, Martin, and Gonthière, concluding with the Napoleonic period. The XIXth century shows the influence of this last period and the general introduction of Greek and Roman details. One chapter deals with "faked" furniture of various kinds, and another with valuable hints and cautions to the buyer, and the book concludes with an interesting glossary and an account of modern dealers' methods in buying and selling. All together the volume is a good handbook to possess on this subject.

Studies in Astronomy. By J. ELLARD GORE, F.R.A.S., etc. London: Chatto & Windus, 1904.

We have several times referred to the articles on astronomical subjects by Mr. J. Ellard Gore, which have appeared from time to time in the *Gentleman's Magazine*. The book before us consists of these and some other articles which have appeared in *Knowledge* and *The Observatory*, collected and revised, partly rewritten and the information brought up to date.

This is an eminently sensible popular book

on astronomy; we say "popular," because it is written for general readers and not for astronomers; but there is nothing "popular" in its style in the wrong sense of the word—none of the sensational paragraphs about the wonders of the heavens by which some writers about astronomy play to the gallery; it is a book intended to give solid and reliable information in plain language, and will be attractive to readers who want information rather than to those who only turn over books for amusement.

Among the subjects treated in separate chapters are "The Size of the Solar System"; "Jupiter and its System" (at present a subject of special interest); "The Distances of the Stars"; "The Sun's Journey through Space"; "The Suns of Space"; "The Darkness behind the Stars"; "The Nebular Hypothesis"; "Light, Electricity and the Ether," etc., etc.

In the chapter on the nebular hypothesis, and in fact in general throughout the book, the author's aim appears to be not so much to put forward any theories of his own, as to give the reader an account of the prevailing and most accepted theories, and the reasons for them. A great deal of the calculation and reasoning on which such theories are built can only be appreciated in detail by those who have had their minds trained in the higher branches of mathematics; by others they must be taken on trust. In this little book the author occupies the useful position of interpreter between the astronomical *avant* and the general reader.

Why, on page 4, does the author, in explaining parallax, say that "the solar parallax is the angle subtended at the sun by the earth's semi-diameter"? Why the semi-diameter? We should have supposed that the most accurate parallax for the sun would be got by taking the largest base possible, *viz.*, the earth's diameter, not the half of that; unless there is some reason in the technics of astronomy for stating it in terms of the semi-diameter.

Municipal Shortcomings. A series of articles contributed to the *Liverpool Journal of Commerce*. By T. MYDDELTON SHALLCROSS. London: Elliot Stock, 1904.

The twenty-five articles, which are reprinted in this pamphlet, have special reference to the city of Liverpool, and although the City Council cannot fairly be held responsible on all the counts of the author's indictment, the articles are well worth consideration. They are written in a popular style, free from technicalities—a method which has its advantages in an appeal to the man-in-the-street, but is not altogether convincing to those who have an intimate knowledge of municipal work. The author's theme is "The unnecessary unhealthiness of Liverpool," and the means whereby the death-rate may be reduced. There can be no doubt that the mortality is greater than it need be, and the author has done a civic service in drawing attention to the fact.

BOOKS RECEIVED.

CITY DEVELOPMENT: A STUDY OF PARKS, GARDENS, AND CULTURE-INSTITUTES. By Patrick Geddes. (Geddes & Co., Edinburgh and London.)

CHINESE ART. By Stephen W. Bushell, C.M.G., etc. Vol. I. (Published by the Board of Education.)

LADY MARGARET HALL, OXFORD.—The Warden and Governors make an appeal for contributions to a sum of £5,000, which is required for the completion of the block containing the dining-hall and library, and of the north wing for residential rooms—known as the Wordsworth Buildings. The hall was founded at Norham-gardens, Park Town, in 1379, as a ladies' college, somewhat analogous to the older colleges of the University. The hall receives fifty-two students. The additional buildings for the chapel, library, and gymnasium were planned and designed by Mr. Basil Champneys. In our issue of February 13, 1897, we published an illustration of the south wing of the Wordsworth Buildings, of which the middle block and the north wing were not then erected, situated beyond Norham-gardens, on the road to the Cherwell. The south wing contains twenty-eight students' rooms, common-room, lavatory and bathrooms. The north wing is also intended for the students. The middle block will contain the main entrance hall and staircase and the dining-hall, with the kitchen and offices below and the library above.

TRADE CATALOGUES.

We have received a pamphlet of forty-eight pages entitled "Healthful Schools: What Engineering Can Do." The author is D. M. Nesbit, of (Leicester), and the pamphlet contains an account of the

method of mechanical ventilation adopted in certain schools in Bradford, Leicester, and elsewhere, and of the results obtained. The author does not enter into details of design and mechanism, but writes in a general way for the purpose of bringing the subject of mechanical ventilation before the notice of all interested in education. Incidentally he draws attention to the ridiculous pamphlet in praise of "natural ventilation" published anonymously a year ago in the style of a blue-book, and also quotes from the discussion at the R.I.B.A. in June, 1904, and from other sources of information. The pamphlet is not an ordinary trade catalogue, but falls rather into this class than into that of "Books." The illustrations include the accompanying diagram of the state of air in schoolrooms in the same building under mechanical and under what is called "natural" ventilation; a practical document which we commend to the notice of our readers.

Effects of Mechanical and Natural Ventilation.

The Mork Patent Pulley Block Co. send us a circular describing their screw pulley blocks with quick return gear, the essential features of which have been mentioned in a previous issue of the *Builder*. They also enclose a leaflet giving particulars of Mork's scaffold chain, consisting of a lock plate and two chains. The plate is made of Siemens-Martin steel, and is so shaped as to cling tightly to the upright pole when the cross pole is suspended, and the greater the weight the firmer becomes the grip of the plate on the upright pole. The chains, being made weldless and of steel wire, are far stronger than ropes, especially when the latter have been exposed to all sorts of weather. This scaffold appliance is extremely simple, and should be a boon to builders and contractors.

We have received from Messrs. Drake & Gorham, of Victoria-street, Westminster, a book entitled "Light and Power," describing many of the arrangements for the electric light which this firm have installed in country mansions. Numerous photographs are reproduced, many of which will be instructive to youthful electricians, and a few are of general interest. Useful hints are given on such subjects as "producer gas plant," oil engines, water turbines, etc. We can recommend this work to anyone interested in installing electric light in a large mansion, as the arrangements of the lights in dining-rooms, picture galleries, etc., shown are instructive, and the power-house illustrations show clearly the magnitude of the plant and the space required for installations of various sizes.

We have received from the Stanley Electric Manufacturing Company, of Pittsfield, U.S.A., a large wall map of California showing clearly the routes of the high-pressure lines which are being used for the transmission of power by electricity. The longest transmission line at present is 232 miles, and the most important one is from Electra to San Francisco, a distance of 147 miles. The mean daily load on this latter line is 10,000 horse-power. The Stanley Company are experts in the transmission of power over great distances, and one of their engineers, Dr. Perrine, has written the standard work on the subject. Stranded aluminium cables are now the type of cable most commonly employed for this class of work. In some cases very long spans of wire are employed. In mountainous districts spans of 1,800 ft. are sometimes made, and have apparently given very little trouble. The pressures employed vary from 40,000 to 60,000 volts.

M'Fear & Co. (Belfast) have sent us a tiny booklet containing descriptions and prices of the felts manufactured by them for roofs, sarking, damp courses, etc. Full instructions are given for fixing, and also for preserving the various felts. Mention is also made of the bow-and-string girder or truss constructed of wood for light roofs.

The Coalbrookdale Company have sent us two sheets containing illustrations, descriptions, and prices of their patent "Speedon" radiators. The general principle of the invention is not altogether new, as gas has for some time been used for heating independent radiators containing hot water. The "Speedon" radiators are heated either by gas or by electricity, each radiator being, according to the description, "a complete hot-water circulating system within itself." The radiators will no doubt prove useful, the principal advantage being that the water retains the heat for some time after the gas or electricity has been switched off. "The Ideal Fitter," an illustrated catalogue, price list, and reference book, has been sent us by the American Radiator Company. It is a new edition, and contains some new features. The contents include illustrations and full details and prices of boilers and radiators of different types for heating apparatus, valves and other accessories, air-gratings, tools, etc. Twenty pages are occupied by useful tables and suggestions on piping and other details of heating apparatus. The catalogue is convenient in shape and size, and clearly printed.

Messrs. Graham, Morton, & Co. (Leeds) have sent us a copy of their interesting catalogue, No. 940, which contains a large number of illustrations of their own works and of conveying plant of various kinds erected by them at home and abroad. The illustrations are the principal feature of the catalogue, the descriptions of the apparatus being of the briefest, and no prices being given. Among the apparatus we notice belt and bucket conveyors for unloading, conveying, and elevating coal, coke, hot ashes, slag, etc.; some of the appliances are decidedly ingenious, and all are devised for the purpose of reducing manual labour and of expediting the conveyance of materials.

From Mr. W. E. Farrer (Birmingham) we have received a copy of a catalogue containing complete illustrations and descriptions of his "improved automatic distributor" for distributing sewage over the surface of small bacteria-beds. The invention consists of a galvanised-iron tipper, which receives the effluent from the septic tank and (when full) discharges it automatically into a series of perforated channels laid on the surface of the filter. The tipper may be either single or double. The latter is arranged so that it discharges the sewage alternately to the right and left, thus bringing two filters into use alternately. For small sewage-purification works, such as those for country houses, the apparatus is well worth a trial. The catalogue contains information which will be of use to those contemplating the erection of such works.

"Hobbies" of Dereham (Norfolk) have sent us their catalogue for 1905, containing illustrations and prices of tools for amateurs, fretwork of various kinds, and some hundreds of fretwork designs for articles of more or less supposed utility.

We have received from Mr. W. Höller a catalogue divided into six sections; the first contains photographic illustrations of oak panelling and other joinery, and the second deals with "art metalwork" of various kinds, including grilles, signs, lamps, and door-furniture. The remaining sections are shorter, and comprise hand-painted tiles, the patent asphalted sheet-lead dampcourse, wall-papers, etc. Many of the designs for oak panelling and metalwork are excellent, and the catalogue as a whole will prove useful as a work of reference for architects and others. The asphalted lead dampcourse has been extensively used abroad, and, as the illustrations show, it is adapted for roofs, tanks, etc., as well as for walls.

Messrs. Chavasse & Kerr (Birmingham) send us their catalogue containing illustrations of various forms of the "Tropicain" patent fire-grate, which gained the Coal Smoke Abatement Society's certificate rather more than a year ago. The grate is simple, the body consisting of corrugated fireclay slabs, and the iron-work being reduced so that it does not appreciably obstruct the heat. There are no front bars. According to the certificate mentioned above, this grate was one of five tested by the Society, and "showed the best results in the diminution of smoke, the heating power of the grate, and the economy of fuel." Any grate which ensures more thorough combustion of fuel than is possible in the ordinary grate, is worthy of a fair trial, and we have no doubt that this will be given to the "Tropicain." The illustrations in the catalogue are far from satisfactory, and will not do much towards pushing the sale of the grate.

The new catalogue issued by Messrs. S. W. Francis & Co. contains illustrations of their various kinds of wood, iron, and steel revolving shutters, brass and other metalwork for shop-fronts, plate-glass and other fascias and stall-plates, iron gates, etc. The testimonials printed in the catalogue range from 1857 to 1901, and the firm is so well known that it is unnecessary for us to describe their manufactures in detail.

