2299

4479

Family Amoxeudidae

Body oblong to elongate or very slender. Head large to moderate. Eye in posterior half of head. Mouth cleft very large. Lower jaw large. Jaws with enlarged teeth, not barbed. Premaxillary and maxillary slender. Gill opening large. Gills 4. Pseudobranchiae well developed. No air vessel. Stomach very distensible. Supraclavicle and postclaviele form long rod from occiput each side downward to abdomen, partly free, not covered by skin. Body and head naked. Dorsal short, advanced to premedian with age. Adipose

fin present. Anal postmedian -
Caudal forked. Pectoral long with
age. Ventral premedian.

Genus Amoxudis Günther

Amoxudis Günther, Rep. Voy. Challenger, vol. 22, 1887, p. 201. Type Amoxudis Lowii Günther, monotypic.

Benthalbella Zugmayer, Bull. Inst. Océanogr. Monaco, No. 193, 1911, p. 14. Type Benthalbella infans Zugmayer, monotypic.

Body compressed, very slender, with long tapering tail with age. Head pointed. Snout rather long, conic. Eye large, in posterior half of head. Mouth with mandible protruding. Row of single teeth in upper jaw and somewhat larger row in mandible. Palate

toothless. Tongue with 8 strong teeth. Gill rakers very strong. Branchiostegals 6? to 8. Body scaleless. Dorsal

fremedian, small. Long low adipose fin median with age. Anal long, low.

Pectoral long, inserted in lower half of body depth. Ventral rather long, inserted before dorsal.

Genus Benthalbella Zugmayer

Benthalbella Zugmayer, Bull. Inst. Océanogr. Monaco, no. 193, 1911, f. 14.

Type Benthalbella infans Zugmayer.

Amoxudis lowii Günther

Amoxudis lowii Günther, Rep. Voy. Challenger, vol. 22, 1887, p. 201, pl. 51, figs. c–c'. Philippine Islands, N. Lat. 4° 33' E. Long. 127° 6', in 500 fathoms. — Goode and Bean, Oceanic Ichth., 1895, p. 122, pl. 40, fig. 150 (compiled). — Fowler, Proc. Acad. Nat. Sci. Philadelphia, 1901, p. 212 (compiled).

4488

depth 4 2/5; head 3, width 3 1/4. Snout 3 in head from upper jaw tip; eye 3 2/5, 1 1/8 in snout, greater than interorbital; maxillary extends half eye diameter behind eye, length equals head from snout

tip; upper teeth with 2 short curved ones in front each side then much smaller close set uniserial jaw teeth; 2 pairs of long depressible upper canines, front pair longer; lower jaw teeth larger, especially posteriorly, than maxillary, and canine still larger and depressible anterior each side; interorbital 4 1/2, low, concave. Gill rakers ar few wide set feeble points; gill filaments 1 1/2 in eye.

No scales.

D. $\frac{I}{II}$, 7, rays feeble, broken, fin base about long as snout;

A. I, 10, ?, rays very feeble, short, broken, fin base slightly longer than snout; caudal damaged, small; least depth of caudal peduncle 5 4/5 in total head length; pectoral 2 3/4 ?; ventral 2 3/4 in eye.

Brown, paler below. Iris neutral gray. Fins all whitish.

43856 U. S. N. M. N. 28° 47' 30" W. 87° 27'.
Albatross Station 2392. 1885.

Length 61 mm.

Caulopus Gill, Proc. Acad. Nat. Sci. Philadelphia, 1862, p. 128. Type Alepisaurus altivelis Poey, designated by Jordan and Gilbert, Bull. U. S. Nat. Mus., No. 17, 1882, p. 276.

Body compressed. Head attenuate, compressed. Snout conic. Eye moderate or large. Maxillary without supplemental bone. Series of small teeth entire length of premaxillary, anterior sometimes larger or curved. Palatine teeth compressed, triangular, pointed, several anterior very long fangs, others moderate. Mandibular teeth like palatine, 1 anterior and 2 or 3 median pairs

4492

2304

Family Alepisauridae

Body greatly elongated, tapering back. Head rather large. Snout produced, long. Mouth cleft wide. Premaxillaries very long, slender, not protractile, form entire upper jaw edge. Maxillary thin, long, immovable. Teeth variable, erect. Opercles thin, membranaceous. No barbel. Gill openings very wide. Pseudobranchiae large. Branchiostegals 5 to 7. No air vessel. Vertebrae 51. Abdominal ribs extend symmetrically whole length of abdomen before anal fin. Body scaleless. No photophores. Dorsal very long, extends nearly whole

length of back. Adipose fin present. Anal moderate. Caudal widely forked. Ventral abdominal.

