Page body (to be Inreduced):

KEPLER

Attempts to reduce the apparent motions of celestial objects to geometrical laws. Some of the Pythagoreans, if not Pythagoras himself, held that the earth is a sphere, and that the apparent daily revolution of the sun and stars is really due to a motion of the earth, though at first this motion of the earth was not supposed to be one of rotation about an axis. These notions, and also that the planets on the whole move round from west to east with reference to the stars, were made known to a larger circle through the writings of Plato. To Plato moreover is attributed the challenge to astronomers to represent all the motions of the heavenly bodies by uniformly described circles, a challenge generally held responsible for a vast amount of wasted effort, and the postponement, for many centuries, of real progress. Eudoxus of Cnidus, endeavouring to account for the fact that the planets, during every apparent revolution round the earth, come to rest twice, and in the shorter interval between these "stationary points," move in the opposite direction, found that he could represent the phenomena fairly well by a system of concentric spheres, each rotating with its own velocity, and carrying its own particular planet round its own equator, the outermost sphere carrying the fixed stars. It was necessary to assume that the axes about which the various spheres revolved should have circular motions also, and gradually an increased number of spheres was evolved, the total number required by Aristotle reaching fifty-five. It may be regarded as counting in Aristotle's favour that he did consider the earth to be a sphere and not a flat disc, but he seems to have thought that the mathematical spheres of Eudoxus had a real solid existence, and that not only meteors, shooting stars and aurora, but also comets and the milky way belong to the atmosphere. His really great service to science in collating and criticizing all that was known of natural science would have been greater if so

Editing Page:Kepler(1920).djvu/12

The screenshot shows a web-based proofreading interface for a historical text. At the top, there's a toolbar with icons for bold, italic, underline, font size, and other document functions, followed by links for OCR, Advanced, Special characters, Help, and Proofread tools. Below the toolbar, a header bar includes 'Header (incomplete)', a page number '(1r) 6 [KEPLER]', and a 'Footer (incomplete)' section.

The main content area displays a page from 'Kepler' with several red underlined sections of text. A vertical red bar on the left indicates where the text has been modified or reviewed. The right side of the page contains a large block of text in a light blue background, which is a transcription of the original Latin text.

- Custom interface for Page: pages

The screenshot shows a comparison between the original page content and the rendered output. The original page content is on the left, and the rendered output is on the right. The rendered output shows the corrected spelling of "CHAMPOLLION ENFANT" and the accurate punctuation of the text.

This page has been validated

I
CHAMPOLLION ENFANT

Le génial savant qui, par une divinatrice intuition, découvrit, au commencement de ce siècle, la clé perdue de l'écriture égyptienne, déchirant soudain les voiles d'une histoire mystérieuse, exhument des entrailles du passé toute une science nouvelle, laquelle dépassa presque aussitôt les balbutiants essais, et atteint déjà de notre temps sa maturité pleine, Jean-François Champollion, l'une des gloires les plus pures et les plus universellement reconnues de notre panthéon national, n'est inconnu d'aucun Français. Les annales scientifiques ont salué sa courte vie de quarante-deux ans, et son œuvre prodigieuse. S'il restait encore, dans ses admirables travaux quelque mérite à célébrer, ce serait aux initiés, professionnels de l'Egyptologie, qu'il appartiendrait de compléter son panthégyrique.

There are no references on this page to include in this list.