The London Warming and Ventilating Co. have sent us their catalogue of firegrates, ranges, etc. It is divided into a number of sections, dealing respectively with plain and tiled register stoves and hob-grates, interiors, mantel registers and iron mantels, wood mantels, dog-grates and urbs, stoves, gas fires, anthracite stoves and grates, and the patent "Record" kitchen range. Perhaps the most interesting open grate is the "Florence," designed for burning anthracite coal. The catalogue is well printed and fully illustrated and priced. Many of the designs are artistic and old-fashioned, but this is what everyone expects in a trade catalogue; good, bad, and indifferent types are collected so that every taste may be pleased.

We have received from Messrs. Doulton & Co. a large and elaborate catalogue of sanitary fittings. The illustrations consist almost exclusively of half-tone blocks carefully prepared from photographs or wash drawings, and printed on smooth paper. Ten illustrations of fitted bath-rooms are first given, and then follows the first section on water-closets, which occupies eighty-four pages. Obsolete closets, such as the wash-out, are not included, but various forms of wash-down and siphonic closet are shown, together with two or three valve-closets; trough-closets and ranges of wash-down closets with automatic flush-tanks are also illustrated. The section on baths runs to 106 pages, and contains an excellent assortment of cast-iron and earthenware baths, shower and spray baths, towel-airers, and other fittings. The next section on lavatories is of almost equal length, and contains illustrations and prices of lavatories of nearly every type, including four views of the lavatories and sinks fitted in the operating rooms of various hospitals. The urinal section (forty-two pages) is also an interesting record of the company's most recent improvements, the first place being given to a series of circular-backed stall urinals in glazed fireclay. In the sink section (forty-two pages) there are illustrations of wash-up-sinks of various kinds, slop-sinks, mortuary slabs, etc. The volume concludes with a short section on cast-iron manhole-covers, gratings, soil and drain-pipes, flush-tanks, etc. The catalogue is a valuable work of reference for the architect and builder, who will find in it fittings suitable for buildings of every class.

Mr. John Jones sends us his new catalogue ("Section List A") of cast-iron drainage

fittings, pipes, etc., among which we may mention intercepting and other traps, and a great variety of airtight cast-iron inspection-chambers, cast-iron chamel-bends and junctions for manholes, drain-pipe bends and junctions, gullies and rainwater-shoes, soil-pipes and manhole-covers. The catalogue contains a comprehensive assortment of the fittings required in connexion with iron drains, and is well illustrated and fully priced.

"Firegrates, Mantels, and Accessories" is the title of a catalogue received from Messrs. Barnard, Bishop, & Barnards. It is divided into two sections, the first dealing with firegrates, mantels, curbs, etc., and the second with kitchen ranges, heating apparatus, boilers and radiators, etc. An interesting feature of Section I is the preliminary series of plans and sections of the seven different types of "fire-basket" made by the firm, the "Victoria" being without iron bars, and the "Economic" having all the angles of the back and bottom well rounded and a very small ash-grate along the front part of the bottom. Many of the numerous designs for interiors, and for cast-iron and wood mantels are simple and artistic. Section 2 is of a more practical nature and contains illustrations of kitcheners, hot-water boilers of various types (including examples of sectional boilers), radiators, etc. The catalogue contains altogether about 160 pages, and is well-bound, clearly illustrated, and fully priced.

Messrs. Wood & Andrews (Manchester) have sent us a copy of the large and interesting catalogue issued by the Metallic Roofing Co. of Canada. It shows the uses to which sheet metal, painted or galvanised, is now put in Canada, and, as far as we know, cannot be matched by the catalogue of any firm in this country. Here, when galvanised iron roofing is required, the old stock corrugated pattern is adopted without a thought that any other design is possible. In Canada there is no such dearth of invention, or fear of innovation. While there is much in the Metallic Roofing Co.'s catalogue to condemn, from an artistic point of view, such as the stamped metal sheets in imitation of rock-faced masonry and the like, there is also very much to praise. It is fully illustrated, the descriptions are complete, details have been thoroughly considered, and the builder will have no difficulty in carrying out the instructions given for fixing the various goods. Among the contents we may mention sheet metal of various designs for roofs and walls, fire-resisting doors, stamped metal mouldings, enrichments and sheets for walls, ceilings, coves, etc. "Hayes" metal lathing, and even pressed metal dressings for windows, dormers, etc. The fire-resisting doors are made in a number of stock patterns, and are very ingenious; they are of wood, in three thicknesses, covered with fireproof paper, and entirely sheathed with sheet metal. Each side of the door is sheathed with a single sheet of metal, which is stamped into panels to fit the wood backing, the edges of the metal being turned back to cover the edges of the woodwork. The catalogue, which runs to more than 350 pages, contains illustrations of many Canadian buildings in which the company's manufactures have been used.

Messrs. Adamsez, Ltd. (Soo.wood-on-Tyne) send us a four-page list containing illustrations, descriptions, and prices of their patent pneumatic closet-sets, in which the cistern is operated by a jet of air entering the hell of the siphon. The air is transmitted from a small bellows, which is actuated by means of a press-button or by seat-action. The device is ingenious, the only moving mechanism being the bellows.

Messrs. G. Kalms & Co. (Brixton) send us a sheet descriptive of their apparatus for drying damp rooms in new buildings. The apparatus contains a chamber in which the air is heated, and thence circulated through the room.

Mr. William Cooper has sent us a sheet containing illustrations and prices of portable houses, studios, and other buildings constructed of wood and galvanised iron. The buildings are of ordinary type, according to the description, "ornamental finish to gables and pinnacles is studied from the most approved Gothic designs," but unfortunately this ornamental finish does not give to the buildings any architectural merit. No fireplaces or chimneys are shown in any of the designs, nor are they mentioned in the descriptions.

Mr. F. Wallis Stoddart's pamphlet "On the best method of sewage disposal for small communities" is not a trade catalogue of the ordinary type, but rather a dissertation on the

subject of sewage disposal in general, with particular reference to the author's patent sewage distributor. This has been described in our columns more than once, and we need only repeat that it was designed for the purpose of distributing sewage uniformly in drops over the surface of percolating filters. The pamphlet contains illustrations and descriptions, not only of the distributor, but also of the other portions of the purification works, including the tank, filter, etc. It is ably written, and well worth the consideration of architects, surveyors, and engineers.

We have received from "Aspinal's Enamel"—this being the name of the company—a little book containing specimens of their "decorators" enamels and "wapieti" washable distempers. There is a good range of colours in each class, and the book will be useful to the architect as well as to the decorator.

From the Brilliant Sign Co. we have received an illustrated catalogue and price list of their manufactures, which include letters of all kinds and sizes in wood, copper, brass, aluminium, glass, etc. The catalogue also shows glazed stall-plates, signs, and fascias in considerable variety.

Mr. George Wragge (Salford) sends us a four-page circular containing illustrations and prices of his "in and out" casement for safety cleaning, and of a small casement ventilator for fixing in one of the squares of lead-light glazing. The former is the more important invention, and is simply a wrought-iron casement pivoted at the top and bottom about 4 in. from one side; thus, in a casement 18 in. wide the pivots will be 14 in. from one side and 4 in. from the other. The larger portion opens outward, and the outside can easily be cleaned when the casement is open, by passing the hand and duster through the 4-in. space. In the case of a three-light window an "in and out" casement in the central light allows two fixed side lights to be cleaned. The sections of the metal used in the casement are somewhat intricate, and we judge from them that the casement will be thoroughly watertight.

Messrs. J. Constantine and Son (Manchester) have sent us a descriptive pamphlet in praise of their convoluted stove for supplying fresh warm air to Turkish baths, houses, and public buildings. The stove has been on the market for the last forty or fifty years, and has recently been used for several important Turkish baths, etc., but the makers are doing themselves a disservice by issuing a pamphlet so badly written and containing expressions so extremely biased and unwarranted. In the preface the authors fall foul of those "warming and ventilating engineers . . . who have strange, dogmatic opinions of some one scheme of ventilation which they are ever ready to apply to any building for whatever purpose it is to be used, to some of which it is entirely wrong and must fail." We commend this curious sentence to the authors' notice, asking them to substitute "warming by convoluted stoves" for the word "ventilation."

From the Edison and Swan United Electric Light Company we have received a catalogue (Section II.) containing illustrations and prices of a variety of electric light fittings and accessories suitable for ships, factories, and mines. The fittings are of simple character, without unnecessary ornament, and are fully illustrated and priced.

Messrs. Lockerbie & Wilkinson have sent us a copy of their catalogue, "G," of rainwater pipes, heads and gutters, soil pipes, ornamental ironwork, etc. The catalogue is admirably got up, and the contents are extremely interesting. Many of the rainwater heads (which are cast in either lead or iron) are of an artistic character, and special attention has also been given to the design of the sockets and ears of rainwater pipes—with excellent results. The "Ducless" patent fixing is an ingenious contrivance for fixing pipes to stand 1½ in. clear of the brickwork. The lead soil pipes, plain and ornamental pipes and tacks being shown. All these goods and also the rainwater gutters are fully priced. The remaining contents of the catalogue are of a more general character, and are introduced for the purpose of drawing attention to some of the other departments of the firm's work.

INTERNATIONAL SOCIETY OF SCULPTORS, PAINTERS AND GRAVERS.—The President and Council of the International Society of Sculptors, Painters and Gravers will hold a reception on the evening of Saturday, January 7, at the New Gallery, Regent-street.

OBITUARY.

MR. WIMPERIS.—We regret to announce the death, on December 21, at No. 37, Half Moon-street, of Mr. John Thomas Wimperis, formerly of No. 25, Sackville-street, Piccadilly, and Bolingbroke-grove, Wandsworth Common, in his seventy-fifth year. Mr. Wimperis was elected a Fellow of the Royal Institute of British Architects in 1877. In February, 1889, he took into partnership Mr. William Henry Arber, who had been closely associated with him during the preceding twenty-four years, under the style of J. T. Wimperis & Arber, architects and surveyors. The partnership was dissolved as from June, 1897, on January 1, 1898, when Mr. Arber purchased Mr. Wimperis's interest in, and undertook to carry on the practice of, the firm. Mr. Wimperis was elected in March, 1902, a member of council of the Architects' Benevolent Society, and retired by rotation in March of the following year. Of Mr. Wimperis's more important architectural works we have illustrated the designs and plans of the following buildings:—The Granville Hall, with upper-room and annex, as a completion of the Granville Hotel, Ramsgate (September 12, 1874); Invercauld, Braemar, with extensive alterations and additions, 1870-5, in the "Scottish baronial" style, for Farquharson of Invercauld (June 5, 1875; view, and lower hall); the Sunderland Arms, Sackville-street, for the owners of the Sutton Estate (June 19, 1875); Hatton House, Westgate-on-Sea (June 12, 1886); Duke-street Mansions, Grosvenor-square, on the Duke of Westminster's estate, November 12, 1887; No. 11, Charles-street, Berkeley-square, after the Palladian manner (July 18, 1891); No. 16, Soho-square, for Messrs. Orme & Son (October 31, 1896); Hill House, Hampstead, with alterations and enlargement, for Mr. George Fisher (August 27, 1898, garden front); reconstruction of No. 35, Dover-street, Piccadilly, for the Empress Club, on behalf of the Hotel Club, and Investment Company (September 2, 1899); and designs for the Oriental treatment of the subway connecting two of Messrs. Liberty's premises in Regent-street (May 16, 1903); the subway was subsequently constructed, but with a different treatment. Mr. Wimperis, or the firm, during the period we mention above, prepared the plans and designs for No. 23, Berkeley-square, in 1890; the reparation of the interior and exterior of the parish church of St. James, Piccadilly, with a reinstatement of the roof in 1884, and the new choir vestry in 1899; blocks of houses in Davies-street and South Molton-lane, in 1899-1900; the new Palace Music-hall and Theatre of Varieties, with Thomas's Great Western Hotel, Plymouth, 1899; the enlargement on the sites of Nos. 36, 37, and 38, Jermyn-street of Prince's Restaurant, Piccadilly, with the iron and glass shelter and new grill-room at the east end in Piccadilly, and the reception-rooms and alterations of the Art Gallery, 1898-1901; the new Palace Theatre, Blackfriars, 1898-9; the alterations and the new library, with winter gardens, etc., Forest Lodge, Tulse Hill, for Mr. G. Adney Payne; the Hotel Osborne, Berkeley-street, Mayfair, begun in 1898; additional premises in Dover-street, W., for the Empress Club, opened in July, 1900; buildings on the south-west side of Park-walk, Chelsea, between Chapel-street and Winterton-place, with the widening of those two thoroughfares, for Mr. R. C. H. Sloane-Stanley, in 1898; new works, with alterations and improvements, at the London Pavilion Music-hall, 1899-1900; No. 50, Charles-street, Berkeley-square, for Mr. Messop; alterations at the Canterbury Music-hall, Lambeth; and enlargement of the Athenaeum, in Godolphin-road, Shepherd's Bush, in 1899-1900; business premises and dwelling-houses at Kingston-on-Thames, King's-road, Chelsea, and in many other parts of London, and the environs; No. 15, Berkeley-street, W., for the Hotel Club, and Investment Company; rebuilding of No. 5, Stafford-street, Pimlico; and alterations of the upper portion of Willis's Restaurant, King-street, St. James's, for occupation by a club, 1902; a house in Gwendolen-avenue, Putney, one of his most recent works; and, in 1886, a mansion in Grosvenor-square. In July, 1886, Mr. Wimperis acted, in conjunction with Mr. D. Cubitt Nicholls, as professional adviser in an honorary capacity—in respect of the limited competition for the St. James's Dwellings, in Carnaby-market, Regent-street, W.