Widely distributed in temperate and tropical seas. Fishes of large size and formidable dentition. The Cretaceous Apateodus, known from remains of the skull, appears related.

4494

Analysis of genera

a.' Skull moderately long; palatine teeth 3 or 4 large canines erect or directed back; jaws rather deep.

Alepisaurus.

a.'' Skull greatly elongate; palatine teeth 5 or 6 large canines directed forward; jaws very slender.

Eugnathosaurus.

Genus Alepisaurus Lowe

Alepisaurus Lowe, Proc. Zool. Soc. London, vol. 1, 1833, p. 104. Type Alepisaurus ferox Lowe, monotypic.

Alepidosaurus Günther, Cat. Fishes Brit. Mus., vol. 5, 1864, p. 420. Type Alepisaurus ferox Lowe. Emendation.

Plagyodontis (Stetler) Pallas, Zool. Ross. Asiat., vol. 3, 1811, p. 383. Atypic. Type Alepisaurus asculapius Bean, designated by Jordan and Evermann, Genera of Fishes, pt. 1, 1917, p. 84. Inadmissible.

Plagyodum Pallas, Zool. Ross. Asiat., vol. 3, 1811, p. 383. Atypic. Type Alepisaurus asculapius Bean.

much enlarged. Tongue toothless. Gill rakers short, spine like. Gill membranes not united, free from isthmus. Dorsal rays more than 40, slender, simple, all depressible in deep groove, fin invisible when depressed. Adipose fin moderate. Ventral nearly median, rays 9 to 13, first simple and spine like.

Analysis of species.

a.' Alepisaurus. Ventral small, rays 8 to 10. ferox.

b.' Aulopus. Ventral rather long, rays 13. altivelis.

4497

Depth 9 1/5 to 10 1/2; head 5 2/5 to 5 3/5, width 3 1/5 to 4 1/8. Snout 2 1/4 to 3 1/8 in head from snout tip; eye 4 to 6 1/4, 1 1/5 to 2 7/8 in snout, greater than interorbital in young to equal to front of interorbital with age, adipose lids only narrow border or marginal; maxillary extends 1/2 to 4/5 eye diameters behind eye, length 1 2/5 to 1 1/2 in head from snout tip; upper jaw teeth very small, uniserial in outer row and inner row of large strongly compressed teeth, first 4

anterior largest and others gradually smaller; lower teeth much larger and broader posteriorly in jaws, 2 canines each side in front and 3 larger ones just before middle; interorbital 5 4/5 to 6 1/2, nearly level; opercle, subopercle and side of mandible basally with strong radiating striae. Gill rakers 5 or 6 + 13 to 20, short points, 1 2/3 in gill filaments which 1 3/4 in eye.

Lateral line median or axial along side.

4505

D. 39; A. 15 to 17; adipose fin 3 1/4 to 4; caudal long as head in young to much greater with age, deeply forked, with broad lobes; least depth of caudal peduncle 7 to 8; pectoral equals head or longer; ventral 1 3/4 to 3 1/8, front edge of spine finely granular.

Dark brown, burnished with silvery white on sides of head. Dorsal with blackish membrane. Adipose fin dark brown. Anal and caudal brown. Pectoral blackish. Ventral dark gray, silvery white basally.

Genus Eugnathosaurus Regan

Eugnathosaurus Regan, Rep. Sci. Res. Voy. Scotia, vol. 4, Zool., pt. 15, May 23, 1913, p. 216. Type Eugnathosaurus vorax Regan, monotypic.

Skull very elongate, strongly compressed, upper surface somewhat convex, with fairly prominent median ridge. Snout and lower jaw much extended, each ending in fleshy appendage. Lower jaw projects beyond upper, suspensorium directed obliquely forward. Teeth pointed, uniserial; premaxillary teeth minute;

mandibulary teeth sub-conical, erect or somewhat retrorse, strongest in middle of length of jaw, more spaced posteriorly; palatine teeth strong, compressed, curved somewhat forward.

Eugnathosaurus vorax Regan

Eugnathosaurus vorax Regan, Rep. Sci. Res. Voy. Scotia, vol. 4, Zool., pt. 15, May 23, 1913, p. 316. S. 71°22' W. 16°34', 1410 fathoms, off Coats Land.

4514

Snout 1 2/3 in head from snout tip; orbit 9, 5 1/3 in snout; mouth cleft reaching orbit.

(Regan.)

Antarctic Ocean. Only known from a skull 150 mm. long and dentaries of a second specimen from same locality. The antrorse palatine teeth especially peculiar.