MR. STELFOX.—We have also to announce the death, in his forty-ninth year, of Mr. Henry Ernest Stelfox, of No. 6, Princess-street (formerly of Clarendon-chambers, Molesley-street), Manchester, and of Windsor-road, Levenshulme. Mr. Stelfox was Ashpitel prizeman, 1888, and was elected an Associate of the institute in that year, and subsequently

The Student's Column.

ASPHALT: ITS COMPOSITION AND PROPERTIES (concluded).

THE three kinds of pitch—all of the same origin—given in Table III. were investigated by E. Donath and M. Asriel, and a notable residue of organic matter was left insoluble. This, also, was examined, and the results are given below:—

TABLE IV.—RELATION OF ORIGINAL COMPOSITION TO RESIDUE.

	Carbon.	Hydrogen.	Nitrogen.	Sulphur.	Oxygen.	Ash.	Insoluble Residue per cent.	Asphalt in Petroleum Extract.
Coal-tar pitch soft	91.89	4.62	—	—	0.78	—	22.82	trace.
" " medium	94.32	3.98	0.148	0.77	to	—	38.06	—
" " hard	93.16	4.36	—	—	3.5	—	29.39	2.19
Black powder residue after the three extractions	89.2	2.3	0.7	—	7.13	0.67	—	—

In the large percentage and nature of the organic matter left from coal-tar pitch, there is thus possible a clear differentiation from refined Trinidad pitch or natural asphalt, but that factor is not sufficient as between the last-named and the petroleum pitches used for many artificial asphalts.

To find out more of the nature of the several bituminous combinations, Dr. Lunge and V. Krepelka (*vide Chemiker Zeitung*, 1904) tested nine different varieties of natural asphalt, four artificial asphalts prepared from petroleum

melting points recorded in the next table are those of the extracted bitumens in each case, and show that the quantity of extract must be supplemented by a knowledge of its properties. The melting point of the crude soft and hard pitches (coal-tar) were 97° and 235° F. respectively, whilst their extracts were 68° and 73° F. respectively.

The melting points were determined by Kraemer & Sarnow's method, to be herein-after described, and in each the mean of four tests is given.

The iodine value, determined by Hubl's method, is for the purpose of ascertaining the way in which the carbon compounds constituting the bitumens extracted are built up.

To show the relation of the melting points of the extracted bitumen, as given in Table V., to the bitumens as they occur in the gross, see table at foot of this page:—

Table V. shows that the natural rocks vary in their properties (as exemplified by the sub-groups), but within certain limits that are in accord with practical experience, and that

TABLE V.—TESTS OF EXTRACTED BITUMENS (LUNGE AND KREPELKA).

pitches, and a hard and soft coal-tar pitch, by treating them with commercially pure chloroform. The extractions dried at 120° C., were then examined for specific gravity, melting point, and for absorption of iodine. In addition, the specific gravity of a solution of given strength of the several bitumens in chloroform was tested, but found to be incapable of materially assisting the discrimination. The melting point of rock asphalt or of artificial asphalt is affected by the proportion of base to bitumen and other organic matter, but the

departure from these properties is greatest in the coal-tar pitches where with an almost equivalent melting point there is nearly a three-fold iodine value and a 25 per cent. increase in the specific gravity of the bitumen. With the petroleum pitch there is not much disparity in the iodine value or specific gravity of the bitumen, but more in the melting point. The difficulty of determining the amount of the adulteration of natural asphalt with petroleum pitch up to 20 or 25 per cent. is so great that Koracs declares it to be impossible, but its presence

Fellow. He served his articles in the offices of Messrs. Baker & Ellis. He was the architect of many private houses, commercial buildings, banking premises, parish halls, and similar buildings in Manchester and the country around, and during the last ten years or so, of several large schools. Amongst the last-named we may mention the schools in North Green-street, Broughton, to receive 590 infants and 500 girls on the two floors, with two assembly halls and a caretaker's house, at a cost of about 14,000*l.*; in Tootal-road, Weaste, with a central hall and seven classrooms for each of the three departments, and with provision for the teaching of cookery, laundry-work, and manual instruction, for 1,275 scholars, the designs being after the English Renaissance in character, and the total cost amounting to nearly 16,000*l.*; in West Peel-street, Regent-road; and in Devonshire-street, Higher Broughton, for about 800 scholars, for which his designs were selected in competition—all for the Salford School Board; the Board Schools in Ashton Old-road, for the Manchester School Board; the St. Peter's church schools, Swinton, to accommodate 1,000 children; and an equally large school for the Lovenshulme Urban District Council. In the earlier part of his career Mr. Stelfox held a lectureship of the Manchester Society of Architects, of which he was a Fellow. We understand that arrangements will be made whereunder the completion of the architectural works upon which he was engaged at the time of his death is to be entrusted to Messrs. C. K. & T. C. Mayor, of Manchester, architects.

Mr. W. C. Laws.—We regret to announce the death of Mr. W. G. Laws, who for many years was City Engineer and Surveyor for Newcastle, and had latterly been consulting engineer. Deceased was born, sixty-two years ago, at Tynemouth, his father being agent to the Duke of Northumberland. Mr. Laws served his apprenticeship with Messrs. Thompson & Boyd, engineers, Newcastle, and afterwards, having adopted the profession of civil engineer, he was much engaged upon the work of the North British and North Eastern Railway Companies. He designed, among other works, the bridge at Wylam. Mr. Laws was appointed Borough Engineer of Newcastle on December 7, 1881. He had been in private practice in Newcastle; but it was stipulated that, when appointed, he should devote his whole time to the duties of Borough Engineer. Mr. Laws retired from the more active duties of his office in November, 1901, when Mr. F. J. Edge was appointed to succeed him. Mr. Laws was then appointed consulting engineer. He was a past-president of the Association of Municipal and County Engineers, a member of the Institution of Civil Engineers, and a member of the Institution of Mechanical Engineers.

MEMORIAL BUST, WESTMINSTER.—A marble bust of the late Mr. William Ewart, M.P., was recently unveiled in the reading-room of the Westminster Public Library. It is the work of Mr. George J. Frampton, R.A.

SWEDISH TIMBER TRADE IN 1904.—In a memorandum dealing with the economic situation in Sweden, Mr. F. S. Clarke, Secretary of H.M. Legation at Stockholm, observes, *inter alia*, that a great change for the worse has this year taken place in the export of timber. The results of 1903 were good in the provinces, and prices in spite of a fall, ruled high. Sawm and planed wood was last year in great demand for South Africa—over 80,000 standards having been exported there, but the supply seems to have been greater than the demand (which was of a speculative nature), and the South African market, as regards such goods, has consequently been closed to Sweden during the whole of the present year. Prices in the United Kingdom (which usually buys 40 per cent. of the total) and in France for Swedish timber fell, as considerable insecurity prevailed in the export trade. This insecurity and the fall in prices has been increased by "obstinate resistance" on the part of many of the Swedish exporters, and by cheap sales at Archangel and at other Russian and Finnish ports. The price of planks fell some 25 to 50 per cent., while battens fell about 10 to 15 per cent. Scantlings and wood of smaller sizes fetched about the same prices as before. The decrease in comparison with last year in exportation up to the end of July last in planed and sawn wood was about 63,500 standards. Taking, as average values for wood of all kinds, the figures given by the Board of Trade in the Export Statistics for 1902, it is seen that the figures in the first six months of 1904 show a decrease of from eight to nine million kroners (400,000*l.* to 500,000*l.*)—a sum which may even be put higher if the fall of prices is taken into account.

qualitatively can be proved by chemical tests, which he sets forth in the *Chem. Rev. Fett und Harz Industrie*, vol. 7. He there gives particulars for preparing solutions of the bituminous extract, and all the substances he tested gave precipitates from these solutions, on the addition of absolute alcohol; that from the coal tar being brown, the bitumens black, sticky, and pitch-like, the petroleum pitch

FIG. I.

and an unknown suspected substance, a fine, flocculent, black deposit. On drying these precipitates at 90 to 95° C., that from coal tar was pulverulent and light brown, from the bitumen black, sticky, and of high lustre, drawing out into fine threads when warm; whilst the other two were black, dull, earthy, and crumbled readily between the fingers. On agitating with absolute alcohol some of the original solution, the coal-tar pitch furnished a brown precipitate and a black, pitchy deposit; the petroleum pitch and the unknown sample, a black, muddy precipitate; and the natural bitumens, black precipitates or pitchy, cohesive deposits.

His conclusions are to the effect that the sticky cohesive properties of the ultimate constituents, as just described, account for the superiority of the natural asphalts for paving materials, as compared with petroleum pitch, which largely consists of earthy matters cemented by empyreumatic resins and oils, and soon loses its properties under the influence of sun and frost.

Continuing his researches, M. J. Kovacs has devised a plan of testing the viscosity or "dropping temperature" of asphalts, a description of which apparatus will be given later. He finds that asphalts for foot pavements must not "drop" under 176° Fahr., and for roadways not under 221° Fahr., and that it is useful to check the determinations by a standard bitumen kept for the purpose.

He advises that the term "asphalt" shall refer only to natural products, which occur either in the pure state or mixed with lime or sand, being, in the *pure state*, black and lustrous, and at the ordinary temperature tough and sticky or almost solid and brittle, with a dropping point not under 95° Fahr., easily and completely soluble in carbon bisulphide, turpentine, and chloroform, with difficulty soluble in petroleum spirit and benzene, and almost entirely insoluble in alcohol.

Specimens in their Normal Condition Tested for Viscosity by M. Kovacs.	Dropping Temperature In Degrees Fahrenheit.
Trinidad Asphalt	200.3
Dalmatian " (bituminous limestone)	206.6
Normal "	221.0
Tataros " (hard Hungarian bitumen)	237.2

These results may be compared with those in Table V. for the extracts, and those to be given later for artificial asphalts by Kraemer & Sarnow's method.