2315

Family Evermannellidae

4515

Body oblong to elongate, compressed. Head large. Snout short. Eye large, orbital cavity expanded downward. Mouth large, widely cleft. Teeth unequal. Large canines slender, barbed, form regular series in lower jaw. Gill opening very wide. Pseudobranchiae well developed. No air vessel. Body naked. Skull considerably expanded behind narrow interorbital. Vertebrae 52, ribs on short processes. Scales absent. No luminous organs. Dorsal premedian, advanced near or before ventral. Adipose fin present. Caudal forked. Paired fins moderate.

4516

Genus Evermannella Fowler

Evermannella Fowler, Proc. Acad. Nat. Sci. Philadelphia, 1901, p. 211. Type Scopelus balbo Risso = Odontostomus hyalinus Cocco.

Evermannella Fowler proposed to replace Odontostomus Cocco. (Precludes Evermannella Eigenmann 1903.)

Odontostomus (not Beck 1837) Cocco, Innovi Ann. Sci. Nat. Bologna, vol. 2, 1838, p. 192. Type Odontostomus hyalinus Cocco, monotypic.

Coccorella Roule,

1929

4517

Body compressed, moderately long. Eye greatly advanced, large, deep orbital cavity with wide transparent membranous lateral fold or wall. Mouth very large, mandible protruding. Premaxillary and maxillary slender. Teeth on premaxillaries with series of small subequal teeth. Lower jaw, vomer and palatines with few depressible very large fangs. No gill rakers. Branchiostegals 8. Dorsal short, rays 7 to 14. Adipose fin far back. Anal long, rays 25 to 35. Caudal small. Pectoral low, near

Evermanella normalops Parr

Evermanella normalops Parr; Bull. Bingham Oceanogr. Collection, vol. 3, art. 3, Dec. 1928, p. (163) 164, fig. 39a (head). N. 24°29' W. 77°29', 8000 feet. depth ?; head 4 3/5, width 2 1/4. Snout 4 in head from snout tip; eye 7, 1 2/3 in snout, 1 4/5 in interorbital; maxillary extends 1 1/2 eye diameters behind eye, expansion 1 1/3 in eye, length 1 2/5 in head; premaxillary with series of small decurved oblique teeth; dentaries with 5 fangs each, second longest and 2 to 4 minute teeth around base of each fang of dentaries; / enormous fang on each

palatine, followed by widely interspaced series of 4 smaller fangs; interorbital 3 7/8, moderately low.

Lateral line extends till above middle of anal fin.

D. 13; A. 31; pectoral 12; ventral 9.

Dark brown, with purplish metallic luster. Length 55 mm. without caudal.

(Parr.)

Western North Atlantic.

4532

Family Scopelarchidae

Body elongate, compressed. Snout conic. Eyes telescopic, lateral, directed upward. Mouth cleft wide. Premaxillary large. Maxillary, if present, small. Teeth on premaxillaries, dentaries, vomer, palatines and tongue, depressible and unequal. Gill openings wide, membranes separate. Gill rakers small. Pseudobranchiae present. Gills 4. Scales very deciduous or absent? Dorsal short, before ventral. Adipose fin high, over hind half of anal. Anal long, postmedian. Caudal forked. Ventral premedian.

45-33

Analysis of genera

a.[1] Eyes telescopic; pectoral longer than ventral; depth 5 1/4.

Scopelarchus.

a.[2] Eyes partly telescopic; ventral longer than pectoral.

Scopelarchoides.

a.[3] Eyes normal; paired fins small; depth 3 1/8.

Promachteon.

Genus Scopelarchus Alcock

Scopelarchus Alcock, Journ. Asiatic Soc. Bengal, vol. 65, pt. 2, 1896, p. 307. Type Scopelarchus guentheri Alcock, monotypic.

Dissoma Brauer, Zool. Anzeiger, vol. 25, 1902, p. 278. Type Dissoma amale Brauer, monotypic.

Body oblong, slightly compressed, subcylindrical. Eyes telescopic. Premaxillaries long, slender, with only small cardiform teeth. Lower jaw with outer series of small cardiform teeth and inner series of larger fangs. Vomer and palatines with fangs. Series of smaller, compressed

decurved, barbed teeth along entire upper surface of tongue. Scales thin, cycloid, somewhat irregularly arranged. Dorsal short, median. Adipose fin present, above hind part of anal. Anal very long, postmedian. Rudimentary caudal rays rather long series. Pectoral large, rays strong, inserted high, upper rays near lateral line than ventral profile of body.