Recent investigations by Mr. Clifford Richardson have shown that an additional clue to petroleum pitch is to be found in the fact that "paraffin" is usually present, and that this can be detected and weighed by Holde's method, as modified by him. Natural asphalt he has found to be free from "paraffin," and the measure of the adulteration when mixed with a known percentage of a petroleum residue was found to be accurate. In this way a 20 per cent. admixture was detected with these particular substances. It must, however, be pointed out that all petroleum residues are not alike, and there is one great distinction between those of America and Russia, viz., that the former almost entirely consists of a series of bodies called "paraffins," whilst the latter consists almost entirely of a series of bodies called "naphthenes." Richardson has shown that there is evidence pointing to the presence of naphthenes in the Trinidad asphalt oils, in this respect as in others the deposits being similar to those of Baku in South Russia. In Europe there are petroleum residues of composition intermediate between the American and Russian, a fact that must be borne in mind in the interpretation of "paraffin" percentages in artificial asphalts.

FIG. II.

FIG. III.

The condition of the various classes of material in Trinidad, point to the fact that exposure to air and consequent oxidation have a considerable influence in their formation from the liquid gulped forth in a constant stream mixed with water, from which escapes sulphuretted hydrogen. The presence of sulphur in the asphalt appears to have an influence upon the properties, which, however, has not yet been clearly ascertained, but the facts just mentioned have led to patents being taken out in Europe and America for conversion of petroleum residues, from oil distillation works and others of a like nature, by blowing air through the mass, and in some cases adding a percentage of sulphur. Whether added sulphur can take the place of sulphur incorporated in a natural product during its genesis, remains to be proved, but it is well known that it has a marked effect when mixed with indiarubber, a substance akin to the bitumens. It is impossible to go into further details as to the effect of oxygen and sulphur, but the facts are mentioned to show what class of material is likely to be met with on the market, and to direct attention to the appropriate methods of discrimination.

The Effect of Liquid and Gaseous Hydrocarbons.

It has been found in Frankfort, in Brooklyn, and other cities where asphalt paving is used that the surface becomes disintegrated and softened if petroleum from passing vehicles or axle boxes of the same is allowed to drop upon it, and, further, that the heavy hydrocarbons of coal gas have a similar effect. The continued leakage of gas under an asphalt road-

way has been found to be injurious, and the affected portions of the substance when tested liberated gas. Passing similar gas into a tube containing sound asphalt speedily brought about the change, which ceased and was reconverted on exposure to air and absence of gas. Tests have shown that the constituents of the gas that were active were those that are absorbable by petroleum oils; an additional proof of the kinship of asphalts to petroleum.

Methods of Determining the Viscosity and the Effect of Heat upon Asphaltic Substances.

The effect of the "petroleum" is to facilitate the softening of the asphalt under the continued application of heat of a moderately high temperature, apparently causing a flux of those constituents that have a higher melting point. This is manifested in the creeping or buckling which is known to occur in hot weather with all except the best asphalts, and to determine this factor it is not sufficient to test the melting point as observed by raising the temperature over a short period of time only until liquefaction takes place, but to ascertain the viscosity by "dropping," or (what appears almost equivalent) the flux, by the effect of an ascertained temperature under a definite pressure. The first of these classes is that of M. Kovacs, whilst the second is that of Kraemer & Sarnow.

M. Kovacs' appliance is described at length in *Chem. Rev. Fett und Harz Industrie*, 1902, and is shown in the subjoined diagrams Figs. I., II., and III.

On a sand-bath *S*, about 6 in. diameter, with a ½-in. layer of sand is placed a beaker *O*, of 4 in. diameter and 6 in. high, containing sufficient rape-seed oil and glycerin to cover the beaker *L*, of 3½ in. diameter and 6 in. high, three-fourths of its height. In this air-bath the dropping frame (shown in Figs. II. and III. plan and vertical section) is placed. It consists of a brass disc, perforated in the centre for a thermometer, and with four perforations of

FIG. IV.

FIG. V.

2 mm. = .08 in. diameter, around which a brass cylinder of ½ in. internal diameter and 1½ in. high is soldered. The disc is supported by a tripod 2½ in. high. A regulated Bunsen burner is placed under the sand-bath, so that the temperature of the air-bath is evenly raised in each determination. The air-bath is covered

with a cork or glass plate. In testing hard-grade asphalt, 7.7 grains ($\frac{1}{2}$ grm.) is weighed out, formed into a pellet, and allowed to stand for from ten to twenty minutes. A pellet is then inserted in each of the small tubes of the dropping frame, this is immediately placed in the air-bath with a thermometer, and a thermometer is also suspended in the oil-bath. The gas burner is applied to the sand-bath, and after some time the softened asphalt is visible underneath the perforated disc, and as soon as it drops the temperature shown by the thermometer in the air-bath is noted. The following temperatures were observed in an experiment showing the rise per minute:—

At start	20° C.
After 5 minutes	22° C.
" 10 "	32° C.
" 15 "	48° C.
" 20 "	65° C.
" 25 "	81° C.
" 30 "	95° C.
" 35 "	106° C.
" 40 "	114° C. = 237° Fahr.

The apparatus devised by G. Kracner & C. Sarnow (*vide Chemische Industrie*, 1903) depends upon the flow of a definite head of mercury through a column of the bitumen substance and noting the temperature of this fluxing point, or melting point, as in Table No. V. It was brought out to overcome difficulties experienced with older methods in determining the softening point of coal-tar pitch, and has found general employment in the German tar industry.

The diagrams Nos. IV., V., VI. show the apparatus, which is quite easy to construct. Nos. V. and IV. are plans, whilst No. VI. is partly in elevation and partly in section. A quantity of about 25 grms. (386 grains) of the pitch under investigation is melted in a small beaker in an oil-bath (see Fig. VII.) at about 150° C., the pitch forming a layer about $\frac{1}{2}$ in. thick. Into this is dipped an open-ended tube made of glass, 4 in. long and $\frac{3}{4}$ in. internal diameter. On removing the tube the upper end is closed

by the finger, and the pitch is allowed to solidify in the tube whilst it is held horizontally and rotated. When the pitch has set, the portion adhering to the outside is removed, and the length of the column inside the tube will be about $\frac{1}{2}$ in. On the top of this is poured 5 grms. (77 grains) of mercury. The tube containing the pitch and mercury is then suspended in a beaker full of water resting in another beaker also full of water. The inner beaker also contains a thermometer, the bulb of which stands at the same level as the pitch. The outer beaker is heated by a Bunsen gas flame of small size. The temperature shown by the thermometer in the inner beaker is noticed immediately the mercury falls through the layer of pitch and is recorded as the softening, fluxing, or melting point of the latter.

FIG VII.

As seen by the illustrations, several observations can be made at once. With substances which soften above 194° F., the outer beaker is filled with paraffin or paraffin oil and the inner with saturated brine or magnesium chloride solution. The thickness of the column of pitch does not within limits affect the result; a layer of pitch of 5, 6, and 7 mm. thickness having softened at 61.5°, 60.5°, and 61.5° C. respectively. The mercury is shown upon the pitch or asphalt being tested in the vertical section of the tube in Fig. VI. and is marked H_g.

Tests made by the apparatus gave the following results on pitches and asphalt of considerable variation in fluxing property: given in degrees Centigrade:—

Soft Pitch.	Medium Pitch.	Hard Pitch.
Average of four results on pitch from Gräbhus.		
51.375	58.55	80.325
Average of three results on pitch from Erkner.		
59.5	61.2	86.866
Refined Hard Asphalt.	Glass Hard Asphalt.	Petroleum Residue from Alsace.
52.0	82.0	103

GENERAL BUILDING NEWS.

ST. MARY'S CHURCH, NUNEATON.—The Abbey Church of St. Mary the Virgin, Nuneaton, has been long a ruin, a small and plain church having been built amid the ruins in 1876 for the use of the parish. Since 1876 the population of the parish has increased more than fourfold, and is now about 7,000, and in March last it was resolved to proceed with the restoration, keeping carefully to the original lines, and preserving all that remains of the ancient work. Mr. Harold Braispear was appointed architect. The complete scheme includes rebuilding the chancel, the north and south transepts, the central tower, and a further portion of the nave. This will give a total accommodation of 900 seats. The cost will be over 14,000*l.*, but only 800*l.* is as yet subscribed or promised.

PROPOSED CHURCH, HARROGATE.—Work has just been commenced at Harrogate on a new church, which is to be erected on a site in Duchy-road, at an approximate cost of 24,000*l.*, excluding the completion of the tower and spire. Mr. Temple Moore, architect, has prepared the designs for the building, and Mr. Thomas Rawling, builder, York, has secured the first contract.

NEW CHANCEL AND CHAPEL, EASTBOURNE.—The newly-erected north chapel and chancel of St. John's Church, Meads, Eastbourne, were recently consecrated by the Bishop of Chichester. The additions have been carried out from the designs of Mr. A. R. G. Fenning, Meads, and are in flint faced with Bath stone in conformity with the original structure, the interior being lined with yellow bricks ornamented with red Sussex bricks, and faced with Bath stone. The organ chamber has been altered to fit the organ, which has been entirely rebuilt.

COUNCIL SCHOOLS, LEEDS.—The new Brownhill Council Schools, which have been erected by the Leeds Education Committee, were opened on the 22nd inst. The schools occupy a site in Harehills-lane, the area of the land

being 8,655 sq. yds., and the total cost will come to about 21,210*l.* The buildings are in two blocks, the larger block facing to Harehills-lane, having been arranged for senior and junior mixed children. The larger block is two stories in height, and provides accommodation for 480 junior children on the ground floor, and 450 senior scholars on the first floor. The infants' school is a separate building, and is only one story high, accommodation being provided for 550 children. Three assembly halls are provided—one for each department—and classrooms are arranged round the halls. There are twenty-six classrooms in all. Two fireproof staircases are provided for the upper floor of the mixed department. One classroom is specially fitted up for cookery instruction. The buildings throughout are electrically lighted. There are also concreted playgrounds. The buildings have been designed under the direction of the architect, Mr. W. S. Braithwaite (Architect to the Education Committee), of Leeds.

A NEW MASONIC TEMPLE.—On Tuesday, St. John's Day, a Masonic temple, which has been erected at a cost of about 8,000*l.* in Cadzow-street, Hamilton, by the Kilwinning (No. 7) Lodge of Freemasons, was consecrated by Colonel P. Spence, Provincial Grand Substitute, Master of the Province of the Middle Ward. The lodge dates back to the XVIIth century, and its written records commence in the year 1752, when the Duke of Hamilton of the time was building Cathelherhault. A couple of years ago they disposed of their original quarters to the town for street improvements. The new temple is situated in a prominent position, and has, on the ground floor, two suites of offices. The lodge-room is on the upper floor, entered through a large doorway in Cadzow-street, the lodge-room proper being a spacious apartment with all the necessary adjuncts. Facing Lower Auchingramont-street is a hall for letting purposes, which provides accommodation for 400 persons, along with a house for the caretaker, cooking kitchen, etc. The design, which was chosen by competition, is in the old Scots style of architecture, and is by Mr. Alexander Collier, architect, Hamilton. In finishing the interior, special attention has been given to the colour decoration, and a free use has been made of stencil ornament. The entrance hall and staircase are painted in shades of purple and green, and the reception hall in white and lemon. The lower walls of the banquetting hall are of green, and the ceiling and frieze white, with stencil ornaments introduced at the frieze. The lodge-room has received special care. The vaulted roof is of a lemon colour, relieved by green and purple bands, and the intervening spaces decorated with Masonic emblems. Over the entrance are the signs of the Zodiac, while at the east end over the Master's chair is the rising sun. The furniture of the room has been designed by the architect. In the lodge-room are seven stained-glass windows, the three over the Master's chair having figure subjects, "Faith," "Hope," and "Charity," while the other four on the side walls show different degrees in Masonry. The preparation-room has three lights, representing "The Way," "The Truth," and "The Life," and the reception-room has four windows of an Eastern character. The rooms are lighted throughout with electric fittings.

MARKET HALL, SHEFFIELD.—The reconstruction of the front of the Norfolk Market Hall at Sheffield is now nearly completed. The frontage has a depth of 42 ft. The main entrance, which is 14 ft. 6 in. wide, is screened off from the Market Hall by folding doors. On either side of the principal entrance are lock-up shops, while on the first floor is to be a restaurant, and in the basement are to be shops with entrances from Exchange-street. The new frontage is of stone and brick, the pilasters and columns being of polished Labrador granite. The architects were Messrs. Holmes & Watson, of Sheffield.

HOSPITAL EXTENSION, BRADFORD.—A new out-patients' department is to be built as an extension to the Bradford Children's Hospital. The new department is to be erected at the east end of the hospital grounds, and detached from the main block, with frontages to Welbury-drive and Bertram-road. On the ground floor there will be a vestibule, a waiting-hall, capable of seating 150 to 200 persons, and an inner hall adjoining, having a registration-room, an operating-room, and a dispensary, all opening directly upon it. On the upper floor there is to be a house for the caretaker, who will act as lodgekeeper for the whole institution, and the basement will include a drug-bury and heating chamber. It is estimated that the cost, including fittings and adaptation of the rooms at present in use for

FIG VI.

by the finger, and the pitch is allowed to solidify in the tube whilst it is held horizontally and rotated. When the pitch has set, the portion adhering to the outside is removed, and the length of the column inside the tube will be about $\frac{1}{2}$ in. On the top of this is poured 5 grms. (77 grains) of mercury. The

out-patients, will amount to 1,700. The building is to be constructed from plans which have been prepared by Mr. James Ledingham. The following are the contractors:—Excavators, masons' and bricklayers' work, Charles Booth & Son; carpenters' and joiners' work, Greenwood Brothers; plumbers' and glaziers' work, Gabriel Jackson; slaters' work, George Wilkinson; plasterers' work, Thomas Bolton; painters' work, James Lynn.

LIBRARY, WHITECHURCH, CARDIFF.—The new free library, built at Whitechurch by means of a grant of 2,000*l.* from Mr. Carnegie, was opened recently. The following are the dimensions of the building:—Ground floor—reading-room, 63 ft. by 27 ft.; lending department, 21 ft. by 16 ft.; librarian's room, 11 ft. 3 in. by 11 ft. 3 in. First floor—kitchen, and two bedrooms for caretaker. There are two entrances, one being reserved for ladies. The reading-room has been provided with a folding partition. There are fifteen newspaper stands and tables for magazines, with seating accommodation for sixty-four readers. The bookcases in the lending department will store about 6,000 volumes. The premises are heated by hot-water pipes. The elevation has been faced with Cattybrook red bricks, dressed with Bath stone. Messrs. R. & S. Williams, Cardiff, were the architects, and Mr. W. T. Morgan was the contractor.

CHELMSFORD FREE LIBRARY.—The foundation-stone of the public buildings at Chelmsford, which will comprise a free library and reading-room, science and art school, and museum, was laid recently by Lord Rayleigh. Messrs. F. Chancellor & Son, of Chelmsford, and London, are the architects. The buildings comprise a ground and first and second floors. In the centre on the ground floor there will be an entrance hall, with main staircase, men's common-room, women's common-room, librarian's room, and office, with lavatory accommodation at the back. In the north wing on the ground floor there will be a museum, library, and large museum, and in the south wing the lending library and reading-room. The first floor will include a classroom for design, master's room, and casting-room, with store-rooms. In the north wing on the same floor there will be a life-room, a room for elementary art and mechanical drawing, and in the south wing a room for applied art, and this last will have a north light window. The apartments for the curator will be on the second floor. The buildings will be heated throughout with hot water, and lighted by electricity. The frontage to the Market-road is 82 ft. The exterior of the building will be faced with red brick, and stone dressings. The builders are Messrs. H. Potter & Son, of Chelmsford, and the clerk of the works is Mr. James Bugg.

LIBRARY, PLUMSTEAD.—A public library has just been opened by the Right Hon. John Morley, M.P., on the south side of High-street, Plumstead. The building has been erected from designs prepared by Mr. Frank Sumner, the Borough Surveyor and Engineer, by Messrs. Henry Lovatt & Co., of Wolverhampton, at a cost of about 14,000*l.* The building has a frontage of 60 ft., and a depth of 151 ft., and is entered from High-street by a vestibule leading to a corridor. On the right is the newsroom, 56 ft. by 24 ft., furnished with stands for fifty-six newspapers, and two tables to accommodate fourteen readers. On the left is the magazine room, 29 ft. by 24 ft., with tables to accommodate forty-two readers. At the rear of the newsroom is the lending library, which, with the borrowers' space, covers an area of 62 ft. by 32 ft., and has at present accommodation for 20,000 volumes. The total length of the lending counters is 59 ft. The ladies' room, with accommodation for twenty-eight readers, and the librarian's room are entered from the borrowers' space. The juvenile library, 34 ft. by 21 ft., has a separate entrance and vestibule from the private road on the east side of the building. It has sitting accommodation for forty-eight readers, and also contains the lending counter for the juvenile department. The portion of the building does not communicate, except privately, with other parts of the library. The first floor of the public portion of the building is approached from the end of the corridor by a stone staircase, and comprises a reference library, 65 ft. by 24 ft., and spare-room, 65 ft. by 30 ft. The reference library is lighted by three large ceiling lights, and has accommodation for 6,500 volumes. The spare-room has an elliptical ceiling, and has been designed with an object of being used as a museum, or for library lectures. In the basement are repairing and store rooms, with shelving available for 5,000 volumes. Lift communication with the lending and reference libraries is also provided. The residence for the librarian is situate on the first floor. The building is electrically lighted, this portion of the work

being done by the Borough Electrical Engineer (Mr. J. B. Mitchell). The floors are fireproof. The elevation of the building in the High-street is faced with Farnham red bricks, having Portland stone dressings, while the east elevation is faced with Istock red bricks, and similar dressings.

TOWNS HALL, MOUNTAIN ASH.—Lord Aberdare opened a new town hall at Mountain Ash recently. The building stands on the site of the old Workmen's Hall. On the ground floor are offices for the surveyor, sanitary inspector, overseers, and rate collectors, with a hall and staircase leading to the first floor. On the first floor is a council chamber and room for the town clerk and education department. On the top floor are several rooms for the use of the caretaker. The principal floors are fireproof, covered with wood blocks. Those used for the council chamber are of oak. The corridors and halls are laid in mosaic work, and the principal staircase is granolithic. These, together with the wood blocks, have been executed by Messrs. B. Ward & Co., Cardiff, and the blocks by Messrs. J. Smith & Sons, Derby. The contractors were Messrs. E. R. Evans & Brothers, Cardiff. The amount of the contract was 4,300*l.* The architect for the building was Mr. John H. Phillips, Cardiff.

STAINED GLASS AND DECORATION.

LEVEN, FIFE.—A three-light east window has just been fixed at this church by Messrs. Percy Bacon & Brothers, of London. The centre light contains three figures, the top depicting Our Lord in Majesty, with Moses and Elias in the two spaces under, while on each side in the outer lights are St. Peter and St. Paul; under the two latter are angels bearing scrolls with texts.

SANITARY AND ENGINEERING NEWS.

LIVERPOOL WATER SUPPLY.—The report for 1903 of the City Water Engineer (Mr. Joseph Parry) contains information as to the supply of water to Liverpool, Wallasey, etc., the quality of the water, the source of supply at Vyrwy and Rivington, the outlay and income connected with the undertakings, etc. The year in question, according to observations made on Rivington watershed, was one of the wettest on record, there having been only three years which exceeded it in the past half century. The total volume of water delivered from the Corporation works during 1903, including statutory compensation waters to rivers in Lancashire and Montgomeryshire, was 17,515,037,000 gallons. The additional number of new houses and other new premises supplied with water in the Liverpool district during the year was 4,111, the net number, after withdrawals, etc., being 3,224. The total number of tenants on the rent-roll of the water account at the end of the year was 187,751. As to the quality of the water, Professor Boyce reported that purity was well maintained during the year. The capital expenditure on the Liverpool waterworks for the year was 5,517,099*l.* 12s. 9d., and the gross revenue on ordinary account, including Chorley, 519,395*l.* 1s. 11d. The new reservoir at Prescott, which was practically completed before the end of 1903, is described with the aid of photogravure views, illustrative of the screening-chamber and automatic valve at the outlet, and of the overflow and washout.

DRAINAGE PLANS.—In addition to those already reported in the *Builder*, the following Borough Councils have considered the letter from the London County Council submitting for an expression of opinion a proposal by the Royal Institute of British Architects for the amendment of the by-laws relating to the details insisted upon in plans of drainage work required to be deposited:—Bermondsey. While agreeing in the main with the Institute's proposal, the Council is of opinion that the power of requiring the detail plans under the by-laws should be retained, but that this power should only be exercised when the local authority considers it necessary. Poplar.—The Council holds that plans in accordance with the by-laws are necessary, and that the suggested amendment should be opposed. Southwark.—Acting upon a report of the Borough Surveyor, the Council are strongly opposed to any alteration being made in the existing by-laws. Shoreditch.—The Council has adopted a report from the Borough Surveyor to the effect that the by-laws referred to have assisted the Works Committee in the past in dealing with plans for drainage work, and that it is in the interest of the public generally that the fullest information should be set out before such plans are approved.

SEWERAGE WORKS, BENWELL.—The sewerage scheme, initiated by the Benwell and

Fenham Urban District Council, was formally opened on the 20th inst. The main sewer is three and a half miles long, and cost close on 20,000*l.* The contractors for the work were Messrs. E. & A. Storey, the engineer being Mr. Harry W. Taylor.

FOOTBRIDGE, COPLEY.—An iron footbridge, erected by the Halifax Corporation over the river Calder, at a cost—inclusive of land for the necessary approaches—of 800*l.*, was opened on the 17th inst. Messrs. Graham, Morton, & Co. supplied the ironwork, and the stonework was carried out by Messrs. Bower Brothers. The plans for the structure were drawn by Mr. J. Lord, the Borough Engineer.

FOREIGN.