Analysis of genera

a.' Eyes telescopic; pectoral longer than ventral.

b.' Single or incompletely double palatovomerine series of subequal fangs, none especially modified; premaxillary with only dense cardiform series of minute, subequal, decurved teeth?

Scopelarchus.

b.² Vomer and palate toothless; premaxillary with only small decurved subequal teeth.

Benthalbella.

a.² Eyes partly telescopic; ventral longer than pectoral. Scopelarchoides.

a.³ Eyes normal, widely separated, lateral; dentition? on vomer and palatines; premaxillary with distinctly enlarged, triangular hook like tooth in front, followed by wideset series of decurved teeth with some smaller teeth between.

Promachteon.

4542

Genus Scopelarchoides Parr

Scopelarchoides Parr, Occas. Pap. Bingham Oceanogr. Collection, No. 2, 1929, p. 16..

Type Scopelarchoides nicholsi Parr, monotypic.

Body elongate, with long tapering tail. Head large. Snout moderate. Orbit large. Mouth large, mandible protruding. Premaxillary teeth small, subequal, recurved, depressible anteriorly, minute erect, fixed, uniserial posteriorly. Lower teeth with dozen compressed, depressible each side. Each palatine with 2 compressed fangs anteriorly, followed by double series of long slender teeth. Scales cycloid, thin, small. Lateral line with greatly enlarged scales. Dorsal far advanced, over ventral. Adipose fin large. Anal long. Caudal large. Paired fins well developed, ventrals larger. Pectoral rays 20 & 22. Ventral rays 9.

4543

Scopelarchoides nicholsi Parr

Scopelarchoides nicholsi Parr, Occas. Pap. Bingham Oceanogr. Collection, No. 2, 1929, p. 16. N. 16°14' W. 99°36'30, 1800 fathoms; Bull. Bingham Oceanogr. Collection, vol. 2, art. 4, Oct. 1931, p. 35, fig. 15 (types; N. 24°7' W. 108°40', 286 fathoms; N. 11°5' W. 89°20'45", 2000 fathoms; Pacific).

Depth 5 3/4; head 3 3/5. Snout to orbit 1 1/4 in head from snout tip; orbit 3 1/8, greater than snout; maxillary reaches opposite hind eye edge, 2 in head from snout tip. D. 6 or 7, fin height 1 1/5 in total head length; adipose fin 2 1/8; A. 21 to 23, fin height 1 4/5; caudal 1; least depth of caudal peduncle 3 1/8; pectoral 2 1/5; ventral 1 1/2. Length 115 mm. without caudal. (Parr.)

Pacific, off Mexico.

4544

Genus Promacheon Weber

Promacheon Weber, Siboga Exped., vol. 57, Fische, 1913, p. 84. Type, Promacheon sibogae Weber, monotypic.

Body rather deep. Head large, conic. Eye small, premedian. Mouth wide, nearly horizontal. Premaxillary with slender maxillary above, forms upper jaw. Point of each premaxillary with prominent triangular tooth, directed forward and slightly downward. No teeth on palate. Gill membranes free from isthmus; connected behind symphysis. Branchiostegals 6, short. Stomach and abdomen not distensible.

4545

Scales present in lateral line. Dorsal long, postmedian. Adipose fin present. Anal long, like dorsal, slightly more posterior. Caudal emarginate. Pectoral low. Ventral inserted slightly before dorsal.

4546

Promacheon sibogae Weber

Promacheon sibogae Weber, Siboga Exped., vol. 57, Fische, 1913, p. 85, fig. 20. Banda Sea, N. Lat. 3°58' E. Long. 128°20', in 2000 meters; N. Lat. 4°30'.2 E. Long. 129°25', in 1000 meters. — Weber and Beaufort, Fishes Indo Austral. Archipelago, vol. 2, 1913, p. 183, fig. 73 (Weber's materials). — Parr, Bull. Bingham Oceanogr. Collection, vol. 3, art. 3, Dec. 1928, p. 158 (compiled).

depth 3 1/8; head 2 4/5. Snout 2 1/3 in head; eye 6, 2 1/4 in snout; premaxillary extends 3/4 eye diameter behind eye, length 1 1/4 in head, with prominent anterior tooth and series of partly curved larger

teeth directed backward, smaller ones between and both kinds of teeth, smaller in mandible; interorbital high.

Scales in lateral line 32, continuous to hypural.

D. 14, fin base 2 1/10 in head; adipose fin 5; A. 17 or 18, fin base 1 3/4; caudal short; least depth of caudal peduncle 3 1/2; pectoral rays 15, short?; ventral rays 10, length 4 1/5 in head. Length 20 mm.

(Weber.)

Banda Sea.