FRANCE.—A monument to Gavarni was inaugurated a few days since. M. Henri Guillaume, the architect for the work, has utilised the basin of the old St. Georges Fountain, in the centre of which he has placed an octagonal granite pedestal which forms the base to a column carrying a marble bust of Gavarni. Humorous figures—his principal works are sculptured in bas-relief on the column, and bronze masks, disposed about the rim of the basin, pour water into it. The sculptural part of the work is by M. Denys Puech.—An exhibition of the works of M. Bartholomé, the sculptor of the "Monument aux Morts," has been opened at the Galerie d'Orléans, Rue Royale.—An "Exposition Internationale de peinture et Sculpture" has been opened at the Georges Petit Gallery, and will remain open to the end of the month. Among the exhibitors are MM. Carrier-Belleuse, Harnisson, Legorst-Gérard, Rochegrosse, A. Smith, Bernstanun, Puech, and Théodore Rivière.—A competition has been opened at Nancy for the erection of a Hotel for the offices of the Chamber of Commerce. A French committee has been formed to raise a monument to Sainte-Buve at Lausanne. It is to be carried out by a Swiss sculptor, M. Lugeon.—A competition is to be opened for the construction of a boulevard along the line of the shore at Hyères.—M. Albert Balu has recently discovered, in the course of his excavations at Timgad, some interesting remains of a Roman building which is supposed to have been a public library.—The municipality of Nancy have opened a competition for the laying out of a public park, with gateways and an iron grille, in the new quarter called Mont Desert.—A sum of a million francs has also been voted for the improvement of the market at Nancy.—M. Tournaire has been commissioned as architect for the enlargement of the Palais de Justice at Paris. The new buildings will include a tower at the angle of the Boulevard de Palais and the Quai d'Orléans, but lower and more massive than that at the opposite corner of the Boulevard.—M. Nestor Alans, member of the Société Centrale des Architectes, has died, at the age of seventy-five, at Montpellier. He was a pupil of Lebas and of Lazard, and contributed largely to the various improvements at Montpellier, especially those in the neighbourhood of Halle Castellane.—The death is announced, at the age of eighty-three, of the painter Giacomelli, celebrated for his illustrations of birds. He was the artist for almost all the standard works on birds, such as Mibellet's "L'Oiseau," André Theuriot's "Nos Oiseaux," etc. His last work was the illustration of the "Merle Blanc" of Alfred de Musset.—The death is announced also of M. Denys Darcy, architect to the cathedral of Saint Denis and to the diocesan buildings of Rheims and Evreux. He received a medal in the Salon of 1869, and gold medals in the Universal Exhibitions of 1873 and 1889.—M. Carolus Duran has been appointed Director of the Villa Medici. M. Duran was born at Lille in 1837; he was a pupil of Souchen, and received medals in the Salons of 1866, 1869, and 1870. He went through all the grades of the Legion of Honour, being named "Grand Officier" in 1900. He obtained the Medal of Honour in the Salon of 1879, and in the present year was elected a member of the Institut. The new appointment compels M. Carolus Duran to resign his position as President of the Société Nationale des Beaux-Arts (New Salon), but he has been specially requested to remain in office till the next Salon. When his resignation actually takes place, he will be succeeded by one of the four Vice-Presidents, MM. Roll, Bessard, Rodin, and Walther.—The Académie des Beaux-Arts has elected M. Knause, a German painter, Honorary and Corresponding member in the section of Painting.—M. Turin, architect, of Paris, has obtained the first prize in the competition for designs for

*The notes up to this point were postponed, for want of space, from a previous issue.

street booths (*barraques*) organised by the conductors of the *Exposition*.—A new bridge is to be built over the Marne, between Champigny and Saint-Maur-des-Fossés.—A large casino is to be built at Nantes, to include a hotel, baths, theatre, and circus.—The "Société des Architectes de Seine-et-Oise" has elected M. Albert Petit, of Versailles, as President for 1905.—MM. Jasson, Gutin, and Lautner have been commissioned architects for a proposed municipal theatre at Nancy, to be erected at a cost of two million francs.—The ancient church of Villy-sur-Avois (Côte d'or) has been classed among "Monuments Historiques."—It is proposed to build among the pine-forests of Arvachon, a "Lycée Climatique," conducted according to the most recent principles of hygiene.—The Conseil-Général of the Seine has opened a competition, for French painters, for the decoration of the new theatre of Fresnes; and M. Eugène has been chosen, by the same body, to carry out the decoration of the theatre of Romainville.—A decorative picture by M. François Flameng, symbolising Music, has just been fixed in position in the Hôtel de Ville at Paris.—M. Nénot has been re-elected President of the Société Centrale des Architectes for 1905.—The Académie des Beaux-Arts has elected Mr. Stanhope Forbes an Honorary and Corresponding member, in place of the late Mr. Watts.—There is talk of erecting at Paris an "Opéra Populaire" on a portion of the grounds of the old *Marché du Temple*. The auditorium will be planned in a fan shape, and capable of seating 4,000 persons. The building is to be entirely isolated, and carried out in incombustible materials, at an estimated cost of four million francs.—The Municipal Council of Paris has passed a vote to the effect that the old Hôtel de Rohan, which is of great artistic value, ought to be taken over and preserved by the State, after the removal of the *Imprimerie Nationale* by which it is at present occupied.—A new railway line is shortly to be opened between Paris, Bourges, and Montluçon, by way of Bourges, Pithiviers, Beaune-Roland, and Argent.—The jury in the competition for a new church at Coulommiers has awarded the first prize to M. Bruner, who will carry out the building.—The death is announced, at the age of sixty-seven, of the architect Arthur Froelicher, who carried out a number of private residences, more especially the châteaux of Mugue and of Roucellerie (Loiret), that of Rosendal at Dieppe, and numerous private hotels at Paris.—M. Detille has been elected President of the Académie des Beaux-Arts, in place of the late M. Pascal. M. Jacquet, the engraver, is Vice-President.—The Académie has given, as the subject of the next Achille Leclercq prize, "The Construction of a Belfry." The work has been commenced for restoring and improving the Place du Belfroy.—The large central balcony is to be replaced by a square in the centre of which is to be raised a statue of Beethoven, by M. Charnoy.—The death has been announced of M. Henri Schmit, architect of the Casino at Monte Carlo; also of M. Bouhon, Vice-President of the Société Nationale des Architectes.

GERMANY.—The new hospital at Munich, built by the architect Heilmann and Littmann under the direction of Herr Stempel, was opened on November 8.—The new theatre at Stuttgart is not to be erected on the site of the old one, which was burned down; three sites are now under consideration. The building is to cost about 5,500,000 francs.—The manager of the theatre at Dessau has made a repertoire of curtain which is said to combine the advantages of asbestos and iron, having the disadvantages of neither; the curtain is absolutely fireproof, having withstood a heat test of 1,500 deg.; old curtains can, it is stated, be remade in this manner.—A competition for designs for a town hall at Wilmersdorf, near Berlin, is to be held in April, 1905. The first premium offered is 8,000 marks, the second 5,000 marks, and there will be two third premiums of 3,000 marks each.—The synagogue at Düsseldorf, built from designs by Professor Josef Kleesattel, is completed; the building is intended to accommodate 1,300 people.—A new art gallery, called the "Heinemann" Gallery, has been built in Munich, after designs by Professor E. Seidl.—The Memorial Church at Speyer, designed by the architects Flügge and Nordmann, is completed; the building cost nearly two million marks.—The architects Reimer and Korte, are occupied with the designing of a building in Berlin for the Society of German Engineers.—The Commercial Schools at Cologne are to be built after plans by the architect Herr E. Vetterlein, and will cost 5,100,000 francs.—The Church of St. Stephen in Berlin, which was consecrated on December 4, is built in Early Gothic style from designs by the architect, Herr

Birckner.—A new hotel in "Pariser-Platz," Berlin, is being built from plans by Herr Gause; the building is to be in Italian Renaissance style.—The Town Council of Munich has offered premiums amounting to 12,000 marks for designs for exhibition buildings and grounds; the competition is to be open to all architects resident in Bavaria.—The new Law Courts at Hamburg are being built from plans by Messrs. Landt & Kallmorgen.—The two new Catholic churches at Löwen have been built from plans by Herr Ludwig Schneider.

AUSTRIA.—The architect Herr Karl Dübüll, director of the firm C. Bamberger, died at Vienna on November 15 in his fifty-ninth year.—The "Leo" Society will hold an exhibition of sacred art in the beginning of December in the Vienna Art Gallery.—The Austrian Museum at Vienna is being enlarged under the direction of Herr Baumann; the new buildings will consist chiefly of exhibition galleries, so that the older portions may be devoted to permanent collections.—Herr Arnold Heymann is the architect for a new theatre for Vienna, to be called the "Landstrasse" theatre.—A new theatre is to be built at Mahr to hold 800 people, at a cost of 400,000 kron.—The sculptor, Professor Edmund Hellmer, is executing a fountain in Hungarian marbles for the Vienna University; the artist has taken his idea from the legend of Castalia.—Herr Otto Kuhlmann has gained the first premium in the competition for designs for a Lutheran church at Chemnitz.

SWITZERLAND.—Herr Julius Stadler, the architect, died at Zurich on November 27, in his seventy-sixth year.—A Chemical Institute in connexion with the University is to be erected at Zurich, also new schools.—New technical schools are also to be built at Winterthur.—A new Almshouse is to be built at Einsiedeln, at a cost of 140,000 francs.

M. Edouard Guinand, is designing a series of workmen's cottages and gardens at Lausanne; each cottage is to be on a different plan.—In the competition for plans for schools at Vausson, near Neuchâtel, the following premiums have been awarded:—First premium (800 francs), MM. Prince & Béguin, of Neuchâtel; second premium (500 francs), Herr Ubaldo Grassi, of Châtel; third premium (300 francs), Herr Werner Lehmann, of Berne.

DRAINAGE OF SANTIAGO.—A despatch from Mr. Lowther, C.B., H.M. Minister at Santiago, states that, in reply to an advertisement published in May last, only two tenders were submitted for the proposed drainage works at Santiago. One was by a Chilean contractor for the sum of 1,186,400, and the other by a local firm, acting as agents for a French firm, for the sum of 1,350,000. Mr. Lowther adds that both tenders have been referred to a commission for examination, but it is generally believed that fresh proposals will be asked for under modified conditions.

CEMENT IN ITALY.—Mr. Consul-General Chapman reports to the British Foreign Office from Florence, Italy:—"No British cement is now imported here; Italian cement is commonly used. The best quality cements are obtained in this district at Fabriano, Chiarvalle, Senigallia, etc."

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—Messrs. Rottmann & Co., wall-paper manufacturers, of Garlick-hill, Victoria-street, have opened new West-end showrooms at 29, Mortimer-street, W.—Mr. Arthur R. Mayston, architect, has removed his offices from No. 7 to No. 11, Great James-street, Bedford-row, W.C.—Messrs. A. Ransome & Co., manufacturers of wood-working and saw-mill machinery, will remove their London offices on January 2 from their present address at Chelsea to 65, Queen Victoria-street, E.C.

SAVOY HOTEL, STRAND.—The associations of the site of the hotel with the earlier history of the palace and precincts of the Savoy are commemorated by a statue, designed and executed in gilded bronze by Mr. Lynn Jenkins, which has just been erected on the bridge at the entrance into the courtyard of the Strand. The figure, which is of the heroic size, clad in mail, with shield and lance, represents Peter, the uncle of Henry III.'s consort, Eleanor, whom the king created Earl of Richmond and Savoy, giving him the land by the riverside whereon the Earl built himself a palace in 1245. Peter gave his property there to the Prior and Brethren of Mountjoy (de Monte Jovis), near Havering-at-Bowen, in Essex. The property was sold to Queen Eleanor, who bestowed it upon her son, Edmund Crouchback, Earl of Lancaster, in 1284. The manor passed to Blanche, daughter and co-heir of

Henry, Duke of Lancaster, who married John of Gaunt, and was then vested, as the Duchy of Lancaster, in the King and his successors on the throne. We observe that considerable pains have been taken to record, with inscribed bronze tablets affixed to various portions of the new structure, the positions of the older buildings which possess but no little interest from the historical and topographical points of view. That example might well be followed in similar cases; the tablets, besides being of value to the present generation, would often be the means of preventing perplexity and controversy hereafter.

BRITISH FIRE PREVENTION COMMITTEE.—No. 39 of the publications of the British Fire Prevention Committee contains nine tests of a lamp, for safety if overturned. The lamp is called the "Petrolite lamp" and is an apparatus in which the air is automatically and continuously carburetted by being made to pass in a downward direction through a receptacle charged with absorbent non-combustible material, saturated with light hydrocarbon (petroleum spirit), such receptacle being immediately below the burner, and the carburetted air being raised through a tube direct to the burner from the absorbent material by the heat of combustion in the chimney or funnel. The draught is started by applying a lighted match through an opening at the bottom of the chimney, or by inserting a lighted taper downwards in the chimney from the top, and the carburetted air thus drawn up will immediately ignite. The regulation of the lamp is carried out by the simple arrangement of turning one lever only, which simultaneously controls the air inlet to the carburettor, the carburetted air exists from the carburettor to the burner tube, and the air supply to the latter. The tests made, which, of course, were of a different character from those usually made on the Committee's premises, appear to have had very satisfactory results. The lamp was overturned several times in two of the tests, falling on the floor among shavings and other easily combustible materials, but in each case went out without igniting anything.

SURREY VAPORVILLE THEATRE, BLACKFRIARS-ROAD.—Several improvements have been carried out, at a cost of about 6,000, for the owner, Mr. de la Pole Temple-West, by Messrs. Kirk & Kirk, of Westminster. Mr. Temple-West has converted the old Surrey Theatre into a music-hall; all the pit floor has been relaid, two new stage boxes have been built, the stage is relaid with pitch-pine, and the grand circle tier is fitted with tip-up seats. The decoration scheme is in gold, cream, and light pink; electric light and hot-water radiators are installed. As the venture is of a somewhat novel kind, we may mention that the prices of admission range from 2d. in the gallery, which is one of the best in London, to 2s. for a chair in the private box. The theatre has belonged to the West family during more than a hundred years past, having been first built in 1782, as "The Royal Circus and Equestrian Philharmonic Academy," for Charles Dibdin and Charles Hughes, the circus-rider, in rivalry of Astley's Royal Amphitheatre in Lambeth. After a fire on August 11, 1805, the Royal Circus was rebuilt, from plans and designs by Cabanel the younger, as the Surrey Theatre, and the house has suffered greatly from fire on two occasions since.

AUSTRALIAN FORESTRY.—The importance of forest conservation is beginning to receive increased attention in the Commonwealth, where the revenue from the various State forest lands remains considerably below that obtained in countries possessing far less forests, contrary to the popular idea in Europe and America, extend over almost the whole area of the State, excepting portions of the Monaro, Lachlan, Murrumbidgee districts, and the trans-Darling region, where extensive treeless plains occur, clothed with salt-bush, scrub, or species of natural grasses. There are at the present time nearly six and a half million acres of forest reserves in the State. In South Australia there are nearly 200,000 acres of forest reserves and plantations; in Queensland, where forest conservation is of recent date, the reserved areas form a total of over 3,000,000 acres; in Victoria the forest reserves cover a total area of 4,679,540 acres out of 11,797,000 acres of forest country, the balance being mostly timber country difficult of access; in Western Australia a beginning has been made by establishing forest reserves, forming a total of over a million acres out of an estimated total of 20,000,000 acres; while in Tasmania about 53,300 acres have been reserved for timber planting and growing. The total area of forest land in the latter State is about 4,000,000 acres, and it has been estimated that

the forest lands of the Commonwealth cover an area of over 50,000,000 acres. The trees met with are chiefly species of eucalyptus, Myrtaceae. The prevalence of the eucalypti, and the large extent covered by the forests, give the country a rather monotonous aspect; but the park-like appearance of the open forests, and the beauty of the many flowering shrubs, win admiration in spite of the sameness of the trees; while even the dull, greyish blue of the foliage of the gum trees, when relieved by the yellow blossoms of the wattle, including the graceful myall, or the beautiful and shapely kurrajong, is not without its attractiveness.

MALDEN BATH IMPROVEMENT BILL.—The Urban District Council of Malden Bath are promoting in the next session of Parliament a Bill dealing with a large number of matters relating to the improvement of the town. Amongst other matters they ask for powers to acquire lands and erect a pump-room for utilising the thermal waters of the Grotto spring, known as the Royal Well, and in connexion therewith to erect baths, pavilions, conservatories, waiting, refreshment, and reading rooms, and museum. They also seek to enlarge the recreation grounds, and improve the existing walks along the bank of the river Derwent, and to erect pavilions for concerts, etc., in the recreation grounds. The Bill also gives the District Council further powers with respect to the regulation of buildings, sewers, and sanitary matters.

LONDON SQUARES AND ENCLOSURES (PRESERVATION) BILL.—The London County Council have now deposited their printed Bill in the Private Bill Office of the House of Commons for the purpose of prohibiting the erection of buildings and structures on squares and enclosures, which in the preamble they state are necessary for recreation and the air spaces afforded by the lands are of great benefit to the health and well being of the inhabitants of the county. The Bill exempts all the scheduled land from assessment and rating on the basis of site value, and provides for the Council and the owners of such lands entering into agreements for their maintenance. Altogether 451 such spaces are scheduled, including the following well-known spots:—Clifford's in-gardens, Temple-gardens, Belgrave-square, Berkeley-square, Dean's-yard, Eaton-square, Eccleston-square, Grosvenor-square, Hanover-square, Whitehall-gardens, St. James'-square, Knightsbridge-green, Soho-square, Vincent-square, Prince's-garden, Belgrave-street, New Court, Cadogan-place, Cadogan-square, Carlyle-square, Han's-place, Cheyne-gardens, Burton-court, Sloane-square, Finsbury-square, Charterhouse-square, Bedford-square, Bloomsbury-square, Russell-square, Queen's-square, Gray's-inn Gardens, Lincoln's-inn-fields, Islington-green, Cromwell-gardens, Onslow-crescent, The Boltons, Harrington-gardens, Hyde Park-gate, Sussex-gardens, Westbourne-terrace, Lancaster-gate, Hyde Park-square, Paddington-green, Portman-square, etc.

ST. PAUL'S CHAPEL, GREAT PORTLAND STREET.—A Bill has been deposited in the Private Bill Office of the House of Commons which provides for the demolition of St. Paul's Chapel, Great Portland-street, which was built under an Act of Parliament, passed in the first year of the reign of William IV. The site is to be sold, and the stained-glass windows, organ, bells, tablets, monuments, and all other ornamental fittings and furniture disposed of by the Ecclesiastical Commissioners as they, with the consent of the Bishop of London, may determine.

ARCHITECTURAL WORK OF MUNICIPAL AUTHORITIES.—The Borough Councils of Paddington, Brompton, and Stoke Newington have decided to take no action in respect to a memorial from the Royal Institute of British Architects urging upon local governing authorities that architectural work be not placed in the hands of engineers and surveyors, and that, where the employment of a county or municipal official is deemed necessary, such official shall be required to have passed the qualifying examinations of the Royal Institute of British Architects.

TECHNICAL INSTRUCTION IN MALTA.—In his annual report on the affairs of Malta the Lieut.-Governor states that a technical and manual school, in which drawing, modelling in clay, plaster-casting, stucco-work, and wood-carving are taught, has been in existence for some years. The attendance is voluntary, and no fees are paid, and as the results obtained hardly justify the expenditure involved it has been decided to close the school as soon as some work which it has undertaken for a private individual is completed, and to develop the technical education which is given in the elementary schools.

CANTERBURY CATHEDRAL.—On December 18 the Archbishop of Canterbury unveiled the west window which has been set up in the

Chapter House in memory of the late Dean Farrar, who, as Dean in 1895-1903, raised a sum of nearly 20,000*l.* for the reparation of the cathedral. The window, which illustrates events in the lives of past benefactors of the church, from the days of Augustine and Queen Bertha, was designed and executed by Mr. A. O. Hemming, of London, who was also the artist of the east window, presented by the Freemasons of Kent; and carried out the scheme for redecoration of the Chapter House.

BUILDING BY-LAWS.—At Lewes Petty Sessions, on Tuesday, at the conclusion of the ordinary business, Mr. W. W. Grantham made an application in connexion with the finding of the magistrates in the proceedings instituted by the Chichester Rural District Council against Mr. Justice Grantham for an alleged infringement of their building by-laws. Mr. Grantham, on behalf of Sir William Grantham, said he was instructed to apply to the Court for a copy of all the depositions, by-laws, and plans that were produced either in Court or before the magistrates during their deliberations, or for an inspection of the same. An inspection might simplify matters and save the expense of copies. The defendant had instructed him to say, in reference to the findings of the Bench, that he proposed to apply to the Court of King's Bench for a *certiorari* to send up all the proceedings to the High Court to be quashed on many grounds, and, if necessary, the defendant would apply for a *mandamus* to be presented to the magistrates of the Lewes Bench to dismiss the informations on the findings of the Bench. Mr. Patrick, the Clerk to the Chichester Council, said the plans, by-laws, and correspondence had already been furnished in full to the defendant's representatives, and the magistrates' clerk's notes only remained. That could be very well left to the Bench. The District Council raised no objection, it being part of their policy to let the defendant's representatives have every possible information. The magistrates and their clerk consulted in private, after which Mr. Kemp said they felt unable to grant the application.

NEWCASTLE, ETC., BUILDING TRADE EMPLOYERS' ASSOCIATION.—The annual dinner of the Newcastle, Gateshead, and Tyne District of the Building Trade Employers' Association was held on the 20th inst. at the County Hotel, Newcastle. The chair was occupied by the President (Mr. W. T. Weir, of Howden). After the loyal toasts, Mr. S. Easton gave "The Mayors and Corporations of Newcastle, Gateshead, and Tyneside." Mr. Edge, City Engineer, responded on behalf of the Newcastle Corporation, and the Mayor of Gateshead also responded. Mr. T. Wilkinson, President of the Northern Counties' Federation of Building Trade Employers, proposed "The Newcastle, Gateshead, and Tyne District Branch of the Northern Counties' Federation of Building Trade Employers." He said Newcastle was one of the most important parts of their Federation, and they looked to that district for light and leading in connexion with all matters in the building trade. They had been organising the building trade in connexion with this Federation movement for six or seven years, and they had had a large measure of success, to which the Newcastle district had largely contributed. Not only did they deal with questions affecting the workmen, but they had come to a better understanding with the architects and surveyors under whom they worked. Ordinary people could not perhaps understand that the builders' business was not directly done with the clients themselves, but through a third party. So he was glad to say that their Federation had managed to bring about an agreement which would protect the rights of the builders, the architect, and the clients. The Chairman (Mr. W. T. Weir) responded. He said in Newcastle they had an association that made itself felt in their midst, and was unanimous in action. During the year their work had largely been of a routine character, but it had been none the less valuable. One of the things they had been aiming at was to ensure that their apprentice bricklayers should learn in classes the practical manner of laying bricks. That object, he hoped, would be attained before another winter had passed. Another thing they hoped to see established was an association of foremen and clerks of works. Most of the foremen were in the men's associations, and he was certain that once they formed an association of their own, it would tend largely to assist architects and engineers in the carrying out of their designs. He went on to refer to the valuable evidence which had been given by representatives of the National Federation on the Royal Commission on trade picketing, which, he hoped, would tend to good all round. Mr. D. R. Brims gave "The Architects and Surveyors."

Mr. Frank Caws responded on behalf of the architects. He thought the improvement in the relations between builder and architect was largely due to the surveyors. There was now much less room for azzard style of doing things than under the old haphazard style of doing things. They ought certainly to be grateful to the quantity surveyors for the excellent work they did. It certainly tended to narrow the ground of difference, and to promote a better feeling between architects and builders and to make settlements much more easy and more just to all concerned. Mr. J. P. Allan replied on behalf of the surveyors. Mr. J. Bewley gave "The Allied Trades," which was responded to by the Sheriff of Newcastle.

WEIGHTS AND MEASURES.—In our number of October 31, 1903, we published an illustration of the official shape, as prescribed by an Order in Council, of the new standard weight of 50 lb, or "half-cental." That denomination was adopted in response to representations made by the Liverpool Incorporated Chamber of Commerce, the Mersey Dock and Harbour Board, and some local authorities. A recent Order in Council, fixing a fee of 3*d.* for the verification and stamping of weights of 50 lb, is appended to a report which has just been issued by the Board of Trade of proceedings of the Standards Department. The report sets forth that local authorities have generally adopted an official regulation authorising inspectors to verify and stamp the new weight, and that the Board have now reverified the standard measures of a chain of 100 links, or 66 ft. and 100 ft. respectively, laid down in 1851 at the National Gallery, Edinburgh, for use in testing measures employed in Scotland for the measurement of land, as also the end gauges at the National Physical Laboratory, and several weights and gauges used at the Royal Mint, Bank of England, Sheffield Assay Office, Goldsmiths' Hall, etc. During the past year eighty-five candidates obtained, upon examination, certificates of qualification, under the Act of 1833, as local inspectors of weights and measures.

CAPITAL AND LABOUR.

YORKSHIRE BUILDING TRADE.—In the new year representatives of the Leeds master builders and operatives will meet to consider the question of winter working hours. At Sheffield the employers have obtained a concession, the arrangement being that during the shortest time of winter employment the men will breakfast before commencing work, and will work from 8 a.m. to 4.30 p.m., with half an hour for dinner. The Leeds, Huddersfield, and York masters desire similar conditions to those in Sheffield. The basis of negotiations in Leeds will be a notice, served by the employers, upon the joiners and carpenters, and masons and bricklayers.

Legal.

CITY CHURCHES ARBITRATION.

The case of the City and South London Railway Company v. the Rector and Churchwardens of the united parishes of St. Mary Woolnoth and St. Mary Woolchurch Haw and the Ecclesiastical Commissioners of England came before the House of Lords, composed of the Lord Chancery and Lords Macnaghten, Lindley, and Robertson, on the 14th inst., on the appeal of the Company from a judgment of the late Mr. Justice Wright as to the basis upon which compensation by the Company was to be paid on certain findings of the arbitrator. In 1893 the Company obtained an Act empowering them to purchase (for their undertaking) the site upon which the Church of St. Mary Woolnoth stands, and in March, 1896, they served notice to treat upon the rector and churchwardens for the purchase of the church and adjoining lands. The same year they deposited a Bill for an extension of time to construct the railway. The Bill was passed with the insertion of clauses designed to preserve the fabric of the church. By the terms of the Act the amount of purchase-money or compensation to be paid by the Company for the portion of so much of the surface as was not occupied by the church as should be occupied by them, and for the subsoil and crypt, and for the temporary occupation of the church, and all other matters of difference, were to be determined by arbitration. In 1900 Mr. R. Wigners was appointed arbitrator, and the most important questions he left for the Court were whether the compensation payable by the Company was to be assessed (1) upon the basis that all the lands taken were the site of the Church of St. Mary Woolnoth, and that the same could

never be used for any other purpose; or (2) upon the basis that, although the lands were at present *extra commercium*, they might, by Act of Parliament at some future time, become available for building, and that the arbitrator might draw his own conclusion as to when that time, if ever, would be likely to arrive; or (3) upon the basis that the site of the church and the rest of the land could immediately be made available for buildings other than a church. On basis (1) the sum payable was assessed at 90,628*l.*, on basis (2) at 135,421*l.*, and on basis (3) at 145,548*l.* Mr. Justice Wright decided that basis (2) was the true basis, and that decision was affirmed by the Court of Appeal. Hence the present appeal of the Company.

At the conclusion of the arguments of counsel the Lord Chancellor, in moving that the appeal should be dismissed, said he agreed with the judgment given in the Courts below. He thought the view taken by Mr. Justice Wright, that the true basis of compensation was that stated in finding (2) of the award, was correct. The other noble and learned lords having concurred, the appeal was accordingly dismissed, with costs.

SANITARY DEFECTS IN TENEMENTS.

At Southwark Police Court recently, the National Model Dwellings Company, the owners of Queen's-buildings, Borough, were summoned before Mr. Cecil Chapman by the Southwark Borough Council for having failed to comply with notices requiring them to remedy certain sanitary defects in seven tenements. Mr. Corrie Grant appeared for the Borough Council, which was also represented by Canon Horsley, the Chairman of the Public Health Committee. Mr. B. L. Wyles, the general manager, appeared for the Company. Mr. Corrie Grant said that, during the eleven months ended December 3, the Borough Council had served 416 intimation notices on the Company requiring sanitary work to be done, and 320 only had been complied with. Queen's-buildings comprised over 600 tenements, with a population of about 5,000, and the Company kept one plumber only to do all the work. The notices were not complied with until weeks had expired, and generally the work was not begun until summonses were issued, as happened in the present case. The Borough Council had prosecuted the Company again and again, and they now asked the magistrate to impose such a penalty as to make it worth the while of the Company to do their duty by putting matters right, "as soon as their attention was called to them." Mr. Wyles said that the Company were overloaded with notices, and were complying with them as rapidly as possible. Their staff on the premises numbered twenty-four, and included three plumbers. Evidence was given by Mr. Long, chief sanitary inspector, and Miss Elliott, sanitary inspector, that, in the present instances, the first notices were served in September or the early part of October, and the work was not done until December. In some instances the sanitary defects were very serious. Mr. Cecil Chapman said that several times their defaults had been brought to his notice, and he had brought pressure on himself to be lenient to them, because they were dealing with property partly on philanthropic ground, not intending to make large profits. But it seemed outrageous to continue that leniency when it was proved that some kind of checkering policy led to positive neglect and danger to the sanitary condition of these tenements. The evidence disclosed gross neglect, and they would be fined the maximum penalty—10*l.* on each of the seven summonses—70*l.*, and 5*l.* 17*s.* costs.—*Times*.

PATENTS OF THE WEEK.
APPLICATIONS PUBLISHED.*

1,579 of 1904.—J. P. O'DONNELL (O. M. Edwards): *Windows*.
A window consisting in the combination of a sash, means for holding the sash in the closed position, and automatic operating means mounted adjacent to and at one side of the plane of movement of the sash in opening and closing the window and connected with the sash, whereby a portion of the sash is enabled to pass by and beyond such means as the window is opened.

1,584 of 1904.—F. HINES, LTD., and F. W. FREEMAN: *Chimney-Pots*.
A chimney-pot comprising a pot having a cam shaped projection formed therein, and a base having a corresponding cam-shaped projection formed therein, the cam on the chimney-pot

being adapted to be placed in the cam in the base, and turned in relation thereto so as to slide thereon, and with or without a wedge disposed between the steps of said cams, whereby the cams are forced or jammed together to form a tight joint and hold the chimney-pot securely in position.

2,174 of 1904.—J. ARADI: *Dismountable Buildings*.
Dismountable buildings whose wall units are composed of a wooden frame coated with artificial stone, consisting in the use in combination with the said wooden frame of a covering of perforated sheet metal to serve as a foundation for the latter of artificial stone.

2,310 of 1904.—G. ALLAN: *Pipe Joints*.
Joining pipes by forming flanges on same, having angled surfaces, and compressing the flanges together by an annular cap or coupling ring, in two or more parts having an inner V-shaped groove, acting on the angled surfaces as the parts are drawn together by bolts and nuts.

6,665 of 1904.—W. W. BANNISTER, and W. J. MANNING: *A Screen for Sifting Gravel and the like*.
The screen is made of triangle section steel blades, which are held in position at suitable distances by triangle-shaped compression clips. The size of mesh is formed, and the triangle-shaped blades are secured by collars fitted on screwed rods, which pass through the ears of compression clips and are held together by nuts on outside of screen frame. The screen frame can be made of wood or metal.

13,824 of 1904.—J. ANDERSON: *Sash Fasteners*.
A sash lock consisting in the combination with a casting having a bolt guide way, and a drum receiving chamber, of a bolt in the guide way, a rotary drum in the chamber, means for rotating the drum, a pin on the bolt, and an inclined groove in the drum into which the pin enters.

16,438 of 1904.—H. E. KENNY: *Window Frames and Metal Weather Strips therefor*.
This consists in the combination with a window frame having a run-way thereon, and a sliding sash, of a series of rubbing projections in the base of the run-way against which the edge of the sash is adapted to engage, whereby the frictional contact between the sash and frame is reduced.

27,241 of 1903.—J. R. LITTLE: *Fireproof Floors, Roofs, and like Structures*.
Fireproof floors and roofs constructed of hollow tubes or blocks placed side by side, and having the joints made water-tight and the end tubes closed to form water conduits or reservoirs.

23,067 of 1904.—H. H. LAKE (C. H. Caspar): *A System of Ventilation*.
A system of ventilation for a building having a series of compartments or rooms, characterised by pipes leading up through the several rooms and provided with suitable inlets in the several rooms, an air space above the rooms, an exhauster arranged to withdraw the air from the room pipes and deliver it into the air space, and an auxiliary chamber in communication with the air space.

23,189 of 1904.—EISENBAHN-SIGNAL-BATANSTALT MAX JUDER & CO. (Aktiengesellschaft): *Devices for Measuring the Deflections of Girders or Rails*.
A device for measuring the deflections of rails or girders, comprising two or more superimposed rows of balls or rollers covered by a movable body, which balls or rollers are pushed apart by the pressure on a covering member by reason of the bending of the girder or rail, and thus cause an extension or prolongation of the row of balls or rollers which may be measured or recorded in any suitable manner.

23,282 of 1904.—F. G. S. HAM: *Ventilating Manhole Covers of Sewers and Drains*.
This consists in the employment of a closing tray in connexion with manhole covers of sewers and drains, said closing tray having a sunken channel or trough for receiving an annular lip on the underside of the manhole cover, to which the tray can be attached or connected by inserting projections thereon into slots in the cover and locking same by a turning movement.

TERMS OF SUBSCRIPTION.

"THE BUILDER" (Published Weekly) is supplied DIRECT from the Office to residents in any part of the United Kingdom at the rate of 10*s.* per annum (10 numbers) PER ANNUM. To all parts of Europe, America, Australia, New Zealand, India, China, Japan, &c., 2*s.* per annum. Send orders to THE BUILDER, 25 Abchurch-lane, London, E.C. 4. Orders should be addressed to the Publisher of "THE BUILDER," Catherine-street, W.C.

SUBSCRIBERS IN LONDON and the SUBURBS, by prepaying at the Publishing Office 1*s.* per annum (52 numbers) and 4*s.* 9*d.* per quarter (13 numbers), can ensure receiving "The Builder" by Friday Morning's Post.

SATURDAY, JANUARY 7.

Junior Institution of Engineers.—Visit to the Voelker Incandescent Lamp Company's Factory, Albert Works, South-street, Wandsworth. 2.30 p.m.	
The Incorporated British Institute of Certified Carpenters (Carpenters' Hall).—Mr. J. D. Maners on "A Visit to Chatham Naval Hospital." 6 p.m.	

TO CORRESPONDENTS.

NOTE.—The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications, and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples, sent to or left at this office, unless he has specially asked for them.

Letters or communications (beyond mere news items) which have been duplicated for other journals are NOT DESIRED.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

We are compelled to decline pointing out books and giving addresses.

Any commission to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

All communications regarding literary and artistic matters should be addressed to THE EDITOR, who replies to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

COMPETITIONS, CONTRACTS, AND PUBLIC APPOINTMENTS.
